Employing a meta-epistemological analytical perspective, this article takes a unique approach by focusing on the process of knowledge production rather than the content. The investigation delves into how knowledge about school absenteeism is generated, emphasizing the methodological and theoretical assumptions underpinning the research publications identified in the systematic literature search. This novel approach provides insights into the positioning of knowledge production within the scholarly discourse. Conceptualisation of cooperation between school and other welfare institutions are particularly explored.

Preliminary findings: There is an epistemological distinction in Nordic research on school absenteeism, between research that establish a causal approach and develops designs where the research will generate knowledge about certain individual causes of school absence, and research that explores school absence as a contextual and relational phenomenon. This distinction contains many nuances, which we present in the paper.

RN27 | T01: Transnational families and care arrangements

Transnational Families, Care Strategies and Public Policies in a Post-pandemic (Im)mobility Regime

Laura Oso, Raquel Martínez-Buján, Paloma Moré

Universidade da Coruña

This article analyses the social protection strategies that transnational families have deployed to cope with the new regime of (in)mobilities that emerged after the Covid-19 crisis. It reflects on how the pandemic has restructured the articulation of the family welfare model and the migration regime in Spain. From a theoretical point of view, it combines the analysis of family strategies of "transnational social protection" with the approach of spatial and social (in)mobilities. The article also includes a multilevel analysis (macro, meso, micro) of the connections between care and migration. A mixed methodology was used: 1) the exploitation of secondary sources to show the impact of the Covid-19 crisis on Latin American immigrant families in Spain; and 2) an analysis of ethnographic material consisting of in-depth interviews (n=41) with various members of transnational families (n=13) residing in Spain (n=27) and in their countries of origin (n=14). The results show that after the Covid-19 crisis, an "assemblage of spatial and social (in)mobilities" was generated for the immigrant population. They highlight the social blockages that the immigrant population had to face: legal, residential, occupational and care, and also how informal arrangements to solve these immobilities are led by women. Those families who were further along in the migration cycle or who had social capital (relatives in Spain) were less affected by the impact of the crisis.

Birth, life and death of transnational families: A multi-sited ethnography across Colombia, Spain and France.

POlina Palash[1], Andrea Souto[2], Laura Oso[2], Virginie Baby-Collin[1]

1Aix-Marseille Université. Telemme; 2Universidade da Coruña. Esomi.

This work focuses on transnational care and social protection arrangements in families scattered across their origin context of Colombia and their migration contexts in France and Spain.

It analyses the gendered caring practices among three generations of mostly female family members, in their evolution over large time frames, applying a life course and trajectory perspective. We draw on a multi-sited ethnography conducted in several localities in France, Spain and Colombia, between 2018 and 2023, comprising 37 members from six transnational families originating from Colombia.

The results of the research allow us to discover the transnational family from several points of view. On the one hand, it reveals the process of construction of the "transnational family space" through the different contexts in which the family members considered for this study find themselves – "here", "there" and beyond – using multisite ethnographic methods. Moreover, it shows the different intergenerational perspectives of younger, older and older respondents, as well as the different stages in the evolution of transnational family ties and socio-spatial trajectories over time.

Thus, our work displays how care and social protection arrangements in transnational families evolve over time, reflecting their birth, rise and dissolution, at while disclosing the underlying tensions

Growing Old Between Cuba And Spain: An Approach To The Transnational Reconfiguration Of Care In Cuban-origin Families

Laura Suárez-Grimalt[1], Montserrat Golías[2]

1Universidade da Coruña, Spain; 2Universidade da Coruña, Spain

This paper examines the mobility of the Cuban population, with a focus on care dynamics for older adults in transnational families.

The presence of the Cuban population in Spain has gradually increased since the 1990s, along with the primary destination, the United States. The direction of these migrations has been determined by legislation on nationality, in the case of Spain, or by immigration policy in the case of the United States.

The Cuba-Spain-United States triangle is a clear example of crossed mobilities (Oso, Cortés, and Sáiz, 2017), historically built within these transnational families. However, this proposal suggests analyzing the constant migratory exchange in these three spaces, beyond economic and political interpretations. This is because the health crisis has invited us to focus on the well-being of families and place care at the center (Solís, Martínez-Buján, and Paredes, 2018).

Empirical observation points to a reconfiguration of the flows of Cuban transnational families. In the case of Spain, there has been an increase in the group over 50 years of age (INE data, 2022). The objective of this proposal is, therefore, to analyze the reconfiguration of care in Cuban transnational families. Our contribution intends to analyze the organization of care among the different members of

867

the family, specially considering older adults, and understand them as a space in which to (re)define migration and mobilities.

To achieve this goal, we will analyze secondary sources and conduct two "family life histories" These histories will be constructed from a biographical, multi-methodological, intersectional, gender and longitudinal approach.

Between Cuba and Spain: Patrimonial Care and the Re-organisation of Transnational Families

Alba Vázquez López, Laura Oso Casas

Universidade da Coruña UDC, Spain

In recent years, there has been an intense scientific production that addresses the issue of migration and care. Beyond the perspective of global care chains,which propose, with a uni-directional vision,the transfer of care from the Global South to the Global North, the "circulation of care" approach (Baldassar and Merla,2013)has brought to light the exchanges in which transnational families participate.

In this paper we analyse a dimension of care that has been less addressed in the literature and that has to do with patrimonial goods. By this,we refer to the care of property, homes, pets, as well as the maintenance of burial plots of family members who are no longer present. To this end,we take a gender and intergenerational approach,bringing to light how this type of care re-organises the dynamics of transnational households, as well as families´strategies for mobility and immobility.

The research takes as a case study the migration of women from Cuba to Spain and, specifically, to the region of Ulloa ,in Lugo.This migration is explained by the demand for labour for domestic service,due to the progressive ageing of the population in rural Galicia.This, in turn, is connected to and structured by the demand for care in the host context.

The methodology used is based on multisite fieldwork.The first phase of the study involved conducting biographical interviews with families of Cuban origin located in the town of Monterroso, a village in the province of Lugo, Galicia. Subsequently,visits were made to their relatives in Cuba (areas of Camagüey, Sancti Espiritus and Havana).A total of 25 people were interviewed during the fieldwork.

RN27 | T02: Gender in Southern Europe

Comparing Regional Gender Disparities: Spain, Italy and France

Sandra Fachelli[1], Pedro López-Roldán[2]

1Universidad Pablo de Olavide, Spain; 2Universitat Autònoma de Barcelona, Spain

The analysis of gender equality at country level is a key information tool to assess the impact of gender policies as well as the trends of change over time regarding this social reality. In this paper we would like to deepen this type of analysis by investigating at the regional level (NUTS2) to what extent differentiated behaviour can be observed within each country in the Gender Equality Index (GEI) elaborated by the European Institute for Gender Equality (EIGE). We have chosen Italy, Spain and France as case study, covering a total of 62 regions, to analyse gender equality with the different indicators proposed in the GEI and to be able to observe what particularities emerge from a disaggregated territorial analysis, essential for the development of local gender policies. We carried out two types of analysis: a) the construction of the index and the analysis of the six main domains that define the measure: Work, Money, Time, Power, Knowledge and Health, with the aim of typifying the regions analysed, showing specific structures and dynamics; b) to relate the results obtained in the RGEI to elements linked to other indicators of economic, social, cultural, political and demographic development. The relevance of this analysis is inscribed in the importance of the persistent regional disparities observed in Europe. Monitoring these regional gender differences is essential in order to identify processes of convergence (or divergence) that are urgently needed and for the evaluation and implementation of policies at regional level.

868

Structure and Agency in Young Adult Women's Fertility Intentions in Italy

Natalia Tosoni

University of Bologna, Italy

The declining fertility has become a typical feature of Southern European Countries, and it has been particularly severe in Italy over the past thirty years, raising relevant questions on social, economic, cultural and welfare sustainability.

In this regard, several demographic research have been conducted to investigate the causes and effects of declining fertility in European countries. Still, few studies have focused on the agency of young adult women in planning their fertility behaviours in different contexts. Investigating the declining fertility considering young adult women agency means recognising them as active subjects who are not only exposed to and influenced by the circumstance's dynamics.

This paper is thus aimed at answering the following research questions: Do the structural conditions – namely referred to the labour market, the everyday cultural patterns, and the welfare regime – impact on young adult women (25-34 years old) fertility intentions in Italy? If so, what is their agency in planning their future in that specific context?

The first question is analysed through quantitative analysis, using regression models on the last Italian National Statistical Office Multipurpose Investigation data on Family and Social Subjects. The second one, instead, is investigated through semi-structured interviews with young adult women in Italy.

Results are interpreted within the theoretical framework of the Sociology of Youth and Gender and Women Studies, and they show how the Italian context limits the realization of fertility intentions and the agency of young adult women.

Discussing Homonationalism In The Context of Queer And Trans Reproduction In Spain And Catalonia

Leon Freude[1], Doris Leibetseder[2,3]

1Universitat Pompeu Fabra, Spain; 2Universität Basel, Switzerland; 3Universität Wien, Austria

This communication analyses the dynamics of homonationalism in the discussions on queer and trans reproduction in the context of Spain and Catalonia. Drawing upon Jasbir Puar's (2013) concept of "homonationalism," the study probes into the interplay between the Catalan independence process and the interconnectedness of queer and trans reproduction with the state. Through the analysis of eight in-depth interviews, the research addresses questions about potential variations in access to queer and trans reproduction between Spain and Catalonia, the presence of racializing or homonationalist ideologies in reproductive discourse, the significance of queer and trans reproduction in the Catalan independence process, and the strategies employed by queer and trans individuals in Catalonia to navigate reproductive challenges in the context of Spain and Catalonia. These interviews, conducted as part of an EU-funded project on queer and trans reproduction in Europe, shed light on both the struggles and the complicity of individuals in utilizing homonationalist strategies within their reproductive journeys. The communication critically examines the role of Spain and Catalonia in wielding homonationalist tools within the realm of queer and trans reproduction.

The Social Reorganization of Care During the Pandemic: Welfare, Community and Gender

Carme Vivancos-Sánchez, Elisabet Almeda Samaranch, Màrius Domínguez Amorós

University of Barcelona, Spain

The aim of the communication is to present some of the results of the research on "The Social reorganization of care during the pandemic: welfare, community and gender" that we are carrying out from several research groups of Catalonia, Euskal Herria, Valencian Country and Balearic Islands. We want to analyze the social impacts of COVID-19 on household care needs, the consequences it has on gender inequalities and on the social reorganization of care work, and the role of community support and solidarity organizations and networks. Our general hypothesis is that the COVID-19 pandemic and the associated measures have meant a return to the home of some care needs that had previously been outsourced, modifying individual, family and collective strategies to respond to care work. This has led to a worsening of the care crisis, consolidating and perpetuating social inequalities, especially those affecting the wellbeing of the poor, and has also led to the emergence of key solidarity initiatives at the community level. The relevance of care work to maintain the current social sustainability and the challenges we face for a new social reallocation of these tasks towards a fairer and more egalitarian model is evidenced. Starting from a critical and non-androcentric perspective, we propose a mixed methodological strategy, on the one hand, quantitative from the systematization and analysis of secondary data sources in Spain, related to the management of time and care work, and on the other hand, qualitative, with in-depth interviews to women with care responsibilities and discussion groups with social entities supporting care.

Women's Contested Identities In Sustaining Sheep Grower Societies in Crete, Greece

Eugenia Petropoulou, Vasiliki Petousi

University of Crete, Greece

The goal of this presentation is to help build a clear picture of women's identity in sheep grower societies in Crete, Greece. Despite the so-called 'feminization' of Greek agriculture, the relevant literature indicates that cultural constructions and representations of gender impose an inferior role on rural women while deeply rooted prejudices and long-established traditions sustain their dependency on men, even today. Drawing data from one focus group (no.6), two group interviews (4 each) and six in-depth interviews with women involved personally in sheep growing and as 'assistants' to men (husbands, fathers, brothers), we investigate the changes in women's identities in pastoral societies in Crete. To achieve this, we emphasize personal, family, economic and community relations and argue,

869

that inclusive approaches are required that incorporate the voices of and lived experiences of women in pastoral societies. The results indicate that at the one end of the spectrum women's role within the family significantly improved in the last decades, while, at the other end, full gender equality and the assertion of a sheep grower farmer identity remains questionable in pastoral societies where traditional male-privileged morals and ethics prevail.

RN27 | T03: Social policy and care Regimes

(Un)Seeing from Southern Europe. Rethinking Critical Disability Studies from an Ethnography in Italy and Portugal.

Fabio Bertoni

Universidade de Lisboa

In the last three decades, there has been a notable increase in attention towards social approaches to disabilities, leading to the development of autonomous fields of knowledge and epistemologies. These frameworks aim to highlight the ableist structures embedded in societies and the intersections between (dis)ability and other axes of power and subordination. The connection with disability social movements and (trans)feminisms has resonated powerfully, offering transformative potential.

However, it's crucial to acknowledge that disability studies are deeply rooted in their original contexts, with the UK influencing the social model of disability and the USA contributing to cultural/critical disability studies.

870

This contribution takes inspiration from the initial stages of a 6-year research project focused on the relationship between visual impairment and the urban environment in Milan and Lisbon. Utilizing an ethnographic approach, the aim is to delve into the daily lives of subjects with a visual impairment in urban contexts. The focus is on exploring how the city acts as a disabling force, examining the interplay between architecture, human infrastructure, social policies, and daily routines that contribute to shaping diverse perspectives on seeing (and not seeing) as a disability.

Throughout this contribution, grounded in relevant aspects of the ongoing project, there is an attempt to reposition disability studies within Southern Europe, specifically in Italy and Portugal.

Three main issues are addressed: firstly, the unique configuration of social movements and the realities of activism and volunteering related to disabilities; secondly, the distinct historical conceptions of the welfare state and urban/metropolitan welfare; thirdly, the relationship between disability and austerity, considering its everyday impact and normalization within the broader context of crisis.

Local Social Care Regimes In Italy And Spain. The Case of The Third Sector

Francesca Donati[1,2], Maria Jesus Rodriguez[2], Emanuele Polizzi[1]

1Università degli Studi Milano-Bicocca, Italy; 2Universidad Pablo de Olavide

Since the 1980s, the welfare crisis has led to the subsidiarisation and territorialisation of services. This is the increase of the responsibilities of local authorities in the design and organisation of welfare. Moreover, the legitimacy and economic crisis, together with the challenge of new social risks, open to the renewal of the relationship between local public actors and non-governmental actors involved in the production of welfare services.

The aim of this paper is to explore some features of the local social care regime. We focused on the role of the third sector in the organisation (from planning to production and delivery) of ECEC (Early Childhood Care and Education) and elderly services in two familistic and regional framed countries: Italy and Spain. We conducted 4 interviews in each municipality with third sector actors of the social economy and volunteer association involved in social services and/or advocacy activities.

We found four main results: first, the institutional variable (norms and laws) is essential in shaping the local welfare mix, the recognition of third sector actors and the regulation of the public-private relationship is one of the most influential factor for the mix outcome and it explains differences between Spanish and Italian municipalities; second, the policy issue has an impact on welfare configuration, indeed differences between local ECEC and elderly services organisation are registered; third difference between volunteer association depending from the country and the policy field exist; fourth, actor interests also shape the relationship between governmental and non-governmental actors.

The Impact of Urban Policies on Citizens' Opinion and Trust in the Welfare State. An Example from Local Welfare Systems in a Southern Welfare Regime

Jesús Pérez Gutiérrez, María Jesús Rodríguez García, María José Guerrero Mayo

Universidad Pablo de Olavide, Spain

In recent decades, changes have taken place in Welfare States that affect governance and the development of multilevel policies where local welfare management, understood in a broad sense beyond the areas of intervention defined by Esping-Andersen (1999), has become more relevant (Navarro and Rodríguez-García, 2009). The capacity for action of local entities will depend on the socio-economic

vitality of their communities and their institutional context, giving rise to place equality regimes, which are determined by the institutional infrastructure and the welfare regime (Navarro et al., 2017). In the Spanish case, we have a Welfare State typical from Southern European countries (Ferrera, 1993) with decentralised competences towards regions and, to a lesser extent, local entities, that configure a specific local welfare regime.

In this context, sectorial policies, as well as integral urban policies, understanding cities as structures of opportunities that have an impact on citizens' access to services and quality of life, are part of the so-called local welfare system. Although we know that there is a social and civic impact of these interventions (Navarro et al. 2016), there is no information on the impact of welfare policies on public opinion on the Welfare State at the local level, as there is at the international, national and subnational levels (Chung, Taylor-Gooby and Leruth, 2018). Therefore, using survey data from local contexts in the region of Andalusia in Spain from the Urban Regeneration and Social Cohesion in Andalusia project (RUCOSA), we propose an exploratory analysis of public opinion on their position on local welfare systems in Andalusia.

(Re)building Trust and Improving Social Policy: Challenges in Enhancing The Relationship Between Society, Science, and Policy

871

Ana Romão[1], Maria da Saudade Baltazar[2], Sara Silva[3], Luís Baptista[4]

1Military Academy; CICS.NOVA, Portugal; 2Universidade de Évora; CICS.NOVA.UÉvora; 3Universidade de Évora; CICS.NOVA.UÉvora; 4Universidade Nova de Lisboa, FCSH; CICS.NOVA

Citizen science is a novel and transformative approach to addressing the diversity and complexity of social challenges. It involves active collaboration between members of society and researchers, based on informed, conscious, and voluntary participation. Despite the growing attention it has received in the last decade, sociology and the social sciences in general have not been particularly active in these areas of research, although the long tradition of valuing citizen participation. We propose to explore how the perspective of citizen science can help us to understand social phenomena better and develop intervention strategies. This contribution presents an analysis model for the national support network for war veterans with post-traumatic stress disorder, with a focus on the situation in Portugal. The different methodologies will be identified, including their advantages and disadvantages. Their applicability to the case under study will be considered, particularly regarding the empowerment of the direct beneficiaries of social policies. Giving a voice to citizens and involving them in defining responses to identified social needs is a way of strengthening the link between society, science, and policies. This, in turn, makes it possible to enhance trust in institutions, a challenge that is even more significant in uncertain conditions, such as those experienced during the COVID-19 pandemic.

RN27 | T04: (Im)Mobilities in Southern European Societies

Migration Experiences In Southern Europe: The Mobility Of Retired Italians.

Marco Alberio, Susi Anny Veloso Resende, Alice Lomonaco

University of Bologna, Italy

This presentation aims to identify experiences of mobility among elderly Italians moving to other countries within and outside Europe. Within the social imaginary aging is rarely associated with mobility and migration, but what can be observed among retired Italians today is a movement out of the country, a choice mainly related to the possibility of improving the quality of life. This study aims to understand patterns of migratory models experienced in Southern Europe along with everyday life experiences that bring new dimensions to both migration trajectories and redefinitions of lifestyles related to old age. Using a qualitative methodology, this study interviewed elderly Italians who decided to live in Portugal and Tunisia. From 46 preliminary interviews, it was observed that both the welfare and financial systems of Italy, Portugal and Tunisia were key deciding factors for many of the interviewees. Preliminary results indicate that the migration motivations of many Italians involve both personal and institutional dimensions related to welfare system patterns in Southern European countries. What we can also observe is how the choice to move to another country has economic impacts on both countries, and especially on the migration experiences of these individuals. On the one hand, we can see the effect of gentrification in Portugal, the real estate market; on the other hand, we see changes in the relationship with the local community, in access to services, and in the cost of living for these people.

Immobility Strategies Of Argentines In a Transnational Polycrisis Scenario

Daniela Herrera Rubalcaba[1], María-Jesús Cabezón-Fernández[2]

1University of Almería, Spain; 2University of Granada, Spain

Recently, the term polycrisis has been revitalized as a lens for the analysis of social processes in current societies. If "crisis" refers to "moments in which a group or groups perceive the emergence of a threat and try to respond to this, under conditions of uncertainty" (Voss and Lorenz 2016); polycrisis points to the "interaction of disparate crises at once, in such ways that the overall impact far exceeds the sum of each part" (O'Regan, 2023). The increase and overlap of crises of diverse nature has caused social vulnerability to become a structural feature of societies at a local and global level, in the North and the South. As an escape to reduce vulnerability, geographical (im)mobility as a survival strategy emerges, generating, in turn, other forms of crisis at the individual or family level.

From the perspective of the polycrisis, based on 38 semi-structured interviews carried out with Argentine people, we analyze their transnational (im)mobility strategies in a scenario of uncertainty influenced by the Corralito crisis, the Spanish Great Recession and the inflationary and employment crisis in Argentina since 2015.

As a result, the (im)mobility strategies of the Argentinians interviewed do not strictly obey economic reasons, but are connected to family events and fundamentally to the possession and control of certain capitals (economic, cultural, social, national, etc.). Trajectories rich in economic capital are more favourable to experiencing mobility while trajectories rich in cultural capital have to "think" more carefully about their decisions to stay or move.

Work-Life Balance In Recent South-To-North Migrations In Europe: The Case Of Spaniards In Sweden And France.

Sandra López-Pereiro

Universidade da Coruña, Spain

872

Precarity and job insecurity have been hitting southern European societies in recent years. Increasing labour deregulation coupled with specific structural problems of southern countries have led to a landscape of unemployment, low salaries and poor working conditions. One consequences of this situation is an increase in tension between work and life for precarious individuals. For young people, permanent uncertainty and lack of resources make it extremely challenging to articulate their lives.

Migration towards northern countries with better opportunities has been an option to navigate through these problems. Specifically, movements towards countries with different labour relationships traditions and welfare frameworks can offer interesting opportunities regarding work-life balance.

The aim of this paper is to analyse the relevance of work-life balance in recent migration from Spain towards France and Sweden. Is it a factor in migratory decisions? If so, to what extent? Does it affect equally to men and women? What role plays the persistent familism of Spain?

In order to fulfil the objective and answer the research questions, semi-structured interviews to Spaniards who moved to Sweden or France from 2008 and onwards were developed. The questions focused on migratory decisions, work-life considerations, and perceptions on welfare systems in both origin and destination countries.

Results reveal that, although interviewees emphasize the importance of work-life balance, they do not consider it as a primary reason to migrate. However, it significantly influences subsequent migratory decisions: staying, returning or onwards migration. The impact is more pronounced for migrants in Sweden.

The Return Mobility and Remote Work Nexus: Labour mobility in Spain and Malta in the aftermath of the COVID-19

Irene López García[1], Heather McNamara[2], Aileen Köster[3], Juan Antonio Roa Dominguez[1], Daniela DeBono[2], Simone Castellani[1]

1University of Cádiz, Spain; 2University of Malta; 3University of Kiel, Germany

As a result of technological developments and the gig economy, remote work has been a trend since 2009. After the pandemic there has been a significant increase. For some, the return was even enabled by their employers, who offered the option of work. Drawing on previous studies we note that remote work indicates clear benefits, most notably: improved work-life balance, lower environmental impact and spatial and time flexibility. Drawbacks have also emerged showing that existing inequalities in the economic sector and the position of the job, territory, gender and age – tend to be reproduced by remote work. Little is known however about remote work in the context of return mobilities, and whether this changes our understanding of the impact of remote work on individual workers, on addressing vulnerabilities and inequalities, as well as the broader impacto n the environment.

In this paper we combine the literature on remote work and contextualise it in a return mobilities framework. We draw on the long research trajectory of return migration and mobilities, and also on qualitative and comparative research between two southern European countries. Our aim is to explore the nature and different typologies in this nexus. The paper takes into consideration the micro-macro continuum of this reality in both countries. For this reason, it tries to understand aspects of a cultural, economic and social nature in relation to the personal decision to return to the country of origin, as well as structural issues related to welfare and social protection policies, labour rights and taxation.

RN27 | T05_01: Education, research and innovation

Predicting Student Dropout in Higher Education Using Artificial Intelligence Technology

Francesco Mazzeo Rinaldi, Vincenzo Miracula, Teresa Consoli, Elvira Celardi, Ornella Occhipinti, Antonio Picone

University of Catania, Italy

A significant level of student dropout characterizes the Italian university system. This has adverse effects on several fronts: on the socio-economic side of the country, due to the lack of return on investments made in skills growth; on the university institutions, in terms of reduced national funding and revenue; and, finally, on students, who must rethink and reorient their life paths. It is, therefore, important for universities to be able to make predictions about the outcomes of their students' academic careers.

Predicting college students' future careers using Artificial Intelligence (AI), particularly Machine Learning algorithms (ML), has gained traction as a promising application to guide educational planning and workforce development. These algorithms can analyze a student's characteristics, academic history, and learning style to predict the likelihood of success or failure and recommend personalized interventions tailored to their needs.

In this regard, this paper presents a project carried out at the University of Catania, Italy, where a novel ML algorithm capable of providing predictions of career outcomes for students in some of the University's departments was developed and tested. The model showed how helpful such tools can be in helping educators and counselors make more informed decisions about students' college careers by analyzing large amounts of data and identifying patterns and trends that may not be immediately apparent through traditional methods.

Secondary School Teachers' Work in Greece: Educational Policy and the Perceptions of Teachers.

Eleni Tsiknakou

Panteion University of Social and Political Sciences, Greece

The present study examines the interaction of educational policy and the working conditions at schools by exploring the perspective of the Educational Policy and the perspectives of sixty-eight teachers of Secondary Schools from the surrounding area of Athens. An analysis of the current underlying laws about Secondary Education was conducted to explore the perception of the educational policy regarding teachers' work and semi-structured interviews of teachers were conducted to ask the teachers about their experience

873

at work and their perceptions of it in relation to the directions given by the Ministry of Education. A grounded theory method of analysis was used to develop an empirically description of this interaction. Findings are discussed in relation to the meaning teachers give to their work, which emerged as an important finding influencing both their thoughts about it and the way they carry it out.

Studying University Careers: A Contribution from Machine Learning

Sandro Brignone, Paola Borgna, Tania Parisi

University of Turin, Department of Philosophy and Education Sciences, Italy

This contribution aims to present the outcomes of a research project conducted by the University of Turin (Italy), in which a Machine Learning (ML) model was developed to provide predictions on the career outcomes of university students of the institution, with the ultimate goal of supporting those who are struggling to successfully complete their academic paths.

The theme of artificial intelligence is introduced, and its applications and potential in the educational field are briefly discussed, focusing on the study of university careers and the phenomenon of university dropouts. Italy holds an unenviable record in this regard and occupies positions close to those of other Southern European countries in international dropout rankings. Subsequently, an experimental project ("Data Lab UniTo") of the University of Turin, in partnership with CSI Piemonte, is illustrated. This project was initiated in 2019 and aimed to construct an ML model capable of providing predictions on the career outcomes of students in certain Departments. The purpose is to offer an effective tool to decision-makers, at various academic levels, useful for making strategic choices in cases of criticality (delays and dropouts). This is a broad and articulated project, which, to date, has been expanded and involved about 60 courses of study at the University of Turin. This paper intends to describe its salient aspects, with particular reference to the ML of the study courses in the pedagogical area of the Department of Philosophy and Education Sciences, also showing the platforms available to the University for consulting the results.

'Dual' Work Placements As An Advanced Form Of Relationship Between Industrial SMEs And Vocational Schools: Evidence From The Basque Country

Beatriz Otero, Mikel Olazaran, Eneka Albizu, Cristina Lavía

University of Basque Country (UPV/EHU), Spain

In the last decades VET policies in Spain have been directed to strengthening the relationships between firms and vocational schools. An important step in that direction was the introduction in the mid 2010s of an extended model of student work placement (so called 'dual VET'). Since then, the literature about the Spanish 'dual' internship model has grown, looking at aspects like initial controversies about the design and early implementation of the instrument, comparison with central European apprenticeship systems, and agents' views about the organisation and results of the extended model.

Most of those studies look at perceptions of educational agents, but little is known about the views of firms. In this context, this paper would like to contribute to the knowledge about the implementation of dual VET in the Basque Country from the point of view of the companies. We look at student work placement as the main instrument of relationship between firms and schools, and check the differences between those firms which have experience only in the standard model and those which have adopted the extended model.

The research question is: Are there important differences between firms who participate in dual VET and those who don't in their views of the relations with vocational schools? And if so, which are they?

In order to answer that question, a quantitative research design has been used based on an ad hoc survey carried out with a sample of 254 industrial SMEs from the Basque region which have received VET student placements.

874

RN27 | T05_02: Spatial Inequalities, inner and shrinking areas

Territorial Crisis Meets Migrant Reception: The Implications Of Welcoming Newcomers Into Spanish Demographically Challenged Areas.

Leticia Santaballa[1], Laura Oso[1,2]

1ESOMI Research Team (Societies in Motion Research Team), University of A Coruña, Spain; 2CISPAC (Centro de Investigación Interuniversitario de los Paisajes Atlánticos Culturales)

The perception of the territorial imbalance faced by Spanish shrinking rural areas in terms of demographics (ageing, lack of generational replacement), economics (de-escalation of local productive sectors), welfare (limitations in access to basic services) or environment (neglected natural spaces), and the policies that frame them, position local communities towards specific dynamics of welcoming migrants. We aim to explore how the international population on the move is linked to the so-called "depopulation" crisis, analysing how "reception initiatives" are shaped by the perception of the territorial crisis, giving rise to three distinct patterns that have a differential impact on the dynamics of reception of migrants, which are considered both as an element of resistance to one crisis (rural devitalisation) and as directly responsible for the other (asylum/immigration/securitisation).

The methodological pillars of this research are based on intensive qualitative fieldwork in Andalusia, Galicia, Castile León and Aragón, using semi-structured interviews and participant observation. This research is part of the H2020 project Investing in 'Welcoming Spaces' in Europe: revitalizing shrinking areas by hosting non-EU migrants (H2020-SC6-Migration-2019-870952).

Social Bonding And (Mis)trust In Inner Areas Of Italy

Danilo Boriati[1], Daniela Grignoli[2], Mariangela D'Ambrosio[3]

1University of Molise, Italy; 2University of Molise, Italy; 3University of Molise, Italy

From a sociological point of view, the trust's topic is qualified with the meaning of social bond (Simmel, 1906), of stability of a established order. Durkheim (1893) defined it by the solidarity concept, a moral and a cognitive agreement able to keep society cohesive. This ones promotes the possibility to cultivate, in simple societies (communities), interpersonal relationships and social relations on a trust basis.

This possibility is also emphasized in contemporary sociological theories: them state that, in "community" social systems, it's still possible to trace "solid" forms of social bonding, based on trust (Bagnasco, 1999).

The results of a pilot research conducted in 2023 in Molise Region, one among the inner areas of Italy, show that "community" does not represent the place of social bonding and trust but, rather, would be the cause of a greater isolation and of problems in social emancipation, especially for young people.

Indeed, in inner areas, take place the depopulation phenomenon that, with aging, produces a vicious circle related to precariousness in life chances. Research data show how intergenerational and institutional tensions undermine the possibility to think about communities as relational and trusting places, connoting them as spaces where there is a strong sense of mistrust and where there is a loosening of social bond.

To re-create a sense of community, better ties for social cohesion and solidarity should be generated. In this direction, welfare policy interventions might also reach the "proximity communities" development, through the co-creation of solutions in order to curb vulnerability, to strengthen the social bond and to reconnect the trust relations and solidarity that are now "broken".

Spatial Inequalities in the Italian Labour Market(s). How Much Have Inner Areas Been "Left-behind"?

875

Maurizio Avola, Rossella Bozzon

University of Catania, Italy

The debate on the geographical dimension of inequality has been particularly intense in recent years (Rodríguez-Pose, 2018; Storper, 2018; Viesti, 2021). Traditionally, analyses at the sub-national level focus on regional divides or urban/rural cleavage. However, in contemporary societies, new interpretations of spatial inequalities and new dichotomies between central and peripheral (or marginal) areas.

In this perspective, the Italian National Strategy for Inner Areas (SNAI) has developed a theoretical and methodological definition of spatial peripherality/marginality concerning the accessibility to services of general interest and its correlation with various forms of demographic and socio-economic vulnerability (De Rossi, 2018; Modica et al., 2021). Although SNAI enhances in Italy an interesting debate on the risk of progressive demographic and economic desertification of inner areas, especially for those most peripherical and located in the South of the country, to the best of our knowledge no studies have empirically deepened the labour market performances among municipalities with different degree of marginality.

Starting from the SNAI classification of Italian municipalities, we aim to fill this gap by answering the following research question: how much have the labour markets of Italian inner areas been "left-behind" (Pike et al., 2023)? Moreover, considering the structural internal North/South divide characterising the country, we want to understand how the two dimensions of spatial inequality overlap in

influencing labour market outcomes. Using Italian labour force surveys, we will provide a detailed descriptive analysis of these geographical inequalities by adopting a diachronic perspective and focusing on different dimensions of labour supply and demand.

Methodological Challenges In Living Labs: Promoting Community Cultural Capital For A Sustainable Rural Development In Mediterranean Regions

Giampiero Branca[1,2], Romina Deriu[1,2], Chiara Ceseracciu[2,3], Roggero Pier Paolo[2,4]

1Department of History, Human Sciences and Education, University of Sassari; 2Desertification Research Centre (NRD) and Department of Agricultural Sciences, University of Sassari; 3University School for Advanced Studies IUSS Pavia; 4National Biodiversity Future Centre (NBFC), Spoke 4, University of Sassari

In Mediterranean regions, depopulation of rural areas is an issue that significantly affects the social, economic and cultural conditions of local communities. Enhancing and promoting the cultural and environmental heritage of these areas can have positive effects in activating contextualized and innovative participatory processes of community regeneration. The "Living Lab" concept is being proposed by EU research programs as "open innovation ecosystems in real-life environments using iterative feedback processes". Following a critical contextualization of such concept in rural areas, we will introduce some reflections emerging from the experience gained by the SUSTAIN COAST european project from Living Labs in Italy, Greece, Tunisia and Turkey, currently upgraded by OURMed project.

We will focus on empirical findings that have defined Living Labs as dynamic learning spaces centered on cultural capital that integrate community tacit knowledge and scientific knowledge, in order to co-design rural development options. We claim the centrality of some key-drivers of success during the operationalization of Living Labs, with specific reference to the enhancement of cultural capital: perform an effective stakeholder mapping including marginalized stakeholders such as elderly, women and youth; develop awareness of the diverse interests and interdependencies at play, promoting a change in community and territorial care practices; encourage empowerment activities to build new synergies between public institutions, local communities and the Third Sector.

We also discuss the critical implications of implementing Living Labs in Mediterranean rural areas, which raises some methodological and epistemological challenges: semantic stretching; time dimension; role of researchers; stakeholder mapping; cultural and social innovation.

RN27 | T06: Societies in Polycrisis: new theoretical and conceptual challenges

"After The Social Disaster Of COVID-19". A Study On The Impact And Direction Of The Pandemic On The Spanish Working Population.

José Ignacio Torres Romero[1], Nicolás Ureña Bautista[2]

1Universidad de Málaga, Spain; 2Universidad de Málaga, Spain

Studying natural disasters from social perspectives is a task that corresponds to sociology because it allows us to anticipate future disasters or similar and avoidable circumstances if we know the directionality of the effects of such disasters. Through the labor perspective of the Welfare State as a mediator of scarce resources in competition, the direction of the social disaster produced in the Spanish working population is investigated. It is also examined from the social exchange theory how this unequal distribution of welfare can lead to a detriment in valuable social objects. A logistic regression analysis is carried out using data from the third edition of the European Social Survey (ESS Round 10 – 2020. Democracy, Digital social contacts). The findings shows a greater impact and effect on self-employed people with few employees, also responding differentially to socio-demographic and socio-economic variables.

Global Crises and Challenges in Southern Europe: a Scenario Proposal for 2030

Marcos Olímpio Santos[1], Maria da Saudade Baltazar[2]

1CICS.NOVA, Portugal; 2University of Évora – CICS.NOVA, Portugal

It is currently clear, through (in)direct observation and reading of available information, that the territories of southern Europe are conditioned by a context where (dis)tensions, transformaintenances and (dis)trusts can be seen, which raises several reflections on its characteristics, explanations and concerns about the future of the aforementioned territories.

The increase in populism, social inequalities, repulsive rural territories, population aging, extreme weather phenomena and migratory flows are some of the challenges facing these territories. Given this context, we intend to present: i) an enlightening framework of the factors that will influence the territories of southern Europe in the coming years; ii) scenarios, mainly in the 2030 horizon, with emphasis on

876

the migration crisis that significantly affects territories in southern Europe and which increases (dis)tensions, transformations (maintenances) and (dis)confidence and, iii) highlight ongoing measures and present suggestions that make it possible to reinforce these measures.

To prepare the article to be presented, documentary research was carried out based on key words and a categorical content analysis was carried out, which made it possible to systematize the challenges that the territories in question face in the present, which could in the future aggravate a situation of polycrisis and also conclude, through prospective scenarios, that the difficult management of migratory flows in southern Europe is associated with old and new challenges of a social, economic, political and security nature.

Based on these results, ongoing responses are presented and debated, additional suggestions are left for reflection, and future lines of research are presented.

What Do We Know About Social Research On Southern European Societies: A Systematic Literature Review

Paula Espinosa Soriano[1], Manuel Fernández Esquinas[2], Olga Salido Cortés[3]

1University of Cordoba, Spain; 2National Research Council of Spain, Spain; 3Complutense University of Madrid, Spain

Social research about the south of Europe has emerged as a research field on his own. In the last decades there have been important contributions on welfare, employment, institutions, politics, migration and other major social problems.

At the same time, several discussions have arisen about the existence of a common set of societal characteristics that justify the approach as a specialty of area studies, and even about the geographic and political meaning of the concept of 'southern Europe'.

Although hundreds of publications have been produced, it is difficult to foresee specific differences and convergences on topics, conceptual bases, methods and distinctive disciplinary schools. One of the reasons of this gap is the lack of systematic literature reviews.

The goal of this paper is to provide an analytic map of the state of social research about the south of Europe. The main questions are: what are the specific 'building blocks' in terms of intellectual influences? Are there newer emerging 'research fronts'? What are the most significant contributions?

We have performed a bibliometric search of publications that can be classified reasonably as related to southern Europe and produced an extensive data set. We have used "co-citation analysis" and "bibliographic coupling analysis", followed by a qualitative review of significant works. The results provide insights of the main theoretical and empirical developments and help to map the state of the specialty.

Italy at a Critical Juncture. Game Changing Crises for the Innovation System

Francesco Ramella, Gianmaria Luigi Pessina

Università degli Studi di Torino, Italy

Italy has long been considered the «real sick man of Europe» because of the dramatic drop-off in its economic growth. However, thanks to the country's unexpected ability to respond to the pandemic crisis, how Italy is perceived internationally was completely overturned in the course of 2021. The argument we will present in this paper is that Italy now stands at a true «critical juncture» which provides a chance to relaunch the country's economic and social growth, taking a high road to development. This is something quite different from a mere rebound after the pandemic crisis. It entails a more structural attempt to correct Italy's growth model that got under way after the Great recession of 2008-2013. Today, a new window of opportunity has opened for this attempt. We will concentrate in particular on the Italian national innovation system (NIS), doing so for two reasons. First, the capacity to produce innovation is now considered one of the keys to competitiveness. Second analyzing the changes that took place in the NIS between the two crises can enable us to identify the «critical antecedents» leading to the critical juncture. Alongside these antecedents, we can also see a profound shift in the climate of opinion: Italians are now more optimistic about the future, and in particular about the twofold transition – technological and green – that is now under way. These are the factors that, together with the flood of resources now available through the Next Generation EU package as well as the agency of institutional entrepreneurs, can create the conditions for embarking on a new development path, although where this path will lead is still hard to predict

877

RN27 | T07_01: Nature, environments and social sustainability

Social and Cultural Consequences of a Decarbonisation Process. The Case Of El Bierzo And Laciana (Spain) Coal Mining Areas: A 'Just' Transition?

Mateo Núñez-Martínez

University Of A Coruña, Spain

Coal mining established itself as the dominant shaft of El Bierzo and Laciana rural communities over the past century, commanding their socioeconomic set-up and development. Nowadays, with all their mines closed and their derived industries teared down, the region has sunk to a significant decline which has showed up in different spheres; not only in the economic and labour sense, but has also been felt in people's consciousness, feeding up a sentiment of estrangement and despondency between local populations. Therefore, this work aspires to specify the different roles played by several actors on this matter, as well as to feature – from an ethnographic approach – the main problems and obstacles perceived by those who are linked to a territory absorbed into a clear demographic drain. Issues such as opinions on the industrial restructuring, expectations regarding future, assessments of the current situation and the dynamization projects, or geographical mobilities as a desired solution for younger generations will be addressed, aiming to describe if there are some existing patterns on the upkeeping of certain narratives and discourses in terms of differences on age, educational level, and gender. Finally, an appraisal of how the demographic decay has influenced local transformations will be made, trying to figure out in which ways would be feasible to stop the massive emigration and to involve those who have already left on the new socioeconomic organisation of the regions.

Navigating Historical Trajectories: A Community-Based Approach to Understanding the 1923 Population Exchange between Greece and Turkey

Ulker Basak

University of Sassari, Italy

Euripides' timeless lament, "What greater grief than the loss of one's native land," sets the poignant backdrop for the 1923 Lausanne Convention. Signed on January 30, this agreement mandated the compulsory exchange of minority populations between Greece and Turkey, profoundly reshaping the Aegean region's fabric of life. This study meticulously examines the repercussions of the 1923 population exchange, focusing on affected communities and their social spaces in Turkey and Greece, employing a community-based approach to unravel its long-term consequences and dynamics.

The Treaty of Lausanne, viewed through specific lenses, addresses humanitarian and ethical considerations. Initially rooted in a nationalist ideology aimed at constructing new nation-states a century ago, this framework now appears outdated. The study comprehensively explores the multifaceted challenges of forced migration, emphasizing historical analysis and scrutinizing the impact on social and collective spaces. The overarching goal is to delve into the diverse challenges posed by this migration and its enduring effects on the identity formation of exchangees.

Utilizing a diverse methodology, the research integrates qualitative methods—oral history interviews, archival analysis, and participant observation with community mapping techniques. Actively engaging with local communities, the study untangles intricate social dynamics persisting since the 1923 population exchange. Community narratives provide profound insights into socio-cultural transformations, emphasizing the resilience and adaptive strategies employed by affected populations, highlighting the significance of localized experiences in shaping broader societal changes. Comparing experiences across regions, the study identifies commonalities, divergences, and lessons, contributing to our understanding of territorial dynamics, community resilience, and social sustainability within Southern European Societies.

878

Climate Exodus: Natural Disasters And Migration Flows From an Environmentalist Perspective (European Excerpt)

Laura Cobelo Parga

Universidad de A Coruña, Spain

One of the main challenges of the 21st century is to address the climate crisis, the repercussions of which are becoming increasingly visible and frequent. The increase in disasters linked to environmental deterioration has resulted in the damage of multiple economic and community systems, forcing populations to migrate both because of the destruction of their environments and because of the search for a better future, leading to multiple struggles for natural resources by the various governments.

Due to these socioeconomic changes and in accordance with the measures formulated in the 2015 Paris Agreement, it becomes necessary to evolve social intervention, betting on a multidisciplinary approach more community-based than ever, capable of adapting to the current context of uncertainty. Therefore, the aim of this study has been the analysis of the existing literature on the subject within a global context, through a socio-critical paradigm that allows a systemic understanding of the issue. This proposal focuses on the transformation of the main results of

the original study in the European context, contrasting the main differences with respect to other territories.

Among the main results, we highlight a large gap in Western awareness of the problem compared to the rest of the world, coupled with ambivalent preventive policies and outdated strategies for action in the face of new climate challenges, and revealing community awareness that is poorly prepared due to the entry of negationist and skeptical currents of the magnitude of the problem.

The Green Transition in Southern Europe Societies: Political and Social Factors Favouring (or Hindering) Low-carbon Behaviour

Maria Carmela Agodi, Ilenia Picardi, Luca Serafini

University of Naples Federico II, Italy

Recent studies (European Social Survey, 2023, Eurobarometer, 2023) show that the vast majority of European citizens think that climate change is real and is a very serious problem. Despite scientific evidence and directives laid down in international treaties, the paths of single countries towards a green transition differ widely. They depend on numerous contextual variables including institutional, infrastructural, economic, political and social ones. This paper aims to provide a comparative up-to-date picture of the interventions' perspectives of Southern European countries in the field of green transition. To this end, a literature review was conducted on the scientific studies and reports to analyse the main social dimensions on which trajectories towards the green transition of Southern Europe societies have been built from 2015 (the year in which the Paris Agreement was signed) to the present, investigating also the relations between : 1. the policies adopted by individual countries. 2. the cultural and social factors that favour or hinder low-carbon behaviour on the part of citizens. The literature review is carried out using the PRISMA standard for data classification. The work therefore identifies different conceptualizations of the European Green Deal in the different countries of Southern Europe, but also the different difficulties, challenges and opportunities that are connected to the green transition in these countries.

Finally, the work provides indications on how more efficient policies capable of encouraging and supporting low-emission behaviour can be built, consistently with the infrastructural, social and political context in which these policy interventions have been implemented.

RN27 | T07_02: Migration and Social Cohesion

Civil Society Organizations to Assist and Integrate Migrants, Refugees, and Asylum Seekers in Sicily

Umberto Di Maggio[1], Davide Nicolosi[2]

1LUMSA University of Rome, Italy; 2University of Catania, Italy

Civil Society Organizations (CSOs) are crucial in assisting and facilitating the integration of migrants, refugees, and asylum seekers (MRAs). They represent a cornerstone of the Italian welfare model aligned with the Southern European welfare approach.

Sicily is one of the European regions with the highest number of MRAs. For several decades, it has faced the challenge of effectively managing these critical and growing migration flows from the Mediterranean, which significantly impact welfare policies.

This study presents some results of the Social Impact Assessment of the PRISMA Project (Integrated Regional Plan for a Multicultural and Welcoming Sicily) conducted by the Sicilian Region under FAMI (Asylum, Immigration and Reception Fund) in collaboration with local CSOs, promoted by the Ministry of the Interior and funded by the European Union.

In light of the survey of a target population of intercultural mediators, social workers, managers, and CSO operators active in the region, this investigation argues for the need to reconsider the organization of the welfare model, placing a renewed emphasis on CSOs in a new welfare perspective.

This reconsideration is motivated by the need to adapt the response to social needs to the new role of public agencies in a political crisis, growing risks, and amplified social perception of emerging challenges, especially in the Mediterranean context.

The results also emphasize a reevaluation of the vital contribution economic migrants and asylum seekers (especially young and women) can make, independently or through organized forms (e.g., Migrant Self Organizations), in different areas (e.g., education, health, employment, entrepreneurship) in a European context that faces significant challenges such as an aging population, youth emigration, productive restructuring, etcetera.

879

Neighbourly Relationships, Immigration and Gentrification in Central Multicultural Neighbourhoods. Reflexions from Russafa (Valencia) and Lavapiés (Madrid)

Francisco Torres-Pérez, Paloma Gómez-Crespo

University of Valencia, Spain

This paper presents two central multicultural Spanish neighbourhoods, Russafa (Valencia) and Lavapiés (Madrid), and its evolution in the last twenty years. Our results are based on previous research by the authors and an ongoing project ParticipaBarrio (PID2021-124346OB-I00l). The two neighbourhoods show a process of gentrification and touristification. Similarly, there are analogous dynamics of cohesion, based on peaceful cohabitation and common interests as neighbours, and dynamics of conflict. Despite the occasional tensions, a daily conviviality has been consolidated over time that has generated neighbourhood relationships of a very diverse type, strong and weak. At the same time, these two neighbourhoods present differences in the development of the gentrification process, with different pace and dynamics, in the underground tensions present in the neighbourhood and in the imaginary aroused by immigration. Our results are compared with processes in similar Spanish and European neighbourhoods, particularly French ones, in a multilevel analysis. At the micro level, neighbourhood relations and dynamics of cohesion and conflict. At the meso level, the neighbourhood, the factors that influence these relationships such as the evolution of the gentrification process, the action or omission of local actors (neighbours, associations and administration), as has been the process of immigrant settlement and the type of immigration and imaginary that it arises. At the macro level, societal, these factors differ according to the state framework that modulates them in a differentiated manner.

"Managing Tensions at a Time of Crisis: Migration Gorvenance and Local Bricolage in the Canary Islands"

Andrea Gallinal Arias

Université Aix Marseille, France

After being considered inactive for more than a decade, over 100,000 people have arrived to the Canary Islands through the Atlantic migration route during the last four years (2020-2023) from different enclaves in Morocco and West Africa. The islands did not have the necessary management and reception infrastructure to provide an adequate response, even less so in the context of a pandemic. The situation was rapidly framed as a "migration crisis" and the consequent response of the government was aimed at "ordering" this crisis. Implemented in urgency, the ministry of migration put in place since the end of 2020 the "Plan Canarias" based on the construction of a series of "emergency humanitarian reception centers" in multiple sites of the archipelago. The long-term aim was to provide the islands with a network of "humanitarian reception" facilities to cope with future arrivals. The emergency rationale behind the development of these new centers justified the choice of locations and the type of structures used, even when the municipalities were against it. Taking these new reception structures as a starting point, my aim is to examine through a bottom-up approach the reorganization of public action in the face of the "migration crisis". Based on ethnographic material, I will analyze the multiple actors engaged on the production of the new reception model (public administrations, political actors, nonstate organizations) and their interactions to document the tensions, conflicts and alliances that have emerged during this process. What can the management of migration crises on Europe's peripheral territories tell us about the effects of multi-scale governance of migration flows on a local level?

Valorising Temporality and Memory for a Critical Understanding of Migration and Asylum: The Case of Greece

Sara El Khoury, Loukia Maria Fratsea, Apostolos G. Papadopoulos

Harokopio University, Athens, Greece

880

Greece is very often portrayed as a new country of immigration in the period after 1990. However, there is a dense and long history that includes flows of emigrants, immigrants and returnees from the late 19th century until today. The largest influx of migrants was that of Greek refugees from Asia Minor (1920s) which led to more than 1.2 million people arriving in the country. The largest exodus took place between 1955 and 1977, when 1.3 million Greeks moved to Western Europe and other developed countries. These experiences of migration have been used by official historiography as a basis for defining national identity and belonging. The diversity of previous migration/refugee movements and the problems faced by these populations in (re)integrating into Greek society have been ignored in favour of the dominant nationalist discourse. Furthermore, the recent migration/refugee crisis is seen as a new, unprecedented phenomenon, despite previous experience with large-scale population movements.

In this context, this paper argues that temporality and memory can contribute to a critical understanding of contemporary migration and asylum issues by avoiding presentism and taking into account the historicity of migration in Greece. Examples from our research are used to show how temporality and memory can enrich research on migration and asylum without neglecting the specificities of the migratory phenomenon. Among the main conclusions is that migration should be considered as socio-spatial process embedded in places and spaces, and that migrants have their own agency that cannot be reduced exclusively to socio-economic conditions and drivers.

RN27 | T08_01: Territories, communities and civil engagement

Municipalism, Civil Engagement and Anti-Mafia Education in Late 20th Century Italy: Toward a Comparative Approach

Vincenzo Schirripa, Maura Tripi

Lumsa, Italy

In the late 20th century Italy a relevant transformation of public space linked together local ruling classes renewal, educational activism of civil society and a paradoxical Southern centrality.

In Southern Italy — and especially in Sicily — a new municipalism and a cycle of collective mobilization wore the insignia of fight against mafia and seemed to mark the way out of a dramatic national crisis.

The anti-mafia characterization was successful in catalyzing commitment and public attention. From a greater analytical distance, those phenomena were connected to more general transformations and still need to be investigated outside the suggestion of a narrative still imbued with a sort of exoticism.

Especially around the crisis of the "Republic of parties" (1989-1994), a progressive bourgeoisie exposed itself with pedagogical intentionality in projects for the renewal of cities. It invested in urban regeneration and culture but also in a recognizable repertoire of educational interventions in "difficult" neighborhoods, in nurseries and services for early childhood, in typical specializations such as environmental education and reading education through libraries and illustrated books — such a repertoire would in itself be susceptible to international comparisons with a certain diachronic depth.

In the background, the new financing and management mechanisms of socio-educational services, from the municipal level to European planning, reiterated North-South schematisms and created spaces of intermediation for new social actors as powerless in determining policies as crucial in channeling funding.

Such a season of active Meridionalism, with its peculiar characterizations in Italy, needs diachronic and interdisciplinary approaches to be contextualized in a "trans-meridionalist" perspective.

Between Engagement And Conflict. Explaining Mafia Strategies Towards Public Institutions In Italy

Francesco Niccolò Moro[1], Aldo Paparo[2]

1University of Bologna, Italy; 2University of Florence, Italy

This article delves into the intricate relationship between the strategies orchestrated by organized crime (OC) in its interactions with public institutions and local political and economic conditions. Our research meticulously examines the factors propelling distinct strategies, categorized as "parasitic," "collusive," and "adversarial." The significance of this study unfolds on two fronts: firstly, by postulating hypotheses elucidating the intricate mechanisms connecting political and economic configurations to OC's strategic decisions regarding the placement of businesses and the selection of specific strategies. This contribution introduces a comprehensive typology of OC activities, delineating their multifaceted relationships with local political arenas.

Secondly, the empirical validation of these hypotheses is executed through a robust dataset encompassing 8,000 Italian municipalities. The findings of our investigation illuminate a nuanced landscape where collusive outcomes prevail in environments characterized by porous political systems susceptible to infiltration due to the limited influence of political parties. Contrarily, adversarial situations materialize in high-stakes scenarios, compelling OC to resort to coercive measures such as threats and violence to secure advantages in the allocation of public funding.

This research not only sheds light on the dynamic interplay between OC and public institutions but also establishes a foundation for understanding the intricacies of decision-making within OC entities. The typology introduced here serves as a valuable framework for comprehending the variegated nature of OC activities and their intricate ties to local political landscapes. Consequently, our study contributes to theoretical advancements in the field, and provides empirical insights that enhance our understanding of the complex dynamics at the intersection of OC and political and economic structures, particularly within the context of Italian municipalities.

Institutional Readiness And Civil Society As Engines Of Social Change In The Rural Areas Of South Italy

Vincenzo Fortunato[1], Carmela Guarascio[2]

1università della Calabria, Italy; 2università di macerata, Italy

Eisenstadt defines social change through social regulation, i.e. "the ability of elites to acquire opportunities for change by mediating them with pre-existing situations, according to patterns of 'self-sustained' growth" (Eisenstadt, 1974:48), in which a social system generates and absorbs change. In this perspective, it is not only the increase in resources, or even the governance of the political institution, that brings about social change, but also the role of other

881

civil society actors (Fantozzi, 2011). People, therefore, matter, and it matters how they are included in the programming processes of development goals.

This hypothesis seems of fundamental interest in those peripheries of the world, which are structured to intercept change with administrative structures and political-institutional capacity that are often weak in this role. What then supports these social structures in intercepting change and producing social regulation, in the sense of Eisenstadt described above? What variables contribute to the generation and absorption of trajectories of change in these places?

The paper presents a survey of rural areas in Calabria, in the South of Italy, focusing on development opportunities, but above all on the resources these areas have and make available for the development of innovative solutions to marginality. The article focuses on the analysis of the planning capacity of the territories, as groups of elites, capable of renewing themselves and intercepting opportunities for change, planning projects for public funds.

The study starts from an analysis of all Calabria rural areas as defined by Minister, that are 58 municipalities, by interviews to all mayors. In a second step, it focuses on the different profiles of institutional capacity capable of better intercepting the public funding.

Divergent Territories: Educational Planning Tools in The Face of Territorial Inequalities

João Sebastião, Eva Gonçalves

ISCTE – – Instituto Universitário de Lisboa, Portugal

The current political and social debate on the need to re-organise the Portuguese state has resulted in the transfer of competences and services from the central state to the municipalities in various areas, including education. This is a structural change, since the education system has always been highly centralised and independent of regional or local communities. From 2022 onwards, the Intermunicipal Communities and Town Halls will develop their own education policies, suited to their territories. Among the strategic planning mechanisms, the Regional Strategic Educational Plans and the Municipal Educational Charters take centre stage. The collaboration of a team of sociologists in drawing them up in two highly unequal territories made it possible to analyse the territorial, social and cultural dynamics and reflect on their educational development strategies. A metropolitan municipality and a group of municipalities located in a rural area in the south of Portugal were analysed. The first, heavily gentrified, has a highly qualified population with high purchasing power, where cultural diversity is seen as an advantage for the digitally-centred municipal economy. The other, rural, marked by demographic regression and ageing, with a poorly qualified population and low purchasing power, where the growing presence of immigrants is disregarded by local institutions. The results point to strategies orientated towards a qualified and diversified educational offer in relation to the social and productive territory of the Metropolitan Area; and towards a "damage control" strategy in which education is considered an instrument for the survival of the rural hinterland.

RN27 | T08_02: Vulnerable communities

The Local and Community Dimension of Care in Vulnerable Neighbourhoods. Circles of Care, Elderly Neighbours and Territory.

Margarita Barañano Cid[1], Pedro Uceda Navas[1], Daniel Sorando Ortín[2], Jose Ariza de la Cruz[1], Sara Porras Sánchez[1], Carlos Rivas Mangas[1]

1Complutense University of Madrid (Spain); 2University of Zaragoza (Spain)

This abstract examines the local and community dimension of care involving the elderly in vulnerable neighbourhoods in Madrid. It aims to highlight the social relevance of both dimensions and the relationship between them in these spaces.

The circles of care in which older people are involved are favoured both by their long-term residential residence in these neighbourhoods and by the complex care networks that exist in them. These circles are understood within the specific welfare and care regime and the socio-demographic and residential model in which they are contextualized.

In peripheral neighbourhoods, less affected by tourism or gentrification, with less rental housing and a longer residential tenure, the provision of care between family members has a greater narrative presence, and there are more community care initiatives. In more rejuvenated, inner-city neighbourhoods, with more rental housing and residential mobility, we found more reference to care provided by non-related neighbours with whom there is spatial and emotional closeness.

Here, too, these care activities are intermingled with various community initiatives, more oriented towards social and political activity, leisure and culture. Older people of these spaces both receive and provide care, the latter above all to their relatives.

The communication is supported by a specific analysis of the empirical evidence produced by the COMURES-CM research done between 2020 and 2023, including a content analysis of the interviews conducted (97) in 6 vulnerable neighbourhoods in Madrid, and two quantitative studies, one of the mapping of community initiatives carried out and another with socio-demographic sources.

882

Social Life In Third Places: An Analytical Study Of Sociability In Southern Europe.

Nicolás Ureña Bautista, José Ignacio Torres Romero

Universidad de Málaga, Spain

It investigates the processes of public sociability in everyday places in southern Europe, such as bars, associations, libraries, restaurants and squares. It analyses their implications for social networks, communities, social capital, democratic spirit, civil society and sense of belonging. The aim is to understand and measure diverse sociability, creating a typology that transcends geography and identifies ways of producing social relations and groups of belonging.

Based on the hypothesis that a differentiated distribution of sociability will generate different types of social relations and networks, several research objectives are established. The aim is to identify the processes of sociability by recognising the determinants of interpersonal interaction, to quantify the types of sociability and to categorise the everyday places linked to these processes.

The research will be carried out in Southern Europe, using a quantitative methodology with secondary data and surveys to exploit statistical data, construct indicators and obtain primary information. The results will contribute to sociological knowledge, addressing the scarcity of sociability research at global and national level. Sociability will be used as an analytical category, providing a new frame of reference in the study of social relations and networks.

It hopes to highlight the importance of public sociability spaces, justifying the relevance of human relationships for social, psychological and emotional health in increasingly individualised societies. The research serves as a way of recovering the concept of sociability and promotes openness and renewal in the analysis of the production of social relations.

Targets of Hate Speech: A Study of the Portuguese Context

Maria da Saudade Baltazar[1], Marcos Olímpio Santos[1], Ana Romão[2,3,4], Ana Balão[1]

1Universidade de Évora, Portugal – CICS.NOVA; 2Universidade de Évora, Portugal – CICS.NOVA; 3Academia Militar/CINAMIL; CICS.NOVA; 4Universidade de Évora; CICS.NOVA

In recent years, Portugal has seen the rise of radical right-wing representatives in the Assembly of the Republic, joining many other European Union countries. The election of André Ventura by the Chega party in 2019, which presents itself as anti-system, has been particularly noteworthy in creating social and political tensions that have significantly impacted trust in social institutions. The emergence of new political parties and radicalized forms of discourse has been increasing since the 2008 financial crisis and other global phenomena that generate uncertainty and daily concerns. This context reinforces hate speech, perceptions of insecurity, and social inequality, which are often amplified by radical right-wing parties through the use of social media. The purpose of our participation is to investigate how the anti-establishment stance manifests as hate speech towards specific targets, such as race, ethnicity, gender, migration, security, and corruption. We will conduct comparative analyses at a European level, with a particular focus on Southern Europe. The data being analysed is sourced from social media, using Facepager. The collected information will undergo network and thematic categorical analysis.

The Making of Champions in the Digital Age: Resources and Obstacles to Progression Within the High-level Sports Career in Climbing

Lucie Forté[1], Florence Bourneton[2]

1CreSco – Université Paul Sabatier et CREPS de Toulouse, France; 2CreSco – Institut National Universitaire Champollion de Rodez, France

Social media have become essential tools for the sporting elite, enabling them to communicate with their public, manage their brand image and generate material or financial benefits that are more or less stable and sustainable. As a platform focused on sharing texts, photos and videos, Instagram notably enables them to share content related to their training, competitions, successes, everyday life moments and extra-sporting pursuits. But in addition to the most visible public accounts on Instagram (which champions sometimes delegate to community managers), many other public accounts are managed by aspiring champions who express a more or less ordinary and/or utilitarian relationship to this Social Media. Favoring a qualitative approach based on an ethnographic survey (field diary and online observation) combined with semi-structured interviews, this project lies at the crossroads of interactionist sociology (Hughes, Becker) and the sociology of socialization (Bourdieu, Lahire). The aim of this research is to explore the plurality of Instagram uses among high-level climbers, and the evolution of their relationship with this social media as they progress through the objective and subjective stages of their sporting careers. In particular, the project will consider the resources and instances of socialization that contribute to the evolution of the relationship that high-level climbers have with Instagram, as well as the forces and determinants of the construction of their digital identities.

Challenging Invisibilities through Humour: The Paralympics on TikTok

Renan Petersen-Wagner[1], Jan Andre Lee Ludvigsen[2]

1Leeds Beckett University, United Kingdom; 2Liverpool John Moores University

The penetration of social media platforms in the cultural production and consumption circuit of sport mega-events means that organisations such as the International Paralympic Committee (IPC) are afforded new and alternative channels to engage with their audiences (Petersen-Wagner and Lee Ludvigsen, 2023). TikTok, one of the largest platforms, is characterised by a higher degree of playfulness and humorous content, and has been used to mobilise audiences for prosocial political aims (Matamoros-Fernández, 2023). Using TikTok's Research API access, we automatically collected metadata from all IPC posts during 2023. After consolidating and manipulating the data through Python, statistical analyses were performed to understand how certain content becomes more visible on the platform (e.g., more views, comments, likes, and shares) by way of the algorithm selection process (van Dijck et al., 2018; Poell et al., 2022). We hold that the IPC, to challenge invisibilities, arguably one of the biggest obstacles for disability sport in terms of its cultural production and consumption (Hardin, 2009), engages in the circulation of humorous content with the aim of promoting inclusion and social change for persons with disabilities. While TikTok and the circulation of humorous content afford the IPC wider visibility to new audiences, it might provoke unintended consequences through further stigmatisation of disability sport as non-serious.

Trusting Social Media? Young Equestrians And Social Media

Oskar Solenes, Silje Poulsen, Synnøve Refvik

Molde University College, Norway

Social media has developed rapidly and is a natural part of modern human life and communication. This is also the case for sports organisations and individuals within the sport industry, and social media research in sport studies has evolved over the last two decades. This research has focused more on professional sports and less on minor and grassroot sports (Aeza, 2023). In this study we explore how young athletes in equestrian sports use social media.

The study is based on focus-group interviews with young equestrians in Norway recruited from an upper secondary school for young talents in equestrian sport. Drawing on Goffman's (1959) "impression management" we try to understand how these athletes experience and produce different impressions of equestrian sport and stable culture in social media.

Findings suggests that there exist norms on what to share and not. The young equestrians describe how they in most cases share "perfect" images, but that some platforms are more private than others. For some, negative feedback and a feeling of social control have made them reluctant to share less polished images of the daily life in the stable. When following others, they "know" that they only see the polished side, and that what they see is not necessarily the truth, some still describe negative influence by social media.

884

Yes we can!" Paralympic Athletes Beyond Stereotype: how media can change and promote no-discriminatory sports

Giovanna Russo[1], Athanasios Pappous[2]

1AMS University of Bologna, Italy; 2AMS University of Bologna, Italy

Recent data from Eurostat show that one in four people (25.4%) in the EU has a disability ranging from mild to severe (EUROSTAT, 2021). In Italy, there are approximately 3.1 million disabled people (5.2% of the population) (ISTAT, 2019). However, people with disabilities are scarcely visible in Italian mass media. News with a focus on disability when it rarely happens, is often misguided, and tends to perpetuate negative stereotypes. One of the opportunities that exist for the mass media to portray disabled people in an empowering and positive way is through the Paralympic Games.

Based on an Italian National project, in this paper, we explore the views and perceptions of Paralympic athletes themselves on how certain representations make them feel, think or react and ask how sport and disability should be better represented at the Paralympic Games to provide a more positive representation of disability. The core overarching aim of our study is in line with the European Disability Strategy and its key term "self-determination", which reflects the right of disabled people to have a say in how they would like to be represented. The research project provides valuable educational and training resources on the promotion of non-discriminatory, inclusive, and empowering portrayal of disability aimed at: a) media professionals/journalists; b) Paralympic athletes; c) members of the disability community.

Through an interdisciplinarity approach between the sociology of sport, media history and disability studies, the project is designed to have a sustainable legacy for future sports editions (such as the PG in Milano-Cortina 2026).

Fight Like a Freak: the Phenomenon of Poland's Fame MMA Freak Fights and the Redefinition of Sports Spectacles

Przemyslaw Nosal, Maja Brzozowska-Brywczyńska

Adam Mickiewicz University, Poznan, Poland

One of the consequences of Mixed Martial Arts' global popularity is the phenomenon of freak fights. While these events follow the MMA formula of two competitors fighting in the octagon, the players, however, are unusual: former athletes, influencers, celebrities, or controversial public figures, often with no prior fighting experience. The fight galas are accompanied by spectacular media coverage: fight cards, fight previews, trailers, talk shows, live conferences with fans, social media streaming, open training sessions, and official weigh-ins.

We consider freak fights a contemporary retelling of the freak show formula in both their design and spectacular, ambivalent dynamic. The contestants undergo similar enfreakment processes to claim or accentuate their freak fighter personas. They are simultaneously objects of ridicule, insult, and hate speech and gain incredible, easily monetised popularity by participating in the galas. The freak fights attract large audiences — live in the arena and on pay-per-view streaming — whose engagement and validation of the spectacle are crucial for the event's success.

The analysis of freak fights as freak shows highlights some significant changes observed in sports (the redefinition of sport competition, spectacles of violence and corporeality), the media (the demotic turn of celebritisation, media spreadability, and audience participation), and in social life generally (the importance of the economy of attention and mediatization of reality).

This article is based on the analysis of all the (so far twenty) galas organised by Fame MMA – Poland's most popular freak fights federation. The content analysis aims at reconstruction of the media coverage of fights and their accompanying events/actions; the discourse analysis focuses on contestants' motivations and logic of their enfreakment, and audiences' interpretations of the freak fight spectacles.

885

Gender Perspectives and Urban Resistance in the Institutionalisation of a Countercultural Sport: the Case of Parkour in Vigo.

Clara Bobillo González[1,2,3]

1University of A Coruña, Spain; 2Research Team Societies in Movement (ESOMI); 3Research Team GENPOL

This paper will analyse the perception of traceurs – parkour practitioners – in the city of Vigo – Galicia – about the institutionalisation of their sport from a gender perspective. Specifically, about the recent formation of a parkour school and a park in the city. Although it may seem that these measures would be positive for all traceurs, the issue is more complex. Parkour is a contemporary sport that is often practised informally – outside clubs or schools, without formal regulation – in urban public space. Some traceurs consider that "taking", "improvising", "reinventing" the city and its uses is part of the sport's identity and so they do not support the construction of specific parks or schools. For this sector, institutionalisation implies a domestication, displacement and privatisation of the sport. This is related to a countercultural character and even to the understanding of this sport as a practice of resistance. Nevertheless, we are in a context in which sport is masculinized, the public space continues to be discriminatory, and women tend to be socialised in "passivity" when it comes to political intervention. From this perspective, it is possible that women traceurs support the institutionalisation of parkour, as specific parks or schools offer them security. All in all, using a qualitative methodology and a gender perspective, this paper will try to approach the web of power/resistance relations established between the traceurs themselves and between them and the institutions, reflecting on the frictions between micropolitics and macropolitics and on the role of athletes as negotiators of urban public space. Shedding light on these issues can help to think about the role of institutions in guaranteeing the equal right to sport in our cities.

Five-a-Side Football, White Petty-Bourgeois Masculinities and Aligning to Ambivalence: An Ethnographic Exploration of Gender, Class and Race in Leicester, UK

Isaac Jordan Hoff

University of Glasgow, United Kingdom

Drawing on an ethnography of 12 white, young petty bourgeois heterosexual men between the ages of 20 – 26 from Leicester, UK this article will critically explore how their masculinities are performed, constituted and articulated in games of five-a-side football through an exploration of 'banter' and 'care'. This will further understandings of white masculinities and the classed and racial identities of the petty bourgeoisie, as well as the current gender politics of the UK in three ways. Firstly, it will make an explicit link between the broader cultural politics of gender in the UK and petty bourgeois masculinities. Secondly, it will critically build upon recent insights into the 'both ways' politics of the petty bourgeoisie in the UK (Evans, 2023) by focussing on how gender factors into this. Finally, it will show how 'aligning' to this broader politics of gender is enabled by intersecting social locations of advantage, showing how alignment to ambivalence can articulate and reinforce inequalities between men, whilst feeding into broader gendered inequalities. Broadly, this will enable critical insights into contemporary transformations and continuities into the constitution of white masculinities, petty bourgeois 'structures of feeling' (see Williams, 1977) and the implications for gendered inequality through the lens of an under-explored sporting context.

Sport and inclusion. The case of Tam Tam basketball

Vincenzo Esposito[1], Francesca Romana Lenzi[2], Mattia Calvani[2]

1quot;Sapienza" University of Rome, Italy; 2Università degli Studi di Roma "Foro Italico"

886

Nowadays, in Italy, sport is officially recognized as a significant social and economic phenomenon that plays a pivotal role in achieving the strategic goals of the European Union. In 2023, the Italian Constitution recognized sport's social and educational importance for the first time in Article 33. The extensive literature has already established that sport is an effective tool for promoting inclusion (Schaillee, Haudenhuyse, Bradt, 2019).

This article examines the inclusion practices of Tam Tam Basket, a youth basketball club based in Castelvolturno. The team was established to provide opportunities for underprivileged youth and children of second and third-generation immigrants who cannot afford membership fees in other clubs.

To delve into the reality of the situation, we employed a qualitative approach (Corbetta, 1999) consisting of two distinct phases, each utilizing different data collection techniques to gather information on the team's life experiences, inclusion practices, and conveyed values. The initial phase involved a Focus Group (Acocella, 2001) with the team players, followed by a case study (Feagin, Orum, Sjoberg, 2016) featuring an interview with the team's president and founder.

RN28 | T03: Physical activity and health

Precarious Bodies and Masculinities – Physical Activity as a Resource in Hormonal Treatment for Prostate Cancer

Cecilia Rindhagen

Linnaeus University, Sweden

Current study focuses on ageing men diagnosed with prostate cancer receiving androgen deprivation therapy (ADT), a form of chemical castration conducted to slow down tumour growth. The treatment usually brings a spectrum of side effects, such as lack of libido, erectile dysfunction, gynecomastia, sarcopenia and increased body fat around hips. Socially, these side effects may have a negative effect on treated men's sense of self, not being able to live up to traditional masculine norms and values. This paper investigate how anticipated ADT side effects can be countered and dealt with through physical activity. The aim was to analyse how participants experienced and embodied physical activity when participating in an exercise programme in relation to ageing, illness and masculinity. Data were collected through both focus and individual interviews with 10 men aged between 65 and 79. Theoretically the study combined ideas about the habituated body with the notion of hegemonic masculinity, analysing processes of both ageing and ADT treatment as a form of precarious embodiment. Preliminary findings suggest that the ageing and ill body evoke a sense of unfamiliarity. Participation made it possible for the men to rediscover their bodily capacity and felt more assured when regaining key abilities related to the notion of masculinity. The men found motivation attending the exercise programme in the opportunity to meet others in the same situation and the group constellation was significant to the men as it promoted an inclusive environment, creating a sense of fellowship. Physical activity could therefore have the capacity to reinforce individuals on different levels.

Fostering Well-Being: Integrating Adapted Physical Activity and Art Therapy for Empowering Vulnerable Individuals

Alessandro Porrovecchio

Université du Littoral Cote d'Opale, France

Our intervention is geared towards exploring the advantages of integrating Adapted Physical Activity (APA) with art therapy, specifically drama therapy and body expression, to enhance social well-being. Grounded in a perspective of clinical sociology and interactionism, our approach draws inspiration from Paulo Freire's pedagogy of the oppressed and, concerning drama therapy and body expression actions, Augusto Boal's Theatre of the Oppressed. Currently, our ongoing action research, conducted in educational settings with adolescents facing mental and social challenges, as well as in healthcare contexts dealing with rare diseases, shows promising initial results.

Adopting an intervention strategy aligned with Freire's educational philosophy, we aim to empower participants by fostering a sense of agency and self-expression. Preliminary findings indicate notable improvements in participants' physical attitudes, communication skills, and self-perception. These outcomes underscore the effectiveness of the integrated APA-Art intervention in promoting emotional and social well-being, particularly within educational environments.

The Transition into Retirement: Sustainable Aging through the Sociability of Exercise

Lis Pedersen Strøm, Lone Friis Thing

Norwegian School of Sport Sciences, Norway

The aim of this research project is to explore the formation of exercise habits during the transition from work life to retirement, a pivotal moment for potential changes in health lifestyles (Eklund et al., 2021, Vansweevelt et al., 2022). In the face of significant growth in the elderly population within Western societies, promoting increased physical activity emerges as a crucial tool for fostering healthier aging and enhancing social sustainability (Stenvold et al., 2020).

Method: Two months of observations in a communal health club and six in-depth qualitative interviews with women in their sixties regularly attending the club following their retirement. The analysis combines Elias and Dunning's theoretical concept of the Spare-time Spectrum (1986) with Crossley's embodied theory of practice (2001) to explore the nuances of exercise context and social capital in shaping exercise habits.

Results: When the Spare-time Spectrum significantly widens upon retirement, women feel entitled to prioritize leisure activities after a lifetime constrained by the time bind of work and family. The welcoming atmosphere of the health club and the organization of the training activities fostered a "leisure-gemeinschaft" that was a source of social capital. In addition, exercising in the pool evoked an embodied, "mimetic" sensation of wellness. These leisurely qualities were identified as crucial to the formation of their regular exercise practice.

Conclusion: As new retirees feel entitled to prioritize leisure activities over spare-time duties, the biomedical perspective often adopted in public health initiatives to increase physical activity among the elderly may inadvertently be counterproductive. Interventions aimed at sustainable aging might enhance their effectiveness by facilitating sociability and pleasurable bodily experiences through low threshold group activities tailored to a variety of taste preferences.

887

Therapeutic Leisure and Baby Loss: An Action Research Approach

Briony Sharp

University of the West of Scotland, United Kingdom

Engaging in physical activity during leisure time has long been associated with promoting overall wellness, healing, and mental wellbeing (Han and Patterson, 2011; Iwasaki, MacTavish & MacKay, 2010). Likewise, research has established connections between physical activity, therapeutic leisure, and meaningful leisure in the contexts of occupational therapy (Wensley and Slade, 2012), depression (Fine, 2009), stress-coping (Hutchinson, Bland & Kleiber, 2008), and bereavement (Williams et al., 2023). This study seeks to explore the intersections of therapeutic leisure, physical activity, and the experience of grief following the loss of a baby. Although therapeutic leisure, also known as therapeutic recreation, lacks a precise definition, it is often associated with enhancing wellbeing, building relationships, facilitating choice, and creating joyful and meaningful experiences (Genoe et al., 2021). This research adopts a multidisciplinary approach, using therapeutic leisure as a lens to examine the complexities of grief, bereavement, physically active leisure, and baby loss. In partnership with a Scottish charity (Held in our Hearts) this project seeks to understand their community who regularly partake in physical activity to gain insight into the benefits these opportunities bring to both mental wellness and physical health while dealing with trauma, grief, and bereavement. This project draws on multiple research agendas – the need for more research on women's health, social prescribing, and physical activity after baby loss – to collaborate with, design and produce the beginning of a necessary advancement in understanding the links between therapeutic leisure and being physically active to navigate baby loss, postpartum and overall wellbeing.

RN28 | T04: Sport for development

"I Can Only Participate in Free Sports": The Experienced Link Between In-Work Poverty and Leisure-Time Physical Activity

Hanna-Mari Ikonen

University of Jyväskylä, Finland

Physical inactivity is a significant issue in all European countries, including Finland. Employers can motivate employees to be more active, but many, such as the working poor – briefly defined as those whose income remains under 60 percent of the national median despite being employed – cannot count on it. Relatedly, physical activity is also threatened by precarious employment – having insecure, short-term contracts, such as 0-hour or on-call jobs.

This presentation examines leisure-time physical activity, exercise, and sports behavior of people who self-identify as working poor in Finland. The analysis is based on 444 free-format written narratives and 68 in-depth interviews. Ongoing thematic analysis reveals how physical activity is conditioned by a burdensome work situation. Tentatively, the meanings of physical activity and sports can be summarized as follows: 1) as vital for well-being, 2) constrained and demotivated by a lack of time and financial resources, and 3) as non-existent because all spare time is spent recovering from work.

The presentation points out the conflict between individuals' labor market circumstances and policy discourse emphasizing the need to increase physical activity. It suggests that precarious, low-income situations have a far-reaching impact on people's lives and highlights the importance of incorporating sports and physical activity into the bigger picture to avoid excluding working poor people from public discussion and policy efforts.

888

Physical Activity and Sport in Niamey's Refugee Sites: A Multilevel Analysis of Changes between 2019 and 2022

Enrico Michelini[1], Alessio Norrito[2]

1TU Dortmund, Germany; 2Loughborough University, UK

Refugee sites are a central mean of managing large-scale forced migrations. Despite their life-saving scope, they are 'liminal spaces' that re-create 'time bubble' feelings. In such settings, sport and physical activities (SaPAs) are standardly organised and believed to be beneficial for site residents.

Against this background, the question 'How do individuals experience organised sport and physical activities in

refugee sites over time?' is assessed through ethnographic studies conducted in 2019 and 2022. The collected data is analysed using qualitative content analysis and interpreted using the ecological systems theory.

Recurring changes within the organisations in charge of sports influence the way that SaPAs are provided. Indeed, the recurring changes mean the frequent restart of programs that should be delivering long-term outcomes for individuals, and thus cannot achieve their objectives. Although difficult to implement, the development of a system for transferring SaPAs-related knowledge is identified as a way to alleviate this problem.

Collaborative Governance of Sport for Social Change

Ramon Spaaij[1,2], Carla Luguetti[1], Fiona McLachlan[1], Brent McDonald[1]

1Victoria University, Australia; 2Utrecht University, Netherlands

Reflecting debates on public sociology and research impact, in this paper we consider how sociologists can serve as co-creators of, and actors in, collaborative governance toward social change in sport. The paper focuses on a critical appraisal of a program of action research called Change Makers, which aims to co-design sustainable solutions to issues of inequity, discrimination, and exclusion in community sport in Australia. Change Makers brings together local coalitions of sports club leaders and volunteers, change facilitators, researchers, and community partners, in a concerted effort to promote equitable social inclusion in community sports clubs. Drawing on collaborative governance theory, the research questions this paper addresses are twofold: What changes has Change Makers affected within the clubs, organisations, and communities it serves? What collaborative governance dynamics and contextual factors affect these changes? These questions are answered through a mixed-methods approach that combines Ripple Effects Mapping, in-depth interviews, surveys, and observations. The results reveal various short-term and intermediate change processes and outcomes. This paper will discuss and illustrate the findings, and chart some of the main impact pathways between the program activities and the identified outcomes. This will be followed by a discussion of the collaborative governance dynamics and contextual factors that shaped the identified changes. We will conclude by reflecting on the value and challenges of the Change Makers program and associated change processes, as well as on the transferability of the findings to other research-informed initiatives that aim to enhance social inclusion in community sport.

Goal Management, Failures, and Social Change: Exploring the Perspectives of Sport for Development NGO Workers in Brazil.

Eva Soares Moura[1], Ivan Cuker[2]

1Faculty of Social Sciences, Charles University, Czech Republic; 2Faculty of Social Sciences, Charles University, Czech Republic

Sport for Development and Peace (SDP) is a global initiative that employs sport to engage young people and contribute to the Sustainable Development Goals (SDGs). Despite increased research in SDP, the specific area of failure remains largely unexplored. This study draws on semi-structured interviews with workers from SDP organizations in Brazil to explore how goals and missions are established and managed, and their connection to diverse experiences of failure among these professionals. The findings reveal a duality of goals and evaluations—mission-driven and donor-driven—and inner struggles within NGOs to balance external expectations with community-centered missions. While external funding sources pressure NGOs to adjust goals, the fulfillment of these goals is often routinized. Contrarily, failure is perceived in terms of unmet core missions and transformative roles for communities or individuals. In summary, the analysis underscores the challenges faced by SDP organizations in measuring their performance and failure, given their self-perception as entities driven by values and committed to enacting unquantifiable good. This creates a complex dynamic when assessing failure within the context of their altruistic missions. Examining the subjective experiences of SDP NGO professionals provides a deeper understanding of their contributions to social change through sports. This perspective also offers new insights into how sports programs intersect with local cultures, identities, and community dynamics.

Street-Football Community As a Means Of Social Care. How Drug Misusers Can Rebuild And Change Their Lives

Bjørnar Blaalid

Western University of Applied Science, Norway

This study explores how and why participating in a street-football program helps drug misusers become socially included in new communities that strengthen non-addict identities, and better their mental and physical health. In Norway, street-football is a recreational recovery-initiative that is becoming increasingly popular among drug misusers. This activity is viewed as a means of helping substance misusers become interested in non-drug activities by situating them in social milieus which does not include or involve drugs. Overarching research question: What characterizes the community that arises in connection with street-football, and how can it have an integrating effect on the participants' lifes?

The study is ethnographically inspired, following a Football team managed by a faith-based NGO. Participating observations and biographical interviews are used to produce thick descriptions on the elleven participants and their everyday-life experiences. In addition, the study adopts a contextual life-course perspective, formulated by Glen Elder. Focusing on the participants own life-stories, lifeprocess and experiences with drugs. Symbolic interactionism compliments the theoretical approach, by focusing on the formation of meanings to the participants regarding drug rehabilitation.

The findings highlight three important aspects for the drug users engaged in the street-football program. Firstly, the importance of having an predictable environment to do regular exercise, promoting physical health. Secondly, developing and learning sporting skills. Thirdly, the ability to interact and connect with 'like-minded' people, develop friendships and acquire new social networks in an safe community.

The conclusion is that participating in street-football can bridge the gap between drug users and society, by giving the drug users access to social recourses and networks, allowing them to gain confidence in themselves, trust in others and gain approval from society.

Sports Clubs: Catalysts for Diaspora Construction

Rahsan Inal

Erzincan Binali Yildirim University, Turkiye

For diaspora communities, sports is a multi-dimensional, dynamic field of relationship that includes cultural, social, and political dimensions. In this context, amateur sports clubs founded by immigrants and people of immigrant origin play a significant role in diaspora construction. This study aims to understand and explain the practices through which the influence of amateur football clubs on diaspora construction is realized. To this end, it focuses on an amateur men's football league founded by Turkish immigrants in London, England. The field research, conducted with a qualitative research design, spanned over six months. Face-to-face, in-depth interviews were conducted with football players and club administrators, and participants' personal archives were also utilized. The research results demonstrate that male community members passionate about football, primarily engaged in an amateur football league, form social relationships centered around football. Football serves as a focal point in diaspora construction, with individuals maintaining their connection to their homeland and ethnic identity through football. Furthermore, football acts as a means through which they reconstruct the social and cultural memory of their country of origin. (This research was financially supported by the Scientific and Technological Research Council of Turkey (TÜBİTAK) under the 2219 International Postdoctoral Research Fellowship Program)

890

Sports, Borders and Material Culture. An Ethnographic account from Skateboarding in Tijuana

Andrea Buchetti

Univeristy of Rome "La Sapienza", Italy

Tijuana is the northernmost Mexican urban area, bordering San Diego and California. From late 1990s, resulting from the neoliberal shifts imposed by NAFTA and related free-trade agreements, most of the historical Californian skateboards manufacturers relocated south to the border, in the so-called maquiladora industry. Maquiladoras are foreign owned factories operating in Mexican special-status regions, dedicated to import raw material, tranform it in finished goods and re-export them in the country of origin.

In addition to be "the land of opportunities and american dream", the United States and namely California are convetionally considered the "homelands" of skateboarding. Since the turn of the millennium, with the border's closure to the flow of people following 9/11, young Tijuana skateboarders (prevented from living the California dream) have developed their own skateboarding culture through informal access to, and exchange of, skateboards produced by U.S. maquiladoras.

In the presentation I trace the stages of this development focusing on the role of the border in simultaneously

developing regimes of immobility, hierarchies of desire, and in providing a material culture susceptible to creating new imaginaries, communities, and identity representations inspired by the U.S. neighbor but claiming an autonomy that fits neither the U.S. nor the Mexican national model.

Skateboards in Tijuana are the goods that embodies the globalization of this sport over the past twenty years. But how are they culturalized locally as either objects of desirable consumption, of transcendence to the other side of the border, or of assertion of autonomy by Tijuana's youth through practices of appropriation, production, and creative consumption?

Sports and the Sacred: Rituals of Sacrifice and a Sense of Belonging.

Álvaro Campelo Pereira, Daniel Seabra

Universidade Fernando Pessoa, Portugal

Sports practice encompasses sociological dimensions associated with concepts familiar to the religious field. Several authors even suggest a sports ritual, in various dimensions, capable of being interpreted through the symbolism of the sacred. Others, not limiting themselves to this interpretative field, deem it appropriate to examine sports and find in them experiences and expressions that would be more easily understandable if contextualized through the concepts of 'sacrifice,' 'rituals and ceremonies', 'belief group/community and belonging,' 'iconography', 'mythologies', 'spiritual sublimation', or Catharsis and redemption'. The main objective of the communication is, by comparing the bibliography supporting both positions with data collected in field studies, to understand i. does the narrative and religious ritual serve to comprehend the behaviors of sports fans? and to what extent is violence in sports sought as a practice that aligns with the senses of catharsis and ritualistic sacrifice.

Exploring these concepts in the context of both sports and religion can lead to a deeper understanding of the human experience and the ways in which individuals seek meaning, connection, and fulfillment.

RN28 | T06: Sport and History

Political Justification and Skateboard Prohibition: Unraveling Norway's Controversial Ban (1978-1989)

Tommy Langseth, Nils Asle Bergsgard

University of South-Eastern Norway, Norway

In September 1978 the Norwegian Ministry of the Environment, passed a law that made skateboarding illegal in Norway. As one of very few countries in the world, Norwegian authorities had declared owning and using a skateboard a criminal offence. The ban lasted for almost 12 years and was, according to the skaters, harshly enforced by the police. However, the ban seemed to have a limited effect. On the contrary, throughout the 1980s a growing portion of the youth in Norway defied the ban, and when the ban was revoked in 1989 the interest for skateboard nearly exploded. In this presentation we analyze the ban on skateboarding from two perspectives: first, from a historical sociological perspective, through neo-institutional theory the political justification and rationalization of the ban is analyzed; second, utilizing Goffmans terms of stigma and social identity the ban's influence on current skateboarding culture is examined.

The political justification of the prohibition is analyzed by highlighting the discrepancy between "rational" arguments based on injury statistics, and ideological arguments based on moral panic. The prohibition served to stigmatize skateboarders as prone to injuring themselves and pedestrians and disrupting the traffic. However, we suggest that the authorities' stigmatization of this group was to some degree embraced by the skateboarders themselves. With roots in surfing and urban Californian lifestyles, skateboarders already saw themselves as irreverent. For Norwegian skateboarders, then, the skateboard-ban was convenient as it confirmed this self-image. Skateboarding was thereby constructed as oppositional from both the inside and the outside.

The Romanian Sports Policy Between Nostalgia And Reality In Post-Industrial Context

Laszlo Peter

Babes-Bolyai University, Cluj, RO, Romania

In Romania sport was used for political and national purposes: as a tool to unite the country (interwar period), as a means of legitimization and international diplomacy (communism), even to distract attention from economic and social problems (transition). At the same time, minorities are looking for a way to keep their identity through clubs. Romanian sports performance is a highly debated issue,

891

the media narratives underlie its decline, and nostalgia for the golden years (the eighties) plays a role. The government is under pressure to ensure the conditions to repeat these successes. In 2022 the Sports Strategy was adopted, but in the meantime the Ministry of Sport was abolished. Based on critical text analysis and statistics and theoretically developed further on a chapter (Peter, L. 2020, The Romanian Sport System. Path to Commercialization", In Rojo-Labainen, Rodriguez Diaz, Rookwood, Joel: Paths (eds.) "Sport, Statehood and Transition in Europe.", Routledge 77-95) the presentation offers the analysis of the dynamics of sports policy and the aims of the Strategy taking into account the context in which the sports operates, highlighting the strenghts and week points of the sports strategy in the contexct of neo-liberal economy and new social realities, whare the state lost its interest.

Based on statistical history of sports performance I argue that the Strategy failed to take into account social conditions like the changing demography, the evolution of the sport economy or the dynamic of the field.

The presentation addresses the social and economic factors that have shaped the sport reality and those that are confronted with the objectives of the Strategy. Methodically, is also based on data and interviews with bureaucrats, journalists, sport managers.

The Emergence and Growth of the Casual Style in Portugal. Conditions, Motivations and Actions.-

Daniel Alves Seabra

Fernando Pessoa University, Portugal

The Casual style emerged in England at the end of the 1970s. Police control of the Hooligans led some of them to change their behaviour. To evade police control and continue to engage in fights with Hooligans from opposing teams, some of them began to organise themselves into small groups, abandoning the use of props or club symbols. They opted to wear branded clothing instead. They also continued to meet up and take part in fights with similar groups of supporters from opposing clubs.

This gave rise to the Casual style, which evolved from Hooliganism. The Casual style also influenced the young supporters of some clubs in continental Europe, even those who were part of the Ultra Movement.

Portugal also saw the emergence and growth of the Casual style in the 21st century. This communication is based on ongoing research into this style in Portugal. The documentary research, observation, as well as the semi-directive interviews carried out, will make it possible to highlight the evolution of Casuals in Portugal. The motivations that lead young Portuguese people to follow this style will also be presented. Their actions will also be described.

The communication will also include reference to the legal framework in which Ultra groups operate, as this has been a predisposing factor to a social dynamic that tends to promote the growth of the Casual style.

Politics of Forgetting. Historical Memory and Football Fandom in Post-Communist Countries in Central and Eastern Europe.

Rafal Chwedoruk

University of Warsaw, Poland

The paper shows that participation in sports-related activity can be linked to adverse changes contributing to tension, mistrust, and undesirable transformation. Organised groups of football fans in post-communist Europe, identifying themselves often as an anti-system movement, however participated in the struggle of the right-wing parties for cultural hegemony. The new wave of politicisation of devoted fans concerned historical memory. They often shaped the collective identity of the fan communities through the politics of memory and numerous activities in the field of stadium performances, as well as articles in fan periodicals and even archival research and publications based on them. Anti-communism also increasingly was method of stigmatising rival clubs and their fans. It has become the politics of forgetting and falsifying the history of their favourite sports clubs. The basis has been the myth of radical dualism of state and society and the mass contestation of dictatorships. The clubs' links with the former regime, and even their participation in the workers' sports movement in the interwar period, were omitted, as the connections of some clubs with the former Jewish communities. However, paradoxically, devoted fans defended the names and symbols of clubs from the communist era. Desk research and ethnographic methods, including participant observation, were used to prepare the study. The data comes from original research conducted over the last twenty-five years.

"I Shouldn't Have To Do This…" 'Grudging Acts', Valuation And The Limits Of Acceptable Practice

Wendy Bottero

University of Manchester, United Kingdom

Illustrated with data from a Mass Observation Directive, this paper explores 'grudging acts' (Bottero, 2023) as forms of valuation (Dewey, 1939). A 'grudging act' occurs when people feel that they really shouldn't have to do an activity yet also feel obliged or required to perform it. By engaging grudgingly, people indicate their sense of the limits of acceptability within practices. But despite their sense of these limits, people still perform grudging acts. While there is a variety of work which explores why people feel they 'should' engage in various practices (such as work focused on instrumental action, values, norms, the internal logic of practices or the role of power relations) there is less attention to why people feel they shouldn't do things, and even less on why, despite feeling this, they still do them. In grudging acts, people participate with the 'wrong' motivation or affect for the situation in which they engage, with their engagement part of broader processes of 'practical reason' (Sayer, 2011), arising from evaluations of how best to act in imperfect and constraining social circumstances. Such valuation must be understood as trans-situational, in which people bring values and commitments to bear across settings, weighing-up their immediate situation in the light of broader circumstances and trajectories, and reassess ends in relation to the costs of the means necessary to pursue them. The sociology of morality has paid comparatively little attention to the process through which 'values' operate across situations (Hitlin and Piliavin, 2004). The exploration of grudging acts helps focus attention on such trans-situational 'valuation' processes.

A Heavy Habitus: Coaches, Clients and Embodiment in Powerlifting.

Mark Doyle

SETU, Ireland

Powerlifting is a strength-based sport comprised of three main components: the bench press, squat and deadlift (Hatfield, 1981), (King et al., 2023).This paper explores the relationship between the client and the powerlifting coach in the modification of the client's body through face to face and/or digitally mediated training programs. The coach works with a lifter to improve lifting technique and also advise on diet with the ultimate goal of increasing the amount of weight that can be lifted by the client. Therefore, the coach is actively involved in reshaping a client's body through lifting, bulking and cutting, generally with less of an aesthetic focus than bodybuilding. For many powerlifters, it is the accumulation of body mass leading to strength gains that trumps muscular definition. It is argued that the coach initiates the client into a powerlifting habitus via the social transmission of bodily knowledge (Underman, 2022) and the monitoring of practices. The embodiment of masculinity is explored through the modification of the body and the increase in the amount of weight lifted as training progresses is also explored.

Data was gathered from semi-structured interviews with coaches and clients, additionally, the researcher reflected on their own experience as a novice powerlifter through reflexive training diaries and logs as a form of embodied ethnography.

Shaping Sporting Careers in Norwegian Youth: a qualitative study of Family Influence, Peer Dynamics, and Socialization

Patrick Foss Johansen[1], Ken Green[1,2], Miranda Thurston[1]

1Inland Norway University of Applied Sciences, Norway; 2University of Chester, UK

This study explored the formation and development of Norwegian youngsters' sporting careers, focusing on the transitions from childhood through the pivotal teenage years. Norway, with its high sports participation rates provides an interesting case study for examining nascent sporting careers. Forty one individual qualitative interviews with 17-18-year-old Norwegians were conducted to understand the role of family and peers in shaping their sporting trajectories. Findings reveal that sporting careers are deeply embedded in family cultures, where parents often initiate and facilitate children's sports involvement. This early socialization lays the groundwork for developing sporting habituses, a concept crucial to understanding long-term participation. As the youngsters transition into youth, peers increasingly influence their sporting choices, contributing to a diversification of sporting repertoires. This shift is marked by a move from formal, competitive sports to more informal, recreational activities, reflecting a change in orientation towards sports. Significantly, the study highlights the mutability of youth sporting repertoires, influenced by changing friendship networks, waning interest in performance and competitiveness, boredom with routines, and the allure of new experiences. This volatility is also driven by growing concerns about body image and health awareness among youth. Understanding these dynamic factors is crucial for developing sports policies that foster lifelong sports engagement, especially relevant in Scandinavian contexts.

893

Gender and Sport: An analysis fron the Basque Country (Spain)

Campelo Patricia, Ispizua Marian

UNIVERSITY OF THE BASQUE COUNTRY, Spain

The gender continues being one of the most explanatory variable of sports habits today. And sport, one of the most resistant areas to equality policies for women and men.

For example, in Spain, data on the presence of women in positions of power in federative structures and sports clubs are disappointing: taking into account the 65 sports federations in our country, only 3 have women at the top of their structures.

In this paper an analysis of this issue, and the results of a survey carried out in one of the territories of the Basque Country are presented. Interesting differences are identified in relation to the sex variable. Likewise, sports socialization from mothers to daughters appears as a habit-generating element for women.

RN28 | T08_01: Trends in physical activities

Physical-sporting Activity and some Growth Patterns of a Group of Adolescents in a Northern Italian Province.

Nico Bortoletto

Univ. of Teramo, Italy

This is a preliminary presentation of the outcomes of a research conducted on approximately 110 adolescents involved in team sports, residing between the provinces of Bergamo and Brescia (provinces particularly affected during the pandemic period). Using some item from Istat's multi-purpose sample research, the outcomes were compared to see if there was congruence between the data reported by the national research and the local data. The outcomes cross-sectionally confirm the importance of organized sports practice in adolescence, both for gaining self-awareness in relational terms and for confirming what is already known in the literature about the importance of family sports practice in order to increase the adolescent's overall propensity toward sports.

894

Role of Sport and Physical Activity on Children's Well-being: Insights from "Growing up in Germany" throughout the COVID-19 Pandemic

Inga Simm, Christine Entleitner-Phleps, Susanne Kuger

German Youth Institute, Germany

Sport and physical activity play a crucial role in the overall well-being and development of children. The COVID-19 pandemic has highlighted the importance of maintaining a healthy and active lifestyle, not only for physical health but also for mental and emotional well-being. The aim of this paper is to disentangle the role of sport and physical activity in the context of children's well-being before and throughout the COVID-19 pandemic in Germany.

We use data from the large-scale representative biennial panel study "Growing up in Germany" starting in 2019 which is well suited to analyse children's well-being in the light of the COVID-19 pandemic and their living conditions. Our sample comprises more than 1500 children aged 3-17 years old.

Descriptive findings indicate that about 80 percent of these children engage in physical activities 1-2 times a week before the COVID-19 Pandemic in 2019, with a positive correlation between higher socioeconomic backgrounds and increased activity. Notably, the commitment to sports

remains strong during the pandemic in 2021, with correlation coefficients of .32 for children and .43 for adolescents. First multivariate analyses reveal that there is a meaningful link between greater engagement in sports and physical activities and enhanced well-being over time, despite the restrictions during the pandemic. Moreover, we could see that the level of engagement in physical activities varies in diverse socio-economic backgrounds.

These insights hold relevance for policymakers, educators, and parents seeking to support the holistic development of children, especially in times of global uncertainty.

School Role in Increasin Sport Activity

Consuelo Diodati

Teramo, Italy

In contemporary societies the amount of people who do not practice sport is growing, as a multifactorial phenomenon. Different socialization agencies can play an important role in stimulating people to keep active: school, family, medical basic district, but even the state can cooperate at stimulating the importance of sport, also through advertising promotion campaigns, as well as by law and incentives. Its relevance has become such that the European Commission itself is working on consistent set of initiatives dedicated to sport and physical activity, as great contributor to the health and well-being of European citizens. Interviews on this topic were conducted with sport teachers (mainly female). School and sport are, infact, important vehicle for educating young people and promoting universal values, such as: peace, loyalty, health, inclusion, gender equality, democratic and sustainable growth, but they can't be left without the sustain of legislation.

To Facilitate for the Young – New Trends, New Needs

Nils Asle Bergsgard, Tommy Langseth

UNIVERSITETET I SØRØST-NORGE, Norway

There has been a steady downward trend regarding people taking part in organized sport in Norway the last decades, especially the adult population, however also the participation among young has fallen. Still, youth are active on other arenas, especially fitness-centers, and also what is termed self-organized sport, both more traditional sport and physical activity like football, skiing, cycling etc. and non-traditional sport and physical activity like skateboard, snowboard, parkour etc. (also named lifestyle-sport). It is the latter that is in focus here. We find some of the same tendencies in our neighboring countries Sweden and Denmark, the latter is seen at as a forerunner when it comes to facilitate for such activities. In Norway, however, the facility structure that should form the basis for sport for all, is seen as traditional and rigid, and that the funding schemes prioritizing facilities for traditional sport. In this paper we go further into the hindrances (and possibilities) for facilitating for self-organized activities, non-traditional type. Based on

an empirical study we emphasis both cultural – what is taken for granted and what needs to be argued for –; structural – the financial system favoring traditional facilities for organized, competitive sport; and political – who have strong spokespersons and a backdoor to the politicians – factors. This is done through a three-level analysis of power execution (Bergsgard 2019), highlighting the symbolic/discursive power's influence on the institutionalized structures and finally the political process and decision – and back again.

RN28 | T08_02: Sport and performance

Performance Analysis and Social Research in Sport. A New Performance Index in the World of Football

Giuseppe Coppola

Università degli Studi di Roma "Foro Italico", Italy

Sport has the power to ease social tensions, build trust between individuals and drive positive change on a personal and societal level.

It has been shown that, from a social perspective, sports activity can provide a means through which athletes have the opportunity to develop relationships for the creation of a sense of belonging (Beauchamp et al., 2014). Positive relationships with significant others in sports, such as coaches or teammates, can have a bearing on sports performance concerning the topic of socio-psychological well-being and have been identified as one of the most important sources for the development of young footballers as early as Bloom's (1985) work. In this regard, moreover, Ivarsonn et al. (2015) pointed to the support of the work environment in sport as a relevant issue in stress reduction and improved well-being, Socio-psychological well-being and risks related to stress, anxiety and social tensions have an impact in sports performance both in the academy for younger athletes (Rongen et al., 2020) and among elite athletes (Lundqvist et al, 2022).

The presented abstract aims to draw attention to the topic of socio-psychological well-being in sport and its importance related to athletes' performance. The research, carried out as part of a doctoral thesis, aims to present an index of performance and well-being developed for the world of football that can consider both statistics collected from footballers and information obtained from a sociological and psychological perspective, following the already established studies on this topic.

The Role Of Professional Athletes And Their Social Networks In The Overall Organization Of Sport Life, In Sport Politics And In The Development Dynamic Of Sport

Madara Elizabete Straume

University of Latvia, Latvia

The aim of the article "The role of professional athletes and their social networks in the overall organization of sport life, in sport politics and in the development dynamic of sport" is to explore what is the role of athletes and their social networks (for instance, sport organizations, tournament organizers, coaches, family members and also others) in the overall organization of sport life, in sport politics and in the development dynamic of sport. Article's theoretical basis will portray aspects of Bronfenbrenner's ecological systems theory and Granovetter's strength of weak ties theory. The method that will be used in the qualitative article's phase are eight in-depth interviews that include name generator and name interpreter questions and in the quantitative article's phase mapping of social networks will also be performed. In this article there will be summarized the conclusions, comparing the social network maps of the athletes who represent individual sports and of athletes who represent team sports. All of that will be done to reach the aim of the study and to answer the research questions. The findings of the article are yet to be determined.

What is the Role of Competitive Sports Amongst Entrepreneurs Whose Lives Are Subjected to Market Competition?

Christian Maravelias

Stockholm university, Sweden

Research shows that an increasing number of technical, economic, legal, etc., specialists no longer work as employees whom are managed by organizations, but as self-managing "entrepreneurs" who sell their skills and expertise on the market. In this context of "market organization", this paper seeks to answer the following question:

What is the role of competitive sports amongst entrepreneurs whose lives are subjected to market competition?

The paper is based on a study of entrepreneurs in knowledge intense service professions that make considerable amounts of money and lead seemingly successful lives, but that also struggle physically and psychologically with the pressures and uncertainties that comes with "a life on the market". The study shows that in their efforts to cope with their lives on the market, competitive sports activities such as tennis, long-distance running, cross country skiing, etc., are used not only as recreation and as ways of maintaining a healthy lifestyle. They are also used by the entrepreneurs as ways of molding themselves, physically and psychologically, into "tuff competitors" and "winners" whom are considered "worthy" of success in work as well as in life more generally. In short, they use competitive sports as a way of injecting the logic of competition into their bodies and minds. But the study also shows that competitive sports convey risks. For it can reveal – to themselves and others – that they are not be made of the right stuff. That they, in fact, are "losers" and not "winners. Since it is seen to expose "the truth" about one's abilities and inabilities, the role of competitive sports is seen by the entrepreneurs to be a "serious and scary game."

RN28 | T09: Football and society

Will Football Still Be A Popular Sport?

Paolo Corvo

University of Gastronomic Sciences, Italy

In recent decades, football has undergone profound transformations that have changed its nature, through its progressive mediatisation and financialization. Many consider it only an industry and no longer a sport. The popular soul of football is in danger of being lost amidst the demands of television programming, large investments by sovereign funds, and more blurred territorial identities. The Court of Justice of the European Union itself has recently proclaimed the prevailing economic dimension of football spectacle. The essay tries to highlight possible ways to keep the popularity of football passion alive. It is an important phenomenon for people's social life, because is at stake the ability to freely express one's emotions in a hyper-capitalistic society.

"Un Capitano!". Affective Negotiation between Former Football Celebrities and Mediatized Fandom: the Case of Francesco Totti on Instagram

Mario Tirino, Simona Castellano

University of Salerno, Italy

Starting from the framework of the mediatization of sport (Frandsen 2020), our paper aims to emphasize the relationship between sports fandom (Sandvoss 2003) and celebrities on social media. Social media brought about sociocultural changes in the world of sports. Conceived as affective environments, they mold football emotions, which is reconfigured by digital cultures (Tirino, Castellano 2020). Sports fandom adapted to new patterns of sports consumption and media. Fans interpret media content in unexpected ways, participating in community processes (Hills 2018) and producing content on social media. Fans often come into conflict and tension with the official products of sports organizations and celebrities and often trigger competitive dynamics within the fan communities themselves. Our paper wants to investigate: i) cooperation and tension between official communication delivered by former football celebrities and fans' content; ii) cooperation and competition within fan communities. Former football celebrities are individuals who face the end of their sports career, but often the beginning of new activities connected with ageing dimension. These new activities allow them to renegotiate their celebrity capital in other social spheres (business, politics, etc.). Media narratives influence the transition from competitive and professional life and retirement, and also

the content produced by fans has an important role in this sense. To achieve our goals, we decided to apply two research techniques: i) media content analysis (Macnamara 2005) of the content produced by one of the most beloved former Italian footballers, Francesco Totti, on Instagram and a fan community related to this former football player; ii) netnography of this fan community. The community was identified from the principles of relevance, activity, interactivity, diversity, and richness identified by Kozinets (2019).

Economic Domination on Football as a Symbolic Domination: The Case of "Modern" and "Traditional" Football

Lucca Ignacio Morais Luiz

University of Innsbruck, Austria

This research aims to propose a novel theoretical approach to the sociological studies of the struggle between 'modern' and 'traditional' football within football clubs and their fandom, bringing the relevance of the practical sense to the understanding of the meanings, directions, possibilities, and limitations of the resistance practice. Examining European literature on this subject reveals a complex spectrum of perspectives within football fan communities defending "tradition," ranging from popular defense of cultural rights to hyper-conservative agendas. Yet, even with this evident diversity of perceptions and actions regarding the "defense of tradition", the majority of the research that I had taken in count aims at the fans' struggle as a dynamic in itself, taking the expression of "tradition" and "modernity" as substantial to reality, making it clear a relevant analytical gap in this field. In a way to frame these differential theoretical approaches, this research employs a literature review methodology using Pierre Bourdieu's typology of sociological approaches, dividing the reviewed literature between opus operatum and modus operandi approaches. This division aims to highlight the need and relevance for the production of researches that aim at the practical sense of football fans, targeting the meanings that orient their "resistance" to "modernity", bringing the usual understanding of this conflict a resistance to an economic dominance to a resistance to a symbolic dominance and also suggests an approach, based on Pierre Bourdieu's theory, that may contribute to the development of this field of research on this direction.

897

RN29 | Social Theory
RN29 | T01_01: Resonance, Alienation, and Love

Resonance and Revolution

Arthur Bueno

University of Passau, Germany

This paper discusses the political implications of the theory of resonance by exploring its (in)compatibility with Marxist conceptions of revolution. Could one conceive of something like a collective struggle for resonance? While Rosa's theory presents a number of arguments that warn against such a prospect, it also continues the radical critiques of capitalism found in the Marxist tradition and in critical theory. Exploring this connection, I propose to re-read Marx's and Lukács' arguments on class consciousness in light of Rosa's theory with the aim of demonstrating the intrinsic link between resonant world-relations and emancipatory struggles.

Theories of alienation

Carl-Göran Heidegren

Lund University, Sweden

What kind of theory does theories of alienation involve? There seem to be many possibilities. Social theory/social ontology: a building block of the social? Theory of society (esp. modernity): an important feature of modern society. Sociological theory (middle-range theory): belongs to the sociological tool-box. Diagnosis of the times: a salient characteristic of our time; part of the vocabulary of time-diagnosis. A sensitizing concept: indicating in what direction to look. A theoretical concept, so it seems, can play different theoretical roles, be part of different theoretical language games.

I will argue that the concept of alienation since some time is about to become a key concept in social theory, as an ever-present possibility pertaining to our relation to the world (subjective, objective, social). In the 1960s and 70s, being ahigh time for theories of alienation, it was rather a key concept in theories of modern (capitalist) society and in the diagnosis of the times. Furthermore, alienation as a social theory-concept is useful for theories of contemporary (capitalist) society and is again gaining relevance for a diagnosis of the times: being a key feature of our time. As examples I will use the work of Rahel Jaeggi, Hartmut Rosa, and the Swedish sociologist Johan Asplund.

The Civic Potential of Love: Social Love and Sociological Theory

Gennaro Iorio[1], Maria Carmela Catone[2], Silvia Cataldi[3], Marco Palmieri[4]

1University of Salerno, Italy; 2University of Salerno, Italy; 3University of Sapienza, Italy; 4University of Sapienza, Italy

This article undertakes a comprehensive exploration of the historical and conceptual dimensions of the public aspect of love within classical and contemporary sociological theory. Drawing from a carefully selected set of authors and acknowledging the valuable contributions of contemporary scholars, the article positions love as a central phenomenon whose influence extends beyond interpersonal relationships to encompass political dynamics and civil life. Using the metaphor of a karst river, love is commonly depicted as a trickle that flows beneath the surface in intimate relationships, but has a powerful public dimension that erupts, highlighting its significance in civil life.

In response to contemporary literature that observes the implosion of love in intimate relationships and its colonization by the consumerist and utilitarian ethic of modern society, French and German critical theory has contributed to a reevaluation of love as a space for criticism of the subject. An example is the work of Boltanski, who conceives love as the social action that allows entry into a regime of peace. Likewise, Honneth recognizes love as a fundamental step in building solidarity, especially in pluralistic societies.

In conclusion, this article seeks to illustrate that the concept of social love is increasingly finding resonance in sociological theory as a distinct manifestation of solidarity aimed at the common good.

From Social Theory To Empirical Research And Back Again

Lisa Waldenburger

FSU Jena, Germany

As a representative of critical theory, Hartmut Rosa has attempted a sociology of world relations with his resonance theory. His aim is to find a solution to the increasing alienation caused by processes of social transformation and acceleration. As an antonym to alienation, resonance as a mode of relationship represents a solution approach that can be defined on the basis of four characteristics: Affliction, Self-efficacy, Transformation and Unavailability. While Rosa's reflections are based on social theory, with brief excursions into his personal everyday experience, there has been no transfer of resonance theory to empirical research. This gap has been filled by translating the theoretical considerations into an empirically measurable and theoretically validated project to capture the possibility of resonance and alienation in the context of social media (qualitative content analysis and type building based on the interviews conducted). In RN29, the implications of the empirical findings for the theory itself are discussed and the extension of the theory along three dimensions – the relationship between resonance and alienation, the source of resonance

898

competence and digital resonance – is presented. The aim is to demonstrate the benefits of linking empirical theory-led work back to theory itself and to counter the lost status of 'theory-ology' in the sense of the empirical turn. This means that a well-founded social theory that unfolds on a higher level of abstraction, necessarily free of empirical evidence, is needed in order to work out its empirical strength in a second step and, ideally, to open up further theoretical questions through empiricism and to further strengthen the theory in the debate.

RN29 | T01_02: Cohesion, Tension, Trust, and Solidarity

"The Leap of Courage": An Integrative Theory of Existential Anxiety and (Social) Trust

Ferenc Mújdricza

Hungarian Central Statistical Office, Hungary

Although trust is a social science 'hot topic', its definitions are fraught with (self-)contradictions and inconsistencies. This confusion is augmented by commitments to outdated concepts (e.g. in organisational studies) and questions the validity of empirical studies.

Cognitive concepts describe trust as a fragile, knowledge/experience-based, calculative, interest-driven capacity: rational decision/expectation assuming uncertainty, risks and vulnerability. They conflate/confuse trust with reliance, naïveté, distrust and manipulative cunning, and cannot explain trust in strangers or why dis/trust "breeds" dis/trust.

Noncognitive concepts consider trust an innate faculty, a benevolence-assuming, irreflective sense of security, affective warmth and optimistic attitude. Some attribute an unconscious background-characteristic to trust. This "pattern in the weave of life" biases the interpretation of information, hence its robustness. Vulnerability-avoidance is replaced with shared vulnerability in this framework. However, it is insufficient for understanding "everyday"/conscious trust, its cumulativeness and naïveté.

This study proposes an integrative concept based on an investigation into the dynamic relationship of trust and existential anxiety. Trust appears as Tillich's subjective "courage to be" – the self-affirmation of being despite the threat of nonbeing – projected on the Other. Courage is actualised in spite of anxiety at the core of objective threat, vulnerability, and risks. The sharing of the courageous self-affirmation accounts for the good-expecting nature of trust and the sharing of vulnerability.

The proposed concept defines forms of distrust, lack of trust, naïveté, reveals the true antithesis of trust, explains conscious/cognitive and cumulative trust, and hints that facilitating trust is only possible by trusting in advance. The radical, courageous "despite-act" of trust transforms the lonesome, anxious individual into the social, optimistic human: the trusting being.

899

(Mis)Trust and Societal (In) Stability – An Analysis of the Social Construction of Reality in Modern Society

Georg Diezi

Institute for Social Change and Sustainability, Vienna University of Economics and Business, Austria

Against the backdrop of increasing social complexity, fading trust in policy makers and scientists as well as the rise of populism and authoritarianism, the question of the stability of social order is gaining in relevance – a "crisis of trust" does not only lead to ungovernability but also to social instability. Therefore, a comprehensive understanding of (mis)trust in and (in)stability of modern society is needed. Many existing sociological approaches only focus on a certain social phenomenon, specific to a nation state or historical period, when explaining (in)stability. Instead a more comprehensive approach is needed. Starting from the assumption that trust in social institutions and actors and thereby the stability of a society depends on the prevalent way reality is socially constructed, this contribution argues that societal communication should be at the centre of a respective sociological observation. It first seeks to provide a brief overview of existing relevant literature while highlighting what it lacks when explaining societal (mis)trust and (in)stability. Then it proceeds to bridge systems theory in the tradition of Niklas Luhmann, which claims to describe modern society comprehensively by putting communication at the centre of sociological observation, with Daniel Hausknost's concept of passive legitimacy, which connects the (in)stability of a social order to the capability of its rulers to generate passive legitimacy through the measures of exclusion, performance and reification. Through merging these approaches, this contribution argues that (mis)trust in and (in)stability of a modern society can be described and explained comprehensively.

"Solidarity" In Social Theory: Between Conflict And Autonomy

Gerard Serralabós

University of Barcelona, Spain

"Solidarity" is a relevant concept in classical social theory (especially in Émile Durkheim's work) abandoned by most sociologists during the 20th century due to its lack of precision and its excessive political and moral connotations. However, during the last fifteen years, a growing body of literature has revived its popularity, a phenomenon that reflects a broader pattern: "solidarity" is usually invoked in times of crisis (Metz 1999). The reappearance of this concept has been particularly notorious in two emerging fields of knowledge that barely interact with each other (Della Porta 2020): social movement studies and studies on civil society (and, related to the latter, studies on voluntarism and the third sector). Social movements conceptualizations tend to focus on conflict, transgression and networks, while studies on civil society emphasize autonomy (from both the market and the state), civility and association as key elements of our societies. Accordingly, solidarity appears, on the one hand, as a synonym for class formation, as the internationalization of social conflicts (Nussbaum, Dingeldey & Laudenbach 2022), as a form of collective action (Sangiovanni 2015) and as an expression of the trust necessary for social order or, on the other hand, as a synonym of social capital that enables an un-coerced human association. Therefore, "solidarity" becomes again a blurry term. Combining a bibliographical review of recent academic works and a textual analysis of classical sociological texts, this contribution argues that the ambivalent usage of "solidarity" in its growing popularity was already a tension in its classical social theory conception. An appropriate historical comprehension of its conceptual evolution will shed light on its potentialities and limits in social theory.

Intergroup Cohesion as a Trigger for Exclusion? The Paradoxical Implication of the Established-Outsiders Model

Marta Bucholc

University of Warsaw, Poland

900

The established-outsiders model stands as one of Norbert Elias's significant contributions to the study of social exclusion and polarization. In my presentation, I aim to revisit Elias and Scotson's insights concerning the social construction of difference, highlighting a key weakness: the assumption that the remarkably homogenous social structure of Winston Parva represents a universal model for understanding exclusion. However, I contend that Elias's theory of established and outsiders can be critically re-examined to overcome the limitations of the original study.

I proceed to analyse three distinct dimensions of societal cohesion within Winston Parva: the behavioural, normative, and cognitive aspects. Contrary to Elias's original model, I propose to separate these dimensions to explore how established-outsiders figurations evolve in heterogeneous, multicultural societies. Central to my discussion is the interplay between the group cohesion of the established and the outsiders, and the often overlooked cohesion of the established-outsiders figuration as a whole.

My main argument posits that figurational cohesion is essential for effectively constructing differences and perpetuating exclusion within an established-outsiders figuration. I support this theoretical stance by examining selected figurational strategies of both established and outsiders, illustrating how the former benefit from maintaining figurational cohesion, while the latter stand to gain from undermining it.

In the concluding part of my presentation, I address the paradox of large-scale societal cohesion promoting exclusion and intergroup hostility, and I discuss the implications of this thesis for studies on global transformations.

RN29 | T02_01: Theorizing, Professionality, and Everyday Sensemaking

Transforming „Theory" and the „Theorist". Boundary Work Within the Sociological Discipline

Thorsten Peetz, Nina Monowski

Universitiy of Bamberg, Germany

In recent decades, the meanings of „theory" and „theorist" have changed fundamentally within the sociological discipline. While the notion of "theory" is more and more narrowed down to one of its recent "meanings" (Abend 2009) – "empirical generalizations" – the "theorist" has lost much of his (sic!) professional status. A glorious figure during the "long summer of theory" (Felsch 2015), the sociologists focusing on conceptual work and philosophical discussions are increasingly devalued.

Like any other social transformation, this development, too, is the outcome of social processes and social construction. In order to understand the transformations of "theory" and "theorists", we draw on the concepts of "boundary work" (Gieryn 1983) and "social and symbolic boundaries" (Lamont&Molnár, 2002). In an analysis of the professional rather than the "theoretical" discourse of sociology, we reconstruct how the boundaries of "theory" and "theorist" are drawn (Abbott 1995), which categories are used to make sense of these identities, how they are related to other identities in the sociological field, and how they are valorized.

For our analysis, we concentrate on discussions within US-sociology and draw on professional newsletters and blogs. In the spirit of computational grounded theory (Nelson 2020), we reconstruct the "meaning structures" (Mohr 1998) underlying these texts as semantic networks and the practices of symbolic boundary work employed in them.

Creative Tensions and Dialectical Theorising: Reading Michael Burawoy And Erik Olin Wright Through The Lens Of Professionalism— Post-professionalism

Anna Engstam

Lund University, Sweden

In the context of social theory/theorising, calls for further specialisation, rationalisation, and methodisation through more far-reaching discipline and reflexivity may well be described as professionalism: further professionalisation is depicted as the solution to various problems that social theorists are presumed to face. On the other hand, opposing arguments that the constraints of professionalisation are not all good can be described as post-professionalist interventions. The post-professionalist message may be reconstructed as follows: we need to go beyond professionalism to produce more interesting and relevant theories, since rigorous and systematic use of logics and methodology to elaborate on established theoretical frameworks and conceptual apparatuses on its own is not enough to achieve this aim – we may even get trapped by professionalism; put differently, we need to use intuition, imagination, and/or experience as well as specialist knowledges and methods of problematisation, clarification, elaboration, criticism, justification and so on. Against this background, I have constructed an ideal type of professional theorising, and then contrasted this type of theorising with what I typify as free-spirited theorising; in total, four subtypes are constructed on the basis of idealised directions for theorising. My presentation in Porto will focus on Erik Olin Wright's and Michael Burawoy's writings on social theory and theorising, especially their ideas of creative tensions, real utopias, and what I would like to name as dialectical theorising ("the dialectic of utopian and anti-utopian thinking"). They certainly did not agree on everything, but together and individually they have made a strong case for post-professional theorising.

Varieties of Theorizing: Three Ways of Relating Scientific and Everyday Sensemaking

901

Kurt Georg Rachlitz[1], Grossmann-Hensel Benjamin[2]

1Norwegian University of Science and Technology (NTNU), Norway; 2University of Zurich

Over the past decade, the theorizing movement has sought to foreground the process of theorizing. Before theory comes theorizing – this is Richard Swedberg's (2016) famous claim that more attention should be paid to this very process and less to its artefacts. This assertion has sparked a discussion about the core of theorizing which has led to two diametrically opposed approaches (Anicker, 2020; Carleheden, 2016, 2019). We argue that the different camps are talking past each other, because neither sufficiently considers that the social sciences are inevitably confronted with a distinction that can be made explicit through a further development of a concept introduced by Weick et al. (2005): the distinction between everyday sensemaking and scientific sensemaking. Based on this claim and following Thomas Nagel (1989), three modes of theorizing can be distinguished: Nowhere theorizing, everywhere theorizing, and somewhere theorizing. While nowhere theorizing and everywhere theorizing give preference to either everyday or scientific sensemaking, somewhere theorizing tries to relate the two forms of sensemaking to each other. The aim of this paper is to highlight these varieties of theorizing in order to avoid any one-sided generalization of it.

Building an epistemologically humanised sociology: Harriet Martineau's concept of the Traveller

Ellie Smolenaars

Social Research & Journalism, Germany

With her Science of Morals and Manners (1838), the early classical sociologist and founding parent of sociology, Harriet Martineau, introduced the concept of the Traveller. Martineau is a nineteenth-century thinker whose writing is an interesting hybrid of a Baconian understanding of science, curious discovery through mixed methods, and communication with readers and citizens.

This paper summarises and develops Martineau's sociological concept of the Researcher-as – Traveller. Within the fields of social theory, her skilled Traveller's scepticism, co-inspired by Francis Bacon's idols, is analysed in the context of the following current transformations: (1) pluralising methods of social theory, (2) mutualising communication contexts, and (3) meta-reflexive tendencies.

It is expected that, as a possible consequence of the further development of Martineau's first Traveller concept, the subject of the human researcher can be re-identified and consolidated in a landscape of evolving systems, rich ontological concepts and endless availability of data. This will provide insights into how humanised research activity can be anchored in current AI and machine-generated scientific landscapes.

RN29 | T02_02: Social theory, Communication, and Public Spheres

Patterns Of Theoretical Continuation – Understanding Social Theory Sociologically

Lukas Beckmann, Sebastian Suttner

Julius-Maximilians-University Würzburg, Germany

The debate on 'theorizing' in sociological theory is a welcome irritation for the field of science. We want to build on the perspective of how theory (or rather: theorizing) works by problematizing theory from a sociological standpoint. For that we are looking at the problem of communicational continuation. Drawing from perspectives of Social Systems Theory we understand theory as a sociological fact in that theory is communication. This poses the relevant question for our presentation: What are relevant factors that facilitate the continuation of theory communication?

As an analytical tool we will categorize the factors of communicative continuation along three dimensions of meaning: thematical (structural), temporal, and social. Looking at theory from this perspective allows us to see how scientific statements are kept relevant. In doing so, we find a topology of relevant factors for scientific continuation that we draw from current diagnoses of sociology and social theory. These factors include e.g. concepts/terms or reference questions on the thematical dimension; the politics of theory, opposition and camp building, on the social dimension; and forgetting/remembering and evolution of theory on the temporal dimension.

Analyzing theory from the perspective of communication is a first step in a broader endeavor to look at reciprocal irritation of science and other areas of society. Therefore, the analysis of relations between sociological theory and mass media, politics, or art can be observed and analyzed with respect to their consequences both for the 'sociologization' of society and the import of problems, forms, and concepts into theory.

From "Them" To "Us": Actor-Network Theory As A Public Sociology

Francesco Bertuccelli

Universtà di Pisa, Italy

The present contribution aims to theoretically address and discuss this question: is it possible to frame current political, ecological, and cultural tensions as due to progressive collapsing of society? Or, in other words, the alleged formation of relatively closed living environments and the fading of intersubjective trust, and thus related affirmation

902

of shortsighted instrumentalism in relationships, must be considered the approaching result of processes of rationalization and expansion of modernity causa sui or, conversely, such "capsularization" should be interpreted as caused by the advancement of individualism undermining social institutions? Too much alienation or too much freedom? In canonical social theory and research both solutions are commonly assumed and empirically tested, oscillating between the two versions of organicism: the whole being more than the sum of its parts, which could only occasionally deviate from established social order, or the whole corresponding to the reductionist sum of its parts, thus obtaining a rational form or not according to independent elements' stock of values. However, the point is that both approaches retain a common pre-assumption, the ability of sociologist to step aside from society and to discriminate between the excesses or shortcomings on both sides, that is to exert a critical vision, ultimately stemming from normative arguments. Anyway, such "view from nowhere" could be the most misleading observation point, as it induces to transfigure social phenomena according to scholarly models about what society is or should be, which are not determined and legitimized according with the audiences they refer to, or even manifestly against them. Here lies the main argument of public sociology, which strives to reconcile the gap and to reflexively put into discussion conditions, limits, and possibilities of scientific inquiry. In this sense, it is argued that, drawing inspiration from feminist situated knowledges and advancement in political ecology, Actor-Network Theory could represent the most radical interpretation of such approach, via the dismissal of customary coordinates emancipation/regulation and agency/context as binding dualisms, and affirming an innovative methodology that adopts an "experimental metaphysics", adhering to the level of informants to compose society and achieve it as a transformative open-end result instead.

Transformation and Alteration of Public Spheres, between Constellation and Configuration

Gilles Verpraet

University Paris Nanterre, France, Sophiapol

Public sphere can be considered as a space of public and private relations (Habermas), where can be formulated and negotiated public and private opinions (Lazarsfeld), subject and collectivity (Simmel), collective institution and social mobilizations (Della Porta). Long term social history takes in account the changes of relation between public and private domains, the modification of public performance (Alexander 2006), the extension of internet media spheres (Verpraet 2012).

We propose to specify these changes and alteration of public spheres by the double figures of convergence and diffraction of cultural values. Constellation considers the diffraction of cultural values by pluralization and by critics (From Adorno to Boltanski). Configuration designates the meaningful social relations between symbolic forms and subjectivities in interaction (Elias, Fontanille, Verpraet 2023)

This analytic framework helps to specify between the domains of uncertainty and consistency (classic epistemology) , the domain of hypothesis as epistemology of possible , the dynamic episteme between the regimes of knowledge (Bachelard). Transformations of public spheres can envision the dimension of trust stabilized inside each cultural configuration, but they also can analyze both the tensions between configurations and the critical tensions inside each configuration . This framework will be exemplified on the Covid stop and go processes.

Foucault's Paradox: Veiling Sexual Controversies and Flawed Sociological Theories.

Marta Soler-Gallart[1], Mar Joanpere-Foraster[2]

1UNIVERSITY OF BARCELONA, Spain; 2Universitat Rovira i Virgili, Spain

The research we present stems from the concern about the discrediting that sociological theory is undergoing in sciences and citizens for having Foucault as one of the references by many sociologists. Foucault, whose flawed theory has fueled influential advocacy for the decriminalization of rape and pederasty is used as a primary reference even in the context of sex education for minors, while hiding this information from students. The study interviewed 19 subjects with diverse profiles, employing a communicative methodology, and confirmed the concealment. However, in today's society, everyone can logically access information sources through which scientists and the public discover this deception, thereby undermining the discipline. The research proposes two conclusions: 1. It clarifies that many sociological theorists reject such a theory which exhibits a very low intellectual level. 2. It initiates a debate about the hypotheses that might explain why this information is concealed and why there is a tendency to: a) portraying Foucault as the preeminent critical thinker; b) characterizing him as a transgressor; c) emphasizing his role as a relativist intellectual; d) using him as a "shield to hide behind"; and e) advocating for the separation of the intellectual from the person. Faced with the social scandal this generates, many theorists have already distanced themselves from it.

903

RN29 | T03_01: Theorizing: Working On and Working With Theories

Theorizing As A Two-Way Street. Or: Why Theorizing Should Be Thought Of As More Than Developing Theory

Erik Børve Rasmussen

Oslo Metropolitan University, Norway

Recent years has seen a surge in interest in theorizing, amounting to something of a "theorizing movement" in sociology. This paper engages with this literature, and with the formative contributions by Richard Swedberg in particular, to challenge and further our current understanding of theorizing, both as concept and practice. My aim is to show that a key aspect of theorizing is missing from current discussions about theorizing. While it is true, as claimed by Swedberg, that before theory comes theorizing, it is also true that before theorizing comes theory. Swedberg has centred attention on theorizing as theory development, and on the creative process of making new sociological theory. But theorizing, understood as the articulation of assumptions about phenomena, is a two-way street that also includes theory application, or the use of theory. The takeaway message, then, is that theorizing regards both the development of theory (through the application of data, or, at any rate, exogenous elements) and the development of data (through the application of theory). Theorizing in this sense is a form of theory work, involving work on and work with theories. In the paper, I conceptualize theorizing as a two-way street and use this conceptualization to discuss the role of theorizing in both theory use and theory development. I draw on a both the theorizing literature and a sociological interpretation of Wittgenstein's finitist theory of language to argue my case.

Theorizing the Agency of Artificial Intelligence – A look over my own shoulder

Fabian Anicker

HHU Düsseldorf, Germany

Theorizing is certainly more an art than a science. Yet, the recent debates about theory construction have helped to explicate some know how, tacit self-understandings and many strategies of theory building that allow us to see much clearer what we are doing, when we are theorizing.

In my talk I will reflect on my own theoretical practice of constructing a theory of agency that helps to understand interaction with artificially intelligent systems. I will show how I use a critical comparison of existing theories to get a clearer idea of what is lacking in contemporary thought on AI. I will show that theory is still divided on the agency-question between classical action theory that restricts agentic notions only to humans and STS and ANT positions that grants agency to any entity that exerts causal influences on a situation. I will show how I sharpen the theoretical problem by confronting these two positions with empirical data on interactions with AI (from a self-conducted laboratory experiment on the interaction with ChatGPT). I formulate two theoretical problems and show how I try to make them as clear as possible: the problem of demarcation and the problem of differentiation of agency. The former refers to the conceptual border between agents and non-agents, the latter to the distinction of different types of AI agency. I show how I make crude comparisons at the beginning to have some idea about the differences that may be important and how I refine these in the process of elaborating the theory. I will show how I go back and forth between theoretical ideas and empirical data to establish the fruitfulness of the theory.

Uberizing Social Theory. On Problems of Model Case Research

Désirée Waibel, Vera Tauber

University of Lucerne, Switzerland

Our contribution invites for reflection of so-called "model cases" in social theory. In a recent book, Monika Krause (2021) outlines and critically investigates social scientists' reliance on "model cases", that is, privileged material objects and sites. While research accumulation via model cases has its advantages and disadvantages, Krause argues that in contrast to the natural sciences social scientists make use of model cases in a unreflective manner. Considering that model cases, for instance, are baked into theoretical generalizations, guide further research and research questions, promote possibly undue universalisms, this lack of reflection has only disadvantages and should be addressed.

In our contribution, we want to discuss the problem of model cases for social theory specifically. We start with problems for which a more reflective approach to model cases seems an easy (and important) solution. We exemplify these "solvable" problems on the case of Uber as the model case for platform-organizations (e.g., Davis and Sinha 2021; Schüßler et al. 2021), which greatly troubled our own research on the platformization of Swiss academic libraries. Here, we demonstrate how strong cases such as Uber shape conceptualizations and research agendas in substantial ways, and how one may counter such shaping forces. However, we then consider how platform research is moreover a typical example of how social theory is used, and ignored, as current scholarship is encouraged to favor case-based nuance over abstraction. As we argue, this form of theorizing is linked to larger cultural and structural shifts in academia and yields problems that can hardly be addressed by reflection alone.

904

Reappraising the Role of Face-to-Face Interaction in Social Theory: Insights from Studies of Autistic Individuals

Lars E. F. Johannessen

Oslo Metropolitan University, Norway

Much of contemporary social science presupposes that face-to-face interaction represents the quintessence of human social engagement. This assumption informs a wide range of social scientific thinking, as evinced in methodological treatises privileging face-to-face over mediated methods and in social theories positing face-to-face interaction as crucial for social bonding and shared meaning. However, despite their broad acceptance, such assumptions are based almost exclusively on research about "neurotypical" people. This makes it highly likely that existing theories come with biased and skewed understandings of what it means to "interact," be "social," or even be "human."

To redress these shortcomings, this article reviews and synthesizes research on the interactional practices, experiences, and preferences of people on the autism spectrum, who have a well-documented aversion for conventional forms of face-to-face interaction. The article contends that studying interactions with people on the autism spectrum can advance our understanding of social interaction more generally, as it can help shed light on taken-for-granted and normative assumptions about interaction and sociality. Specifically, the article uses the heterogeneity of autism to chart a "spectrum" of different interaction logics, each comprising a distinct set of situated needs, preferences, and motivations for interacting. The article thus contributes to relativizing the presumedly universal "face-to-face logic" presupposed by dominant theories of interaction, situating this as one of many ways in which people understand and navigate their social worlds, and thus expanding our understanding of what it means to "interact" and be "social."

RN29 | T03_02: The Social, Society, and Individuality

Sociology Meets Poststructuralism: Liquidity of the Late Modern (In)dividual and the Society of Control.

Neja Berger

University of Ljubljana, Faculty of Social Sciences, Slovenia

Since Beck introduced the concept of the risk society, the process of individualization has been a focal point in attempts at a comprehensive social theory addressing late modernity. Despite Beck's initial commitment to providing an analysis at the level of the individualised subject, sociological discourse has fallen short in addressing this gap. Articulations of late modern conditions, such as Bauman's liquid modernity or Reckwitz's society of singularities have all elucidated the effects of a presumed individualization, and attributed its cause to neoliberalism, globalisation, and technological developments. But the causal link between these systemic changes and the transformative process at the level of the subject still remains inadequately explored.

This paper highlights this gap, proposing a synthesis with Foucault's theories on power and Deleuze's thought on societies of control. Utilising their framework, I interpret liquidity of the late modern subject as a manifestation of a novel form of power that neither (negatively) constricts nor produces individuals in reference to a norm. Thus the sociological concept of individualization is reinterpreted as dividualization: late modernity marks the end of subjects formed into individuals because such a transformation is integral to the reproduction of the neoliberal stage of capitalism. Extending analysis in social theory within this framework is especially important in the age of Big Data when the process of (in)dividualization works in conjunction with algorithmic nudges and suggestions, steering the neoliberal subject's freedom towards autonomous alienation and profitable information production. This exploration underscores the complexity of the late modern condition, challenging conventional sociological interpretations and offering a fresh perspective rooted in philosophical analysis of subject formation.

905

Governmentality and Social Structure from a Foucauldian Perspective

Dániel Kömüves

Doctoral School of Demography and Sociology, University of Pécs, Hungary

In this presentation, I will focus on the historical development and theoretical foundations of the concepts of social structure. Using Michel Foucault's notion of biopolitics and governmentality, I analyse the historical changes in how

statistical apparatuses and political thinkers created different categories to represent the structure of the society in the 18th and 19th centuries. Foucault's ideas could contribute to a better understanding of theories on social structure in at least two ways. On the one hand, we can use Foucault's theory of power as a basis for a critique of traditional structure analysis in general, as illustrated by Agnes Horvath and Arpad Szakolczai. On the other hand, we can also apply Foucault's concepts to reflect on changes in the representation of social groups from a historical perspective. To illustrate this, I rely mainly on the analyses of Mitchell Dean and Karl Polanyi. According to their concepts, I demonstrate the transformation of the criteria by which the poor (paupers) and different segments of society were grouped into classes. How this was linked to aspects of liberal government and to power relations in general, what is the social context in which they were created and how this relates to issues of population control and government? I argue that Foucault's views offer a better understanding of structural theories, which examine socio-cultural and socio-economic inequalities within the framework of a self-regulating market.

Jan Szczepański's Theory Of Human Individuality As An Attempt To Look For A New Paradigm In Sociology

Tomasz Leszniewski

Nicolaus Copernicus University, Poland

This presentation attempts to critically review the individuality theory proposed by Polish sociologist Jan Szczepański and answer the questions: what role does individuality play in understanding and explaining social changes? How can we include the individuality of man in social theory? And is this an example of searching for a new paradigm in sociology? What kind of advantage does it give us of an individuality category?

The above questions appear from particular theoretical and methodological assumptions taken by Szczepański. 1) individuality realizes an essential social function –it can reduce or even exclude human suffering rooted in the social order – it emphasizes the moral character of loneliness that determines the reflexivity of man. 2) One ingredient of individuality is the inner world of man, which has a different logic of action than the social system – based on the common social reality, individuality gives its a particular meaning according to the biographical trajectory of a person. 3) Man's individuality could be developed by being aware of their opportunities to externalize values of the inner world. 4) The human concern about the development of the inner world and reflexivity relation with self does not have to be the cause of alienation and disappearance of community. Still, it is even necessary for the occurrence of trust and solidarity in social relationships. Eventually, individuality has a moral facet and can be a source of pro-community attitudes. The proposed conception of individuality allows us to analyze the individualization process and individualism from a different (alternative) point of view, giving us a chance to grasp the complexity of changing society,

emphasizing the necessity of individuality being included in the sociological explanation.

(E)valuation and Audit Culture: Procrustean Logic, Social Valuation and Recognition, and the New Iron Cage(?)

Vasiliki Kantzara

Panteion University of Social & Polical Sciences, Greece

Evaluation as a policy instrument that assesses individual and institutional performances has gained momentum in recent decades and it is applied in almost every sphere of human endeavour raising several questions and concerns. For instance, part of the literature on evaluation tackles the consequences of the policy in education showing that inequalities have increased as well as the privatisation trend of common goods. This development is related to the 're-calibration' of the state (Ball) and is explained as 'academic capitalism' (Slaughter and Leslie), to name but a few.

In my view the emergence of the current form of evaluation raises several questions, relevant to sociological theorising: How does evaluation as a policy instrument has gained momentum? What are the underlying connotations that may account for its widespread use?

In the paper, firstly, I delve into the literature on evaluation exploring its emergence in the context of audit culture (Strathern). Next, I examine the interlinkages between current and previous forms of valuation that as processes inform among others the construction and sustenance of hierarchies.

Moreover, I explore the link between evaluation and the claims of, as well as the 'struggle for recognition' (Fichte, Hegel, Honneth, Ricoeur); these are processes linking individuals to society and social life with varied effects. For some authors these struggles may account for social transformation as well.

The relation between evaluation and recognition is to my knowledge scantily researched. This line of inquiry could provide fruitful insights into the less obvious aspects of power arrangements as well as into social transformation processes and the trust citizens may have in social changes.

906

RN29 | T04_02: Social theory, Literature, and Interdisciplinarity

The Dialogic Society: Catalyzing Sociological Theory's Rise and Prestige Among All Sciences

Elisabeth Torras-Gómez, Esther Oliver-Pérez, Mimar Ramis-Salas

Universitat de Barcelona, Spain

Historically, sociological theories have elicited no interest from other scientific domains outside the social sciences and humanities. Disciplines such as mathematics or neuroscience had shown little regard for sociological frameworks.

However, the theory of the Dialogic Society has transformed this scenario. Principles in this theory, such as co-creation or social impact, are of utmost need for all scientists wanting to advance their contributions to the improvement of society. As an example, at the first Social Impact International Conference, the Nobel Prize laureate Harald Zur Hausen, who discovered the link between papilloma viruses on cervical cancer, acknowledged the need to collaborate with social sciences to know in which ways that knowledge would best benefit society. The evaluation of the social impact of actions such as conducting regular check-ups or vaccinating the population was necessary to establish which was the best way to proceed.

This paper presents the role of the Dialogic Society theory in propelling the scientific prestige of sociological theory to new heights. On the one hand, it has positioned sociological theory as an invaluable contributor to the collective pursuit of societal improvement, aligned with society's own goals. On the other, it has overcome the historically limited engagement with sociological concepts from disciplines outside the social sciences, sparking a newfound interest and demand for sociological theory across diverse scientific domains.

Border Praxeology: Integrating Sociological Practice Theories into Border Studies

Ulla Connor

Saarland University, Germany

The field of Border Studies has experienced rapid growth in recent decades, marked by its increasing internationality and multidisciplinarity. Amidst discussions seeking common theoretical frameworks and methodological approaches for border investigations (as seen in Walther et al., 2023), sociology has seldom engaged in this discourse. This contribution aims to explore how sociological perspectives can enrich border research, specifically through the lens of practice-theoretical approaches (e.g., Allison et al. 2017, Gherardi 2019).

While the concept of practice is not new to Border Studies, it remains underdeveloped. Despite its established presence, there is a dearth of theoretical and methodological exploration of practice-oriented approaches in border research. This contribution addresses this gap by introducing the concept of "Border Praxeology." (Gerst/Krämer 2017, Connor 2023) Through a synthesis of practice sociology and border studies, it presents a set of theoretical concepts and methodological tools, establishing a novel research approach. Central to this framework are sociological practice theories, providing guidance on key concepts, methodological considerations, and research tools such as ethnography.

In essence, this contribution seeks to pave the way for an enriched understanding of territorial borders by integrating sociological praxeological perspectives into the discourse of Border Studies. The development of a Border Praxeology offers a promising avenue for advancing theoretical and methodological approaches within the growing and evolving field of Border Studies.

Social theory and Annie Ernaux

Cato Wittusen

University of Stavanger, Norway

The auto-fictional novels of Annie Ernaux are often considered sociological works of literature. In this paper we will discuss how Ernaux' novels can contribute to social theory, focusing in particular on La Place (1985). In philosophy there have for a long time been very different views on the relationship between philosophy and literature, a discussion that goes back to Plato and Aristotle and the so-called ancient quarrel between philosophy and poetry. A dominant view in philosophical conversations about the value of literature for philosophy is that philosophical literature can only illustrate and help us understand philosophical theories. A contrasting view is that literature, by means of literary devices and narrative form, can investigate, and even transform, philosophical problems in its own way. Interestingly, Ernaux has often mentioned the influence from Pierre Bourdieu's theoretical perspectives and empirical studies. One might therefore conclude that her works merely illustrate theoretical perspectives. However, we will argue that while it is tempting to take a writer such as Ernaux to illustrate and make important social insights available to their readers (most of them not social theorists), it is important that we also recognize how her ways of describing and drawing attention to social phenomena help social theorists rethink and develop perspectives and concepts within social theory. Not only can her descriptions help us pay attention to complex social phenomena in refreshing ways, but they might also lead to thoughtfulness that strengthens and transforms our bonds with social reality.

907

Woman On Woman: The Transgender Difference As Theorised Through Alain Badiou

Ciara Cremin

University of Auckland, New Zealand

It is frequently said by advocates of transgender that 'trans women are women'. The statement itself is a contradiction in terms. For clearly, as qualified, trans women fall short of being woman in an unqualified sense. The presentation approaches this statement through Alain Badiou's notion of the vanishing difference, or difference in the sameness as elucidated through his interpretation on Malevich's White on White. It is not a question of whether trans women are indeed women, but what it means to be a woman at all. Rather than invalidating trans identities, in their (minimal) difference from the sameness of ciswoman, trans, it is argued, opens a space for new ways of thinking and doing gender.

RN29 | T05_01: The Past, the Present, and the Future

Theorising Contemporary Nostalgia: Longing for the Past in the Context of Current Tension, Trust and Transformation

Dariusz Brzezinski

Institute of Philosophy and Sociology of the Polish Academy of Science, Poland

In 2001 Svetlana Boym stated in her now classic book 'The Future of Nostalgia': 'The twentieth century began with a futuristic utopia and ended with nostalgia'. In more than twenty years that have since passed, yearning for the past has indeed taken on an extraordinary significance in the contemporary world, enormously influencing current tension, trust and transformation.

As far as contemporary politics is concerned nostalgia is exemplified, for example, by Brexit, or the rise of neo-nationalist aspirations. Nostalgia is also important for the transformation of contemporary culture, as the past is very often a reference point for shaping contemporary cultural phenomena. Yearning for the past is very much present, for example, in contemporary film productions, computer games, fashion and design. Technology also has an increasing influence on contemporary nostalgia, as – for example, through AI algorithms – it provides tools for exploring (and sometimes playing with) the past. Nostalgia is therefore subjected to politicisation, mercantilisation, mediatisation and technologisation.

In light of all these phenomena, sociologists need to investigate the meanings and functions of nostalgia in contemporary society and culture, but also reflect on the theoretical framework of nostalgia. Recently, Michael Hviid Jacobsen stated that '(...) nostalgia is in desperate need of theoretical elaboration and empirical investigation'. With regard to the dynamically developing 'nostalgia studies', Niclas Salmose concluded that they 'have not yet formulated a theoretical framework for its practice and method'. In my paper, I will attempt to revise the theoretical framework of nostalgia in sociology, paying particular attention to its relevance to contemporary tension, trust and transformation.

Transformative Power of Dystopia

Michal Kaczmarczyk

University of Gdansk

In my presentation, I aim to advocate for the thesis that the increasing prominence of dystopian narratives can be interpreted through the lens of Niklas Luhmann's social systems theory. This theory claims that societies are composed of various interdependent systems. I propose that the rise of dystopian literature and movies serves as a form of sublimation and differentiation of negative elements within the

908

self-descriptive narrative of the general social system. This process is analogous to the role of civil disobedience within the legal system, where it acts as a means of highlighting and challenging legal norms; the function of parliamentary opposition in the political system, which provides a necessary counterbalance and critique of governing bodies; the significance of errors in the scientific system, which are essential for the advancement of knowledge; and the role of debt within the economic system, which, despite its negative connotations, is integral to the functioning of modern economies. These elements, while seemingly negative, are crucial for the evolution, adaptation, and self-regulation of their respective systems. Similarly, dystopian narratives, by reflecting society's fears and anxieties, contribute to the self-description and ongoing evolution of the social system as a whole, especially in the age of growing global risks and accelerating technological change.

Sociology Of The Future. Theoretical Foundations, Approaches, And Prospects.

Manuel Reinhard

Helmut Schmidt University Hamburg, Germany

21st-century societies are in a "crisis of the future". As the meta-analysis of the Global Satisfaction with Democracy Report 2020 conducted by the University of Cambridge's Centre for the Future of Democracy has documented, since 2019 more than half of the world population living in democracies doubts the ability of their countries' public institutions to successfully cope with the societal challenges of the present (from political polarisation ["culture wars"] to economic inequality ["refeudalisation of the economy"] and the fragmentation of the public sphere ["filter bubbles"]). It is therefore not surprising that the research field of sociology of the future has recently attracted increased sociological research interest. The research field – which must be clearly distinguished from that of futures studies ("futurology") (i.e., research attempts at forecasting societal futures) – aims to expand "traditional" past-oriented socio-theoretical perspectives in sociological research (e.g., social structures, milieus, and socialisation) by shedding light on the role that "future cultures" (i.e., interrelationships between people's anticipations of, aspirations regarding, and interventions for the future) play as drivers of social crises, dynamics, and transformations. The aim of this presentation is – by giving an overview of the socio-theoretical foundations (Part 1), approaches (Part 2), and prospects (Part 3) of the currently burgeoning sociological research activities on engagements with the future in today's societies – to provide an introduction to one of the most dynamic developments in contemporary sociology on both sides of the Atlantic.

Contemporary Diagnoses of Social Crises and Futures: theoretical insights from European and Brazilian scholarship

Mariana Motta Vivian

Freie Universität Berlin, Germany

As a multidimensional idea, which can be associated with very different phenomena and meanings, the concept of "crisis" seems to have become a leading category in contemporary sociology. If the foundation of the discipline was directly related to the scientific endeavour of thinkers concerned with explaining the phenomenon of modernity – especially in what concerns the social changes experienced by Western societies in the late nineteenth and early twentieth centuries –, in societal contexts of profound transformation as the ones we live in today, the crisis idea assumes a prominent role in the diverse theoretical attempts to translate a shared sense of an unsettling present associated with an unknown future. But what is really in crisis in the present times? And what futures can emerge from a crisis diagnosis? As part of a broader interdisciplinary project regarding futures in Latin America, the present work discusses social theorizations of crises through the articulation of insights coming from both European and Brazilian scholarship. Based on a critical analysis of contemporary crises diagnoses, it argues that, even though polyphonic and polysemous, the crisis discourse acts as a signifier capable of providing a messy and puzzling present with a shared meaning. The crisis grammar, in this sense, might limit imagined futures, but it does not necessarily prevent prefigurative links with the times to come. Following this two-fold argument, the potentialities and limitations of social theorizing on crisis are addressed in order to identify its role as a reading key to social change.

909

RN29 | T05_02: Transforming Social Theory and Sociological Research

Transforming Social Theory: Steps Towards a General Societal Ontology

Patrick Joseph O'Mahony

University College Cork, Ireland

If indeed social theory has been pushed to the margins of sociology and the other human and social sciences that draw from it, how has this come about? There are multiple possibilities, for example, that it results from opposition to the perceived hegemony of theory, or that it has been made less relevant by the growth of 'local theories' within sub-disciplinary and inter-disciplinary constellations. One further possibility will be explored here. Social theory lacks an adequate general architectonic that would make it relevant to contemporary societal concerns viewed through the prism of the social sciences. For society has a remarkable capacity for social change of all kinds and in all directions and contemporary theory has struggled to fully keep pace with it, with the consequence that researchers frequently take only take a little of it and go on to instead develop theoretical frameworks of their own. The paper advances the case for the continuing necessity of a general social theory. and for this it outlines elements of a correspondingly general societal ontology. Such an ontology must contain both necessary elements and elements that respond to changing societal conditions. It will be argued that such an ontology can be built from modifying the social theoretical resources advanced in various generations of critical theory that arose in both dialogue and difference with other and theory traditions and multiple disciplines. The basic elements of such an ontology will be briefly presented and its advantages for enhancing the general relevance of social theory to exemplary dimensions of intellectual fields and social research outlined.

Bringing Together Theories Of Integration And Conflict

Olli Petteri Herranen

University of Helsinki, Finland

Throughout history, human beings have created both formal and informal arrangements that generate close integration between people as well as contradictions and interpersonal conflict. Structural and institutional theories of these arrangements address two fundamental questions of social science: i) how it is possible for modern societies with highly developed divisions of labor to remain relatively orderly at the systemic level, i.e. for people to live in integrated societies; ii) even though these societies are torn apart by systemic conflicts. The so-called Grand Theories have in the past attempted to explain the possibility of system integration and the causes and consequences of conflicts arising from within the same system. Although there have been attempts to combine these theories of integration and conflict, this aspiration has been abandoned and these aspects have been treated as two separate sets of phenomena.

If societies with a highly developed division of labor tend to organize themselves in orderly ways, I suggest that there must be some organizing standards underlying these operations. Otherwise, the conflicts would tear the social fabric to shreds. Thus, as Habermas has emphasized, the instrumental order is not stable, i.e., social orders cannot achieve permanence if they are based solely on competing interests. To address this problem, I propose that integration and conflict theories can be seen as complementary aspects of the minimum necessary conditions of the prevailing social order. They explain the mechanisms of normative integration necessary for the peaceful reproduction of modern societies and the contradictory dynamics of these processes, of which capitalist competition is one of the most central. Within these minimum necessary conditions, more specialized theories can be valid at the same time.

Towards a Sociology of Guilt

Jakob Hartl[1,2]

1University Halle-Wittenberg; 2Research Institute Social Cohesion

In Britten's 1945 opera the eponymous protagonist Peter Grimes seeks to restore his social and societal reputation, tarnished by the death of his apprentice, via economic success: "These Borough gossips listen to money, [...] Get money to choke down rumour's throat." (Slater/Britten 1945) Notwithstanding Brett and Wood's analysis of the opera as a "powerful allegory of homosexual oppression" (2002), this paper proposes another angle to the cultural significance of guilt for the social texture and its relation to sociological theory. Beyond the emotional significance of guilt as/and shame for the social fabric (e.g. Scheff 2000), this paper presents an approach to guilt based on Bourdieu's theory of capitals and the state (1983, 2014) and Graeber's analysis of debt (2011).

The simultaneous establishment of centralised states and respective markets is an anti-transcendental movement aiming at reifying guilt in an earthly and social manner, and subject it to social norms, which allow for varying (re-)valuations. This becomes particularly tangible in times of societal transformations, which trigger said re-valuations of past deeds, guilts, and capitals and allow for the moral lading of (new) economic realities (cf. Hilmar 2023). The result is a moralization of economic, political, and social relations, in which domination is extended to the realm of morals in order to dictate the terms of the interchangeability of capitals/debts/guilts and which, due to the inherently retrospective characteristic of these re-valuation, undermines existing group consciousnesses (Halbwachs 1980).

Two Theorizing Moves to Revitalize Social Theory: Global Social Positioning and Leaning into Discomfort; The Case of Multilingualism in Global Stratification

Ana Velitchkova

University of Mississippi, United States of America

I propose two theorizing moves to revitalize social theory. First, building on intersectionality, I propose a type of theorizing I call global social positioning. Global social positioning involves juxtaposing multiple dimensions of persons' social identities (gender, race, and class but also nationality, ability, and other meaningful categorizations) and examining how these multiple dimensions of inequality interact to influence different outcomes of interest. This move complicates the notion of "margins" and theorizing from the margins by highlighting mixed experiences, marginal along some dimensions of inequality but privileged along others. Tensions between different dimensions of persons' global social positions can be illuminating.

Second, I find that leaning into discomfort as part of theorizing can be informative. Emotions carry information. Practicing radical reflexivity and examining the nature of one's emotions expands what constitutes empirical data. Thinkers' global social positions, experiences, and understandings become part of the data.

To illustrate the generative potential of the proposed theorizing moves, I provide an example. I theorize multilingualism as a mechanism through which people outside the global core can become aware of and find their place in the hierarchical global social order. I arrived at this proposition following the two proposed moves. I examined my mixed feelings toward my multilingualism experiences (leaning into discomfort). I traced my upward social mobility trajectory focusing on multilingualism (global social positioning). My experience demonstrates how multilingual education in the semi-periphery can sort individuals into social classes domestically and how it opens avenues for upward social mobility globally. For upwardly mobile migrants in the global core, multilingualism can lead to a double form of social marginalization, from the host community and from the community of origin.

Creativity and Ignorance

Jose Angel Bergua

University of zaragoza, Spain

I propose to think the limit condition embodied by the social through creativity in several steps. First, I will pay attention to contemporary capitalism, the context in which the main and most pressing demand for creativity unfolds, although it makes a soft use of it. Second, I will show that creativity in its strong sense demands that the observer recognizes his ignorance in the face of an object to which he recognizes cognitive and operative autonomy. Third, I will affirm that the recognition of ignorance in the subject corresponds to an external reality based on indeterminacy, since no event is more likely to appear than another, something that the social and natural sciences recognize, although they are unable to explain how the creative spark springs from this nothingness. Fourth, I will prove that the ancient myths of death and rebirth, all the rites of passage and the incubation process of shamans and ancient sages make it possible to fill this gap. Fifth, I will point out that the consumption of entheogens, present in those worlds, but equally stimulated by the new spirit of capitalism forged in the last third of the twentieth century, allows the experience of death and rebirth through the dissolution of the ego and the consequent expansion of consciousness. Sixth, I will suggest that creativity is an unconscious knowledge that is related not to logos but to wisdom, characterized by accepting the dissolution of subjectivity in the indeterminacy on which our existence rests. Finally, I will propose four tips for liberating indeterminacy and thus favoring the creation of anarchy.

911

Bringing Genuine Agency Into Historical Institutionalism: A Weberian Approach to Distinguish Types of Agency and Institutional Conflict

Lukas Pfäffle

University of Heidelberg, Germany

Institutionalism tends to develop a structural bias. Nevertheless, institutional theories have consistently involved the interference of actors. Bringing structure and agency together poses a demanding challenge to the concept of the institution. Tension arises when institutional plasticity undermines its original purpose or structurally determined institutional contexts leave no room for agency. This paper enhances historical institutionalism's ability to account for agency. It links historical institutionalism with a Weberian concept of the institution, which sets ideas at its basis. Thus, institutions consist of a regulatory and a symbolic-cultural dimension. Dynamics in these dimensions can vary. Transformation can occur in the regulatory dimension without altering the institution's idea. In addition, genuine opposition to the idea and its institutionalization becomes possible. Institutions embody both transformation and

continuity simultaneously. This complex nexus between institutions and individuals allows for defining different types of agency and the institutional conflicts that arise within these contexts. Institutions enable and restrict action in various dimensions. They do so for incumbents as well as for their challengers. Their ideational basis allows for open opposition by challengers while still being structurally shaped by the institutional context. Order and conflict are not mutually exclusive; instead, different degrees of institutional stability come with different kinds of institutional conflict and agency. This framework enables the inclusion of real agency in historical institutionalism without making the concept of institutions too fluid.

RN29 | T06_02: Theory, Concepts, and Epistemic Injustice

The Twofold Indispensability of Theory for Empirical Knowledge: Adorno's Sociology Today

Frank Welz

University of Innsbruck, Austria

Contrary to the musealizing tendency to reduce sociological theory to its history and separate it from empirical research, my contribution will stress the unique role of theory in sociology.

Without theory, there can be neither facts nor social change, neither tension nor trust nor transformation – but in which sense?

To answer the question, I will recall Theodor W. Adorno's position, which mediates between theory and empirical knowledge. In the first step, I will rethink and update Adorno's sociology, considering capitalism's neoliberal period emerging after Adorno. In the second step, the analysis proceeds along three lines: First, regarding epistemology, Adorno's sociology relies on a critical realist view of theory formation. Secondly, regarding methodology, it advocates a broad concept of experience through empirically open 'constellation analysis'. Thirdly, regarding ontology, Adorno's sociology includes an understanding of 'subjectivity' that is neither autonomous nor determined but integrated into the sociological analysis. The latter point will be discussed as the core challenge of contemporary social thought, which perishes in current project-funded sociological research.

912

Substantial and Functional Concepts in Sociology

Helmut Staubmann

University of Innsbruck, Austria

In his early work, Substance and Function, Ernst Cassirer (1910] presented his epistemological conclusions from the radical transformations of the natural and formal sciences at the turn to the 20th century. According to him, ancient thinking and, in its wake, thinking up to the pre-modern era were still tied to substantial concepts, e.g. numbers stood for numbers of something. Such thinking in substances and the "thing concepts" based on them is still prevalent in our everyday life. However, according to Cassirer, a developed science is based on functional, relational or formal concepts.

The epistemological problems highlighted by Cassirer are no different in the cultural and social sciences. But here it is not just a matter of the transfer of metatheoretical

interpretations of an otherwise analogously modernized scientific practice. The basic thesis asserted in this paper is that sociology, in contrast to the formal and natural sciences, has only incompletely carried out the transition from a substance logic to a functional-relational logic. This makes sociology vulnerable to political and ideological instrumentalization.

Based on Cassirer's epistemology, three orders of sociological approaches can be distinguished: sociologies based on substance concepts (proto-sociology); sociologies that go beyond life-world concepts, but in the basic concepts of which substances still play a role, and sociologies based on formal-functional definitions of concepts.

Cassirer's idea of scientific progress, developed from the formal and natural sciences, is also valid in the human sciences and especially in sociology. A reconsideration of his ideas opens up the opportunity for advancing beyond the currently dominant practice of sociology oriented towards traditional substance thinking.

Epistemic Normativity and Injustice in Max Weber's Ideal-Type Methodology

Yufan Sun

The University of Edinburgh, United Kingdom

This paper examines the inherent contradiction within Max Weber's ideal-type methodology and its impact on social research. To achieve this goal, I engage with two contemporary sources: Catherine Z. Elgin's epistemic normativity and Miranda Fricker's epistemic injustice. It begins by offering the procedural logic of Weber's methodology: from idealization to de-idealization. Inquirers construct idealized conceptions as benchmarks to confront and de-idealize in the face of reality. The methodology is based on a liberal pluralism of values, where inquirers use their different values to select and research different aspects of reality, constructing ideal types. However, the liberal-pluralist values remain idealistic, lacking consideration for its de-idealization in reality. To clarify its idealistic feature of values, I introduce the notion of epistemic normativity and argue that Weber assumes that inquirers are not only free and equal but also interdependent. Only under the assumption of freedom and equality can one inquirer select his/her preferred side of reality without impeding others' endeavors. And their different selections can be mutually supportive to grasp complex reality. To offer the shortcomings of the lack of de-idealization of values, I analyse epistemic injustice of ideal types. His methodology allows inquirers to disregard materials that don't align with the ideal type during its construction (testimonial injustice). Furthermore, inquirers might be overconfident in their ideal type, which undermines others' interpretive capacity(hermeneutical injustice). The epistemic injustice can be seen Weber's writing of The Protestant Ethic and the Spirit of Capitalism.

Social Theory's Dual Political Imaginary And The Arc Of Contemporary Modernity

Craig Alan Richard Browne

University of Sydney, Australia

This paper explains how the political imaginary's antinomies have inflected social theory and assesses the immanent potentials for social theory's renewal. It argues that the symbolism and representations of the political imaginary disclose the institution of society and that the incipient political imaginaries of modern social theories are constitutive of their basic structure and normative orientations. My analysis shows how the political imaginary's reconfiguration confounded influential social theory perspectives' visions of contemporary modernity. In many respects, this critical analysis was anticipated by Claude Lefort and Cornelius Castoriadis' theory and diagnoses of the times. Lefort and Castoriadis' elucidations of the imaginary revealed aspects of the constitution of theories of society and their antinomies that had only been gestured towards previously by other conceptions and interpretations. I show how the arc of the transition in contemporary modernity manifests the dynamics of the conflict between the modern capitalist imaginary of pseudo-rational domination and control, and that of the project of autonomy. Despite its profound importance to the renewal of social theory and its insight into the formative conflict of modernity, my analysis suggests that it is necessary to think both with Castoriadis' theory and beyond it in order to grasp the arc of contemporary modernity's transition and the corresponding vicissitudes of social struggles. The arc of transition is evident, it will be argued, in the reconfigurations of the social relations of capitalist production, political forms and social integration. Similarly, the conflicts intrinsic to these institutional changes exemplify tensions in the dual political imaginary.

RN29 | T07_01: Crisis, Critique, and Emancipation

A Sociology Of Critique For Challenging Times

Anna Daniel

Distance University Hagen, Germany

In times of polycrisis, growing social tensions and declining trust in political and social institutions, a sociology of critique, that is sensitive to the diagnosis of the times and focuses on the transformative potential of critique, is particularly in demand. In the last years of his life, Michel Foucault had already given much thought to the social upheavals, which we are facing today, and he adressed the topic of critique not only in his famous lecture 'What is critique?. In the social science, however, these considerations have not yet been acknowledged in a systematizing way. Due to the particular topicality of his reflections and also on the occasion of the 40th anniversary of his death this year, I would like to close this desideratum in my lecture. On the base of Foucault I will present a sociology of critique that focus on the practices of critique and places them in a dynamic relationship to the modes of government, against which they are directed. This perspective is equally capable of illuminating the dimension of power, the dimension of truth production and the dimension of subjectivation and of sounding out the practices of critique with regard to their transformative potential. In times of polycrisis, it also seems particularly appropriate, not only to place a stronger focus on the motives of protest and critique, but also to ask about the ethical orientation and scope of critical practices. A sociology of critique based on Foucault makes it possible to focus on this question as well and to discuss it critically with regard to a central challenge of our present – to strengthen social coexistence in a new way.

Materialist Epistemology – Forgotten Paths of Critique

Finn Gölitzer

Goethe University Frankfurt, Germany

In recent decades, the epistemological assumptions of classical social theory have been widely challenged, particularly by feminist as well as post – and decolonial critiques (cf. Spivak, 1988; Haraway, 1988). In order to criticize western knowledge production, they targeted the inherent violence of philosophical categories of reason. One critique of epistemology that always remained underexposed in the course of these debates is a theoretical approach that emerged in the 1970s. Following Alfred Sohn-Rethel, theorists such as Hans-Georg Backhaus, Bodo von Greiff or later Moishe Postone attempted to formulate an in-depth critique of capitalism and epistemology against the background of a re-reading of Marx's "Grundrisse", which placed particular emphasis on analyzing the relationship between the commodity form and the form of thought. This attempt can neither be clearly integrated into a traditional Marxist nor a poststructuralist framework. By situating philosophical thought in a historical-specific social form, those theories provide fruitful aspects for current critical theories.

My contribution is indented to introduce the aforementioned theoretical approaches and discuss their relevance for current social theory.

No emancipation without theory! Assessing Micro-Narrative Paths To Frame The Critical Role Of Self-Theorising In Action-Research with a Wider Lens

Helder Pedro Martins do Carmo, Ana Paula Pereira Marques

CECS: Centro de Estudos de Comunicação e Sociedade (Universidade do Minho, Portugal)

Action-research responds to sociology's founding double tension between knowledge and emancipation, by radically placing its value and meaning in the hands of the, in manyfolds marginal, protagonists. This stresses the practical need of trust as competence for achieving its scientific and transformative power. However, theory, and specially theorizing, remain distant to the social participants. Some of this can be explained by the static and functional concept of theory as a condition, a resource, a context /background, or a result, but also as (de)legitimation.

Here theorizing is a competence of the protagonists, and self-theorizing, not as Tripp's inductive "action theorizing" and not as MacNiff (even if it's undeniable the emancipatory power of being "clear about both what we are doing and why we are doing it") but pragmaticaly. Not self-awareness, but self-service, what humbles, but hopefully improves, the emancipatory ambition of the researcher, creating a new tension between apriorism and empiricism.

Expanding on Tripp about the need and the value of theory to action-research, some perspectives are presented as a crescendo of trust: from atheoretical, to minimalist (Scriven), and Merton's mid-range, onto Luhmann's systemic trust, vis-a-vis Habermas communicative-action, Giddens' "double hermeneutics", and Bourdieus' "theory of practice". A synthesis is reached with Mills' sociological imagination, after a wider Weberian lens shows our reasons, contradictions, irrationalities, conflicts and paradoxes.

With this wider lens, this presentation proposes a relational and dynamical ideal-typical framework about theorizing competence building and it's conditioning factors. applied to two action research case studies. We conclude, confronting the value of the framework with a critical realistic perspective and the grounded theory power in producing valid theories, that pass the triangulation test, on Denzin's perspective

914

RN29 | T07_02: Humanism, Colonialism, and Fascism

Humanism and Empire – Re-examining "the human"

Filipe Carreira da Silva

Universidade de Lisboa, Portugal

The paper offers a comprehensive exploration of the interplay between humanism, anti/colonialism and the reconfiguration of essential concepts that have shaped our understanding of humanity. The narrative interweaves the ideas and actions of anticolonial thinkers such as Eric Williams, Kwame Nkrumah, Aimé Césaire, Leopold Senghor, Amilcar Cabral and Julius Nyerere to provide a fresh perspective on the critique of humanism and its significance in the broader struggle against colonialism.

In particular, the paper examines the concept of "the human" and its transformation in response to anti-colonial critique. The theorisation of the human takes on particular importance for those whose humanity has long been denied. Dehumanisation raises questions that are fundamental to understanding what it means to be human. These are questions of identity and liberation, of meaning and purpose, of being and becoming, which are central to philosophical anthropology in general. This paper explores how anticolonial thinkers of the mid-twentieth century played a significant role in detranscendentalising and reconfiguring the once transcendental category of "the human." The paper argues that this process of detranscendentalisation laid the groundwork for the development of a more modest, secular understanding of "the human" that later became central to the human rights discourse of the 1970s. This transformation was a response not only to the dehumanising effects of colonialism, but also to the environmental consequences of anthropocentrism.

Decolonizing Volunteering? A Postcolonial Critique of the Ideal Type of 'Volunteering'

Itamar Shachar

Hasselt University, Belgium

Since the 1990s, there is an upsurge in the public interest in volunteering: policy makers, corporations, civil society actors as well as academic institutions seek ways to promote and govern volunteering efforts as a panacea to neoliberalism social ills, but represent volunteering promotion as an 'a-political' and altruistic project. As part of this growing interest, social scientific research identifies and stabilizes 'volunteering' as a separate research object, distinguishing it from other spheres of human activity such as work, politics or domestic-familial obligations, and thus re-establishing fundamental modernistic distinctions. In this paper, I will further argue that such definition of 'volunteering' is a case of constructing an 'ideal type' in the Weberian tradition, which is based on a collection of empirical phenomena that were stripped off their particularities in favor of abstract commonalities.

The paper adopts postcolonial critiques, in particular the work of sociologist Gurminder Bhambra, the Weberian theoretical and methodological heuristic of the ideal type to critically asses their offsprings in volunteering research. As an alternative, the paper examines the relevance of Bhambra's proposal for the development of 'connected sociologies' to analyzing volunteering promotion as a world-making project that creates new connections and alliances, which are embedded within a neoliberal version of the 'coloniality of power' as identified by Anibal Quijano. By doing this, the paper contributes to a decolonization of the paradigmatic assumptions and analytical frameworks that guide the study of volunteering, while examining the possible contribution of such critical engagement to contemporary debates in social theory.

Lélia Gonzalez: An Amefrican Perspective to Reorient the Canon

Stefan Klein[1], Mariana Toledo Ferreira[2]

1Universidade de Brasilia (UnB), Brazil; 2Instituto Federal de Educação, Ciência e Tecnologia de Goiás (IFG), Brazil

Our hereby proposed presentation aims to bring to the forefront the contribution by a historically marginalized, Black Brazilian intellectual called Lélia Gonzalez, who developed her perspective mainly during the 1970s and 1980s. Having passed away precociously, without even taking her Ph.D., this aspect, coupled with the well-known and persisting, worlwide spread obstacles for recognition stemming from racial and gender prejudice, kept her work from being taken into account besides a few circles. Throughout the last years, specially from 2020 onwards, when an edited volume with her texts and speeches was published by a prestigious editorial house in Brazil, her reflections have gained traction, foremost – though not exclusively – among the social sciences and also spreading towards the debates among philosophy.

After focusing on one of her main conceptual contributions, the debate on Amefricanity, we will deal with the potential of introducing her in the sociological debate, specially paying attention to the outlooks presented when it comes to engaging in a critical appraisal of the established canon. A dialogue with the epistemological debates on universalim and indigenization (Akiwowo), the captive mind (Alatas) and the outsider within (Hill Collins) enables us to situate her contribution towards questioning the theoretical status quo (Dufoix). Our argument stresses ways in which her reflections could be critically taken up to foster anti-racism, hence interpreting her as a paramount theoretical-epistemological expression to enact change from the margins towards the established white and male academic canon conforming the established history of sociology.

915

Fascism: Towards a General Sociological Theory

Mark Gould[1], Jonah Benjamini[2], Joshua Gerstein[2]

1Haverford College, United States of America; 2Independent

This paper is focused around three insights: I contend that we can explain the genesis of fascist movements if we conceptualize them as forms of patrimonialism (particularistic, personalistic political processes, even if bureaucratically grounded (a patrimonial bureaucracy)), as fundamentalisms (charismatic re-evocations of subterranean (Sykes and Matza), traditional-hierarchical values within the context of (incipient) modernity), and forms of "disorder" (motivated violations of institutionalized norms, here those that reconstruct some component of social action) that proceed from within the state (i.e., where state actors violate institutionalized norms of authority) and are supported within the societal community/civil society (by significant portions of the political nation). If we think about fascism in these terms, we will have conceptualized it as something we can explain generally. In this paper, I formulate a general theory of revolution applicable to fascism, a general theory of fascism, and specify it to individual cases, to Nazism and to contemporary USA.

RN29 | T08_01: Theorizing the ecological crisis

The Pitfalls of Transformation. On the Socio-Ecological Dilemma of Simultaneity

Sighard Neckel

University of Hamburg, Germany

The ecological restructuring of carbon-based economy and fossil ways of life – often referred to as "socio-ecological transformation" – confronts modern societies worldwide with an unprecedented challenge: economy and politics, technology and everyday culture must undergo a fundamental change in a very short time if the most serious effects of climate change are still to be contained. Until now, social theory has analysed comparable upheavals as transformations that should take place one after the other in certain sectors of society in order to be successful (Albert O. Hirschman, Jon Elster, Claus Offe). However, the need to change all societal systems and sectors simultaneously in the face of the ecological crisis creates dilemmas that neither modern societies nor social theory are really prepared to deal with. Economic development, democracy and the protection of the planetary livelihoods could mutually block each other, even though they are equally necessary for an ecological change. Therefore, this paper will discuss the specific dilemmas of a "socio-ecological transformation" and how societies could possibly escape them. The existing theoretical models of societal transformations will be summarised, shortcomings in relation to the climate crisis will be identified and conceptual alternatives will be discussed.

Ecological Communication and Social Transformation

Roderick Condon

Trinity College Dublin, Ireland

This paper approaches the question of social transformation through the paradigm of Habermas's communication theory of society and social evolution.

The paper aims to consider cultural transformation in the social construction and interpretation of nature in the contemporary discourse of ecological crisis as opening a horizon towards the ecological transformation of late capitalism. Here it adds to the Habermasian frame insights from Beck's theory of risk society, Luhmann's theory of ecological communication, and the fields of ecofeminism and environmental sociology. The paper thus seeks to approach the question of ecological transformation by way of the communication of ecological crisis, understanding the language of crisis diagnosis as a semantic deepening and increasing reflexivity of modern culture with regard to nature. Here, the emergence of ecolinguistics, as the language through

916

which the natural environment is conceptualized and eco-logical crisis is communicated, marks a crucial development.

The paper has two aspects. The first situates the emergence of ecolinguistics within Habermas's thesis of modernity. Here, the selective rationalization associated with the capitalist path of modernization is interpreted as involving a particular linguistification of nature. This linguistification placed the natural environment outside capitalist material and symbolic relations. Against this, the emergence of the modern environmental movement spearheaded a re-linguistification of nature, proceeding through the elaboration of ecolinguistic forms. The present moment thus sees a dialectic in the semiotic construction of reality. The second considers this dialectic by way of the further intersection of ecolinguistics and political ideologies, with ecological communication conducted through ideologically-specific crisis frames. From these, differing ecological futures extend: green capitalism, ecosocialism, and ecofascism.

The Spatial Turn in Social Theory: Lefebvre's Insights on Energy Transition

Xaquín S. Pérez Sindin

University of Copenhagen, Denmark

In "The Production of Space," Henri Lefebvre presents a socio-spatial theory that establishes a dialectical relationship between space and social relations. He proposes a spatial interpretation of Marxism, focusing not merely on production in space but on the production of space itself. Lefebvre argues that space is not a static backdrop but is actively produced, impacting and being impacted by social relations. His key point is that the industrial capitalist state utilizes space to dominate everyday life. Therefore, altering capitalist production relations necessitates changing how space is produced. In a context of climate change adaptation, transformations in production systems must also consider alterations in the production of space. Here, we highlight how proximity to key production centers in current energy systems (namely, areas reliant on fossil fuels) shapes gender and intergenerational relations and how these, in turn, become sources of social tension. We conduct a survey to a representative sample of the population (1,500) in Spain. The variables included in the questionnaire deal with sentiments toward the social and economic impact of the energy transition, as well as overall environmental values and attitudes. We have adopted a multi-stage sample design. The population was divided into two clusters: those living in the former coal mining areas and the rest of the country. Subsequently, we stratified the clusters according to age and sex. The results confirm that female and young population exhibits more positive sentiments toward the energy transition. These differences, however, disappeared in the former coal mining areas. The results suggest the need of a spatial turn in social theory and the potential of developing a Lefebvre's inspired green theory in connection to climate change adaptation.

The Dialectics Of Freedom: Is a Modern Society Still Possible?

Mikael Carleheden

University of Copenhagen, Denmark

What is meant by a modern society? Modernity is usually portrayed as a specific epoch in human history, which began in Western Europe and then spread across the world. Sociologically, it concerns the specific institutions that underpin how members of a modern society organize their common affairs. So, what can be said to distinguish a modern social order from other social orders? What types of interactions and institutions are central? What specific norms and values underpin a modern social order? The Hegelian basic answer is freedom. This answer has been further develop by Axel Honneth in his book Freedom's right. Accordingly, modernity should be understood as social order under the conditions of freedom. In my presentation, I will further discuss and develop this claim by distinguishing between conceptions of freedom, regimes of freedom and pathologies of freedom. However, anyone attempting to develop such a theory of social order today can no longer avoid two ongoing but delayed discussions within sociology. First, how should we understand the relationship between the modernization of society and colonialism? Second, what significance has the modernization of society had for the ongoing mass extinction of species and the systematic environmental destruction of the planet we humans inhabit? In both cases, the temporal correlation between these historical events already indicates the relevance of the questions. In this presentation, I will attempt to provide tentative answers.

917

RN29 | T08_02: Education, Arts, and Capital Conversion

Comparing Various Theories on the Social Organization of Arts

Tasos Zembylas[1], Volker Kirchberg[2]

1University of Music ad Performing Arts Vienna, Austria; 2Leuphana University Lüneburg Germany

From the 1970's a vital sociological interest on arts and culture has raised. One can speculate about the multiple reasons for the renewed interest in the social organization of arts (production, distribution, consumption, valuation, archiving), and the diversity and plurality of different theoretical perspectives is indeed remarkable. Putting the focus on "how" modern societies organize various artistic activities implies references to formation and institutionalization but also to transformations and unforeseen and unintended ruptures. This focus explains why theories on the social organization of arts stand in an inherent nexus to general social theories.

This insight has motivated us to look closer and analyze the emergence and reception of 7 particular perspectives on the social organization of arts: the interactionist approach, the structural field theory, the systems theory of arts, the production of culture perspective, the neo-institutionalism, the cultural institution studies which has been inspired by practice-theory and pragmatist approaches, and the sociological network theory. All these approaches depart from an anti-essentialist understanding of arts and apply contextual and relational thinking on their research questions. However, they have emerged from very different theoretical foundations and scholarly contexts. Our analysis and comparison will not be evaluative – creating a ranking of theories –, but epistemological, which presupposes an appreciation of each distinct perspective aiming to advance the understanding of theory building and theoretical innovation.

Conversion into Symbolic Capital: Testing the Foundations of Bourdieu's Capital Theory

Jón Gunnar Bernburg, Sigrun Olafsdottir

University of Iceland, Iceland

Bourdieu's influential theory of social stratification assumes that economic capital (money), social capital (beneficial ties), and cultural capital (valued symbolic resources) constitute the major bases for symbolic capital (respect, deference). The idea is that economic, social, and cultural capital converse into symbolic capital that thus makes individuals able to dominate social life in ways that the dominated deem legitimate (i.e., allows individuals to dominate others without being seen to do so). For Bourdieu, such conversion into symbolic capital is foundational to how inequality is misrecognized. But despite its long-standing theoretical impact, this idea has rarely been tested. We address this issue with novel operationalization and analysis of key constructs. We conducted a population-representative survey in Iceland (N > 1000) that allow us to examine how the major forms of economic, cultural, and social capital converse into symbolic capital. Following the logic of Bourdieu, we carefully operationalize symbolic capital as field specific. Thus, we distinguish between symbolic capital in the public sphere (having a sense of voice in the public debate) and symbolic capital in frontstage settings (having a sense of respect in everyday public settings). In support for the theory of conversion into symbolic capital, we find that education, occupation, and money control all converse into symbolic capital in the public sphere, and moreover that they all do so in part through embodied cultural capital and elite social ties. However, only embodied cultural capital converses into symbolic capital in frontstage settings, possibly reflecting everyday egalitarianism in Iceland.

Teaching Theory: Lessons from a Rancière-ian Approach

Omur Birler

Middle East Technical University, Turkiye

Jacques Ranciere is a contemporary French philosopher who is mostly known for his studies in the field of political and social theory. This study, however, takes its premises from the intersection of the two fields: theory and pedagogy. Even though the research question is related to the field of social theory, the question itself originated from the classroom experiences. As a professor of political and social theory, I have been attending to students' experiences in theory seminars and classes. Varying from too abstract to impenetrable, very sophisticated to puzzle-like, students expressed their encounter with the content of theory always with a difficulty. While such observations carry an indisputable element of truth, the problem seems to lie more with the classroom experience than the teaching material itself. In other words, the question is not the theory per se, but how to teach it.

Taking this formulation as the basic research question, this study has two main inquiries: is a Rancierian approach to teaching theory (one that takes the equality of the minds as its fundamental premise) possible and if so what would it entail? To that aim this study attempts to uncover the difference in the learning experience of senior students from the Department of Political Science and Public Administration in METU when a different teaching and evaluation method is used in the classroom. The sample is composed of 47 senior students who were enrolled with the ADM 4150 Modernity and the Idea of Freedom, an advanced level theory class, over the past five years.

RN29 | T09_01: Embodiment and The Unavoidability of Interpretation

The Interpretation of Cultures: Geertz Is Still in Town

Simon Susen

City, University of London, United Kingdom

Clifford Geertz's The Interpretation of Cultures (New York: Basic Books, 1973) is widely regarded as one of the most important contributions to the humanities and social sciences in general and anthropology in particular. On its 50th anniversary, the literature drawing on this monumental work is so vast that it is hard to see how anything of significance may still be added to the wide range of insights gained from the in-depth engagement with its main argument. The noticeable differences in opinion between followers and detractors of Geertz's project notwithstanding, most commentators will agree that The Interpretation of Cultures, having dominated the agenda of Anglophone anthropology for at least two decades after its publication, had a major and lasting impact on neighbouring disciplines and subdisciplines – notably sociology, social psychology, politics, history, philosophy, and cultural studies. This paper aims to demonstrate that the key conceptual components of Geertz's enterprise can be located in his case for an interpretive theory of culture, epitomized in the methodological commitment to providing a 'thick description'. The first half of this paper comprises an inquiry into the core assumptions underlying Geertz's defence of this endeavour, before moving, in the second half, to an assessment of some controversial issues arising from his approach.

Exploring «Sour Grapes»: The Convergence of Universal Premises and Contextual Significance in Mechanistic Causal Explanations

Mats Eirik Lillehagen

Oslomet – Oslo Metropolitan University, Norway

This article revisits a classic question in social theory. Formulated in contemporary terms: How can we understand the relationship between interpretative, meaning-based understanding and causal, mechanistic explanations of social life? It critically examines Isaac Arail Reed's influential synthesis developed in his book "Interpretation and Social Knowledge," which attempts to marry what he calls 'Landscapes of Meaning' with mechanistic explanation. Although I argue that Reed's Aristotle-inspired approach ultimately falls short, it provides a valuable foundation for developing a more convincing model.

Building on this, I propose a novel approach to understanding the interplay between specific historical meanings and general mechanistic features in explaining social action. This is developed through an analysis of the 'Sour Grapes' mechanism, popularized by Jon Elster. I begin by re-analyzing and reconstructing this mechanism by using cognitive metaphor theory. Building on this I then show how situational features can be connected to the general schema by discussing empirical data on various social stratification systems, including caste and modern economic systems.

I thereby construct a model highlighting the essential role of both hermeneutical interpretation and mechanistic schemas in causal explanations. This approach not only offers a critique of Reed's solution but also advances a generalizable, ideal-typical model for understanding the intricate relationship between context-specific details and overarching mechanistic patterns in social theory. This model aims to provide a more nuanced account of the dual role of hermeneutical and mechanistic elements in the causal analysis of social phenomena, as well as new insights into how the two interact.

Crisis of Worldly Meaning. A Schutzian Consciousness of Problem

Zihan Zhang

Universität Bielefeld, Germany

919

Alfred Schutz's profound exploration of meaning forms the essence of his scholarly pursuits, seamlessly weaving through every facet of his research and shaping his responses to the crisis of his time. A scrutiny of Schutz's reflections on meaning can also offer insights into our contemporary predicaments. Drawing inspiration from Husserl's "European Scientific Crisis", we can assert that Schutz's theoretical engagement is fundamentally attuned to an acute awareness of the neglect or reduction of meaning. In this way the problem of Husserl was generalized. "Meaning" is used in certain contexts as a synonym for relevance, significance, sense, and reference, but Schutz didn't provide a rigid definition. In social sciences, meaning serves as the foundational premise, resisting facile explanations. Schutz, acknowledging the relativity inherent in meaning, posits that it surpasses mere linguistic or structural definitions. For him, meaning transcends mere material counterparts of word; it embodies a realm, surpassing tangible entities and events. Simultaneously, meaning defies reduction to a contentless medium which resembles a spaceless fulcrum between both meaningful ends. While both perspectives, denying or affirming meaning's substantive nature, bear scientific merit, Schutz posits that, for the life-world, meaning is contextually grounded and relatively stable. The crisis of meaning, as articulated by Schutz, has both historical roots and enduring relevance. Its historicity and immanence intertwine, stemming from disturbances in the sedimentation of our stocks of knowledge. Therefore, the crisis of meaning is both historical and eternal as well. Its historicity and immanence exist in mutual interpretations.

The Interplay of Interpretation and Embodiment: A Phenomenological Approach to Epistemology

Csaba Szalo

Masaryk University, Brno, Czech Republic

The concept of interpretation traditionally draws attention to the epistemological commitment against the empiricist claim that unmediated access to the world is possible and advantageous for humans. Various philosophers of science, from Feyerabend to Sellars and Davidson, affirm the unavoidability of interpretation and offer a revealing critique of our assumedly direct epistemic confrontation with "facts". Asserting the untenability of epistemological foundationalism does not necessarily rely on a commitment to epistemological nihilism. For social theory, it is crucial to safeguard this discourse about the possibility of truthful knowledge that (i) does not adhere to empiricist presuppositions and, at the same time, (ii) resists the sceptical assumption that the endorsement of interpretive mediation would make our epistemological access to the world unjustifiable. This task requires making clear how could the theoretical knowledge's validity be justified (i) without neglecting linguistic, affective, and social mediation, and at the same time (ii) not reducing justification to a struggle-driven social practice without having a chance to claim that available knowledge of particular phenomena is distorted, impoverished, or misleading. The paper focuses on the phenomenological perspective on embodiment as an alternative to the empiricist notion of experience. Disclosing the entanglement of matter and meaning captures how corporeal and other modes of mediation condition the plurality of perspectives and give grounds to justify epistemological validity.

RN29 | T09_02: Non-Human Elements, Hybrid Life Forms, and Social Explanation

Latour and the Critique of Social Explanation

Stephen Kemp

Edinburgh University, United Kingdom

One of the key social theory trends of the last few decades has been the rise of actor-network theory. Although sociologists have undoubtedly showed an interest in ANT, the wholesale adoption of the ideas of Bruno Latour, a major figure within actor-network theory, would be challenging for the discipline. After all, Latour is clearly critical of standard sociological practices of social explanation and critique as well as the language-centred modes of analysis favoured by many forms of social constructionism and discourse analysis. In this paper I want to elaborate on, and appraise, Latour's critique of social explanation. I argue that Latour is unenthusiastic about both the social and the explanatory components of this mode. For Latour, social explanation overrates the human input into events in the world, and problematically deprioritizes non-human elements such as artefacts, 'natural' objects and spiritual entities. Further, Latour argues that social explanations account for events by reference to a small number of influential entities, rather than grasping that many entities participate actively in events via their ability to mediate. As the Durkheimian tradition is a key exemplar of social explanatory theorising, I draw on examples from the work of Emile Durkheim, Mary Douglas and David Bloor to explore these issues. I argue that while Latour makes convincing points about the need to include non-human entities in sociological accounts, adopting a totally unweighted approach to the influence of entities on events results in an uninformative mode of analysis.

920

Towards the Triple Hermeneutics – Challenges of Knowledge Verification in Contemporary Societies

Krešimir Žažar

University of Zagreb / Faculty of Humanities and Social Sciences, Zagreb (Croatia); Next Society Institute of Kazimieras Simonavičius University, Vilnius (Lithuania)

By extending original conception of double hermeneutics of A. Giddens, the paper discusses some of the key challenges in knowledge formation processes nowadays. Contrary to the context which depicted Giddens, in the 21st century a social scientist copes not just with an issue of an interpretation of what other human actors already interpreted (double hermeneutics), but also the third 'level' might be identified which is mainly connected with flat ontology,

emergence of non-human actors (or 'actants') such as artificial intelligence entities or machines emulating human cognitive capacities capable of producing quite convincing intelligible artefacts. In concrete terms, it has been becoming increasingly demanding to distinguish between human and non-human productive output. This is the issue both in the level of theory development, but even more in the context of justification, i.e. knowledge validation. Alongside emergence of non-human 'subjectivity' the third layer of triple hermeneutics should comprise reflection and self-reflection whether a developed theory and/or knowledge contains potential biases. This is especially important in relation to salient external pressures imposing on scientific work today primarily from the domain of politics, but also from an economy field in a form of 'sponsorship' financing preferred types of research. Connected with the former, one should also take into account bias of a certain self-censorship by avoiding not fashionable or favourable research topics. Finally, it is concluded that adding third layer in the triple hermeneutics scheme is inevitable in reliable knowledge validation process, as well as in the final instance in nurturing truly democratic societies.

Artificial Intelligence as a Hybrid Life Form. On the Critique of Cybernetic Expansion

Joern Lamla

University of Kassel, Germany

Artificial intelligence (AI) challenges human intelligence and our humanistic self-conception. This contribution argues that this is happening for good reasons but is based on a mistaken opposition that falls short. Human beings and technology have always been intertwined in hybrid forms of life. Yet the exact nature of this hybridity is misunderstood when inadequate dichotomies of human subject and technical object are replaced by a totalizing conception of a cybernetic informational universe that reduces all that exists to this latter, single point of comparison. Representing the paradigm of digital society, AI is a bearer and expression of such a cybernetic expansion that both anchors digital analogism in society as a closed system of interpreting the world, or a cosmology, and renders it plausible at the level of knowledge. AI thus deepens and generalizes conventions and functional patterns of justification that have a long history in industrial society. The thesis proposed here is that, to counter this expansive dynamic effectively and critically, more needs to be done than evoke humanistic values. What we need is a better understanding of the ontological heterogeneity of the societal modes of existence that are assembled in hybrid forms of life. Thus, to regain the necessary critical ground for this theoretical debate, the paper uses anthropological theory to explain that a new, digital analogism is spreading with this development, the problematic one-sidedness of which can be better grasped against the background of Philippe Descola's alternative ontological schemes and cosmologies.

Critical Theory in the Age of the Digital

Yuri Asochakov, Dmitry Ivanov

St. Petersburg state university, Russian Federation

The paper contains the critical analysis of the digitalization discourse which is reflecting not social innovations but managerial and bureaucratic appropriation of virtualization routine practices. Virtualization as a replacement of things and real actions by images and communications was the anti-system tendency at the end of the 20th century when digital technologies enthusiasts created virtual networks escaping control of reified institutions. But now that 'Great Escape' of cyberpunks, hackers, pirates, and copyleft activists has been absorbed by the system as digital technologies usage became social routine and the newest form of social control. Social life is alienated into virtual realities arising on the digital networking platforms exploiting human interactions.

To reveal contradictions and true direction of digitalization, we need a development of critical theory following the dialectical line of the Frankfurt School neo-Marxism. The totality of domination structures and new forms of social control in postindustrial society are analyzed on the basis of algorithmic rationality conception. Algorithmic rationality now has replaced instrumental reason (Horkheimer) and technological rationality (Marcuse) which organized praxis and thinking of people in the early and late industrial ages. Algorithmic rationality is a new domination logic as reality is perceived to be dynamic and hybrid network of objects functioning automatically without human subjectivity. The current post-virtualization tendencies and micromovements in everyday life can be treated as a source for an authenticity resistance to the virtual and artificial substitutes of humanity brought by total digitalization / coercive virtualization of social life. Distinction between emancipative digital technologies and oppressive algorithmic rationality should become the basis for the new critical theorizing in the age of the digital.

Embracing the Countryside: Social Cohesion's Role in Enhancing Youth's Subjective Well-Being in Rural Croatia

Bruno Šimac, Tijana Trako Poljak

Faculty of Humanities and Social Sciences, Croatia

In contemporary social sciences, there is a growing interest in understanding the elements that contribute to young people leading fully contented lives. Previous studies have suggested that residence in cohesive societies can elevate individual well-being. Therefore, this study examines whether social cohesion at the local level positively influences life satisfaction among rural youth. Using a mixed methods research approach with a sequential design (QUAL → QUAN), we conducted 37 semi-structured interviews and a survey with a sample of 351 rural respondents aged 18 to 34. The integrated findings indicate that young people in rural Croatia show a high level of satisfaction with their lives and the countryside as a place of residence, expressing feelings of security, contentment with personal health and the quality of leisure time. Conversely, dissatisfaction is associated with limited employment opportunities and financial challenges. Importantly, both the qualitative and quantitative results consistently conclude that strong social cohesion at the local level positively influences the subjective well-being of Croatian rural youth. Key factors that contribute to higher life satisfaction are well-developed social networks of family and friends, which provide a vital support system, and a strong rural identity characterized by a developed sense of belonging and attachment to the local community, the rural space, and the natural environment. This study underscores the importance of fostering strong social cohesion within local communities to improve the subjective well-being of rural youth. This research was conducted as part of the scientific project "SECRURAL" funded by the Croatian National Science Foundation (UIP-2019-04-5257).

Rural Youth In Remote Rural Settings Of Sweden Acting Together In Uncertain Times

Linda Fridén Syrjäpalo

Stockholm university, Sweden

The Covid-19 pandemic, inflation and the threat of war has changed and challenged the everyday life of young people living in remote rural settings. This paper draws on empirical data from my ongoing dissertation project with 36 participants, using ethnographically inspired methods including interviews, home visits, mobile methods such as walks and car drives, and informal talk.

The paper will focus on collective coping strategies that youth, living in remote – and highly car dependent – rural areas in the Swedish north, use to deal with the challenge of rapidly increasing fuel prices due to global events. The already burdensome situation of mobility inequality due to the lack of public transport, is further strained in this new situation. Young people in the sparse countryside respond together by reorganizing their lives and their mobility through collaboration.

This paper aim to explore how studying time spatial organization can show how rural youth deal with issues of inequality in their everyday lives. The paper focuses in particular on the topic of everyday mobility by asking these research questions; How does young people in remote rural areas organize their everyday mobility in relation to the new challenges? How do social networks and materialities interact with young people's organization of mobility in remote rural areas?

I draw on the relational turn in rural studies about increased recognition of the interwoven and co-constitutive construction of rural spatiality through material and discursive phenomena, processes and practices (Heley et al., 2012). In analyzing the youth's mobility in and between different socio-spatial contexts, I focus on how social networks, materialities and policy interact with the organization of rural youths' everyday lives.

Mismatched Aspirations: Young People and Employability in Portuguese Rural Areas

Ana Sofia Ribeiro, Isabel Roque, João Carlos Sousa

University of Lisbon, Institute of Social Sciences, Portugal

Scarce employment opportunities are one of the challenges related to living in low density and less developed areas. Regardless of the dematerialization of training programmes and even of employment opportunities accelerated in the post pandemic period, it remains that young people based in Portuguese rural areas, even though increasingly qualified, many times do not find suitable positions in the local labor markets. Over time, this barrier may result in forced relocation to coastal cities or abroad, or in a NEET (Not in Employment, Education, or Training) situation. Public Employment Services (PES) play a critical role in providing young people with employment and training opportunities. Through the reinforced Youth Guarantee Framework or through Social Innovations programmes, PES seek to reduce youth unemployment by providing young people with access to education, training, or employment opportunities, including upskilling and digitalization training.

Adopting an employability perspective, this contribution analyses 20 interviews of young people aged 25-35 years old, based in rural areas, former beneficiary of PES and associated partners training programmes, and examines how these opportunities have contributed to their labor market inclusion. It argues the importance of matching training

to young people's aspirations and the need of qualitative evaluation of PES interventions, while highlighting the influence of mobility infrasctrutures shaping the access to desired jobs.

RN30 | T01_02: Digital youth

Researching Platforming Families: Methodological Challenges and Analytical Opportunities of a Cross-Generational and Cross-Cultural Study

Signe Opermann, Veronika Kalmus, Maris Männiste, Marit Napp

University of Tartu, Estonia

"Platformization" (van Dijk et al., 2018) marks a new period of digital transformation and "deepening mediatization" of societies and life-worlds (Couldry & Hepp, 2017) over the last decade. This provokes researchers to consider what media practices people are involved in individually as well as collectively, and how are those shaped in the context of the development of data – and algorithm-driven global digital platforms as powerful economic actors (Helm et al., 2023) and socio-technological environments. This paper presents methodological reflections from an international project PlatFAMs on platforming families and digitally transforming everyday lives in Estonia, Norway, UK, Spain, and Romania. While a large body of research has focused on young people as the generation most engaged with new technology and media forms, this research aims to reveal across three generations how children, their parents and grandparents within one nuclear or other type of family negotiate their relationships in the transforming context of not merely using, but rather "domesticating" (Silverstone et al., 1992) various digital platforms for communication and information, education, entertainment, consumption, care, parenting, socialization, etc. We will discuss the qualitative design of, and ethical considerations in, family-based participatory research, and shed light on the challenges of operationalising the conceptual framework of platformization in a cross-generational and cross-cultural study. We will also introduce preliminary results of the first round of individual interviews with representatives of three generations in ten Estonian families, illuminating the unique perspectives on inter-generational relationality and family practices, and addressing aspects of autonomy, privacy, tension, and power dynamics.

923

Youth Political Participation on Twitter

Paula Joanna Sillat, Airi-Alina Allaste

Tallinn University, Estonia

The global proliferation of social media platforms has significantly reshaped society. Social media is believed to introduce new avenues for political engagement, albeit with notable criticism regarding participation via these channels. On one hand, there is unparalleled access to information and a diversification of political involvement. On the other

hand, the rapid increase of disinformation and algorithmically engineered communicative fragmentation is believed to fuel political polarization.

The empirical section of the paper relies on netnography on Twitter (now X), supplemented by in-depth interviews with active users conducted in spring 2022. The objective was to explore the factors that encourage or hinder political participation, how young people engage on Twitter, the significance they attach to it, and the perceived impact of their Twitter participation on other forms of engagement.

The findings indicate that while young people exhibit an interest in political and social issues, they perceive their activity as lacking, with active political engagement primarily evident in initiating discussions through original posts. Factors such as positive feedback from fellow users and anonymity were identified as supportive of participation. Despite recognizing the importance of fact-checking and source criticism, informants tended to prefer social media as a news source, considering it a reliable information channel. They acknowledge Twitter as a crucial platform that fosters political engagement through information dissemination, raising awareness about current issues, and fostering discussions that have the potential to drive societal change.

Digital Ties and Tomorrow's Horizon: Examining Online Social Capital and Future Expectations Among University Students in Hong Kong

Wan Sang Kan

City University of Hong Kong, Hong Kong S.A.R. (China)

This research aims to investigate the correlation between online social capital and future expectations among university students in Hong Kong. Engaging 293 participants in a cross-sectional study, the study used the Future Expectation Scale for Adolescents (FESA) to measure the students' outlook on their futures and the Internet Social Capital Scale (ISCS) to measure the extent of their social capital in the digital realm. Our findings indicate a positive link between online social capital and future expectations (p < .001), highlighting the important role of online interactions in shaping students' perspectives on their prospects. Notably, online bonding social capital emerged as a significant predictor for all dimensions of future expectations, while online bridging social capital was predictive for most dimensions, with the notable exception of expectations related to church and community involvement. This study emphasizes the critical role that online social networks play in nurturing the aspirations and prospective achievements of young adults. The exchange of social capital in online settings can enhance university students' future prospects in various domains, including career development, global collaboration, knowledge exchange, cultural awareness, and personal development, thus further facilitating and benefiting their future endeavors.

Young People with Disability and Digital Generation – Towards Inclusive Citizenship

Susan Marie Eriksson

South-Eastern Finland University of Applied Sciences, Finland

The effects of digitalization have been studied from various angles in youth studies and sociology. Digital activity of persons with disabilities is also growing field in social research, as digitalization is remarkable social change affecting daily lives. However, there is lack of research in youth studies concerning young people with disabilities, and their opportunities to live youth or life as a young person. One crucial reason for that is ableism in thinking, as it is implied, that person with disability is incapable to lead a lifestyle typical to young people.

Analyzing the character of their digital activities, this presentation deals with the opportunities of young persons with disabilities to participate in digital youth cultures. Qualitative interview data collected amongst young persons with mobility impairments and ethnographic data amongst persons with profound and multiple intellectual disabilities show, that possibilities to use digital devices have increased their opportunities for participation to a large extent. However, the nature of participation varies considerably between young persons, and is related to several individual, socio-material, and sociocultural dimensions in their daily life practices.

The analysis of the digital practices of these young people furtherly shows, that intersectional difference relating to individual attributes, such as socioeconomic position, is essential in recognizing the nature of the opportunities of young people with disabilities. It has a considerable impact on their statuses also regarding digital citizenship.

924

RN30 | T01_03: Youth and the future

The Future as an Issue for the youth in Brazil

Alexandre Barbosa Pereira

Federal University of Sao Paulo, Brazil

This presentation undertakes an examination of the meanings of the future for Brazilian youth. The study investigates the diverse representations that Brazilian youth formulate about their future, as well as the representations of the future that public policies create for and about young people. In an era marked by escalating global crises, encompassing health, climate, political, and economic dimensions, understanding how young individuals aspire to their futures emerges as a pivotal inquiry in contemporary youth studies.

Within the Brazilian context addressed in this research, the focus lies on contemplating how disadvantaged and Black youth construct their future aspirations. The study also seeks to scrutinize the expectations of the future that are established for them. Consequently, the research adopts a threefold approach, employing distinct methodologies: a) ethnographic research within youth cultures and their narratives about the future; b) open interviews with young individuals regarding their future expectations; c) surveying and analyzing public policies that address the future of youth as a focal point of intervention.

Carried out in São Paulo, Brazil, the research explored youth cultures such as carioca funk, hip-hop, and tag graffiti. Interviews were conducted with young individuals in public high schools, and the study analyzed the issues related to a specific reform policy in the Brazilian high school system. The principal justification presented by the State for this reform was to provide young people with resources to develop their life projects. This research aims to understand the implications of this reform on the young people's aspirations.

Exploring Future Imaginaries: A Comparative Study of Student Perspectives from England and Spain

Predrag Lazetic[1], Alicia Villar-Aguilés[2]

1University of Bath, United Kingdom; 2University of Valenica, Spain

This comparative paper delves into the future imaginaries of higher education students in England and Spain, with a specific focus on those pursuing studies in different disciplines. Employing a qualitative research approach that combines creative visual methods with usual focus group approach, we conducted focus groups to delve into students' core values, aspirations, and visions of the future. As contemporary higher education increasingly positions students as human capital and future workers, societal narratives emphasize career trajectories, employability, and work as paramount life aspirations (Brooks et al, 2022), little emphasis in research and policy is given to students themselves and their voices. Simultaneously, generational stereotypes depict them as hedonistic, with questionable work ethics and limited aspirations. This key value of this article is comparative as the unique and divergent social, policy and institutional contexts of England and Spain shape value and future imaginaries influenced for example by distinct hegemonic discourses in these societies.

This paper adopts the concept of "orientations" from Sarah Ahmed's work adapting it to explore how individuals navigate the complexities of envisioning their future. We investigate how young people approach their lives, the core values that shape their navigation and future life imaginaries and how they how they envisage reaching their destinations. These imaginaries also shape students in the institutional university environment in relation to the teaching staff and fellow students.

The findings present the stances, discourse and visual representations that reveal diverse ways in which young participants engage with the idea of the future, both personal and societal. Ultimately, this research contributes to a nuanced understanding of the intricate processes involved in shaping future imaginaries among students in England and Spain.

Taking Their Future in Their Own Hands? Young People's Social and Political Concerns and Engagement for the Future in a Global Perspective

925

Natalia Waechter[1], Gudrun Quenzel[2]

1University of Graz, Austria; 2University College of Teacher Education Vorarlberg, Austria

Multiple global crises contribute to young people's growing worries and concerns about their personal as well as their countries' and the planet's future. While for previous generations, the life stage of youth has been considered a "moratorium" from adult obligations and worries (Erikson, 1988), youth researcher today state the loss of the moratorium and consider youth a "serious life stage" due to increasing responsibilities and concerns (Böhnisch, 2022; Quenzel & Hurrelmann, 2022). In our presentation, we will answer the questions which social, economic, and political concerns young people have, which concerns they share around the globe, and how their concerns differ by global region. Furthermore, we have investigated if young people feel responsible for making the future a better place, or if they rather trust in the adult institutions to solve the problems.

We will answer these questions by presenting new findings from a large-scale quantitative survey with young people aged 18-26 ("Generation Z") which was carried out in 2022 in 31 countries worldwide (n=21,700). While the main concerns of the global Generation Z were racism, education, poverty, and access to health care, young Europeans were most concerned about access to affordable housing, racism, sexism, and climate change. About a third of all surveyed

members of Generation Z reported having changed their personal behavior or lifestyle to address a social issue they are concerned about. We conclude that despite of having found global similarities, specific regional conditions shape young people's concerns as well as their civic engagement.

In Search of an Oasis of Youth. Exploring spaces for youth development

Ewa Krzaklewska[1], Valentina Cuzzocrea[2]

1Uniwersytet Jagielloński, Poland; 2Università degli Studi di Cagliari, Italy

In this presentation we explore in depth the potentialities of the concept of 'oasis of youth'. The concept is proposed by the Authors based on analysis of 18 qualitative interviews with young Europeans who have undertaken more than one Erasmus stay abroad during their higher education. Starting from the J.J. Arnett's concept of emerging adulthood, we reflect on spaces for exploration for young people in Europe. As the analysis suggests, this 'oasis of youth' may symbolise a niche in which young people live out a youthful lifestyle (being), while getting prepared for the transitions to adulthood (becoming). The idea of a youth oasis contributes to the discussion on the transformative potential of youth, highlighting processes of youthful exploration in order to achieve personal growth. Beyond this analysed case, it allows to describe the diverse social spaces that express the social value of youth allowing young people to live youth momentum while in education, despite growing uncertainty and harshened structural conditions. As we argue, the opportunities described by Arnett to transform one's life through intensive exploration are rare and not widely accessible, constituting an oasis in the sense of exceptional circumstance rather than a generalised framework for young people. In this presentation, we further reflect on potential usage of this metaphor to understand and reflect on changing cultural demands towards youth people.

RN30 | T02_01: Youth, solidarities and civic participation

"Postmodern Solidarity". Youth Volunteering Between Flexibility And Proximity

Giacomo Buoncompagni[1], Letizia Materassi[2], Laura Solito[3], Carlo Sorrentino[4]

1University of Florence, Italy; 2University of Florence, Italy; 3University of Florence, Italy; 4University of Florence, Italy

In Italy, there are 7 million people who, in addition to their daily commitments – study, family commitments, work, sport, etc. – decide to perform free actions in support of the community. However, only 6% of young people between the ages of 18 and 29 continuously carry out activities that can be explicitly defined as "voluntary work".

In this regard, we ask how italian adolescents, compared to other age groups, redefine the three key dimensions of solidarity: belonging, identification and responsibility.

Specifically, there were two main research questions that drive the study: What meanings prevail in adolescents' perceptions? (RQ1) What are the main motivational levers that, particularly with the pandemic emergency, may have brought young people closer to volunteering?(RQ2)

The study involved female and male students (407) from secondary schools present in different metropolitan areas of Italy.

In a first phase, an online form on the "Datalifestudio portal" of the University of Florence was distributed. Definitions, perceptions, short text productions and emblematic images of volunteering were collected. The research path was then enriched with an additional qualitative methodological tool: the focus group among students.

In Italy the volunteering is often experienced as a more or less pleasant way of spending one's free time, without the urgency of an associative membership that accompanies growth. However, despite the insistence in recent years on the ability to inhabit virtual environments, the direct relational contribution, the close contact with both other volunteers and the beneficiaries of voluntary action, continues to have an enormous explanatory power, even in the world of associations.

926

Civic and Political Engagment. The Differences between Two Young Generations in Italy

Andrea Casavecchia

Università di Roma Tre, Italy

The paper aims to analyze the change in participation among young Italians. The objective is aimed at verifying whether the trends emerging in Europe are confirmed: the growth of civic engagement and disaffection with politics (Barret, Pachi 2019). The activities and commitment of two demographic cohorts of young people (20 – 30 years old) are compared through a re-elaboration of secondary data, derived from two multi-purpose Istat surveys 2013 and 2022.

The analysis starts from the assumption that these two cohorts are characterized by a different "generational placement" (Mannheim 2000, Chisholm 2002, Merico 2019): the young people of 2022 have lived the experience of Covid, the lockdown, the Ukrainian war for example. First of all, the participatory styles of the two generations are outlined and compared, and then we highlight how civic and political commitment differs. Finally, it will be shown how socio-economic status and the level of education change trends and contribute to building "generational units" (Mannheim 2000), which have different trends between generations and therefore are oriented towards different landscapes (Maira, Soep 2004).

Cultural Practices in Formal Education as an Arena for Youth Authentic and Meaningful Civic Participation

Anda Laķe, Līga Vinogradova, Sabīne Ozola

Latvian Academy of Culture, Latvia

There is a contradiction between public sector's investments for fostering young people's civic participation from one side, and NGO data (the Latvian Civic Alliance, etc.) on the other side, attesting to young people's lack of belief in their agency. A possible solution may be sought in unconventional civic participation forms (Bárta, Boldt, Lavizzari

2021) grounded in young people's interests, values and emotional choices (Cross et al 2014, Walther et al 2019), which develop in parallel to formally institutionalised frameworks for civic participation, most notably students' self-governments.

The goal of the research is to expand knowledge on cultural practices as a tool of civic participation in the formal education environment. The research questions: What authentic and meaningful participation expressions do secondary education students identify? Do they complement (and in what ways) the activities of the cultural education programme "The Latvian School Bag"?

The empirical data has been collected in the impact assessment study of the cultural education programme "The Latvian Scool Bag". The data reveals that the programme has fostered 1) power-sharing practices uncharacteristisc of the formal education in the decision-making related to students' choices of cultural activities; 2) authentic and meaningful participation expressions inpsired by the cultural experiences gained in the programme.

The data has been collected by the sequential mixed methods strategy: quantitative and qualitative. The opinions of 12th-graders have been studied by 1)using CAWI (nationally representative sample of students: 1061 students from 66 educational institutions) and 2) four focus group discussions with a heterogeneous composition of young people. Data analysis reveals many formal education environment characteristics as a precondition for cultural practices as authentic and meaningful participation forms.

927

Don't Ask Us To Vote (First Give Us Space!). Teenagers And The Public Life In Italy

Emanuela Pascuzzi, Sabina Licursi

Università Della Calabria, Italy

Conventional measures such as low voter turnout and reduced membership in associations are used as evidence of the youth disengagement from political and civic life. Research shows that young people tend to be distrustful of political institutions and do not take part in the public decision-making process. Yet, are we sure they are totally indifferent to public issues or apathetic? And what do we know about teenagers, living the crucial period during which citizens form the basis of political attitudes and behaviours? How do they learn to and get engaged in contemporary society?

Informed by results of a mixed methods research, the paper contributes to the understanding of teenager's public participation attitudes, experience and socialisation in Italy. The study was based on a web survey with about 1,300 adolescents, 6 focus groups and 4 world café workshops carried out in five Italian cities in the years 2020-2023.

Findings show that teenagers: are highly exposed to information but feel uninformed about the political system, rules and current affairs; distrust politicians but claim for a strong leader able to bring order to society; disagree with lowering the voting age to 16 but think that young people can change society; are taught that democracy is essential

but cannot count in their school; are asked to engage but do not find space to meet and discuss in their daily life. They are interested in public issues but mostly participate in invisible forms. When asked, they give many ideas on how young people can play an active role in the community for the better good.

RN30 | T02_02: Youth and Transitions

Uniformed Transitions: A Strategy Between Opportunities And Constraints

Nuno Almeida Alves

Iscte – Instituto Universitário de Lisboa, Portugal

Transitions from education to employment have been a substantial subject on Youth Studies on past decades. The focus has lied on the pace of these transitions, and how they have become protracted due to important changes in education, labour market and regulatory environments. This has turned young people's access to permanent and full-time employment into an almost unattainable condition, blocking other steps into adulthood.

This proposal reflects on the agentic response of a specific segment of young people in respect to these transitional constraints. Every year, a non-negligeable number of young people between 18 and 26 years of age in Portugal applies either to the Military Academies or to temporary contracts in the Armed Forces. Though this strategy, young people have access either to Higher Education training followed by a guaranteed employment for life, or to a temporary contract lasting up to 6 years, which might be followed by a permanent contract if some restrictive conditions are met.

However, these employment guarantees come at a cost. The admission into a total institution and compliance with a strict set of values and rules; the voluntary inhibition in respect to young people's practices and behaviours; the auto-segregation from peers and family. How, with whom and with which information is this strategy devised? How do they negotiate with these restrictions in such an important time of their lives? These and other questions will be answered through the thematic analysis of 40 interviews held with candidates to different positions in the Portuguese Armed Forces.

Adulthood As A Life Course Construct: Experiences Of Lithuanian Children From Transnational Families

Ginte Martinkene

Klaipeda University, Lithuania

This paper aims to show how transnational life experience in childhood forms unique identity maps and affects life course scenarios in adulthood. By giving the voice of adult children from Lithuanian transnational families the research examines how living at a distance experience in the childhood create transnational background for adulthood. Subjective concept of adulthood emerges as social construct. Transnational life experience in childhood becomes one of the major elements that constructs subjective life

928

course scenarios in adulthood but not the only one. Global and personal crises also play a significant role in shaping the identity of young people. The methodological uniqueness of the research by using Mapping method combined with Timelining method in a life course perspective (Elder 1985) allowed the research participants to look deeper into their own life experiences by seeing and talking about them and enriched the research with detailed data and in-depth knowledge of life stories by listening to the voice of the research participants. The subjective reflections of the experiences of adult children from Lithuanian transnational families have emerged showing that not only the traditional normative markers of adulthood are important in becoming adult, but individual aspects and experiences as well. These aspects highlight the individual agency of the research participants to shape their own life course scenarios. In addition, the study showed that these aspects lead young people to potentially enter adulthood earlier. Linked lives aspect is also important as well as Individual Agency aspect The experience of transnational life in childhood, individual agency and social environment form unique life scenarios and unique maps of identity.

Coping with Failure in Second Chance Education. How Young Adults Negotiate Pro-longed Transition into Adulthood

Hatice Altindal

Bergische Universität Wuppertal, Germany

Second-chance education in Germany offers an opportunity to achieve "Abitur" (highest general school degree that qualifies for tertiary education). It is a chance to correct the possible wrong decision due to an early stratifying general school system, which brings along the problem of inequality in participation in education. With the second chance education students are given the opportunity to pursue their educational aspirations, which previously existed to a large extent but were not realized. By graduating, students try to find their place in society and (re-)integrate themselves into it. Integration here means that the actor is integrated into networks, finds recognition and a place for themselves in society.

Now the question arises, why these students want to be students again, even though they might have to drop out of their jobs for this wish, have stressful phases and have to live or to continue to live in precarious conditions. In this regard, my research questions are: What are the occasions and educational paths that lead to attendance in institutions of second chance education? How do young adults navigate through these reversed status passages? How do young adults interpret their educational biographical success / failure and how do they dealing with them?

My work will be a qualitative longitudinal analysis. The biographical interviews were conducted and repeated once a year with the same students for three years. 34 interviews were conducted.

RN30 | T03_01: Youth and inequalities

Italian Young Men in Incel Virtual Communities: Marginalization, Self-Victimization and Violence Against Women

Annalisa Dordoni

University of Milan-Bicocca, Italy

Young people in contemporary society are faced, on the one hand, with the risk of intensification of gender-based violence and the rise of old and new forms of discrimination, and, on the other, with the social risk of precarity and poverty, especially after decades of stagnation, economic crisis and austerity.

Incel and red pill virtual communities produce and reproduce discourses of gender-based violence and online hate speech against women, justifying it with their anxieties and fears about the future, their economic conditions of job precarity, in-work poverty and uncertainty (Dordoni and Magaraggia, 2021). They are transforming what is a real situation of inequality and social exclusion (Unt et al. 2021), especially for young people with working-class origins, into anger and hate (Kimmel, 2013).

In order to study this phenomenon, an ethnographic observation in Italian Incel and Red Pill social media groups was carried out in 2020-2021 – during the COVID-19 pandemic outbreak.

The study adopts an intersectional approach and focusses on gender-based violence, cyberhate and marginalized working-class masculinities, integrating reflections and concepts used in the fields of sociology of work, youth studies and gender studies.

Also, the paper aspires to contribute in identifying key aspects of this phenomenon, which may be useful towards designing prevention policies, and proposing different imaginaries for the younger generations.

The Influence of Supply-Side Factors on Gender-Typical and – Atypical Career Paths: Investigating the Role of Parents, Extracurricular Activities, and Individual Characteristics

Julia Zimmermann

Universität Leipzig, Germany

Horizontal gender segregation in the labor market is not only problematic in terms of social inequality, it is also economically inefficient. In addition to creating incentives that break down the gender-stereotyped demand behavior on

929

the part of companies, it is therefore necessary to take a closer look at the causes of gender differences in young people's career choice behavior. The aim of this presentation is to contribute to the identification of preconditions and contexts that foster horizontal gender segregation. Using longitudinal data from the German Youth Institute's "Growing up in Germany (AID:A II)" survey, the presentation examines whether family characteristics, extracurricular activities and individual factors such as self-efficacy expectation, gender role orientation, work values and interests can predict the transition into gender typical and – atypical vocational or academic training. The data confirms that the majority of the young women and men follow gender typical career paths. However, women are significantly more likely than young men to aspire to gender-neutral occupations. Furthermore, the results of logistic regression models provide evidence that informal and non-formal learning processes are influential in the choice of gender-typical and – atypical career paths. The results suggest that different policy measures need to be taken for boys and girls in order to reduce gender differences in occupational choices: While girls should be encouraged to develop an interest in technology at an early age, stereotypes about female and male attributions and competencies need to be dismantled in the case of boys.

Differentiation Among Youths – Everyday practices of racialization at an YRC in Sweden

Shahab Mirbabaei

Karlstad university, Sweden

The current discourse of race in Sweden is arguably consisting of conflicting and scattered ideas. Discussions of race and visible differences carry a stigma and people tend to present themselves as colorblind. Concurrently, research testify to the social relevance of race through the racializing or othering experiences of certain groups. My research contributes to this field through an in-depth ethnographic study of racialization and racism among youth. I attempt to provide theoretical and empirical insights to nuance our understanding of when, how and for whom race matters in Sweden.

My research explores everyday, verbal and physical, practices of racialization among youths at an YRC (youth recreation center) in a mid-sized town in Sweden. Unlike co-curricular activities which are tied to the classroom curriculums, the YRC can be perceived as a form of institution, and an everyday setting, that some youths visit after school for extra-curricular activities. Through my research questions, I show particular interest towards how youths approach ideas of difference and similarities, categories and stereotypes, how race intersect with other categories, and youths' approach to phenotypical markers. The material for this study has been collected through participant observations and focus group interviews. At the conference, I plan to present results and an early analysis based on my observations and interviews of recurring conversations and quotes related racialization and racism. I also plan to present methodological and ethical considerations, theoretical insights and experiences from my field work.

The Ecological Potential of Young Italians. A National Survey of 14-18 Year Olds

Davide Girardi

Istituto Universitario Salesiano Venezia, Italy

The cohorts born in the new millennium could also assume a central role in Italy in the processes of ecological and social transition. The question is, however, to what extent this public discourse is for young Italians powerfully mobilising or is it instead a question of vanguards. In this sense, is there among those attending secondary school today an "ecological potential" that could become a fundamental resource for the challenges posed by the transition in the Italian context? To answer these questions, this paper focuses on the results of a survey conducted among a representative sample of 1,800 young Italians aged between 14 and 18. The working hypothesis is that the socio-historical location of 14-18 year olds presides over the formation of a specific "generation bond". On the basis of the survey results, it can be seen that the 14-18 year olds involved in the survey strongly emphasise a civic value plexus connected to the contribution that citizens will be able to guarantee in the future in the environmental issues that are considered most critical in Italy today. This ecological potential could therefore materialise an ecological transition whose dynamics are, however, still to be written, especially in the narrow space of the transition to the adult state of young Italians. Their "long view" can, however, force the limits of such a space, inviting institutional actors to guarantee transition infrastructures to adulthood that are more solid than those currently in place; otherwise a potential that nevertheless exists and clearly appears will be wasted.

RN30 | T03_02: Youth views, attitudes and perspectives

"Left In The Dark": Young People's Perspectives On Government Policymaking During Their Transitions To Post-16 Education And Training Within The Context Of The COVID-19 Pandemic In England.

Alice Weavers

King's College London, United Kingdom

During the COVID-19 pandemic, national education policy in England was in a state of flux, continually changing and adapting to evolving public health guidance. This paper explores how young people experienced these policy changes during their transition from school to post-16 education and training. Focusing on themes of distrust, disconnect, and confusion, it highlights their perspectives on how they felt about the relationship between the government and young people.

This paper draws on government policy documents and qualitative data from 'Young Lives, Young Futures', an ESRC funded longitudinal study exploring the school-to-work transitions of young people who do not plan to go to university. The data comes from the first wave of interviews with over 100 young people, aged 15-18, from four different areas in England. This group of young people are seldom heard in policymaking and this paper brings their experiences and views to the forefront.

The analysis finds a disconnect between the government and young people during the COVID-19 pandemic, with a lack of direct communication leading to participants feeling "left in the dark" and "forgotten about" by decision-makers. However, many of the participants had ideas for how the government could better support their transitions and listen to their views about policy. In emphasising the importance of governments working with young people to ensure policies respond to the diversity of their experiences, this paper has implications beyond the pandemic context, for future times of crisis, as young people continue to navigate their transitions in a changing world.

Dynamics of Pro-European Orientation Amidst Crises: A Comparative and Longitudinal Analysis of Pro-European attitudes of young Europeans (2014-2020)

Dragan Stanojevic[1], Anja Gvozdanović[2]

1University of Belgrade Faculty of Philosophy, Serbia; 2Institute for Social Research in Zagreb, Croatia

This presentation aims to investigate the factors that contribute to pro-European orientation among young European citizens through the exploration of three key research questions. Firstly, we seek to map the dynamic trajectory of pro-European orientation in a period marked by two recent crises – the migrant crisis, and the COVID-19 pandemic. Secondly, we aim to recognize the individual-level determinants that underlie pro-European orientation, particularly the recently observed upswing in pro-European sentiment. Drawing on Hobolt and de Vries (2016), our study employs both utilitarian and identity approaches to gain insight into the driving forces behind pro-European sentiment. Thirdly, we aim to delineate the role of contextual factors that either contribute to or hinder pro-European orientation. Our analysis includes contextual dimensions such as the state of national democracy, economic conditions, and the share of foreigners and asylum seekers (Czymara, 2020; van der Brug et al., 2021).

To detect the dynamics of pro-European orientation we will conduct longitudinal analyses on the data collected in six waves of the European Social Survey (ESS) spanning from 2014 to 2020. Utilizing the same dataset, we will employ a multilevel analysis (at three levels) to establish the contribution of specific factors at the individual, country, and time levels in shaping pro-European orientation during crises.

931

Navigating Europe: Spanish Youth's Insightful Grasp on European Politics and Institutions

Mihaela Vancea, Dani Cetra Bernado, Priscila Álvarez Cueva

University of Barcelona, Spain

The 2019 European Parliament elections marked a notable increase in voter turnout, rising from 42.6% in 2014 to 50.6%. Post-electoral survey highlighted that this boost was mainly driven by increased participation among young adults, reflecting a stronger sense of civic duty towards the European Parliament and a more positive view of the European Union. The upswing in turnout was observed in 19 Member States, with significant increases in several countries, including Poland, Romania, Spain, Austria, Hungary, and Germany.

Younger demographics, under 25 and 25–39, played a leading role, indicating a promising outlook for youth turnout

in the upcoming European Election 2024 (EE24). However, variations exist in the knowledge and engagement levels with European institutions among young adults. This article aims to shed light on the knowledge and perceptions of Spanish youth regarding European institutions and politics and their impact on the daily lives of young Spanish citizens. Using a quantitative approach, this study employs an online survey distributed to a representative sample of Spanish youth to systematically assess their understanding and perspectives on European institutions and politics.

RN30 | T04_01: Youth and generations

Generation Gaps, Past And Present

Jennie Kathryn Bristow

Canterbury Christ Church University, United Kingdom

The temporal dislocation provoked by the Covid-19 pandemic has been widely acknowledged to have significant implications for young people, who were quickly labelled 'the Covid generation'. This label lacks definitional rigour and reproduces the problems of 'generationalism' observable in previous forms of generational claimsmaking (Rudolph & Zacher, 2020). Nonetheless, its use raises two important questions. First, has the current period of accelerated social change, beginning with the upheavals provoked by the pandemic and followed by acute cultural, political, and geopolitical destabilisation, created the conditions for a distinctive generational consciousness (Mannheim, 1952 [1928]), in which children come of age in a world considered to be dramatically different to that taken for granted by their elders? Second, might the temporal and cultural dislocation observed during the present period give rise to a 'generation gap', of the kind observed following the First World War, and during the 'cultural revolution' of the 1960s? This paper draws on an ongoing study of the discourse of the 'Covid generation' in media and policy narratives (Bristow & Gilland 2020, Bristow 2023, 2024), and a study of the experiences of the 'Covid cohorts' of university students in the UK (Potter et al, in progress), to analyse the implications of these questions for the sociology of knowledge.

932

Youth Perceptions Of The Boomer Generation On Social Networks.

Víctor Gago Rivas, Ángel Martín Gómez, Carmen García Gutiérrez

Universidad of Salamanca, Spain

In recent years, the generation has gained importance in the narrative of social change and conflict, as reflected in the spread of digital phenomena such as #OKBoomer, which highlighted the negative perception of this generation by later generations, popularising the term "boomer" as a pejorative adjective. In order to find out whether the use of this term is an expression of conflict and generational vindication, we downloaded more than 600,000 tweets, in Spanish, issued between November 2019 and December 2022, which contained the term "the boomers". Using supervised machine learning techniques, we quantified the percentage of tweets that, through the use of this term, expressed generational claims or conflicts. Subsequently, we used topic modelling techniques to investigate under which themes these are expressed. We found that, during this period, most of the tweets analysed expressed conflicts and demands, focusing on issues such as material and economic inequality, lack of opportunities to develop a life project and political issues. Everyday generational clashes

were also observed, related to digital skills or attitudinal differences. In conclusion, behind the use of the term "boomer", claims of the younger generations are being expressed in the form of generational conflict, either by blaming the "boomer" generation for their situation or by denouncing the lack of empathy of the "boomer" generation towards them.

Convergence and Divergence in the Political Socialisation of Youth in Poland

Hakob Matevosyan, Félix Krawatzek

Centre for East European and International Studies (ZOiS), Germany

This paper examines under what conditions the attitudes of young Poles today converge or diverge from their parents' political and social views. Poland has been experiencing significant societal polarisation since 2015, which has resulted in a relationship between generations oftentimes portrayed as exclusively antagonistic. This fragmentation of society has profound significance for families. Thus, we examine the Polish case within the context of the profound disruptions between generations, mapping onto broader political and social discourse while exploring conditions of convergence between generations and its connection to the larger narrative of the family as a fortress.

To understand the intergenerational political convergence and divergence, we analyse the self-assessments of young Poles with regard to party attachment and various socio-cultural values compared to their parents. We explore the relevance of different factors such as religion, political party preferences, and educational achievement, as well as demographic factors. These factors help us better highlight the reasons behind convergence and divergence among young Poles and their parents. Central in the paper is its focus on the gender dimension, which has been underexplored in the literature but emerges strongly as a pattern in convergence and divergence in our analysis.

For the analysis we can rely on an original online survey conducted by the authors in April-May 2023 with over 2,000 respondents aged 16-34.

Finnish Students' Experiences of Social Interaction, Mental Health and Performance Pressure during the COVID-19 pandemic

Pia Nyman-Kurkiala, Amanda Hyvönen, Henrik Groundstroem, Jessica Hemberg

Åbo Akademi University, Finland

Objective of the study:
Young adults' everyday existence and lives have been dramatically affected by the COVID-19 pandemic, and students have experienced limitations both in university studies and in social life, which has affected their well-being and health. The aim of the study is to explore Finland-Swedish young students' experiences of social interaction, health and performance requirements during the COVID-19 pandemic.

Methodology: A qualitative exploratory design was used. The dataset consisted of essays written by 43 young adult students (aged 18-28) at a university in Swedish-speaking Finland. The data analysis method consisted of qualitative content analysis.

Results obtained: The results showed four main categories: Continued health obstacles, self-reflection and vitality, Performance requirements as a constant destructive companion or source of self-compassion, New start with university studies, Balancing act between social interaction and loneliness.

Conclusion: Young people's experiences of high performance demands and stress in everyday life need to be addressed and supported by the university and society. Further research should focus on investigating which forms of support and psychosocial interventions should be developed in the opinion of young people, in order to adequately respond to their needs.

933

RN30 | T04_02: Youth values & social trust

School and School Environment as Socialization Agents of Inclusive Attitudes

Daniel Gerbery, Roman Džambazovič

Comenius University in Bratislava, Slovak Republic

School is an important agent of socialization that affects the formation of value orientations and attitudes of young people. it aims at bringing up young people up to become well-informed, critically thinking citizens (Hess 2009; Neundorg – Smets 2017), providing various stimulus in the periods of their life cycle, which are key for development of social and political attitudes (Blakemore – Mills 2014).

Presentation examines attitudes towards immigrants' rights among the secondary school students in Western and Eastern European countries, focusing on the role of the characteristics of the secondary schools. Attitudes towards immigrants represent an indicator of inclusive acceptance of cultural and social diversity, which is becoming crucial in the times of expanding nationalism, populism and rising global inequalities.

We show how attitudes towards rights of immigrants varies among young people cross-nationally and how they are influenced by the characteristics of the schools. We examine the role of formal aspects of education (school's curricula, type of education provided), its informal context (social climate, availability of extra-curricular cultural activities), as well as its socio-economic characteristics. In addition, we also explore theoretically funded hypotheses about the role of individual dispositions (cultural capital, heterogeneity of close social ties, class identity) and their interactions with higher-level determinants.

Our research is based on data from the quantitative Survey of young people's cultural literacy (2020), which was part of the comparative project Cultural Heritage and Identities of Europe's Future. We use multilevel modelling strategy in order to examine the effects both at individual and school level and their combined influence on attitudes towards immigrants.This work is supported by the Slovak Research and Development Agency under the Contract no. APVV-20-0449.

Social Trust Amongst Adolescents

Alexander Niclas Saaranen

Lund University, Sweden

Despite the ample interest in trust as a research subject and the believed heightened malleability of trust amongst younger people, most historical and contemporary research base their findings on data with participants above the age of 18. While previous research indicate that social trust is durable and resistant to change amongst adults, the same conditions may not apply for adolescents. In this study I explore how social trust develops during the transformative phase of adolescence, a stage in our lifecycle believed to be marked by increased malleability and change. To remedy the current gap of knowledge surrounding youths and social trust I draw on rich survey data from the World Value Survey, the European Social Survey as well as nationally representative panel data from the Swiss Household Panel. Utilising fixed effects regression analysis accompanied by longitudinal growth curve modelling, I find that most adolescents experience a severe loss of social trust during the transition from dependent young child to independent young adult – the timeframe also known as the impressionable years. The drop in trust that occurs during the impressionable years is then recovered gradually over the course of the lifespan, with some people never reaching similar levels of social trust ever again.

Generational Changes and Youth Political Participation in Portugal: Polarization, Deinstitucionalization and Trust, a Comparative Study

Nuno Miguel Augusto

University of Beira Interior / Center for Research and Studies in Sociology (CIES_Iscte), Portugal

In this communication I aim to outline the main sociopolitical characteristics of the Portuguese youth, concerning the relationship with the party and the electoral systems. Similar to the European reality, Portuguese youth have recently exhibited two trends – a preference for non-conventional or non-institutional forms of political participation, distancing themselves from electoral and party activities combined with (or explained by) a lack of trust in political instituions (one of the lowest levels of political trust in Europe). Additionally, there is a tendency towards polarization in party and ideological identification, reflected in an increasing alignment with both far-left and far-right parties, although this may not necessarily translate into actual voting, which remains limited. Across generations, there is a diminishing significance of centrist parties, historically leading portuguese governments and vote. To achieve this, a quantitative and comparative analysis was conducted within an European context, using various waves of the European Social Survey and European Values Studies questionnaires, with a particular focus on the latest waves. Contrary to the trend in most European countries, Portuguese youth display significantly higher levels of interest in politics and political mobilization compared to older cohorts, revealing a contradiction between apparent disengagement from institutional processes and the political mobilization of these cohorts. This reinforces a tendency towards a deinstitutionalization of the participation forms and a reintegration into non-institutional forms of engagement.

934

The Impact of Economic and Religious Factors on the Spread of Post-materialist Values in the First Post-communist Generation: A Comparative Analysis of 24 Countries

Laura Dauksaite

Vilnius University, Lithuania

This study uses Inglehart's theory of materialist–post-materialist value change to analyse the values of the first post-communist generation (born in 1991–2000) in 24 post-communist countries. The analysis of the data from the World and European Values Surveys of 1990–1993, 1999–2004, 2008–2014 and 2017–2022 waves leads to the conclusion that in the majority of post-communist countries, post-materialist values have become stronger in the first post-communist generation compared to those of older generations. This trend is particularly pronounced in the economically strong post-communist countries, but is also observed in the economically deprived ones. Only six countries show a statistically significant correlation between the importance of religion in people's lives and materialistic–post-materialistic values in the first post-communist generation. The study also revealed that post-materialist values are more widespread in countries dominated by the Roman Catholic faith than in Orthodox and Islam-dominated countries in the first post-communist generation.

RN30 | T05_01: Youth policy, services and practices

Vulnerable Andalusian Youth: Other Life Paths

Virginia Gutiérrez Barbarrusa

Universidad Pablo de Olavide (Sevilla, España), Spain

We present the results of one of the objectives of the project "The resources of Andalusian youth: Diagnosis for the design and evaluation of public policies aimed at their full emancipation", winner of the 2022 Edition of the Research Award of the Economic and Social Council of Andalusia.

Among the results, we obtain that the group of 18 to 29-year-olds residing in Andalusia has an incidence of social exclusion of 39.4%, 11% above the national average (FOESSA, 2023). We also know that at least 7000 young foreigners reside in Andalusia "without family references".

This paper focuses on these two groups. To understand the context of young people in vulnerable situations, we have taken qualitative data from the work of the Spanish Red Cross (Romera, Grané and Gil, 2021) in three areas of competence: life, training and employment. Concerning young foreigners, we have taken different documentary sources and conducted in-depth interviews with young migrants and NGO workers; in both cases, we analysed the role of the family as a support network and in transmitting values and attitudes.

The family is a fundamental support, but it can burden these young people. Regarding young people without family references, we highlight the importance of the new referents in our country. Finally, we will explore Andalusia's youth policies and gather some proposals.

935

Facilitators And Barriers To Care-leavers Engagement With After-care Services: Findings From A Realist Informed Study.

Ceryl Teleri Davies[2], Louise Margaret Prendergast[1]

1Bangor University; 2Bangor University

Without a familial safety net, care-leavers rely on the state as a 'corporate parent' to help them navigate challenges and responsibilities associated with transitions to adulthood and independent living. Research indicates that care-leaver's engagement with multi-agency support services can improve their social and individual outcomes. However, little is known about the key barriers and enablers to engagement with support, or what an effective model of engagement looks like.

The aim of this study was to identify the barriers and enablers to after-care support services and co-produce a

practice model and toolkit with care-leavers and multi-agency practitioners. Informed by a realist approach, an initial logic model was developed from a review of the international literature, refined through qualitative interviews with care-leavers and multi-agency practitioners. The model illustrating links between inputs, mechanisms and outcomes subsequently underpinned the practice model and toolkit. This will be evaluated through a social return on investment to explore its social value and impact on practitioners and care-leavers.

In this paper we discuss our findings from the qualitative interviews with care-leavers and multi-agency practitioners conducted within four areas in Wales, UK. We outline the main themes identified, including factors associated with enabling engagement: tailored approaches, consistency, transparency, persistence, and responsiveness. Additionally, we highlight issues of stigma, resilience, and trust, and discuss the challenges experienced by practitioners in delivering support in the context of structural constraints. Finally, we discuss the outcomes of engagement and significance of these findings to wider policy, practice, and research.

A 'Lost Generation'? Generationalist Thinking and Young Adults' Housing in Sweden

Elias le Grand

Stockholm University, Sweden

In the last decades the Swedish housing market has been increasingly deregularised and privatised. This has led to growing housing inequality, which has particularly disadvantaged young adults. Parental coresidence among young adults is increasing, and for the vast majority their coresidency is involuntary. Many young adults have also entered into insecure rental contracts or ended up in shared accommodation. As residential independence is a marker of adulthood, staying in the parental home may be viewed as a failure. It may also cause young adults to delay other life course transitions such as marriage and parenthood. In this paper I present ongoing research on recent public debates about the housing situation of young adults in Sweden, particularly in relation to generational and age-related categories. Preliminary analysis suggests that there is a recurrence of generationalist narratives (White, 2013) in which young adults are positioned as a 'lost generation' who are the victims of previous generations' selfish appropriation of public resources. It is argued that such generationalist discourses serve to homogenise and stereotype generational categories, and largely fail to address intra-generational differences, which would allow more nuanced analyses of the processes that condition young people's housing prospects.

Young People and the Politics of Listening in Social Services and Social Research

Laura Davy

Australian National University, Australia

There is increasing recognition in policy studies and practice that listening to people with lived experience is crucial for creating tailored, responsive social services and trust in their efficacy. However, the mechanisms for engaging young people – especially young people with disability and young carers, who are key targets of social policy initiatives – are often poorly implemented and do not lead to meaningful reforms to practice. Addressing the institutional barriers these young people face in being heard is critical to designing services and systems that meet their needs.

This paper discusses a co-designed Australian research project investigating how young adults with disability and young adult carers of family members with disability experience being "listened to" by the institutions, organisations and services that impact their lives. It draws on "the politics of listening", a theoretical approach concerned with the interpersonal, cultural, and institutional processes of listening that render some voices heard, and others ignored.

The paper will explore the early findings of this research project, particularly reflecting on the co-design process. Working with a co-researcher group of young people with lived experience has shaped the project approach and methodology in important ways such as the accessible design of a national survey of young people's experiences of being engaged by government funded services. This process has also yielded important methodological and theoretical insights into the politics and practice of listening in co-produced research.

RN30 | T05_02: Post-Covid and contemporary youth

The Generation Of Polycrisis

Francesco Ramella, Sonia Bertolini

University of Turin, Italy

In Italy, young people are returning to be seen and heard.

Over 20 years ago, young Italians seemed invisible. Not so much and not only because there were fewer and fewer of them, but also due to a certain lack of social "distinctiveness": they seemed "domesticated". Judging by the results of a research we conducted recently, today the situation has decidedly changed. Although with many differences related to regions, gender and social condition, young people are decidedly different from their parents and grandparents. Because the acceleration of social change has inevitably increased the gap between generations. You can see it looking at their attitudes towards work, consumption, social media, family, spirituality, gender identity, the environment, politics, and much more. Their public participation is also growing.

The under-35s represent a new generation, which possesses precise distinctive traits. They were born and raised after the fall of the Berlin Wall. They experienced adolescence in the context of a technological revolution that provided them with new tools for information, communication and interaction. Furthermore, their future has become radically uncertain. And this trait characterizes them, since they live in an era of polycrisis. This term indicates not only the coexistence of a plurality of crises, but also their mutual amplification and is particularly appropriate to connote the context in which young Italians become adults.

In Italy, young people live a peculiar asymmetry in their social recognition: their "valorization" in the private sphere corresponds to a dramatic "devaluation" in the public dimension.

Impact Of The COVID-19 Pandemic On The Apprenticeship Market In Switzerland: Changes In The Interests Of Young People

Milan Stocker

Universität Bern, Switzerland

In Switzerland about two-thirds of compulsory school leavers complete a dual apprenticeship, where over half of the time spent in a training firm. The Swiss vocational education and training system (VET) is thus linked to the economy, making it vulnerable to economic fluctuations. Consequently , the economic turmoil during the Covid-19 pandemic impacted the apprenticeship market's supply and demand. During recessions, open apprenticeship positions typically tend to fall. Thus, school leavers who wish to pursue vocational training are confronted with the tense situation on the apprenticeship market. Young people may alter their training choice if their preferred occupation is affected by the crisis, because they perceive unfavourable prospects and an increased risk of training companies' bankruptcy amid poor economic conditions. This paper examines whether and how the affectedness of an occupation during the pandemic changed its demand for specific apprenticeships. The change in the demand of young people is examined through their search queries and applications on online apprenticeship portals before, during, and after the pandemic. To measure how the different occupations were affected by the pandemic, I use administrative data on short-time work, bankruptcies, and the number of open apprenticeships. While one in six Swiss compulsory school leavers reported that they had changed their educational plans because of the pandemic (Golder et al. 2022), it remains unclear which occupations were more frequently abandoned, and which gained interest. Additionally, it is uncertain whether the changes in search and application patterns are temporary or will persist over time. To close this research gap, I use time-series analysis to recognize trends as well as regression models to control for gender, lower secondary school track and region. Results indicate that Covid-19's impact varies across occupational sectors. Strongly affected sectors like gastronomy, have seen a decline in search queries during and after the pandemic, whilst less affected sectors remained stable or have even observed an increase in interest. By analyzing the changes for specific occupations in detail, this research will highlight the impact of crises on the apprenticeship market in Switzerland.

I have never attended an ESA Summer School before.

Legal Consciousness, Everyday Morality and Pandemic Risk Management. A Sociological Research on Legal Consciousness of Italian Young People.

Isabella Università di Urbino;[1], Anna Uboldi[2]

1Università bocconi; 2Università urbino

This research focuses on youths' law experience during the pandemic time (Ewick Silbey 1998). The research explores how the rules were daily implemented, in terms of acceptance, interpretation, negotiation and rejection of them, or of some of their aspects. The theoretical framework considers the interconnection between research on legal consciousness, ethical choices in everyday life, including the management of risks as elaborated in Douglas' cultural theory of risks, and the Bourdieusian approach to moral judgment. This analytical perspective questions how legality is (re)produced in uncertain conditions and how socio-cultural differences continue to act in a highly individualized society. Discursive interviews, with photo stimulus, are carried out with 72 young people between 18 and 25, students and workers, Italian and with migratory experience, residing in different Italian regions. Based on the analysis of 70 narratives with a mixed methods approach, our findings show different ways of acting and attributing meaning by young

937

people to everyday life. This concerns the orientation of oneself in managing normative uncertainties and pandemic risks. Thus, different narratives can be identified: individual translation, trust in procedure, fatalistic claims, and cooperative criticism. These narratives are recurring repertoires of perceptions and practices. Besides confirming the processual character of legal consciousness, our data show systematic differences in the mobilization of specific cultural schemes by young people with different amounts of cultural capital

SF and the Doing of Youth Sociologies for the Anthropocene

James Goring

Deakin University, Australia

A sociological imagination for the Anthropocene must find innovative, productive, and critical ways to move beyond the human exceptionalism and methodological individualism that underpins the more conventional sense of a sociological imagination which characterises orthodox sociologies of young people. Some of this work is being done in the post-humanities (Braidotti 2019), in feminist studies of science, technology and society (Haraway 2016), and in critical studies of the Anthropocene and the Capitalocene (Latour 2017, Moore 2016, Tsing 2015). In this presentation we want to point to the possibilities that emerge for a sociological imagination for the Anthropocene that can be found in other disciplines, fields, domains, and genres. In this sense, as Haraway (2016) observes, It matters what stories tell stories. What stories can we tell with/for/about young people and the Anthropocene? How do these stories connect to, intersect with, exist in tension with other stories about our pasts-presents-futures?

In this presentation we will explore some of these challenges and opportunities through the video-telling of one young person's story over a period of 3 years. This story is drawn from a number of projects we have conducted during 2020-2023 in which more than 100 young people participated in innovative video-based interviews about their pasts-presents-futures in the context of the pandemic and the unfolding crises of capitalism and the climate.

In exploring the forms of storytelling we have tried to develop, we will discuss the challenges that these modes apparently present for the the orthodoxies of youth sociology as these challenges are manifested in the practices and responses of the journal editors and reviewers who gate-keep what a sociological imagination should look like and do.

RN30 | T06_01: Youth health and wellbeing

Predictors of Subjective Well-Being Among Young Poles: Evidence from the ULTRAGEN Project National Survey

Agnieszka Golinska, Justyna Sarnowska

SWPS University, Poland

The framework of the study is rooted in the concept of multi-crisis (Beck, 1992). Especially the COVID-19 pandemic, followed by the war in Ukraine and the economic recession, has undeniably caused a state of emergency in Poland (Pustułka et al., 2023). Concerns about those crises impact Subjective Well-being (SWB), a state in which a person believes that their life is good and enjoyable, regardless of how others perceive it (Diener, 2009) of young Poles. Empirical evidence shows that SWB is influenced by extrinsic but also intrinsic factors (Gomez et al., 2009) thus, both life events as well as psychological factors should play an important role as determinants of SWB. Young adults, with less experience from previous life disruptions and adaptation processes, are particularly vulnerable in times of crisis (Weinberger et al., 2018).

The paper is based on the national survey conducted in January 2023 as a part of the bigger research project "ULTRAGEN: Becoming an adult in times of ultra-uncertainty: intergenerational theory of 'shaky' transitions" funded by the National Science Centre of Poland. The representative sample consisted of 2104 young Poles (49% of women) aged 18-35 (M = 27.55; SD = 4.99). Within the study, we explore the role of both the variables related to the perceptions of the crisis as well as psychological variables as predictors of individuals' SWB, measured using the modified Personal Wellbeing Index (International Wellbeing Group, 2013), the scale that adopts a domain-level representation of global life satisfaction.

Mind the Gap: Understanding the Impact of School-to-Work Transitions on Youth Mental and Emotional Health

Ilaria Pitti[1], Eleonora De Stefanis[2]

1University of Bologna; 2University of Milan

The paper delves into the intricate interplay between mental and emotional health and the challenging transition from school/university to the workforce. Presenting the preliminary results of the Erasmus+ project "Mind the Gap: Supporting Young People's Mental and Emotional Health in School to Work Transitions" (2023-2025), the paper seeks to shed light on the multifaceted factors influencing the

938

mental and emotional well-being of young individuals navigating this transitional phase, as well as on young people's own copying strategies.

The discussed research is based on a series of qualitative interviews conducted in Italy, Germany, Spain and Slovenia with young people aged between 16 and 25 and differentiated backgrounds in terms of gender, socio-economic status, ethnic background and sexual orientation.

Firstly, hrough the intersectional analysis of the interviews the study explores youth subjective experiences of mental and emotional health during the school/university to work transition. Secondly, by focusing on the dynamic interplay between academic stressors, career uncertainties, and personal identity development, it provides a comprehensive understanding of the emotional challenges faced by young adults during this critical period and of the strategies they enact to deal with them, individually and collectively. Finally, while examining the emotional impact of academic expectations, societal pressures, and the inherent uncertainties associated with career choices, the contribution also investigates the role of different professionals working with young peoeple in this phase (e.g., teachers, educators, career advisors) in fostering environments conducive to positive mental health outcomes.

Changes In Adolescents' Well-being During The COVID-19 Pandemic And In Its Aftermath

Michal Kozák

University of Oslo, Norway

The restrictions put in place to mitigate the spread of the coronavirus dramatically changed adolescents' lives during the COVID-19 pandemic. Several large-scale studies have found that adolescents' well-being deteriorated during the pandemic and that this decline was most marked among adolescents from families with a low socioeconomic status. However, less is known about adolescents' situations after restrictions had been lifted and life had seemingly returned to normal. In this study, we address this issue by using nationwide, large-scale, repeated cross-sectional data from more than 500,000 adolescents in Norway, who were assessed on key well-being aspects before the COVID-19 outbreak, during the pandemic and after all restrictions were lifted in the spring of 2022. Our main objective is to examine whether well-being changes related to the pandemic were reversed when restrictions were lifted and whether social gradients according to parental socioeconomic status returned to pre-pandemic levels after the restrictions were lifted. Multilevel analyses showed that after Norway removed all restrictions, adolescents reported lower satisfaction with peer relationships and less-optimistic future life expectations, but less loneliness compared with long-term trends. Moderation analyses revealed that adolescents from poor families and with low parental education suffered more adverse changes both during and after the pandemic across several domains. While our results do not indicate a general worsening of well-being among Norwegian adolescents in the period following the pandemic, there is concerning evidence that exacerbated socioeconomic

inequalities in well-being during the pandemic have remained in its aftermath.

Youth Life Satisfaction and Political Efficacy: A Comparison of Croatian and Slovenian Youth across Socioeconomic Strata

Dunja Potočnik, Anja Gvozdanović, Iva Odak

Institute for Social Research in Zagreb, Croatia

Research on the relationship between political efficacy and life satisfaction of youth is relatively scarce. In order to fill that gap, this paper presents the results on youth life satisfaction in Croatia and Slovenia in regard to their socioeconomic background and political efficacy. The paper is based on the quantitative data collected during the project "Youth wellbeing and support structures before, during and after the Covid-19 pandemic" and includes nationally representative samples of young people aged 16-29 in Croatia (N=1216) and Slovenia (N =1287). The data were collected at the end of 2023. Following the framework developed by Bandura (1991, 1997), we argue that political efficacy is an important predictor of life satisfaction. We are starting from a hypothesis that young people with a developed sense of political efficacy have higher results on life satisfaction, which is mediated by their socioeconomic status. The results of multiple regression analysis indicate there is a contribution of political efficacy to life satisfaction, depending on the type of political efficacy and socioeconomic strata, and conditioned by the openness of the political system. The findings will be explained from a contextual, and life-stage perspective, emphasizing divergent political transitions after the 1990s and current socio-political developments that are to a different extent supportive of youth progressive civic and political participation in Croatia and Slovenia. The obtained results are significant for further development of supportive frameworks that would improve youth political efficacy and their civic and political participation.

939

RN30 | T06_02: Youth and political participation

Youth Political Participation Today: Subjectivities, Ethics and the Everyday

Carmen Leccardi

Università Milano-Bicocca, Italy

The paper focuses on some characteristics of young people's political participation today, in a time of increasing scepticism of traditional political organizations and disenchantment towards representative democracy. Based in particular on a qualitative ongoing Italian research on unconventional political participation among young people and its link with futurity, the paper aims to mobilize new conceptual tools for the analysis of political participation. Politics is being reinvented making use of a new type of temporality, able to connect short/medium term futures with everyday experiences. It is in this analytical framework that the concept of 'everyday utopias' (Davina Cooper) seems to offer a way to focus on what is doable in the everyday while capturing a sense of hope and potentiality. This form of 'temporal work' (Michael Flaherty) resonates with the need for young people to intertwine the need to express control of their lives, meaningful relations and subjectivities. A specific role is played, in this frame, by the increasing importance of personal responsibility (like in the struggle for climate justice). Responsibility, here, expresses young people's need for a subjective, ethical engagement here-and-now. In this respect, and from a methodological point of view, Kurt Wolff's proposal (Surrender and Catch) proved to be important as it opened up perspectives on the relation between given knowledges, ethics and research experiences.

Emerging of New Public Spheres. Why Did Young People's Electoral Activity Surprised Sociologists?

Monika Kwiecinska-Zdrenka

Nicolaus Copernicus University, Poland

Emerging of New Public Spheres. Why Did Young People's Electoral Activity Surprised Sociologists?

In the fall of 2023, the democratic opposition won the elections in Poland. Turnout analyzes indicate that this was due to, among others, the great mobilization of women and youth. This result surprised many sociologists. In recent years, these young people (of which many took part in the parliamentary elections for the first time, and representing the first generation after 1989, which grew in the conditions of an already well-developed democratic system and Poland's belonging to the European Union) were described as "pathologically passive", unstable, immature citizens, indifferent, passive, politically apathetic, passive aggressive citizens. We have been observed young people's withdrawal from politics and the radicalization of their preferences.

However, if we change the perspective – both related to the definition of youth (in terms of a generation, not an age category) and the way of understanding the presence of this generation in the public sphere (the ability to overcome in the imagination and action the horizons of one's own interest political or non-political), we will see that new public discourse is emerging, at least when it comes to matters important for this generation to face public matters (including status quo endangered by collapse of democracy).

The diagnosis of of civic involvement of young people, emphasizing both the old and the new forms, acknowledging the motivations and meanings attributed to civic engagement and disengagement, allows to better understand their functioning as adult citizens in future.

The presentation is based on the results of empirical research on approximately 3,000 young Poles, with a comparison of their attitudes to the behavior of their parents' generation.

Generations, Crises, Inequalities and Solidarities

Maria Grasso

Queen Mary University of London, United Kingdom

The most recent generations of young people have gone through several challenging experiences in their formative years. They have experienced economic crisis, political crisis, a health crisis, an ongoing environmental crisis, a cost of living crisis. These developments have impacted on young people in many ways including in terms of their political, social and economic outlooks, their educational paths, employment, economic security, and the opportunities available to them to flourish and enact positive social change for the future. All these experiences are likely to have impacted on young people coming of age and experiencing their formative years in profound ways leading to the formation of new values in relation to those of generations coming of age in previous periods. In particular, this could be reflected in growing support for leftist values amongst young generations coming of age through these experiences. Moreover, these experiences are variegated within generations in terms of different dynamics of experiences such as those relating to gender or class or spatial inequalities. I will critically examine these crucial aspects in relation to generations and social change and build on insights from previous work to examine how these patterns can lead to opportunities for the development of solidarities and collective political action for social change in the current socio-historical juncture.

RN30 | T07_01: Youth, social class and mobility

Spatial, Affective and Temporal Dimensions of Youths' Everyday Class Struggles

Maria Keil

University of Tuebingen, Germany

Today's youth is not only confronted with several societal crises but also with increasing social inequality. Trajectories into adulthood are not linear anymore and meritocratic promises are often enough shattered when entering the labour market. But how do young people perceive social inequality and how do they develop a sense of one's place? The paper presents results from a grounded theory study based on longitudinal ethnographic data and guided interviews following 19 adolescents during their transition from school to work in a German city. Using the relational framework of Bourdieu's praxeology and the concept of symbolic boundaries, the paper presents spatial, affective and temporal dimensions of social class in young people's everyday life.

Different mobility patterns can be identified between young Muslims in disadvantaged neighbourhoods and white middle-class adolescents. The appropriation of local space is not only formed through (anticipated) experiences of symbolic violence, but also shapes the (social) space of possibilities and the interaction with and trust in institutions, such as schools, universities, youth clubs, museums, etc. Spatial appropriation is also interwoven with affective dimensions of social class intersecting with gender, ethnicity and religion. Whereas some fear gender – and sexuality-based hatred in working-class areas of the city, others avoid white working – and middle-class districts anticipating racism. Finally, temporal dimensions of social class address the past, present and future within everyday practices and shape the sense of belonging in unsteady times.

Young People's Lay Perceptions of Material And Symbolic Inequalities

Sanna Aaltonen

University of Eastern Finland, Finland

In this presentation I focus on young people's lay perceptions of inequality and social class. Drawing upon thematic analysis of interview data produced among 17–19-year-old upper secondary students in four municipalities in Eastern Finland, I examine their subjective sense of inequality (Bottero 2020) and how they see themselves positioned in a stratified society (e.g. Irwin 2018; Snee & Devine 2018). From previous research we know that class identities are fundamentally ambivalent. Further, young people tend to see themselves as agents capable of controlling their own lives, and they have been accused of being blind to the existence of structural constraints arising from gender, ethnic, or class divisions ('epistemological fallacy' by Furlong and Cartmel 2007).

Instead of adopting a restricted focus on how young people fail to grasp inequalities, my presentation deals with both identifying and downplaying of differences. The sense of inequalities is examined with a special reference on language, drawing upon the notion that linguistic practices are linked to the construction of inequalities, and the cultivation of moral distinctions (e.g. Bourdieu & Thompson 1991). Thus, the presentation contributes to the understanding on how both material and symbolic boundaries and hierarchies are articulated by young people and what consequences these hierarchies are seen to have in their lives.

The presentation is written as part of a cross-disciplinary research project 'LINSOC – Linguistic variation, social class and experiences on inequality in Eastern Finland'.

The Patterns of Youth Life Chances Differentiation in Lithuania: the role of education, employment, and family background

Ruta Braziene, Sonata Vysniauskiene, Laima Okuneviciute-Neverauskiene, Justina Krauledaite

Lithuanian Social Science Centre, Institute of Sociology, Lithuania

The paper examines the subjective attitudes towards life chances of the Lithuanian youth (aged 18-35). Based on the concept of life chances introduced by M. Weber (1920) (cited by Grusky 2001), the theoretical aspects of life chances are analyzed. The theoretical construct at the micro level is based on the following theoretical approaches: life course theory (Brady, 2018; Jones, 2019, etc.), employment quality and security (Braziene, 2020, Barbieri, 2009; Kalleberg, 2009), subjective well-being and health (Diener, 2009), economic independence, and autonomy (Baranowska-Rataj et al., 2015; Walther, 2006; Corijn and Klijzing, 2001, Shanahan 2000, etc.), socioeconomic situation (Nolan and Whelan, 1996) and family socioeconomic background (Munro, 2019; Cho, Brand 2019; Bourdieu, 1984, Bourdieu, Passeron 1977). For the survey research, life chances dimensions were distinguished: individual socio-demographic characteristics; family/household characteristics; parents' family characteristics and status; work, employment, and career opportunities; income and material; learning, study, and training opportunities; subjective welfare and health; autonomy (housing, financial, decision making, etc.). The total number of primary indicators was 367. A differentiation of youth life chances indexes was constructed based on the representative survey research results in 2023 (N=1209). The indexes reveal the diversity and patterns of youth life chances (age, gender, education, employment status, family background, etc.). The results of this study demonstrate the differentiation of young people's life chances but also allow the development of public policy recommendations

941

at a national and regional level. The Lithuanian Science Council funds this research.

Russian Youth Experience of Downward Mobility and Achieving Recognition in the Current Context.

Ekaterina Pavlenko

National Research University Higher School of Economics, Russian Federation

The paper focuses on the changes that occurred in downward mobile young people's understanding of their social positioning and mobility, with particular interest in how young people in Russia today draw boundaries between social groups and themselves, and how they construct what becomes the foundation of their personal understanding of dignity and recognition. We are looking at the way young people perceive their past choices with regard to education and work within the perspective of the future they strive to achieve.

We are using the data gathered within "Trajectories in Education and Careers" longitudinal research project. We have collected in-depth biographical interviews with participants of the national representative panel. The sample includes three groups of youth, depending on their answers to the question about their status in relation to their parents' (subjective social mobility): upward, downward and reproducing. Our informants were interviewed in the summer of 2023, at the age of 24-26, amounting to 56 interviews. All informants signed consent agreement forms, and their data was anonymized. We are using Michele Lamont's latest work on the concept of recognition, as well as Annette Lareau's insights into the role of upbringing practices in order to look into meaning structures that shape individual trajectories. We hope to show how understanding of downward mobile young people social stance and the means to establish the life they wish for themselves has changed over the years, and how they perceive their future.

RN30 | T07_02: Youth, social relationships and belonging

Ethnic Homophily in Friendship Selection among Czech and Ukrainian Secondary School Students in the Czech Republic

Ákos Bocskor

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

The paper investigates ethnic homophily in friendship selection among secondary school students in the Czech Republic. As several European countries are becoming increasingly multi-ethnic, the salience of harmonious interethnic relations is widely recognized. However, an extensive body of research has demonstrated that, even in diverse school settings, ethnic homophily (preference for same-ethnicity peers) is prevalent in friendships. While in-group friendships can provide some benefits for immigrant children, the benefits of having native/majority friends have been widely documented.

Data from the first wave of the Czech Education Panel Survey (2023) is used, which includes over 20,000 students (aged 15-16) from 249 schools in the Czech Republic. Following the Russian invasion of Ukraine in 2022, the Czech Republic hosted over half a million Ukrainian refugees, which made them the largest foreign-born ethnic group in the country. Consequently, our analysis focuses on interethnic friendships among Czech and Ukrainian students at school.

The paper sets out two goals. First, drawing on intergroup contact theory and social identity theory, we investigate the relationship between ethnic homophily and ethnic diversity across classrooms. Second, applying exponential random graph models, we investigate to what extent can ethnic homophily be explained by network characteristics (such as reciprocity and transitivity) and by homophily along other dimensions including socio-economic status and peer popularity. Additionally, we control for structural factors such as classroom size in our first set of models, and for gender and the level of empathy in our network models.

942

Relationship between School Climate and Sense of Belonging among Students of Diverse Ethnic Backgrounds

Svetlana Jovic[1], Natasa Simic[2]

1State University of New York, Old Westbury, United States of America; 2University of Belgrade, Faculty of Philosophy, Institute of Psychology

Educational contexts serve as significant agents of socialization, contributing substantially to the development of not only academic skills but also of a diverse range of socio-emotional competencies. An important factor linked to students' satisfaction and general level of well-being is sense of belonging. Alarming PISA results demonstrated that 17-40% of 15-year-olds are dissatisfied with school and that one in four adolescents have low feelings of belongingness (Willms, 2003). More specifically, studies suggest that the meaning of belonging may be different for students of different ethnicities who experience differential levels of discrimination (Murphy & Zirkel 2015), which consequently affects the sense of school belonging among these students (Brown & Tam, 2019). Therefore, our paper focuses on the sense of belonging as it relates to individual variables (e.g., ethnicity, SES, and gender) as well as to broader, school-level variables, such as multicultural climate and ethnic discrimination in schools. Participants (N=904; Mage=16.24, SD=1.05) were recruited from 20 high-schools located in multi-ethnic regions of Serbia. Ethnically, students identified as Serbian (ethnic majority; 69.9%), Bosniak (11.1%), Hungarian (10.8%), and Roma (8.2%). For this paper we used a single-item 5-point Likert type measure to assess school belonging ("I feel I belong to this school"), Delaware School Climate Scale (DSCS), version for students (Bear et al., 2011, 2014a; 2014b), and a 12-item five-point Likert-type scale assessing ethnic discrimination by peers, teachers, and the institution. Individual-level variables were not significantly associated with the sense of belonging. School factors, however, proved to be significant predictors, especially those related to bullying, teacher-student relationship, and students' engagement. This indicates that a greater focus should be placed on contextual–school-level factors instead of the intrapersonal ones.

Exploring Campus Green Spaces and Student Sense of Belonging through Photovoice

Jennifer M. Pipitone[1], Svetlana Jović[2]

1University of Mount Saint Vincent, United States of America; 2State University of New York Old Westbury, United States of America

Access to green spaces has been shown to increase sense of belonging within urban environments. However, few studies have explored the role campus green spaces may play in contributing to students' sense of belonging within their campus community. Drawing from a semester-long photovoice project in New York City that invited 26 students to capture photos of campus green spaces and voice preferences, concerns, and potential improvement to the college community through an exhibition, this presentation explores the multiple roles campus green spaces play in student lives. Enacted in student photo-making and narrating were several themes. First, while students frequently photographed the campus great lawn and centrally-located plaza, the most common green spaces were miscellaneous, with a third of all photos featuring areas between buildings or along pathways and roads. Relatedly, although uses included socializing with friends and taking a break between classes, the most common was passing through (i.e., noticing nature while walking by). Finally, green spaces served as symbolic representations of students' lives (e.g., changing leaves representing growth) and their college careers (e.g., stairs and hills representing work ethic/steps in life). Taken together, these findings suggest that while actively using green spaces may be important, even the green spaces observed walking through campus have meaning and can promote student sense of belonging. Institutional and pedagogical implications of using photovoice methodology will be discussed as a way to foster campus cohesion and empower students to address social and environmental issues on campus, and in their communities of the future.

Trust, Distrust and Belonging in East Helsinki

943

Tarja Tolonen, Anni Nyyssölä, Hanna Yrjänä

University of Helsinki, Finland

Trust, Distrust and Belonging in East Helsinki

Tarja Tolonen, Anni Nyyssölä and Hanna Yrjänä

University of Helsinki, Sociology

In our study we focus on young people's relationship with their neighbourhood. In this paper we ask: how do young people relate to their neighbourhood and see their future and life there? In our ethnographically inspired qualitative research in East Helsinki, we have conducted interviews with 17-20-year-olds, who mainly belong to racialized minorities.

In our analysis we draw inspiration from Nira Yuval-Davies' (2006) dimensions of belonging. Our analysis takes place on two levels. First, we focus on general distrust of East Helsinki created by the media, statistics, city planning and populist politics. East Helsinki represents a stigmatized place of disadvantage, justified by high unemployment, low-income-rates and a high number of foreign-language-speaking population and is seen in media as one potential breeding ground for youth crime. The academic and media representations of East Helsinki materialize in urban regeneration programs which attempt to fix things from top-down. Secondly, we analyse young people's feelings of belonging, including trust and distrust, their communities and social relations in East Helsinki. Without dismissing the experiences of disadvantage, our aim with this paper is to add nuance to the at times black-and-white discussion of segregation and to increase the understanding of the perspectives of the young people living in territorially stigmatized areas.

RN30 | T08_01: Youth, work and education

My Confinement Experience: Analysis of Biographical Narratives of Young Students in Transition to Adulthood and Higher Education

Sandra Coelho, Cláudia Carvalho Amador

Universidade Católica Portuguesa

We conducted a research involving 43 first-year students of Economics and Management from Católica Porto Business School, focusing on their digital life experiences during the initial wave of the Covid-19 pandemic. Biographical narratives were applied. The findings reveal that social networks served as crucial allies against isolation but also triggered feelings of discomfort. The hastily implemented distance learning, lacking preparation, led to widespread dissatisfaction due to challenges faced by teachers and the students' susceptibility to distractions. Additionally, we investigated the transitions to adulthood and higher education during the pandemic for these young individuals. The absence of significant events, such as birthday parties and graduation trips, was highlighted as distressing. Despite comfortable material conditions, the darker side of the pandemic was perceived in the realm of leisure. In summary, this study provides an in-depth understanding of young individuals' experiences during confinement, addressing both the digital dimension and transitions to adulthood, enriching our comprehension of the challenges faced by this generation in times of a pandemic.

Narratives Of Growth At The Bottom Of The Knowledge Economy

Maria-Carmen Pantea

Universitatea 'Babes Bolyai', Romania

Many graduates from the Social Sciences and Humanities in Romania start their employment in the thriving business service sector. This entails work in finance, accounting, procurement, data entry and customer support: all areas claiming a stance in the 'knowledge economy'. Whilst many multinationals gradually located low-end office work in Romania, it is uncertain whether the sector can sustain career progression for large cohorts. Nevertheless, the companies advertise the promise of 'growth' and the concept is gaining currency among the graduates themselves. Also, an entire professional layer emerged, with the purpose of fostering growth at/ through employment in the sector.

Informed by over 100 face-to-face interviews with young employers in the business service sector, HR staff and managers at different levels of seniority, the presentation asks how the main actors conceptualise 'growth'. In this process, the research also asks: What it takes to grow: who grows in companies, when and under which enabling circumstances? What are the (expected) paths to growth and how strategic thinking or pure luck play a role? Ultimately, what does 'de-growth' look like and what the refusal of growth tell about the changing nature and meaning of work?

The presentation suggests that despite its pervasiveness, companies and graduates alike, rarely define the concept. When prompted, young people tend to display rather diffuse projections, and less, strategic plans and pathways. Companies' representatives project growth in the labour market by and large, turning to 'personal growth' as a strategic move to circumvent the promise of 'in house'' career advancement.

New High School Reform in Brazil: Youth Experiences and Projects in Urban Outskirts

Felipe de Souza Tarábola[1], Maria Carla Corrochano[2], Elmir Almeida[3]

1Universidade de São Paulo – USP, Brazil; 2Universidade Federal de São Carlos – UFSCar, Brazil; 3Universidade de São Paulo – USP, Brazil

In recent decades and in different national realities in Latin America, public secondary education systems have undergone several reforms in their structural formats, curricular proposals and purposes, together with the democratization of school access and attendance, increasing the presence of young people from different socio-economic backgrounds. Based on a dialogue between theoretical references from sociological studies of education and youth, this paper focuses on the school experiences and future projects of young people living on the urban outskirts in the face of the current reform of secondary education in Brazil. The consequences of this reform had great repercussions on the Brazilian public scene, especially considering the implementation of training itineraries and the curricular component called "Life Project". Throughout 2023, eight discussion groups were held with young people from schools located in urban outskirts of the State of São Paulo, one of the first to implement the reform. The results show a mismatch between young people's expectations regarding secondary education and the changes implemented in schools. There are also negative effects on plans for access to higher education, which had been a new reality among the popular classes, following the adoption of affirmative actions in the country in recent decades.

The authors of the proposal are undergraduate and graduate professors at the University of São Paulo and the Federal University of São Carlos, focusing on sociological studies of youth, investigating the relationship between young people and education, work and collective action. They participate in the Brazilian Youth Research Network.

Higher Education, Affective Governance and Ideas of Youth Employability

Minna Marita Nikunen

University of Jyväskylä, Finland

In my paper, I will analyse the current ideals of 'employability', especially affective / soft skills. I ask how these ideals are transmitted by higher education institutions to students, and how students interpret and use them in their identity work. These ideals are often global but they are implemented locally, in this case in Finland. I call the overall process 'affective governance': the demands to develop affective capacities or soft skills are seen essential for young adults as employees/entrepreneurs-in becoming.

In the analysis, I use 1) materials from Finnish universities' web sites on student employability, 2) policy documents on youth employability created by Finnish ministries and European commission and 3) students writings on their expectations towards university education in terms of employability. In Finland, there has been a longstanding reliance to entrepreneurialism, especially as developing an entrepreneurial mind-set – as a central important component in increasing employability. In this paper, I claim that the current idea of tuning one's mind to entrepreneurial frequency has incorporated some ideas of therapy culture, such as personal growth, self-assurance, happiness and emphasis on affective capacities and soft skills.

RN30 | T09_01: Youth, climate justice and activism

Framing Climate Justice From an Intersectional Youth Perspective: Fridays for Future

Antje Daniel

University of Vienna, Austria

In August 2018, 16-year-old Greta Thunberg began demonstrating for climate justice in front of the Swedish parliament. From this protest arose a global protest movement under the slogan Fridays for Future, which, according to organizers, covered 163 countries and over four million people in September 2019. Since 2019, youth are at the forefront of addressing the climate crisis and are able to mobilize masses for climate justice (Almeida 2019, De Moor et al. 2021). With Fridays for Future, a new form of youth activism emerged, unique in its global scope and the low average age of the activists (Daniel & Deutschmann 2020; De Moor et al. 2020). Although all protests take place under the globally shared master frame of climate justice, youth demand vary in Austria. Youth in Austria contribute to linking globalising orientations (master frames) of climate justice with context-specific problems. Climate activism thus configures itself between global and local conditions, but also depends on gender, education and other social categories. Against this background, the presentation aims to highlight the intersectional framing of climate justice in Austria climate activism. In so doing, the first question that is addressed is, who are the young people engaged in the climate justice movements? What motives drive activists and how do youth frame climate justice from an intersectional perspective reflecting local conditions, gender, age or socio-economic background and education? This perspective on youth environmental activists is important to understand the relevant ecological conflicts and their political negotiation by young people. The presentation results from the research project on youth activism in Austria, Bangladesh and Uganda and is based on a mixed methods research.

945

How Can Youth Work Support Transformative Youth Activism?

Sarah Ward[1], Maureen McBride[2]

1University of Edinburgh, United Kingdom; 2University of Glasgow, United Kingdom

For youth in low-income neighbourhoods in Scotland, multiple crises have deepened existing poverty and inequalities. The increasing educational attainment gap causes many young people to leave school with no positive destination. Young people report that their neighbourhoods are not good places to live due to a lack of affordable housing and sustainable jobs. Further, youth from low-income

neighbourhoods are often pathologized and further marginalised for their lack of economic and civic participation. Meanwhile, the local resources available to disadvantaged young people are being eroded. State-funded youth provision has been cut, with responsibility for youth delivery devolved to community-based organisations that are themselves frequently victim to precarious employment and funding.

Within this challenging landscape, pockets of potentially transformative relational work support young people to develop agency and voices for social change. Youth work organisations deploy a range of creative youth-led activities focused on promoting youth voice and developing participation opportunities for marginalised youth. Using holistic, trauma-informed and situated approaches, youth workers build responsive and trusting relationships with young people. This paper explores the potential for transformation offered within such settings, given the limitations such organisations have to address structural inequalities. Based on a research project in Scotland exploring the question, 'What are the barriers and enablers to working-class youth activism?', we employed qualitative in-depth interviews and focus groups with youth activists across three youth organisations to examine the role of identities, intersectional inequalities, activity types and resources in supporting disadvantaged young people to develop agency and voice towards action for change.

Generation Dread? Young People and the Hope of/for Intergenerational and Climate Justice

946

Peter Kelly

Deakin University, Australia

In much of our work in the Young People's Sustainable Futures Lab (YPSFL) we continue to situate many of the issues that concern us about young people's pasts, presents and futures – for example, the pandemic and its consequences, the climate crisis, the crises of global capitalism, the mass extinction of bio-diversity – in wider debates and discussions about the impacts that different groups of humans have had, and continue to have, on the earth systems that sustain the complexity and diversity of life on the planet. In this presentation we will draw on more than 100 video interviews we conducted with young people in Melbourne (AUSTRALIA) during 2020-2023 to situate aspects of this ongoing work. Drawing on theories of intergenerational and climate justice, and posthuman understandings of the complex entanglements of the human and more-than-human that shape young people's hopes for living well in the Anthropocene we will explore how sociologies of young people can contribute to imagining what a 'radical politics of hope' (Braidotti 2013) for intergenerational and climate justice might mean for 'Generation Dread' (Wray 2023) – those contemporary populations of young people in different places who are experiencing the sorts of generational anger and emotional responses that are evident in the 'climate endgame of the historical present' (Frantzen 2023). In thinking with what many of these young people told us, we will suggest that any exploration of the promise of intergenerational and climate justice must acknowledge that if 'climate change accumulates in our bodies, it accumulates in our minds and brains too, and in our nervous systems. It sediments as a generational experience' (Frantzen 2023).

RN30 | T09_02: Youth practices and substance misuse

A Qualitative Research on the Relationship Between Youth Values and Substance Use

Berrin Güner, Müge Uysal

Adnan Menderes Üniversitesi, Turkiye

With advancing technology, global mobility and ease of transportation, drug production and addiction has become a problem that concerns not only Turkey but the whole world. The decreasing age of starting substance use has increased the importance of studies aimed at understanding and analyzing the world of young people. The lack of a value-centered philosophy of life on the road to substance use makes young people very defenseless and fragile.

The aim of this study is to investigate the increasing substance addiction among young people from the perspective of transformation in social values. Being able to enter the world of meaning of young people who use substances and learning their ideals and goals will enable us to better understand substance addiction, which prevents the individual from thinking rationally and making decisions, and to produce solutions. The most challenging aspect of this study is that the subject content is sensitive and made drug users uneasy. Therefore, snowball sampling method will be used to determine the participants in this research spread over time. Pre-prepared semi-structured interviews will be applied to individuals aged 15-30 living in settlements such as Ilıcabaşı, Orta Mahalle and Germencik, where substance use is particularly concentrated in Aydın province. This research aims to understand their future plans, life philosophies, personal boundaries and values through open-ended questions prepared for the participants' experiences and perceptions. The effect of the values revealed in the findings on the relationship between substance use behaviors and addiction will be analyzed sociologically.

The Relationship Between Tobacco Use And Life Satisfaction Among Serbian Students

Mihajlo Djukic, Dusko Bodroza

Institute of Economic Sciences, Serbia

Tobacco use is responsible for 8 million deaths annually. Most people start smoking in their teenage period. About one third of those who start using tobacco on a regular basis die from tobacco-related diseases. The most important determinants of smoking initiation refer to smoking status of the parents and friends. However, some studies found that onset of smoking is also associated with depression and low life satisfaction. Other studies reported bidirectional relationship between life satisfaction indicators and tobacco use suggesting that tobacco use could also be responsible for personal wellbeing. Youth are often aware of the smoking consequences, but often underestimate the risks since expect to stop before the negative health outcomes occur. Smoking prevalence rates in Serbia, although slightly decreasing over the last decade, are still higher compared to most of the European countries. This research aims at analyzing relationship between smoking status and life satisfaction indicators among students (18 to 30 years old) in Serbia. The analysis is based on the sample of 1,430 respondents out of which 26.6% consume tobacco products including those being occasional ("social") smokers. Analysed life satisfaction and wellbeing indicators include subjective perception of physical and mental health and were assessed in a 1 to 7 Likert scale. Additionally, use of alcohol and gambling practices were also taken into account as control variables. Obtained results could provide valuable information for the policy makers referring to redesigning tobacco control and youth policies.

Young People and Different Drinking Cultures

Airi-Alina Allaste[1], Sara Rolando[2], Torsten Kolind[3], Venus Athena[3], Gaia Cuomo[2]

1Tallinn University, Estonia; 2Eclectica, Italy; 3Aarhus University, Denmark

947

The paper explores the relationship between perceived cultural norms of alcohol consumption and social context from the perspective of young adults. Today's youth are the first generation to grow up in a globalized world that is largely discussed in the context of diminishing national and regional differences. However, even though different drinking cultures are believed to be merged due to the increasing homogenization of practices and norms of alcohol consumption, some studies suggest that the cultural position of alcohol remains different in European countries. The paper aims to analyse how young adults from Estonia, Denmark, and Italy understand excessive drinking, highlighting both similarities and differences in drinking patterns, and demonstrating how that are related to broader historical developments and contemporary attitudes.

The empirical part relies on 24 focus group interviews (N=128) conducted in spring 2022 with young adults from Estonia, Italy, and Denmark. The focus group interviews were conducted using the Reception Analytical Group Interview (RAGI) method, which utilized two video clips of drinking scenes in distinct contexts as stimuli for eliciting collective meaning-making processes, experiences, feelings, and perspectives of alcohol use. All group discussions were recorded with participants' permission, transcribed verbatim, and analysed using the software NVivo or Atlas-Ti. For the paper, analyses of the data are structured three-dimensionally: the (un)acceptability of heavy drinking, "othering" based on alcohol use, and gender-specific drinking norms.

RN30 | T09_03: Youth, social bonds and lifestyles

Title Case: Sociological Analysis of the Phenomenon of Youth Gang in Greece. Forms of Appearance, Member Characteristics and Suggestions for Dealing with it

Theano Manoudaki

Panteion University, Greece

One of the characteristic features of most forms of juvenile delinquency is collective behavior, whether it concerns delinquent actions of minor severity or organized criminal behavior oriented towards the acquisition of profit. Juvenile gangs are differentiated from other youth groups with deviant behavior not only because of their delinquent activity but mainly because of the degree of organization within the group and the particular identity that members form for themselves and for the group itself.

The present study deals with the phenomenon of youth gangs as it has developed in Greece during the last decades and is based on a qualitative analysis of interviews with gang members in the wider area of the city of Athens. Through the analysis of the interviews, both the reasons why young people join a gang, as well as the degree of connection and dependence on it, are revealed. It is also analyzed the way in which they perceive their role and themselves in it as well as the identity they form through their participation. It also examines how group members organize their actions and the use of violence within and outside of the group. Finally, the relationships and perceptions of gang members towards the school, the family and the police will be discussed.

Distinctive Features of Hikikomori Lifestyle Among Russian Youth

Ekaterina Orekh, Elena Bogomiagkova

St. Petersburg State University, Russian Federation

The report aims to analyse the phenomenon of strong expression of digital escapism in Russia, which can be found in a specific lifestyle referred to as hikikomori. Under the term «digital escapism» we understand practices of using the virtual environment (dumscrolling, web surfing, video games, online gambling, virtual communication) in order to distract from everyday social reality. Modern hikikomori are characterized by long periods of voluntary isolation from the social environment in real life, lack of work or study, and active or even excessive use of the Internet. Studied since 1998 as a phenomenon of Japanese society, today the lifestyle of hikikomori ceases to be specific to that culture. Every year a number of studies appear which document similar phenomena in other countries, and Russia is no exception.

The hikikomori phenomenon in Russia has a short history and concerns mainly young people. There are very few cases of empirical analysis, reduced to a quantitative survey conducted on one of the Internet platforms and to the analysis of publications in the thematic group of the social network VKontakte. Access to these respondents is difficult, and at the moment they can only be judged by their representations in virtual space, making our research particularly relevant.

The purpose of our study is to analyze the phenomenon of hikikomori lifestyle among Russian youth. For our tasks, we use the method of in-depth interviews with youth representatives, who have some similar lifestyle features to Japanese hikikomori.10 in-depth interviews were conducted in August-November 2023.

Unmasking Identity, Masking the Entertainment

Ayça Oral Aksu

Mimar Sinan Fine Arts University, Turkiye

This study examines the evolving cultural landscape of cosplay in Turkey, tracing its progression from a niche hobby to a transformative practice, especially impactful among the youth. Through ongoing ethnographic research started in 2021, the research uncovers cosplay's role in navigating identity, fostering social connections, and challenging established norms within the intricate socio-political context of Turkey. Grounded in critical youth studies, performance studies, and cultural studies, the research analyzes cosplay as a space for identity construction and performance, investigating how individuals adeptly negotiate gender norms, racial representations, and societal expectations. Emphasizing cosplay's function as a hub for community building, inclusivity, collaboration, and a sense of belonging among Turkish youth, the study employs a nuanced methodology involving ethnographic fieldwork, semi-structured interviews, and visual documentation. It highlights cosplay's empowering impact on young individuals, enabling them to articulate their identity, challenge societal norms, and foster supportive communities.The research explores the intricate interplay between youth culture and the nuanced political landscape, examining how cosplayers navigate this evolving socio-political milieu addressing social issues, such as political polarization and inequalities through creative expression. The significance lies in providing insights into the under-researched cultural sphere, highlighting the creativity of young people and examining how cosplay has become a distinct cultural sphere in Turkey that empowers young people to express themselves, build communities, and negotiate their place within a complex social and political environment by contributing to the pursuit of a more free social and cultural landscape.

RN31 | Ethnic Relations, Racism and Antisemitism

RN31 | T01_01: Antisemitism after 7 October, Memory and Rethinking

Between instrumentalization and denial: Rethinking antisemitism in Spain after October 7th.

Marta Simo[1], Marta Marín-Domine[2], Alfons Aragoneses[3], Alejandro Baer[4]

1Universitat Autònoma de Barcelona, Spain; 2Wilfrid Laurier University, Canada; 3Universitat Pompeu Fabra, Spain; 4Consejo Superior de Investigaciones Científicas, Spain

In the recent research project "Sites of Tension: Shifts in Holocaust memory, anti-Semitism and political contestation in Europe (2020-22)", the results for Spain aligned with those of the other four countries studied. Far-right nationalist parties engaged in revisionism of World War II narratives, including the distortion of the Holocaust, while at the same time showing openly pro-Israeli attitudes. During the same period, Spanish far-left parties showed very little explicit antisemitic discourses while they often diluted the Jewish Holocaust by reinforcing other persecuted victims of the Nazi regime.

However, since the October 7th attacks in Israel a new discursive constellation is emerging in Spain vis-à-vis Jews and Israel, which has common characteristics with other Western countries, but also specific national traits. On the one hand, there is a revival of traditional anti-Jewish tropes that are unacknowledged as such across the political spectrum and that emerge in the representation of Israeli military actions. On the other, the proliferation of speech about antisemitism itself, in the form of accusations by conservative and far-right actors, or as defensive denial by the left (antisemitism seen exclusively as a rhetorical weapon to shield Israel from criticism), configures a zero-sum game that severely limits a transparent and critical debate on the problem of antisemitism in Spain.

This presentation will address the challenges of combating antisemitism in this new discursive constellation, with a specific focus Holocaust memory and its place in postcolonial studies, forcing a relation between the historical past and the current political situation in Israel.

The Racisms of the Postcolonial

Thomas Doerfler[2], Eberhard Rothfuss[1]

1University of Bayreuth / Jena, Germany; 2University of Bayreuth / Jena, Germany

Postcolonialism has become one the leading ideologies in academia and in certain fields of (institutional) politics. Based on the narratives of diversity, de-colonialisation and a general critique on ‚western' epistemes, it claims that ‚western' philosophy derived from this hemisphere can't contribute to ‚southern' (aka ‚non-western', ‚subaltern', ‚indigenous ' etc. knowledge. It's second pillar is the classic left political ideology of the victim-narrative, which says that all non-western cultures are a consequence of the ‚colonial' heritage of these systems, as if they have no agency by themselves but are still only ridden by the past.

Third fundament is what Lacanian psychoanalysis calls the dialectics of the »master signifier«: every victim-narrative needs a ‚betrayer' who has ‚robbed' the identity of oneself. The most popular of such constructs in left ideology is ‚Capitalism', ‚Imperialism', ‚colonialism' or similar. In antisemtism it is ‚the jew' or jewish culture/politics etc. When it comes to Palestine we face a telling flip of ideological positioning within the left: confronted with the surely unsatisfiying situation of the people (the victim) it must be clear that there is a ‚betrayer' of their cause (the robber) – that is, well, Israel. To fit it into the aforementioned scheme, the state of the ‚ultimate victim' (Zizek) is turned into the ultimate perpetrator: to defend their cause, like in the actual situation since October 2023, they became like their tormentor and commit a ‚genocide'. I want to trace the roots of this construction being a false/uncritical ‚identity logic' (Adorno) that reveals with every ‚evidence' it gives it's racist ground: truth is relative and belongs to context (ex-Prof. Gay, Harvard) – except for one's own (victim-)cause, which bears the ‚ultimate truth'.

Guilt and Defence in the German Discourse on 7 October

Elke Rajal

University of Passau, Germany

The lecture focuses on discourses on the German left and right on (German) guilt in the context of 7 October.

While the German extreme right has long denied responsibility for Nazi crimes, in recent years the so-called New Right has popularised the idea of a cult of guilt. It is not guilt per se that is denied, but the culture of remembrance associated with it is massively questioned, and it is denied that guilt should entail corresponding responsibility. Political action and cultural practices that refer to German guilt are dismissed as fetishistic or cultic.

In the course of Documenta 15 (2022) and in the wake of the 7 October pogrom (2023), actors who see themselves as post-colonial leftists suddenly demanded that Gaza/Palestine be freed from German guilt. The pro-Israeli actions of the German government and the outrage over the pogrom are seen as exclusively determined by the discourse of German guilt. Furthermore, guilt is reversed when it is claimed that Israel itself is to blame for the Hamas pogrom.

The lecture reconstructs the influence of the two German historians' disputes ("Historikerstreit 1.0" in the 1980s and "Historikerstreit 2.0"/Catechism debate since 2021) on right-wing and left-wing discourses around an alleged fetishisation of guilt. It shows the dynamics of guilt deflection

949

in the discourses around 7 October in the various political camps. And it relates current German discourses on guilt to studies of memory and dominant forms and functions of antisemitism. From the perspective of Critical Theory, in particular Adorno's writings on guilt and defence, it examines the unifying elements as well as the different derivations of defensiveness against guilt on the German left and the right.

RN31 | T01_02: Historical and Conceptual Perspectives on Racism and Antigypsyism in Europe

500 Years A Slave: The Historical Political Economy Of The Racialisation Of Roma (Or A Case Study Of Racial Capitalism Over The Longue Durée)

Ashli Mullen

University of Glasgow, United Kingdom

The history of Roma in Europe is a history of violent persecution and exploitation, in which the forces of the state and capital loom large. From over 500 years of enslavement (Beck, 1989) to attempted extermination during the Porrajmos or Samudaripen (in which at least a quarter of a million Romani people, or around a third of the total European Roma population, were murdered), state racism and state-sanctioned exploitation cast their shadows over half a millennium. These historical facts remain largely under-theorised within the mainstream of the sociology of racism yet are ripe for exploration. This is especially so given that the sociology of racism has recently been enriched by transatlantic interdisciplinary conversations on 'racial capitalism'. Yet to speak of racial capitalism is not to treat the dual systems of racism and capitalism as synonymous, nor to collapse the two. Whilst centuries have been marked by a grotesque symbiosis of their expropriation and violence, a sufficient theoretical account of their embroilment must grapple with their independent efficacy. That is, with how the twin histories of racism and capitalism grew to become entangled across time and place in the making of the modern world. In this paper, I read against the grain of dominant perspectives on racial capitalism, from political Marxism to postcolonial studies, to re-tell this story. In doing so, I argue that the case of the racialisation of Roma complicates these dominant accounts, whilst posing generative new insights of its own.

950

How Can A Materialist Theory Of Racism Contribute To The Critique Of Antigypsyism?

Anna-Sophie Schönfelder

Justus-Liebig-Universität Giessen, Germany

Antigypsyism is a relatively new subject of research compared to racism or antisemitism. Discussions about the special nature of this form of domination draw parallels with antisemitism on the one hand, as people identified as

"gypsies" are considered to be harmful to the community and without a place, similar to Jews (End 2016). On the other hand, there are similarities to racism, as antigypsyism often manifests itself through social neglect and claims of an inferior culture (Bhabha et al. 2017). Such comparisons can be helpful, precisely because they make it clear that antigypsyism is not subsumed within other forms of domination.

However, if we want to do conceptual justice to the distinctiveness of antigypsyist ideology and practice, further specifications are necessary. To this end, I will draw on the differentiation between social and racist dimensions of antigypsyism proposed by Wippermann (2015) and Tittel (2020). The connection between these two dimensions is also central to current debates on a capitalism-critical foundation of a theory of racism (see for example Reed et al. 2009; Bhattacharyya 2018; Egger 2023). In my presentation, I explore to what extent antigypsyism can be included in a materialist analysis of racism. Would this allow us to decipher ethnicized accusations of work-shyness and criminality as projections arising from the conditioning of people into bourgeois subjects? Or does a simple derivation from capitalist dynamics rather lead to functionalist conclusions that lack the explanatory power for experiences such as spatial segregation or generalized mistrust that people identified as "gypsies" often have?

Racialisation of Roma and Muslims in a Nation State: the Case of Poland

Michal J. Buchowski

Adam Mickiewicz University in Poznan, Poland

The problem of the racialisation of the 'Other' in Central Europe is linked to nationalist ideologies. These are based on an exclusivist image of an ethnically homogeneous state. The 'Other' is seen as a contamination of the immaculate body of the nation and a threat to its existence. Although Muslims (commonly classified as 'Arabs') and the Roma are perceived in different ways, they are orientalised and racialised in a similar way, often in an overtly racist manner. With regard to these numerically marginal minorities in Poland, symptoms of a fear of small numbers can be observed. In the defence of an imaginary national and religious homogeneity and in a cultural fundamentalist mode, they are portrayed in the media – both linguistically and visually – as a major threat. At the same time, they provide ideas about the mythical 'Other' that are evoked and intertwined into complex images. Roma and Muslims embody negative attributes that are rejected as unacceptable by dominant group of 'Us' and incompatible with the nation's culture. Representations of the Other are politicised by those who produce discourse as they seek to draw clear boundaries around and to consolidate the nation. These 'fantasies' are perceived as real and have an impact on intergroup relations at the grassroots level. Ethnographic data highlighting these processes, particularly discrepancies between nationally circulated stereotypes and everyday practices in local communities where dominant majority and minorities coexist, resulting from an ongoing (2021-24) study on "Othering and racialisation of Roma and Muslims in a nation-state," will be presented.

RN31 | T02: Antisemitism after 7 October: Conceptual and Practical Implications

Antisemitism and Misogyny in today's Anti-Democratic Authoritarian Rebellions, exemplified by Incels and Jihadists

Gesche Gerdes

University of Passau, Germany

In my paper, I will focus on the so-called incel movement as a contemporary expression of anti-democratic authoritarian rebellion in which antisemitism and misogyny are intersectionally fused.

Incel is an acronym for involuntary celibate and serves as a self-description for thousands of young heterosexual men who gather in online forums to share their deep frustration at not finding a sexual partner. Incels blame modern society in general, and women in particular, for their loneliness. In virtual communities, they reinforce each other's worldviews, sometimes radicalising themselves to the point of committing terrorist acts. Their hateful ideology is not only directed at women and what incels perceive as feminine, but also at Jews and what they perceive as modern Western capitalist society.

I will analyse the incel movement using the framework of the authoritarian personality developed by Theodor W. Adorno and others in the 1940s, as well as Karin Stögner's concept of the intersectionality of ideologies. This approach allows me to focus on the ways in which antisemitism and misogyny intertwine to form the anti-democratic authoritarian syndrome under today's neoliberal economic conditions, while also highlighting the importance of sexuality and gender in the constitution of authoritarian personalities.

The Hamas attack on Israel on 7 October 2023 demonstrated the lethal combination of antisemitism and misogyny, that poses one of the greatest contemporary threats to emancipation, freedom and democracy in the so-called Western world and beyond. I will conclude my talk by applying my analysis of the incel movement to Islamist jihadism as another contemporary expression of anti-democratic authoritarian rebellion.

951

The Implications of Post-October 7 Expressions of Post-Holocaust Antisemitism for Western Democracies

Gerald Steinberg

Bar Ilan University

This analysis will build on the existing frameworks for studying post-Holocaust antisemitism, incorporating a database on post-October 7 manifestations, in order to consider the wider political implications for Jewish communities and, more broadly, western democracies. In particular, the paper will examine the role of social and political alliances that adopt antisemitic agendas under headings such as intersectionality, decolonization, solidarity, etc. In addition, we will consider these developments in the light of the debate over the application of the IHRA working definition in frameworks such as universities, labor unions, media platforms, political parties and other core institutions.

Rising Antisemitism and Discourses on Antisemitism and Israel in Germany after the Hamas Massacre of October 7: An Analytical Overview

Kim Robin Stoller

International Institute for Education and Research on Antisemitism, Germany

In the aftermath of the tragic events of October 7 orchestrated by Hamas, there has been a disturbing escalation of antisemitic incidents and crimes in Germany, as well as a partial shift in the discourse of the protesters. This paper offers a comprehensive analysis of these developments, drawing on data from civil society, state institutions, social media, and the media. A noticeable increase in public demonstrations, many of which have been marked by antisemitic episodes, signals a significant shift in public discourse and, to some extent, perception.

This study examines the nuanced changes in rhetoric and sentiment toward Hamas, Israel, and the nature of the demonstrations themselves. A critical examination of the language used in these anti-Israel protests reveals novel approaches to Israel, German historical contexts, and the Holocaust. This paper systematically analyzes the topoi employed by the demonstrators, highlighting a shift in narratives and public opinion.

It also identifies and characterizes the key actors in these demonstrations, exploring their perspectives and motivations. The analysis employs a multifaceted methodological approach, integrating qualitative and quantitative data to provide a holistic understanding of the current antisemitic climate in Germany.

Through this work, we aim to shed light on the dynamics of contemporary antisemitic mobilization in Germany and offer insights into the societal and political implications of these developments.

Conspiratorial Social Critique And Antisemitism

Balázs Berkovits

Comper Center, University of Haifa, Israel

Since the work of Karl Popper there has been ample discussion about critical social science potentially becoming conspiratorial, due to the way they explain social phenomena. Some theoreticians nowadays, criticizing Popper, even argue that critical social science is by nature "conspiratorial" and "paranoid", as suspicion lies at its essence. However, this dangerous assumption would mean that the presupposition of conspiracies cannot and need not be avoided and that there cannot be a clear-cut distinction between conspiracy theories and social critique, neither on epistemological nor other normative grounds.

A detailed examination of the relationship between three terms designating practices of interpretation is needed: conspiracy theories, critical social science, and antisemitism. The link between conspiracy theories and antisemitism is obvious; however, a hypothesis has to be tested: whether the links between conspiratorially minded explanations and social critique have the effect of rehabilitating antisemitic critique as social critique? Whether the anti-hegemonic stance expressed by conspiratorial explanations passing as critique legitimizes antisemitic expressions on the "progressive left"?

Supposedly, this is the case when Jews are perceived as part of the power elite, let it be financial or political; or when they become the epitome of the privileged classes, "betraying" their original position of outcasts (like when there is question of "Jewish whiteness"); or again, when they are pictured as being favored by the state and its apparatuses to the detriment of other groups or minorities (termed as "state philosemitism").

952

RN31 | T03_01:
Antisemitism, Perceptions, Practices and Institutional Responses

Police Statistics on Antisemitism in Germany. Results from a Civil Society and Practice-oriented Research Project

Colin Kaggl

Bundesverband RIAS e.V., Germany

In Germany, the October 7 massacre and the subsequent rise in antisemitic incidents prompted policymakers to question the effectiveness of the official German political – and hate-crime statistics (KPMD-PMK) (see Buchsteiner 2023). However, the accuracy of and deficits in the official statistics have long been the subject of critical debate by the Federal Association of Departments for Research and Information on Antisemitism (Bundesverband RIAS) and other representatives of civil society.

A major point of criticism is a divergence in perceptions between official data and the experiences of affected communities. Given already low levels of institutional trust, this could strain relations and deepen distrust between Jewish communities and the state.

Bundesverband RIAS was founded in 2018 to ensure the consistent recording and documentation of antisemitic incidents by civil society throughout Germany and thus strengthen the perspectives of those that are affected in public discourse. Beyond that, RIAS started the research project "Exchange between police and civil society on antisemitism" (APZAS). Using a mixed-methods approach of expert interviews and quantitative analysis of the KPMD-PMK the project explores the (non-)registration of antisemitic offenses by the German police and the underlying understanding of antisemitism in all its forms.

The proposed paper presents the results of this research and delves into findings of mechanisms and practices of police actors and statistics, as well as criticisms of these by civil society and the scientific community. It thus offers critical insights into the inner workings of the state and police as key players in the fight against antisemitism.

Buchsteiner, Jochen. 2023. Faeser will antisemitische Straftaten differenzierter erfassen. Frankfurter Allgemeine Zeitung, October 30.

Understanding Antisemitism And Its Relation To Racism – The Perspective Of German Jews

Niklas Herrberg

Heinrich-Heine-University, Germany

A recurring part of the conflict about an appropriate understanding of antisemitism is the relationship between antisemitism and racism, their similarities and differences, but also the question of subsuming antisemitism under the category of racism. However, researchers have often paid little attention to the perspectives of Jews. In my presentation, I will therefore address the question of how Jews, as those primarily affected by antisemitism, understand antisemitism and its relationship to racism.

In light of a phenomenologically oriented sociology of knowledge in the tradition of Alfred Schütz, the everyday understanding of antisemitism comes into focus. The experience of antisemitism can undermine the unquestioned nature of everyday life evoking the need for a practical interpretation. On basis of a coding of 21 problem-centred interviews with Jews living in Germany and a line-by-line analysis of key passages, I was able to reconstruct the diversity of understanding antisemitism in everyday life.

My analysis indicates that the interviewees agree on the need for an appropriate understanding of antisemitism. In their perspectives, especially the non-Jewish society lacks sufficient knowledge about antisemitism. However, the interviewees' specific understanding of antisemitism varies, mirroring the positions of the public controversy. While some interviewees emphasise the ideological distinctiveness of antisemitism, another sees antisemitism as "racism against Jews". Yet others trace antisemitism and racism back to a common origin, thereby emphasising differences and similarities. Regarding the lifeworld it is crucial to understand that these interpretations are tied to the practical anticipation of antisemitism as well as the need for promising responses.

No Antisemitism, Nowhere. Sociological Perspectives On A Widely Neglected Issue Within Social Work

Holger Knothe

IU International University of Applied Sciences Munich, Germany

The subject of this paper is the sociological exploration of the neglect of Antisemitism as an important social problem within the profession of Social Work in Germany. Despite recent efforts to promote the subject of combating antisemitism in educational settings it is still rather insular in Social Work education and practice. In light of rising antisemitic attitudes and actions within Germany the widespread lack to address antisemitism as a social problem e.g. highly visible in the field of school social work can be seen as

953

rather peculiar and highly disputable. This finding became even more evident in light of the October 7 massacre and the subsequent silence of German Social Work Professional Organizations in its aftermath. This resonates strangely with Social Work's core beliefs as a highly ethical profession in which "Principles of social justice, human rights, collective responsibility and respect for diversities" (IFSW 2014) are integral. Hence the paper unfolds sociological and historical perspectives on the possible reasons for the neglect of Antisemitism as a social problem within Social Work. The interconnectedness between Social Work's high ethical stance on the one hand and the absence of combating current antisemitic practices, discourses and attitudes towards Jews on the other hand is thereby very often entangled with Germany's current migration situation. It remains an open question if the manifold, yet insular efforts of changes in education lead to a beginning shift of perspective in order to sensitize German Social Work professionals and educators alike for the ongoing relevance of Antisemitism and the fragile situation of German Jewry.

The German Press and Israel: Research Findings of a Study on Reporting on Israel

Jonas Hessenauer, Lukas Uwira

Tikvah Institut, Germany

Previous studies on German media coverage of Israel have shown that it is often distorted, decontextualized, one-sided, erroneous, and even contains antisemitic motifs. An ongoing empirical research project of the Tikvah Institute in Berlin investigates the German media coverage of Israel in 2023. Using qualitative content analysis, the authors identify recurring distortions and mistakes in the reporting. While the reproduction of antisemitic stereotypes in the articles examined is relatively rare compared to the findings of prior studies, distorted reports that depict Israel in a negative manner occur with some frequency. Articles adopt one-sided perspectives, and events are often not sufficiently contextualized or historically classified. These distorted reports about Israel are problematic because they can influence the attitudes of recipients and amplify antisemitic beliefs. In addition to the presentation of different forms of distortions, preliminary quantitative results about the frequency of these phenomena will be presented. One focus will be the development of reporting on Israel after October 7th. Despite persistent distortions, for example, the German media reported on Israel in a slightly more supportive manner after Hamas' massacre than before, except in letters to the editor and interviews. This is a noticeable change compared to the reporting on prior conflict phases (e.g. the Second Intifada). It will also be discussed whether October 7th and its aftermath had a lasting impact on German journalism and its coverage of the Israeli-Palestinian conflict or whether it was just a short-term change.

RN31 | T03_02: Anti-Roma Racism and Social Exclusion

Cacophony in conceptualizing and operationalizing ethnicity: The case of Roma in Hungary

Vera Messing, András László Pap

HUN-REN Center for Social Sciences

Using secondary research from the political, education and employment fields this paper aims to demonstrate the consequences of confused and overlapping conceptualization of the Roma in Hungary as an ethnic group, as a racialized minority, as a national minority and as a socially disadvantaged group. We discuss the conceptualization and operationalization of race and ethnicity in Hungarian law, with particular interest in the use of legal categorisations, terminological clusters, and their relationship to policy-making. Our thesis is that conceptualization, operationalization and policy-framing are connected and that the incoherent conceptualization and operationalization of race and ethnicity contributes to the ineffectiveness of policies geared towards ethnic groups in Hungary, and especially with regard to the Roma population. We also identify the phenomenon of ethno-racial data processing-phobia, a reluctance to "see" race and ethnicity by policy actors due to a false apprehension of European privacy regulations. We argue that this leads to the Murphy law of data protection: where discriminators have no difficulties identifying their victims, but when it comes to remedial action or social inclusion measures, action is paralysed by the mis-interpretation or overly cautious application of the principles of processing ethnic data. The case of Roma communities in Hungary provides a unique opportunity to reveal the political and ethical dilemmas in conceptualizing and operationalizing race, ethnicity and nationality in the law, in public policy and in related everyday practices. By presenting the above dilemmas we intend to fill in a research gap left open by the Western and Northern Europe research tradition that mostly overlooks how ethnicity (and race) function differently in Eastern Europe.

954

Ethnic Experience Index – the case of Roma in the Czech Republic

Laura Fonadova[1], Tomas Katrnak[2]

1Masaryk University, Faculty of Economics and Administration, Czech Republic; 2Masaryk University, Faculty of Social Studies, Czech Republic

Currently, there is a lack of quantitative research on the significance and meaning of ethnicity for Roma individuals in the Czech Republic. The meaning of ethnicity for its bearer is usually the subject of qualitatively oriented research. To address this gap, we aim to measure the significance and meaning that Roma individuals attribute to their own

ethnic identity quantitatively, which has not yet been studied in the Czech national context in this sense.

When it comes to the particular case of Roma in the Central European context, there is a discrepancy between the publicly declared identity and the identity attributed by others. Our objective is to reveal how Roma perceive their ethnicity, in terms of the dimensions that are commonly followed by the Racial and Ethnic Identity (REI) measures, such as the extent to which Roma people are concerned about their ethnicity, what it means for them to belong to this group and what kind of experience means to be Roma in today´s Czech society.

In the paper, we present the Ethnic Experience Index we have used and the results of its application. We analyse data collected in 2023, as part of a representative survey focused on the Roma population, under the project "Creating a system for quantitative data collection to evaluate the situation of Roma in Czech society" (1563 respondents). We will demonstrate how the index is related to the socio-demographic and mainly socio-economic situation of Roma people.

Roma as a "Suspect Community" in Addressing the Covid-19 Pandemic in Slovakia

Daniel Škobla[1], Richard Filćák[2]

1Slovak Academy of Science, Slovak Republic; 2Slovak Academy of Science, Slovak Republic

In this article we use empirical data to examine the management of the pandemic situation during the COVID – 19 outbreak in affected localities inhabited by Roma in Slovakia. Approximately one-third of Roma in Slovakia live in segregated neighborhoods where there is widespread poverty, overcrowding, and the absence of water and sanitation. Constructing the Roma minority as a "suspect community" (Breen-Smyth 2014), as a racially defined category of people who pose a threat to public health, the government deployed violent measures that included forced COVID – 19 testing conducted in several hundred settlements with the assistance of the military. Once those infected were identified, entire settlements were sealed off and people were forced to go into quarantine. The Army's Special Operations Forces, which are part of the armed forces, were active in building quarantine sites and guarding isolated neighborhoods. This approach to Roma was strikingly different from the management of the pandemic in relation to the general population.

We argue that this discriminatory and violent anti-pandemic measures towards the Roma emanates from the principles of colonial racism, particularly ideas of racial hierarchy. We argue that Slovak (and Czech) societies historically created specific colonial cultures without colonies, where dominant groups exert power and authority over less powerful and subjugated ethnic minorities (Spivak, 1988; Blunt & Wills, 2000). We conclude that the governmental responses of COVID-19 and the militarized quarantines in Roma neighborhoods clearly reveal that neocolonial attitudes play a structural role in Slovak society's treatment of its own ethnic minority

RN31 | T04: Racism, Belonging and Social Mobility in Diverse Societies

Exploring Experiences of Ethnic-racial Discrimination of Young People in Formal and Non-formal Education Contexts in Portugal and Their Civic and Political Consequences

Juliene Gonçalves[1], Carla Malafaia[1,2], Pedro D. Ferreira[1,2]

1Faculty of Psychology and Education Science, University of Porto, Porto, Portugal; 2CIIE-Centre for Educational Research and Intervention, Porto, Portugal

In the context of increasing diversity in both communities and schools, understanding the impacts of ethnic-racial discrimination in educational contexts becomes essential for the development of intervention strategies and policies. Our research focuses on the analysis of racism and ethnic-racial discrimination faced by young students aged between 12 and 18 years attending formal (basic education and high-school levels) and non-formal educational contexts in a city in the north of Portugal. This research taps into various manifestations of these experiences, aiming at understanding their civic and political impacts. Explicitly filling existing gaps in the literature, our research directs attention to the intricate relationship between school and community in the everyday trajectories of young people subjected to discrimination. The methodological approach is qualitative and based on young people's perspectives, with data collected through discussions in focus groups. These will allow us to explore young people's perceptions of discrimination and racism and how they see themselves as political actors and citizens. Understanding the diverse experiences and manifestations of discrimination in the educational trajectories of racialized young individuals and those belonging to ethnic minority groups, as well as identifying critical actors in these experiences, constitutes crucial aspects of this research. This communication discusses how such experiences of discrimination and racism reverberate in the social relationships of these young individuals within their educational institutions and communities. This study can contribute to practices that promote more egalitarian and respectful educational environments, endorsing the importance of political-educational approaches sensitive to ethnic and racial diversity.

955

Fragmentation or Integration? Ethnic Diversity and the Structural Cohesion of Social Networks in Schools

Georg Lorenz

Leipzig University, Germany

Scholars concerned with social cohesion in ethnically diverse societies often investigate ideational indicators, such as trust, and find negative associations. Another aspect of social cohesion, which might be a mechanisms underlying diversity's effects on ideational cohesion measures, is structural cohesion, describing the connectivity of social networks. This study investigates the structural cohesion of adolescent friendship networks and compares it across differently diverse classrooms. We distinguish multiple types of ethnic diversity and the consolidation of ethnic origin with socio-demographic attributes, such as gender and socioeconomic status. We theorize that these diversity aspects would undermine structural cohesion only if students had pronounced preferences for associating with ingroup others (i.e., homophily preferences). Our analysis of a computational measure of structural cohesion in data from the Trends in Student Achievement Study 2018, which included information on over 1,300 complete friendship networks in German schools, reveals that none of the considered diversity aspects are related to the structural cohesion. Confirming the relevance of this finding, we show that an ideational cohesion indicator—school attachment—is also unrelated to classroom diversity, while structural cohesion is a significant predictor of ideational cohesion. Our findings have important implications for diversity and cohesion research, indicating that homophily preferences are not powerful enough to fragment social networks in diverse contexts.

Negotiated Homes: Transmission and Transformation of Belonging in Kurdish Diaspora

Orkide Izci

University of Bologna, Italy

This paper analyzes the meanings of home(s) found in the biographical narratives of three generations of Kurdish-Alevi women who come from Northern Kurdistan and Turkey and live in the diaspora in Germany. Blunt and Dowling (2006) argue that home must be considered a spatial imaginary (the relations between feelings, attachment, and dwelling) and a political space of negotiation and contestation. This sociological analysis of 'de – territoriality' and displacement of an ethnic group is guided by the issue of how displaced populations deal with questions of 'home' as a concept of belonging(s) such as origin, homeland, nation, diaspora and the hosting country. This research focuses on the collective memories, life stories, migration experiences, and diaspora effect in (re)making homes, sense of belonging(s), and identities from a gendered and inter-generational perspective. This study will show what it feels like to feel at home in terms of belonging and identities: what is home, how diaspora and hosting country influence the idea of home, and what are the inter-generational transmissions of the sense of home, belonging, and identities? Analysis of the 'sense of belonging' found in the narratives of Kurdish-Alevi women in the diaspora shows transformation not only from one generation to another but also indicates a broader social change because experiences of belonging and identities are dynamic and sensitive to changes since self and society are interconnected and cannot be analyzed separately (Simmel 1964; Elias 2001; May 2011).

Rejecting Racism as an Interpretative Frame: Ethnoracial Minorities Navigating the Prospect of Stigmatisation in Business and Finance

Julia Orupabo, Marjan Nadim

Institute for social research, Norway

Newer contributions in assimilation theory demonstrate that upward mobility is not sufficient for the acceptance of ethnoracial minorities in mainstream society. Analytical concepts such as 'space invaders' (Puwar 2004) and the 'integration paradox' in discrimination research suggest that despite gaining access to spaces that have historically been occupied by the majority (middle class), minorities often experience othering and stigmatisation. Departing from this scholarship, this study examines experiences of stigmatisation – and strategies to avoid stigmatisation – among ethnoracial minorities who have entered middle-class positions in the fields of business and finance in Norway. Building on 40 in-depth qualitative interviews, the study finds that although the minority professionals are acutely aware of the reality of stigmatisation and discrimination in the Norwegian labour market, they maintain that they have not had negative experiences related to their ethnoracial background. Furthermore, they challenge the usefulness of anticipating stigmatisation and resistance. Rather, the main strategy to navigate the prospect of facing stigmatisation is to embrace a 'positive mindset' emphasising their agency and downplaying racial frames and narratives of discrimination. This strategy is enabled by their experience that ethnic boundaries in the Norwegian labour market can be permeable, and that elite educational credentials and outstanding work achievements can override ethnoracial difference, at least in specific contexts. This study contributes to the research literature on minority 'space invaders' entering predominantly white spaces by showing how rejecting racism and ethnoracial stigmatisation as interpretative frames is used as a strategy to stay competitive and maintain a sense of self-determination.

RN31 | T05: Postcolonialism, Antisemitism, and Historical Memory

„The holocaust as an application of colonial practices" – Aimé Césaire As A Keyword Provider For Postcolonial Antisemitism?

Randi Luise Becker

University of Passau, Germany

Antisemitism and racism are two ideologies of group-based enmity that do not function in the same way and yet must be combated together in order to make a society without exclusion imaginable. However not least the reactions of the anti-racist, academic landscape all over the world in regard to October 7th have shown that a critique of racism does not necessarily go hand in hand with an understanding of how antisemitism reproduces itself in different forms and narratives.

In my dissertation, I examine if, where and how points of reference for antisemitism can be found in early, canonical texts of postcolonial theory and how these are taken up, changed or reinforced in the reception history of postcolonial studies till today.

In Porto, I would like to present my analysis of Aimé Césaire´s work and its reception: As a theorist from Martinique and founding father of the Négritude Movement, he has significantly shaped postcolonial studies and continues to influence them today. In particular, his thesis that National Socialism was a colonial practice that was this time applied to white people is widely received today in thematizations of the relationship between the Holocaust and colonialism.

In my paper, I present what Césaire actually says about Jews, National Socialism and Israel in his work and show the extent to which points of reference for antisemitism can be found in his work. I then show how these points of reference changed in the development of postcolonial studies and the reception of Césaire to answer the question, if Césaire can be seen as a provider of keywords and ideas for postcolonial antisemitism.

A. Dirk Moses And The "Catechism-Debate": Shifts In Holocaust Memory?

Hendrik Hebauf[1,2]

1Goethe-University Frankfurt am Main, Germany; 2Bucerius Institute for Research of Contemporary German History and Society, Israel

A. Dirk Moses' essay "Der Katechismus der Deutschen", which triggered the "Historikerstreit 2.0" in 2021, is an indicator of a possible shift within the German understanding of the Holocaust, away from the singularity thesis and towards embedding the Holocaust in a colonial continuum of violence. Based on Moses' monograph "Problems of Genocide", also published in 2021, the lecture examines the connections between these changes in memory and Moses' academic work, particularly his postcolonial understanding of history. In doing so, Moses' view on the topics of the Holocaust, Zionism, and colonialism, which are closely linked to the "Historikerstreit 2.0", is analyzed. Focusing on the Nazi war of extermination and the history of Israeli Holocaust remembrance, the consistency of his understanding of history is discussed on the one hand, and the connection of this understanding of history to the current debate on a diversification of German politics of remembrance is worked out on the other. The lecture is intended both as a reflection on and a contribution to the current debate on Holocaust remembrance and colonialism. The aim is to show that Moses discursive-psychological paradigm for the explanation of a global history of violence is confronted with an epistemological problem. It fails to reflect the primacy of the object. This deficiency is simultaneously linked to the attractiveness of Moses theses for a national renewal of German culture of remembrance. Reducing the history of violence to discursive-psychological causes tends to disregard an analysis and critique of contemporary causes of violence (E.g. contemporary antisemitism or racism) in favor of an overemphasis on the significance of representation and memory for the present.

Antisemitism And The Antiracist Struggle

Hansalbin Sältenberg

Södertörn Unibversity, Sweden

In this paper, I discuss resistance against antisemitism in relation to the overall antiracist struggle. Inspired by postcolonial theory and critical race studies, and by locating notions of "Swedishness" at the core of the analysis, I show that antisemitism can be understood as a form of structural racism entangled with other racisms. Through in-depth interviews with self-identified Jews in Sweden, some of whom had a strong antiracist identity while others did not, the paper sheds lights on the experience of being a minority and having "a rather good life", not being exposed to discrimination on the labor market, yet being exposed to forms of everyday racism. The paper discusses the opportunities and limitations for antiracist alliances between Jews and other people exposed to racism, not least people from the Middle East, a group that is portrayed as particularly antisemitic in hegemonic discourses.

957

Jews As ›Whites‹ And The Lack Of Solidarity Within Progressive Circles After The Antisemitic Massacre On October 7th

Tim Stosberg

University of Passau, Germany

In recent years the characterization of Jews as ›Whites‹ has become a common theme within postcolonial and critical race theory-inspired approaches to Jewishness and anti-semitism. In this context, ›Whiteness‹ is conceptualized as a social norm and a practice of domination – thus, it is viewed as both a social and political category. Hence, the critique of Whiteness aims to unveil unmarked and un-named power structures and privileges associated with in-dividuals racialized as Whites. However, scholars like Balázs Berkovits and David Schraub have criticized that portraying Jews as Whites often leads to the reproduction of antise-mitic beliefs, such as the trope of ›Jewish power‹.

Building on this critique, my aim is to shed light on the shift within the social sciences from perceiving Jews as victims of antisemitism to being portrayed as alleged perpetra-tors of white supremacy and settler-colonial violence. I will primarily focus on the postcolonial assertion put forth by scholars like Edward Said, Abigail Bakan, or Lorenzo Veraci-ni, suggesting that Jews, once they adopted Zionism, have become White, consequently signaling the end of antisem-itism. Furthermore, I will address the lack of solidarity with Jews within leftist and progressive circles after the antise-mitic massacre on October 7th, placing this silence in the context of the discursive ›Whitening of the Jews‹.

RN31 | T06: Antisemitism, Antizionism, and Public Memory: Historical and Contemporary Perspectives

Anti-Zionist Campaign In Poland (1967-68): Antisemitic Violence, Jewish Experiences, And Public Memory

Piotr Forecki

Adam Mickiewicz University, Poznan, Poland

In June 1967, responding to the Six-Day War in the Middle East, Polish authorities started a campaign against Zionism that resulted in the army purges of individuals accused of being traitors. 'Zionists' were a virtual enemy because no political movement of this kind had been active in Poland for a long time already, and it was a codeword to target Jews. The antisemitic campaign in Poland culminated the following year, and it has reached Jews in workplaces, neighborhood surroundings, and their homes.

The dominant historical narrative about these events, typi-cally points to such manifestations of antisemitism as prop-aganda, discrimination at work, and job losses, which led thousands of Jews to leave the country. However, autobio-graphic sources reveal that the range of forms of violence the Jews experienced was broader. The presentation will discuss the diverse and recurring patterns and practices of antisemitic violence at the time. How are they remembered by the victims? Are memories of their experiences present in historiography? Answers to these and other questions will be provided on the basis of preliminary research find-ings from the project Jews in Poland in the Aftermath of the 1967-68 Antisemitic Campaign: Biographical Experi-ence, Identity Changes and Community Dynamics. My main sources are biographically oriented in-depth interviews supplemented with published memoirs, press, and archival records.

Polish Jews After the 1967–68 Antisemitic Campaign: Antizionist Stigmatization and Redefinition of Attitudes Towards Israel

Marcin Starnawski[1], Aleksandra Maria Gluba-Pieprz[2]

1University of Lower Silesia, Poland; 2Adam Mickiewicz University in Poznan, Poland

The paper analyses the impact of the antisemitic campaign in communist Poland beginning with the government's

958

response to the Six-Day War in June '67 and culminating in March '68 as the authorities' way of handling the pro-democratic protests and the crisis of legitimacy. Denouncing the Jews as Zionists and employing anti-Israel rhetoric was a strategy of blame and a way to avoid the charge of using antisemitic racism in party-state politics. What followed was massive discrimination and forced exile of a substantial part of Poland's Jewish population. Framing our approach as a historical sociology of culture and politics, based on autobiographic (interviews and memoirs) and press sources, we ask questions that stem from the ongoing project Jews in Poland in the aftermath of the 1967–68 antisemitic campaign: biographic experience, identity changes, and community dynamics. How was the antisemitic stigma present in the context of 'anti-Zionism' and the actual significance of Israel to the Jewish community at the time? How and when did the attitudes towards Israel and its relevance for Polish-Jewish identity change over the decades? How were such changes manifested in the Polish-Jewish transnational community, including both the exiles (of whom fewer than one-third arrived in Israel) and those staying put? How can the tension between official politics and personal and communal sentiments be traced in Poland, as evidenced in the only remaining Yiddish newspaper – the communist weekly Folks-Shtime?

Revival of Antisemitism

David Hirsh

Goldsmiths, University of London

The paper deals with the revival of antisemitism after October, 7.

Following October 7th, Young Jewish People Facing Antisemitism in France. Results of a New Quantitative Survey

Claudine Attias-Donfut

CNAV

A strong wave of antisemitism has occured in France, like in many other western countries, after the October 7th massacre of Israeli men, women and children by Hamas. This paper presents the results of a large survey conducted in France among a large sample of young jewish people, after these terrible events in order to know how do they face such a growing antisemitism, and what are their feelings and reactions. The survey has been conducted on a large sample of young jewish people (around 1300) , including schoolboys, school girls, attending public or private schools, – students attending universities, and young active people. According to the results show, more than 43% of them have been subject to antisemitic harassement and more than half of them (53%) have been subject to another form of harassment . Only 41% did not suffer from antisemitic or other kind of harassment.

The paper presents how these young jewish people face these difficult situations, thanks to their strong family attachments and showing both resilience and solidarity.

RN31 | T07_01: Media, Discourse, and Antisemitism

Unveiling Antisemitism with Survey Experiments: New Designs to Address Social Desirability Bias in Antisemitism Research

Heiko Beyer[1], David Jäger[2], Lars Rensmann[2], Carina Schulz[1]

1Heinrich-Heine-Universität Düsseldorf, Germany;
2Universität Passau, Germany

In the field of antisemitism research, the validity of quantitative surveys is often compromised by the phenomenon of socially desirable responding. This issue not only skews descriptive statistics, leading to an underestimation of antisemitic attitudes, but also risks generating spurious correlations. Our research addresses this methodological challenge by implementing three distinct survey experiments: a factorial survey, a visual experiment, and a context framing experiment. Each of these approaches is designed to circumvent the biases inherent in traditional survey methods.

The factorial survey dissects complex attitudes into simpler, factorial components, reducing the respondent's ability to align their answers with perceived social norms. The visual experiment leverages imagery to elicit more instinctive responses, thereby bypassing the cognitive filters associated with social desirability. Lastly, the context framing experiment manipulates the contextual presentation of questions, aiming to disrupt the respondent's preconceived notions of the 'acceptable' response.

Our study draws on a representative sample of the North-Rhine Westphalian population, ensuring the generalizability of our findings within this region. The combination of these innovative methodologies provides a more accurate picture of antisemitic attitudes, paving the way for more effective policy interventions. This research not only contributes to the academic discourse on antisemitism but also offers practical tools for researchers grappling with the challenges of social desirability bias in survey data.

Rotating National Populism and Role of Hate Ideology. The case of Poland.

Ireneusz Krzeminski

Warsaw University, Poland

1). During past eight years 2015-2023, Polish nationalistic populist party, Law and Justice, developed the strategy of destroying democracy. Populists grants had been effective due to support of nationalistic, antisemitic and xenophobic ideology.

2). Ideology operates, using the hate as a main factor in organizing minds and behaviour of people. I'll would illustrate it by showing political and propaganda activities of L&J. In Poland, after eight years of L%J rules, in parliamentary elections there was a great success of opposition parties which united in one block.

3). What is going now and how L&J reacts to new Polish rulers? My main thesis is simple – the ideology used during the election campaign, now is being used as a tool pretended defence of democracy and constitution!

The President, Mr A. Duda, and the leader of L&J, Mr Kaczynski, who had broken Constitution many times, now redefined theirs goals.However, hatred is the main feeling they propagate and the hatred colours their views in general.

4). On the base of the article by Leszek Kolakowski, I'll try to show the role of hatred in the nationalistic populism politics. Professor Kolakowski shows how the ideology of hate erodes the minds of followers making them useful for manipulation by the leaders of the political movement.

Denunciation, Unmasking, Exposure: the Specificity of the Antisemitic Persecution Pattern in Poland

Anna Zawadzka

Polish Academy of Sciences, Poland

In the proposed paper, I would like to explore the mechanism of antisemitic gossip, which is characteristic for Polish culture. Often the content of this gossip is not what is implied by the fact of someone's Jewishness, but the very fact that someone is Jewish – as if it were a fact that is firstly concealed and secondly compromising. During World War II, the chances of survival 'on the Aryan side' were almost exclusively for assimilated Jews who knew the Polish language and the Catholic rite, had been brought up in the national culture, and had the so-called 'good looks' – an appearance that did not lend to antisemitic racialisation. However, they remained the subject of constant 'round-ups' and extortion by the Poles, who engaged in 'identifying the Jew', a peculiar game with deadly consequences. On the basis of Jewish literature and memoirs (Krystyna Żywulska, Henryk Grynberg, Hanna Krall, Adolf Rudnicki) and data collected for the research project 'Jews in Poland after the 1967-1968 Anti-Semitic Campaign: Biographical Experiences, Identity Changes and Community Dynamics', I would like to show how this pattern of antisemitic violence – a pattern of unmasking and denunciation – has been reproduced since the war and how it functions in Poland today. My goal is to analyse this pattern in relation to the category of assimilation and the question about the whiteness of Jews, which have recently gained new importance. Together with the conference participants, I would like to discuss how this question can be addressed in the Eastern European context.

960

The Common Antisemitic Matrix of Different Conspiracies

Claudia Gina Hassan

University of Rome Tor Vergata, Italy

To the combination of post-truth and disinformation that has dominated public sphere studies in recent years, a third node of the issue is added: that of conspiracy and conspiracy theory.

This widespread diffusion corresponds more to a highly parceled and mediatized public sphere than to a dominant and powerful theory that has taken over everything else. Conspiracy theories are not merely descriptive but have a performative power and rhetorical function within public discourse that often has long-lasting consequences. By moving between old and new conspiracies, very different in time and space, it's necessary to identify their common anti-Semitic matrix. For example, the new idea of a conspiracy for an ethnic replacement of Italian and European civilization is articulated through a typical and ancient form of conspiracy of Jewish strong powers.

Conspiracy theories, however, have taken on different forms, subjects and objects in both a diachronic and synchronic sense. But in reality, the form of conspiracy as we have known it since the past two centuries is the result of modernization with its particular socio-political-cultural context. Whereas in the past conspiracy theories were ascribable to minority groups located on the fringes of politics and were placed in the category of pathology, today, however, they are widespread and highly visible. In the generalized distrust regarding the truth and plausibility of public discourse and in the climate of epistemic uncertainty, conspiracy theories represent a real cross-cutting and widespread subculture that exerts a certain attraction on which we intend to shed light here.

RN31 | T07_02: Intersectionality, Racism and Ethnic Relations

Violence Against Roma Women – Discursive Positions On Domestic Violence And Prostitution With Roma Women As Victims

Enikő Anna Virágh[1], Zsuzsanna Vidra[1,2]

1ELTE Eötvös Loránd University, Hungary; 2HUN-REN, Hungary

Studying violence against Roma women is a specific subfield of domestic and sexual violence and prostitution. The relevance of the topic is related to this group's multiple vulnerabilities. It might seem evident that women of a disadvantaged and socially excluded minority population are at higher risk of victimization by violence. Nonetheless, when their victimization is accounted for, there are a lot of social, and political stakes involved.

In this study, our goal is to identify and describe the major positions of different social actors (politicians, experts, activists, civil organizations, journalists) in the discourses on violence against Roma women. Through a discourse analysis of media and political texts, we aim to explore how political, and civil stakeholders and the media construct the problem.

The main issue around which the debates revolve is whether the ethnicity of the victims (and perpetrators) should or should not be mentioned, or, a color-blind or non-color-blind approach should be taken. Civil actors promoting Roma emancipation either use a color-blind approach aiming to avoid ethnicization and essentialization of the problem, or argue from an intersectional perspective and highlight the importance of the non-color-blind approach. The non-color-blind approach, however, is also used by conservative actors arguing that ethnicity is a key issue in understanding violence against Roma women, while others from the same position frame the problem in an essentialist manner and use prejudiced language.

961

Exploring Roma Feminism and its Demands: A Dialogue with Community Leaders in Spain

Emilia Aiello[1], Teresa Sordé[2], Elisabeth Torras[3], Lena De Botton[3]

1Autonomous University of Madrid, Spain; 2Autonomous University of Barcelona; 3University of Barcelona

Scientific debates surrounding feminism in the 21st century increasingly call for mainstream feminism to include the voices of non-white women, as well as looking also at

the work and expressions of feminism taking place in the Global South. While progress has been made in the United States in acknowledging the work and demands of non-white feminism, Europe lags behind in recognizing and amplifying the feminist contributions and demands of its largest non-migrant ethnic minority, the Roma. This way, although some studies can be found about Roma feminism and how Roma women are organizing at the grassroots level to contest inequalities, much more can be learned about the specific traits of Roma feminism. In this context, this study is framed in a larger line of research about grassroots Roma women and leadership on which the co-authors have been collaborating and researching during the last years. Specifically, the study presents findings from qualitative fieldwork conducted with 23 Roma women and young adults organized in civic organizations across Spain, exploring how they understand and experience feminism. Despite working towards gender equality among Roma men and women, as well as equality between Roma and non-Roma women, many do not identify with dominant representations of feminism. Our results highlight three key elements of what these women would claim as Roma feminism: the role of men as allies, claiming freedom as women as a central aspect of Roma cultural identity, and advocating for a feminism that promotes and safeguards the idea of equality of differences.

Studying Racialization and Racism with an Old Age or a Liffe-course Lens: The Need for a Research Agenda

Sandra Torres

Uppsala university, Sweden

The study of racialization and racism is informed by various research traditions, theoretical orientations as well as disciplines. As such, this area of research is relatively fragmented, and seems to lacks a research agenda of its own, and an old age astute and life-course informed. Within the sociology of aging, there has been a lukewarm interest in engaging with these notions. Opportunities to let racialization (as a notion that can inform research) and racism (as an experience that can affect an array of circumstances for people that live into advance old age) have not been seized yet. In light of this, two extensive scoping reviews were conducted focusing on mapping out whether, and how, these notions inform research on older ethnic minoritized and racialized people, and doing the same for research on older migrants. The reason why two different scoping reviews were conducted is that not all research on older ethic minoritized populations is migration-informed, and neither is research on older migrants, ethnicity-informed. This presentation – which relies on the systematization that guides scoping review methodology, and the recommendations for data volume that allow social scientists to identify evidence-based knowledge gaps – will present results from these scoping reviews. The presentation will use the results generated to argue not only that the sociology of racism is in need of a life-course-astute and old-age-informed research agenda, but also to illustrate the type of research questions that

could be used to advance the state of the arts of research on the sociology of aging that brings attention to ethicized and racialized minorities.

Concrete Universality And The Race/Class Problematic: Raya Dunayevskaya, C.L.R. James, And The Dialectic Of Power And Revolution

Jonas Grahn, Magnus Granberg

Mid Sweden University, Sweden

In this paper, we explore the concept of concrete universality in contemporary Marxist theory with a view to the contributions made by two theorists and activists associated with the Johnson-Forrest Tendency (JFT) in the early postwar U.S., Raya Dunayevskaya and C.L.R. James. Inherited from German idealism, concrete universality became a lesser-known trope in the materialist-dialectical arsenal of traditional Marxism. However, the concept found its way into some of the heterodox Marxisms on the fringes, sometimes clearly on the outside, of the traditional paradigm; Evald Ilyenkov and Lucio Colletti's writings being prominent examples, along with the writings of the JFT. Today, this lineage informs a vast field of Marxist theorizing concerned with "practically true" abstractions, concepts, and universals. However, from a historical point of view, this field seems to be undergoing a process of diremption, becoming polarized between two rather self-contained circles, with studies of the "abstract domination" and "real abstractions" of capitalist power on the one hand and theories of "insurgent" universalities and revolutionary social forms on the other. Against this background, we argue that contemporary Marxist theory might benefit from Dunayevskaya and James' work on race, which they approached as a concrete and practical reality at the heart of the economic base of U.S. capitalism and, at the same time, as a locus of social revolution where "black masses as vanguard" prefigured and generated new modalities of universality through struggle.

RN31 | T08_01: Historical and Contemporary Antisemitism and Social Constructions of Racial Differences

Aspects of Anti-Semitism in Greece yesterday and today. The Case of the Organization "National Union Hellas", Popular Orthodox Rally and the Greek Solution.

Anthoula Vretti

National and Kapodistrian University of Athens, Greece

The aim of this study is to investigate Greek anti-Semitism during the interwar and the modern period in Greece. More specifically, this study focuses on the activity of the "National Union Hellas" organization (N.U.H.) or more widely known as Tria Epsilon (3E) since 1927, when it was founded in Thessaloniki, until 1933 – 1934. In the Popular Orthodox Rally where it had a strong presence in the decade of the 2000s and the Greek Solution which is currently in the parliament.This paper examines the political, social and economic development of the specific party – organizations in order to highlight to what extent anti-Semitism remains on the agenda of political parties over the years. This is a historical research, which is based mainly on archive material and in the speeches of political leaders.

The main conclusions of the paper are that the Popular's Orthodox Rally is a party quite different from the traditional pre-war and post-war neo-fascist parties of Europe. It belongs to a series of far-right parties that have emerged in Europe since the late 1980s shaping the political agenda with issues of multiculturalism, immigration policy and the purity of the nation. Although the National Union Hellas that we presented above was also an anti-Semitic organization, their common points are few or diminishing as Popular Orthodox Rally enters the Parliament and the European Parliament, also interesting are the positions of the Hellenic Solution where their leader comes from Popular Orthodox Rally.

Experiences Of Anti-Muslim Racism And Antisemitism By Muslim-jewish People. A Reconstructive Study On The Exploration of Conjunctive Coping Strategies

Fatih Bahadir Kaya

Ruhr University of Bochum, Germany

Anti-Muslim racism and anti-Semitism as structures of inequality are understood and examined in the academic literature from a theoretical and historical perspective as separate structures that have each undergone historically different genealogies and processes (cf. Benz, 2004; Beyer, 2015; Brumlik, 2016; Chernivsky & Lorenz, 2021; Shooman, 2014; Amir-Moazami, 2007; Attia, 2009; Attia et al., 2021). This dissertation project refrains from macro-theoretical analyses and comparisons and focuses on the lifeworlds and individual experiences of the individuals affected by anti-Muslim racism and anti-Semitism.

Using problem-centered interviews (23 interviews provide the empirical basis for this study) according to Witzel (cf. 2000; Witzel & Reiter, 2012, 2022) and the documentary method according to Bohnsack (1983, 2003, 2007, 2009), the contexts in which anti-Muslim racism and anti-Semitism arise and how they are perceived are first reconstructed on the basis of the experiences of the affected individuals. One of the relevant questions here is what narrative-theoretical similarities and differences can be identified in terms of individual experiences?

Consecutively, the doctoral project focuses on using the collected narratives and articulations of Muslim and Jewish individuals to show whether and how conjunctive coping strategies emerge. Taking into account and emphasizing homologous and heterologous coping strategies, the doctoral project aims to reconstruct a conjunctive experiential space for how affected individuals overcome anti-Muslim racism and anti-Semitism.

The National Idea and the Construction of Racial Difference in the Origins of Sociology in Spain (1875-1925)

Hector Romero

UNED, Spain

In this proposal I present the study of the discourses on national identity that are reflected and elaborated in different periods of the history of sociology in Spain, taking into account the role they play as expert discourses in the social construction of racial difference and its political impact. I will pay special attention to the origins of sociology in Spain at the end of the 19th century and the first decades of the 20th, linked to the intellectual concern for crime and criminal law. The discussion on charity and social exclusion,

the poor and the prisoner, fueled the sociological literature around deviant behavior, spinning the "social question" around an axis of distinction between the 'normal' and the 'pathological'. I will also deal with the reception of positivism and Spencerian evolutionism and the debates that it raised when interpreting, from that incipient sociology, the history of Spain and the foundations of "national character", and in the much discussed relationship between Krausism and organicism. The work of sociologists such as Urbano González Serrano or Manuel Sales y Ferré captures that intellectual atmosphere and its tensions, permeated by racial interpretations of "national being". Thus, the ideas of nation, modernity (as a problem) and national character as a result of a process of racial and cultural hybridization are amalgamated in the intellectual production of the so-called positivist Krausism, institutionalism and social reformism of the time, which are the sources from which the first Spanish sociology draws.

Shaping Borders: Social Movements And The Political Representation Of Ethnic And Racial Minorities In Portugal

Nuno Dias, Ackssana Silva

CICS.NOVA

In the last couple of years, black social movements have emerged beyond the scope of the traditional immigrant associative movements based on national origin and area of settlement and changed the debate topics from housing and human rights to a broader affiliation area, namely around skin colour, African ancestry, and institutional racism. Despite the increasing diversity of Portuguese society, largely due to immigration, the question of social cohesion is seldom discussed in relation with political participation as a component of citizenship. Notwithstanding the recent dynamics in social movements of people of African descent in Portugal, and the first time a political party presented a black woman as the main candidate to parliamentary elections in the 2019 legislative election, the political landscape has changed little to nothing in relation to ethnic and racial presence and discussion at any level of government.

This paper results of an exploratory ongoing research on minority representation in local politics focusing on the municipality of Amadora and will look at minority representation at the municipal level and at the level of the political structures of the six parishes that comprise the municipality of Amadora to establish a clear image of minority representation in the territory. Subsequently, we will analyse the discourses of members of associations representing people of African descent and stakeholders to understand what variables (demographics, political engagement, prejudice) are affecting the likelihood of a non-white candidate on an eligible position in local politics and the relevance of the matter for local movements.

RN31 | T08_02: Attitudes, Memory and Racialization

Ambivalent Narratives On The EU External Border Crises: Between Racialisation And Inclusion

Elzbieta Opilowska

University of Wrocław, Poland

The paper discusses narratives surrounding the border and migration crisis on the EU's external border as constructed by the public discourse in Poland. Building upon the changing conceptualisation and social construction of a border and narrative approach, it explores frames, contexts (national, European), standpoints and narrative strategies that have been applied to justify the (in)hospitable policy towards migrants on both the Polish-Belarusian and the Polish-Ukrainian border. By analysing official statements by Polish state representatives, NGOs reports, and public opinion polls, two rival narratives have been identified. Whereas the first focuses on the securitisation of the border and the dehumanisation of migrants and is underpinned by the radicalisation and genderisation of borders, the second deploys a welcoming border narrative by constructing an imaginary of an open border and migrants as "our Slavic neighbors",realising an integrating narrative strategy, but is not free from hierarchisation. As such, this paper sheds light on bordering practices,explored from the perspective of language analysis, and reveals narrative strategies that can be applied within a broader migration and border discourse.

Anti-German Sentiment and the Difficult Heritage of Post-war Camps in Poland

Magdalena Lemańczyk

Institute of Political Studies, Polish Academy of Sciences, Poland

The post-war camps in Poland (1944-1950) for decades have been a part of a difficult heritage strongly linked to anti-German sentiment. The strength of this sentiment depends largely on the socio-political and cultural context in Poland. The victims of these camps were mainly Germans, but also people of other nationalities, people of the Polish-German borderlands and Poles considered "traitors to the Polish nation". Difficult heritage is understood, according to Sharon Macdonald, as "(…) a past that is recognised as meaningful in the present but that is also contested and awkward for public reconciliation with a positive, self-affirming contemporary identity" (Macdonald 2009: 1). In this sense, the study applied the concept of authorized heritage discourse (AHD) from Laurajane Smith's (Smith 2006), who introduced the issue of power relations into the theoretical framework of critical discourse analysis (CDA).

Thus understood, heritage is also dissonant and troublesome because it encompasses social processes closely linked to a range of cultural and social identities, opening up social divisions (Tunbridge and Ashworth 1996). The author will present the mechanisms of power relations towards this heritage in a sociological and historical context and its multidimensional effects, based on the results of the most recent sociological-historical research on the memory and commemoration of the post-war camps in Poland, conducted in 2021-2022 among 27 representatives of several milieus: Polish and German politicians of various levels, the German minority, Silesian regional movements, experts, churches representatives. The method used was a semi-structured interview questionnaire and content analysis (literature, press).

Classroom Diversity, Identity Style and Attitudes toward Ethnic Minorities

Markéta Spitzerová

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

Negative attitudes towards minorities are associated with issues such as racism, discrimination, social problems, or crime (Beelmann & Heinemann, 2014). In this article, I examine the role of identity styles in the relationship between intergroup contact and prejudice in adolescence. According to the contact hypothesis (Allport, 1957; Pettigrew & Tropp, 2006), interaction with members of outgroups can foster a positive shift in attitudes toward these groups. Similar results were also indicated in a meta-analysis of research conducted among children and adolescents at schools (Tropp & Prenevost, 2008). However, we know from previous research that individuals vary in their strategies for reacting to their environment. Berzonsky (2004), in his theory of identity development in adolescence, distinguishes three identity styles: informational, normative, and diffuse/avoidant. These styles reflect individuals' social-cognitive strategies when confronted with conflicting experiences challenging their established identities. Previous studies show that people with a dominant normative or diffuse identity/avoidant style tend to be more susceptible to prejudice (Miklikowska, 2012; Ozer et al., 2022). Using data from the first wave of The Czech education panel survey (n= 20,000 students aged 15-16 from 249 schools), the goal of this paper is to test if the effect of contact with outgroup members at school on prejudice is moderated by the identity style. Data will be analyzed using multi-level regression models, where individuals are nested in classrooms which are nested in schools. The results of my article will be contribution to the literature on the contact hypothesis.

RN31 | T09_01: Trauma, Memory, Social Relations, and Antisemitism

The Lasting Shadow of the Holocaust: How Collective Trauma Shapes the Perception of Antisemitism

Mathis Ebbinghaus[1,2], Ilana Axelrod[1]

1University of Oxford, Germany; 2Leipzig University

This article explores how collective trauma influences the perception of antisemitic threats. Through in-depth interviews with 61 Sephardic and Ashkenazi Jews in Sao Paolo and extensive ethnographic observation, we show that the salience of the Holocaust in the collective memory of Ashkenazi Jews shapes both their perception of present-day antisemitism and their support for institutional protection measures. Sephardic Jews, by contrast, perceive antisemitism as harmless and do not connect antisemitic incidents to the Holocaust or the history of antisemitism. Building on these descriptive observations, we detail the social processes through which collective memory becomes part of group identity thereby sensitizing minority members to present-day threats and discrimination. However, when traumatic events do not resonate with group members' collective history, they retain authentic definitions of self-identity by rejecting the past as an orienting device in the present. The findings provide novel insights into the enduring impact of traumatic events and their role in shaping perceptions of antisemitism today.

Willingness for Social Integration in a Deeply Divided Society: Views of Jews and Arabs in Israel

Nohad 'Ali[1], Dennis Rosenberg[2]

1Western Galilee College, Israel; 2Hebrew University of Jerusalem, Israel

This study aimed to identify factors shaping the willingness for social integration into a society marked by a deep divide in residential terms. Social integration was studied at two levels: collective and individual. In addition, it was studied not only from the view of the ethnic minority (i.e. what predicts their willingness for integration) but also from the view of the ethnic majority (i.e. what predicts their willingness to integrate ethnic minority). The data were obtained from the 2021 "Still Playing by the Rules" nationwide survey conducted in Israel to understand the attitudes toward various social, identity-related, and integrational aspects among Jewish and Arab citizens of the country. The samples included survey respondents who provided answers for the items assessing each abovementioned social

integration type (NJewish = 1501; NArab = 717). The results show that a better image of the counter population, higher perceived quality of interethnic relations, and frequent obtaining of instrumental help from the counter population were associated with the greater willingness for each type of integration in both populations. Slightly less consistent associations were found for institutional trust, spread of hate toward the minority population by mass media, frequency of leisure with the counter population, and frequency of experiencing negative contact with the counter population. The results provide support for a myriad of theoretical frameworks, like ethnic competition theory, interethnic contact hypothesis, and media cultivation theory. The findings imply that the willingness to socially integrate members of ethnic minorities, as well as the willingness for such integration from the minorities' side, is a function of a myriad of interpersonal experiences as well as social and media-related attitudes.

Teaching in a Diverse and Divided space in the Shadow of War: Lecturers coping with conflictual realities in Israeli academia

Maya Kahanoff[1], Tamar Hager[2]

1Hadassah College, Jerusalem Israel; 2Telhai College

Lecturers in academia are meant to teach, challenge and support students. But what happens to them, as part of the conflictual fabric of Israel?

In this lecture, we turn the spotlight on them, on us. We both have been teaching courses dealing with dialogue, multiculturalism, and activism in Israeli society for many years. The encounter with students from diverse ethnic, national, and class backgrounds, while attempting to develop their critical thinking skills, has become more complex over the years. We have seen more expressions of disagreement on social, ideological, and political issues, turning the classroom into a conflictual zone. The atrocities of October 7th and the ensuing war in Gaza have intensified the polarization between Jews and Palestinians in class, followed by ingroup closure, negative intergroup attitudes and mistrust, as well as expressions of mutual hostilities.

By sharing stories about teaching, encounters with students that evoke feelings of achievement and success, as well as those encounters that arouse frustration, anger, and a sense of failure, we will attempt to reflect on teaching in these challenging times. We will discuss students' difficulties in reaction to our teaching, however, our focus will be on our own difficulties as lecturers forced to part with our worldviews and pre – conceptions in order to engage students who think differently.

Our stories demonstrate an attempt to create a space in which moments of discomfort and anxiety may be examined and lead to new insights, suggesting that the academic arena is an opportunity for everyone present to examine worldviews and beliefs and acquire new knowledge, and perhaps also hope in the possibility of dialogue even in a reality of war.

Privileged passing

Liora Sion

copenhagen university, Denmark

This paper analyses the growing similarities between Jews and Palestinians in Israel through the practice of passing. Passing often refers to a performative movement out of a marked group into the hegemonic group. For the most part, passing is a one-directional phenomenon and there is no conceptualisation or accepted term for the opposite experience – moving from the hegemonic group to the marked group. In order to analyze such a performance, I suggest the term privileged passing to describe Jewish Israeli men who pass as Palestinians.

In Israel, which has a strict ethnic division, passing is usually not a quest for a transformation of oneself and one's identity, but a temporary act to profit oneself. I term it as sojourner passing: that is, an abrupt and temporary event limited in space and time in order to gain access to religious, financial or militarised goals. That is, sojourner passing is a potential act of passing that is less threatening for ethnic identities.

966

RN31 | T09_02: Global Perspectives on "Race" and Racism

Race beyond the "West": Narratives and Counternarratives of Blackness in/from the Maghrib

Alessandra Turchetti

University of Milan Bicocca, Italy

My paper, which is located at the intersection between visual/digital anthropology and critical race studies, aims to investigate the images and imaginaries of Blackness in contemporary Maghrib, especially Morocco. In the popular imagination, as well as in academia and in the art-world, Africa is often separated into two disconnected worlds: North Africa and Sub-Saharan Africa. This geographical and epistemological separation, reified and institutionalized in the colonial era, is first of all a racial fracture. Under the French colonial administration, Sahara became a sort of "color line" separating the "White" Africa (Afrique blanche) from the "Black" one (Afrique noire). The "Saharan Divide" is also linked to historical dynamics within the continent, such as the trans-Saharan slave trade. Morocco played a major role in the slave trade but slavery and its legacies (in terms, for example, of anti-Black prejudices) are still a taboo in Morocco which represents itself as a color-blind society with no racism. Nevertheless, in the past few years, Blackness has become a crucial political and cultural issue, taking on different meanings and embracing new (counter)narratives. The question of "race" is thus a complex and controversial topic in contemporary Morocco, which touches on many aspects (from economics to religion, from geopolitics and national identity to social movements, cultural and artistic expressions and gender issues). Through a critical, intersectional, transnational and transhistorical approach, I will explore different figures of Moroccan Blackness (Gnawa, Sub-Saharan migrants, Black Moroccan activists and artists), focusing on the connections between local meanings of race and global imaginaries of Blackness.

Ethnic Prejudice, Racism and Discrimination in Italy

Walter Greco

University of Calabria, Italy

The present paper aims to present initial findings from a survey on ethnic prejudice, racism, and discrimination conducted at the Dispes-CATILab of the University of Calabria through 1,500 telephone interviews, representative of the Italian population.

The primary thesis seeks to demonstrate that the increasing influx of foreign populations in Italy, a consequence of globalization-driven migration flows, serves as a pretext for fostering a system of prejudice across the country and its social stratification. Both old and emerging forms of prejudice and discrimination serve as the moral foundation upon which political consensus is built and sustained by specific political parties.

The rise of populism across Europe, coupled with the vulnerabilities of democracies, appears to provide fertile ground for the development of a new form of social control. Widespread levels of prejudice can function as a tool within a societal apparatus that extends its reach to different aspects of social life.

By examining the data, it becomes conceivable to hypothesize that prejudice, along with forms of discrimination and racism, is rooted in ancient fears. Simultaneously, it undergoes a specific re-functionalization, particularly when uncertainties in everyday life become more tangible and are entwined with a persistent crisis in social regulation. Prejudice, therefore, not only has a cultural foundation but also draws energy from an unexpected and revitalizing source of legitimacy embedded in common sense.

Where the Culture of Exclusion and Hatred are Not Present...

Ágnes Kövér-Van Til

Eötvös Loránd University, Hungary

The paper focuses on how the second and third generations of Holocaust survivors reflect the recent changes in the political atmosphere and public discourse in Hungary with regard to the growing authoritarianism, the mainstreaming of far-right politics and the exclusion of minority groups. This exploration is part of a more extended research on the transgenerational impact of Holocaust trauma among the second and third generation of Hungarian Holocaust survivors. Previous research has reported heightened sensitivity to social injustice, discrimination, and oppression among Holocaust survivors and their offspring (Morgan et al. 2022, Danieli 1998). Other research results have also confirmed that the second and third generations of Holocaust survivors show a higher level of social responsibility, empathy, and sensitivity (Bar-On 1998), which can be interpreted as a form of a post-trauma adaptational style (Danieli 2015). Although these people often perform well in societal life, they are highly exposed to re-traumatization, as they are more sensitive to crises and adverse social environment, which in extreme cases can even play a role in the reactivation of acute stress reactions (Bar-On 1998). Based on the analysis of interviews with 65 second – and 30 third-generation Holocaust survivors, the study presents the effects of the increasingly authoritarian and discriminative Hungarian politics and public discourse on the survivors' descendants. The text analysis reveals the impact of the family trauma of the Holocaust on their social sensitivity and trust, as well as the societal conditions affecting their sense of security.

967

Welfare Policy Discourse In Austria – Where Racism And Classism Meet And Intersect

Andreas Schadauer

University of Vienna, Austria

Large strands of welfare state discourses in Austria are closely linked to the topic of labour, labour relations and willingness to work. One dominant position states that social benefits must not undermine the motivation to take up work, no matter the given pay and working conditions. This has also always been part of the concepts of welfare chauvinism and spillover of racism into welfare discourses but is especially immanent in the resurfacing image and discussion of the "guest worker" ("Gastarbeiter") in recent policy debates. "Gastarbeiter" is and has always been a euphemistic term concealing the over-exploitation of migrants based on global inequalities. This discourse centralises the notion of the immigrant workers as resource to be used if needed and thrown away if depleted or not asked for anymore. If they however dare to stay, they are among others degraded e.g. as "scroungers", blamed for disturbing social cohesion or endangering the welfare state. To illustrate this racializing practice, the presentation is based on an analysis of central contributions of policy makers, public figures and newspaper articles relevant for and influencing this discourse. It analysis how the immigrant "other" as well as the Austrian citizens are on the one hand demarcated into social classes with different ascribed values and on the other hand within these classes separated into useful or useless for the labour market and welfare state. In conclusion and referring to the few attempts at a critical theory of racism, it will be argued that within these discourses on welfare state not only racist but also classist fragmentations are enacted, used and intertwined.

968

RN32 | Political Sociology
RN32 | T01_01: How extreme and far-right wing ideologies matter

The challenges of extremism and right-wing ideologies in contemporary European democracies. The panel focuses on recent insights from sociological research on far-right ideology in contemporary politics. Both contents of ideological messages and conditions of their circulation will be addressed.

Producerism and Reproducerism. The Economic Ideology of Radical Right-wing Parties

Marianna Griffini[1], Oscar Mazzoleni[2]

1Northeastern University London, United Kingdom; 2University of Lausanne

The economic dimension of populism has been little studied to date, although it is ever more relevant. Recent academic work has focused on populist prescriptions of how the economy and society should be organised for ensuring material prosperity (e.g. Mazzoleni & Ivaldi 2022). Within this field, the concept of producerism, often associated to right-wing populism (e.g. Shantz 2014; Berlet & Lyons 2000; Bergman 2022), has been advanced as an economic and political ideology, emphasizing the importance of producers (e.g., workers, farmers, small business owners) as contributors to common prosperity, allegedly undermined by groups the populist radical right envisions as parasites (e.g. elites, immigrants).

In this paper we adopt a gendered approach to producerism, drawing on thriving literature on gender in the populist radical right, which stresses the duplicity of the latter's attitudes towards gender (e.g. De Giorgi, Cavalieri, Feo 2023). Radical right-wing populism fights for women's rights, especially for mothers, but also imposes reactionary values regarding abortion rights and LGBTQ+ rights (Norocel and Giorgi 2022). The result is the relegation of women to their traditional reproductive role.

This paper contends that producerism and reproducerism are complementary facets of the political economic ideology of the populist radical right. The latter develops a gendered and materialistic vision of the people, split between men the producers, and women the reproducers. Our argument is based on case studies of populist radical right parties' and leaders' discourse in Europe, specifically the Italian Lega and Fratelli d'Italia, the French Rassemblement National, and the Swiss People's Party.

The Ideology behind the Mandate. Mapping American Conservatism from Reagan to Trump.

Mattia Diletti[1], Luca Massidda[2]

1"Sapienza" Università di Roma, Italy; 2Università della Tuscia

The paper tracks the trajectory of U.S. conservative thought between Ronald Reagan's first electoral achievement (1980) and the 2024 election. Comparative textual analysis of the first (1981) and the last (2023) "Mandate for Leadership", published by the Conservative think tank Heritage Foundation, will provide the groundwork for drawing the ideological maps of American conservatism at two crucial stages of its history. We suggest that the political thought of the America's leading conservative think tank is a key reference for looking into the ideological evolution of American conservatives over the past 50 years. Leaning on the perspective of ideology as a symbolic form as proposed by John B. Thompson (1990) and the morphological approach first proposed by Michael Freeden (2012), the paper will seek to identify both the mutations and invariants of the ideological ecosystem of American conservatism. Second, we will analyze whether, and to what extent, ideological configurations of think tank manifestos were embedded into the narratives proposed by Reagan in the 1980 election campaigns and by Trump in his third run for the White House (2024). This second part of research will be pursued by comparing Republican Party leaders' official campaign ads.

969

Ideological Evolution of the Extreme Right: Symbols of the Past in FdI, Afd and Vox's Political Communication

Giorgia Bulli

University of Florence

The recent success of the Fratelli d'Italia party in the 2022 parliamentary elections in Italy has sparked a debate on the extent to which the party's programmatic and values platforms have definitively departed from the ideological appeals of the post-fascist extreme right. This debate has extended to the European level, particularly in light of the success of radical right-wing parties in countries that share experiences with extreme right-wing totalitarian and authoritarian regimes, such as Germany and Spain. In Germany, the Alternative for Germany party's repeated electoral successes at the state level have focused attention on the Afd's alignment with extreme-right ideology. In Spain, these issues have also been raised in conjunction with the electoral successes of Vox and its inclusion in government coalitions in important Autonomous Communities.

Building upon these considerations, this paper aims to comparatively analyze how the three parties address the authoritarian political past using three predominant strategies: 1) denial of ideological affinity; 2) symbolic and contextual evocation; 3) explicit appeal. These strategies will be tested through the examination of party manifestos,

statements by party leaders and prominent figures, and contributions posted on major social media platforms. The results of this exploratory investigation will be contextualized within established analytical frameworks, ranging from the hypothesis of the normalization of the far-right (Wodak 2022) to the thesis of the transformation of typical far-right content into a right-wing populist ideology and strategy (Mudde 2019).

Gender Perspectives in the Far-right Politics. The Italian Political Movements and Parties Between Convergences, Conflicts, and Polarizations

Milena Meo[1], Antonio Tramontana[2]

1University of Messina, Italy; 2University of Messina, Italy

In contrast to the emergence of new sensibilities that are determined from gender issues, and consequently in front of the progressive demand for the recognition of new civil rights, there is a constant and dynamic development of misogynistic and sexist spheres of influence.

This angry response to the loss of privileges taken away by the advancement of gender claims feeds both political parties and social movements. On the one hand, what emerges from the articulated galaxy known as Manosphere contributes to the process of constructing masculinity through the use of gender stereotypes. On the other, stereotypes based on a traditional and hierarchical view of gender roles are present in social communication by far-right leaders, in their respective political manifestos and election programs.

In order to highlight how such convergences contribute to the new forms of political polarization and radicalization, the purpose is to analyze the articulation of the manosphere in Italy. This analysis is the partial result of the research activity conducted under the PRIN 2020 entitled "Stereotypes and Prejudices: the Social Representation of Gender-Based Violence" (Coordinated by Prof. F. Saccà as P.I.). In particular, we will focus on Men's Rights Activism (MRA), their anti-feminist, misogynist and sexist imaginary. Far from considering MRA as a peripheral opinion movement, the aim is to highlight the convergences with the gender imaginary that shapes the perspective of the mainstream Italian Far-right Parties and underpins the new political and cultural conflicts.

RN32 | T01_02: New debates in governance

This session brings together papers discussing a variety of current debates in governance including governance under crisis, in authoritarian setting, and the impacts of new governance approaches for democracy and policy.

Project-based Governance: How Funding Schemes Impact Local Governance on Migrant Integration

Irene Ponzo

FIERI, Italy

The paper is aimed at bringing to the fore a novel type of governance arrangement, i.e. the project-based governance. Drawing inspiration from the garbage-can model (Cohen, March and Olson 1972), the project-based governance puts into question the problem-driven nature of governance prevailing in the literature and contributes to highlight how governance can be driven not only by problems but also and especially by opportunities and solutions. Specifically, in this type of governance opportunities and solutions are offered by bids and calls for projects issued by public or private entities. Project-based governance provides a useful lens to understand certain governance arrangements that tend to develop in those policy fields where structural and stable funding is almost absent or marginal, shedding light on funding schemes' decisive role. After illustrating the key features of the project-based governance, the paper provides empirical examples drawn from Italian local experiences. Finally, it shows some major consequences of this type of governance for the local migrant integration policies.

Policy Entrepreneurs, Crises, and Policy Change

Evangelia Petridou[1,2], Jörgen Sparf[1,2], Nikolaos Zahariadis[3], Thomas Birkland[4]

1Mid Sweden University, Sweden; 2NTNU Social Researh, Norway; 3Rhodes College, USA; 4North Carolina State University, USA

Our understanding of policy entrepreneurs as agents of change has evolved considerably in the past few decades. Concomitantly, the scholarship on crises and the challenges and opportunities they present for effective governance and public policy has burgeoned as well, not in the least because crises are a ubiquitous component of politico-administrative structures. This is particularly evident in the era of pandemics, financial and military crises. In this manuscript, we connect the theoretical approaches of the concept of crisis with the theory on policy entrepreneurs. Our purpose

970

is to shed light on the drivers of policy change during and in the aftermath of crises from an agency perspective, using illustrative examples including the Covid-19 pandemic, terrorist attacks, the financial crisis, war, and extreme weather events. We explore tenets of crisis policy entrepreneurship and conclude with themes drawn from the case studes as well as implications for policy entrepreneurship and crisis policymaking.

Local Power, Where We Are And How We Got Here: Discussing The Tangle Between Trajectories and The Quality And Professionalization Of Local Democracy

Margarida Estêvão

CIES-IUL, Portugal

In recent decades, Portugal has introduced a number of legislative innovations (e.g. participatory budgeting; limitation of mandates; parity law) with the aim of contributing to the quality of local democracy, reversing the previous image of vices and corruption. However, each political phenomenon is a complex network made up of multiple protagonists and relations, where different trajectories, meanings and intentions intersect. Therefore, the quality of local democracy is not only linked to the legal tools that support it, but also to the ones who use them and to the sociopolitical context in which they do so.

To try and make up for the lack of studies on local power in Portugal, this communication aims to discuss the impact of new local political elites on the quality of local democracy. To that end, at the beginning of 2024 a questionnaire survey was made available to the universe of Portuguese mayors, focusing, among other questions, the sociographic dimension, individual and professional trajectories, and entry into and relationship with politics. Together with a content analysis of CVs and biographical notes available online, this communication explores the results of that survey.

This aims to contribute not only to the development of a database on local government in Portugal, which is still lacking, but also to the discussion on the quality of local democracy, political trajectories and the professionalization of political offices at this level of power.

RN32 | T01_03: Politics and memory

Memory, mobilized by a variety of different political actors, shapes action, experience, and political decision-making. This session brings together papers on memory to discuss how politics and the construction of memore interact today in a variety of settings.

Memories Of Nazism In Germany: Transformations And New Tensions

Alexandra Oeser

Universite Paris Nanterre, France

This paper addresses ordinary appropriations of politics by adolescents visiting concentration camp memorials in Germany.

Since reunification, German memory politics of the nazi past have undergone considerable transformations. The victims of German extermination policies have become centerpieces of German, but also transnational memories (Traverso, 2005). German memory politics have even been presented as a "model" for other countries and different pasts (Neiman, 2019). But memory politics developed in the Federal Republic after the 1970's and 1980's have reached their limits. Trust in the effectiveness of memory of the nazi past as educational protection against extreme right votes has been eroded. Thirty years after reunification, Germany struggles with a double failure: the country's extreme right has had major local successes, and more and more criticism arises against the exclusionary effects of German memory for Germans whose grand-parents have not lived the second world war in Germany (Özyürek, 2023).

Based on a long-term ethnographic study of three memorials in Germany, this paper will address these tensions through the example of adolescents who visit memorial camps, while subscribing to extreme right-wing discourses. One explanation of the drifting apart of memory politics and their contemporary uses can be found in the hardening of memorial discourses and their exclusionary effects for migrant populations; another in the pedagogical divide between emotional and unanimous rejections of the nazi past and a lack of analytical and historical explanations, a third in the practical uses of the memorials by teachers and students, as well as formal and political constraints.

971

"Narr-acting" Europe's Past: Intra-Institutional Memory Activism in the European Parliament.

Andrea Apollonio[1,2]

1University of Turin, Italy; 2University of Florence, Italy

This paper examines the political discourse on 'European historical memory' as it is constructed and transformed in the European Parliament in the context of EU politics of memory. The term 'EU politics of memory' refers to political interactions and struggles between various actors, within or close to the European institutions, regarding memorial narratives, practices and policies that use 'Europe's past' to support claims and projects in the present. The concept of 'discourse on European historical memory' aims to identify the interweaving of memorial narratives exhibited and contested by actors in European fora, i.e. the 'discursive dimension' of European memory politics. According to several authors, the European Union began to engage with this field of political interaction from the 1990s onwards and became more involved from 2005 onwards. Since the end of the Cold War, European institutions – or rather, the actors interacting within them – have developed a discourse on the historical memory of the EU. The study examines the sociological and political dynamics of the construction of the discourse on "European historical memory", with a particular focus on the 9th parliamentary term (2019-2024). For interpretive purposes, this research uses an extensive empirical database consisting of institutional texts such as resolutions and transcripts of debates on 'European historical memory', as well as semi-structured interviews with selected informants, i.e. memory entrepreneurs who interact with the discourse across the parliamentary arena.

The Making of Ethno-racial Memory Activism in Malaysia: Quasi-religious Mnemonic Mobilization, Post-memory Generations, and Chinese Education Movement in Abeyance.

Ke Liang NG

National Taiwan University, Taiwan

This article elucidates how the ethno-racial grassroots memory activism sustains postcolonial Malaysia's Chinese Education Movement in abeyance by 'quasi-religious mnemonic mobilization': leveraging ancestor worshipping, embodying movement memories, and generating mnemonic symbols.

To mobilize the apolitical Chinese post-memory generations to participate in a movement losing explicit threat in settled times poses a critical challenge.

With authoritarian state repression replaced by neoliberal assimilation, concealed under the guise of free choices and personal freedom, ethnic Chinese minority activists in Malaysia encounter difficulties in mobilizing, transforming, and recruiting post-memory generations into movement organizations.

Through participant observation at the Lim Lian Geok Memorial in Kuala Lumpur and Chinese schools across West Malaysia, coupled with conducting in-depth interviews with Chinese Education Movement activists, I illustrate how the making of ethno-racial memory activism constitutes symbolic politics of inter-generational ethno-racial remembrance, worshipping, and identity-making through quasi-religious practices.

Firstly, memory activists build a memorial museum as an ethnic commemorative infrastructure, worshipping a movement leader—Lim Lian Geok—as 'ZuHun' (soul of the ethnic Chinese, 族魂).

Secondly, memory activists utilize the memorial museum as a free space to embody lived movement memories, officially erased and unrecognized, through the quasi-religious movement technique, aiming to spiritually transform the apolitical subjectivities of post-memory generation students.

Thirdly, memory activists have generated the Lim Lian Geok Spirit Award as symbolic capital to make officially unrecognized grassroots Chinese education movement activists across countries recognized, thereby symbolically strengthening the movement in abeyance.

Lastly, this case of ethno-racial memory activism contributes to a sociological framework that transcends conventional binaries, including modernity/tradition, secular/religious, rational/emotional, and structure/culture models.

972

Voices from the past: How Political Elites are influenced by the political history. An Iberian comparison.

Pablo Cañete Pérez

European University Institute, Italy

Although Portugal and Spain have had analogous government compositions between 2008 and 2015 and the Troika intervened in Portugal, Spain ended up implementing more stringent austerity policies after the Great Recession than its neighbouring country. What explains this divergence? This paper focuses on the key role of political culture in driving this difference. As evidenced by previous research, these two countries experienced different pathways of transition to democracy (a revolution in Portugal and an agreed transition in Spain), which left a longstanding legacy on the political culture. Relying on elite interviews with the politicians involved in the implementation of austerity measures between 2010 and 2015, I show there are still vivid legacies from the transitions in the justification of austerity policies. The political legacies from the 1970s are crucial in understanding contemporary political decisions in Iberian countries.

RN32 | T01_04: Right-wing populism and illiberalism

Research in this session explores the interconnections between illiberalism and the far-right, exploring both its conceptual underpinnings and its empirical evidence, and discusses far-right political imaginaries.

Policing Belonging: Police, Protest, and the Citizenship Amendment Act in India

Deep Chand, Parishmita Dutta

Goethe University Frankfurt, Germany

The present BJP-led Indian government has passed the Citizenship (Amendment) Act, 2019 [CAA1-2019] in Parliament to grant citizenship to 'illegal migrants' of six non-Muslim communities from Pakistan, Afghanistan, and Bangladesh. The systematic attempt to exclude Muslims from said countries has led to massive social protests across the country at different times and spaces. The protesters have strongly articulated how the Act is

discriminatory and violative of the basic structure of the Constitution of India. It

institutionalises preferential treatment based on religion, which directly conflicts with the inclusive spirit on which the idea of India was formed.This study aims to unfold the question of policing belonging about anti-Citizenship Amendment Act [CAA] protest as police being a part of the 'state apparatus' (Althusser, 1971) have played a vital role in eroding and creating tension in belonging of protesters. Policing belonging can secure a sense of belonging and solidarity among protesters as citizens' human rights and right to protest are constitutive of citizenship.

However, in the context of the anti-CAA protest, it is not only this Act threatening and creating tension in belonging, but the violent forms of policing itself erode belonging for protestors. Using the repression-protest literature, the study seeks to understand how policing of protest create conflict and tension in in belonging as the protesters face police brutality during the protest. The study will also try to comprehend policing protest from the point of view of the protesters who employed a 'repertoire of resistance' to express their opposition against the political establishment.

Denunciations as a Tool of State Control in Authoritarian Hybrid Regimes: Evidence from Turkey

Emine Ay

Dublin City University, Ireland

The surge in denunciations in Turkey reflects a widespread trend among citizens, particularly since the 2016 coup, with indications of the regime leveraging these reports to target political opponents. Despite this, scholarly work has yet to explore the relationship between increasing authoritarianism and the denunciation phenomenon in Turkey. Existing knowledge on citizen-led denunciation practices is limited to extreme forms of governance seen in 20th-century totalitarian regimes and contemporary dictatorships. Little is known how mass reporting can thrive in hybrid regimes. Addressing this gap, our study delves into the decade-long denunciation phenomenon in Turkey, aiming to unravel the political and societal factors contributing to emergence and persistence of mass reporting.

The study implements a multi-level analysis to explore the state-society interactions through denunciations. Macro-level analysis explores the politics and ideology informing citizen mobilization for denouncing as reflected in the political discourse. For this, Critical Discourse Analysis is conducted to examine speeches by Erdoğan between 2013-2023. Micro-level examination reveals the diverse individual experiences within the reporting system. Victims of denunciations and users of the reporting system are interviewed to illuminate the societal repercussions. Meso-level illuminates the interplay between the state and society through legal, judicial, and bureaucratic resources utilized to facilitate denunciations. The Legal Doctrinal Method, along with interviews with legal and bureaucratic experts, is employed to uncover the political engineering behind the denunciation mechanism. This involves examination of the regulation, solicitation and processing of denunciations, as well as its consequences. Focusing on Turkey, this paper exposes the political engineering behind horizontal citizen surveillance. It argues the ostensibly democratic framework is leveraged by aspiring autocrats to elicit denunciations from society, impacting the institutional arrangement and citizen behaviours.

Cracks In The Neoliberal Consensus And The Hegemonic Battle For Authoritarian Rebelliousness: Analysis Of The Emergence And Positioning Of The Far-right In Chile

Luciano Santander

Freie Universität Berlin, Germany

In the diverse panorama of neoliberalism in Latin America, the response to anti-neoliberal mobilizations reveals a staunch defense of the model by reactionary and authoritarian

973

means. Is there a common thread in the institutional defense of neoliberal actors in the different countries? What mechanisms sustain the institutionality of neoliberalism under normal conditions?

I argue that challenged neoliberal projects tend to deploy a series of coercive strategies, which I called collectively "Authoritarian Mechanisms of Neoliberalism" (AMN). This paper delves into one facet of the AMN: the ascent of the far-right in Chile. It scrutinizes the rapid rise and consolidation of these actors.

The study focuses on two pivotal variables influencing the emergence of ultraconservative populist groups in Chile. First, the far-right strategically positions itself as defenders of Chilean national identity, as antithesis of a re-foundational left. Secondly, the skillful reorientation of public discourse from social rights, fundamental during the protests of 2019, towards public order and security.

By conducting 12 semi-structured interviews with far-right leaders, and crossing this empirical evidence with documentary analysis, this work reveals that the far-right's emergence as neoliberalism's guardian represents a manifestation of authoritarian mechanisms intrinsic in the model's actors struggle for hegemony. Central to this endeavor is the employment of a remarkably effective strategy, which is display the notion of authoritarianism as common sense.

By scrutinizing this dynamic in Chile, this study contributes to a broader understanding of how neoliberalism wields authoritarianism to safeguard its dominance. This endeavor offers crucial insights into the complex interplay between neoliberalism, democracy, and reactionary responses, providing a nuanced perspective on the socio-political landscape in the region.

Discursive Legitimisation of Illiberal Democracy by Populist Right-wing Parties – the Case of Poland

Katarzyna Zielińska, Magdalena Góra

Jagiellonian University, Poland

The starting point for our research is the Weberian assumption that every authority and every political order requires legitimation. In the context of observed processes in Poland and other countries worldwide leading to democratic backsliding or the construction of a system of illiberal democracy, the question arises about how political actors justify illiberal order or the need for its implementation. According to the principles of the discursive approach, the hegemonic status of a given order depends on the effectiveness of its legitimation. Therefore, our paper seeks to analyze how Poland's right-wing ruling coalition, the United Right (2015-2023), legitimized their actions that resulted in the dismantling of key elements of liberal democracy. Statements made by members of parliament representing this coalition during plenary parliamentary debates on judicial reform, civil rights (women's rights, LGBTQ+ rights), and relations with the European Union serve as our research material. The analysis of legitimization strategies will be the starting point for a broader discussion on the consolidation mechanisms of an illiberal order.

RN32 | T02_01: Populism and conspiracy. The transformations of radical and far right

Are populism and conspiracy distinct or intertwined concepts? To what extent radical right-wing actors connect populist stances and conspiracy narratives? This panel will deal with these questions providing theoretical discussion and empirical research.

Amplifying The Populist Anti-Immigration Cause Through Climate Policy Discourses – Does The Relative Degree Of Mainstreaming Matter? – Evidence From Swiss People's Party And National Rally.

Klaudia Koxha, Oscar Mazzoleni

University of Lausanne, Switzerland

974

Research suggests a positive link between radical-right populism and climate skepticism/opposition to climate policies. Nonetheless, the populist discourse on climate varies across the radical left and right and within the same party family. Scholars highlight 1) party history and 2) diverse national contexts to explain variation in climate policy positions of radical-right populist parties and 3) the positioning of populists in government vs. opposition affecting the degree of moderation of their discourses on climate (Huber et al. 2021, Taggart & Szczerbiak 2013, p. 34). Yet, while we expect opposition to climate policies to exacerbate the anti-elite discourse and amplify popular sovereignty as a main discursive element, we argue that populist discourse on climate could intersect with and amplify other populist core issues, such as immigration. To our knowledge, the intersection of climate change and immigration in populist discourse is largely underexplored. Studies show that populist frames may shift, i.e. populists may moderate their discourses due to a 'normalization' strategy, such as in the case of Marine Le Pen/National Rally regarding immigration (see Hutchins & Halikiopoulou 2020). Thus, we expect the intersection of climate policy framing and immigration to be affected by the relative mainstreaming of a radical right populist party; the more a party stays away from the mainstream, the higher the likelihood of this intersection. One party that has arguably stayed away from the mainstream is the Swiss People's Party (see Mazzoleni 2016). Thus, to test our expectation, we compare the Swiss People's Party and the National Rally, conducting a discourse analysis of party programs, Facebook posts, and press releases during the last national elections campaign (April 2022 in France, October 2023 in Switzerland).

Challenging Democracy: How Do Conspiracy Ideas of Populists Politicians and Citizens Align?

Reinhard Heinisch[1], Oscar Mazzoleni[2]

1University of Salzburg, Austria, Austria; 2University of Lausanne, Switzland

The Great Exchange, rigged elections, climate change as a hoax, viruses (e.g., HIV, COVID-19) created in government labs, and George Soros as the mastermind of many evils are just a few of the conspiracy narratives that have fueled political debate in liberal democracies around the world and prompted significant new research on the phenomenon. In the process, the literature has diverged, with some focusing on the demand side, that is, the conspiracy mentality of citizens who are receptive to conspiracy narratives or actively motivated by conspiracy discourse, and others focusing on the supply side, that is, political leaders who engage in conspiracy narratives. The rise of radical populist parties promoting conspiracy theories and the growing support they find highlights the importance of this issue for the state of democracy. In order to assess the importance of conspiracy theories in democratic political discourse, it is necessary to examine the extent to which demand-side and supply-side conspiracy theories correspond to each other. In short, the aim is to assess the extent to which voters of radical populist parties are motivated by certain conspiracy ideas and also to see whether these are also present to a similar extent in the narratives and discourses of populist actors. The proposed paper is based on original data generated through a funded study designed to investigate this question comparatively in key Western European countries.

Moderating radical-right wing parties? Populism and conspiracy theories during the 2022 French Presidential Elections

Oscar Mazzoleni, Grégoire Yerly

University of Lausanne, Switzerland

The analysis of mainstreaming represents one of the most relevant issues in the literature on radical right-wing parties (e.g. Akkerman, De Lange and Roodujin 2016). Meanwhile the significance and the ways by which this issue can be tackled remains a challenge. This paper addresses how and to extent populism and conspiracy theories are provided by radical right-wing parties' supply. Aiming this scope, we will explore discourses by a rooted and establishment-oriented party and a new and anti-establishment party, that is the Rassemblement national (RN) and Reconquête in France. We will test the hypothesis that the RN provided more moderate during the 2022 French presidential elections. We will adopt a discourse analysis approach considering press releases, Facebook posts and party manifestos by both parties between August 2021 and August 2022.

Debunking The Disinformation Ecosystem

Felix Schilk, Mara Precoma

Universität Tübingen, Germany

Most tensions, social conflicts, and political discourses relating to contemporary transformations are connected to the emergence of a disinformation ecosystem in recent decades. Strategically disseminated disinformation, including conspiracy theories, aims at fostering polarisation and distrust of governments, institutions, and the media. Informed and critical people are, however, the very essence of democracy. Countering disinformation is thus a key challenge for everyone who believes in democratic values and debate.

These challenges have not gone unaddressed in recent years. Different approaches against disinformation have been funded and implemented by authorities at the European, national, and regional level as well as by the media, NGOs, and social networking platforms, among them fact-checking, debunking, digital and media literacy, civic education, and consulting.

In the cross-European research project "REDACT: Researching Europe, Digitalisation and Conspiracy Theories" we examine these approaches. We aim at figuring out how the people who conduct them understand the phenomena of disinformation and conspiracy theory, and how hegemonic perspectives in social science on a national level translate into different approaches across regions.

For this purpose, I conducted 30 semi-structured expert interviews with individuals working in institutions, the media, and NGOs that tackle disinformation. Drawing on a Sociology of Knowledge and Grounded Theory approach, I will first provide a typology of my interlocutors, their understandings, and the approaches they apply and second show how institutional settings and funding shape the implementation and continuation of projects. My research helps to understand path dependencies in governmental and non-governmental crisis management, and to identify key challenges in the fight against disinformation.

975

RN32 | T02_02: Democracy today

Democracy remains a core theme in political sociology and the core of this session on how democracy is framed, supported, and used in our discipline.

From Authoritarian to Liberal Democrats: People's Conceptions of Democracy in Germany, Austria, and Switzerland

Martin Ulrich

Saarland University, Germany

Against the backdrop of the increasing electoral success of populist parties in the EU, many scholars argue that liberal democracy is under threat from populist parties. Their rejection of representative democracy in favor of direct and majoritarian conceptions of democracy is seen as a direct challenge to the core principles of liberal democracy. However, the supporters of such populist parties would see themselves as democrats. This is because the concept of democracy is highly contested, meaning that different people ascribe different meanings to it.

This paper has two main contributions. First, it studies the most prominent conceptions of democracy among the German, Austrian and Swiss population. Using data from the 10th round of the European Social Survey, this paper finds six types of democrats through a Latent Class Analysis. This typology includes supporters of liberal democracy who still account for the majority in all three countries. However, there are other classes that show less support for key liberal principles or that combine them with an acceptance of leaders above the law. The second contribution focusses on the consequences that these different conceptions of democracy have for key aspects of political participation (probability of non-voting, affiliation with populist parties, satisfaction with democracy, etc.).

The results of this paper will help to shed a light on the scale of the challenges to liberal democracy, both at the abstract level of what people consider democracies to be, and at the real-life implications of these conceptions.

Types of Democrats Compared: Comparing Democratic Profiles between the Majority and Muslim Minority Population in Belgium

Guido Priem, Cecil Meeusen, Bart Meuleman, Koen Abts

KU Leuven, Belgium

To reduce the negative impact of radical narratives posing Islam as fundamentally undemocratic, it remains crucial to get an accurate picture of the actual level of support for liberal democratic principles among Muslim minorities in comparison the to majority population. However, studies measuring public support of democratic principles generally assume that support for liberal democracy follows a one-dimensional concept and that citizens will either accept or reject these norms consistently. However, public opinion studies tend to show a substantial group of people who are not consistent in their support for democratic values, combining general support for democracy with a tendency to support authoritarian practices, such as the rejection of political opponents or minorities. Using the Belgian National Election Studies 2019 for the majority population and the Belgian Minority Election Studies 2019 for the minority population, this study will make use of Multiple-Group Latent Class Analysis (LCA) to distinguish different democratic profiles within both the majority and Muslim minority population in Belgium. By identifying how both groups interpret and combine their support for several core indicators of liberal democracy, including indicators for individual freedom (freedom of speech, freedom of religion, freedom of association) and indicators for political equality (equal rights for homosexuals, women and immigrants), this study aims to more consistently map out which liberal democratic values are the most under pressure among both groups, while at the same time identifying the values with the biggest division between the majority and Muslim minority population in Belgium.

Democracy and its Threats in the New Year Speeches of the Czech and the Slovak Presidents

Zuzana Kusá

The Slovak Academy of Sciences, Slovak Republic

Political discourse,and especially the speeches of political actors privileged to speak in the name of the „nation", co-shapes the way people think about issues and principles of governing society. I will present part of my CDA research of the tradition of presidential New Year speeches that continued in both the countries after the split of Czechoslovakia. The focus is on how Slovak and Czech presidents in office between 1994 and 2022 defined the meaning of democracy, its basic features, value principles and what they called threats to democracy. I show that that with the exception of Václav Havel and one other, presidents presented

976

democracy as self-evident and taken for granted and they determined its components, conditions and connections mainly indirectly: by listing democracy among other desirable values without specifying their mutual connections or naming its formal characteristics. Certain exceptions to this enumerative delimitation are passages in which they talked about threats to democracy.

I suggest that the prevailing non-argumentative approach to democracy of the majority of presidents may have contributed to the narrowing of democracy to its formal characteristics and to the weakening or emptying of its value foundations, and thus also to the loss of its importance for part of the population of Slovakia and the Czech Republic.

Taking Democracy Seriously as a Sociological Concept

Jenni Brichzin

University of the Bundeswehr Munich, Germany

If there is one thing that we, as political sociologists, may take away from the political upheavals of recent years – ranging from internal contestations of democracy to external threats, from the Trump-presidency to the war in Ukraine–, it is the fact that democracy is a social and societal force in its own right with central analytical importance. Immediate social repercussions of democratic decline, such as the re-essentialization of societal conflicts or the relapse into vulnerability of entire social groups, are so imminent and so widely visible as to make the conclusion appear trivial: understanding contemporary society means understanding it from a sociological stance that systematically and centrally incorporates the concept of democracy.

In my presentation, I will tackle a threefold task. First, I will draw on current research to delineate the ways in which the democratic decline threatens to fundamentally transform social orders. Second, I will show how, with few exceptions (e.g. Habermas, Laclau/Mouffe), democracy as a theoretical concept is marginalized in sociology. Consequently, sociological analyses of the present often struggle to adequately take social transformations as outlined before into account. To address this gap, my final (and main) task is to offer a programmatic understanding of the democratic formation of society that goes beyond the common conception of societies structured by capitalism. I draw on John Dewey, for whom democracy is not just a governmental system or a collection of political institutions, but a 'mode of associated living' that permeates social interactions at their core. Dewey's perspective opens up a view of current societies that are not only determined by a capitalist 'logic of competition', but also by a democratic 'logic of configuration'.

RN32 | T02_03: Interlinkages between attitudes and political actions (1)

The session explores the interlinkages between attitudes and political action, exploring the role of external factors in shaping and changing political attitudes – including networks and critical junctures – , the interplay between political attitudes and identities, and the role of emotions.

Trials of life, Emotions and Far-Right Attitudes

Bernard Enjolras, Audun Fladmoe, Kari Steen

Institute for Social Research, Norway

Economic grievances and cultural backlash are among core, competing explanations for the growing appeal of far-right parties. In this paper, we take an alternative explanation provided by Rosanvallon (2021), as our theoretical point of departure, according to which the experience of personal hardships or "trials of life", resulting from societal structural conditions and their afferent emotions, are associated with support for far-right ideas. We translated Rosanvallon's typology into empirical concepts and embedded these in a representative survey of the adult Norwegian population (N=3766), fielded in 2022. This allowed a study of how holding far-right attitudes was related to experiences with trials of life, and to explore the role of anger and fear in this context. Results indeed showed a relationship between having experienced "trials of contempt", "trials of social bonding" and "trials of uncertainty" and far-right attitudes. The relationship was even stronger among those who felt fearful about the state of society, whereas anger did not play a mediating role. Based on these results, the notion of "trials of life", seems a fruitful avenue for empirical research on the foundations for far-right attitudes. Theoretically, the perspective enlarges the scope of hardships to be considered, beyond economic ones, and allows for capturing the effect of experienced economic, cultural and social transformations, as well as the subjective evaluation of these experiences.

What Contextual Factors Influence the Social Acceptability of Extreme Political Behavior?

Armin C. D. Küchler

Bielefeld University, Germany

Various forms of extremism are of great security significance for democratic societies. However, it remains unclear under which contextual effects normal people may develop feelings of justification for extremist behavior. Drawing on General Strain Theory (GST), this paper argues that certain perceived economic and personal strains can serve as mechanisms for the general acceptance of extreme actions. These individuals are neither extremists nor radicalized, but understanding how perceptions of contextual effects shape societal attitudes can play a crucial role in preventing an individual's susceptibility to the multifaceted process of radicalization. In addition to the aforementioned forms of perceived discrimination by the GST, a perceived sense of belonging and perceived territorial prestige are also part of the analysis. Furthermore, it was found that the more people score on the Index of Susceptibility to Radicalization, which consists of the three theoretical dimensions "perceived discrimination", "authoritarianism", and "distrust of democracy", the more open they are to extremist behavior. However, a contextual influence remains independent.

In a quasi-experimental, factorial survey design, participants are asked to what extent it would be justifiable for them if a described person were to resort to drastic means – means that go beyond civil disobedience – in order to achieve a political change in his or her life situation. The fictitious person in the experiment is – or is not – affected by the contextual influences defined above. This method is embedded in representative questionnaires from three major German cities (N=2.990), which allow for further covariates, such as the index of susceptibility to radicalization.

When Discussing Important Matters and Politics, Extremists' Networks Do Not Resemble Echo Chambers

Eva Jaspers[1], Miranda Jessica Lubbers[2], Marcel Lubbers[1]

1Utrecht University, The Netherlands; 2Autonomous University Barcelona, Spain

This study explores the dynamics of political discussion networks across the political spectrum, considering the variation in network composition and structure based on political orientation.We derive from the understanding that humans are inclined to engage with similar others, but those with extreme political views may face challenges in finding like-minded individuals while possessing a heightened preference for homophily.

Examining core discussion networks and patterns of tie activation, the study posits hypotheses suggesting that extremists are more likely to be isolated, maintaining smaller, more homogenous networks with pronounced divisions between differently-minded individuals. We use the 2013 Spanish General Social Survey (N=8403) that includes many personal network questions and political orientation for both respondents and their networks.

The preliminary results show that, contrary to expectations, extremists were found to have, on average, larger networks than moderates. Both fewer opportunities to meet like-minded others and a preference for homophily seem to shape extremists' networks: they were more heterogeneous than that of moderates, even if their deviation from expected heterogeneity based on random mixing was also larger (particularly for the extreme right). Consequently, extremists were significantly more exposed to opposing views in their core networks than moderate individuals. Tie activation followed similar patterns: Despite tendencies of homophily in their tie activation (which moderate individuals lacked), extremists were significantly more likely to talk about politics with family and friends with opposed views than moderate individuals.

In summary, the research suggests that personal networks, despite individuals' political extremeness, act as a buffer against online filter bubbles, fostering exposure to diverse perspectives within core discussion circles.

The Effect Of Sanctions On Political Attitudes In Autocracy

Alexandra Orlova

Freie Universität Berlin, Germany

978

Since February 2022, extensive sanctions have targeted Russia as a response to the full-scale invasion of Ukraine. Less than in a month Russia became the most sanctioned country globally. Sanctions aim to pressure and influence policies, but those imposed on Russia since 2014 have not significantly changed Russia's policy towards Ukraine, much less prevented a war.

A reasonable question arises as to whether and why sanctions can be effective at all. I believe the potential reaction of the target and particularly likelihood to comply, which is often overlooked, is one of the key factors behind the effectiveness of sanctions. In autocracies, especially those with mineral resources, sanctions may seem insignificant, easy to circumvent, or not pose a threat, making it easier for them to maintain undesirable behavior. More importantly, sanctions can backfire, fostering support for authorities and increasing authoritarianism. They risk becoming an expensive, inefficient foreign policy tool.

Therefore, understanding how sanctions affect attitudes in autocracies is crucial, because it forms the political price to be paid by authorities to continue undesirable behavior. While their economic impact is well-studied, their influence on political attitudes is often overlooked. In this paper, I explore this gap, focusing on the Russian case. What can be expected from the Russian population under the unprecedented scale of the imposed sanctions? Do they provoke an increase in dissatisfaction or lead to greater support for the authorities? Do they affect attitudes toward the war?

Utilizing two quantitative datasets representative of Russia—one from a state-affiliated research center and

another from independent researchers—I employ logistic regressions to analyze the effect of sanctions on political attitudes. Although causation cannot be claimed, associations reveal the broader picture of the effect of sanctions. Contrary to expectations, the research finds no rally-around-the-flag effect in Russia. Instead, the consequences of sanctions were associated with a decrease in support for the authorities and the war, and an increase in the positive assessment of democratic renewal.

This study makes a significant contribution to the broader debate on both the effectiveness of sanctions and understanding the (radicalizing) Russian society.

Deindustrialization's Polarising Impact on Confidence in the Political System: Evidence from 171 OECD Countries and Year

Anders Ejrnæs, Tomasz Drabowicz, Mads Dagnis

Roskilde university, Denmark

This study utilizes a three-level multilevel model and data from the European Value Studies and World Value Studies to examine the relationship between industrial employment, union membership, income, and confidence in political institutions within democratic systems. By separating comparative effects from temporal changes, the research design offers insights into causal heterogeneity and the role of industrial composition. The findings reveal the challenges posed by the decline of industrial sectors and the diminishing engagement of unions with political confidence. Lower levels of confidence in political institutions are associated with diminished industrial employment, suggesting a potential erosion of democratic legitimacy. The impact of union power on political confidence has become negligible, questioning the relevance and effectiveness of unions amidst economic transformations. Changes in the industrial-service employment ratio magnify the relationship between income and confidence in political institutions, with lower-income groups experiencing a greater decline in confidence. The declining union power widens the confidence gap between higher-income and lower-income groups. This study has implications for future research on political confidence, urging further exploration of the evolving role of unions and the implications of economic transformations on societal divisions and democratic legitimacy.

RN32 | T03_01: Gender and politics – leadership and political activism

The panel focuses on the role of gender in the political sphere by combining the analysis of gendered performances of political leaders with the exploration of grassroots activism related to gender issue.

Styles, Themes and Narratives of a Female Leadership: an Analysis of Giorgia Meloni's 2022 Election Campaign

Flaminia Sacca'[1], Luca Massidda[2]

1Università Sapienza di Roma, Italy; 2Tuscia University, Italy

This paper deals with the analysis of power from a gender perspective. In particular, it analyses the 2022 electoral campaign of Giorgia Meloni, the first woman ever to have become prime minister in Italy. Her election has initiated a heated debate on the characteristics of power, on gender disparity and on feminism. While Meloni herself has denied her gender any specificity to her role, we argue that on the contrary, being a female leader has softened the image of an otherwise perceived as a radical right wing party that has challenged democratic values and the Italian democratic history. On the other hand, it cannot be denied that, the mere fact of having a woman in that role represents a tangible example of new possibilities for the younger generations. We will present the data collected during a Research Project of National Interest funded by the Italian Ministry of University and Research: «The Transformations of Democracy: Actors, Strategies and Outcomes in Opposing Populism in Political, Juridical and Social Arenas» (principal Investigator: prof. Carlo Ruzza, Trento University; Unit coordinator: prof. Flaminia Saccà, Sapienza University).

The Strong Man Fighting the Virus. Viktor Orbán's Masculine Narrative during the Covid-19 First Wave

Luca Massidda[1], Flaminia Saccà[2]

1Università della Tuscia, Italy; 2Sapienza Università di Roma, Italy

The paper analyses the leadership style adopted by Victor Orbán during the first wave of the pandemic. It conducts a content analysis of the official speeches delivered in March and April 2020 to identify the topics, moods, and formats that characterized the political communication of the Hungarian far-right populist leader. The aim of this paper is to

979

investigate whether the health emergency has intensified the use of populist rhetoric's traditional characteristics, such as appealing to 'the people', attacking the elite, and ostracising others, or if it has resulted in a change in its argumentative structures. The analysis will concentrate on Orbán's self-representation, specifically identifying the rhetorical devices and discursive strategies used by the Hungarian Prime Minister to establish himself as a strong, masculine, and agentic leader. The presented data were collected as part of the research project «The Transformations of Democracy: Actors, Strategies and Outcomes in Opposing Populism in Political, Juridical and Social Arenas» funded by the Italian University Ministry (principal Investigator: prof. Carlo Ruzza). Our local research unit was coordinated by Prof. Flaminia Saccà.

Feminisms and Populisms in Italy and Bolivia. Social Tensions and Political Challenges Around Gender Inequalities

Valentina Raffa

University of Messina, Italy

The relationship between populism and gender appears complex and contradictory. Generally, right-wing populisms develop a discourse on gender that conceals a traditional view of gender roles and a lack of attention to the rights of women and LGBTQ+ communities. When they advocate for the rights of women and LGBTQ+ communities, they do so within positions that are anti-immigration and anti-Islamic, contrasting liberal Western values with an obscurantist Middle East. This leads to strong social and political tensions related to sexualities, gender, transgender issues, gender-based violence, abortion, also in terms of intersectionality, and a crisis of trust in democratic institutions.

Feminist movements navigate within these social tensions, acting as important actors in anti-populist resistance. They advocate for the expansion of civil, political, and social rights for women and LGBTQ+ individuals, and they set new political challenges about gender inequalities. This contribution will analyze the relationship between populism and gender issues in a comparative perspective between a European country, Italy, and a non-European country, Bolivia. It will observe the persistences and differences between the two phenomenologies based on the cultural variable of the reference contexts and the ideological variable of the investigated populist forms.

The Political Role of LGBTQ+ Centres Against Discrimination in Italy. A case study

Fabio Mostaccio

University of Messina, Italy

The lack of laws that protects people from homophobic and transphobic violence in Italy encourages systemic discrimination and contributes to increasing the inequalities experienced by LGBTQ+ people, who are also denied access to resources and, in general, to citizenship rights. For this reason, Italian LGBTQ+ communities have self-organized to create anti-discrimination centers and shelters for young who are victims of violence. The aim is to arrange support and assistance for vulnerable people without social protection. These organizations, providing essential services to sexual minorities, carry out political action to combat violence and raise cultural awareness, reaffirming the need for recognition of the rights of LGBTQ+ people. After a tough political clash and pressure from social movements, in 2022, 37 projects were funded across the country to create Centres Against Discrimination (CAD) and 2 Shelters for victims of violence.

The political role in these activities is the focus of this paper: we present the first results of research carried out with a qualitative approach (in-depth interviews, interviews with key informants) in a specific case study, a CAD in Reggio Calabria (Southern Italy), a peculiarly fragile area of the country from a political and economic point of view.

The presentation analyzes this organization's actions and working methods to verify its political role and social impacts on the territory.

This work represents a first step for a subsequent comparison with other case studies in Italy and Europe.

980

RN32 | T03_02: News, mass media, and journalism: political implications

This panel unpacks different dimensions of the relationships between politics and newsmaking, exploring how journalism understands the political implications of their work, news media framing practices, politicized news media and the interconnections between news and social media.

An Empty Concept in a Hostile Environment: Understandings of Populism Among Journalists Covering the Populist Far Right in Italy and Spain

Carlo Berti, Carlota M. Moragas-Fernández, Arantxa Capdevila

Universitat Rovira i Virgili, Spain

Journalists have been confronted, recently, by a political arena characterized by the growing presence of populist forces. In Europe, populism (predominantly of the far right) is often characterized by hostility towards journalists, considered part of the "evil elites". Populists' affinity with social media, moreover, has fuelled political communication styles characterized by polarization and disintermediation, partially undermining journalists' role of gatekeepers and watchdogs. Recent research shows that journalists make an often derogatory, albeit vague use of the category of "populism", which can become an empty signifier bent to political partisanship or hiding other, more relevant features of political forces. Drawing from semi-structured interviews in Italy and Spain, our research investigates how journalists understand and use the term "populism", and how journalism practice has been impacted by populist forces. We focus in particular on far-right populism's influence on journalism practice, interviewing journalists that have covered these forces with a critical stance. Our results show that, while journalists can usually define populism, they do not always believe it is a useful concept for journalism, as it can at times be too vague and prone to manipulation. Journalists highlight several difficulties in their relationship with far-right populist forces, such as an increased hostility, difficulties of access, loss of gatekeeping power. However, according to some, these difficulties are brought about not only by populists, but more broadly by changes in political communication and new technologies. We discuss the implications of these issues for journalism practice and for democracy.

Shifting Narratives – Analyzing the Discursive Framing of Migration Connected to Russia's War on Ukraine in Hungarian Online Media Using the Tools of Natural Language Processing

Ildikó Barna, Renáta Németh, Jakab Buda

Eötvös Loránd University, Hungary

Following the 2014 parliamentary election, Hungary's governing party, Fidesz, faced a significant decline in popularity due to various scandals. In response, Fidesz initiated an extensive anti-immigration campaign, elevating migration to the forefront of political discourse. While much analysis has explored how Fidesz has strategically placed migration at the center of public attention, our paper focuses on the evolving framing of the issue.

In February 2022, amidst the Russian-Ukrainian war, the government's narrative on migration underwent a radical transformation. Previously stigmatized "undeserving, bad" migrants from non-European, predominantly Muslim countries were replaced by "deserving, good" migrants with closer religious and cultural ties to the Hungarian population. Initial analyses based on a limited number of articles indicated a corresponding shift in media discourse.

Our presentation is rooted in an extensive and methodologically innovative analysis of a large-scale online media corpus comprising thousands of articles from February 2022 to December 2023. This corpus, representative of both pro-government and non-pro-government outlets, enables a comprehensive examination of media along political leanings. Our study pursues a dual objective: first, to unveil the discursive framing of migration due to the Russian-Ukrainian war in Hungarian online media, with a focus on political affiliations; and second, to compare this current framing with the previous one, shedding light on the evolving narrative surrounding migration. By delving into the nuances of media discourse, our paper contributes to a deeper understanding of how political transitions influence the framing of migration in Hungary, offering insights into the dynamic interplay between political events and media representations.

Contestation about Pandemic Management in Greek News Portal and Social Media

Angelos Loukakis

National Centre for Social Research, Greece

The Covid-19 crisis has caused a serious health, welfare, economic, and social crisis in almost every country around the globe. In most countries, governments followed scientific advice which led to different crisis management policies. Focusing on Greece, although the government set up

981

a scientific committee, and consulted on COVID-19 management policies, in many cases political decisions did not follow scientific recommendations. Moreover, sometimes members of the government or scientific committee spread contradictory messages. These facts led some political and social actors to distrust both political and scientific leadership and to contest their decisions in the public domain.

Having these incidents in mind this paper combines fresh empirical data collected from both Political Claims Analysis and Facebook Comments Analysis in the context of the Poco-Covid research project to identify elements of contestation about pandemic management in Greece. The research question that the paper aims to address is whether, to what extent, and how the Greek Covid-19 crisis debate was contested. Moreover, it tries to reveal the different patterns of the contestation across the different phases of the pandemic as well as the differences between contestation in media and bottom-up social media contestation by examining, whom they target and how they evaluate them, the issues that they raised, as well as the frames that they apply to justify their claims.

This paper argues that contestation about pandemic management follows different patterns between news portals and social media. While, in the first low levels of contestation appear and the strategy of individual responsibility prevails in the social media debates contestation is much more visible and issues such as government responsibility and conspiracy theories are more salient.

Neoliberalism And The Authoritarian-Populist Repertoire: The Case Of Chega's Far-Right Newspaper

Jaime Roque

University of Coimbra, Center for Social Studies, Portugal

An incompetent and corrupt government, a bankrupt economy wasting money on inefficient public services, welfare scroungers taking advantage of taxes taken from hardworking people and private businesses, street violence caused by ethnic minorities, terrorist acts perpetrated by Muslims and pyromaniacs, children and women abused and killed by monsters, security forces humiliated and assaulted on a daily basis, a soft penal system lacking proper punishments such as the death penalty, life imprisonment and chemical castration. Portugal, in the second decade of the 21st century, has turned into a third-world country and its all because of socialism. This is the crisis narrative constructed by the portuguese Chega (Enough) party in a country that was considered by many analysts as immune to the rise of the far-right until five years ago. This specific electoral trajectory has been mostly addressed through descriptions of its ideological profile and style of political communication, often emphasizing the party's "anti-systemic" nature in relation to Portugal's political system. Informed by a critical sociological perspective on contemporary politics, the present communication explores the construction and topography of Chega's dialectic of crisis narrative and authoritarian solutions through Stuart Hall's concept of authoritarian populism, originally used to analyze Thatcherism's articulation of neoliberalism and social authority. This is done through a critical frame analysis of the three most prominent social themes found in Folha Nacional (National Sheet), a newspaper published by Chega since June of 2022: political corruption, (in)security and economic crisis. Contrary to mainstream perspectives, the results argue that Chega's "politics of fear" is embedded in the political project of neoliberal penality and in the longer historical continuities between the center-right and the far-right.

982

RN32 | T03_03: Interlinkages between attitudes and political actions (2)

The session explores the interlinkages between attitudes and political action, exploring the role of external factors in shaping and changing political attitudes – including networks and critical junctures – , the interplay between political attitudes and identities, and the role of emotions.

What affects voter turnout in European countries? A multivariate analysis (1990s-2020s)

Felice Addeo, Marialaura Ammirato, Angela Delli Paoli, Domenico Fruncillo, Domenico Maddaloni

University of Salerno, Italy

Voter turnout has been, and still is, one of the most important topics in research on representative democracies, since it is considered as an indicator of legitimacy of the political institutions, the political debate and the public policies. Developed in the framework of the ongoing Horizon TRUEDEM research, this paper is aimed at a first outline of the whole complex of the variables at stake when voter turnout is addressed in political research, with a special reference on social and political trust. After a short review of the literature, we draw on Norris' approach on trust and political behavior to outline a heuristic model in which voter turnout, as a dependent variable, is explained by political trust, as an intervening variable affected by (1) the societal environment (including generalized trust as a cultural long-term feature of this environment), and (2) individual skills, on one side, and (3) the political actors' performance, on the other. Subsequently, the model is tested by means of a multivariate analysis based on data collected within the TRUEDEM project and referring, in particular, to elections for the European Parliament (1994-2019) and for national parliaments (1991-2023). The results seem to support the hypothesis that political trust is an important variable in the causal path leading to explaining variations in electoral turnout.

Xenophobic Attitudes In Eastern Europeans: A Study Of The Interplay Between National And European Identities

Sorana Constantinescu[1], Alexandru-Vasile Sava[2]

1Babes-Bolyai University, Romania; 2University of Bucharest, Romania

In this paper we will trace how East-European nationals attempt to assert their claims to a European identity on the basis of their opposition to non-European migrants and refugees. This complicity in racist and xenophobic practices may seem paradoxical, as most East-European ethnic groups are (or in some cases were until very recently) met with xenophobic hostility when emigrating towards West-European countries. However, such a phenomenon has historical parallels to how certain groups of European migrants (Irish, Italians, Slavic peoples etc.) were faced with racist hostility when migrating to the United States in the 19th and early 20th century, and rejected from the category of "whiteness". According to previous analyses of the subject developed within whiteness studies, the inclusion of these ethnic groups into the racial category of White Americans was contingent on their participation in the racial oppression of African-Americans, as well as other racial minorities. We will analyze whether a similar process is underway with nations from the Eastern periphery of the EU. To this end we will analyze the voting behavior and political participation of East European diaspora populations together with survey data on the shifting attitudes towards minorities to explore how the perception and self-representation of East-Europeans in Western European countries (with a specific focus on Romanian nationals) has shifted with the appearance of newer non-European migrant groups, and what potential implications this might have on the development of European identity in general.

983

Domestic Political Preferences, Trust and Attitudes Toward the Russia-Ukraine War in Slovakia

Jozef Zagrapan

Institute for Sociology of the Slovak Academy of Sciences

The Russian attack on Ukraine has had a profound impact on Europe, reshaping the geopolitical landscape in significant ways. While the countries of the European Union expressed support for Ukraine from the outset, certain segments of societies lean towards favoring a Russian victory in the conflict. This analysis focuses on attitudes towards the war in Slovakia, a neighboring country of Ukraine. Its goal is to investigate the potential connection between national political preferences, political trust, and geopolitical inclinations—specifically attitudes toward the conclusion of the war in Ukraine. To address this research question, data from the online 'How are you, Slovakia?' survey series

were utilized, with a sample size of 1000 respondents. The results indicate that individuals with higher political trust and trust in the media express a desire for Ukraine to succeed. Conversely, those who perceive their own economic situation as unfavorable and those with far-right political preferences tend to favor Russia's success.

How National is "National Pride"? A Critical Assessment of the Single-item Measurements, Using Austrian Data from 1990 to 2022.

Nico Tackner

University of Graz, Austria

The concept of "national pride" is used throughout different survey programs to study the phenomenon of nationalism in comparative research across societies and time. Hitherto, the single-item measure of "national pride" has shown to be robust in Austria since the item was first introduced in 1990 in a representative survey. The share of those being either "very proud" or "quite proud" ranged consistently between 90% and 96% over the time-span of three decades. However, during the three panel waves of the Values in Crisis (ViC) survey, we have seen a steady decline to 71% in 2022. Rather than attributing this to the Covid-19 crisis, I was intrigued in studying, what this commonly employed item actually measured. In the presentation, I try to point out two major issues: First, while the item appears to be a consistent question, only the response categories are unaltered across the different surveys. There are vast changes in the wording of the item. This leads to semantic differences of more emic and ethic versions of the item between the different waves, even within the same survey program. Being sometimes more open to ethnic conceptions of nationhood (being Austrian) and sometimes restricted to a civic conception of nationhood (being a citizen of my state). Second, looking at the panel data, the ones with declining pride are overwhelmingly right-wing voters. Which in turn raises the question of validity when it is nationalists who are not proud any longer.

RN32 | T04_01: Religion and politics

Religion is a crucial element in contemporary politics – both in terms of politically active religious actors and contentious issues related to religion. The panel explores how religious grammars and values penentrate the political agenda, the activism of religious actors, and the interconnections between political, legal and societal structures and religion.

Gender, Religion, and Populism in Contemporary Greece: The Cohabitation Agreement Debate

Niki Papageorgiou[1], Chara Karagiannopoulou[2]

1Aristotle Univeristy of Thessaloniki, Greece; 2Panteion University, Greece

This contribution is an effort to trace the interplay among gender, religion and far-right (FR) populism in the Greek context by deconstructing and analyzing, by means of documentary analysis, the discourse of two radical right political parties – the People's Association Golden Dawn (GD) and the Independent Greeks (ANEL) – and the Orthodox Church of Greece (OCG). It focuses on the 2015 debate about same sex couples' right to cohabit. The findings show that, due to ideological affinities between the OCG and the FR in Greece, multiple intersections between gender and religion can be observed in the FR populist discourse. It is argued that, in the Greek case, the religious discourse about gender legitimizes the gendered FR populist discourse, while the legitimized gendered discourse of the FR legitimizes its ethno-nationalist discourse, which is the main locus of the intersection between gender and religion.

984

The Role Of Christianity In Contemporary Hungarian Media Discourses On The European Union

Anna Vancsó[2], Réka Tamássy[1], Ákos Bocskor[3]

1Corvinus University of Budapest, Budapest Business School, Hungary; 2Eötvös Loránd University, Hungary; 3Institute of Sociology of the Czech Academy of Sciences

The interpretation of the European Union on each level – its actual functioning or the question about its future connected to its vision formulated in the past – has endless variation in contemporary media. Meanwhile, media framing is crucial in how citizens create their image concerning the EU and its enlargement process. As the Hungarian partners in the Mediatized EU Horizon project, we focused on the main discourses present in the Hungarian media concerning this process. During the analysis, we discovered several

topics connected to the EU and the integration process, but we also found overarching discourses connecting national and international issues. These discourses share several elements, one of which is the explicit and implicit role of Christianity. In this presentation, thus, we aimed to focus on Christianity in its several forms used in these discourses and issues: as part of national and European identity, as the dominant culture in the European continent, or as a value system connected to the previous aspects. We investigated topics such as migration and demography, human rights, LGBTQ+ issues, environmental concerns, the position of the Central-Eastern European countries, and the V4 as referring to Christianity in different ways. We have used content and discourse analysis methods, followed by interviews with the Hungarian media and political elite members using Q methodology built on the media analysis results.

Gendering The Consequences Of Religious Conversion Through Legal Narratives In Migration Courts In Sweden

Ebru Öztürk

Mid Sweden University, Sweden

In a courtroom, every person accused of a crime is presumed innocent until proven guilty, but at the migration courts, appellants are presumed bogus until proven otherwise. Since they were not found credible by the respective migration agency (for many reasons, including unproven identity, documents, etc.), they appeal to a migration court and the court assesses whether there is a reasonable basis for changing the migration agency's decision.

This paper critically examines the credibility assessment and discursive space of intersectionality in migration courts, focusing on asylum seekers who have converted from Islam to Christianity in Sweden. Using qualitative legal text analysis, it evaluates cases from the Migration Court in Stockholm and explores the power dynamics constructed during judgement. The aim is to scrutinize the court's perception and assessment of religious conversion, probing the often severe juridical consequences experienced by converts. Diving into gendered aspects of credibility, the paper dissects a specific case where the absence of a male network led to the approval of a female asylum seeker's application, reflecting the societal norms in Afghanistan. The paper accentuates the dominance of stock stories and narratives that reinforce pre-existing stereotypes in the legal system. The findings seek to contribute to a deeper understanding of how the legal system adjudicates on religious conversion asylum claims, through exposing inherent biases.

Delegitimizing Liberal-Democracy With Its Own Discourse: Ultra-Orthodox Leaders And The Israeli Supreme Court

Avital Sicron

Hebrew University of Jerusalem, Israel

Since the 1980s, there has been a political debate regarding the appropriate authorities of the Supreme Court in Israel. This debate has become even more salient and polarized in the past year. The current study traces public discourse regarding this issue over four decades and explores the role of ultra-orthodox leadership in delegitimizing the court. Using an analysis of newspaper articles about key Supreme Court rulings and the theoretical lens of Peter Berger's theory of legitimation, I posit that ultra-orthodox leadership changed the type of legitimation mechanism used to criticize the court. In the 1980s-1990s, their leading legitimating principle was religion, i.e., claiming that the Supreme Court hurts the states' Jewish nature. However, since the 2000s, critique against the court was legitimated through liberal democracy. Ultra-orthodox leadership has increasingly used liberal-democratic principles, such as the importance of personal liberty and the separation of powers, to denounce Supreme Court rulings.

This is especially notable because many ultra-orthodox communities are essentially opposed to liberal-democratic ideals, as these identify the will of the people as the source of sovereignty rather than divine power. Despite this, their leadership increasingly adopted liberal-democratic discourse. While this may be perceived as a sign of democratization, it is in fact more complex. Harsh critique against the Supreme Court has formed the basis for legislation meant to curb its authority, thus threatening its independence and its ability to protect the rights of individuals and minorities. Therefore, this case is a unique example of a group which is opposed to liberal democracy and working to weaken one of its key institutions but is adopting liberal-democratic discourse to do so.

985

Gender Resistance and Populism in the Discourse of Vox

José M. Pérez-Agote Aguirre, Carmen Innerarity Grau, Lasanta Palacios María

Public University of Navarre, Spain

This paper analyses the discourse of Vox on gender. In order to identify Vox' particular appropriation of the global discourse of anti-feminist resistances and to locate this party on the map of the use of gender made by European radical right parties, we start from what the literature has established about the populist discourse on gender. Firstly, we approach the idea of anti-feminist resistance itself as a set of interrelated concepts – such as "backlash", "anti-feminism" or "gender ideology" – through which feminism has studied the reactions against gender and women's rights following the third wave of far right. Secondly, we analyze

the statements on women and gender in Vox' parliamentary interventions and its official Twitter account during 2021 and 2022. A provisional advance of the results allows us to affirm that its discourse of anti-feminist resistance is characterized both by replicating the classic strategy of backlash – as denoted by the insistent use of the concepts "gender ideology" and "feminazi" – and by its militancy in organizational anti-feminism, which has been present since the beginning of the party. Therefore, the anti-feminist reaction is more than just a complementary issue, as Mudde claimed, and constitutes one of the central elements of Vox's populist discourse. In conclusion, this set of elements of resistance would place Vox in a position close to that of Hungary and Poland with respect to gender, with whom, moreover, it does not share its authoritarian drift.

RN32 | T04_02: Post-pandemic politics – Covid-19 and its impacts

The Covid-19 pandemic had a huge impact on European politics, and its relevant consequences contribute to shape (or re-shape) political activism and trust. The session explores the multidimensional impacts of the pandemic in different European contexts.

Covid-19 As A Catalyst For Anti-institutionalist 'Careers'.

Tim van Meurs

University of Amsterdam, Netherlands, The

During the Covid-19 pandemic, anti-institutionalism seemed to have transitioned to the mainstream. Whereas aversion to (establishment) politics, science, and related institutions has been around for years, it had not resulted in such a consistent stream of (large-scaled) protests and explicit disregard for official health advice. While anti-institutionalism aligned with gradual formation of personal beliefs (e.g., political beliefs) is likely to remain a deep-rooted sentiment, the Covid-19 pandemic was an extraordinary occurrence. This was evident from the various groups in society that were not previously (vocally or actively) involved in anti-institutionalist discourses, but were during Covid-19. A pressing question that remains is whether this involvement can become a catalyst for further anti-institutionalist 'careers', or if it was case-specific involvement that declined together with the decline of Covid-19 related discourse in media and everyday life. To this end, I conduct in-depth interviews with Dutch citizens that, according to themselves, first developed feelings of anti-institutionalism during the Covid-19 pandemic, to answer the research question: How did Covid-19 shape citizens' anti-institutionalism, and how has it developed during and after the pandemic's heydays? These interviews focus on how and why Covid-19 caused interviewees to become anti-institutionalist, and on the form this took during, but especially after the heydays of the pandemic. This study can provide insights into the development of anti-institutionalist 'careers', following the 'deviant careers' approach more recently applied to studies about e.g., politically discontent citizens and vaccine-skeptics, and may offer indications about the formation and longevity of anti-institutionalist discourse during exceptional societal disruption.

986

WHO, Multiple Endorsements, and Vaccination Willingness

Renu Singh[1], Naoko Matsumura[2], Yoshiharu Kobayashi[3], Christopher Howell[4], Tobias Heinrich[4], Matthew Motta[5]

1Durham University, United Kingdom; 2Kobe University, Japan; 3University of Leeds, United Kingdom; 4University of Southern Carolina, USA; 5Boston University, USA

Despite the World Health Organization (WHO) being the key international institution in global health, there were concerns about its ability to issue effective public guidance during the COVID-19 pandemic. However, the WHO was not the only organization involved in public messaging during the pandemic, as the number of global actors involved in public health emergencies has steadily grown. In this increasingly complex global health governance landscape, how do endorsements from multiple organizations affect individual health decisions like taking a vaccine during the COVID-19 pandemic? We study this using a survey experiment implemented in the US, Japan, and Canada during 2020, which involves vaccine endorsements from the WHO, the Centers for Disease Control and Prevention (CDC), Oxford University, and the Gates Foundation. We find that the WHO was effective at increasing willingness to take vaccines more quickly, but also that endorsements from the other organizations were nearly as effective. Furthermore, we find that the effect of the WHO's endorsement becomes less important as respondents received multiple endorsements from the other global health organizations. These findings highlight potential advantages for multi-actor public health messaging in global health governance.

Navigating Solidarity in Crisis: Political (Dis-) Engagement in the Covid – 19 pandemic

Maria del Carmen Mayer

Bielefeld University, Germany

While Italy was dramatically hit by the COVID-19 pandemic, collective solidarity actions, such as free distribution of essential items like food, rose within civil society and social movement actors confronting the crisis. This paper contributes to the growing literature exploring this phenomenon by analysing processes of political subjectivation, investigating how collective solidarity actions shaped the individuals experiencing of the ability to act and engage politically during the pandemic. Through an interpretive and qualitative in-depth study, the paper explores the lived experiences of activists and volunteers who engaged in solidarity actions within the metropolis of Milan, contributing to a nuanced understanding of the limits and potential of engagement as a politicising empowerment.

Utilising Grounded Theory methodology, the research is based on extensive participatory observation during food distributions, network and group meetings in late spring and summer 2021. In addition, over 70 hours of qualitative semi-structured individual and group interviews with activists and volunteers from different grassroots solidarity groups in Milan were conducted in two rounds, in summer 2021 and 2022.

The findings highlight diverse trajectories of trust and deception, their impact on individuals' sense of power to act, and its correlation with trust in transformative political participation. The study underscores the challenges associated with efforts of care and solidarity during periods of heightened societal tension, emphasising the potential for experiences of powerlessness and limited influence to lead to friction and disengagement. Ultimately, these dynamics may undermine the initial motivations for solidarity-based political Curie participation, shedding light on the complex interplay between collective action, political subjectivation and societal engagement in times of pandemic crisis.

Europe, Covid Politics and the (Un) Expected Surge of Nationalistic Narratives

Faten Khazaei

KU Leuven, Belgium

More than being turning points in history, crises are moments of acceleration of processes that are already in place. The Covid-19 pandemic, as one such crisis, has triggered and exacerbated conversations about who belongs and who does not within different European nation states, whose lives should be protected, to the detriment of whom and to what cost. In the face of the outbreak of the coronavirus, the unity of the European Union, at least at the beginning of the crisis, started to crumble. Nation states reappeared as the main actors, and nationalistic responses spread in Europe. Government after government closed their borders, introduced a travel ban for the Schengen Area. They restored to war metaphors, in some cases even granting the military a visible role in the management and communication of the crisis.

To learn from and to avoid falling back to these understudied but historically repetitive reactions in the face of emergencies, in this paper I examine the political language used during the media coverage of the COVID-19 pandemic and the related policy documents in three European countries (Belgium, Italy, and Switzerland). Different points in time will be considered: before the outbreak in Europe, at the time of the outbreak, and the spring of 2021 following the implementation of vaccination programmes in Europe.The focus of this project, funded by a European Marie Skłodowska-Curie fellowship, is to examine and to compare configurations of different European national identities that were generated during the management of the pandemic, and to investigate the links between nationalistic and war-related discourse, on the one hand, and the exclusionary policies and practices that (re)emerged in Europe and beyond, on the other.

987

RN32 | T04_03: Formation of the political subject

The panel explores the formation of the political subject from different perspectives – including political socialization and the impacts of critical junctures and ideologies on political subjectivity and the process of political subjectivation.

From Sunday Lunch To The Ballot Box – Political Socialization And Political Homophily In Hungarian Society

Dömötör Gere[1], Ádám Stefkovics[1,2]

1Századvég Foundation, Hungary; 2HUN-REN Centre for Social Sciences

Political socialisation is the process of forming an individual's political identity, in the course of which the individual's attitude to politics and political worldview is formed. Political socialisation takes place in different spheres, of which the family and parents are of particular importance. Previous research in Hungary has confirmed that the family is an "incubator" of citizenship. However, there is little data available in Hungary that would allow for a more precise understanding of the transmission of political attitudes. This study investigates political homophily within the family (between parent and child) and the effects of parental political characteristics on the

individual in Hungary. Our data are drawn from a nationally representative telephone survey of 2000 respondents sampled in 2023. The results show that in nearly two-thirds of Hungarian families, family members held the same political views during the respondent's childhood, with the highest proportions of homophily indicators, fathers' and respondents' voting activity, and mothers' and respondents' conservative-liberal attitudes. The effect of parental characteristics was tested using structural equation modelling (SEM). Parents' political interests and ideological positions had a strong direct effect on the same child characteristics, but the individual's political participation and party preference were only indirectly influenced by parents. The success of attitudinal transmission was strongly enhanced if the parents were themselves, homophiles, along with the trait in question. Our results point to the important role of the family as a primary agent in political socialisation and suggest new research directions.

Conflict and Transformation in the Political Socialisation Process of the Tamil Second-generation

Marilena Macaluso[1], Giuseppina Tumminelli[2]

1University of Palermo, Department Cultures and Societies, Italy; 2University of Palermo, DEMS, Italy

The paper aims to analyse the political socialisation processes of the second-generation of the Tamil community in Palermo, from a reflexive perspective (Bettin Lattes 2006). The theoretical framework of reference considers political socialisation as a process whereby one becomes a member of a political community, in close connection between this and a broader socialisation with overlaps between the political dimension and the other aspects that mark one's life. The paper presents the results of a research conducted in Palermo, collecting 20 biographical interviews of second-generation youth and adults of Tamil origin (then analysed through the T-Lab software) and carrying out participant observation of secular and religious events. An active and changing pathway that each subject contributes to create between continuity, conflict and change is revealed. In which the institutional and individual dimensions intertwine, in a complex framework that unites several levels: local, national and transnational in the biographies of individuals and in the life of the diasporic community (Macaluso, Tumminelli 2023).

Intersectional inequalities, occupational segmentation, gender and generational differences are intertwined in biographies with practices of life politics, political participation often in the absence of citizenship, and the claiming of rights and recognition for oneself and one's community history. The reversible and changeable character of socialisation as a process open to change also suggests interesting insights into permanent socialisation. Thus, an enduring process that makes symbolic resources available in the complexity of postmodern politics, manifestly or latently involving different socialising agencies, in the context of "deep mediatisation" (Couldry, Hepp 2017).

Subjects of Crisis: How People Are Made to be Tragic, Harmful and Dangerous

Jan Dobbernack

Newcastle University, United Kingdom

In contemporary social-political diagnoses, crisis is hard to avoid. Popular frameworks (e.g. 'polycrisis') trace the confluence of economic, environmental, political and social conditions and draw attention to cascading effects. Missing from such work is a measure of concern for the personalization of crisis and for the production of social visibility. Among the most important functions of crisis is the close view it provides on groups that are framed as its perennial subjects or that are newly positioned in this frame. The paper develops this argument and adds a perspective to contemporary theorizations of crisis on how crisis positions

988

subjects, suggests relationships with social others, and puts spectators into the picture.

Among the constituencies of crisis that it briefly considers are problematic ethno-religious minorities, harmful migrants, trans people (who are ambiguously cast as vulnerable and dangerous), or tragic members of working-class communities, often racialized as 'white'. Subjects of crisis emerge as dangerous, damaged or tragic, often with reference to grievances and resentment, the potential for problematic conduct, and based on moral evaluations portraying them as worthy, beyond redemption or something in between. Rather than the 'simple' production of abject populations and different from the situational concern with 'moral panics', I argue that crisis creates expansive social worlds. Groups are assembled in this way, often for the apparent benefit of spectators invested in tensions and conflicts who themselves are constituted as viewing subjects. The paper considers the panoramic space that crisis makes available and explores this space with an interest in the politics (not least spectacle of contemporary 'culture wars') that images of crisis tend to substantiate.

Limits Of "Neoliberal Subjectivity": A Case Study From Turkey

Bahar Oral-Gündoğdu

TED University, Turkiye

This paper aims to investigate the "neoliberal subjectivation" together with its so-called impediments to the collective actions and public inclinations of people under the neoliberal capitalism. The literature on "neoliberal subject" imposes the thesis of "de-democratization", assuming the rising of economized subjects who think and act as homo economicus on every domain of life in place of the politically minded citizens. This argument has been questioned by drawing on a case study from Turkey as a developing country which has experienced neoliberal transformation simultaneously with the West since the 1980s. In this study, forty professionals from Istanbul and Ankara, the two biggest cities of Turkey, were chosen in terms of their convenience to the "human capital" theory. Through in-depth interviews, they have been asked about their realities and strategies in the neoliberal context together with their inclinations towards collective action and publicity. The findings of the research indicated that economized conducts of the subjects are not developed out of the discourse of human capital theory but of the imperatives of neoliberalism crystallized within the production domain, new governance techniques, extended financialisation and the authoritarian politics accompanying with them. Thus, rather than being their preferences or reflecting their horizon, neoliberal subjectivity constitutes only the limits of individuals within the institutional operations of neoliberal capitalism. That's why subjects should not be degraded to be a functional component of capital or neoliberalism; but need to be considered with their contradictions and potentials of collective action that are also intrinsic to neoliberal capitalism.

RN32 | T05_01: Political actors and the digital (1)

Digital technologies increasingly intersect with political practices. This double-panel presents an overview of research on this topic, from different perspectives, including the role of AI, how activists engage with the digital, and digital technologies impacts upon policies and politics.

AI-infused Politics: How Generative AI Transforms, Challenges, and Empowers Political Actors and their Practices

Alice Mattoni

University of Bologna, Italy

In recent years, general-purpose AI systems based on large language models (e.g. ChatGPT, Claude 2, Stable Diffusion, Vall-e), whose function is to generate content in response to a human prompt, have proliferated rapidly around the world and are increasingly being used in different social domains. These general-purpose AI systems and the content they produce are also rapidly entering, and will increasingly enter, the realm of politics. Yet we know little about how they support different forms of political engagement. This paper is the first systematic attempt to explore how these general-purpose AI systems, more commonly known as generative AI, are transforming the practices of different types of political actors: from political parties, politicians and their staff, to movement organisations, activists and the citizens who support them. It does so by moving beyond overly pessimistic and overly optimistic views of the issue, and instead takes a pragmatic approach that looks at what political actors do with generative AI systems to support various forms of political engagement. The paper begins with a review of the extant literature on general-purpose AI systems in relation to politics. It then proposes a preliminary definition of AI-infused politics and a related typology, taking into account two main dimensions: the overall form of actors' engagement with politics (within and outside institutions) and the extent to which generative AI systems are used to support actors' political engagement (extensive and limited use). Finally, the paper uses data collected through desk research to examine case studies from around the world that exemplify four different types of AI-infused politics, and discusses the key generative AI-related practices that are more central to each of the four types.

989

Activists' Digital Stories And Intersectional Knowledge Translation: FFF, Trust, And Transition

Nicole Doerr

UCPH, Denmark

This paper combines visual, digital media, interviews and ethnography in order to study the diffusion of knowledge on ecological transition that emerges through digital storytelling and knowledge sharing between climate justice activist groups in the Global South and their European counterparts in the digitally networked Fridays for Future community. Addressing the crisis of andropogenic and capitalist versions of EU and global climate adaptation politics, the paper conceptualizes ecological transition through the analysis of alternative practices of storytelling and trans-local knowledge translation practices advanced by transnationally connected FFF activist communities, which create and translate new and alternative visions of climate justice through online storytelling on Most Affected People and Territories (MAPA for Future), including indigenous and local BiPoC for Future communities. Based on decolonial and intersectional theories of knowledge translation I trace how critical voices from the 'Global South' and indigenous activist perspectives become shared within broader, transnational public spaces and digital media debates about Europe's green transition among the intersectional Fridays for Future (FFF) movement in Germany. Focusing on digital visual practices of storytelling, and interviews with local FFF activists in Germany, it highlights the importance of visual, digital media as a way for marginalized voices and their visions of climate justice in inspiring effective local practices of ecological transition beyond institutionally promoted EU official green transition politics. Based on innovative visual, digital and narrative methods and online and offline ethnography, the paper advances political sociology's understanding of critical knowledge translation advancing trust and building effective local practices toward a deep ecological transition due to social movements in Europe learning from, digital dialogue and engagement with indigenous and MAPA climate justice activists in the South.

Transformative Technocultural Worldings: Reflections on 'memeing Back' and Other Innovative Feminist and LGBTI+ Tactics Against the Rise of Anti-feminism

Mia Liinason[1], Onur Kilic[2], Shao Shao[3], Guanqin He[4], Sama Khosrai Ooryad[5], Suay Melisa Özkula[6], Ov Cristian Norocel[7]

1Lund University, Sweden; 2Lund University, Sweden; 3University of Amsterdam, the NL; 4University of Utrecht, the NL; 5University of Gothenburg, Sweden; 6University of Trento, Italy; 7Lund University

Digital media offer tremendous possibilities for emancipatory feminist and LGBTI+ collectives to create other possible worlds in solidarity and struggle. By the same measure, however, digital media also allow similar potentiality for far-right actors to build profoundly different subjectivities and networks of belonging. In the context of these dynamics, this semi-plenary roundtable presents a transdisciplinary conversation focusing on how, and to what effect, digital technologies enable diverse communities of feminist and LGBTI+ initiatives, as well as exclusionary, misogynist and anti-LGBTI+ collectives, to materialize and shape civil (and uncivil) societies. This roundtable conversation will highlight expressions of visual misogyny in the context of platform affordances in diverse national and media sites, digital identities of the far-right metapolitical project, and illuminate threats – but also opportunities – for LGBTI+ resistance in digital space. We will explore cyber 'living ghosts' as new modes of subjectivity on Weibo, and attend to the aesthetic and tactical interventions of 'memeing back' and 'meme-feminism' against the rise of mediated anti-feminism. Contributors share an interest for exploring how digital and cultural initiatives transform existing societies and worlds. After short reflections on the topic based on their ongoing empirical research, panel participants will engage in a joint conversation led by the chair, followed by questions from the audience.

990

RN32 | T05_02: Polarization in politics

The session explores political polarization by discussing political conflict and ambiguity, and analysing the shape and nuances of individuals' political and ideological polarization.

Tension, Crisis and the (In-)Tolerance of Ambiguity

Antonia Schirgi

University of Graz, Austria

The SARS-COV2-Pandemic and its multiple implications gave rise to social tension and contributed to tendencies of polarisation. In the aftermath of the pandemic, some political and social-interventionist actions were taken in order to "overcome" this polarisation, amongst them a project led by the Austrian Academy of Sciences (ÖAW). This presentation draws on material that emerged from the focus groups conducted as part of this project (participatory observation, transcripts of focus groups). It questions whether and how discourse can contribute to overcoming polarisation.

In a first step, polarisation is reconstructed as a result of a social intolerance of ambiguity. Following Else Frenkel-Brunswik and Maurice Merleau-Ponty, opposing opinions and convictions are understood as rooted in (socially caused) one-sided perceptions (e.g., when only the best or worst possible effects of certain measures are perceived) of phenomena that are composed of a multiplicity of (sensory, normative, conceptual) perspectives. One way of overcoming polarisation would be to perceive the other sides of a phenomenon and to integrate these sides – to tolerate ambiguity.

In a second step, an analysis (deductive-inductive qualitative content analysis) of the focus groups is presented, centred on the extent to which the discourses have contributed to a change and broadening of the individually expressed perspectives. This analysis includes a typology of different forms of dealing with other perspectives: the non-acceptance of other perspectives; the joint discussion of different perspectives that remain side by side; an integration of perspectives.

Finally, implications of this analysis for the concepts of polarisation and the (in-)tolerance of ambiguity are discussed.

Opposite Universes. A Focus on the Ideological Polarization of the Italian Electorate

Marco Palmieri, Melissa Mongiardo

Sapienza University of Rome, Italy

The study analyzes ideological polarization in Italy, conceptualizing the relationship between ideology and political polarization. The morphological character of ideologies is closely related to the context in which they manifest themselves (Freeden, 2008). Political polarization is the tendency to concentrate political supply mainly around two opposing poles (McCarty, Poole, Rosenthal, 2006). These poles are characterized by high levels of ideological distance and high homogeneity within them, resulting in a lower propensity of voters to move from one side to the other (Fiorina, Abrams, 2008; Druckman, Peterson, Slothuus, 2013).

The methodology combines economic and demographic indicators and electoral results of the 2022 general elections. The hypothesis is that electoral behaviour is strictly connected to the territories' socioeconomic and demographic structural contexts (Mongiardo, Palmieri, 2023). This paper identifies the forms of ideological polarization considering Italy divided into two blocs with different electoral competitions.

The North Centre (high economic level and social inclusion): The political clash is between the forces heirs of the traditional ideologies; here, abstentionism decreases. The South (low economic level and social inclusion): The electoral competition is between the hybrid-tactical forces outside the system of traditional political forces; here, abstentionism increases.

The aim is to reflect on the latent causes of the different forms of ideological polarization, considering the model of Inclusive/Extractive Institutions (North, 1990; Acemoglu, Robison, 2006). According to our interpretation, in the North Centre, the social form of institutions is horizontally and collectively oriented. In the South, the vertical relations between the political and socioeconomic systems led Institutions to be extractive; here resides a dysfunctional interpenetration between the political and socioeconomic systems.

991

Public Opinion and Political Polarization: A Comparative Study in Spain and Europe

Jose A. Lopez-Ruiz, Sebastian Mora, Agustín Blanco

Universidad Comillas de Madrid, Spain

Across Europe, political discourse has taken on increasingly extreme ideological stances, leading to a negative impact on the quality of democracy in nations. This polarization is evident in conflicts and tensions within parliaments, political parties, and traditional and digital media. One crucial question is how much these polarising ideologies resonate with and spread among the public, particularly regarding critical aspects of democratic coexistence such as immigration, cultural and religious diversity, and gender identities. To explore this question, we will use primary data from the Observatory on Encounter Culture Survey (2021-2023) to analyse questions related to discrimination, trust in institutions, corruption, and environmental commitment. Specifically, we will compare primary data from Spain with other European countries, creating a temporal series that spans pre and post-COVID crisis periods up to the present. These questions are replicated from international surveys,

including the World Values Survey Wave 7, Eurobarometer 77.4, European Social Survey Round 10, and the International Social Survey Program. The analysis uses statistical significance tests for association and mean difference tests for inter-group and category comparisons, identifying any significant differences between countries and, in Spain, in the time series.

The Construction Of The Conflict. The Case Of The Valencian Parliament

Fernando Martínez Rodríguez, Francesc Xavier Coller Porta

Universidad Nacional de Educación a Distancia (UNED), Spain

Political consensus is a fundamental part of the proper functioning of a healthy democracy. Although the citizen´s perception is that politics is based solely on confrontation and bickering, empirical studies such as Proyecto Consenso have shown that the level of consensus in the Spanish territorial chambers is higher than it seems, although with differences among them. In this paper we explore the case of Comunitat Valenciana, one of the regions with less consensus in Spanish politics. Analyzing 9 semi-structured interviews with parliamentarians of the X Legislature of the Valencian Parliament, we approach the construction of conflict in the Valencian territorial chamber at three levels: contextual, institutional and personal. The results of the interview analyses show that at contextual level the fragmentation of cultural identity is superimposed on the left-right political axis, creating two partisan mega-identities (blaveros and fusterianos) that polarize the debates. At the institutional level, the supremacy of the Congreso de los Diputados and the central leaderships of the parties influence the territorial debates, reducing the room for maneuver of the Valencian parliamentarians. Finally, at personal level, the existence of conflicting profiles and the use of social networks and media for differentiation with the rest of the parties hinder the debate. However, there is hope: in those spaces where the media spotlight does not reach, is where the Valencian representatives smooth out differences and manage to reach agreements.

RN32 | T05_03: Protest and politics

The panel explores different aspects of the politics of protest in contemporary societies, focusing on diverse forms of protests – including political debates and activism – and on protests regulation and control.

Social Cleavage and the White Paper Protest in China

Kuan-Chia Lin

National Taiwan University, Taiwan

In late 2022, the "White Paper Movement," opposing the government's zero-COVID policy, emerged across China, marking the most significant and widespread social protest since the Tiananmen Movement. This raises questions about the drivers of participation and support for social protests in a regime that stringently controls and suppresses social resistance. Utilizing data from an online survey conducted in December 2023, this paper shows that unemployed individuals and those with lower educational levels are more likely to support and participate in the White Paper Protest. Conversely, urban residents show less support for the protest, while rural villagers are more likely to participate or know someone who has. Notably, CCP members, in comparison to non-members, are more likely to be involved or acquainted with participants in the protest. The findings of this research highlight the significant social cleavages within Chinese society and suggest the potential impact of these divisions on the stability and future of China's authoritarian rule.

992

Gun Talk Then and Now: The Discourse Surrounding Firearms Control

Lucie Němcová

Charles University, Czech Republic

Gun laws in Czechia are currently exceptionally liberal, due to a consensus across the political spectrum. However, following the tragic and unprecedented mass shooting in December 2023, the need for re-evaluation of existing legal framework resonates among the public, politicians, and experts. This research utilizes Critical discourse analysis and Discourse-historical approach to analyse the discourse and trace the arguments in political discussions on gun control. The analysis will focus on the discourse of relevant stakeholders during three key moments: 1) Political mobilization against an EU directive that tightens gun ownership in 2017. 2) An amendment to the constitutional law which from 2021 onwards includes the 'Right to defend one's life or the life of another person even with a weapon'.

3) A mass shooting in the Faculty of Arts, which resulted in 14 deaths in 2023. The study examines arguments both for and against gun control during three significant periods. Its aim is to uncover the evolution of discourse about gun laws and policies, to identify changes in arguments and rhetoric, and to discuss these arguments in the context of the current debate on gun control in other settings. It is imperative to understand evolution of gun control discourse since it can provide insights on what factors influence policy shifts and helps to identify values that shape policy debates. Understanding changes in rhetoric over time is critical for representatives working to oversee the intricacies of gun legislation.

Marginalizing the Moral: Realistic Reasoning and the Disappearance of the Future

Colm Flaherty

Roskilde University

Political movements today seldom advocate for utopian or idealistic futures, preferring instead to emphasize idyllic pasts. In this article, we argue that the disappearance of the future depends, at least in part, on the increasing prominence of a style of reasoning we call realistic reasoning. Based on focus groups with right-wing populist party voters in Denmark, we suggest that realistic reasoning has four main features. First, realistic reasoning depends on common-sense constructions of what actors define as realistic and feasible. Second, realistic reasoners identify political issues as legitimate based on their understanding of what can and cannot be controlled. Third, realistic reasoners focus on local issues rather than global ones. Finally, and most importantly, realistic reasoning attempts to marginalize idealistic, utopian, or moral styles of reasoning, depicting actors who adopt these justifications as dreamers, out-of-touch, or lacking legitimacy. This article demonstrates how right-wing populists in Denmark use realistic reasoning to justify their focus on political issues such as immigration or crime rather than potential issues such as the environment, the economy, or the welfare state while simultaneously employing this style of reasoning to delegitimize and devalue other political actors. The article further shows how one consequence of this style of reasoning becomes an inability to articulate or imagine futures, forcing actors to turn back to the past. The article concludes in noting that this style of reasoning does not only characterize right-wing populism, but that it has clear links to other societal developments such as welfare state restructuring, increasing financialization, and democratic deficits and suggests that actors who wish to confront right-wing populism must also work to restore the legitimacy of other forms of reasoning.

RN32 | T06_01: Political actors and the digital (2)

Digital technologies increasingly intersect with political practices. This double-panel presents an overview of research on this topic, from different perspectives, including the role of AI, how activists engage with the digital, and digital technologies impacts upon policies and politics.

Fandom and Political Leaders: Exploring Varieties of Attachment on Social Media Platforms in Italy

Giovanni Barbieri, Marco Mazzoni, Roberto Mincigrucci

University of Perugia, Italy

The weakening of party loyalties has raised fundamental questions about the formation of political identities, including the forms of political belonging, the nature and extent of affective connection with parties and communities and the impact of digital politics on participation. Several researchers have begun to associate the concept of fandom with that of politics, questioning whether the phenomenon of fan-like attachment to specific political leaders can be considered a new form of political participation (Hinck and Davisson 2020; Sandvoss 2013; Dean 2017). Our study aligns with this line of research by mapping the phenomenon of fandom in Italy and providing insights into its main features.

In particular, our study aims to explore the fandom pages on Instagram and Facebook devoted to the main Italian political parties' leaders: Giorgia Meloni; Matteo Salvini, Elly Schlein; Giuseppe Conte, Matteo Renzi, Carlo Calenda. Through our analysis, we will measure the number of active pages devoted to the aforementioned leaders, the engagement they achieve, and the content they publish. In particular, we will classify the shared content within three categories of fan attachment: political, which emphasizes the political skills of the leader; satirical or entertaining, where political content is irrelevant and fan communities primarily seek to have fun or joke; adoring, where fans exhibit a physical and emotional attraction to the leader.

The analysis results will enable us to make initial assessments of the role of political fandoms in the Italian discourse and to identify the possible political consequences of this type of engagement.

993

The Final Boss is Woke: Video Games and the Gender Discourses of Far-Right Video Influencers

Briar Dickey

Vrije Universiteit Brussel, Belgium

Scholars have noted the significance of 'geek masculinity' and conflicts about video game culture to digital far-right mobilisation. Despite this, existing observations about video games and the far right neglect to investigate how far-right actors engage with the fictional content of games, focusing rather on the role of nerdish male grievance and surface-level acknowledgements of their attachment to pop culture.

Narrative-driven games, however, are not only pop cultural objects around which nostalgia and male entitlement interact, resulting in violent anti-feminist mobilisation. They are also audiovisual fictions inviting players to activity construct an identity and make judgements and choices within virtual, often intentionally political worlds. Given this and their role in key digital far-right conflicts about gender, far right discourses about video game fictions are particularly well-positioned to tell us both about the role of audiovisual fiction and pop culture in far right mobilisation and the role of fictional tropes, mythology and stories in far-right identity construction.

This research zooms in on this unique facet of digital far-right culture through a multimodal discourse analysis of 50 videos from YouTube, Rumble and Twitch containing either gameplay or commentary on games by far-right-leaning influencers. It examines two interrelated dimensions of far-right engagement with games. Firstly, it explores how critiques of video games are used as a vessel to share reactionary ideological messages about gender and society, demonstrating the strategic use of pop culture by far-right influencers and contributing to a wider body of work on far-right 'metapolitics'. Secondly, it explores how engagement with video game fictions results in the construction of far-right masculinities and femininities, as well as provoking critiques of deviant gender expression.

Cadres and Bureaucrats: Sovereignity and Law in Markus och Malcom

Tor Hammer

Mittuniversitetet, Sweden

Markus och Malcom is a Swedish political podcast that is associated with a local populist party from Örebro, Örebropartiet. It is hosted by the party leader Markus Allard and prominent member Malcom Kyeyune, and it is one of the party's main channels of political communication and ideological development. The podcast had a left-nationalist and self-admitted populist identity when it begun in 2014, but it has since actively sought to distance itself from the political left and have begun engaging more closely with the far right. Markus och Malcom is of interest not only because podcasts are a novel and understudied form of social media with interesting synergies with populist politics and its uses of media technologies, but also because of its ardent attempt at developing a novel political and ideological worldview. In this paper I will focus on the latter, critically interrogating the understanding of sovereignty that emerges throughout podcast as they argue for the necessity of what they call a cadre-state – a state run by political cadres who, unlike the bureaucrat, does not treat the law as a series of neutral statutes, but rather as means for a political purpose – and how this relates to their ambition of a Sweden run by local populist parties.

994

RN32 | T06_02: The impacts of gender politics

The panel discusses gender perspective on politics, focusing on both gender-related issues and gendered politics, providing a complex overview of the processes at stake.

Gendered Public Policies: The Discourse around FeminisminSpain

Blanca Alonso Gracia, Olatz Zeltzin Arriaga Huerta, Mar Nacher Escartí

Universidad Complutense de Madrid, Spain

One of the objectives of the European project FIERCE (Feminist Movements Revitalizing Democracy in Europe) is to multi-disciplinarily analyze the impact of the feminist movements in public policy processes. To this aim, the project focuses on how the feminist discourse is shaped and developed, as well as on how it transcends its own limits, permeates the public imagination and puts certain struggles and issues on the agenda, while prompting reactionary counter-discourses and movements. Thus, through discourses, political stances and alignments, the project studies tensions and conflicts in the public policy process, not only with regards to far right anti-gender forces, but also within the very feminist actors.

One of the research lines proposed by FIERCE has been the analysis of the networks of actors around certain gendered public policy debates. As Twitter data was not accessible, the project has conducted a Discourse Network Analysis (DNA) methodology. This has entailed the retrieval and posterior codification and analysis of hundreds of newspaper articles related to gender public debates between the years 2019 and 2022, which has enabled a mapping of the constellation of actors, their relationship with other political actors, their stances, as well as the impact that those alliances have had on gender politics. The present paper aims at presenting the results of such a line of research.

Intersectional Gender Structure and Political Impact of Western Education: A Comparative Historical Analysis

Aray Gaipova

Leiden University, Netherlands, The

Cross-border educational mobility of citizens of developing countries to advanced democratic nations has been associated with democracy in developing countries (Atkinson 2010, Freyburg 2015, Gift and Krcmaric 2015, Mercier 2015, Spilimbergo 2009). This relation between Western education and democratization hinges on the assumption that Western education challenges persisting structures of inequality by equipping underprivileged groups with social and cultural capital. However, strong disparities in access to Western education have persisted across different types of programs (Dassin 2013, Dewachter et al. 2022). In my paper, I investigate the relationship between the intersectional gender structure, Western education of non-Western citizens from developing countries, and sociopolitical inequality in these sending countries. Adopting a qualitative research design that combines in-depth interviews, focus groups, and secondary evidence analysis, I test whether women and particularly women from lower socio-economic background are able to access Western education similarly to their male counterparts. I use comparative historical analysis of post-Soviet Kazakhstan and Kyrgyzstan, selected through most-similar systems, to trace causal processes and mechanisms in this relationship. Embedded in interdisciplinary debates across comparative politics, sociology, gender studies, and education studies, the research addresses the persisting tensions in the processes of internationalization of education by identifying if and how certain segments of the population get filtered out of the selection into Western education. As a result, the findings are relevant for transformative social change in the field of international education and have important implications for the restructuring of Western educational opportunities in a manner that unfolds their democratic potential.

Just about Language? Political Polarization and the Discourse on "Gendern" in Germany

995

Werner Binder

Masaryk University, Czech Republic

In many contemporary societies, debates on issues such as immigration or climate change have become markers or even drivers of political polarization. Yet, there are also cases of polarization on specific issues, which do not lead to broader political polarization. Under what circumstances and how do polarizing issues become divisive for whole societies? In order to address this question, I would like to investigate the discourse on "Gendern" in Germany, a linguistic practice that aims to reflect gender diversity and inclusivity. Although "Gendern" is widely perceived as a polarizing issue and rose to political prominence in the regional elections 2023, it has not (yet?) become a marker or driver of political polarization. In my talk, I will map the public discourse on "Gendern" and identify the various ways in which the issue is framed by different actors in the field. As empirical data, I will use political speeches and official statements of organizations as well as newspaper articles and social media posts, including readers' comments. I want to focus in particular on the interaction between the opposing camps, how they frame their opponents and their arguments. My understanding of political polarization is informed by Alexander's civil sphere theory as well as Laclau's and Mouffe's discourse theory, but I will also draw on Braunstein's work on political backlash and Rever's model of performative polarization to understand how "symbolic

entrepreneurs" try to confine or delimit polarization on this issue.

The Cost Of Visibility: Gendered Online Hostility Against French MPs

Annina Claesson

Institut Polytechnique de Paris/Sciences Po, France

Gendered online violence against elected officials has recently been identified as a key factor complicating women's political participation, especially as social media becomes a central political tool (Sobieraj, 2020; Håkansson, 2023). While we know that women politicians experience higher levels of sexualized and personal abuse on social media, we know less about how this affects their political practice. This paper explores the gendered impact of online violence on MP's working practices, grounded in the case of France. How do MPs adapt to a hostile online environment while pursuing visibility?

Combining computational and qualitative methods, I propose a framework differing between personal abuse, political criticism, and expression of support in order to understand MPs' online experiences. I trained a state-of-the-art automatic classifier to recognize these categories and applied it to the total number of tweets targeting French MPs in the period October 2022-April 2023 (approx. 30 million tweets). I explore how higher levels of abuse and criticism affect their media engagement. This was complemented by over 40 interviews with MPs and their staff.

Results indicate that there is a qualitative, rather than a quantitative, difference in how men and women experience abuse and criticism in their online visibility work. Particularly among higher profile women MPs, the labor undertaken to manage and moderate personal abuse constitutes a significant burden, and influences the extent to which they engage with traditional and social media. The paper argues that online violence is a key factor reinforcing gender inequality in the allocation of visibility among politicians.

RN32 | T06_03: Urban environmental politics

The panel focuses on urban environmental politics, discussing the interplay between policy processes and grassroots activism.

Analyzing Transformative Public Action: Dissecting Change In Two Case Studies Of Remunicipalised Drinking Water Services In France

Colin Brown[1,2], Kevin Caillaud[2]

1Bordeaux Metropolitan Area Water Company (France); 2National Research Institute for Agriculture, Food and the Environment (INRAE, France)

Our research provides an empirical analysis of the recent remunicipalisation of water and sanitation services in Bordeaux and Lyon (France). These politically driven decisions, made in 2020, entailed simultaneous processes of, on the one hand, creating new public companies and, on the other hand, transforming large existing socio-technical networks. We analyse these processes as projects to reconfigure the public policy "referential" in these territories, which were respectively historic strongholds of the multinational drinking water and sanitation companies, Suez and Veolia. We examine, in the respective contexts, the different approaches among the political and administrative stakeholders enacting these transitions to a public management model—notably to what extent they conceptualise and implement disengagement efforts with respect to past logics, power dynamics and practices associated with the outgoing concession service delivery model. This leads us to question the establishment of new forms of governance that accompany such transitions, including certain inevitable operational consequences (e.g. new institutions and the associated codes of conduct) but also lesser predictable impacts of a newly politicized service (e.g. transfer of politically charged concerns onto everyday operations). In relation to these considerations, we contribute to the literature on new public management, examining the paradox of the implementers' ambitions to bring water "back to the public" realm and supplant the modus operandi of private operators, all while defending performance-oriented management strategies that aim to "get the best of both worlds". In this way we show how these transformative processes are marked by sociopolitical influences and engrained neoliberal ideals.

996

Toward Sustainability as Political Process: Interpreting Urban Globalisation through the case of the EU's Urban Agenda

Monika De Frantz

University of Vienna, Austria

As European societies struggle with complex crises, the global goals for sustainable development (SDGs, UN 2015) highlight the political challenges of joint human action for societal transformation. Focusing on cities as centres of globalisation and growing urban areas, the UN-SDGs dedicate a specific urban objective (no. 11, 2015), followed by the EU's Urban Agenda since 2016. Merging economic with social and environmental objectives, the notion of sustainability addresses not only practical limitations of growth but also implies critiques of modernity through tensions in institutional ordering and loss of trust in human progress. Particularly, cities symbolise these modern tensions – as centres of creative societal innovation and places of complex interconnected problems. Against national-populist retreat from EU integration, urban contexts offer multi-facetted opportunities for local civic participation, multi-level governance and experimental learning across countries, sectors and disciplines. However, in a rapidly changing and diverse world, any governing stategies are necessarily limited, contextually differentiated, imply winners and losers, and thus possibly conflicts and contentious mobilisations.

So, how may urban research contribute to the SDGs? Reflecting current transformations, scholarly debates on urban globalisation pose societal diversity as critical claim, which connects capitalism critiques with cultural identity and environmental sustainability. As the SDGs frame a variety of urban transformation efforts, this paper reviews the recent literature on the EU's Urban Agenda to enquire some relevant normative, practical and epistemological perspectives on sustainability. Thus elaborating my previous work on EU urban multi-level governance (De Frantz 2022) by embedding sustainabilitiy objectives in diverse contexts contributes to politicizing the SDGs as open-ended processes of democratic transformations on the ground.

Democratizing the Green City? The Contentious Politics of Urban Biodiversity between Participation and Expertise

Riccardo Emilio Chesta[1], Renato Casagrandi[2]

1Politecnico di Milano, Italy – NBFC National Biodiversity Future Center; 2Politecnico di Milano, Italy – NBFC National Biodiversity Future Center

The politics of biodiversity has recently emerged as a key issue of urban governance. Big cities are investing massively in the greening of urban spaces as part of their strategy of both sustainability and competitiveness.

Greening urban spaces means not only renewing or adding some natural elements to urban landscapes, but intervening on their social dimensions. Programs of urban biodiversity triggers interesting dynamics regarding the relations among technical experts, citizens and green politics.

Notwithstanding its 'naturalistic' feature, urban biodiversity is neither purely 'technical' nor a 'natural' issue. It impacts directly on many social and political dimensions. So, what are the characteristics of the new urban politics of biodiversity? How is the problem of nature politicized by the main relevant collective actors? How does it become a public good, subjected to conflicts and aspirations to participation?

The presentation compares evidences from in-depth cases of citizens participation and conflicts in the metropolitan area of Milan. It pinpoints the key aspects of the politics of urban biodiversity and link them to the broader attempts to 'democratize the green city'.

Sustainability Culture and Environmental Activism Among Young Adults: A Survey on Italian Students

Viviana Asara, Alfredo Alietti

University of Ferrara, Italy

997

The new climate movements emerged since 2018/2019 have represented the birth of a new wave of environmental mobilizations, putting forth a vigorous critique of institutional 'environmental' politics and governance. Furthermore, some fundamental cleavages at the core of sustainability debates – such as the role of economic growth, technological innovations, social inequalities/justice, and the transformation of the mode of production and consumption – have acquired renewed importance in the discourses and frames of the new movement. On the other hand, young people's eco-political actions are embedded in a neoliberal governmentality that acts by individualising responsibility within the marketplace (Kyroglou & Henn 2020) by means of a "performative environmentalism" (Anantharaman 2022) .

While several studies have analysed the determinants of EC, such as socio-demographic factors, socio-psychological constructs, and political orientation and variations in value systems (Rampedi & Ifegbesan, 2022; Liu et al 2014), few studies have investigated the role of institutional trust and political efficacy (Boulianne & Ohme 2022), and social and cultural background (Della Porta and Portos 2021) as intervening variables mediating the effect of EC on young adults' environmental activism and sustainability culture.

Our study aims to fill in such a research gap by investigating the relationship between university students' perceptions on the climate crisis and the ecological transition and their institutional trust and environmental activism. These questions are explored by means of a structured online questionnaire that has been distributed to all the population of students enrolled in Bachelor's, (2 year) Master's Degrees and 5 – and 6 – years Single-Cycle Degrees at the University of Ferrara.

RN32 | T07_01: The politics of everyday experiences

The panel explores mundane politics by focusing on how social actors make sense of their everyday experiences.

Cities And New Human Rights: Children's Right To Clothing In Nottingham

Michele Grigolo

Nottingham Trent University, United Kingdom

This paper presents some preliminary theoretical reflections and empirical findings from my current research agenda on cities as spaces of new human rights. In this research, I look at how cities foster new human rights. By this I mean that cities 1) inject new meaning into existing human rights and 2) are incubators of new ideas and concepts of human rights. My argument and analysis are premised on a notion of the 'urban' borrowed from Lefebvre's work and his idea of the right to the city. While commentators have tended to present human rights and the right to the city as distinct or even irreconcilable, my point is that these two notions of right may be fruitfully combined and further developed to explore the social and political processes in space through which human rights acquire new meaning and significance. The empirical part draws on a study that has not been completed yet, of children's right to clothing in Nottingham, in collaboration with Sharewear Clothing Scheme. Children will be invited to reflect on the meaning of clothing in their everyday life and space, and eventually on clothing as a human right. A critical analysis of children's lived experiences of clothing will be performed, which is expected to illuminate the link between human rights and the right to the city, and new meaning of human rights in the context of contemporary marginality, crisis, and agency taking place in the urban form.

An Inquiry of Engagement of Unemployed People

Maggie Müller

Roskilde University, Denmark

In this paper, I explore how individuals in rural areas experience unemployment and the situations they find themselves in. Grounded in Thevenot's concept of regimes of engagement(2006), this study examines how individuals, living in rural areas with a formerly high working-class identity, engage with their surroundings in the wake of unemployment. Regimes of engagement, as a theoretical lens, provide a nuanced understanding of the ways individuals establish connections, make meaning, and navigate their social environment.

The research unfolds in a rural post-industrial area in Southern Denmark employing an ethnographic approach. Over the course of nearly a year, I follow the everyday life of six unemployed people, combining interviews, photo elicitation, and shadowing. This methodological diversity ensures a comprehensive exploration of unemployment encounters on formal, local, and proximate levels, capturing the complexity of individual experiences. The research focuses on working "with" the unemployed, prioritizing their subjective vantage point for analysis. By concentrating on the experiences of individuals in a rural post-industrial setting, this paper addresses a gap in the literature, offering insights into the complexities of unemployment in such contexts.

Initial findings suggest that unemployed individuals engage in various situations beyond job-seeking activities. Their engagements encompass both material and immaterial aspects. For instance, it becomes evident that a cat holds significant meaning in shaping how the unemployed person feels about himself and his life. These engagements may arise from emotional attachment, nostalgia, or a need for care. Others are influenced by a broader structured governing such as interactions with the welfare institutions and the labor market.

While many studies concentrate on either the individual or the interaction between welfare institutions and the unemployed, this paper provides a more nuanced perspective. By highlighting the subjective experiences of the unemployed, it enhances our understanding of the broader societal implications of unemployment. This challenges conventional categorizations of unemployment as a purely objective issue and contributes to a deeper understanding of unemployment.

I am applying to the ESA PhD Summer School for the first time to present my research on unemployment dynamics in a diverse scientific setting and connect with fellow PhDs and scholars.

Social Vulnerability, Collective Imaginaries and Infrastructures of Solidarity in Rome

Antonio Putini

Sapienza, Italy

Social vulnerability expresses the conditions into which large sections of the population who find themselves living in a post-industrial development context are plunged (Beck, 2000). According to Ranci (2002) states of vulnerability arise in fact from the transformations following the transition from a Fordist to a post-industrial society. Starting from this definition, the contribution provides a set of reflections deriving from the results of a field-research conducted in the neighbourhoods of Torpignattara and Certosa in Rome. Through a participatory methodological approach – built around 2 focus groups with a neighbourhood committee, 15 in-depth interviews and 123 questionnaires – the research offers an insight into states of social vulnerability (Ferrigni, 2021; Istat, 2020; Lelo et al., 2021). What emerges is a contrasting overall picture that summarized some of the main trends observed in the urban environment during

998

the last decades: the collapse of political-administrative institutions; the radicalisation of the processes of economic and financial value extraction; the centrality, in the processes of socialisation, integration and social cohesion, of institutions such as schools; the need, transversal to the various social groups, of meeting places and moments that contribute to reconstructing a community and identity dimension in an environment that is, on the contrary, an expression and concretisation of the impersonality of social relations, made even more acute by that parenthesis of suspension and isolation constituted by Covid-19. Finally, the mediating role between individuals and institutions that the world of associations, voluntary work and informal groups finds itself playing, often with substitutive rather than integrative or subsidiary functions, with respect to local administration.

Critical Religious Selves Muslim Palestinian Women Caught Between Religious Patriarchy and a Hegemonic State

Nahed Mohamad Ashqar Sharary, Sarab Rabia-Abu Queder

New York University, Israel

This study explores how Palestinian women in Israel develop a religiosity that enables them in negotiating identity and empowerment. It examines the dynamics necessary for them to develop religious identities and the significance of these dynamics in their daily lives. These components include self-perception, dress codes, body image, relationships, sexuality, familial relationships, work, agency (autonomy), gender-based relationships, the relationship as members of a minority group with the hegemonic, Jewish State of Israel, and the women's internal identification with, and dissonance between, Islamic Sharia law and the status of women. The central argument is that the development of religious identity is built around a combination of political, social, religious, and socioeconomic conditions which coincide with the individual's self-identity and unique personality.

this process is being significantly influenced by external religious control over them, in conjunction with hegemonic regimes which promote the patriarchal power, resulting in women seeking religious consciousness choosing, in a seemingly paradoxical way, to take part in processes that consistently strengthen their religious Muslim identities.

The study is based on in-depth, open-ended interviews with 33 Palestinian women who self-identify as religious, all aged 30–60. All but four of the participants hold academic degrees. The findings of this study reveal the existence of critical religious identities in both the personal and interpersonal spheres of women's daily lives, which contribute to their sense of self while emphasizing the need for strengthening their sources of Islamic religious knowledge: in other words, a "religious self" which encourages the development of a psychological agency anchored in Islam, through which the individual may challenge the collective forces which oppose the established sense of self.

RN32 | T07_02: Beyond identity – intersectionality, queer and trans politics

The session explores gender, queer, and trans politics, and discusses the analytical concepts to approach these topics, including intersectionality and power.

Political participation and Anti-violence policies

Maria Mirabelli[1], Sabrina Garofalo[2]

1Università della Calabria, Italy; 2Università della Calabria, Italy

The regulatory crisis that characterises states has led to a redetermination of institutional processes and balances, of the trust and legitimacy of the system, and of the relationship between citizens and political institutions. Within this framework, our reflection aims to focus on the experience of anti-violence centers in Southern Italy, from a particular point of view, that of the relationship between institutions and culture. The research we are conducting with an intersectional approach seeks to reconstruct the experiences to understand how anti-violence centers understand political participation at local, national and international levels. In some cases they prove capable of building important networks to address different issues related to violence, other times they are configured as parallel paths, which also have difficulty communicating with each other. The aim of the work is to understand how civil society networks engaged in policies to prevent and combat gender-based violence can really act and influence the political agenda and in particular, and how political participation is understood and declined in terms of building democracies based on non-infringement of human rights. In this case, analyzing the link between institutions and culture, allows to codify the dialectic between tension, trust and transformation, starting from the subjective experiences of anti-violence centers immersed in relationships of intersubjective and political trust. The hypothesis of work is that the dialectic between tension and trust, read in the relationship between culture and institutions, can give rise to dynamics of transformation of contexts and territories.

999

Social Movements, Futurities and Social Transformation: An Analysis of Contemporary Queer and Trans Politics

Alexandre Nogueira Martins

Freie Universität Berlin, Germany

Queer and trans social movements have long been regarded in social research as culture – or identity-based activism and their demands for inclusion as already been achieved in most Western societies. Nonetheless, the comprehension of their politics may go far beyond the focus on identity (Haider, 2018; Ferguson, 2020) as many strands grounded on non-hegemonic positions of class, gender, and race have been disputing the futurities of gender and sexual politics. In a dialogue with contemporary analysis of social movements against neoliberalism (Cox 2016; Dinerstein 2019), especially queer and trans (Gleeson, Rourke, 2021), the paper aims to analyze the political practices of radical queer and trans activist organisations in Argentina and Colombia. From documents and interviews analysis, we investigate, firstly, how social reproduction practices have been central to the political organization of those movements (Raha, 2021) and how they have entailed a relation to futurity and social transformation. Secondly, queer and trans radical demands and strategies in those countries are investigated as part of contemporary struggles for redistribution (Fraser 1996). The campaign for jobs, housing, and healthcare for trans populations is taken as a case for understanding the visions of futurity and social transformation from queer and trans movements. The paper aims to contribute to an analysis that goes against and beyond reductionist divisions of redistribution versus recognition or class-based versus identity-based social movements in order to better apprehend the futurities envisioned in current social transformation processes in which social movements play an important role.

Revisiting Intersectionality: A Dialectical Approach to Power Relations in Capitalist Societies

Julia Schmid

University of Vienna, Austria

The concept of intersectionality, developed in the 1970s within the framework of Black feminism in the United States, serves as an analytical tool for examining mutually constitutive power relations, primarily based on the triad of race, class, and gender. Originally emerging in the struggle against sexism in the Black civil rights movement and racism in the Second Wave feminist movement, intersectionality has inherently united analytical and political dimensions from its inception (e.g., Combahee River Collective 1982; hooks 2001 [1982]; King 1988; Lorde 1984). Nevertheless, the concept's political implications have come under growing criticism in recent years. This was particularly apparent amid the ongoing Middle East conflict, as intersectional

left-wing activists and scholars employed the concept to promote anti-Semitic slogans. Consequently, this has led to the concept being dismissed as a mere political tool, exacerbating inter-identity conflicts. Despite the understandable criticisms raised in this context, this theoretical paper wants to refute the fundamental rejection of the concept and instead advocate for a dialectical reinterpretation. In doing so, the paper aligns with a tradition of the Frankfurt School that seeks to connect and further develop feminist approaches with the theorems of Critical Theory (e.g., Becker-Schmidt 2008; Fraser 1994, 2022, 2023; Klinger 2008; Knapp 2008). Proposing a dialectical conceptualization of intersectionality, the paper aims to undertake a theoretical examination of the multilayered contradictions and ambivalence inherent in modern capitalist societies by specially looking at research conducted in the field of the international division of labor (e.g., Bair 2010; Collins 2014; Dunaway 2014; Mies 1996; Mohanty 1986; Wright 2006; Yeates 2014).

A Toxic Cocktail Of Compassion and Transphobia: A Discursive reading of the Dutch Opposition to the Transgender Act

Iskra de Vries

University of Warsaw, Poland

'What is the point of this? Tomorrow you will identify as a camel, the day after as a dromedary?' bashed Geert Wilders, leader of the Party for Freedom, a far-right party recently elected as the largest in Dutch parliament (own translation, 21 Sep 2022). Being confronted with the heated and ongoing debate on the proposed adjustment of the Transgender Act in the Netherlands, I aim to empirically map political and public discourses to reconstruct the interpretation processes of the Act. In April 2024, a motion was initiated to withdraw the bill in its totality, which passed by a slim margin. The analysis is grounded in the affective economies as developed by Sara Ahmed (2014). By carving out the resisting narratives of the Act's opposition – and their positioning on gender in conjunction with their understanding of valid knowledge in society – the article simultaneously contributes to the debate on anti-gender mobilizations, as the initiated simplification of the Act backlashed in the founding of several organizations and political and public actors explicitly opposing the so-framed 'trans and gender ideology.'

My proposition for the affective mapping of the various interpretations of the Act unmutes the issues related to gender discrimination and the rejection of gender knowledge more broadly speaking (Bracke and Paternotte 2016; Paternotte 2019). Furthermore, by reconstructing the emotionality of the discourses around the Act, my central concern will be to shed light on how transphobic and sexist prejudices are mobilized and distributed, if not justified. The novelty of this article lies not in describing the general anti-gender strategies, as this is already done rather extensively, but in offering the localized Dutch adaptation to its operation. As my analysis will show, the resistance to the Act is largely executed in the name of compassion and for the sake of good policy-making.

RN32 | T07_03: Political sociology in contemporary times of crisis – Palestine and Israel

This session includes contributions discussing the use of political sociology in understanding crisis and conflict, including in Palestine and Israel.

"Multiple Crisis and Conflicts: The Importance of Being a State. Obstacles and Opportunities of the Palestinian State-building"

Rosalba Belmonte

Università degli Studi della Tuscia, Italy

Nowadays, the exercise of sovereignty by a power pursuing public interests on a territory and its inhabitants is no longer a sole prerogative of nation-states. Indeed, states coexist with a plurality of new orders such as non-state public authorities.

An example of non-state public authority is the Palestinian National Authority (PNA), namely the self-government body established by the Oslo Agreements (1993) to administer the Palestinian Territory for an interim period of five years, with the aim of forming an autonomous Palestinian state that has never been achieved.

Although since its establishment PNA has embarked on an institution-building process aimed at gradually achieving the independence in terms of territorial control, economy, people flow management and transnational relations, after thirty-one years an effective and fully functional Palestinian state was not established, and the current and increasing exacerbation of the conflict in the Gaza Strip suggests that it is not destined to be born in the short/medium term.

The obstacles that have prevented the establishment of a Palestinian state are both endogenous – deriving from the Palestinian actors' behavior and choices – and exogenous – arising from the choices, the behavior, and the omissions of external actors.

The aim of this work is to present and analyze in depth the abovementioned obstacles and then to discuss the opportunities that the creation of an effective and fully functional Palestinian state could guarantee to local populations in terms of justice, rights, and protection, and to the political stability and security of the whole region.

Israel-Palestine: Beyond the Violation of International Law: Colonialism, tension, and transformation

Arees Bishara

Tel Aviv University

The Israeli settler colonial practices and the war on Gaza raise critical questions about the applicability and limitations of Sociology, international law, and human rights norms. Recent events, including the bombing of civilian sites like schools and churches and UN properties in Gaza by Israel, have prompted outrage and resignations from UN officials who condemn the lack of accountability for apparent war crimes. However, powerful actors like the US and EU continue to provide Israel with diplomatic cover and material support, undermining the authority of international legal frameworks. This roundtable will examine the tensions between human rights ideals and geopolitical realities, analyzing how politics and power dynamics shape the discourse and enforcement of international law and Academia. It calls for academics and institutions to uphold democratic norms, allowing free speech and debate on these issues. The discussion aims to move beyond stagnant two-state proposals toward an equitable resolution respecting Palestinian rights. It asserts sociology's transformative potential to address global crises like this conflict by applying critical perspectives and methodologies. The field's diversity offers multidimensional understandings of causes and solutions, helping rebuild trust and stability. By relying on the sociology of war theory that focuses on the macro-level patterns of war-making, how societies and states engage in warfare, the meaning that war has in society, and the relationship between state structure and war-making, this roundtable tackles the role of international law and Sociology in the Israel-Palestine discourse, arguing for open academic dialogue and sociological insights to promote social change.

When Violence Trumps Politics: Historical Perspective on the Derailment of Peace Negotiations to War in Israel/Palestine

Lev Luis Grinberg

Ben Gurion University, Israel

In 1994 I suggested a theoretical framework for analyzing the peace negotiations between the Israeli government and the PLO. The framework was based on elitist theories of transition to democracy, which explains the political dynamic as struggles between four elites, the moderates among the rulers and the ruled, seeking peaceful transfer of power, and the extremists in both sides, who tacitly cooperate in sabotaging the compromises between the moderates.

1001

The expected democratic outcome of such process in Israel/Palestine was dismantling the military occupation and establishing a Palestinian State, however, the paper emphasized the capability of extremist opponents to sabotage it, given the power of zealot Jewish settlers, and the armed organization of Palestinian resistance. Indeed, in 1995 Rabin was assassinated by a Jewish religious zealot, and in 2000 sparked the second Intifada, finally derailing the negotiation process into violent clashes between Israeli military repression and Palestinian terrorist attacks.

The redeployment of the IDF around Gaza in 2005, and imposing a blockade, was designed to detach it from the West Bank, successfully preventing the establishment of a Palestinian State. The new regime of divide and rule under military domination created a fragile "unstable stability" of sporadic violent clashes without diplomacy. The Israeli bombardment of Gaza in response to Hamas missiles was legitimized as acts of self-defense, and in the West Bank the continued expansion of Jewish settlements provoked Palestinian resistance, either by terror or popular uprisings.

The proposed paper analyzes the rise to power of religious nationalist zealot elites both in Israel and among the Palestinians, exploding in criminal acts against humanity since the October 7 massacre, questioning the viability of political solutions to the crisis.

Political Sociology Of Crisis In Times Of Crisis: Introducing The 'Augmented Discrepancy Approach'

Jenny Preunkert[1], Joris Steg[2], Martin Seeliger[3], Johannes Kiess[4]

1University of Duisburg-Essen, Germany; 2University of Wuppertal, Germany; 3University of Bremen, Germany; 4University of Siegen, Germany

Sociology has evolved and developed as a "crisis science". In times of crisis, political sociologists are frequently inquired to understand the structural mechanisms and dysfunctionalities that led to the crisis as well as to process the social and political consequences. Moreover, the cascade of crises since 2007 – including the world economic crisis, the political crisis over migration, the covid pandemic, the Russian invasion of Ukraine and the inflation crisis – are accompanied by the claim of the crisis of liberal democracy. Here, political sociology is called upon to analyse, what these crises mean for societies, democracies, institutions, convictions, and behaviors of people taken for granted in normal times. In this paper, we address the relationship between political sociology and crisis and discuss possible characteristics of a genuine political-sociological approach to (political) crisis. Here, we propose and introduce an 'augment discrepancy approach' (ADA) as a heuristic framework for the empirical analysis and comparisons of (political) crises: this approach or perspective interprets political crises as resulting from a gap between democratic ideals, i.e., the self-understanding or legitimation narratives within society, and real-existing political practices. From this angle, a social constellation appears as a crisis, if the material conditions and practices constituting it (considerably) deviate from a certain understanding of democracy and if members of society perceive this deviation as such to a relevant extent. The paper concludes with a consideration of the merits of the discrepancy perspective for the sociological analysis of (political) crises.

1002

RN32 | T08_01: Debating democratic innovation

The papers in this session explore evidence from different types of participatory democratic governance experiences.

Public Administration as Innovative Ecosystem for Governance of Potentialities? A Case Study in Berlin.

Jun Chu, René John

The Institute for Social Innovation (ISInova), Germany

In recent decades, citizen participation in local planning and decision-making processes has attracted considerable attention from scholars in the interdisciplinary fields of policy, governance and civil society. The issue becomes even more relevant today in the context of the rise of political polarisation, populism and distrust in politics. While the processes of participation have been thoroughly investigated from the perspectives of empowerment and democracy, an increasing number of studies draw focus on the aspect of public administration in its capacity to deal with participation in the tension between structure and agency. However, the question of the organisational conditions for participation still requires further explanation.

Based on our ongoing case study in Berlin's local administration within the framework of the BMBF-funded research project EmpHyRes (2023-2026), we focus on the potentials and challenges for a possible organisational change in public administration during the participation processes. By posing the question of under what conditions the quest for digital citizen participation can become a source of innovative change within the internal structure of the local administration, we aim to investigate the dynamics, tensions and challenges for a future-oriented organisational form and thus provide more insight into the complexity of transformation processes at the local level in the digital age. Furthermore, we will explore the theoretical fruitfulness of bringing the organisational angle back into the discussion on the politics of engagement and participatory governance.

Changing the Machine from Within: An Analysis of the Costs and Impacts of the Professionalization of Activism

Héctor Gil Rodríguez[1], Eduardo Romanos Fraile[2], José Luis Ledesma[3], Jorge Sola Espinosa[4], Daniel Sorando Ortín[5]

1Universidad de las Islas Baleares, Spain; 2Universidad Complutense de Madrid, Spain; 3Universidad Complutense de Madrid, Spain; 4Universidad Complutense de Madrid, Spain; 5Universidad de Zaragoza, Spain

After the local elections of 2015, several citizen candidacies emerging from social movements entered Spanish city councils with the aim of transforming their modes of governance. The objective was to promote a novel way of "doing politics", which would translate the demands of the protest cycle led by the 15M movement into the sphere of local institutions. However, these innovative models of governance encountered various structural rigidities and administrative inertia from the outset, significantly limiting their transformative potential. This paper aims to analyze the way in which these factors modulated the dynamics of the new municipalism and had an impact on the actors involved in them.

Through a series of in-depth interviews with activists who took part in diverse "city councils for change", our aim is to delve into the subjective dimensions of the professionalization of activism. This involves exploring the discursive space that these activists put into play to rationalize the personal and political costs of the so-called "institutional assault". By exploring these costs and impacts, we seek to assess the extent to which the experience of government has changed the political culture of a generation of activists with the configuration of new expectations and perceptions about institutional politics, social movements and the relationship between these two spheres.

1003

Conference on the Future of Europe: Challenges, successes and expectations

João Limão, Inês Campos, Sandra Oliveira

CE3C – Centre for Ecology, Evolution and Environmental Changes, Portugal

In response to a certain erosion of representative democracies, national, regional, local or even supranational public authorities in various parts of the world have sought to counter a certain cynicism on the part of citizens by promoting innovative, more participatory and deliberative democratic initiatives, from referendums to citizens' assemblies, mini-publics or participatory budgeting. At European level, the Conference on the Future of Europe (CoFoE) was the most visible expression of this trend by the European Union (UE). Held on an unprecedented scale, this conference involved European citizens from the 27 Member States in the debate on the future of Europe and in the deliberation

and presentation of proposals in several key areas of European policy. Through a case study based on more than a dozen in-depth interviews with participating citizens and members of the organisation, and the analysis of various documents about this initiative, this research seeks to understand the main challenges and results achieved in the CoFoE, and how citizens and organisers view the initiative. If everyone agrees on the uniqueness of the CoFoE in terms of scale and innovation, opinions are less unanimous on the success and effectiveness of the initiative in terms of the follow-up given to citizens' proposals and the effectiveness of the participatory dimension. The timing of political decisions worries some citizens, who fear that their proposals will be lost in the intricacies of the decision-making process. Once again, organisers and citizens agree on the ineffective communication of the initiative.

Building Societal Resilience Through ICT-based Co-production: Citizen Action And Public Services During The War In Ukraine

Kristina Muhhina[1], Olga Matveieva[2], Dmytro Khutkyy[1], Tetiana Mamatova[3]

1University of Tartu, Estonia; 2Ruhr University Bochum, Germany; 3Dnipro University of Technology, Ukraine

This paper examines the transformative potential of Information and Communication Technology (ICT) in the co-production of public services, drawing on a case study from the Dnipropetrovsk region of Ukraine. The central research question is how to harness the benefits of ICT-enabled co-production of public services for building societal resilience in the Dnipro region? The first sub-question is what are the current challenges in the co-production relationships between governmental and societal actors in the Dnipropetrovsk region? The second sub-question is how to tackle the identified challenges in the co-producing relationships to enhance the capacities to manage resilience in the Dnipropetrovsk region? The study is framed within the co-production theory, reimagining public service creation as a collaborative endeavor where citizens transcend the traditional roles of recipients and customers to become active, contributing partners. This paradigm shift, caused by the war, involves citizens deploying their resources, expertise, and insights in concert with government entities to address public challenges effectively and fill the gap that is not covered by traditional government services. The study investigates the ways ICT-enabled co-production can bolster societal resilience amidst the ongoing Russian war in Ukraine which became a reason for activating civic initiatives in co-production of public goods. Utilizing Linders' (2012) typology, which outlines the variability in citizen co-production initiatives, the authors explore the typology of ICT-facilitated C2C (Citizen-to-Citizen) services in the Dnipropetrovsk region during 2022-2023. This approach emphasizes a more holistic and participatory role for citizens in the ideation, design, and realization of public service solutions.

RN32 | T08_02: Discourse politics in crisis

This session brings together a broad range of approaches to discourses, values, and principles in politics.

Illiberal Democracies and the rule of law in the European Union

Maria Cristina Marchetti[1], Erica Antonini[2], Emanuele Rossi[3]

1Sapienza University of Rome, Italy; 2Sapienza University of Rome; 3University of RomaTre

The reference to values enshrined in the article 2 of the Treaty of Lisbon has assumed an increasing role in the construction of European identity. They establish an internal and external conditionality principle that guides the political action of the European Institutions and the definition of the "European way of life".

Among these values, the institutions have paid particular attention to the rule of law, certainly one of the most controversial in the recent experience of the EU. As some member states have witnessed a shift towards "illiberal democracies" (Zakaria 1997), concerns about the erosion of democratic principles and the rule of law have emerged; the consequence could be a "democratic backslidings" (Bermeo 2016) which separates liberalism and democracy.

This paper aims to analyse the challenges posed by illiberal democracy to the EU's commitment to upholding the rule of law, focusing on the following issues:

– the relationship between illiberal democracy and the rule of law in the EU;

– the instruments adopted by the EU institutions to protect the rule of law;

– the rule of law as a value for European citizens and Member States. For the former, data from Eurobarometer 489 on the Rule of Law (2019) and the Special Eurobarometer 508, Values and Identities of EU citizens (2021) will be analysed; for the role of member states, the Rule of Law Reports (2020-2023) will be examined;

– the analysis extends to the potential implications of illiberal practices for the EU's internal cohesion and its ability to project a united front on the global stage.

1004

When the "No" Turned to "Yes": Political Cynicism and Crisis of Representation in the Aftermath of the Greek 2015 Bailout Referendum

Costas Gousis, Angelos Kontogiannis-Mandros

Panteion University of Social and Political Sciences, Greece

The July 2015 bail-out referendum marked the apex of the Greek crisis and constituted a pivotal moment in the overall trajectory of the Eurozone crisis management. In this context, our aim here is to illuminate its political repercussions and more specifically to analyze its impact vis-a-vis the growing crisis of representation that is clearly manifested in the sharp and prolonged increase of electoral abstention. To that end, we pay particular emphasis on the dynamic and the characteristics of political cynicism; a variable that in our opinion is of utmost importance for the analysis of Greek politics in the post-2015 period. Political cynicism is of course a contested concept and thus our elaboration begins with a brief elaboration on the relevant debate and our take on it in relation to the specificities of the Greek crisis. Following that, we put forward our main research findings and elaborate on the complex interplay between political cynicism, crisis of representation and electoral abstention in the backdrop of EU's crisis management and SYRIZA's handling of the 2015 referendum. Our analysis utilizes survey data but relies primarily on qualitative data in the form of 75 in-depth interviews and 10 focus groups of 7 participants each. This data combination allows us to draw significant insights into the impact of the third austerity package, the vicious circle of the Eurozone debt crisis and the dynamics that continue to underlay the Greek political system.

Contentious Chronicles. Preliminary Analysis of the Processes of Political Subjectification in a Southern Italian Region.

Fabio de Nardis[1], Angelo Galiano[2]

1University of Foggia, Italy; 2University of Salento, Italy

Starting from a review of the most representative territorial conflicts that have characterized the history and geography of a specific area of Southern Italy, we intend to relate the multiple forms of political subjectification with which different segments of the population have reacted to the phenomena of depoliticization that have animated Italian political, economic and ecological history in the neoliberal era. From the analysis of some case studies emerged through the method of Protest Event Analysis, we described and analyzed the combinations of practices that so-called 'subaltern' groups and 'spontaneous' movements enact as concrete responses to the processes of capitalist valorization of the territories; their active or passive adherence to dominant political formations, and their attempts to influence the agendas of these formations in order to impose their own claims and knowledge oriented toward overcoming the very condition of subalternity. In each case investigated we found the presence of multiple elements of conscious direction that nevertheless failed to surpass the level of 'popular science' in which they were born or to elevate their action beyond the level of a-systematic rebellionism. This seems mainly due to the inability of leftist political actors to channel, reposition and guide the demands for change of the weaker segments of society. The thesis is that of overcoming spontaneism as political practice and horizontality as method. Both elements, instead of being a resource to the foundational processes of conflict subjectivities, proved to be an obstacle, negatively affecting the outcome of the contentious action The data collected are based on in-depth interviews with key actors and the mapping of all conflict episodes that occurred between 2007 and 2017 in Salento.

Neo-Authoritarian Regime of Truth: Epistemic Politics in Neo-Authoritarian governance

Amir Barjasteh

Tampere University, Finland

The rise of neo-authoritarian forces, in both democratic and non-democratic systems, has brought along updated technologies of governance. This neo-authoritarian politics includes not merely devices for the infringement of human rights but also epistemic politics on how to affect people's opinions and justify those destructive devices. These governing technologies are methods for achieving a given aim: to "sabotage accountability" (Glasius, 2023) and thereby erode democratic processes.

While prior studies have convincingly shown that the securitization process (and thereby de-politicization) is the main logic in neo-authoritarianism (Gerschewski, 2023; Vuori, 2008), the literature on epistemic practices upon which the securitization process is activated is scattered in diverse disciplines. Drawing on Foucault's notion of "truth-making regimes," this study argues that neo-authoritarian governance has discovered the recipe of knowledge (re)production, which has a certain power of separation between truth and error.

As the concluding chapter of my doctoral dissertation, this piece reviews the cases of securitization practices investigated in my articles during my doctoral studies (article-based dissertation), and shows how neo-authoritarian actors govern the epistemic field to silence society's voices. Such epistemic politics can have harmful consequences for human dignity.

RN32 | T09_01: The socio-politics of space

While often overlooked in political research, the role of space appears to be crucial for the analysis of the political processes.

Only Nature is Beautiful Here. Tracking the Social and Political Consequences of Spatial Inequalities in Central Europe

Ludmila M. Wladyniak, Anja Decker

Czech Academy of Sciences, Czech Republic

Regional inequalities are increasingly understood as a risk to social cohesion, a cause of social and political polarities and a source of perceived injustice and marginalisation. The proposed paper is part of the project Social and political consequences of spatial inequalities that explores this issue with a focus on three Central European countries – the Czech Republic, Poland and the eastern regions of Germany. Drawing from the concept of 'left behind places' (Rodríguez-Pose, 2018; Psycharis et al., 2020) a central research objective of the project is to understand how inequalities between regions are reflected in local perceptions of injustice as well as to map the potential political agency of the subjects affected incl. bottom-up responses to spatial inequalities and processes of peripherialization.

The study includes a qualitative research approach (focus group interviews including photo-elicitation, and in-depth expert interviews) designed to explore the subjective meanings and viewpoints of those living in disadvantaged regions. The proposed paper discusses preliminary results of research conducted in two regions of Czechia facing amongst others depopulation and de-industrialization, low-wage work, and difficult accessibility of services. Giving voice to a broad spectrum of social groups, we seek to understand in more depth how the perception of the region is reflected in local political attitudes and actions (such as radicalization, indifference, populism, grass-roots movements, local activism, etc.).

"Relation between District Magnitude and Local Incumbency: Cases from Turkey"

Erdoğan Altun

Istanbul University, Turkiye

In representative democracies, what is essential for power is to get more votes than the other competing political party or candidate. Parties or candidates have instruments at their disposal to come to power. Among these instruments, we can mention methods such as clientelist policies (vote buying, participation buying, pork barrel, patronage, etc.), election campaigns, ideological discourses, and the use of ethnic and religious sensitivities. Parties and candidates try to use these instruments when competing on two scales for power: general elections and local elections. These two electoral scales require the implementation of two different policies at the macro and micro scales. If parties and candidates make the right moves, they can win long-lasting and iterative incumbencies at both scales.

This study will focus on an issue whose impact in local elections has not been carefully analyzed: the relationship between the size of the electoral district in terms of population and resources and long-lasting and iterative power. The argument will be analyzed in this paper is the following: In local elections, the smaller the electoral district, the more likely it is that winning candidates will win again and remain in power for a long time. Because politics become personalistic in local. Candidates, and particularly the clientelist relationships they control, enable candidates to become actors embedded in society and better able to analyze the needs and preferences of voters in their communities. Therefore, the smaller the electoral district, the greater the probability of the same candidate coming to power more than once in local elections. In this study, this argument will be tested by analyzing the election results in the "belde"s (districts smaller then subprovince) in Turkey.

Tension and Trust in the Social-Ecological Transformation: A Case Study on Lusatia (Germany)

1006

Ann-Katrin Kastberg

Institute for Social Research (Goethe University Frankfurt, Germany)

Current conflicts on tension, trust and transformation often reveal themselves in certain local contexts. In my paper I will explore on the connection between right-wing-populism and the obstruction of climate policies, focusing on the local case study of Lusatia in Germany. The region Lusatia, which is known for coal mining and coal-fired power generation, can be described as a place of a contested social-ecological transformation: While the region has to implement climate policy measures by 2038 due to the decision to phase out coal, the "Alternative für Deutschland" – a partly far-right party that in parts denies the climate crisis and obstructs climate policies – is gaining support in Lusatia in particular. These parallel developments are an example of the potential for an intensifying tension within the socio-ecological transformation (cf. Gürtler et al. 2021: 182).

How can we study, describe and explain this tension? In my dissertation I approach these questions with qualitative methods, building upon critical theory and psychoanalytical ideas. Drawing from my own research I will provide insights on the narratives of climate obstruction by right-wing populist and far right actors and present preliminary findings on the different responses to these narratives in Lusatia. The current transformation is evoking memories of the reunification among the population, who are reacting with both hope and mistrust to the promises made by politicians. While the former react with commitment and

activism, the latter show tendencies of political protest or withdrawal. As I will show, the social-ecological transformation faces challenges in gaining trust from the public and is therefore vulnerable for anti-democratic tendencies.

Social Divisions in Contemporary Politics: A Spatial Approach to the Analysis of Socio-political Attitudes and Preferences in Flanders

Dieter Dekeyser, Henk Roose

Ghent University, Belgium

In this study, we assess what contemporary political cleavages divide people in Flanders, Belgium. We specifically look into the existence of new cleavages separating people based on their perceptions of political institutions and (direct) democracy. Information on a broad range of policy issues (economic interventionism, migration, environmental issues), democratic institutions (populism, democratic participation), and societal perceptions (social unease, conspiracy mentality) from 2232 respondents is analysed by means of Multiple Correspondence Analysis (MCA), using survey data from 2019. We find evidence for two structuring dimensions. The first axis distinguishes people with a pessimistic and populist outlook on politics and democracy from those with more optimistic views of politics. The second axis separates people with cultural and economic conservative attitudes from those with progressive attitudes. Interestingly, classical sociological explanations (e.g., education, occupation, and age) are primarily associated with axis one, while political partisanship is linked to both axis one and two. These results provide new insights into the recent success of populism in politics, and also illustrate (potentially) important sociological changes in the social structuring of political attitudes in contemporary society.

RN32 | T09_02: The role of political trust

Our knowledge about the factors that shape trust in political systems and institutions is constantly evolving, and new questions about trust and confidence are emerging in contexts of crisis and rapid change. This session brings together papers examining trust and confidence in a broad range of settings.

Schooling, the Higher Educated and Political Trust: Critical Citizens, Universal Democratizers, or Defenders of the Political System?

Leandros Kavadias, Bram Spruyt, Jochem van Noord

Vrije Universiteit Brussel, Belgium

Classically, tertiary educated people have been found to have higher levels of confidence in political institutions than the non-tertiary educated. However, most of the existing research regarding the position of the tertiary educated has been conducted in democratic countries. Contrary to the widely held assumptions about the democratic power of schooling, recent evidence shows that the tertiary educated living in autocratic regimes show high support for the political system. These findings indicate the need for a revision of the 'education effect' on political trust. Moreover, many countries in the contemporary world are developing into 'schooled societies', where schooling has become a central institution. In these societies, schooling has become an authoritative basis for stratification, granting the tertiary educated a dominant position in society and the political field. Here, the tertiary educated are likely to be defenders of the political system as well. Following this reasoning, we examine the relationship between the development of schooled societies, educational attainment, sector of employment, and political trust. Multilevel analyses (Nindividual=102,389; Ncountry=85) show that (1) the tertiary educated have more confidence in the public institutions than non-tertiary educated people and that (2) this is especially true for the tertiary educated working in public institutions. Simultaneously, (3) in more schooled societies, the tertiary educated have more political trust than in weakly schooled societies, while non-tertiary educated people display a lot less confidence. Finally, (4) for the non-tertiary educated, this is true regardless of the sector of occupation. Yet, for the tertiary educated, their increased political trust in strongly schooled societies does not hold for those working in public institutions, who displayed high trust regardless of how schooled a society was.

1007

What Do Digital Skills and Competencies Reveal About Political Participation and Trust? Insights from the Austrian Digital Skills Panel Project

Dimitri Prandner[1], Manuela Grünangerl[2]

1Johannes Kepler University of Linz, Austria; 2Paris Lodron University of Salzburg, Austria

Most western democracies are under pressure. They faced and continue to face complex 'multi-crises', which includes, but is not limited to economic, health and migration related challenges. These crises led to a loss in trust in political institutions in many countries, providing ample opportunities for populist and anti-democratic actors to position themselves. In parallel numerous digital technologies matured, providing the public with new means for political participation. However, this came with a cost: fears of misusing digital technologies for political gains, the widespread dissemination of disinformation and misinformation as well as other aspects like polarization are continuous reminders.

While there is substantial research on loss of trust in political institutions and how political participation changed, the role digital skills and competencies of the public played in these processes is less researched, despite the often-discussed influence of digitalization on the public and political sphered. Accordingly, we discuss what kind of influence digital skills – inspired by van Deursen and Helsper – and digital competencies – inspired by the EU DigComp Framework – have on conventional (e.g. voting), as well as alternate and digital forms of participation (e.g. online petitions, social media engagement with politicians) before testing their impact on trust in political institutions.

Using multi-wave CAWI panel data from Austria (n=2000; multi-stage-quota sampling, matches population structure), focusing on digital skills and participation, preliminary results show that digital skills – especially those tied to digital privacy and safety – and interest in digital technology have a statistically significant impact on political online participation. Yet there is no indication that political participation in general benefits from digital skills or competencies. Trust is positively correlated with skills and competencies.

Trust in Political Institutions in Modern Russia in the Context of the Formation and Legitimation of a Personalistic Regime.

Nataliya Velikaya

Institute of Socio-Political Research of the Federal Center of Theoretical and Applied Sociology of the Russian Academy, Russian Federation

Political regime in Russia has undergone many transformations in recent decades, including an authoritarian turn.

In this context the Russian political elite has searched for a new mechanisms of legitimization. The most important indicator of legitimation in this case is trust, which we consider within the framework of a socio–cultural approach.

The paper is based on the data from the annual monitoring survey "How are you living, Russia?" (1992-2023), conducted by the Institute of Socio-Political Research of the Russian Academy of Sciences since 1992. The sample size varied from 1,312 to 1,866 respondents in different years.

Analyzing the dynamic of values sharing by respondents one can see it dependence on political discourse, including activization of traditionalism, conservatism and neo-imperialism. At the same time the high level of loyalty to the regime, expressed by indicators of approval of the political system, is accompanied by a low level of trust in political institutions (excluding the president) and by the awareness of the fact that ordinary citizens (as it was mentioned by 69% of respondents in 2023) cannot influence the government.

Actual political order is rather evolving towards a "neo-authoritarian" and personalistic, with the weakness of the party system, the underdevelopment of parliamentary institutions, the strengthening of presidential power, the pressure on independent media. Paradoxically but majority of Russians do not connect the activities of Putin with the course of the government and the socio-political situation.

We also analyze a persistently low level of trust in civil society institutions, which leads to an increase in social distances, and to political escapism.

1008

The Politics of Breaking Promises: A Comparative Analysis of Declining Promissory Legitimacy in Chile and South Africa, 2009-2018

Elizabeth Freda Soer[1], Rommy Roxana Morales Olivares[2]

1Max Planck Institute for the Study of Societies, Germany; 2Universitat de Barcelona, Spain

In both Chile and South Africa, neoliberal economic policies have remained resilient. This resilience is surprising not only because both countries have a history of strong socio-democratic social movements, but also because two governments came to power promising to implement more left-leaning policies in the post-authoritarian period. Accordingly, the paper will provide a comparative analysis of the "promissory legitimacy" of the Michelle Bachelet administration in Chile and the Jacob Zuma administration in South Africa. Jens Beckert coined the term "promissory legitimacy" to refer to "the support that political authority can derive from the credibility of the promises that political leaders make regarding the future states of the world." When authorities lose their promissory legitimacy, legitimacy crises can arise. We investigate how the Zuma and Bachelet regimes "talked left and walked right"

and attempted to maintain their promissory legitimacy while failing to deliver. In order to analyse this phenomenon, we conducted a quantitative text analysis of a total of 656 tweets concerning important events during both

administrations. Furthermore, we conducted 12 semi-structured interviews with some of these important actors to gain further insights. The preliminary finding of the paper is that the promissory legitimacy of the government declined. Accordingly, a narrative emerged that blamed inefficiency on the government's "mismanagement of the economy" instead of blaming neoliberal economic policies. Paradoxically, this narrative only strengthens the resilience of neoliberalism since it fits neatly within neoliberal discourses of governmental inefficiency.

RN33 | Women's and Gender Studies

RN33 | T01_01: Gender and Care Work

Feminisation of Care, the Case of the Elderly in Spain

Mª Isabel Pons-Sorolla Vázquez, Magdalena Díaz Gorfinkiel

Universidad Carlos III de Madrid, Spain

Care for the elderly is one of the main challenges facing today's societies. The ageing of the population, the incorporation of women into the public sphere, and urban development, are shared characteristics in Europe. Long-lived societies – and the resulting long-term care – represent a clear challenge not only for social policies, but for the respect of human dignity and the rights of individuals. It is necessary, not only to meet the basic needs of the growing number of older people, but also to preserve their rights, their fundamental freedoms and their autonomy. This approach must incorporate, among other variables, the issue of gender equality.

This presentation proposes to analyse the feminisation of care in the elderly population, based on the empirical material of the EDI Project. This feminisation is analysed from the dual perspective of those who receive care as well as those who provide it. It shows how feminisation of care has important consequences in people's living conditions from both approaches. Some of the phenomena that are analysed relate to areas such as access to care resources and the development of public policies, social support for paid and unpaid care activities, access to individual use of time and to social networks, and people's health conditions and satisfaction with their own lives.

Gender Division Of Unpaid Domestic And Care Work: Perceptions And Practices Of Immigrant Women In Portugal

Cláudia Casimiro[1], Estefânia Silva[2], Cristina Pereira Vieira[3], Janete Borges[4], Joana Topa[5], Mafalda Sousa[6], Paulo Costa[7], Sofia Neves Neves[8]

1Interdisciplinary Center for Gender Studies (ISCSP-ULisboa); 2Department of Social and Behavioral Sciences, University of Maia and Interdisciplinary Center for Gender Studies (ISCSP-ULisboa); 3Department of Social Science and Management, Open University and Interdisciplinary Center for Gender Studies (ISCSP-ULisbon); 4Department of Social and Behavioral Sciences, University of Maia and School of Health, Polytechnic of Porto; 5Department of Social and Behavioral Sciences, University of Maia and Interdisciplinary Center for Gender Studies (ISCSP-ULisbon); 6Faculty of Psychology and Educational Sciences, University of Porto; 7Department of Social Science and Management, Open University and Centre for the Study of Migration and Intercultural Relations (CEMRI/Uab); 8Department of Social and Behavioral Sciences, University of Maia and Interdisciplinary Center for Gender Studies (ISCSP-ULisbon)

According to statistics from various international organizations and scientific studies, the gender gap in unpaid work (domestic and care work) clearly shows the profound inequality between men and women around the world. On average, women spend three times as much time as men doing this type of work. If this is true worldwide, is it different in the lives of immigrant women? What are the perceptions and practices of immigrant women in Portugal, of Brazilian, Cape Verdean, and Ukrainian nationality, concerning unpaid work, and how do they articulate it with their professional lives? That's the research question that will guide the presentation based on the results of the thematic content analysis of 5 focus groups, recorded and transcribed in full, with 43 immigrant women. These focus groups were held in 5 different areas of Portugal as part of the BOOMERANG project: Study on the perceptions of the economic impact of unequal sharing of unpaid labour on the lives of immigrant women and men in Portugal (CIEG/ISCSP-ULisboa). The results will be presented according to four axes of analysis: 1) the type of unpaid work carried out by women; 2) the causes that underlie the unequal sharing of unpaid work; 3) the impacts of this unequal sharing on the lives of women; and 4) the strategies that could be adopted to mitigate and/or combat gender inequality at this level and its effects. The presentation will conclude by suggesting some specific measures that could inspire public policies to make it easier for these women to reconcile their personal, family, and professional lives and to achieve greater and more effective gender equality.

Caring Spaces: Women and the Geography of Voluntary Care Work in Newcastle Upon Tyne

Molly Jane Taylor

Newcastle University, United Kingdom

Questions of care are intrinsically linked to gender as an ordering principle. Drawing on an intersectional approach to the layered inequalities that women are made subject to in the urban environment, provisional PhD findings on the creation of collective communities of care for women in the city are discussed. The title of this paper is: 'Caring Spaces: Women and the Geography of Voluntary Care Work in Newcastle Upon Tyne' and it seeks to examine three key research questions: 1) How are the geographies of care work in Newcastle gendered? 2) What is the place of individual ethics in voluntary care work provision? 3) How can

affective geographies of care be understood intersectionally? Existing scholarship outlines that the voluntary sector is playing increasingly important roles in the delivery of services, many of which compound in the urban environment. Furthermore, a wealth of academic literature has examined caregiving and its gendered divisions. As such, this project worked collaboratively with volunteers at organisations in Newcastle that provide space, services or support for women in the local community through participant observation and creative practice focus groups. On the basis of this qualitative data, this research makes valuable connections between the positive impact of women's volunteer work to create spaces of care, and the extent to which the provision of such care space is reliant on the individual ethics of women volunteers. Preliminary findings suggest that the practice of community care building requires a dialectical analysis of the mutual dependencies of women in the community, and the impact of voluntary care work on those that provide it. This relies on an understanding of the ways in which emotions and spatial contexts intertwine to shape the landscapes of care and foster community bonds, through the care work that is provided for women, by women. These provisional findings support the need for a gendered, sociocultural approach to understanding geographies of care. This is a first-time ESA Summer School submission.

The Role Of Gender In (Care-) Work-Related Theories Of Practice Of Psychotherapeutic Teams

Ina Braune

Institut für Sozialforschung, Goethe-Universität Frankfurt a.M., Germany

Exhaustion and stress are widespread and diagnoses of mental illness have been on the rise since the 1980s. In public and scientific opinion, stress and strain associated with the changing culture of employment are attributed a central role in this increase in mental strain. These social changes like subjectification, digitalization and the increasingly precarious nature of work have gendered effects. In addition, the distribution of care work is also organized along gendered lines with women doing the majority of care work. At the same time, the practice of psychotherapy, which is responsible for the treatment of (care-)work-related psychological stress, is analyzed from a sociological perspective as individualizing the consequences of structural conditions.

In my paper, I will follow on from these connections between work, gender and psychotherapy in current society and examine the extent to which work-related gendered demands occur (in crisis form) among patients in psychosomatic acute hospitals in Germany. It shows how coping with these demands is addressed and interpreted by the staff and how the category of gender is (made) relevant in everyday clinical practice and in the action-guiding knowledge of doctors, psychotherapists, specialist therapists, social workers and nursing staff. The aim of the paper is to draw out a typology of action-guiding (gender) knowledge

in theories of practice of team members involved in the treatment of (care-)work-related psychological stress.

The paper is based on a qualitative research project funded by the German Research Foundation, in which interviews, group discussions and participant observations were conducted with psychotherapeutic professionals. It focuses on the sociological reconstruction of explicit and implicit (gender) knowledge using the documentary method developed by Ralf Bohnsack.

1011

RN33 | T01_02: Mothers

Reimaginations of Motherhood in the Neoliberal Era: Proposals, Tensions and Resistance from Feminism.

Carme Vivancos-Sánchez, Clara Camps Calvet

Universitat de Barcelona, Spain

In this research we investigate how the idea of motherhood is being reconstructed among women who participate in feminist spaces and assemblies in Barcelona. We explore the tensions that arise in women who embrace a feminist identity while navigating the complex neoliberal socioeconomic reality, an environment that exerts a significant influence on their personal and social development. The main objective is to see what is their discourse on motherhood, the proposals to overcome the heternormative and biparental model that emerge from feminism (and also their resistance) and the tensions they encounter with the ways of doing of the capitalism in its globalizing and mercantilizing phase. For this purpose, nineteen women who are not mothers and who are active in feminist spaces in Barcelona were interviewed. The context in which these feminist (re) imaginations of motherhood occur in Southern European societies is not only the neoliberal context (which will be discussed throughout the article) but also the context of the transformations of family dynamics and the crisis of care, and it is from this context that we study this reality. We start from the premise that the imaginary determines how reality is perceived through different mechanisms, such as practices and struggles in social movements, and that social constructions exert a powerful influence on the generation of realities and subjectivities

Nigerian Mothers in Higher Education Professions: Navigating Gendered Challenges and Cultural Dynamics

Mary Oluwatobiloba Odetoyinbo

Lancaster University, United Kingdom

Extensive research has been conducted in Europe and North America to understand the experiences of mothers in the higher education profession, but limited knowledge exists in other contexts, particularly in Africa and notably in Nigeria. Nigeria has unique socio-cultural practices of patriarchy and strict adherence to traditional gender role divisions. The discussions around gender in higher education professions have brought attention to the challenges that women face in advancing at a similar pace as their male peers. However, these conversations have not fully explored how women's experiences with maternity and motherhood intersect with workplace norms and how they navigate these complexities in their careers. This qualitative phenomenological study draws upon Acker's (1990) Gendered Organization framework to explore the experiences of female academics in Nigeria during pregnancy, maternity, and return-to-work. The study aims to understand how mothers in academia manage and navigate the world of academia and motherhood and the implications of this on their career prospects and outcomes. It delves into how cultural norms and practices shape the career trajectories of women and how societal expectations surrounding women and mothers impact and perpetuate gendered processes in the workplace. The examination aims to add to the existing knowledge in Management and Organisation Studies, specifically regarding the experiences of women in understudied contexts such as Nigeria. The findings of the study aim to demonstrate the need for Nigerian academia to proactively accommodate maternal identities while ensuring that women are not unfairly disadvantaged due to societal expectations surrounding motherhood and caregiving.

The 'Drip, Drip, Drip of What People are Actually Saying': Subtle Sexism Against Working Mothers in UK Work Settings

Yvonne Ehrstein

Aberystwyth University, United Kingdom

1012

Having children continues to raise doubts about women's job commitment and performance in the contemporary UK workplace. Penalising women for being mothers, workplace cultures persistently foreground mothers' perceived commitment to paid work as lower than of those who more closely resemble the wholly committed 'ideal worker'. Drawing on 27 in-depth interviews with mothers working in both the private and public sector in the UK, this presentation sheds light on the operation of a new form of sexism at work. Existing outside of anti-discrimination legislation and affecting women after pregnancy and breastfeeding, such sexism is i) motherhood-based rather than gender – or pregnancy-based, and ii) subtle rather than explicit or overt. I argue that such subtle forms of everyday sexism against working mothers have come to form part of the 'inequality regimes' (Acker, 2006) within contemporary organisations. The interconnected practices, processes and interpersonal encounters that re/produce subtle sexism within organisations take a range of shapes including day-to-day comments and questions from colleagues and employers such as 'Who is looking after the children?' or 'How will you cope with these children?'. These work as constant and unsolicited 'reminders' of women's presumed primary caregiver role, which is seen as being in conflict with the responsibilities of a committed 'ideal worker'. While the ambiguity and low visibility of such subtly sexist interactions and events contribute to impeding the possibilities for change, I also draw attention to how some women resist and challenge such sexism through calling its appropriateness and legitimacy into question. I discuss the link to severe consequences for women's careers such as limited opportunities, participation and failures to gain promotions — and possible changes.

Am I Adult Enough to Have a Room on my Own? Mothers' Experiences of Spatial Transformation in Polish Empty Nests

Marianna Magdalena Kostecka[1], Magdalena Anita Gajewska[2], Magdalena Żadkowska[2], Magdalena Herzberg-Kurasz[2], Bogna Dowgiałło[2]

1Adam Mickiewicz University, Poznań, Poland; 2University of Gdańsk, Poland

The arrangement and experience of the family home is influenced by a number of factors, of which gender dynamics in the household remain one of the crucial orders. Deborah Tannen (1990) argues that paternal authority is associated with power and control in the household. Scholars such as Allen (1996) and Madigan et al. (1990) have also examined the relationship between domestic privacy, prevailing gender ideologies and family roles.

In Polish society, there is a tension between traditional expectations of women as mothers and the developing emancipatory approach to women's roles (Budrowska 2000; Korolczuk 2012). This tension extends to control over the home, its functions and spaces, and the reorganisation of personal space (Gajewska et al. 2023).

Our aim is to highlight the challenges and ambivalence experienced by Polish mothers during the transition into empty nest (Żadkowska et al. 2024; de Singly 2021). We propose to analyse the entry into a new phase of motherhood and womanhood in the context of their homes (cf. Woroniecka 2014; Herzberg-Kurasz 2023).

Drawing on 42 dyadic and 42 individual qualitative interviews conducted in Poland, we explore the women's emancipation through the processes of gaining private place. Spatial attitudes and everyday practices serve as a compass, revealing the reconfiguration of the mother's role. The most striking change is the decision to have a personal bedroom or study. Alongside this, we have also identified more subtle practices that enhance privacy and intimacy. New uses of shared spaces and new rituals, such as long baths or lounging on the sofa, create comfort and relaxation in women's places.

RN33 | T01_03: Intersectionality

Postcolonial intersectionality. Rethinking Intersections of Race and Gender in the Colony and the Postcolony

Sofia Aboim

Universidade de Lisboa, Portugal

Colonial regimes invested in the construction of systems of racial classification. These social categories of difference carefully manufactured the dichotomy between coloniser and colonised, out of which empire and its racial hierarchy took shape. Racial categorisations emerged from this constant work of politically legitimising colonial violence. Postcolonial scholarship has long emphasised the colonial dimensions of race, racial hierarchies and classifications. A second critical approach emerged from intersectionality theory, first developed in the United States in the 1990s as a way of addressing the long-term consequences of the US experience of slavery and forms of categorisation. Although both perspectives share a critical approach, there has been little conversation between intersectionality and postcolonialism. This paper seeks to fill this gap by developing the notion of postcolonial intersectionality. Despite the success of a 'Southern critique' of hegemonic knowledge systems (Connell, 2022), further efforts are needed to decolonise sociology. Thus, rather than arguing that the intersections of race, class, gender or sexual orientation are rigidly interlocked, the paper defends a postcolonial model of race and gender categorisation. The empirical case of colonial and postcolonial Mozambique will inform our undertaking. Focusing on the life stories of Mozambican men and women who migrated to South Africa from the 1950s onwards, the paper examines colonial and postcolonial intersections of gender, migration, (post)colonialism, capitalism and socio-economic inequality in Southern Africa. It examines how individuals, past and present, navigate the different racial and gender systems constructed under the rule of the British and Portuguese empires.

1013

#MeToo Movement Goes Local: Assessing Intersectionality in the Portuguese Context

Célia Taborda, Ana Sofia Pereira, Carla Cerqueira, Priscilla Domingos

Universidade Lusófona, CICANT, Portugal

In recent decades, feminist movements have taken on a hybrid form, manifesting both in digital spaces and face-to-face interactions. Notably, the #MeToo movement exemplifies this phenomenon, supporting the existence of a purported fourth-wave activism characterized, among

other things, by a renewed focus on intersectionality – that explores the intersecting facets of identity, such as gender, race, class, age, and nationality, to expose various exploitations and oppressions (Crenshaw 1989, 1991) –, and the use of digital technology (Chamberlain, 2017; Cochrane, 2013; Munro, 2013; Rivers, 2017). Founded in 2006 by african-american activist Tarana Burke to address sexual harassment and violence against black women, #MeToo gained global attention in 2017 when Hollywood actress Alyssa Milano popularized the hashtag on Twitter, sparking a viral movement. However, as #MeToo transcended borders, it seems to have shifted away from its empathetic, intersectional roots to become predominantly associated with white feminism.

Through a qualitative close reading and hermeneutic analysis of 828 news pieces from eight leading national newspapers and magazines, this research seeks to understand the Portuguese version of the #MeToo movement. With an emphasis on four axes of oppression – race/ethnicity, class, age, and nationality – the study examines whether Portuguese #MeToo reflects intersectionality.

Our findings reveal a lack of intersectionality within the Portuguese iteration of #Metoo, primarily driven by media coverage centered on national public figures, sidelining diverse voices. Nonetheless, additional research is needed to fully understand changing intersectional dynamics and assess how inclusive the Portuguese #MeToo movement can be.

Intersectional insights into the practice of Obstetric Violence in Portugal: subjectivities of racialized Brazilian bodies

Mariana Holanda Rusu[1], Conceição Nogueira[1], Joana Bessa Topa[1,2,3]

1Faculty of Psychology and Educational Sciences, University of Porto, Porto, Portugal, Portugal; 2University of Maia, Maia, Portugal; 3Department of Interdisciplinary Gender Studies, University of Lisbon, Lisbon, Portugal

Social and gender studies have given space to discuss the main characteristics of daily care during the pregnancy and puerperal cycle and understand how practices of obstetric violence are faced, due to the specificity of the event that involves the female body. Characterized as gender violence, as it is directed at women, seen as objects of a patriarchal society, prone to shame, alienated from their bodies and programmed to be passive. Objects of exploitation and domination, practices of obstetric violence limit female autonomy, preventing women from making their own choices, considering them an inferior being, incapable of discerning what is appropriate for the health and well-being of themselves and of your child. The present communication aims to critically analyze the obstetric violence that still punctuates obstetric care in the Portuguese context with a technocratic model and practices of objectification of the racialized Brazilian body that are justifications of knowledge and power that act as interpretive operators and manufacturers of bodies, these bodies who carry experiences, giving place

to the perceived object, representing values and social attitudes that support them in their experiences, go through processes of dehumanization through the articulations of gender/race/class/ethnicity/sexuality, suppressed in most approaches to gender built from a place of white and western privilege. Therefore, the interest is to bring realities that are still invisible and that produce more vulnerabilities and violations in relation to social life and in relation to subjectivities, problematizing relationships that interconnect with specific identity belongings such as being a woman, Brazilian and racialized.

Locating Subjectivities of Asylum-Seeking Women: Feminist, Intersectional and De-Colonial Perspectives

Evangelia Tastsoglou

Saint Mary's University, Canada

This paper derives from an empirical study of asylum-seeking women survivors of gender-based violence arriving through the Eastern Mediterranean route to Greece in the second decade of the 21st century. Through qualitative, in-depth interviews of 20 key informants and 35 asylum-seeking women arriving from diverse African and Middle-Eastern countries, the journeys to "safety" in the EU are being focused to investigate and interrogate the ways in which the agency and resilience of these women defies stereotypical "Northern" assumptions about gender and refugees of generalized or gender-based violence. Non-conventional narratives, with unexpected twists in harrowing journeys, camps and transit spaces or "settlement" in urban jungles are foregrounded and analyzed to reveal the humanity and subjectivities of asylum seekers who are neither passive victims nor heroic survivors, as stereotypically portrayed in the global "North." Using feminist, intersectional and de-colonial perspectives asylum-seeking women in Greece are presented as human beings, sometimes fighting and resisting, but also aquiescing, negotiating, connecting with others and forming alliances, making strategic choices under highly constraining circumstances and limited options, adapting and changing themselves in the process. Instances of racism and legal status discrimination are considered from the viewpoint, experiences and identities of women while their intersections with gender and social class are discussed.

RN33 | T02_01: Care Work: Transformations and Challenges

The Future of Care Work: Some scenarios.

Lise Widding Isaksen, Lena Näre

University of Bergen, Norway

To be cared for is an essential physical, social, and emotional need, not only for individual people, but also for societies. For several decades, however, complex processes leading to stagnating welfare services, increasing marketization of care, demographic ageing have led to a situation in which care has become a 'scarce commodity' and care work increasingly precarious and undervalued.

This situation is described as a care crisis and/or a normalization of neo-liberal welfare policies.Are there alternative ways to think about future developments of care?

Can responses to 'scarce commodities' bring possibilities to think differently on the future of care work? We think there is a need to connect sociology of care and welfare to the sociology of futures and argue that sociology can and should be more directly involved in claiming what futures might be, should be and in materialising these claims.

We discuss three scenarios 1) digitalization and new health care technology as a response to 'scarce care resources' 2) global care chains, global solutions to local problems and 3) care commons as a prefigurative image of how the future of care work can be.

Particularly, we will discuss how the commons of care is a metaphor that can be lifted up as an image of a future welfare state where people create and recreate care resources, and care resources are just as important as air, water, soil, fish, agriculture etc. Here we are talking about public resources, society's shared sources of care which are created in relationships in interaction between the local norms and values about the use of resources.

Rethinking Care. A Qualitative Study of Young Women's Feminist Activism in Argentina (2015-2022)

Anna Bednarczyk

Polish Academy of Sciences, Poland

With my presentation, I aim to reflect on when and how the concept of care emerged in young women's biographies in the context of feminist mobilizations in Argentina between 2015 and 2022. The massive character of the Ni Una Menos movement and the great victory of the National Campaign for the Right to Legal, Safe, and Free Abortion, preceded by years of grassroots activism, impacted the way young women in Argentina reconceptualize and rethink care and

care work. One of the directions of reconceptualization of care is theorizing the concept of collective care and rooting it in empirical material.

I am inspired by Miriam Ticktin's work which distinguishes collective care from the liberal understanding of care as welfare or humanitarianism. She argues that welfare limits care to the provision of services by a state, humanitarianism, on the other hand, tends to create hierarchies by using ambivalent moral values like comparison, pity, or sympathy (2021). She urges to search for new conceptualizations of care that challenge structures of power and have transformative potential.

Based on sixteen months of ethnographic fieldwork in Córdoba, the second-biggest city in Argentina, and thirty semi-structured interviews with young women I explore various instances of care in my interlocutors' biographies. I then propose a definition of collective care that derives from the experiences of young women involved in political mobilizations around women's rights. I analyze five key elements of this definition and the way they interplay with the everyday experiences of transition from childhood to adulthood.

Transformations and Continuities in the Discourses on Care in the Context of COVID-19.

Sandra Obiol-Francés[1], Jordi Bonet-Martí[2], Jokin Azpiazu Carballo[3]

1University of València, Spain; 2University of Barcelona; 3University of the Basque Country – UPV/EHU

In recent years, different discourses have appeared in the social imaginary (care as a collective responsibility, self-care, the vindication of care work, etc.) that aimed to articulate a rights-based response to the care crisis affecting our societies. However, with the outbreak of the COVID-19 pandemic and the associated social distancing measures, these emerging discourses came into contradiction with the official discourses based on the hegemonic medical model, which promoted individual responsibility and the return of the responsibility of care to the home. In this paper, we propose a feminist analysis of how the impact of COVID-19 has led to a transformation of discourses on care, especially those that appeal to new ways of understanding and organizing care. To this end, we based our study on the sociological analysis of the discourse system of a corpus of 30 in-depth interviews with women with care responsibilities in the home in different parts of Spain. The purpose of these interviews was to find out how they had organized care in their homes before, during, and after the pandemic. The analysis allows us to identify the permanence of the most traditional discourses on the organization of care that coexist – often in conflict – with discursive references to new ways of covering this care, especially in those women with higher cultural capital.

1015

Pandemic And Times Of Care: Changes And Permanencies

Isabel Nadal Amengual[1], Carme Vivancos Sánchez[2], Marta Luxán Serrano[3]

1Universitat de les Illes Balears (UIB); 2Universitat de Barcelona (UB); 3Euskal Herriko Unibertsitatea (UPV/EHU)

We start from the idea that the pandemic have highlighted the consequences of the commodification of public, collective and solidarity-based spaces on common life (Fraser, 2014), accelerating and aggravating social processes that were already taking shape (Comas, 2023; Luxán et al., 2023). In terms of the social organisation of care, while in some cases confinement allowed more time to be devoted to care and led to a "rediscovery" of the home as a safe environment and of care as a restorative and satisfying activity, in others it constituted a "new crisis of care" (Moré, 2020). Thus, as on so many other occasions of emergency, women's time, work and bodies withstood the situation and sustained everyday life (Sagastizabal and Legarreta, 2023). We investigate the articulation of the times before, during and after the pandemic based on the narratives and life stories of 29 women with care responsibilities in the territories of the Basque Country, Catalonia, the Balearic Islands and the Valencian Community, carried out within the framework of the RESCUPAN R&D project (PID2020-118801RB-I00). We pay special attention to families in more critical situations, such as single-parent families, since they experienced more stress, fatigue, family overload, lack of time for self-care (Carbonero et al., 2021) and, especially, difficulties to count on community support, social or family network that, prior to confinement, could mitigate and improve their realities (Brey et al., 2023). We delve deeper into the changes that the pandemic may have brought about as a possible relevant element for the greater visibility and social recognition of care.

RN33 | T02_02: Work-Life Conflict

The Bigger Half: Spousal Relative Housework And Gender Deviance Neutralization

Joanna Syrda

University of Bath, United Kingdom

Gender is by far "the most reliable determinant of time in housework" (Kroska, 2004) among heterosexual couples. In general, regardless of income, education, ideology, or extent of paid employment, women tend to do far more domestic labour than their male partners. Using Panel Study of Income Dynamics (PSID) 1999-2019 dataset this study investigates the role of traditional gender identity norm

First, I show that the distribution of the share of housework done by the husband exhibits a sharp drop to the right of 0.5, where husband's housework exceeds wife's domestic labour. This discontinuity and concentration is a puzzling pattern as standard economic models of marriage cannot account for this distribution. I formally test the impact of traditional gender identity norm and 50-50 sharing rule as departures from model predictions about spouses' housework and leisure time.

1016

Much of previous research focused on spousal relative income as a dimension where gender deviance occurs to be compensated via housework. I show that it is spousal relative housework itself, where norms are constituted and enacted, as spouses significantly adjust their housework to follow traditional gender identity.

While previous research has focused on neutralization through housework of gender deviance in the dimension of spousal relative income, this research shows that it is housework division itself where traditional gender identity norms exist and shape the behaviour of wives and husbands. Specifically, I identify an aversion to a situation where a husband spends more time on domestic labour than the wife.

"I Am Rather Organized, And I Like to Have a Finger in Every Pie". Gendered Constructions Around Work-Family Conflicts in Iceland.

Andrea Hjálmsdóttir[1], Valgerður S. Bjarnadóttir[2]

1University of Akureyri, Iceland; 2University of Iceland, Iceland

This study aims to explore gendered discourses around arrangements and decisions in relation to domestic chores and childcare among working parents in Iceland. Over the last decades, men's involvement in childcare has increased

and men's attitudes towards gender equality have become more egalitarian. However, men's participation in household chores has not kept up with increased labour force participation by women. We specifically turn our focus on the gendered constructions around work-family conflicts, time, and care work within the walls of homes.

We draw on semi-structured interviews with 16 participants, both fathers and mothers, in heterosexual relationships. The interviews were conducted in the spring of 2022, after all social gathering restrictions because of COVID-19 pandemic were lifted. The intention was to follow up on the situation caused by the pandemic, not least as work-family conflict became a current topic in public debate during the pandemic.

The findings indicate that intensive care-work was shouldered by the mothers, reflected both in the mothers' own descriptions of their everyday realities, but also in the fathers' accounts of their own involvement and priorities in caring for their children. The findings point to differences in immediacy of time, both in terms of work and private life. That not only applied to care-work during the pandemic, but also during normal times, revealing the dominance of traditional gender roles among the parents and families represented in the study. Further, the study unveils how structural roots of inequality and gender norms is masked by the language of individual choices and responsibilities.

Work-To Family Conflict Or Family-To Work Conflict? Variations In Work Family Conflict On Women's Mental Well-Being By Class

Berglind Hólm Ragnarsdóttir[1], Valgerður S. Bjarnadóttir[2], Andrea Hjálmsdóttir[1]

1University of Akureyri, Iceland; 2University of Iceland, Iceland

In this presentation we report findings from a study where we estimate the effect of work-family conflict on women's mental well-being and explore whether that relationship is contingent on class. Prior research finds that high levels of work-family conflict negatively impact women's well-being. However, most research concentrates on women of high socio-economic status. Variation in the effects of work-family conflict across socio-economic class has been understudied. Moreover, most estimates of work-family conflict do not distinguish between the differing effects of work-to-family conflict and family-to-work conflict, two directional components of work-family conflict that have different antecedents and consequences. We use data from a cross-sectional phone survey conducted on a sample of Icelandic women in spring 2022. Key findings include: i) work-to-family conflict and family-to-work conflict both have a direct effect on symptoms of anxiety and depression for all women, ii) when we introduce the interaction term for class we find that work-to-family conflict increases symptoms of anxiety and depression across the class spectrum, but, iii) the effect of family-to-work conflict is contingent on class position. Working-class women are more likely to experience symptoms of depression and anxiety

due to family-to-work conflict than women of intermediate or salariat class. These findings underline the importance of including class-structures in research on work-family conflict and not ignoring class disparities in women's resources and barriers when it comes to juggling work and family. Moreover, these findings demonstrate the need to consider both work-to-family conflict as well as family-to-work conflict in research on work and family.

Household Labour and Changes of Gender Regime in Post-Transitional Croatia

Inga Tomic-Koludrovic, Mirko Petric, Augustin Derado

Ivo Pilar Institute of Social Sciences, Croatia

Although the socialist gender regime has been frequently thematised in the post-socialist discussions on the position of women in the former socialist states, they have often revolved around theoretical and normative issues. In some areas, these discussions have been scarcely backed by empirical evidence. For instance, in the former Yugoslavian republic of Croatia, in an area highly important for the understanding of gender asymmetry, such as household division of labour, there had been very few empirical data for the socialist period. In the post-socialist period, however, there exists by now a relatively rich – albeit predominantly quantitative – body of empirical data on different aspects of the gendered division of housework.

This paper uses qualitative data obtained from 23 semi-structured partner interviews to identify how women and men in post-transitional Croatia describe and perceive the division of work in their households, as well as to attempt to contextualise these descriptions into wider matrices of gender relations. In data analysis, we applied reflexive thematic analysis (both semantic and latent), discourse tracing (Le Greco and Tracy, 2009) and the "household portraits" perspective (Doucet, 1996). Starting from the premise that gender regimes are "complex systems of inequality, which vary over time" (Shire and Walby, 2020), as well as that "several regimes may coexist in the same period" (Lett, 2012), we have identified three matrices of gender relations in the division of housework: the transformed traditional, the transformed socialist and the post-socialist.

RN33 | T02_03: Gendering Academia

Beyond Merit. Women's Paths Towards the Position of Full Professor. The Voice of Italian Female Academics

Marianna Filandri[1], Silvia Pasqua[1], Anna Uboldi[2]

1Università di Torino, Italy; 2Università Bocconi, Italy

The study investigates the career paths of Italian women towards the position of full Professor.

We conducted 34 discursive interviews with female academics of STEM and SSH disciplines (chemistry and economics sectors, Miur register) from universities in central, northern and southern Italy. The women united by having reached the qualification stage, but differentiated by grade and career path.

A consolidated line of research highlights the persistence of a significant disadvantage of women in Italian academic careers. It also shows how this gap refers to structural dynamics of discrimination.

We examine how female academics make sense of the obstacles and opportunities that shaped their careers, and how they interpret everyday dynamics through, or not, the lens of gender inequalities. Within a common framework of general recognition of both forms of everyday sexism and conciliation problems, different discursive and practical strategies can be seen, aimed at facing, naming and giving meaning to the difficulties encountered. Reproductive modalities of gender inequalities are also identified, which refer to different processes of tacit adhesion to an unfair social order. We identify five ideal types that cuts across the STEM and SHH: a-problematic optimists, (a)problematic acquiescents, ambivalent moderates, radical critics, and resigned critics.

The study shows how gender inequalities are produced and inherent in the same academic 'conditions of work', permeated by a hegemonic male and neoliberal value system.

Playing the Game to Get Playtime: Creativity, Competition and Desire in Norwegian Academia

Amund Rake Hoffart, Juni Katrine Lie

University of Oslo, Norway

In this paper we explore the tension between academic competitiveness, hierarchies and institutional demands, on the one hand, and the desire for knowledge, creative flow and exploration of intellectual interests, on the other hand. The empirical foundation of our study is based on 45 open narrative interviews with researchers at various phases of their academic career: PhD-students, postdoctoral fellows and professors in the humanities and social sciences at a larger research university in Norway. Our study is part of a larger research project investigating transformations – in the form of a potential remasculinization – in academic culture, knowledge production and governance within the context of "audit culture" and "corporate academia." We engaged with the interview transcripts using depth-hermeneutic method associated with Alfred Lorenzer (Hollway & Volmerg 2010) and were particularly attentive to ambivalences and tensions in the research participants' stories about everyday life in academia. The stories, in particular, revealed a tension between creative intellectual pursuits and the strategic priorities required in contemporary academia. This paper explores these tensions by drawing on feminist readings of Pierre Bourdieu, and specifically the notion of illusio – "the fact of being caught in and up by the game" (Bourdieu 1998: 77) – to illuminate different motivational forces spurring researchers' affective investment in the academic field. We are particularly interested in experiences of the creative process and what hinders or enables researchers to experience glimpses of undisturbed intellectual pursuits – which we refer to as "academic play time". We suggest that, paradoxically, playing "the game" (Bourdieu 1998:80-81) of academic competition and positioning is a key part of experiencing glimpses of unhindered academic playtime.

Gender Equality Plans In Italian University: A Challenge To Change Gender Perspective And Order In Academia Through Students' Training

1018

Marta Scocco, Melanie Sara Palermo, Isabella Crespi

University of Macerata, Italy

Gender Equality is based on the right of all human beings to "equal rights, freedoms and opportunities", a condition that today is still not achieved in the European Research Area and in the HED sector in general. Women are still under-represented in university governing bodies and at various levels of university decision-making. This lack of gender issues' visibility has also occurred in curricula and educational content with a potential impact on students and younger generation's social construction of gender. Although most Universities in Europe have already drafted a Gender Equality Plan – GEP, which constitutes an effective tool for initiating change and addresses various manifestations of gender inequality, it is crucial to move from a "tick the box" approach to the utilisation of the potential of such a dynamic document is paramount. This is the main aim of the European project Pro-Gendering which, thanks to the collaboration of partner universities, intends to change organisational cultures by raising awareness and motivating the academic community, including students, to engage and take initiatives to promote gender equality. Using the qualitative (GEP comparative analysis and interviews) and

quantitative (online survey) data collected in the project's research activities, this contribution discusses potential implementation for those actions that these official documents specifically address to students. Strengthening the capacity of universities to build inclusive educational communities also through the provision of know-how for the implementation of GEPs and the education of university students on GE are key objectives for the development of an increasingly inclusive future society. Suggested Topic: The Social Construction of Gender.

Gendering Academia in Italy. From Gender Imbalance to Gender in Balance

Barbara Poggio[1], Naldini Manuela[2]

1University of Trento, Italy; 2University of Turin, Italy

Why do women in universities remain underrepresented in academic careers and governing bodies? What are the obstacles and processes that make it more difficult for women to enter the academy permanently and reach apical and leadership positions? What policies are needed to eliminate these disparities?

These questions are addressed through qualitative and quantitative data collected as part of the national project "GEndering Academia" (GEA – https://www.pringea.it/), focused on gender asymmetries in Italian academia. The project, funded by the Ministry of Education, University and Research, analyzed academic careers and working conditions of young researchers and professors in SSH and STEM disciplines in 4 different Italian universities. By considering recent transformations in the university system and making use of different levels of analysis and a "mixed-method" approach, the research offers an articulated picture of gender inequalities in the academia and the processes reproducing them, visible both in the persistence of traditional gendered practices and patterns and in recent neoliberal changes in university, characterized by an increasing emphasis on productivity and excellence, as well as increased job insecurity.

Drawing on the main findings of this research, the paper focuses on possible intervention strategies to promote greater gender balance within academic settings. It will outline some of the main policy areas analyzed in the national study that emerge as most relevant to removing gender inequality and discuss how such policy interventions might be integrated within the existing suvra-national (EU) and national system of promoting gender equality, from gender budgets to GEPs (Gender Equality Plans).

RN33 | T03_01: Gender Inequalities and Institutions

Gender Asymmetries in Research and Innovation Institutions: Challenges and Potential to Address "Gender Fatigue" and Promote Sustainable and Effective Gender Equality Plans

Arianna Santero

University of Turin, Italy

Gender Equality Plans (GEPs) in public and private work organizations have become increasingly important, particularly considering the persistent gender imbalances in the labor market, which have been exacerbated during the pandemic. European efforts to ensure GEP adoption in universities and research centers applying for H2020 funds, as well as the National Strategy for Gender Equality introduced by the Italian government, based on the European Strategy for Gender Equality, have highlighted the significance of GEPs. However, studies on the enactment of these plans are still limited, particularly in small research centers.

This paper aims to identify the challenges, limitations, and potentials of implementing Gender Equality Plans in research centers in Italy. This will be achieved by analyzing the international theoretical discourses on this topic through a literature review on GEP implementation and impact, and by identifying successful strategies utilized by Italian organizations through 10 interviews with key informants about advancement perspectives from stakeholders. The analysis involved three key steps: 1) detecting and monitoring gender imbalances; 2) raising awareness of gender asymmetries; 3) promoting well-being by designing innovative solutions. Among the best practices, particularly for promoting work-life balance, the article notes the construction and integration of qualitative-quantitative tools to detect gender asymmetries, the use of participatory methods, and the definition of shared, context-specific goals and actions with a phased approach to incentive identification. Finally, the paper discusses certain factors that might encourage initiatives to endorse substantive equality and diverse perspectives within research and innovation careers from an intersectional and women's studies approach.

1019

The Role of Residential Care Institutions in Combating And/Or Perpetuating Gender Inequalities: An Inquiry On Gender Knowledge And Practices In A Portuguese Residential Care Institution

Daniela Balby Santa-Marta, Sandra Palma Saleiro, Sandra Gomes Mateus

Iscte-iul, Portugal

Although little is known about gender in the institutional residential care contexts, evidence shows that girls are more dissatisfied with institutional residential care, due to the low prioritisation of their specific needs. There is a lack of studies that takes gender as a relevant aspect to understand the experience of children and young people in care. Gender transformative education implies an integrative approach to education, ranging from laws and public policies to pedagogies, training content and the professional and personal practices of all those directly and indirectly involved in the education and socialisation of children and young people of all genders. As a byproduct of the Erasmus+ project Space4us, which focused on empowering girls living in care, research was carried out to understand the role of residential care institutions in addressing gender inequalities. Seven semi-structured interviews were conducted, with professionals responsible for the educational and care strategies and practices of young people in a residential care institution, and later analysed using content analysis. The results of these study indicate that, despite the attitude of openness, acceptance and adaptability to diversity, gender is not considered a differentiating aspect of the reality of the children and young people in care and is therefore ignored as relevant to the institution's professional training and the construction of educational and intervention strategies. A gender-blind approach prevents the identification of the specific characteristics and needs of girls and boys, which has implications for collective and individual intervention in the fight against gender inequalities.

The Agency and Leadership of Pious Lithuanian Catholic and Lutheran Women: Challenging the Dichotomy of the Religious and Secular

Morta Vidūnaitė

Vytautas Magnus University, Lithuania

The secular is often presented as rational, progressive, and associated with public and male sphere, while the religious is seen as irrational, backward, and associated with private and female sphere (Asad 2003; Knibbe and Bartelink 2019). Nevertheless, the relationship between the two is a boundary zone that is heavily contested (Beckford 2003). The "secular" and "religious" concepts of agency reflect this dichotomy influenced by classical secularization theory (Beckford 2003; Woodhead 2003, 2008).

There has long been a perception that secular people have the most agency and religious women have the least (Mack 2003). Feminist theory has used the notion of false consciousness to describe religious women and has associated agency with female emancipation, liberation, and resistance (Mahmood 2005). From a secular liberal point of view, agency lies in individual autonomy and freedom (Giddens 1976, 1984).

More recently feminist scholars have acknowledged that pious women might have goals other than feminist ones, such as piety, morality, the observance of religion, care for others, fulfilling relationships, etc., and their agency can exist even in their subordination to patriarchy (Abu-Lughod 2002; Avishai 2008; Davidman and Greil 1994; Mack 2003; Mahmood 2005; Orsi 1997; Ozorak 1996).

Based on the open and modal concept of agency (encompassing both religious goals as well as secular, liberal, and feminist ambitions) and semi-structural qualitative interview data (2022-2024), the presentation explores, how religion provides the pious Lithuanian Catholic and Lutheran women with agency for leadership in church, career, family and elsewhere, challenging the dichotomy of the religious and secular.

Empowerment and Agency: Women's Pilgrimages to the Hasidic Destinations in Poland and Ukraine

1020

Alla M. Marchenko

Hebrew University of Jerusalem, Israel

This research is focused on agency and empowerment of women who travel to the Hasidic destinations in Poland and Ukraine. Empowerment, seen as an individual process of obtaining power, is linked to agency, which is the ability to act. Both are embedded in and influenced by sociocultural contexts. Religion is often perceived as burden, another structure of male domination over women. However, religious women find sources of agency and empowerment in their religious beliefs and rituals (El-Or 2006, Taylor-Guthartz 2021). How do women's pilgrimages to the graves of righteous people (known as Hasidic destinations) in Poland and Ukraine contribute to empowerment and agency? What are the most important aspects of empowerment, in this context, and what do they unveil in women's relations to their communities?

It is possible to differentiate four approaches to empowerment of women connected to religious domain of life: avoidance (Rosenberg et al. 2019), resistance (Israel-Cohen 2012), inventing new rituals (Neriya-Ben Shahar 2018) and active engagement (Avishai 2008). Based on qualitative interviews and observations of two most popular destinations (Leżajsk in Poland, Uman in Ukraine) in 2023 and 2024, research results discuss aspects connected to inventing new rituals and active engagement. Specifically, these are: strengthening religious beliefs, sisterhood, controlling internal subordination system, caring connection and exposure to diversity. While mentioned aspects of

empowerment are intertwined, there are certain linkages of these aspects to both destinations of pilgrimages and social status (including religious and family status, age and education) of female pilgrims.

RN33 | T03_02: Gendered Spaces and Services

Gendered Structures of Spatio-Temporal Dynamics Experienced by Young Women: Feeling (Un)safe in Urban Spaces of Ankara

Cansu Okan

Ankara University, Turkiye

This study examines young women's everyday urban experience in Ankara in relation to fear of crime and feelings of safety. Within the discussions surrounding gender inequality in urban space, scholars contend that the configuration of urban spaces, shaped by power dynamics, significantly influences the social interactions occurring in public spheres and contributes to the (re)production of inequalities within the city. Indeed, the gendered structures of cities which are laden with patriarchal norms have influenced and restricted women's access to, and participation in, public space. Gaining a comprehensive understanding of how women resist and contest the prevailing limitations and exclusions within the city first requires examining how they experience the gendered structures of urban space. At this point, fear of crime and feelings of safety emerge as important aspects of young women's urban experience. Following Ahmed (2004), this study focuses on how fear of crime and perceptions toward safety are experienced in a way that affects the daily lives of young women. Consequently, this study aims to understand how young women experience the gendered structures of spatio-temporal dynamics in Ankara, an important case which presents the struggle between the republican aims of modernization, and conservatism in Turkey, through their own narrations and expressions. Based on the in-depth interviews carried out with 52 young women residing in different parts of the city, this qualitative research also delves into the factors cited by these women as influential on these perceptions and opinions, namely socialization, past experiences, and news and media.

1021

Rights And Access To Sexual And Reproductive Health Services For Sikh Punjabi Women Living In The Lisbon Metropolitan Area

Teresa Mamede

Iscte – Instituto Universitário de Lisboa, Portugal

Over the last two decades, the concept of women's empowerment has become ubiquitous in the development agenda and it's interdependence with sexual and reproductive health (SRH) has been affirmed, since the control of

women's reproduction and sexuality is recognized as one of the most harmful forms of women's subjugation. While the effects of women's empowerment on SRH have been studied extensively, there are still knowledge gaps regarding its relationship with the migratory context.

Based on a case study, our aim was to understand the impact of the empowerment of Sikh Punjabi women living in the Lisbon Metropolitan Area on their access to and use of SRH services, through their perceptions, practices, experiences and expectations. With a qualitative approach based on direct and participant observation and 13 semi-structured in-depth interviews with Sikh Punjabi residents and stake holders from health and migration fields, we sought to shed light on this understudied community in Portugal and contribute to improving healthcare services.

It was found that the problems identified in the use of SRH services are fairly homogeneous, although they are not always characterised by negative experiences. The main criticisms directed at the National Health Service include difficulties in scheduling appointments at Health Centers, the time gap between booking and the appointment date, the lack of detail on the part of health professionals during the diagnosis phase, and, notably, the challanges in effective communication with professionals.

Despite the pernicious effects of the barriers encountered, we have seen that Punjabi Sikh women have not been deterred from their conviction that they have the right to quality healthcare. The strategies implemented demonstrate the potential for fostering a process of collective empowerment.

Hungarian Women in Architecture – Tendencies, dynamics and prospects

Júlia Böröndy

ELTE Eötvös Loránd University, Budapest, Hungary, Hungary

Stereotypes suggest that architecture is a profession for men, but trends in the male-female ratio regarding university enrollment and graduation seem to prove this wrong.

The first part of the research is based on a longitudinal analysis through the review of archival documents and a digital database. The results reveal how female representation changed at the Budapest University of Technology and Economics Faculty of Architecture (the main architectural school in Hungary) during the period between 1941 and 2023. Although the gender ratio became balanced in the 2000s, furthermore, the tendencies of the last few years indicate the feminization of the profession; women are still nearly invisible: only a few or none of them are listed as laureates of architectural awards, as the leading designers of buildings published in journals, or as members of competition juries. This phenomenon is addressed in the second pillar of the research, which includes focus groups to examine the underlying factors, such as the incompatibility of women's unpaid caring work with the common long-hours culture, the questioning of women's competencies because of their gender, or the exclusion from informal networks.

Promoting Gender Equality in Higher Education: between institutional tensions and transformations in four Portuguese HEIs.

Sara Merlini, Anália Torres, Paula Campos Pinto, Fátima Assunção, Bernardo Coelho, Diana Maciel

CIEG/ISCSP-ULisboa, Portugal

Higher Education is a pertinent locus for analysing institutional cultures on the promotion of Gender Equality (hereafter GE) policies, particularly because it contributes directly to scientific and technological development. Portugal's delay in implementing these policies, along with the recent expansion of the Higher Education system, pose specific challenges and opportunities for institutional change at HEIs. Looking to catch up, Portuguese HEIs have started to recognize GE promotion importance, both due to external and internal forces (Horizon Europe; ENIND2030; RCM186/2021). This presentation draws from a larger project on GE in HEIs(EEA Grants), that included both qualitative (4case-studies, 25interviews with academic leaders and 9focus-groups) and quantitative data, namely trends over the last two decades across Europe. In the 4 case-study HEIs – selected by contrast sampling (subject area, educational subsystem and regional location) – the comparison between institutional cultures promoting GE allowed us to better understand how change takes place and the different availability and tensions when implementing measures. Rather than differences at regional level, the evidence has shown that the size and composition of HEIs, as well as the predominant scientific areas, are more relevant factors in explaining inequalities, and can mitigate or reinforce the possibilities of implementing measures. Power struggles and resistance were identified in two ways: ignorance about the facts of inequality and the lack of objective conditions for promoting and realizing GE at the HEI. In view of the different institutional cultures, we found that the commitment to transforming HEIs into more equitable, inclusive and fair contexts depends on the involvement of the entire academic community and the recognition of gender studies as an area of knowledge that requires long-term learning and investment.

RN33 | T03_03: Gender Differences and Dynamics

Unveiling the intricacies of the Gender Dynamics in Mosuo Society: the Enmeshment Between Patriarchy and Matriarchy

Christina Wang

International School of Beijing, Cambridge Centre for International Research

The Mosuo people of China, widely regarded as the "Last Matriarchy of China," have been subject to misrepresentation and romanticized narratives in existing scholarly literature. They have often been epitomized as a deviance from traditional gender norms in patriarchal societies. Renowned for their "walking marriage" tradition and matrilineal culture, the Mosuo society has gained a reputation as a haven where formal marriages are absent, and promiscuous sexual practices are sanctioned (Yong & Li, 2022, p. 28). In this unique social milieu, men are relieved of traditional fatherly responsibilities (Hua, 2008), and women hold dominant positions of authority (Wu et al., 2013; Zhou, 2010). This research endeavors to rectify these misconceptions and illuminate the intricate gender dynamics within Mosuo society. Contrary to popular perception, an in-depth analysis reveals the presence of an underlying patriarchy operating within this unique social structure. By means of an in-depth examination of interviews, casual conversations with Mosuo community members, religious narratives, and data collected through observations in the Lugu River region of Yunnan, China, this paper aims to demonstrate that, on the one hand, women are revered as sacred and entrusted with family financial matters. However, on the other hand, the gender-based division of labor within Mosuo culture inadvertently fosters gender inequality. The complex gender dynamics observed within Mosuo society provide valuable insights into the pursuit of gender equality and the cultivation of harmonious relationships between men and women. While exhibiting certain elements resembling Western and Chinese patriarchal societies, the Mosuo society also demonstrates a high degree of respect for women.

Shifting Gears: Navigating Generational Transformation Amid Digital Disruption in Women's Labor Participation in Mechanical and Plant Engineering

Katharina Bässler, Anna-Kathrin Wimmer, Yves Jeanrenaud

Ludwig-Maximilians-Universität Munich (LMU Munich), Germany

In German STEM fields (Science, Technology, Engineering, Mathematics), women are still significantly under-represented, especially in engineering: Not even a quarter of engineering students in Germany are female. Equally under-represented are women in engineering positions on the labour market.

Various studies suggest that the increasing digitalisation of the workplace and other areas of society is opening opportunities for under-represented groups, including women in engineering. Meanwhile, Germany's engineering culture, which has traditionally been conservative, is gradually undergoing a generational shift. Furthermore, digitalisation and technology have been associated with gendered connotations, often excluding women from these fields by denying corresponding competences and ascribing them to male gender roles. But to what extent are these processes of generation change and digitalisation hindering or strengthening each other?

To shed light on these questions, our ongoing research project "digiMINT", funded by the German Federal Ministry of Education and Research (funding code: 01FP22M01), focuses on the under-representation of women in STEM fields, especially in mechanical and plant engineering. The project's empirical base founds on a mixed-methods approach of narrative interviews and quantitative online surveys with female pupils, STEM students, young professionals, as well as industry representatives from mechanical and plant engineering in Germany. This enables a comprehensive and multi-perspective picture of engineering education and work settings.

Consequently, our paper not only highlights the changes in the gender order associated with generational change within the engineering discipline and work culture, but also presents the first empirical findings from the project on the impact of digitalisation within the discipline and its gendered effects.

Gender Dynamics in Mining Areas: Contrasting Environmental Attitudes and the Role of Women in Spain's Energy Transition

Xaquin Perez Sindin[1], Manuel Docampo García[2], Alexia Sanz Hernández[3], Angel Alonso Domínguez[4]

1University of Warsaw, Poland; 2University of A Coruña, Spain; 3University of Zaragoza, Spain; 4University of Oviedo, Spain

The attention given to the role of women in the literature on mining communities allows us to discuss the concept of "mining women." They often connect to the community not as individuals but through the family, sharing with other families "a common fate determined by virtue of their similar relationships with a wage-earning husband in the mining industry." Ronald Frankenberg encapsulated their position by suggesting that "the woman pays for her dependence with subordination." However, this image contrasts with recent studies in the field of environmental social sciences, where being a woman tends to be associated with a greater predisposition for caring and protecting the environment, both in behaviours and in the awareness reflected in their narratives. Here we present the results of our research focused on analysing local sentiments toward energy transition in Spain. We want to study whether female in the former coal mining areas exhibit any differential pattern compared to overall female in Spain and thus contribute to current theoretical debates on gender and mining. We conduct a survey to a representative sample of the population (1,500). The variables included in the questionnaire deal with sentiments toward the social and economic impact of the energy transition, as well as overall environmental values and attitudes. We have adopted a multi-stage sample design. The population was divided into two clusters: those living in the former coal mining areas (800 respondents) and the rest of the country (800 respondents). Subsequently, we stratified each of the clusters according to age and sex. The results confirm that female population exhibits more positive sentiments toward the energy transition. These differences, however, disappeared in the former coal mining areas.

"Italian Feminist Daughters: What the 'Generation Y' Has to Say About Growing up in a Feminist Household"

Marta Maria Nicolazzi

Statale University of Milan, Italy

Seeking to reconcile childhood and feminism as well as moving away from adult-centric perspectives on generational change, this paper explores the childhood experiences of women of Generation Y that grew up in feminist households in Milan, Italy. Specifically, it aims at understanding the role that mothers have in shaping the political identity of their daughters and the effects of feminist assumptions on motherhood and family structures. The research engaged with existing literature, connecting the mother-daughter relation to debates around agency, care, politics of childhood, concept of 'generationing' and generational feminism. Adopting an abductive value-based reflective and relational approach, the data was collected through one-to-one, semi-structured biographical interviews with Milanese women born between 1981 and 1999 who had a feminist mother. Findings from the interviews show an overall positive impact of feminism on gender stereotypes within family structures that reflected themselves on household dynamics as well as on generational order. Placing communication at the core of their parenting agenda, feminist mothers broadened their children's possibility to perform agency and transformed the existing standardized top-down power relation with their daughters into a more horizontal dynamic based on trust and mutual learning. Challenging the idea that messages tend to get lost in translation across generations, this paper also unveils a strong continuity between feminist waves as daughters' political identity is deeply shaped by their mothers' feminist dialogue.

RN33 | T04_01: Education and Policies

Activity Of Women Living In The Countryside In Non-governmental Organizations

Aneta Uss-Lik

University of Wroclaw, Poland

The research conducted in 2020 by the author of the article shows that In rural families, the patriarchal model of the family model, modified to the reality in which women play more and more roles, is maintained and implemented – apart from the traditional role of wife, mother and housewife, also the role of co-managing the farm. This co-management, however, is primarily about taking over some of the responsibilities while leaving the decision to the men. Women managing farms more often (than men) indicate agreeing their strategic decisions regarding the matters of this farm with other people. It can be assumed that one of the explanations for this consultation of decisions is the desire to maintain a pattern of behavior well-established in culture, in which decisions-decisions are made by men (Kluba, Szczepańska, Uss-Lik 2021).

This impact could be complemented by one more aspect – finding by women space for emancipation outside their own home, precisely in an NGO. This aspect, based on the example of rural women involved in the activities of non-governmental organizations (NGOs) and rural housewives associations.

Results of qualitative interviews conducted with women managing local NGOs in Poland (10 cases studies) indicate that (1) in women's organizations operating in the countryside there is a large potential of unused social capital, (2) this capital is most often channeled into activities for the benefit of the local community, and (3) acting in social organizations is a form of reducing social inequalities and self-realization of women, which has a positive effect on the entire community.

The Black Female Nurse Lecturers Lived Experiences In Higher Education

Beverley Brathwaite

Roehampton University, United Kingdom

What is it like being a Black British woman of Caribbean heritage, a registered nurse and a nurse lecturer in the predominantly white space that is academia and female dominated nursing profession? A pilot study was undertaken as part of my Doctoral research and female nurse lecturers were interviewed that all identified themselves as Black of Caribbean origin born in England. There is a legacy of Black Caribbean and African women coming to the epicenter of the British Empire as nurses or to train as a registered nurse (Brathwaite, 2018; Flynn, 2011).

The movement from practicing in the clinical environment to nurse educator in higher education is one fraught with white privilege, white supremacy and various forms of racisms on the one hand and being seen as a role model and empowering the large number of Black and Brown students nurses who see what can be achieved on the other (Alexander & Arday, 2015; Bouattia, 2015; Watson, 2017; Bhopal, 2018; Arday & Mirza, 2019;)). Using a postcolonial feminist and intersectional lens, the participants gendered lived experiences were interpreted (Finlay, 2011). The Black female nurse academics experiences are one that are contextualised through the inequality experienced in both nursing and higher education and the calling out that inequality and navigating it throughout their lives (Rollock, 2022; Watson, 2017).

The Long-term Trends in Gendered Educational Attainment in Poland

Alicja Zawistowska

Universtity of Bialystok, Poland

The reversal of the gender gap in education represents a rare example of reordering social hierarchy. Until the end of the XIX century, females were not permitted to enter tertiary education, and access to secondary schools was highly restricted. This pattern has changed significantly in Poland in the XX century. Under socialism, females constituted a majority in full secondary schools, and since the '70s, they represented more than half of tertiary education students. The gender gap in higher education has widened dramatically since the mid-90s, leading to unprecedented asymmetry in the educational attainments of males and females.

This presentation aims to analyze the patterns and dynamics of this historical shift in Poland. To document the evolution of the gender gap between generations born in XX and the beginning of the XXI century, I will use two complementary data sources. First, to illustrate the major trends in the gender gap in secondary and tertiary education, I will utilize administrative data collected by the Statistical Office. Secondly, I will employ data from the European Social Survey to estimate the effect of social status (measured by parental education attainment) on the educational outcomes of several generations of males and females. The analyses revealed that both mothers' and fathers' education exerted a stronger effect on the educational attainments of daughters than sons.

The discussion will encompass the impact of the disparity in educational achievement on female and male gender roles.

1025

How Does Policy Framing Affect Support For Gender Equality Policies? Evidence From Survey Experiments Fielded Across Europe

Amy Alexander

University of Gothenburg, Sweden

Who supports gender equality policy, and how does this support depend on the framing of the policy? Different gender equality policies are currently politicized in various democracies. We fielded two survey experiments across 27 EU countries to test who is most (least) likely to support policies on gender quotas in politics and school reforms for less gender-stereotypical teaching. Based on theoretical expectations about support for gender equality and policies in general, we manipulate whether the policies are described as a) promoting material vs. symbolic gender equality, b) benefiting only women vs. everyone, c) supported by experts vs. a majority of the population, and d) endorsed by left – vs. right-wing political parties. Pilot study results reveal partly gendered trade-offs in policy support: Some policy framing appeals to women but deter men, and vice versa. Further, the proposed school reform provokes more strongly polarizing effects than the proposed gender quotas in politics. The policy support patterns by population group differ by the proposed gender equality policy, suggesting that different gender equality policies yield different patterns of support and opposition in the population. Our findings carry implications for the study of gender attitudes and policy support.

RN33 | T04_02: Gender, Technology and Stem Issues

Decoding Gender in Smart Home Research

Bartosz Hamarowski[1,2], Nina Fárová[3], Julia Gruhlich[4], Sandra Frydrysiak[2], Blanka Nyklová[3]

1Nicolaus Copernicus University; 2University of Lodz; 3Czech Academy of Sciences; 4University of Göttingen

Smart homes, as technologically advanced residential systems, are commonly touted as agents of change in both individual lifestyles and broader socio-environmental strategies. However, their innovative thrust tends to primarily manifest in material terms rather than ideological ones, usually consolidating rather than reforming existing social structures. In these hyper-modern living spaces, the continuation and potential intensification of entrenched traditional gender norms and power dynamics emerges as a critical issue, necessitating a thorough social science-led investigation into how smart technologies might unwittingly maintain or aggravate social inequalities.

Drawing inspiration from Judy Wajcman's early advocacy for a gendered lens in smart technology studies, our research explores the degree to which discourse on smart homes has responded to this call. We present a critical review of a representative set of 92 disciplinary-diverse smart home publications, examining how gender-related notions and issues are addressed or neglected, and explore their distributional characteristics and thematic range. Through both bibliometric exploratory and qualitative analyses, our survey delves into the key themes, theoretical underpinnings, methodological approaches, and main findings of the collected studies. This systematic approach allows for an in-depth exploration of the representation and operationalization of the gender category in smart home research.

1026

Our findings underscore a significant deficiency in gender-sensitive approaches within the analyzed domain, highlighting the urgent need for inclusive and multifaceted research methodologies, as well as emphasizing the importance of embedding more thoughtful gender frameworks in future techno-academic advancements.

Can Post-Materialistic Values explain the Gender Equality Paradox?

Lukas Arnold, Mingming Li, Wilfred Uunk

University of Innsbruck, Austria

The Gender Equality Paradox (GEP) describes the phenomenon that gender segregation in STEM (Science, Technology, Engineering, and Mathematics) fields increases in more "developed" and gender-equal societies. A common explanation for GEP is that when economic conditions are better, boys and girls aspire more toward the fulfillment of

post-materialist values. In the presence of gender-stereotype norms and practices, this leads to more gendered educational and occupational aspirations. However, whether a shift towards more post-materialistic values underlies GEP has not been tested in the literature. Using four waves of the Trends in International Mathematics and Science Study (TIMSS) on students' mathematics-related career aspirations with multi-level regression models, we test (a) the effect of societal affluence on boys' and girls' mathematics career aspirations (i.e, the gender-affluence paradox), (b) the extent to which the effect of societal affluence can be attributed to a country's post-materialistic values, and (c) the extent to which a country's post-materialistic value orientation moderates the effect of household affluence and SES on the gender gap. We also test whether the gender gap in post-materialistic (work) values increases with societal affluence. We focus specifically on post-materialistic work values (consequently working culture) because we hypothesize that work life goals underlie educational STEM choices and preferences. By doing so, we try to find an explanation for the GEP that relates to cultural differences between "modern" and "late modern" societies and to the absurdly persistent gender stereotypes in these.

Hybrid Femininity: Practices Of Navigating Gender Boundaries In Male-dominated Technology Start-up Organizations

Edyta Tobiasiewicz

Jagiellonian University, Poland

In the new economy, the high-tech industry is recognized as one of the most powerful and profitable globally (Neely et al. 2023: 320). Recent research indicates that women employed in technology organizations encounter various challenges and barriers in advancing their careers, including microaggressions, discrimination, and sexual harassment (Alegria 2019; Alfrey & Twine 2017; Mickey 2022).

Start-up organizations, as a form of global culture and entrepreneurship (Koskinen 2023), present a specific type of technological landscape characterized by their ideology rooted in Silicon Valley, special work ethos, and non-traditional financing methods. Numerous analyses reveal that prevalent practices, norms, rules, and organizational logic within technological start-ups strongly favor cultural patterns of masculinity (Papageorgiou 2022; Cooper 2000; Wynn & Correll 2018). Despite this, women are actively engaged in these spaces, assuming various roles, including regular employees, leaders, and founders of start-ups (Startup Genome & We Rise 2021). However, we still know little about how women, through various gender practices (Connell 2006; Martin 2003), achieve and sustain high status within the start-up industry and what practices they undertake in response to barriers and challenges.

Based on 43 qualitative interviews conducted between 2021 and 2023 with males and females working in start-up organizations (as part of a broader research financed by the Poland National Science Centre grant no. 2020/37/N/HS6/03913), I will discuss how women manage their gender status, how navigate gender boundaries, and how (depending on the context) selectively exposing and withdrawing femininity (or masculinity) during interactions to negotiate position in the workplace and avoid sexual harassment. Finally, I will present a conceptualization of the term "hybrid femininity" as a category that helps to understand this analyzed pattern of gendered practices.

Gender Gap In STEM And ICT Education: What Can Education And Educators Do?

Inês Simões[1,2], Rosa Monteiro[1,2], Lina Coelho[1,2], Sofia Madeira[2]

1Faculdade de Economia da Universidade de Coimbra; 2Centro de Estudos Sociais, Portugal

The shortage of women in science, technology, engineering, and mathematics (STEM) fields, particularly in ICT, has been a matter of increasing concern in Europe. The acknowledgment of a "severe gender balance issue" is evident, with only 19% of ICT specialists and one in three STEM graduates being women. The emphasis has been on attracting girls and women, highlighting the persistent gender gap.

While the phenomenon of horizontal gender segregation has long been denounced, only recently have strategies emerged that prioritize gender stereotypes in education for thorough examination and corrective actions. Currently, there exists a growing body of studies and programs dedicated to addressing gender inequalities in STEM and ICT. These initiatives delve into the root causes and propose solutions, encompassing policies and pedagogies to counteract gender stereotypes and discriminatory practices within the educational sphere. Diverse stakeholders, including policymakers, education experts, and advocates for gender equality, actively participate in tackling this challenge.

This presentation draws upon the outcomes of a European research project aimed at addressing the STEM gap through gender-inclusive education and teaching programmes. The insights are derived from an in-depth questionnaire administered to educators, an analysis of practices at both national and school levels, and interviews conducted with experts.

Our focus will be on the initiatives implemented in Portugal to enhance the involvement of girls aged 11 to 15 in the fields of STEM and ICT. We aim to understand how these initiatives identify the issue, the frames they use, the identified causes, and whether their strategies promote more systemic approaches addressing gender stereotypes and inequalities in education or if they adopt more targeted approaches that leave the existing gender regimes in education untouched.

1027

RN33 | T04_03: Gender and Language

Reading Gender. Exploring the Reading Practises as Cultural Spaces of Emancipation and Ambivalence

Michela Donatelli

University Roma Tre, Italy

This article explores the relationship between men, women, and cultural practices by exploring the representation and use of books. Starting with a historical overview of the construction of female readers in comparison to their male counterparts, the article highlights the manifestation of gendered dimensions within cultural spaces, with a particular focus on reading circles. Reading circles offer a nuanced observation of gender dynamics through participants' interactions and interpretation of the texts under consideration. In these contexts, the act of reading reveals its dual nature, serving simultaneously as a tool for emancipation and as a mirror reflecting gender differentiations. Based on qualitative research conducted through participant observation within reading circles organised in 3 public libraries in Rome, this paper aims to contemplate how the reception of specific texts can sustain subversive biographical trajectories. It is a dual movement that transcends the dominant norms of femininity and embraces values that favour material and symbolic autonomy from men. In line with previous studies (Albenga, 2017), the article adopts a socio-historical perspective on reception, exploring various aspects of reading practices to discover the meaning readers derive from books. Bourdieu's (2001) concept of co-production is used to illuminate the dynamic interaction between authors and audiences, as well as the practical and symbolic use of cultural goods. Chartier's (1988) notion of appropriation differences is considered, which emphasises creative invention at the centre of reception processes. Specific activities within reading circles contribute to creating a literary field in which genre functions as a distinctive category, and both authors and readers transform being female from 'negative symbolic capital' to 'positive symbolic capital' (Moi, 1999), showing, a certain ambivalence, the emancipatory potential of reading.

Expanding Boundaries: "Gender Theory/Ideology" and Twitter Debate on Gender-Sensitive Language

Roman Kuhar[1], Rok Smrdelj[1], Monika Kalin Golob[2]

1University of Ljubljana, Faculty of Arts, Slovenia; 2University of Ljubljana, Faculty of Social Sciences, Slovenia

This paper examines Twitter (X) discussion in Slovenia following the decision of the Faculty of Arts, University of Ljubljana, to adopt gender-sensitive language in their internal regulation documents. Employing social network analysis, this study identifies distinct user communities with predominantly right-leaning political affiliations. Linguostylistic and critical frame analyses revealed that these communities emphasize different themes related to gender-sensitive language, often introducing new, tangentially related topics. However, a common thread connecting these debates is the discursive concept of "gender theory/ideology." The analysis of the most retweeted tweets demonstrates that "gender theory/ideology" acts as a unifying force within communities, bringing together disparate actors. The study also reveals the colonizing nature of "gender theory/ideology," as it diverts the focus of the debate toward new issues, potentially transforming them into ideological matters. Additionally, the findings highlight the de-democratizing effect of "gender theory/ideology" by limiting the boundaries of legitimate debate and excluding alternative perspectives. The absence of dissenting voices and the prevalence of ideological homogeneity within the right-leaning network creates an "echo chamber" effect that marginalizes alternative viewpoints. Importantly, our research demonstrates how "gender theory" has transformed the structure of public debate in Slovenia since its initial mass emergence in 2015.

It's a Wonderful World Where You'll Find ... Good Girls and Naughty Boys. An Analysis of Gender Representations in Romanian Songs for Children

Diana-Andreea Moga

University of Bucharest, Romania

Romanian songs for children started to be found more and more often among children's daily activities, being one of the main sources of learning, fun and interactive recreation. The current research aims to study how certain gender roles are attributed and highlighted to the representations of femininity and masculinity in Romanian children's songs, wanting to identify a favorable socio-cultural context in which certain prejudices and gender stereotypes can be early developed among children even during the primary socialization. Thus, the research question from which this

1028

study starts is: How are the representations of femininity and masculinity presented in Romanian children's songs? As a theoretical framework, I discuss gender as a social structure to highlight the perpetuation of the existing gender system, rooted in the "traditional" social structures of Romanian society. To facilitate the analysis of these theoretical aspects, this research will be carried out through a complex study based on two types of content analysis – quantitative and qualitative, focusing on both song lyrics and related videos, selected through a hierarchy that includes five YouTube channels for children's entertainment. As a few results, I expect gender inequalities to persist in many of these representations. According to the traditional benchmarks of gender as a social structure, femininities are taking shape that promote the image of a beautiful, caring, docile woman in the private environment, strongly impregnated by numerous domestic activities. In contrast, masculinity is associated with holding power both in the family and in the professional sphere, promoting the nonconformist, disruptive and even violent nature of boys and men. The differentiated cultivation of nonconformism and the diversity of professional involvement reinforces the symbolic superiority of masculinity in public life. This research proves useful because it discusses a topic less presented by researchers until now. It is important to understand the great impact that such representations of femininity and masculinity have on children's socialization, because these children's songs continue to promote the traditional roles associated with each gender in a contemporary society where we aspire to equality. I have also not attended one of the ESA Summer Schools before.

Lead, Supporting, Or Background Character? A Story Of Age(less) Hallmark Narratives In The Era Of 'Please Don't Ask Me My Age'

Raisa Gabriela Zamfirescu, Irina Zamfirache

Faculty of Sociology and Social Work, Romania

Going beyond discussions regarding the relationship between social, psychological, and biological age, the movie and TV industry has its own persistent way to guide itself and to divide the actors, especially the actresses, by their biological age. The double standard of aging is still very visible. Once there is a certain threshold crossed, there is no way back; the roles are becoming stereotypical and, most of the time, unidimensional.

More and more actors from the Hallmark family choose not to publicly disclose their age, precisely because of the fear of not limiting their roles only to a certain generational typology: among the 628 analyzed films (titles launched by two of the Hallmark Media trust between January 2015 – December 2023), there were identified numerous actors whose age is not available online. Is this strategy of depicting the self effective in an era of informational transparency?

Another dimension of this study is to examines gender and age representations in Hallmark films to identify whether these programs reproduce similar gender gaps and patterns

of underrepresentation of individuals over 40 as Hollywood films.

This study captures typologies created through gender-related clichés, bringing into attention the most visible stereotypical portraits seen as well as the impact on the age of the actors, especially regarding the variety of the received and acted roles. Also, we want to discuss the change and persistence observed in the importance of age for the careers and roles of Hallmark actors, as well as for the typical characters portrayed.

1029

RN33 | T05_01: Domestic Violence and Intimate Life

Title: Experiences, Needs, and Utilization of Services by Victims of Lethal or Near Lethal Domestic Violence

Sabry Adel Saadi

Université du Québec a Montréal, Canada

The research aims to fill a crucial gap in comprehending the needs and help-seeking experiences of intimate homicide survivors and their families. Through in-depth interviews with survivors of near femicide and proxies of women killed, this study explores psycho-socio-judicial needs in the post-separation period, shedding light on self-determination and agency in response to these challenges.Methodologically, the study relies on the Canadian Initiative for the Prevention of Domestic Homicides, incorporating 26 interviews conducted in Québec. Utilizing a narrative research framework, interviews delve into participants' experiences of feeling unsafe, actions taken, help-seeking, and the effectiveness of support received. Phenomenological analysis ensures an intimate understanding of survivors' experiences.The author's unique positionality, as a man from a visible minority and part of sexual and gender diversity, and a survivor of domestic violence, enriches the research. Professional experience as a specialized educator and social worker, combined with active involvement in data collection, ensures a nuanced and empathetic analysis.Preliminary analysis uncovers initial themes, providing insight into survivors' journeys. The research aims to inform interventions and policies by identifying specific needs and proposing a framework for enhanced support systems. Ultimately, the goal is to contribute to the protection and support of survivors of attempted femicide and their close ones, fostering more effective public policies in the realm of domestic violence.

"…Here We are Arab Women in Uniform Engaging in Domestic Violence and Arresting an Arab Man who Raised his Hand on a Woman… It Does the Job…" – Cultural Responsiveness among Arab Policewoman in Israel towards Arab Women who are Victims of Violence.

Tal Meler

Zefat Academic College, Israel

Arab-Palestinian women in Israel (native-national-minority) who have experienced intimate partner violence (IPV) as excluded discriminated women face complex challenges in seeking help which may ultimately impact their ability to leave violent relationships. Over the last decade there has been an increase in IPV towards Arab-Palestinian women. Their representation as victims of violence or among femicide cases is disproportionate and exceeds their percentage in the population.

Despite a significant foothold in the public discourse intimate partner violence (IPV) in Israel, the State's efforts to address this issue reveal deep problems and widespread lacunae. This poses inquiries about the efficacy of various institutions, including the police, in adequately addressing women's needs as well as the extent policies are tailored to women from distinct locations.

The Israeli police are viewed as representing the state, intensifying friction with minorities and resulting in minimal trust and support from Arab citizens, particularly women. Arab policewomen who enlisted face national/gender community objection. Despite the prevailing male/macho, conservative, and racialized police culture, the presence of Arab policewomen offers advantages. Departments handling domestic violence within the police force may offer better support for women experiencing intimate partner violence (IPV) to alleviate their challenges.

Through semi-structured interviews with 27 Arab policewomen in Israel, I ask: how do Arab policewomen perceive Arab women victims of IPV who are seeking safety from violent relationships and turn to the police? Second, how do policewomen who investigate IPV understand the extent to which their organization's practices reflect cultural responsiveness in serving Arab women?

Femicides And Homicides in Intimate Relationships: An Analysis of Judicial Stereotypes

Madalena Duarte

university of coimbra, Portugal

Feminist theories of law have played an important role in denouncing that a stereotypical view of gender, of intimate

1030

relationships and of social roles remains in legal culture. Analysing these stereotypes is particularly relevant in violence in intimate relationships cases, in which, as some studies have shown, there is still a legal understanding that this is a crime with shared guilt, with the victim's behaviour being scrutinised. In this paper, I explore, with reference to the Portuguese context, how gender stereotypes are, consciously or not, present in the legal assessment of homicides and femicides committed in a context of intimacy.

To this end, I'll analyse interviews conducted, between 2021 and 2022, with judges and with women who had committed a homicide in an intimate context, with the aim of discussing, in an articulate way, their experiences and representations regarding both this type of crime and its legal treatment.

This qualitative analysis will be complemented with a content analysis of 160 court cases (with first instance and appeal decisions) on homicides (committed and attempted) in intimate relationships.

I conclude that the existence of apparently neutral and vague legal concepts contributes to the reproduction of models of femininity and masculinity, and for a hegemonic and heteropatriarchal understanding of romantic love, namely in determining the motives for the crime, in which the victim-offender relationship plays a significant role. This biased understanding has (in a more or less subtle way) legal consequences for women, both as victims and as criminals.

'How Can Someone Be A Woman and Activist Yet Be A Good Citizen?': Stories Of Intimate Citizenship Of Polish Activist Women

Ecem Nazlı Üçok

Charles University, Prague

The current populist political environment has been shaped by growing tensions and differences, which have led to innumerable transformations resulting in consequences for intimate life. The paper focuses on the impact of political changes in Poland, particularly the rise of the PiS government, on the intimate lives and citizenship identities of Polish activist women. Two of Poland's constitutive elements, namely religiosity in the guise of Catholicism and a profoundly entrenched patriarchy in the society, have raised the tension between the feminist movement and the populist counter-movement (Paternotte & Kuhar, 2017). Plummer (2003) argues that the emergence of the women and LGBTQI movements brought up a host of potential new identities that demand recognition and lay claim to rights and obligations. The electoral success of the far-right in Poland in 2015 and 2019 and the consequences of these political shifts have raised violent attacks on women's and LGBTQ rights and bodies. In the paper, Plummer's notion of 'intimate citizenship' will be used to explore how Polish activist women are experiencing the tension between being a 'good citizen' and a 'bad citizen'. The study intends to critique classic models of citizenship by showcasing the gendered nature of the citizenship process and the meaning of

'dissident citizen'(Sparks,1997). By incorporating life-story interviews of Polish activist/migrant women living in 'exile,' the paper aims to provide a voice to those affected by suffering, tension, and contestations and demonstrate how social movements contribute to creating solidarity through narratives demanding recognition (Miles, 2022).

RN33 | T05_02: Gender, Violence and the Economy

Unveiling Economic Violence Against Young Women in Türkiye: A Critical Examination

Ayşe Zeynep Zülfikar[1], Elif Öz[2], Dr. Hilal Arslan[3]

1Koc University, Department of Sociology, Computational Social Sciences Program; 2Middle East Technical, University Department of Sociology; 3Hacettepe University, Institute of Population Studies

The study aims to show the hidden forms of economic violence and investigate its connection with other types of violence experienced by young women aged 18-29 in Türkiye, in relation with the concept of emerging adulthood. Our study seeks to propose social policies to combat economic violence against young women and create a liberating effect on their lives by using feminist methodology. For empirical part, we used (1) nationally representative violence against women survey data and (2) semi-structured in-depth interviews to reveal young women's challenges in terms of economic freedom, value, self-confidence, emotional burden, money control and saving.

The secondary quantitative data analysis '2014 Survey on Domestic Violence Against Women in Turkey' found a 12% prevalence of economic violence among young women, particularly in urban areas, Western Anatolia, the 25-29 age group, with primary education, divorced or separated, married before the age of 18, and with low wealth. Most significantly, 80% of these young women reported a lack of personal income, and this percentage is higher among women in rural areas, Southeast Anatolia, the 15-24 age group, individuals with no formal education, those currently married, those married before the age of 18, and individuals in low-income households. With indicating a 10% increase compared to all women, this figure highlights the vulnerability of young women and challenges presumed economic empowerment in this age group, showcasing experience heterogeneity.

The key topics regarding the prevalence of economic violence among young women found to be 'the relationship between economic freedom and social status', the impact of the economic freedom on feeling valuable, being self-confident, emotional burdening and young women's understanding of managing finances and saving.

Appropriation of a Generation of Turkish White-Collar Women's Labour: Economic Abuse in the Marriage as Grounds for Divorce

Aylin Akpinar

Linnaeus University, Sweden

Appropriation of women's labour in the marriage and transfers of capital from women's native households which were not used for the family were cited as grounds for divorce by a generation of Turkish white-collar women who married in the eighties, in their twenties. The four narratives selected for presentation is drawn from research data which was gathered through in-depth interviews with divorcées of various ages and backgrounds living in three metropolitan cities of Turkey, in 2016. The presentation theorizes on gender ideology and gender as structure and problematizes the enfamilied selves of the women and their parents' supporting the image of women's husbands as main breadwinners. These performances are depicted as collusive femininity in contrast to women's performances leading to their divorces depicted as alternative femininity. Two of the women gave their monthly salaries to their husbands and received pocket money. A third woman paid the college fees of their children besides the health insurance bills for her and her husband but did not know how much money her husband earned. In the fourth case, the couple lived in the flat entitled to woman's father and received support by the woman's mother covering the daily costs of the household while the husband saved money and bought the company he worked in. The instrumentalization of their marriages became the reason for women's divorces. I consider these women as caught in between, a generation of Turkish women who had empowered themselves by gainful employment but not through individuation in their intimate lives.

A Critical Examination of Women's Integration and Experiences in Irish Banking Post-Marriage Bar Removal

Kate O'Keeffe, Aisling Tuite, Zeta Dooly

South East Technological University (SETU), Ireland

This research focuses on the experiences of women in Irish banking organisations following the removal of the so-called 'marriage bar': a piece of legislation which required women to resign from certain jobs on marriage (Foley, 2020). In 1973, Ireland joined what is now the European Union; this led to extensive legislative, economic and societal change (Jobling, 2023)

A primary objective of the research is to evaluate the integration of women into banking organisations following the lifting of this 'bar' and to critically examine their lived experiences. This paper highlights the male-dominated structure of banking organisations and the archetype of the 'ideal worker' as conceptualised by Joan Acker (1992). Despite

legislative advancements towards equality, organisational and societal norms lagged behind (Harford and Redmond, 2012).

The paper examines sixteen interviews conducted with twelve women and four men using Wengraf's (2001) Biographic Narrative Interpretive Method (BNIM) allowing for the 'pushing for PINs' (Moran, Green, and Warwick, 2022). These interviews offer rich insight into the life narratives of participants and the exploration of specific incidents. These data are transcribed carefully and organised using NVivo software. Reflexive Thematic Analysis (Braun and Clarke, 2019; 2006) and Narrative Analysis (DeVault, 1994; Riessman, 1993) are applied.

Findings offer insight to mixed feelings about work, family life, and career opportunities. The banking organisations placed financial and behavioural barriers for women, highlighting struggle for equality in the workplace.

This paper aims to understand the personal and societal challenges faced by these women in banking and examines the broader context of social norms and ideals that influence effective equality. The study offers insight into the impact of equality legislation and the need for comprehensive social change.

RN33 | T05_03: Violence and Social Media

"A Cognitive Map of Sexual Violence Victims' Decision-Making: Understanding the Preference for Social Media Over Formal Legal Avenues – Insights from Media Consultants"

Hila Nadav, Azi Lev On

Ariel University, Israel

The objective of this study is to develop a cognitive map that outlines the decisions and actions taken by victims of sexual violence. This cognitive map is informed by interviews with ten media consultants who specialize in assisting sexual violence victims. These consultants offer a view of the decision-making processes of victims.

Existing literature extensively explores the perceptions and behaviors of sexual violence victims. This article contributes to this field by proposing a detailed cognitive map that illuminates the specific decisions made by victims in choosing where to disclose their assault.

The study's findings, as depicted in the cognitive map, reveal several vital points:

Sexual assault victims often perceive media as a primary avenue for achieving justice, prioritizing it over formal legal means. In the media, victims tend to prioritize the process over the outcome. In terms of process, victims place utmost importance on the values of voice and respect.

Framing Gender-Based Violence: The Gendered Impact of Institutional Intervention on Media Discourse in Italy

Ester Fanelli

Brown University, United States of America

Sociologists have long examined how social movements strategies and discourses evolve after their institutionalization. In their struggle to put gender-based violence on the public agenda, feminist women have ambivalently underlined the risks that institutionalization entails, most notably the assimilation of gender-based violence with other social issues, and the shifting away from its feminist, cultural, and structural interpretation. Critics of feminists' success in this field argue instead that feminist mainstreaming risks hiding other factors behind gender-based violence, or even its gender symmetric nature.

Focusing on the Italian case, where institutional intervention happened recently and in a heterogenous way across

1033

regions, I use topic modeling and word embeddings methods to analyze a large corpus of more than 30000 articles published between 1992 and 2023 in local and national Italian newspapers. Using an event study research design, I investigate the effect of institutional intervention on who writes about gender-based violence in terms of gender and political alignment, and how.

Over the past three decades, articles on gender-based violence written by women correlated more strongly with a feminist framing compared to those by men, that were instead consistently more likely to reference other social issues. However, institutional intervention had gendered-specific effects that narrowed these gaps. Men's articles increasingly incorporated a feminist framing after regions adopted antiviolence policies, while women's articles became more likely to reference institutions and social services, with differential effects across newspapers' alignment. This research, utilizing novel methodologies, reveals how institutional intervention can legitimize specific framings across different societal groups, contributing to our understanding of cultural change following a social movement's success in placing its issues on the public agenda.

Reconfiguring Academic Feeling Rules: Ramifications of Digital Violence

Hande Eslen-Ziya[1], Alberta Giorgi[2]

1University of Stavanger, Norway; 2University of Bergamo

This study delves into the intricate emotional responses of academics subjected to online violence, presenting a comprehensive exploration of this pervasive issue. Leveraging semi-structured individual interviews with eleven academics—hailing from diverse academic levels and institutions in Europe and the United States—who reported experiencing online attacks, our research elucidates the multifaceted nature of their emotional experiences. The interviews, offered insights into participants' coping strategies, emotional states during and after incidents, and the impact of these emotions on decision-making processes. Integrating Hochschild's (1983) insights with perspectives from scholars like Lorde (1983) and Ahmed (2004), specifically focusing on gender, work, and emotions, our study sheds light on how academics encountered a phase of uncertainty in established conduct and emotional norms while navigating online harassment. This research then contributes a nuanced understanding of the emotional landscapes of academics facing online harassment, shedding light on coping mechanisms, emotional complexities, and ethical considerations inherent in this domain.

Dynamics, Patterns and Emotional Mobilization of Feminism discourse: Focusing on South Korean Twitter Dataset

Dahyun Ryu, Wonjae Lee

KAIST, Social Computing Lab of Graduate School of Culture Technology, Republic of South Korea,

This study examines the dynamics of digital feminism in South Korea, seeking to enhance the global understanding of digital activism. It analyzes 7.03 million tweets containing 'femi', a term linked to feminism in Korea, from January 2018 to January 2023. This research also highlights the role of emotions in mobilizing individuals in the digital space, a key aspect for understanding feminist discourse on social media(Ahmed, 2013; Ureta et al., 2021).

The first research question focuses on the prevalent themes in feminist Twitter discourse within this period, examining how they have changed over time. This approach not only highlights the unique aspects of digital feminism in South Korea but also contributes to the global understanding of digital activism's intersectionality with cultural and social norms. Using biannual top-tokens and n-gram(2, 3, 4 gram) methods, the study identifies key discussion topics like the cultural industry, sexual violence, appearance labor, and educational issues. These topics are categorized into areas such as politics, education, crime, sexuality, feminist taxonomy, and transgender issues through topic modeling.

The second research question explores the relationship between emotional tone and Twitter engagement, focusing on how negative emotions correlate with increased retweet activity. This inquiry sheds light on emotional mobilization's role in digital feminism, essential for grasping online activism's emotional dynamics. Sentiment analysis categorizes tweets as negative or positive, and network analysis evaluates the influence of emotional tone on tweet clustering.

RN33 | T05_04: Men and Masculinities: Changes and Challenges

Polish Young Men Do Cry. Present Challenges In Gender Norms And Generational Changes In Defining Masculinities

Dorota Brzezińska, Magdalena Żadkowska, Natasza Kosakowska-Berezecka

University of Gdansk, Poland

Both men and women are embedded in gendered systems and cultures (e.g., Hearn, 2014; Levtov et al., 2014; Lorentzen, 2011). In a broader societal scope, gender norms determine status, power, and rules of social relations regulating women's and men's lives, often leading to positive and negative consequences related to their health and well-being, education, and careers (e.g. Elliot, 2020; Greig et al., 2000). Movements progressing toward gender equality question social norms that are disadvantageous not only for women but also for boys and men, such as mandates of emotional control or pressure on employment and fulfilling breadwinner roles (Ellemers, 2018; Scambor et al., 2014).

In our research, we investigate possible changes in gender order, considering the perspective of adolescents and professionals who support young and adult men. Within the framework of the Polish-Norwegian project "EQUAMAN. Masculinity navigator – unpacking the relationship between masculine roles, well-being, and gender equality" we conducted: (a) a quantitative study among 550 adolescents (16-17 y.o.), that focused on the importance of boy's sense of gender identity and their attitudes towards gender roles and gender equality; (b) 3 FGI with 30 boys (16-19 y.o.); (c) 2 FGI with 11 health, psychological, and social welfare specialists. The data collection took place in Poland. We aimed to learn how young men define and negotiate their gender roles in transformation, and if (via experts' lenses) a generational change can be observed. The outcomes shed light on practical implications for educational interventions targeting boys and men.

Gendering Nursing and Rethinking Masculinities: An Exploration of the Nexus Between Men and Caring Occupations

Nicole Braida, Maddalena Cannito, Raffaella Ferrero Camoletto

University of Turin, Italy

Care practices have historically been associated with women, both when enacted in the 'private' domain of the family and when enacted in the 'public' sphere of paid work.

The aim of our research is to contribute to the debate by exploring the nexus between masculinity and care looking at a specific work domain: nursing. Among caring occupations, indeed, it is an interesting case study because it is an extremely feminized workplace (in Italy, for example, until 1971, access to this profession was closed to men), and a domain where the gendered ambiguity between cure and care is more easily detectable.

Drawing on 28 interviews with Italian male nurses, the paper aims at investigating how men perform masculinity and care in a feminized work environment. From our analysis it emerges that male nurses perceive care practices as central to their profession; a fact that, though, force them to cope with two aspects that expose them to the risk of 'de-virilization': body work and emotions. The body is considered both a technical tool and a communication channel with patients, part of the embodied competences of a nurse. However, it emerges some problematic aspects – specifical to men – linked to the symbolic implications related to the contact between gendered bodies. Looking at emotions, even if many respondents insist on the emotional suppression and on the show of empathy, as part of their professional practice (emotional work), they also stress a female 'predisposition' to emotional labor linked to daily care and relationality.

Our research, then, sheds light on the implicit gendered implications of care and on the challenges and opportunities that it determines for the performances of masculinities.

Single Fathers in Swedish Twenty-First Century Media

Helena Wahlström Henriksson

Uppsala University, Sweden

Since single parenthood is a highly feminized phenomenon, it is important to investigate how "media images and representations intertwine with political and social ideologies" (Gallagher 2014, 27) to convey messages about single fathers. Drawing on findings from an interdisciplinary cultural studies project on single parents in Swedish media, this presentation explores representations of single fathers in three sets of materials: newspaper articles, fictional cinematic film, and literature (fiction and life writing). The analysis focuses on how these representations speak to the contemporary political and ideological context of their time of

1035

production. Single parenthood, including single fatherhood, is "normalized" rather than socially or morally stigmatized in Sweden, and family policy has promoted fathers as (potential) primary parents since the 1970s. I demonstrate that in the media the single father is a "split figure" (Hall 2019) in the Swedish media landscape, for while newspapers represent him as a competent primary parent who manages well to combine work and family life, in Swedish film he is primarily a tragic figure marked by disqualification as a parent, and in literature, while demonstrating parental commitment and ability he embodies a fear of lost or unrecognized parental legitimacy. It would seem, then, that while newspaper representations discursively align themselves with father-friendly and gender-equality oriented national family policy in portraying the single father as a successful parent, films and literature offer counter discourses in their subjective explorations of single fatherhood as fraught, failed, or threatened.

Empirical Evidence On Shared Parental Leave In Austria: Pathways For Shared Parenting?

Gerlinde Mauerer

University of Vienna, Austria

Against the background of Austria being a conservative welfare state and facing challenges in establishing institutional infant care, I want to discuss obstacles in going beyond gendered role stereotypes and establishing long-term shared parenting arrangements, which often include precarious working conditions and part-time contracts in paid work, mainly for. In parallel, building up emotional bonds during a child's infancy and bearing mental load still are highly gendered topics. My Austrian empirical research results show that the provision of well-paid, shorter childcare benefits on one hand promotes men's uptake of parental leave and their gain in caring abilities. However, on the other hand, obstacles in overcoming gender inequalities in both parents' reconciliation of employment, childcare and family management are still to be observed: last but not least due to employers' gendered expectations and due to a lack in the provision of (public) childcare and education. The empirical research included two empirical waves (interviews with parents in Austria, 2021, 2023). In my presentation, I will focus on starting emotional bonding with an infant and both parents' attempt to dually share the reconciliation of family management, infant care and employment. The results indicate a (re-)production of traditional gender roles in the transition to parenthood, which still counteract the realization of gender justice despite the provision of parental leave rights for both parents in Austria. Moreover, men's shares in the uptake of parental leave in Austria are low, about 4% in all forms of childcare benefits (and parental leave variants). Nevertheless, the results also show men's pathways in developing caring attitudes and being an involved parent are the first steps towards realizing gender justice in the transition to parenthood.

RN33 | T06_01: Harassment, Gendered Violence, Femicide

A Culture of Silence: Gendered Violence in Post-Conflict Northern Ireland

Kim Elizabeth McFalone

University of Manchester, United Kingdom

Northern Ireland is commonly referred to as a 'post-conflict' society, however violence against women has increased dramatically since the Good Friday Agreement of 1998 which marked an end to The Troubles. This phenomenon has been noted in other post-conflict societies, which will make this research impactful across disciplines and contexts. The general research project will examine the lived experiences of women in relation to rape culture, comparing the everyday lives of older women who lived through The Troubles and younger women who were born after the ceasefire. As the general research project is still at early stages, this will be a theoretical paper which outlines the necessity to study post-conflict societies with a focus on gender and sexual violence. There is a culture of silence which persists in Northern Ireland in relation to both political violence and sexual violence, as well as contested definitions of victimhood for victims of political violence which links to modern rape myths surrounding who is deserving of the label of victim. I will explore this culture of silence through applying the continuum of sexual violence (Kelly, 1988) to challenge the hierarchies of harm applied to both political and sexual violence and uncover how these hierarchies interact with one another to legitimise the silencing of violence. This research will also consider the shifting negotiations of militarized masculinities and determine how these can facilitate high levels of violence against women in contemporary Northern Ireland.

1036

Results from the Research Conducted in Isolating Gender Violence (IGV) among Professionals Attending Victims of Gender Violence in the Region of Extremadura (Spain)

Maria Angeles Serrano Alfonso, Beatriz Muñoz González

Universidad de Extremadura, Spain

Scientific literature defines isolating gender violence (IGV) as that suffered by people who support victims of gender violence. Thus, its identification is a key element as a preventive mechanism, both for victims as for defenders. However, although progress has been made in the delimitation

of the concept, in its legal regulation and in its manifestation in areas such as sexual harassment in universities, it is still unknown whether IGV is suffered by professionals attending women victims of gender violence. To provide with some scientific knowledge to this question, qualitative research with a communicative approach has been conducted using in-depth interviews. In particular, such interviews have been made to professionals of the Extremaduran system of attention to victims of gender violence. Results allow to place them as preferential victims of IGV. Furthermore, a clear isomorphism between the process of victimization followed by gender violence victims and professionals have been found too. Finally, research also allows the identification of mechanisms of victimization professionals suffer, which have been classified in subtle and open and which differ in the level of violence.

A deep understanding of such processes of victimization is essential, on the one hand, to face an occupational risk which has been ignored to date. Such risk is affecting not only the health of these professionals but also the quality of their service provision which, on the other side, contributes to fuelling denialist discourses of gender violence.

The Representations of Students at the University of Coimbra Regarding Sexual Harassment Since the 1960s

Daniela Sofia Neto[1,2]

1Faculty of Economics of University of Coimbra, Portugal; 2Centre For Social Studies, University of Coimbra, Portugal

This study aims to understand the social representations of students at the University of Coimbra in relation to harassment since the 1960s. The term "sexual harassment" was coined in the second wave of the feminist movement, with MacKinnon being its driving force, who defined it around power relations and discrimination based on sex. Since the phenomenon of sexual harassment has arisen in the workplace, most studies are related to this context, making it imperative to problematise harassment in relation to the spaces where it occurs. With regard to the study of sexual harassment in the context of higher education, more recent studies have made it possible to analyse the problem through the lens of identity characteristics. They have also sought to study the relationship between these problem and organisational norms and policies. Coimbra presents fertile ground for research due to the fact that it was Portugal's first university and due to the struggles, it waged (especially in the 1960s), which still today reveal important contours for the country's democratisation process. Nonetheless, the legacy of women's invisibility still shows the remnants of a patriarchal society that tends to subordinate women. This is particularly relevant if we look at recent years in which there has been constant reporting of sexual harassment in higher education institutions in Portugal, partly as a result of the #MeToo movement. Coimbra has been no exception to this exposure, especially in the media. In this study I propose a qualitative approach based on documentary analysis, focus groups and semi-structured interviews (with students and ex-students) according to previously defined time segments. The data collected to date

makes it clear that harassment practices have always existed and have only rarely been denounced. Fieldwork since the 1960s has made it possible to understand codifications attributed to femininity and masculinity that are imperative for understanding the phenomenon of sexual harassment. In recent years, with social movements (like #metoo) and increased awareness, this reporting has been growing. This research has paved the way for theorising sexual harassment from an intersectional perspective and from the perspective of the institutions' own organisational culture.

Femicide In Wartime

Shalva Weil

Hebrew University of Jerusalem, Israel

Femicide is the intentional murder of women because of their gender. While most intentional homicide victims are male, the majority of domestic homicides are female. There are no up-to-date statistics on the extent of femicide globally, although an (under)estimated 89,000 femicides per year is being quoted in UNODC statistics.

Femicide in war is different from femicide in peace, and yet the dividing-line between the two is thin. The difference is that in peace and in war, the rules of the game change. In the Republic of Kosovo, men are socialized into "toxic behavior" toward women from a young age. When the men commit sexual and gender – based violence against women as adults, the legal system casts the survivors of gender-based violence back into a cycle of maltreatment.

In Israel, c. 20 femicides are perpetrated annually, but in 2023, dozens, maybe hundreds (numbers are unfolding), were added to that number in that female citizens were targeted by Hamas terrorists on 7 October as women, raped before and after they were murdered, and their sexual organs dismembered.

This paper is in no way an examination of the Gaza-Israel conflict. On the contrary, it presents the difficulties of data collection of femicide during war (e.g. bodies burned after rape) experienced in Rwanda and elsewhere, and documented in my edited volume "Femicide in War and Peace" (Routledge, 2023). It also examines the distortions of the perpetrators and their supporters that a higher political ideology could replace condemning femicide as a human rights violation. Finally, it attempts to analyse the statements and silence of feminist organisations and NGOs, which normally work to prevent femicide.

1037

RN33 | T06_02: Misogyny and Social Media

Misogyny and the Incel Subculture in Italy: A Netnographic Study

Felice Addeo[1], Valentina D'Auria[1], Vincenzo Esposito[2], Francesco Notari[1]

1Università degli Studi di Salerno, Italy; 2Università degli Studi di Roma "La Sapienza"

The rising role of online and digital interactions in mass culture among young people (Standlee, 2017) lead to the proliferation of the Incel phenomenon, among the most popular and active online subculture (Mountford 2018; Salojärvi et al. 2020). The Incels are a mostly young male community that struggles to properly relate with women, both romantically and sexually. The Incels criticize the society since they believe it is marked by an excessive glorification of physical attractiveness and feminine superficiality when picking partners (Halpin, 2021). Such beliefs frequently deteriorate into sexism and hate speech aimed at the female figure (Jaki et al., 2019). Although, according to European Commission (2021), Italy is the fourth biggest country in Europe in terms of Incel presence, there are few empirical research on the Incel culture and its potential harm to society (Clarke & Turner, 2020; Baele et al., 2021). To address this gap, we chose an exploratory-descriptive approach through a netnography (Kozinets, 2002, 2010) to explore the dynamics of the biggest Italian Incel community. This approach allowed us to gain a better understanding of the Incel culture, by exploring its ideology we found the empirical evidence of their misogynistic point of view, the community was structured around concept of sexual market, women as naturally evil, legitimizing masculinity, male oppression, and violence. An interesting result is the concern about the mothers as the Incels see them as someone who challenges paternal authority and affects their son's self-esteem in their interactions with women.

Gender-based Violence and Misogyny Against Women in Politics on Social Media

Jure Skubic, Milica Antic Gaber

Faculty of Arts, University of Ljubljana, Slovenia

In this study we explore the escalating concern of gender-based violence and misogyny targeting women in politics within the realm of social media. Rather than contributing to the further democratization of public and political spaces, social media platforms have become conduits for the dissemination of hate speech, aggression, violence, and misogyny against women engaged in politics at various levels (local, national, international). This study addresses the critical questions surrounding violence against women in politics on social media and examines the associated risks and consequences for women at different stages of their political careers, including parliamentarians and those initiating their political journeys.

Employing critical discourse analysis, our research delves into the discourse on Twitter during the two months leading up to the Slovenian parliamentary election in April 2022. Through the examination of over 300 hand-collected Tweets in the Slovenian language, we aim to elucidate the impact of Twitter discourse on pre-election events and assess the extent of violent and misogynistic content directed at women actively participating in the election campaign.

The overarching objective of these violent and misogynistic activities transcends mere psychological harm and the instillation of fear. Their aim is to induce a sense of inferiority, dissuading women from active political participation and compelling them to retreat from the public sphere into the private domain. This research contributes to a nuanced understanding of the multifaceted challenges women in politics face within the digital realm and underscores the imperative for concerted efforts to mitigate the adverse effects of online violence on political engagement and underlines the importance of studying the phenomenon of violence against women in politics.

Misogyny On Social Media: The Case Of "Kezban"

Kutlu Asena Kayhan

Marmara University, Turkiye

1038

This study examines the character "Kezban", a name associated with the "ideal woman" in popular Turkish movies of 1970s, which then became one of ridicule and hatred in humorous texts and memes in social media at the end of 1990s, eventually turning into a general insult for women. Using critical discourse analysis, this study looks into "Kezban" memes and texts, referring to Goffman's concept of stigma and Bourdieu's concept of symbolic violence. The aim of this study is to explain how, under the mask of humor, women are constantly exposed to humiliation, insults and made to always feel the judgmental masculine gaze on them. Through ridicule, their self-esteem is damaged, they are shamed, subjugated to male dominance and silenced.

The story of Kezban is actually the story of masculinity in crisis in the post-industrial era. Unable to maintain the socio-economical standards of their fathers, men feel like failures and a loss of their masculinity. As women's movement after the 1980s made them more visible and vocal, women become primary targets for men's feelings of shame, hatred and anger for "stealing" their positions. Humor thus becomes a weapon in men's campaign against women.

The ease of production and circulation of memes, one of the most popular forms of digital humor, means a lot of repetition. This gives memes an active role in the construction of social perceptions and meanings. This study argues, social media, a place thought to be inclusive and egalitarian, has increasingly become an environment hostile to women, where hate speech against women can be rapidly produced and distributed, sustaining the patriarchal hierarchy in the society and setting the stage for violence against women.

Negotiating Gender in the Digital Age: Youth and the Representation of Femininity and Masculinity on Social Media

Manolo Farci[1], Cosimo Marco Scarcelli[2]

1University of Urbino, Italy; 2University of Padova, Italy

This research examines the complex interplay between media logic and gender dynamics within the online activities of Italian adolescents. Engaging 800 participants aged 14-16 in an online workshop, the research used ethnographic observation, visual artifacts, and group conversations to explore adolescents' creation of fictional social media accounts aimed at peer popularity. The study's primary objective was to elucidate how adolescents perceive and construct notions of success in online spaces, particularly in relation to media-driven ideals.

Key findings reveal that adolescents' constructions of popular online personas are heavily influenced by prevailing gender norms and heteronormative discourses. The study highlights a predominant trend where female representation in social media is idealized and sexualized to cater to the male gaze, thereby reinforcing traditional gender roles. Secondly, the study reveals that while women are often viewed as passively sexualized, there is a prevalent perception that girls adeptly navigate social media mechanisms. This belief prompts a defensive moral condemnation from boys, culminating in the stigmatization of female online representations as inauthentic or driven by insecurities.

This research contributes to the understanding of how digital environments perpetuate and possibly amplify gender stereotypes among adolescents. It raises critical questions about the role of media in shaping youth perceptions of gender and popularity, offering insights that are vital for educators, policymakers, and scholars in gender studies. The findings challenge the notion of digital spaces as liberating realms for identity exploration, suggesting instead that they may reinforce conventional gender narratives.

RN33 | T06_03: Combating Inequalities-Violence and Women's Agency

From The Non-Discrimination Clause To Combating Violence – Comparison Of The Belém Do Pará And Istanbul Conventions

Antonio García Cazorla[1], Alexandra Sipos[2]

1Minority Rights Group Europe, Hungary; 2HUN-REN Centre for Social Sciences, Hungary

Violence against women is „a violation of human rights and a form of discrimination against women" (Council of Europe Convention on Preventing and Combating Violence Against Women and Domestic Violence and Its Explanatory Report, 2011). Approximately one-third of women worldwide experience physical or sexual violence from their partners in the private sphere (WHO, 2021), and in the EU, „one in three women has experienced some form of physical and/or sexual assault since the age of 15" according to a 2012 research (FRA, 2014).

International efforts to tackle this matter include various instruments. As these evolved, so did the conceptual framework addressing this issue: initially the focus was on formal equality and the non-discrimination clause, followed by a progressive shift towards a more explicit recognition of violence as a human rights violation (Holtmaat, 2008). Within these, two legally binding treaties stand out: the Belém do Pará Convention and the Istanbul Convention. The Belém do Pará Convention, adopted by the Organization of American States in 1994, was the first binding regional treaty recognising violence against women as a punishable violation of human rights. The Istanbul Convention, established by the Council of Europe in 2011, was the first binding European treaty on the matter.

The paper analyses and compares these two regional conventions involving three aspects: the conceptualisation of violence, monitoring mechanisms, and the role of States in the treaty's implementation. Despite contextual differences between Europe and America, the analysis and comparison highlight similarities and distinctions in text and implementation of these conventions. Initial findings indicate that both treaties share similar objectives and monitoring mechanisms, yet they differ in conceptualising and addressing violence against women (Sipos–Garcia, 2024).

1039

Victims' Interests as a Cultural Repertoire in Lawmaking: Reform of Dutch Sexual Violence Law in the Wake of #MeToo

Annelien Bouland[1], Mischa Dekker[2]

1Carlos III University Madrid, Spain; 2KU Leuven

In recent years, victims of sexual violence and their experiences have received increasing social recognition, most notably through the global #MeToo movement. This is also reflected in the increasingly central role of victims in the legal process, from the process of lawmaking to the trial. While much scholarship analyses the role of victims in sexual violence trials, how references to victims/the increasing centrality of victims shapes the process of lawmaking and legal reform remains understudied and undertheorized. Drawing on research in cultural sociology, we conceptualize victims' interests as a prevalent cultural repertoire that informs processes of legal reform. This article focuses on a case study of the drafting of a new sexual violence law in the Netherlands (2020-ongoing). We conducted a qualitative content analysis of all parliamentary documents relating to the new law on sexual violence and interviews with key actors involved in the process of lawmaking. We highlight three effects of this cultural repertoire on the Dutch legal reform of sexual violence: 1) it allowed specific types of actors to play a more central role in legal reform; 2) it shaped how actors and organizations defend their interests; and (3) it shaped how the role of sexual violence law was defined and communicated. What does making victims more central to legal reform on sexual violence entail concretely, and what tensions and resistance does this provoke? We argue that analyzing how this cultural repertoire informs lawmaking sheds a fundamental and original light on the politics around victimhood and sexual violence in the post #MeToo era.

Struggling With The Full Force Of The Law – 'Law Talk' As Critique Of #Metoo As Reproduction Of Gendered Domination

Trine Cosmus Nobel

Roskilde University, Denmark

In this essay, I critically examine the prevailing reliance on legal concepts in navigating the complex moral dimensions surrounding sexual violence, arguing that it may contribute to the reproduction of gendered domination. I build on two strands of literature and empirical data to justify my argument: Firstly, I explore the ways in which critiques aimed at discrediting the #MeToo movement, which I consider a contemporary manifestation of cultural narratives shaping the moral boundaries of sexual violence, frequently invoke legalistic concepts. For example, critics often invoke the idea of a 'witch hunt' or 'kangaroo court', referencing illicit quasi-legal procedures, contrasted with the perceived authority and privileged role assigned to institutionalized, legitimate legal settings. Secondly, I engage with socio-legal scholarship highlighting the potential inadequacies of employing legalistic 'law talk' in comprehending #MeToo and broader cultural dialogues on gender, power, and violence. I synthesize and extend these two strands of scholarly analysis and empirical insights, offering a theoretically anchored analysis of the consequences of a widespread reliance on legalistic discourse, considering our present knowledge about the dynamics of sexual violence The examination focuses on the cumulative victimization experienced primarily by women as well as sexual and ethnic minorities, considering the substantial objective and subjective barriers to attaining legal justice. In my analysis, I draw on feminist socio-legal scholarship, insights from Bourdieu's framework of practice theory as well as its subsequent feminist reception.

"Don't put all your eggs in one basket": The Postfeminist and Entrepreneurial Subject in Chinese Reality Dating Shows

Xintong Jia

University of Essex, United Kingdom

Intimate relationships are presented as personal business on reality dating shows. Dating contestants perceive intimate relationships as work, illustrating the growing influence of an entrepreneurial mindset on contemporary perspectives and personal lifestyle choices. The entrepreneurial self is framed as a project demanding a lifelong and all-encompassing process of transformation and upgrading. This paper explores the postfeminist and entrepreneurial subject embodied by female candidates on the reality dating show 'New Matchmaking Conference', produced by Jiangsu Satellite TV from 2019 to 2021. The data are derived from thematic analysis of the show and audience reception with 23 young women viewers in China during the Covid-19 pandemic. Audience reception research combines texts-in-action viewing sessions and in-depth interviews to capture not only the live moments of TV engagement but also the viewers' reflection on the entrepreneurial subject depicted on dating shows. The paper has summarized three key themes that collectively construct the entrepreneurial subject: 1) the middle-class imagination; elucidating the bourgeois taste and lifestyle presented by dating candidates; 2) the aspiration for a 1+1>2 relationship; reflecting the expectation for an 'ideal' relationship where both parties maximize mutual benefit, emphasizing that relationships and marriage serve as avenues for self-optimization; and 3) "Don't put all your eggs in one basket", outlining the calculating and precarious subject who engages in the (unpaid) labour of self-branding, curating a positive persona, and publicizing social media accounts on the show. This paper contributes both empirically and theoretically to the existing literature on the postfeminist and entrepreneurial subjectivity, offering insights into how postfeminism and neoliberalism are lived, experienced, and represented.

RN33 | T06_04: Gender, the Life Course, Families and Care

Reconstruction of Grandfathers' Fathering in Turkey: Masculinity, Family, Work

Esra Gedik

Yozgat Bozok University, Turkiye

This study delves into the often-overlooked realm of caregiving roles shouldered by Turkish grandfathers, providing a nuanced exploration of the intricate interplay between masculinity, family dynamics, and the delicate equilibrium of work and life. Against a societal backdrop associating caregiving primarily with females, the research aims to illuminate alternative gender constructs in the Turkish context. It focuses on pivotal moments where traditional masculinity confronts challenges, including crises and periods of assuming primary childcare responsibilities, employing a multifaceted methodology for a comprehensive perspective. The research foundation is established through a qualitative synthesis of existing literature on fathering, gender, and nontraditional family structures. This groundwork is complemented by in-depth interviews with a diverse cohort of Turkish grandfathers, facilitating the exploration of their narratives and the identification of recurring themes. Narrative analysis, a critical component of the methodology, deepens understanding at the intersection of gender, family, and work. Contrary to prevailing assumptions relegating Turkish grandfathers to auxiliary roles in childcare, the study challenges these notions, revealing that they do not assume mothering responsibilities. Instead, societal perceptions often stereotype them into roles like the "baby entertainer" or "part-time father" — essentially, as mothers' helpers. By challenging stereotypes, the study underscores the diverse and evolving nature of caregiving among Turkish grandfathers, significantly contributing to understanding masculinity within Turkish familial and societal contexts. Furthermore, it interrogates societal resistance to nontraditional gender roles, aiming to uncover how these resistances are generated and perpetuated in the fabric of everyday life in Turkey.

Exploring Practice of Relational Agency in Living Apart Together Relationships

Shuang Qiu

Keele University, United Kingdom

This paper takes a relational approach to examine how agency is developed and negotiated through the practice of living apart together (LAT) relationships. China's dramatic socio-economic transformations over the past few decades have witnessed a growing diversity in people's intimate relationships and personal lives. At the same time, a heterosexual couple living with their dependent children remains the most prevalent living arrangement in contemporary Chinese society. In-depth interviews with 35 LAT women at different life stages with contrasting socio-economic profiles were conducted to explore why they ended up living apart from their partners. The analysis shows how people's agency in living a desired co-residential partnership intersects closely with practices of gender, social norms about family values, and their life stages as circumstances and contexts change. In the split households that are a result of structural constraints, people tend to be 'forced' to live separately from their partner, and family life is essentially shaped surrounding the gendered family roles and maintained through gender inequalities. Couples living apart can also be a personal choice. There is a rise in individualism and reflexivity, especially among the young generation, in making sense of changes in their personal lives, while social and cultural expectations of female roles in Chinese society are particularly strong. This empirical-based study on LAT relationships provides an important insight into the interaction between individualism and familism and argues that practice of agency is conditioned by intersections between social circumstances, gender roles, and relational bonds with others.

Masculinities: Care, Privilege and Trust Explored with Ageing Czech Men

Iva Smidova, Tereza Mensikova

Masaryk University, Czech Republic

1041

Exploring social inequalities based on gender and age still presents a challenge in intersectional analytical perspective. The paper presents work-in-progress findings from a qualitative sociological study on the institutions of ageing men. Fieldwork is based on face-to-face interviews with (ageing) men in several social settings in the Czech Republic. Using a critical analytical perspective and grounded in feminist methodology, this paper compares and explores the themes of care, privilege, and trust – or lack of any or all thereof – among two groups of communication partners. These are graduates of courses designed to reflect on masculinity (mostly urban, upper-middle-class men in their middle adulthood) and users of transition homes (older men in shelters for homeless people designed for single overnight stays). Intersections of age and gender and their various conceptualisations provide diverse implications for the topics of care – provided and received (being cared for) – in these social settings. Analysis of 27 interview transcripts opens up issues related to care, such as trust in institutions and one's own capabilities to bring about desired change, respectively, preventing change from happening. It helps us understand continuity as well as change and transitions in their lives connected to age and gender. It points out the reproduction of privileges and inequalities within groups of men and normative expectations related to masculinities. And it aims to bring further understanding to the gender and age related perspectives on care in broader social and analytical terms of continuity and change in the gender order.

(Un)changing Masculinities: Mineworker Men's Everyday Lives after Retirement

Atilla Barutçu[1], Fatma Umut Beşpınar[2]

1Zonguldak Bülent Ecevit University, Turkiye; 2Middle East Technical University, Turkiye

This presentation explores the construction of retired mineworkers' masculinities, focusing on the dynamics that evolve during increased free time post-retirement and daily life practices. The masculinities of the working class in mining cities have undergone changes through two processes since the 1980s: privatizations and early retirements. Mineworker masculinities in Zonguldak, one of Turkey's significant mining cities, are no exception. Despite the deindustrialization process, Zonguldak maintains its identity as a "mining city", and the impact of mining masculinity persists. The study investigates how the extended free time post-retirement influences the gender identities and performances of mineworkers, who have shaped their masculinity through years of demanding work. In-depth interviews with 15 retired mineworkers in Zonguldak reveal that retirement brings both opportunities and crises. Opportunities include specialization in other fields or applying mining skills elsewhere at early ages. However, crises arise from the perception of a labor-intensive skill becoming idle, leading to a sense of uselessness in a still active life. Overall, daily life after retirement is imbued with meaning derived from the mining profession and identity, with an effort to maintain a heroic masculinity that endures beyond retirement.

RN33 | T07_01: Violence Against Women and Women's Voices

What is the Impact of Women's Movements on Policies to Prevent Violence against Women? A Comparative Study Set against Political and Social Change in Spain and Italy

Consuelo Corradi, Stellamarina Donato

Lumsa University, Italy

Actions to counter violence against women are a fully-fledged policy field with significant differences across countries. Through a comparative analysis of Spain and Italy since the 1980s, this presentation maps the interplay between women's movements and national governments in launching violence against women (VAW) policies. In Spain, policy formation was the outcome of dual feminist–socialist activism, leading to dialogue between movements and the government. In Italy, movements opposed the government from the outside. In both countries, the critical factor inciting responsiveness on VAW was not one single variable but a mixed combination of political opportunity, movement identity, dedicated women's state agencies, and the soft power of international institutions. Today, as the narrative on VAW spreads globally, the interplay with national governments may serve to increase knowledge about the role and impact of women's movements on this, and other policy issues.

Combating Violence Against Women: An Examination of the Struggles of Women's NGOs in Turkey

Nilay Çabuk Kaya[1], Yasemin Yüce[2]

1Ankara University, Dept.of Sociology, Turkiye; 2Ondokuz Mayıs University, Dept. of Sociology, Turkiye

Violence against women (VAW) is a pressing social problem in Turkey, and despite policies implemented since 2007 through National Strategies and Action Plans, there are notable deficiencies in prevention. It is imperative to assess the effectiveness of current policies and practices in addressing women's needs, evaluating achievements, and identifying obstacles and gaps from stakeholders' viewpoints.

While the number of cases of violence against women is increasing in Turkey, many different policies and practices

1042

have been developed and implemented to combat violence against women. The question then arises: Why do these practices and policies fail to reduce the number of cases of violence against women? This presentation, part of a nationally representative research in Turkey, will discuss why current practices, legislation and policies are insufficient from the perspective of women's NGOs. Women's NGOs, which are important actors in the fight against violence against women, are in a position to observe and know both sides of women subjected to violence and the state institutions responsible for their protection. Because of this position, they are well-placed to identify shortcomings and inadequacies in the field of combating violence against women. For this reason, focus group discussions were held with 34 women's NGOs selected from 12 different provinces in Turkey. According to the results of the discussions, state institutions have generally lost the perspective of working with women's NGOs. They carry out the State-NGO cooperation as specified in the National Action Plans with the selected women's NGOs that align with the government's political orientation and support its policies.

Women's Perspectives on Achievements, Challenges and Gaps in VAW Policy and Implementation in Turkey

Fatma Umut Beşpınar[1], Merve Kaya[2]

1Middle East Technical University, Turkiye; 2Ankara University, Turkiye

This presentation is based on a national-level research project that aims to evaluate policies and practices in combating violence against women through a gap analysis method to identify the achievements, obstacles, and gaps in policies and practices to combat VAW in Turkey. Based on the results of our research, this presentation will highlight the experiences of women who have been subjected to domestic violence. It adopts the feminist model, which recognizes women's strength, resilience, and agency, and seeks to achieve the goals of women's empowerment and self-determination. In this context, the main findings of qualitative data obtained from semi-structured in-depth interviews with 36 women in 12 provinces of NUTS-1 statistical regions of Turkey are evaluated. The research includes women from diverse backgrounds, but a common characteristic of the participants is that they have experienced violence within their nuclear family, extended family, and intimate relationships. According to the main findings of the interviews, there is a need to raise awareness of the current gender inequality, provide social and economic support to women, and revise existing policies not only in response to violence but also with a preventive focus on violence. These findings, presented from the perspective of women who have experienced violence, will contribute to the improvement of existing policies and services related to combating VAW in Turkey, taking into account the needs and characteristics of these women. It is emphasized that the perspectives of these three prominent institutions – the family, the state, and women's NGOs – in preventing and combating violence

are far from developing a comprehensive approach to VAW without taking into account women's experiences.

What Does It Mean "Gender Approach" In Studies and Policies On VAW?

Angela M. Toffanin, Beatrice Busi, Caterina Peroni

CNR, Italy

The proposal aims to discuss continuity and changes in definitions and social representations on gender-based violence, and namely on male violence against women (vaw), as defined in sociological debates as well as by policies and public discourses in Italy.

During the last five decades, the adoption of a gender approach has been consolidated to understand violence against women, defining it as a structural phenomenon located within the social structure of relations between women and men. Oriented towards women's suffering and agency, this approach crosses European as well as Italian policies, at least at narrative level (Schwartz 1997; Creazzo 2008, Corradi, 2006, Pietrobelli et al., 2020). On the other hand, the evolution of the debate on gender issues under the name of equality has originated approaches based on gender symmetry (Straus, 2014), such as those found in some Nordic countries. Both these narratives are also connected to situated discourses, characterised by tensions and continuities in gendered social orders at local, national and transnational level.

Based on ongoing researches in the Italian context, we propose an interpretation of the evolution of definition of vaw considering three areas of analysis:

– the policies supporting women in situations of violence, in particular those related to socio-economic empowerment measures;

– the mobilizations across the country, following the feminicide of a young woman in 2023;

– generational changes in stereotypes of gender roles, masculinity, femininity and violence, collected both from qualitative studies conducted in 2024 and the survey published by Istat in 2023.

RN33 | T07_02: Women's Activism

Inter-Generational Gender Patterns: Disabled Women's Shifting Feminist Discourses

Magda{lena} Szarota

Lancaster University, United Kingdom

Despite being one of the largest and most diverse minorities in the world, disabled women face intersectional discrimination that is under-researched. This oversight extends to neglecting the knowledge generated by disabled women activists within sociology. To address these epistemic gaps, which also persist in Women's and Gender Studies, a critical examination of the history of discrimination against disabled women and the production of knowledge by them is necessary. Furthermore, such scrutiny is crucial for understanding the gendered discrimination faced by marginalized populations in neoliberal and patriarchal societies. This paper aims to address some of these omissions by exploring the inter-generational knowledge-making processes related to the conceptualization of feminism and the interconnected concept of gender, as advocated by disabled women and their allies. The empirical foundation of this exploration is based on the advocacy efforts of leading disability organizations led by Polish women over the past two decades. These organizations have critically engaged with dominant exclusionary discourses in Poland and Eastern Europe regarding gender, identity, citizenship, and agency. Therefore, their contributions can be framed as 'new feminist activism.' Additionally, this paper contributes to discussions on the 'generations of feminism,' highlighting how changing economic, political, and cultural contexts shape the approaches to conceptualizing feminism and gender among representatives of women-led disability organizations of different ages.

Women Empowered as Active Agents For The Living Together Of Their Communities

Mar Joanpere[1], Esther Oliver[2], Marta Soler[2]

1Universitat Rovira i Virgili, Spain; 2University of Barcelona, Spain

In contemporary societies, women, irrespective of age, cultural background, educational path, or socio-economic status, drive diverse empowerment processes globally. Their leadership in these endeavors enhances agency and amplifies voices in social spheres crucial to their lives, families, and communities.

This communication ESA highlights outcomes from the All Women project, titled "Empowering all women through adult education for sustainable development" (2021-2024).

The paper specifically delves into a case study exploring women's involvement in a successful educational initiative, the Dialogic Scientific Gathering, and their contributions to the development of a dialogic model of conflict prevention and resolution in an urban preschool and primary education setting. The study finds that women engaged in the Dialogic Scientific Gathering played a pivotal role in mobilizing other families to implement the Dialogic Model of Conflict Prevention and Resolution in the community. They actively participated in dialogue spaces, offering evidence-based arguments for social impact, fostering unity, and contributing to improved coexistence in the school community.

This paper reflects on the transformative effects of women's participation in community processes, underscoring their role as social agents shaping and influencing the social contexts in which they participate.

"My Body Speaks My Ideology" – Expressions Of Participation And leadership Among The Girls Active In The Protests In Israel.

Sigal Oppenhaim – Shachar

Bar Ilan university, Israel

The current protests in Israel provide a fertile ground for tracing the power that motivates adolescence girls and documenting different narratives of defiance of power and leadership, some of which are embodied.

In light of the fact that there is no universal experience of girls, we have to look for components of safe spaces that allow them sense of power and autonomy. That is, to examine how intersections of identity positions alongside cultural contexts and reality circumstances allow some of the girls to become active and to explore their leadership ability.

From the analysis of the findings collected through semi-structured interviews and focus groups with girls aged 16-18, it appears that the girls experience the activity itself and the demonstration arenas, as safe spaces. This is mainly because they can exhibit defiance through their body, the same female body with all that is embodied in it, which from their point of view, the current government, strives to have them hide.

And so, it is interesting to see how the body, shape, clothing and gestures, express narratives of active participation. Coupled with highlighting their femininity, they position themselves in the arenas of protest, reclaiming an expression of power that is mostly perceived as masculine.

1044

Footprints of Protest Masculinity in the Little Square of Agonies: Avatar Aesthetics, Incels, and Manospheric "Neo-realities"

Ozan Félix Sousbois, Hande Eslen-Ziya

University of Stavanger, France

This research explores the manifestation of protest masculinity within the incel community, specifically examining avatars as a unique form of self-expression and community-setting. Through an analysis of avatar self-portrayals sourced from the incel website incel.is, our aim is to reveal the political potential of aesthetics in shaping the identities of incels, considering the structuring role of erotic capital. These avatars, infused with distinct qualities, establish a profound connection with their subjects, transforming into visual practices that facilitate both self and communitarian ideological and political expressions. Diverging from the conventional emphasis on class-related aspects of protest masculinity, this study analyzes incels' aesthetic expressions as a creative form of social manifesto, providing a distinctive approach to understand their critics about "sexual agony" or male-loneliness within the context of gender-radicalization.These avatars function as pathways for subjectivation and politicization, simultaneously "cursing" and envying the hegemonic beauty standards for men. Conducting a comprehensive thematic and visual analysis of about 1000 avatar photos, our research delves into the intricate interplay between graphical and thematic choices. This investigation unveils the volatile dimension of incel-collectivity by studying their pictural agenda and choices, as well as their contribution to the emergence of digital protest masculinities. The findings accentuate the pivotal role of avatars in reshaping incels' realities into what can be termed as "neo-realities," elucidating how these choices actively reshape visual narratives surrounding incel-culture. Consequently, this study illuminates the nuanced ways in which such choices extend beyond a simple individual expression, carrying broader socio-political implications and identifications. It provides valuable insights into discussions on masculinity, identity construction, and the socio-political landscape.

RN33 | T07_03: Beyond the Binarism

The Binary Of Sex And Gender As Common Sense? Transformations And Continuities

Anike Krämer

TU Dortmund, Germany

In the Western world, the certainty of sex and gender in the sense of male and female as unambiguous, natural, and unchangeable is reflected in the assumption that there are two and only two sexes and that the genitals provide information about the sex. We know that intersex people exist who do not fit that binary.

Furthermore, gender is deemed innate and unchangeable because of an understanding that it is grounded in the body.

In my presentation, I will discuss how this 'naturalness' of sex and gender shifts, transforms, and continues when a child receives an intersex diagnosis and no longer fits into the (medical) binary system of male and female. My findings are based on my research on the everyday experiences of parents of intersex children in Germany. For this I conducted narrative interviews with parents and analyzed them using grounded theory methodology.

In a society where the dichotomy of sex is an unquestionable fact, parents with an intersex child have to figure out how to integrate "intersex" into their knowledge. The self-identification of the child becomes the decisive factor for the parents to identify their child's gender. The parents try to identify the child's self-identification by analyzing their child's preferences when it comes to playing, colors or behavior. While becoming reflective about gender, the parents are still looking for gender-biased behavior. Also, they still see gender as something innate and unchangeable, because they believe that identity is grounded in the body. I will argue, that the parent's common sense of sex and gender change, but that the concept of unambiguity, naturalness and the unchangeable of sex and gender still persists.

1045

Transphobia Beyond Waves: Interrogating Feminist Genealogies

Hannah Victoria Ayres[1], Marcel Obst[2], Elizabeth Ablett[3]

1University of Warwick, United Kingdom; 2Sheffield Hallam University, United Kingdom; 3Newcastle University, United Kingdom

'Generation' typically evokes specific historical periods or age cohorts, and has, in Western feminist epistemologies and feminist organising, often been employed in problematic ways through the notion of 'waves' of increasingly progressive feminism. Generation is often invoked as a

shorthand to delineate feminism's 'bad objects' (Nash and Pinto, 2020, 2023), demarcating political and epistemic boundaries through negative affects and a presumption of intergenerational conflict. Such antagonisms can work to elide the many complex relations, overlapping interests and intersectional alliances between and within generations. We explore the usefulness of the notion of 'generation' in relation to thinking about trans-exclusionary feminism in the UK and Spain. It is perhaps tempting to dismiss TERFs as outdated, old-fashioned, and soon to be confined to the dustbin of history. But this fails to respond to the ongoing influence of their rhetoric in the present moment and the entrenchment of trans exclusionary ideas in political discourse and policy. It also fails to do the uncomfortable work of reckoning with the history of Western feminisms' entanglements with 'fasciant themes' (Lewis and Seresin, 2022), and the ways in which forms of exclusion, including racism and transphobia, structure certain aspects of Western feminism. We trace the exclusionary history which prefigured the present TERF influence, and examine the seemingly 'strange alliances' between feminists and right-wing/far-right. We then explore forms of accountability to one another that do not depend on tropes of intergenerational antagonism, and thus can reckon with feminist complicities whilst working towards more fully liberatory trans-inclusive feminist futures.

Intersex people and transformative research agendas: Findings from the Intersex – New Interdisciplinary Approaches (INIA) Research programme

Surya Monro

Loughborough University, United Kingdom

Intersex people and people with variations of sex characteristics frequently face social erasure, discrimination, and stigmatisation. Intersex minors in many countries still experience non-consensual and medically unnecessary medical interventions such as clitoral reductions, which often leave them traumatised and with serious long term health issues. Intersex people's suffering is a result of intersecting forces, including sex/gender binarism, body normativity, and ageism (as irreversible interventions are carried out on young children because of adult's prejudices). There are severe tensions between medical practitioners who continue with practices that are shown to have high risk of harm, human rights advocates and intersex activists who condemn early non-vital interventions, and parents, who may or may not have normative ideas about their children. Intersex people and those with variations of sex characteristics experience specific sexuality-related and gender – lelated harms and issues, which are often absent from Sociological discussions; this presentation will outline some of them.

Intersex people are subjected to epistemic injustice by non-intersex people (including medics and social scientists) who build careers in the fields of DSD (Disorders of Sex Development) and/or intersex studies without engaging in impactful work to support medical and social reform. The

Intersex: New Interdisciplinary Approaches (INIA) international research programme was an attempt to counter this. It was funded by the European Commission (2020-2024) to deliver 10 original research projects. INIA https://www.intersexnew.co.uk/ drew on aspects of Participative Action Research methodologies Topics included issues of gender, older intersex people, activism, equality and diversity, healthcare, cultural representations, human rights frameworks and ethical research methodologies. This presentation provides an overview of some key projects and findings.

Generational Shifts in Young Women's and Nonbinary People's Accounts of Sexual Harassment

Satu Venäläinen, Sanna Aaltonen

University of Eastern Finland, Finland

The #metoo movement and various other social media campaigns have made sexual harassment increasingly visible in recent years. Such collective practices of naming and thereby resisting sexual harassment have been made possible by feminist discourses that have enabled the linking of personal experiences to gendered social structures. In our presentation, we examine temporal shifts in young people's accounts of sexual harassment based on two datasets generated by 15–16-year-old girls and nonbinary people which were collected 20 years apart (2000 and 2021) in Finland. We present the results of an analysis that drew on poststructuralist discourse theory, intersectionality and Sara Ahmed's writings on complaints in exploring the young people' positions in relation to sexual harassment in the two datasets. We show how in the 2000 dataset, the participants emphasized individual agency and responsibility, whereas in the 2021 dataset, they acknowledged gendered and intersectional patterns in victimization and actively resisted victim-blaming and silencing. Therefore, the positions the participants held in the two datasets differ specifically in the extent to which they are informed by feminist discourses and the extent to which sexual harassment is seen as warranting and legitimating complaint. We conclude our presentation by discussing the possibility of reading this pattern as an indication of generational shifts in young people's capabilities to recognize and criticize sexual harassment in their everyday lives.

1046

RN33 | T07_04: Men and Masculinities Between Modernity and Late Modernity

Navigating Anonymity: Tracing Provincial Masculinities through Rental Car Consumption in Anatolian Towns in Turkey

Bengisu Öten, Dilek Cindoğlu

Kadir Has University, Turkiye

This study traces how provincial masculinities are performed and reproduced in provincial conservative contexts by looking at the rent-a-car consumption practices of local consumers in Konya, Turkey. Cars constitute a private mobile space in modern urban settings and contribute to the construction of hegemonic masculinities through daily routines, intertwining notions of freedom, privateness, and visibility within the fabric of car cultures in the modern era. However, especially within conservative and tightly-knit provincial urban environments, where the daily whereabouts of community members are closely under surveillance paradoxically, the privacy of the car becomes public through this gaze. Hence, owning a car in these environments entails a compromise of freedom. The preliminary findings suggest that rental cars also serve the anonymity needs of the local notables when they transgress the moral boundaries of the community to gain their freedom. Connell and Kimmel argue that masculinities undergo changes influenced by culture and geography to gain community approval. In this framework, through rental cars, provincial masculinities opt to forsake recognition, a predominant aspect of masculinities and car cultures. The vehicle becomes a temporal negotiation zone between freedom and visibility in the daily construction of provincial masculinities. This article employs an ethnographic approach, utilizing semi-structured interviews with rent-a-car proprietors and their clients in Konya. It seeks to trace the dichotomies inherent within these contexts, such as moments of anonymity/visibility, publicness/privateness, and transience/permanence. This exploration aims to unearth the nuanced dynamics of masculinities within these settings while delineating the intersections between conservatism, temporality, and anonymity.

Lost Boys or Uncooperative Immigrants? – Intersectional Analysis of Constructions of Accountability in the Online Discourses on "Street Gangs" in Finland

Marja Lönnroth-Olin

University of Helsinki, Finland

This paper analyses how the online audience discuss youth street gangs in Finland, a topic that has gathered a considerable amount of public attention and concern in recent years. The public discussions have been clearly gendered and racialised, with young immigrant men as the main culprits, and the gangs have been constructed as a threat to Finnish values and national security. The data consists of comments to news articles about street gangs, collected from three Finnish online media sites (hs.fi, yle.fi; svenska.yle.fi). The analysis combines critical discursive psychology with an intersectional approach, and explores how accountability is constructed in lay discourse online; a perspective that has been left somewhat unattended in discursive research on this topic. This combined theoretical and methodological approach allows the analysis to simultaneously shed a light on the interactional level discursive work in the online environment, as well as on the structural level societal discourses that shape these everyday meaning-makings. The analysis shows how intersectional categorisations, such as age, class, gender, race, and ethnicity are mobilised to construct accountability for various actors, ie. society, family and the individual. Moreover, it shows how the sense-making around youth street gangs rely on national historical narratives that shape understandings of proper gendered citizenship. In practical terms, the question of accountability has implications on what is seen as proper reactions and measures to combat the problem. Moreover, the discourses can be mobilised to legitimise exclusion and control of those considered to belong to the outgroup.

1047

Exploring the Manosphere's Discourse on Prostitution: Unraveling Masculine Self-Perceptions

Carina Schulz, Niklas Herrberg

Heinrich Heine Universität Düsseldorf, Germany

The changes in masculine subjectivation in late modernity and the crisis of neoliberal subject cultures can trigger authoritarian reactions. From a gender sociological perspective, the reference to traditional ideals of masculinity is particularly relevant in this context. The emergence of the so-called Manosphere can be considered as a manifestation of these developments. With reference to Connell's work on Hegemonic Masculinity we understand this as a defence of a masculine self-perception whose hegemony is perceived as being threatened.

Especially the engagement of the Manosphere with the topic of prostitution offers an often-unrealised potential to elaborate implicit masculine self-perceptions. Therefore, we focus on how the interpretation of prostitution by actors in the Manosphere is accompanied by discourses of subjectivation. Our presentation addresses the gender images within the framework of a sociological discourse analysis of postings from a client forum, as well as one key online forum each of the so-called Incels and Men Going Their Own Way. We identify central themes of gender-related understandings of subjects and further interpret them through a fine-grained sequential analysis.

In terms of Hegemonic Masculinity, we can point to three particularly relevant self-perceptions. Firstly, the attempt to defend masculinity through the exertion of power over women. This manifests through blatant misogynistic degradation and the objectification of women. Secondly, the declaration of a claim to women, framing sex and affection as obligations women must fulfil for men. Finally, masculinity is defended by asserting independence from women, with prostitution being rejected from a standpoint of superior morality.

Analysing the Construction and Impact of Visual Discourse in Loyalist Communities through the Lens of Masculinity.

Paula Ellen Surgenor

Ulster University, United Kingdom

This paper seeks to decipher mechanisms that are operating within iconography, and furthermore examine how the material is deployed, within residing communities of Northern Ireland through the lens of masculinity. Although many academics have touched upon discourses of masculinity to explain the underpinnings and perpetuation of conflict, there are inchoate understandings in relation to Northern Irish visual material. This is perhaps surprising given, even at first glance, the obvious masculinity-related themes of guns and militarism depicted in the murals of key actors and events from the conflict and in the banners, flags and insignia that are so prevalent in many local areas. This research focuses on the production and display of such powerful visual material and explores the extent to which it can be viewed as gendered. By focusing on gender, the research seeks to highlight the potential of this dynamic for understanding and responding to common forms of sectarian or politically motivated behaviour.

Visual material can represent a device for understanding sectarian and gendered behaviour and provide a means to decipher the function of power and control in local communities. This research will examine how these depictions can illustrate assumptions of power and appeal to militarized masculine tendencies which mobilise and amplify the scope and scale of Loyalist agency. The research will therefore explore how the construction and deployment of such identities can pose serious implications for community relations and the perpetuation of endemic sectarianism and segregation in Northern Ireland's post conflict environment.

RN33 | T08_01: Gender and Socialization

Resistance And Hierarchies In Mealtime Conversations. An Ethnography Of Power And Care In Family Socialisation

Fairley Le Moal[1], Coveney John[2], Isabelle Mallon[1,3]

1Centre Max Weber, UMR 5283; 2College of Nursing and Health Sciences, Flinders University; 3Université Lumière Lyon 2

The image of families happily eating together, having conversations, is a pervasive ideal across many societies in the Global North. Family mealtime conversations – also called commensal communication – are viewed positively and have been associated with social and health benefits, but few studies have investigated the way they enfold and are regulated. This study examined how family members managed and took part in mealtime conversations, and how different gendered, class-based, and cultural norms of family life, fatherhood, and motherhood shaped communication. Based on 90 hours of in person observations in 14 households across France and Australia and interviews with parents, this ethnographic study examined how family members engaged or disengaged from commensal conversations and how table talk was regulated. The data was analysed using grounded theory (Charmaz, 2014). Goffman's work on the 'territories of the self' in social interactions and his theories about conversational territories (1971) supported our analysis and allowed us to focus on regulation and power relationships in mealtime conversations and on their articulation with relationships of care (Tronto, 2008). Unequal and hierarchical gendered relationships were thus observed during mealtime conversations. The commensal communication reinforced the fathers as custodians of parental authority and the mothers as guardians of egalitarian relationships between siblings, of family cohesion and of children's health and wellbeing. Mealtime conversations were built around children, but they were also seen showing resistance and engaging on their own terms and according to their age-related capabilities. The management of conversations repositioned parents in traditional roles of domestic care and power relationships.

Gender Regime of Kindergarten

Svetlana Radovic

Preschool Teacher Training College Novi Sad, Serbia

Commencing with the theories of reflexive modernization and patriarchy, this paper examines the nexus between the process of individualizing gender roles and the transmission of patriarchal patterns within the framework of gender socialization at an early age. The focus is specifically

1048

on kindergarten, recognized as a pivotal institutional agent of socialization. Participant observation is employed as the primary method to investigate this relationship. Trained students served as observers during their two-week internships, observing gender-oriented interactions among children and between children and educators in kindergartens located in Novi Sad, Serbia. Qualitative and quantitative analyses of meticulously recorded field notes indicate that 72% of the total observed gender-oriented interactions (378) perpetuated a traditional pattern of gender roles. Gender-stereotyped interactions pervade all facets of kindergarten activities, including learning, play, and everyday routines. Children exhibit a greater tendency to replicate the traditional pattern of gender roles in their interactions compared to teachers interacting with children, with boys displaying this tendency more frequently than girls. Preschool teachers, in responding to gender-stereotyped interactions among children, predominantly rectify children's behavior in alignment with stereotypical roles. Furthermore, the majority of the limited instances where children challenged stereotypical gender roles resulted in their subsequent alignment with the stereotypical gender role following the reaction of teachers or other children. The findings of the study suggest that the gender regime within kindergartens perpetuates a patriarchal pattern of gender roles, and instances of individualizing gender roles are infrequent.

Gender Inequality and Their Determinants in Physical Activity Involvement Among Adolescents in Spain

Áxel De León Marcos[1], Ainara San Juan Escudero[2], Jesús Rivera Navarro[1], Leyre Gravina Alfonso[2]

1University of Salamanca, Spain; 2University of the Basque Country, Spain

Introduction. Engagement in physical activity during adolescence has a plethora health and social benefits. Nevertheless, adolescents decrease their physical activity as they grow older, especially females.

Objective. To understand physical activity habits among adolescents and possible gender inequalities and their determinants.

Methodology. With the usage of different neighbourhoods of Madrid and Bilbao, a Z index was constructed, stratifying the neighbourhoods of these two cities into three socioeconomic tertiles: low, medium and high. Once the neighbourhoods were ranked from the highest to the lowest level, 5 neighbourhoods of each city were selected according to their socio-economic status.

Educational centres in the selected neighbourhoods were studied; 36 semi-structured interviews were carried out, of which 12 were with key informants. Furthermore, 24 focus groups were conducted, 6 with students, 12 with teachers and 6 with parents. These techniques were applied proportionally in the two studied cities.

Results. In addition to indicators such as social class, gender has been highlighted as key determining physical activity habits. Female students decrease their participation in formal sports both outside and inside schools, as opposed from their male counterparts. Lower socioeconomic respondents suffer a steeper decline due to burden of caregiving.

Conclusions. Understanding the reasons for gender inequality in physical activity participation among adolescents can

Gender and Care between Bonus/ step-grandparents and Bonus/ step-grandchildren

Linn Alenius Wallin

Lund University, Sweden

Almost half of all divorced Swedes are aged 60+ and many of them are, or have been, part of a reconstituted family. This increases the probability of having (or to be a) bonus/step-grandchild and raises the question:

How does the caregiving dynamic between bonus-grandparents and bonus-grandchildren intersect with gender and life situation, unraveling the intricate threads that weave through familial relationships in later life?

The data consists of in-depth interviews (and diaries, lifelines, concentric circles, and drawing exercises) with bonus-grandchildren (n13) and bonusgrandparents (n13) who´s bonus-relations departs from re-partnering as well as family of choice.

Building on Mason´s (1996) concepts of care, I argue that the disproportionate caregiving burden previously in life diminishes women's willingness of care for bonus-grandchildren, while for men caring is conceptualized as an opportunity to redress previously missed chances for engaging in caregiving activities. An additional argument is that when informants engage in joint caregiving as a couple, the care of bonus-grandchildren is viewed as a means of fortifying the relationship. Conversely, when caregiving is carried out separately to separate sets of grandchildren it competes with time allocated for the couple.

In the context of bonus-grandchildren assuming caregiving roles, I observed that the interviewed girls articulate their involvement in providing both emotional and practical care to their bonus-grandparents. In contrast, the boys in the study predominantly characterize their caregiving contributions in terms of practical assistance. This research underscores gender-specific patterns in children's caregiving roles, shedding light on distinct dimensions of practical and emotional support within the familial caregiving dynamic. This research contributes to a nuanced understanding of how gendered caregiving dynamics shape intergenerational relationships in reconstituted families and families of choice.

RN33 | T08_02: Generations

Sentient Dependencies in "the Most Individualised Country in the World". Rethinking Generation, Gender and Care in Sweden.

Sara Eldén, Terese Anving, Linn Alenius Wallin

Lund university, Sweden

This paper discusses the possibilities of rethinking the narrative of how intergenerational relations have developed throughout history in Sweden, focusing specifically on how to understand dependency between generations in a family. We argue that the dominant narrative of "decline in family care between generations" has taken its point of departure in an understanding of in/dependence that rests substantially on the notion of the autonomous individual. Care responsibilities being taken over by the state has been equated with an idea of an overall independence of significant others.

The paper departs from a study of care biographies, with interviews from three generations of Swedes – women and men born in the 1940-50s, in the 1960-70s, and girls and boys born in the 2000s (63 informants). These narratives are analysed through the theoretic lenses of personal life (Smart 2007, 2009; May & Nordqvist 2019), relationality (Mason 2004; Twamley et al. 2021:4; May 2015; Nilsen 2021), and care as "sentient activities" (Mason 1996); perspectives that places the reflexive social self at the centre and enables the capturing of the multi-dimensionality of relationships. The analysis shows that the expansion of the welfare state has transformed care doings between generations in ways that have enabled simultaneously independence, particularly for women, but also new forms of dependence, less informed by economic necessity but often just as strong or demanding as economic ties – sometimes constraining, sometimes positively affirming – as people continue to be embedded in webs of relationships to kin (Smart 2007:23).

Profiles Of Oppression In The Inter – And Intra-Generational Female Chain

Ignazia Bartholini

University of Palermo, Italy

In today's sex/gender system (Rubin 1974) there are still residues of that oppression that we consider as an invisible barrier that prevents women from expressing their needs for identity affirmation in private, professional and public life.

The challenge imposed on women in combining tradition and postmodernity translates into a "genuine club on the head" (Bartholini 2023). However, one wonders whether the elements that determine this oppression are not to be understood today as attributable to an emotional work (Hochschield 2011) of a matrilineal nature, rather than a late patriarchal one. And whether they can be traced back to significant female relationships of an intra – and inter-generational nature that guide women's habits and postures with latent forms of emotional blackmail.

The search results we propose to return, and based on 31 biographical interviews with professionals between 40 and 55 years old living in southern Italy, highlights how "female habits" are partly the product of a "gentle violence" perpetrating "in" the "inter – and intra-generational gynaeceum" (mothers, grandmothers, relatives and reference figures in various roles) of the interviewees.

The self-representations of the sample of interviewees, inspired by family-work conciliation, hide an oppressive configuration of models and habitus that imposed on the woman must be able to carry out her role as partner, mother and worker (perhaps even successful) and to carry out the functions foreseen by this same multiple role without failure (divorce, separation, loss of employment ecc.), under penalty of disapproval of one's "inter – and intra-generational female chain".

New Generations, Old Problems? Gendered Experiences Of Different Generations Of Women At A Hungarian University

1050

Anikó Gregor, Ágnes Kövér-Van Til

Eotvos Lorand University, Hungary

Several recent studies confirm that European higher education institutions remain highly gendered and gender stratified (see, e.g. Drew & Canavan 2020, Rosa & Clavero 2022, Séllei 2015). In our presentation, we will complement the previous findings, coming from a mainly Western European context, with the research results at the largest public university in Hungary, a country with a heavy anti-liberal (Fodor 2022), reactionist-populist (Fraser 2017) gender regime. The research aimed to ground a Gender Equality Plan for the university to tackle the epistemic injustice (Clavero & Galligan, 2021) and, not only to identify the problems of those working in different faculties and positions in the organizational hierarchy but also to shed light on the experiences of the academic staff of different age groups about gender relations within the university. Our goal is to explore how the perception of gender problems and sensitivity to gendered interpersonal and institutional relations change among academics of different age groups. Preliminary findings confirm that younger female academics have stronger awareness of their gender-based disadvantages and they show higher level of competence to recognize adverse situations that limit their career chances. By contrasting the experiences of different age groups, our presentation also contributes to the debate on the sociological use of the concept of generation (Constanza et al., 2023), and does so from a gender perspective.

Tensions in Transnational Spaces – Gender, Generation, and Struggles over Female Autonomy

Anika Liversage

VIVE – the Danish Center for Social Science Research, Denmark

Over the past half century, migration from the Middle East to Western Europe has altered the composition of European populations and brought different understandings of gender into close contact. This paper explores tensions over the gender order in ethnic minority communities in a biographical perspective. Based on a larger interview material, I compare and contrast the life stories of two women, who arrived in Denmark from the Middle East as children. Following expectations, the women married at young ages, only to find themselves in relationships that were not only unhappy but also abusive. In Denmark, acceptance of divorce is high and female divorcees can survive either through working or through state support. Consequently, the two women were able to leave their husbands, but by doing so, they transgressed boundaries of socially acceptable female conduct. The paper explores the different ways in which both parents (particularly fathers), but also the broader ethnic minority community tried to force the two women back "in place". Strategies included harassment, ostracism as well as physical violence. The women's experiences bring out the sometimes-ferocious struggles over continuity and change in the gender order in transnational social spaces. Access to Danish support structures enabled the women to survive physically, but emotionally, the strains of being labelled as outcasts took a heavy toll. However, their experiences also motivated the women to work for establishing social spaces where divorced ethnic minority women can meet like-minded others, thereby contributing to increasing ethnic minority women's scope for agency in intimate matters.

RN33 | T08_03: Generations of Feminism

Intergenerational Difference Between Women from Different Generations and from Different Women's Organizations in Türkiye

Özge Konuralp

Middle East Technical University, Turkiye

The interviews held with 56 representatives of 25 different women's organizations, women's platforms/coalitions and digital platforms with diverse political standings (including secular, liberal, feminist/reformist, socialist, Kemalist and Islamic women's organizations) in Türkiye between 2020-2021 reveals that intergenerational difference emerges as one of the outstanding features between "older" and "younger" generation of women's approaches towards understanding of gender identity, feminism, intersectionality and organizational culture of women's organizations. Analysing the intergenerational difference, this study points out four important findings regarding the intergenerational difference between "older" and "younger" generations: 1) Young women are more eager to get organized in flexible and less institutionalized organizational models and from time to time this inclination is subject to criticisms of "older" generation of women in terms of not taking a long-term role in women's organizations and engage in conventional/ traditional way of advocacy. 2) Young women problematize hierarchical and highly institutionalized organizational structures in women's organizations as well as hegemonic secular discourse in women's movement, have less "red lines" than the "older" generation in terms of being inclusive, and adopt a more liberal and "Queer" approach in terms of understanding of gender equality. 3) Young women put a great emphasis on "intersectionality" and the way in which they identify themselves as "feminist" goes beyond the normative and discursively "Western" hegemonic understanding of "feminism" and "being a feminist" which refers to a certain stereotype. 4) Intergenerational difference between "older" and "younger" generation of Muslim women from different women's organizations stand in a distinct position due to their unique feature of taking religious doctrines as a central context and addressing religious doctrines in their advocacy for women's rights and gender equality.

1051

Generational Silences in Context – Orientations in Feminist Sociology over Local and Global, and Time and Space dimensions

Elina Oinas

University of Helsinki, Finland

This paper will discuss methodological challenges as feminist scholarship needs to identify new tools to detect gaps and silences. The paper takes its starting point in 1980s feminist sociology where listening to women's voices was a key theme (Oakley 1980, Stanley & Wise 1993, Ettorre 2022) and contrasts these debates with current queer and black feminist urge to take silences and silencing in white academia seriously. What does the trajectory in feminist scholarship mean in methodological terms when conducting qualitative research in different locations and when publishing internationally? How do we address power and epistemic "passing" in contemporary feminist social science tool kit? The paper will use student data from methodology class rooms as its data.

Registers of Hope: an Effort Towards Building Intergenerational Feminist Hope

Elizabeth Ablett[1], Carys Hill[2]

1Newcastle University, UK; 2Warwick University, UK

This paper explores the conditions of hope within feminist knowledge production in UK Higher Education. Feminist knowledge production, in its capacity to identify and work towards dismantling unequal power relations and injustice, is a site of ongoing work to produce more 'hope-full' relations and futures (Ahmed, 2014). But as a site of work, it is also subject to power imbalances, injustice, prejudice, and inequalities that structure neoliberal academia, including a reliance on casualised labour, citational politics, bullying or misconduct, and promotional inequalities. Fostering feminist hope thus requires a reckoning with hope's ambivalence and the (unequal and unjust) conditions under which it emerges, and which can work to dampen, grind down or extinguish it.

We understand feminist hope not as blind faith or passive inaction, but as a fundamentally relational and affective force which requires psychic and social work; the 'social relations of hope'. This paper explores how we recognise and seek to (re)produce feminist hope, value it, and equitably (re)distribute it, focussing on the forms of 'quiet hope' that can emerge among feminist scholars who work to foster everyday intellectual, emotional, and material hope with one another. In doing so, we unpack what feminist hope is contingent on and how we might nourish 'quiet hope' as a form of hopeful intergenerational relations and accountability that holds a capacity to simultaneously confront feminist complicities in injustice working towards more fully liberatory and 'hope-full' feminist futures.

The Process of Achieving Adulthood in Perspective of Gender Differences. The Case of 30-year-old Poles.

Jolanta Grotowska-Leder

Warsaw University of Life Sciences, Poland

Transition from youth into adulthood is characterized with increasing complexity, fragmentation and differentiation in postmodern societies (Walther et al. 2001). This process is differentiated by structural factors such as gender, place of residence, family resources and also individual life choices. The aim of the paper is to characterize the difference of the process of achieving adulthood of Polish young adults. Basing on qualitative research findings with young adults (60 in-depth interviews) I want to confront women`s and man`s paths into adulthood. I answer four main questions: How do young adult women and man define and interpret adulthood? What life strategies do they undertake in terms of adult social roles: workers, intimate partners, parents? What are their expectations towards the social policy institutions? Answers to these questions result from the findings of the research project „Public policies for completed adulthood in Poland" conducted in 2015-2020 at the Institute of Sociology, University of Lodz and financed by the Polish National Science Centre of Poland.

RN33 | T08_04: Strategies of Resistance

Feminization of Survival and Counter-Strategies of R-Existence. A Case Study of Migrant Women Employed in the Sicilian Countryside

Monica Massari, Federica Cabras, Simona Miceli

University of Milan, Italy

While early migration studies suffered from a strong gender bias, which overshadowed peculiarities of female forms of mobility, from the 1980s onward the emergence of the 'feminisation of migration' paradigm has addressed the growing visibility of women in contemporary global migration. A widespread approach, however, has been often that of 'adding women and stir' (Salih 2011), which has allowed to question the invisibility of women, but not to deconstruct gender neutrality in many migration theories. Moreover, the recurrent overlapping, in the public debate, between female forms of mobility and the sex market or the care sector has not only enhanced stereotyped forms of representation of migrant female workers, but also obscured their presence and role within other sectors, such as in the case of agriculture, a traditionally masculinized one. Based on the outcomes of a fieldwork carried out on the working and living conditions of migrant women employed in greenhouses in Sicily, this paper addresses the so-called feminisation of survival carried out by women of different generations, struggled between harsh conditions of exploitation, isolation and personal fragility and daily micro r-existence practices that allow them to resist and survive. The adoption of an intersectional approach allowed to shed light not only on process of multiple oppression, i.e. on the ways how gender, nationality, age, marital status, skin colour, legal status and other conditions are linked to different forms of oppression and exploitation, but also on the agency that individuals show on the basis of the social structures and conditions available.

Ecofeminist Critique to Development from the Perspective of the Mozambican Women

Djamila da Silva Sales de Andrade

Universidade de Coimbra, Portugal

This paper is a part of a research about the ecofeminist critique to development from the standpoint of the Mozambican women. I started from a conceptual framework based on ecofeminist theory and a social-critical epistemological orientation. The methodological approach is qualitative, and I used focus group interviews as information-gathering technique with an intersectional approach: one with a group of academic and activists' women, and the other with a group of peasant women from Maputo province. I stated the problem in the following question: To what extent do ecofeminist critiques of development reflect the challenges and concerns of Mozambican women in Maputo province?

Like many African countries, Mozambique is undergoing a social, political, and economic crisis and the consequences of the global ecological catastrophe. The ecofeminist critiques of development can be summarized in four essential points: (1) the Western anthropocentric vision, which continues to define humanity's relationship with the planet and all the living and non-living beings that inhabit it; (2) the presence of androcentrism and misogyny in development thinking; (3) the development discourse as a patriarchal, colonial and capitalist product which adopts a predatory and extractive view of life, promoting global climate catastrophes; and (4) the profile of developmental extractivism in Africa combined with the specific ecological effects to which the continent is exposed, and their impact on women. I conclude that at a time when the country is dominated by neoliberal and extractivist capitalist policies, in which life is a privilege for some and not a right for all, I argue that ecofeminist critiques correspond to the concerns and challenges of these Mozambican women from different backgrounds. In the context of a globalized economy, where struggles are increasingly interdependent, there is a growing need for articulation and action from both the North and the South. As such, this paper aims to contribute to the collective construction of ecofeminist thinking and practices that emerge from a way of speaking and thinking about the world from southern Mozambique. It's the first time I would participate in the ESA summer school.

Muslim Women's Self-care as a Source of Agency and Resistance. Two case-studies from Italy

Giulia Mezzetti, Veronica Riniolo

Università Cattolica del Sacro Cuore, Milano, Italy

This paper examines forms of intersectional agency displayed by women originating from Muslim-majority countries (mainly Morocco and Egypt) residing in Italy, comprising first-generation migrants and their descendants. It does so by analysing different practices and spaces of resistance – namely, a private Facebook group reserved to Arabic-speaking women and an association – studied through the conduction of semi-structured interviews and observation (the fieldwork started in May 2023 and will end in March 2024). The first represents a virtual space for exchanging practical advice and moral support, which may turn into sources of empowerment, as women taking part in the exchanges encourage each other to emancipate (e.g. by sharing information on how to look for a job, study or acquire the driving license) and to speak out in the face of discrimination they experience, thus also expressing a form of voice (Hirschman 1970). The second, too, represents a powerful example of voice, as the association considered promotes an activity of sensibilization against domestic violence within the Muslim community and provides support to victims, defying taboos about gender roles and family

1053

relations. We argue that these two cases are exemplary of how women who face intersectional discrimination can "take care" of their cause and shape repertoires of action to counter exclusion precisely by tapping into the factors which generate their marginalization – being young, women, Muslim. Besides, we interpret these two "claimed spaces" (Riniolo 2023) through feminist theories that consider the practice of self-care as a practice of resistance (Lorde 1988; Woodly et al. 2021).

Contours of Gender-Based Violence in the Global South: Towards a More Inclusive Approach

Clarice Santos[1], Maria Rita Taunay Lorenzo Fernandez[2]

1Middlesex University, United Kingdom; 2Universidade de São Paulo, Brazil

Gender-based violence (GBV) is a global crisis with widespread consequences, impacting women across cultures, socioeconomic levels, and life stages. Despite the proliferation of GBV research and significant contributions from various disciplines, there is a disproportionate focus on the experiences of women from the Global North in shaping theories and knowledge, neglecting high rates of violence in the Global South, where women face both structural marginalization and ontological discrimination.

In response to the growing demand for research that considers diverse contexts, this paper moves beyond traditional agendas to seek innovative approaches to address and resist GBV. It provides reflections from two researchers engaged in autoethnographic projects. One project involves an author embarking on a fundraising pilgrimage to raise awareness for GBV, exploring transformative interactions with fellow pilgrims and local communities. In the other, the author delves into the ancestral experiences and perspectives of Afro-Amerindian women, revealing unique dimensions of their struggles and how they circumvent coloniality to resist contemporary subordination and silencing.

Embracing a transdisciplinary lens and departing from detached epistemic stances, the project advocates for new ways of understanding and transforming the world based on interdependence and relationality. This collaborative approach contributes to a more inclusive understanding of GBV within the context of contemporary mobilizations in Latin America, where intricate connections between violence, power, gender, race, and other intersections unfold. The paper also extends theoretical discourse, offering practical insights into how individuals and groups can collaborate across disciplines and institutions to broaden possibilities and create the conditions to effectively combat GBV globally.

RN33 | T09_02: Resistance to Women's Rights and Gender Equality Policies

Title Case: Discursive Strategies Legitimising Resistance to Gender Equality Policies in the University.

Katarzyna Leszczyńska

AGH University; Faculty of Humanities, Poland

In recent years, equality policies have been implemented in European universities with the aim of ensuring equal treatment in structures, teaching and research. Three main types of equality policies at universities can be identified. These are policies targeting structural solutions, knowledge and institutions. Public reactions to the implementation of equality policies vary, one of which is resistance within and outside universities.

In this presentation, I would like to discuss the different discursive strategies that justify resistance to gender equality policies in the university. I conducted my research in 2021-2024 at one of the largest technical universities in Poland. The material I rely on in the presentation is the result of methodological triangulation: in-depth interviews, quantitative surveys with academic and administrative staff, students and PhD students, and content analysis of qualitative comments included in the surveys (a total of 3438 surveys with students, including PhD students, and 2001 surveys with staff). The research diagnosed experiences of gender inequality and expectations and opinions on various countermeasures.

In reconstructing the strategies justifying resistance to gender equality policies in universities, the analysis will highlight their intersectional determinants (age, position in the university structure, gender, type of solutions opposed). I want to show the connection between these strategies and the phenomenon of backlash and the increased activity of right-wing movements in Poland, as well as the masculinised organisational culture of the university, the neoliberal conception of science and the hierarchical structure of the university. The theoretical framework is rooted in Critical Discourse Analysis. The analysis of strategies of legitimisation helps to decode the relationship between language and ideology that justifies resistance to equality policies.

1054

Re-masculinisation of Academia: a Historical Materialist Approach to Gendered Power Dynamics in Current Academic Capitalism

Helene Aarseth, Rebecca Lund

University of Oslo, Norway

Gender scholars have claimed that the shift to 'academic capitalism' (Slaughter and Leslie1997) and more market-oriented forms of governance and positional competition in academia instigates a process of re-masculinization (Aléman 2014).

While men and women are measured on the exact same performance criteria in the global knowledge economy, these processes of re-masculinisation operate in subtle, indirect, and complex ways.

Drawing on free-association narrative interviews with 48 professors, post docs and PhD candidates the humanities and social sciences at a university in Norway, this paper aims to further develop the conceptions of the dynamics involved in and driving these subtle forms of gender domination. More specifically, we explore how scholars handle the potential tensions between subjective emotional processes involved in creative scientific pursuits on the one hand and the requirement to do well in the positional competition on the other.

We argue that the gendered implications of current market-based forms of governance should be sought in different modes of emotionally informed ways of having and relating to the world. In order to account for this, we suggest that feminist historical materialism, a theoretical approach that gained traction in the 1980s and 1990s, may be retrieved and revised to shed light on new forms of gendered power dynamics in contemporary capitalism, in academia and beyond.

Anti-gender Appropriation of Feminist Abortion Discourse: Shifting the Human Rights Frame Through Affect

Mojca Pajnik[1,2], Leja Markelj[2], Živa Humer[2]

1University of Ljubljana, Faculty of Social Sciences, The Peace Institute, Slovenia; 2The Peace Institute, Slovenia

Reproductive rights, abortion in particular, have been at the center of feminist activism and struggles for several decades. However, the landscape has shifted with the rise of neoconservative anti-feminist and anti-gender movements, reshaping public discourse on this topic. This paper delves into the discourse on abortion rights in Slovenia, a post-socialist country with a constitutional legacy of protecting reproductive rights. The objective is to analyse the ongoing debate by juxtaposing the framing of the topic by feminist and anti-gender actors, revealing frame repertoires in their narratives. We aim to complement existing studies that have analysed pro – and anti-abortion discursive opportunities by exploring discourses in their relation to mobilization of affects. We draw upon empirical data obtained through a frame analysis of activist documents addressing abortion, covering the period 2010-2023. Preliminary findings indicate a prevalent framing of abortion as a human rights issue, embraced by both feminist and anti-gender actors, albeit with significant differences. While feminist actors frame abortion using assertive language, as women's right to self-determination, anti-gender discourses accentuate abortion as harmful, framing it as the right to life of unborn children. Unpacking these discursive shifts we show how anti-gender actors strategically mobilize affects such as empathy, anger, frustration, and sadness, as mechanisms to legitimize and sustain pro-life positions. We point out that emotionally charged discursive redefinitions are underpinned by deeply gendered hierarchies. This study contributes to contemporary scholarship by unravelling how anti-gender actors strategically employ an emotionally charged appropriation of discourse commonly associated with liberal movements.

Gender Inequalities In Women's Careers In Higher Education Institutions In Portugal

Fátima Assunção, Diana Maciel, Anália Torres, Paula Campos Pinto, Bernardo Coelho, Sara Merlini, Tânia Reigadinha

CIEG/ISCSP-ULisboa, Portugal

1055

The debate on gender equality in higher education institutions has gained increased visibility in the public arena in Portugal in the last few years. This presentation discusses some of the results of a research project on gender equality in higher education institutions in Portugal, funded by EEA Grants. In particular, it focuses on the secondary analysis of national and comparative official statistics and the qualitative interviews conducted with 10 women academics who have reached positions of leadership. Secondary analysis shows that in Portugal, as in many other countries, there have been advances in terms women's access to higher education and academic career. Women account for about half of the students, teaching staff and researchers in higher education. However, they are under-represented in the top position of the academic career and in decision-making positions. There is a higher percentage of women researchers working under precarious contracts, in comparison to men, and Portugal presents a comparatively high feminization of researchers associated to less R&D expenditure per capita researcher. The analysis of the interviews illustrates some of the changes occurred in gender relations in higher education in the country, the role of family and socioeconomic conditions as resources on which women draw on in their ascendant careers and the ways in which subtle barriers foster persisting patterns of vertical segregation, lending support to research showing the impact of the biasing effect of gender stereotypes, the difficult access to strategic social networks dominated by men and the gendered division of service work on women's academic trajectories.

RN33 | T09_01: Gender Order

Between the Impossibilities of the Past and a New Gender Order – Analysing the Professional Trajectories of Portuguese Women Visual Artists

Sónia Bernardo Correia

ISCTE-IUL, Portugal

The communication results from an ongoing doctoral research that aims to elucidate the gender dynamics within the Portuguese artistic field, and also to understand how gender shapes the array of opportunities and constraints of visual artists' professional trajectories.

In the qualitative component of the study, the life paths of 43 female artists were delineated through in-depth interviews. Analysing their accounts allowed me to discover what they observe in the field and shed light on how gender impacts their professional endeavours. Despite the identification of instances of gender inequality, many artists contend that their careers are affected by other circumstances, such as the socioeconomic background, the quality of the social network, the randomness of the gatekeepers' decisions or the size and deregulation of the art market.

The inequalities in work-life balance are the overarching theme that unifies the representations and practices of the interviewees. Nearly all mothers among them acknowledge a deceleration or even an interruption in their artistic pursuits, attributing this to the demands of motherhood. Those without children admit that the prospect of motherhood is significantly constrained by the idea of professional disappearance and precariousness.

The findings of this research provide insight into the experiences of these women, positioning them amid the "impossibilities of the past" (Silva & Leandro, 2013) that persist in relegating them to the peripheries of the artistic field, and a new social (and gender) order that, more recently, appears to animate both artistic structures and women's agency, propelling them towards the coveted centers of recognition.

Changing The Gendered Order: The Case Of French-speaking Feminist Podcasts

Dimitra Laurence Larochelle

Université Sorbonne Nouvelle – Paris 3, France

Characterized by the intimacy between producers and listeners the podcast constitutes a quintessential territory both for exploring themes related to intimacy as well as for giving visibility to marginalized voices. In this sense, the podcast constitutes an alternative space of major political and cultural importance since it plays a prominent role in the production and circulation of counter-discourses and resistances within the public sphere. In this sense, the podcast provides a platform that lends itself to challenging the norms imposed by patriarchy.

This study focuses on feminist podcasts and their potential as means of resistance to gender-based violence within French-speaking societies. This alternative medium, characterized not only by privacy but also by the ability of those who express themselves on it to maintain their anonymity, provides a space which is at the same time safe and intimate as well as a form of public expression. Feminist podcasts thus lend themselves to the sharing of individual experiences and the discussion of "taboo" topics.

Taking these elements into consideration, I consider that feminist podcasts constitute spaces of resistance to gender-based violence as they contribute to the awareness-raising and denunciation of this phenomena. Podcasts thus provide a platform for an auditory experience that can challenge heteronormative and sexist ideals. In consequence, they are tools with a liberating potential. Feminist podcasts reveal therefore the political potential of digital practices.

The results presented through this paper are based on a podcast ethnography of seven French-speaking feminist podcasts as well as on interviews with their producers.

Stigmatization Toward Eating Disorder from the Gender Perspective – Continuity or Slow Change in the Gender Order?

Dorota Mroczkowska, Monika Frackowiak-Sochanska

Adam Mickiewicz University in Poznan, Poland

Our presentation examines the stigmatization of eating disorders in women and men from a gender perspective. The attitudes toward mental health issues reflect the persistence and change of gender schemes. EDs are pertinent examples, as they have historically been considered the most gendered of all psychiatric illness presentations,

The studies on the ED stigma content reveal the presence of negative beliefs in ED populations, such as being responsible for their condition, negative attitudes, and social distance toward people with EDs. Despite the importance of the topic, little is known about the differences in stigmatizing attitudes toward men and women with ED. The low (although growing in the last decades) morbidity rate in the male population explains insufficient knowledge, leading to men's exclusion from epidemiological studies.

The authors – sociologists and psychologists prepared a research model including:

– synthesis of current knowledge on common and specific EDs stigma content of inncluding stereotypes, prejudice, and discriminatory behavior against men and women with EDs.

– identification of the gender characteristics associated with increased stigmatization of people with EDs.

– evaluation of the impact of ED stigma on individuals with EDs in terms of self-stigma, depending on their gender, resulting in mental condition, help-seeking behavior, and therapeutic adherence.

The above model is utilized in the ongoing research on a sample of Polish students aged 18-25 (N=1000) and psychologists and therapists (N=500). This presentation will discuss the research results, and its conclusions for gender-sensitive research, theory, and the practice.

Using Mobile-Based Technology to Support Victim-Survivors of Domestic Abuse

Kate Butterby, Nancy Lombard

Glasgow Caledonian University, United Kingdom

The use of mobile-based technology to support victim-survivors of domestic abuse is becoming more prevalent, with the 24/7 availability and ease of use reported as positives.

We report on developments of ISEDA (Innovative Solutions for Eliminating Domestic Abuse) a Horizon Europe project involving 14 partners from 9 European Countries which aims to tackle and eliminate domestic abuse using multi-sector expertise via modern technological tools and practices.

One of the key tools to be deployed by the project is a chatbot which victim-survivors will use to seek help and find information alongside being able to store and record evidence to be used in court. Primarily, it will give women access to supportive technology in countries where services are not always commonplace, for example, countries where women's services lack consistent funding, or where police training on domestic abuse is sporadic.

In this paper we explore whether technology such as the chatbot should be integrated within women's services as a complementary tool available to support victim-survivors, and explore whether this can be done without adding to the workload of the already under-funded and overworked domestic abuse sector. We also highlight ethical issues surrounding the use of technology within the development of the chatbot specifically, and in the field of domestic abuse more broadly, and consider how these issues can be addressed

RN34 | Sociology of Religion
RN34 | T01_01: Religion and (Digital) Media

Attitudes towards digital media during the time of transformations: The Roman Catholic Church and the Jehovah's Witnesses in Poland.

Marta Kołodziejska

University of Warsaw, Poland

During the Covid-19 pandemic, all religious organizations in Poland had to, at least partially, shift to digital media to facilitate participation in religious services, prayer groups, and organizational meetings. However, this reliance has not necessarily translated into a change in attitudes towards digital media within these organizations. As part of the international Recov-19 research project, this study involved the analysis of official documents and selected magazines and websites published by the Roman Catholic Church and the Jehovah's Witnesses in Poland from 2020 to 2023, using qualitative content analysis. It also comprised the analysis of online survey conducted among religious and community leaders from both churches. Grounded in the concepts of media settlers and deep mediatization, the investigation focused on how these sources framed the meaning and function of digital media, as well as the attitudes towards its use. The paper discusses two key findings: 1) the attitudes and ascribed meanings did not necessarily align with the extent of digital media use by the churches, and 2) there was a pronounced emphasis on the practical aspects of using digital media, along with a focus on the connection between online activities and secularization. In conclusion, the paper reflects on how religious organizations conceptualize digital media in response to the perceived tensions and distrust in public health services, as well as to react to societal transformations.

Dixit Algorizmi – Transcendence In The Age Of Digital Reproduction?

Adrian Totaro

Rheinland-Pfälzische Technische Universität Kaiserslautern-Landau, Germany

Social development is increasingly influenced by digitalization processes. This is also reflected in the field of religion (cf. Campbell/Tsuria 2022; Maasen/Atwood 2022). In contrast to secularization theories, religion hasn't disappeared, it's just changing its form (Luckmann 1967). Secular and religious discourses appear as a so called "two pluralism" (Berger 2014).

Space, materialities, practices of action, and interaction are considered essentially for experiencing and coping with religious transcendences. Religion interprets the world and makes it meaningful to the individual by providing a stable framework for the disordered and subjective contingencies of individual existence. According to Hu-bert Knoblauch, however, it isn't only relevant to "take an analytical perception at the role of materialities, objects and spaces", but to ask "whether participation in religious communities, which is usually conceived as the physical co-presence of the faithful, cannot be trans-formed into new mediatized forms" (Knoblauch 2017, 238, own translation; cf. further Hepp/Krönert 2009; Hjarvard/Lövheim 2012).

In 2022 ChatGPT, a large language model, is released by OpenAI. AI became an everyday phenomenon. This paper examines, by following the sociology of knowledge (Berger/Luckmann 1967; Knoblauch 2017), the social significance of an AI worship service and asks questions about the conditions of the constitution and construction of social situations as well as the role of AI in the construction of religious experiences. The study follows an empirical hermeneutical method. From a sociological perspective, it is important to clarify how AI-generated religious communication succeeds – algorithm talks (dixit algorizmi) – and what kind of answers can be provided by sociological theory in terms of technical-media changes in the field of religion, which reach over the inclusion of media forms or their mass medial dissemination.

Religious Voices and Anti-genderist Discourse in the News Media: The Case of the Ratification of the Istanbul Convention in Lithuania

Gintare Poce

Vytautas Magnus University, Lithuania

In today's context, religion is often seen not only as a part of private life but also as an active actor in the public sphere, seeking and able to influence certain political processes and decisions. One such example is the involvement of religion in political decisions on gender equality issues. In public discussions, religious actors often oppose gender as a concept based on social construction and imposed by what they call "gender ideology." Concerns that this "ideology" could take over the legal discourse is a common basis of their argumentation in the discussions on the ratification of the Istanbul Convention. This paper presents the main results of the analysis of Lithuanian news media coverage of the Istanbul Convention between 2011 and 2021. The analysis shows that religious actors entered the news media discourse by presenting arguments against the ratification of the Convention and supporting the opinions expressed by conservative political actors. These arguments are based on the idea that the Istanbul Convention is a threat to the future legal support of the natural rights of men and women, their natural roles and Christian values. Also, as this research shows, in Lithuania, where the Catholic Church is supported by tradition, the active involvement of religious actors in the public sphere on political gender issues has also shown a certain level of the politicisation of religion.

(Re)Negotiating Religion in the Public Debate: Catholic Church Between Legacy and Social Media in Italy

Rita Marchetti[1], Susanna Pagiotti[1], Anna Stanziano[2]

1University of Perugia, Italy; 2Sapienza University of Rome, Italy

To understand the place and role of religion, and particularly churches, in our societies, among other factors, it is necessary to consider their journalistic coverage and the mediatized public debate about them. The way different media outlets cover churches when they express their views on the issues at the center of the public debate inevitably contributes to shaping our understanding of a plurality of issues, religious and non-religious, and our way to consider religious actors.

The spread of digital media and social media platforms has made more complex to understand how the public debate contributing to transform how religion is discussed and re-interpreted. Indeed, social media have rendered religious discourse more accessible and immediate, enabling a diverse range of actors to engage in the discussion, but also activating new dynamics of attention and newsworthiness.

This paper analyses the media representation of the Catholic Church in 10 print, digital, and online-only Italian newspapers (277,537 articles) and the discussions on the Catholic Church on Facebook (2,873,095 posts) over a 5-years period (2017 to 2021). The study shows how the discourse around the Catholic Church in Italy changes over time and is renegotiated thanks to the intervention of different type of actors and the rules and affordances of considered platforms. Between convergences and divergences among different media outlets, digital newspapers and in particular social media show more emphasis on scandalous and curious aspects, but also on religious actors usually not allowed to participate in the public debate of the mainstream media.

RN34 | T02_01: Religion, Health and the Pandemic

Barrier or Bridge? The Role of Migrant Minority Religious Groups During and After the Covid Pandemic in London and Milan

John Eade, Samuele Molli

Roehampton University, United Kingdom

For state institutions, especially in Europe, religions have historically had a double and contradictory face: problem and resource. This dilemma is particularly true for minority religious groups as they can represent both a «barrier» that weakens trust in public bodies and a «bridge» that serves as an intermediary of trust in state institutions.

The Covid pandemic can be seen as a «stress test» which challenged the sense and direction of the relationship between the state and religious minorities. In the name of public security and its supremacy, state institutions called for respect, especially in terms of duties and obedience, for the introduction of drastic decisions that had important repercussions. In sum, the major question was: stay with or resist the state?

Our paper discusses the ways in which minority religious groups responded "from below" to the pandemic regulations imposed "from above" by the state. It focuses on the challenges that the pandemic created for these groups and explores different reactions, such as compliance and resistance. We will also analyse the position of the groups at the intersection between exogenous pressures from public institutions and endogenous processes linked to people's spiritual and social needs.

The paper draws on data gathered during a cross-national project, where we compared Bangladeshi Muslims in London and Peruvian Christians in Milan and their location within two different state-minorities configurations.

Finally, we will discuss the ways in which trust represents an important analytical lens that questions current approaches towards diversity in societies where religious-based associationism is a key feature of minority group presence.

Healing Through Faith: an Exploratory Analysis of Healing Testimonies in the Universal Church of the Kingdom of God During Austerity Politics in Portugal

Ana Gonçalves Broda Santos

Instituto de Sociologia da Universidade do Porto (IS-UP); University of Porto / Faculty of Arts, Portugal

This work explores the social effects of the austerity public policies in Portugal during the 2010-2014 financial crisis, and how religious belonging could have acted as a mechanism for social cohesion. We are particularly interested in the ways through which religious belief and/or religious belonging was perceived to have impacted physical and/or mental health. This period and state of crisis took a toll on Portuguese society and generated profound financial, economic and social instability.

For this analysis we look into one specific religious group, the Universal Church of the Kingdom of God (UCKG), and the healing testimonies published in the church's newspaper (Folha de Portugal) under the column "Casos Verídicos" ('True Cases') throughout the years 2010-2013. Our methodological approach is of a qualitative nature, focused on discourse analysis. We will group the testimonies into different problems/illnesses, demographic profiles, simultaneously reflecting on the perceived impact that faith/religious belonging had for those church members.The main aims of this paper is to outline a typology of testimonies given by the church's members regarding health problems, as well as to engage in a broader reflection on the role of religion and faith concerning social cohesion, particularly during times of crisis.

The Dynamics of Religious Engagement in Poland before, during and after the COVID-19 Pandemic

Rafał Boguszewski

Warsaw University of Life Sciences, Poland

Just as religious ideas can lead to empirically tangible social change, so social change affects the level of religious awareness and perception. Religion and religiosity emerge as both a shaping force and a dependent phenomenon, contingent upon the context.

In this regard, it is noteworthy that religious commitment has differentiated the ways in which Poles coped with the threats posed by the pandemic. Simultaneously, the coronavirus pandemic, with its far-reaching implications for societies globally, including Poland, significantly influenced the transformation of religiosity.

In my presentation, I aim to address whether and how Polish people have religiously changed as a result of the COVID-19 pandemic. Specifically, I will examine the extent to which the pandemic has either strengthened or weakened religiosity, the degree to which it has caused (or accelerated) a retreat from the Church and religious practices, and which demographic groups are most evidently affected by this phenomenon.

I will base my considerations on the results of five waves of quantitative CAWI research conducted at various stages of the development of the COVID-19 pandemic. The research was conducted from April 2020 to August 2022 on quota samples of adult Poles reflecting the social structure in terms of gender, age, education, size of the place of residence, and region.

Constructions of Religion in Swedish Newspaper Articles on Funerals during the Covid – 19 pandemic

Karin Jarnkvist

Mid Sweden University, Sweden

This paper examines the discursive construction of religion in Swedish newspaper

articles on funerals during the Covid – 19 pandemic. Thirty articles from the six most

prominent newspapers were analyzed using Multimodal CDA and intersectionality.

The analysis reveals that most articles deal with religion as an institution, followed by religion as a group and individual religiosity. Religion is constructed in intersection with ethnicity and gender. The CoS is privileged, portraying Lutheran Christians as professionals. Minority religions are positioned as 'the other', something 'problematic' or 'different' from 'Swedish (secular) values' and ways of living. Migrant men and women are portrayed stereotypically. However, alternative narratives are told by well-educated and influential representatives of different minority religions, giving these religions a 'voice'. I argue that increased religious literacy is needed among media workers if the reporting should be based on equality within and between the power categories of gender, ethnicity,

and religion.

RN34 | T03_01: Local Governance of Religion

Local Phobias. Conflicts Over Migrant Minority Religions and Their Presence in Italian Urban Scenarios.

Samuele Davide Molli[1], Maurizio Ambrosini[2]

1University of Milan, Italy; 2University of Milan, Italy

Religious diversity represents one of the main results of migratory flows. The geography of cities is transforming in unexpected ways due to the practices of «reuse and re-conversion» of empty spaces actuated by migrant minority groups for their social and religious needs. This change has become a controversial issue in Italy, both in terms of relation with public institutions and for the fears related to the erosion of the culture and security of local territories.

Our paper considers the problems that minority religions encounter in Italy when decide to recreate a place of worship. Specifically, it examines different conflicts over visibility and invisibility of minorities' religious places and their right to be accepted in the public space of Italian cities. We will also see at how different municipalities or nativist movements initiate disputes against the possibility of readapting and reconverting empty spaces for religious motives.

The paper discusses fresh data gathered in a wide research project on 348 immigrant religious centres in the region of Lombardy. Thanks to this study, we will use a reach collection of visual data, 120 interviews and a series of observations collected during social and spiritual activities.

We initially explain specific patterns of sacralisation of space we observed in 1) city central areas, 2) urban neighbourhoods and 3) extra-urban industrial or agricultural areas. We then consider the conflictual sides of sacralisation of space, such as the diffusion of fears for public order and security, public opinion campaigns in media and the use of discriminatory planning norms against migrants' religions. Thirdly, the paper examines the counterstrategies migrants try to adopt for maintaining the possibility to dispose of worship places in Italy.

Interfaith Governance In Local Politics: A Study Of The Changing Dynamics Of Jewish-Muslim Institutional Relations In Germany

Arndt Emmerich

University of Hertfordshire, United Kingdom, Max Planck Institute for the Study of Religious and Ethnic Diversity, Germany

Sociological interest in Jewish-Muslim relations at the local level has recently increased in Europe (Gidley and Everett 2018, Becker 2019, Nagel and Peretz 2022, Emmerich 2023), partially revising the polarised macro-debates around the ongoing Israel-Palestine conflict and "imported" religious antagonism thesis. Contributing to this emerging sociological inquiry of Jewish–Muslim encounters, this article adds a new analytical layer to this debate by focusing on local interfaith dialogue and the governance of religious diversity. Through the case study of Frankfurt's Council of Faiths (Rat der Religionen) and other at times competing initiatives, the empirical discussion investigates how Jewish Muslims relations are negotiated, disrupted and re-established. Perceived by policy-makers as a prime institutions to ensure social cohesion, the interfaith initiatives in this research became involved in internal and external disputes and political crisis, in particular over Jewish-Muslim relations and (extra-)local events (e.g. occurrences in the Middle East). The analysis draws on Foucault's understanding of power: not just a coercive tool but also as a productive, creative and regulative force. The role of church authorities and their imbued – what Foucault called – "pastoral power", is pertinent for this study on local interfaith councils and Jewish Muslim relations. By researching several organised interfaith encounters in Frankfurt over more than 20 years, the article is able to demonstrate how crisis moments lead to new management strategies and processes of institutionalisation, changing internal affairs within Muslim, Jewish and other faith communities and altering partner choices within dialogue constellations.

Combatting Racism In A Context Of Religious Transformation: Insights From Research With Muslim Communities And Local Authorities In Ireland.

Dr James Carr, Dr Tiba Bonyad, Mr Patrick Fox

University of Limerick, Ireland

This paper will present selected original research findings derived from the Ireland based, European Commission funded, Sustainable Alliances Against Anti-Muslim Hatred (SALAAM) project. The religious profile of Irish society has transformed dramatically over the past thirty years with Islam now one of the fastest growing religions in Ireland. Contemporaneously, Ireland has also witnessed an escalating growth in anti-Muslim animus. Resonating with the work of Law et al (2018), and employing a public sociology (Burawoy 2004) perspective, this paper explores how Muslim communities and municipal authorities can build trust and develop anti-racism initiatives by means of educational practices, public awareness campaigns and through the development of local level political participation platforms. Drawing on the perspectives of Muslim communities (n=193) and municipal authority staff (n=69) from four Irish cities, this paper will argue that resistances to anti-Muslim hatred, developed at the local level hold the potential to counter exclusionary discourses and practices operating nationally and beyond. Moreover, with the process of racialisation as a core focus, it will also be argued that SALAAM provides a model that can be replicated to challenge

other racisms, including those directed towards racialised religious communities, across jurisdictions. This paper will conclude with a discussion of the role and importance of public sociology (Burawoy 2004) in the fight against racisms in all of their pernicious forms; a role that is arguably more important than ever in societies that are transforming at seemingly exponential rates.

Religion And Socio-Cultural Dynamics In The Management Of Muslims at Local Level: Opportunities And Obstacles In The Perspectives Of Policy-Transferability

Roberta Ricucci[1], Luca Bossi[2]

1University of Turin, Italy; 2University of Turin, Italy

Despite there being a rich body of literature on migrations, studies investigating religion within immigrant communities, including its role and impact on the second generation, have been less extensive. However, evidence from some contemporary ethnic groups suggests that religion may play a strong role in the lives of both first – and second-generation members. Even though several studies have been focussed on Muslims with a migratory background in Europe, this chapter intends to address an emerging field of study concerning the management of the Muslim diaspora at the local level. Requests for places of worship, recognition of rights and appeals to participate in the policy-making process are managed at the level of local rather than national administrations. Across various cities in various European countries, numerous approaches appear to dismantle the social construction of the Muslim exception; and the concepts of 'spatial regime', 'street level bureaucracy' and 'secular place-making' can be used to compare and contrast what each social reality gives to religion, thereby generating a specific spatial order negotiated between the state, the city's governance, secular space and the various religious affiliations, including Islam with its sub-groups.

The paper will describe and discuss several European cities' approaches through interviews (with stakeholders, policy-makers, religious associations' representatives), and field visits carried out in the last five years outlining their strengths and weaknesses in the perspective of policy transferability.

"Mosques in Germany on the Way to Postmigration Between – Negotiations of Tension, Transformation and Identity"

Halil Emre Ucar

Ruhr University, Bochum, Germany

My dissertation examines mosque communities in Germany as specific spaces of (post-)migrant identity negotiations due to there migrant emergence. In these spaces, identity discourses intensify in multilayered and complex fields, which are constituted through ambivalent expectations from inner (community) and outer (society) sphere. Within these dynamics, mosques evolved into multifunctional centres of religious, cultural and social life for Muslim people. Their relevance unfolds both through physical and transnational spatiality – they are simultaneously spaces of the sacred and profane, spaces of negotiation between generations and genders as well as spaces of sphere differences.

The establishment of mosques began with the first generation of migrant workers that came to Germany in the 1960s. Through genealogical transmission, these communities are attended by their children and grandchildren. Thus, three different types of socialization collide through these three generations. The relationship between them is reflected upon and lived out, actively referencing a cultural heritage that is present in a conjunctive experiential space. Retrospective reflections and prospective visions of belonging and identity alternate in an ambivalent oscillation. Furthermore, the context of a post-migrant and post-modern society leads to an increase in contingency.

Here, national policies and political developments towards Muslims must be considered. For instance, the preventing of foreign imams from working in German mosques, the denial of an official public corporate status as religious community or the rising far-right extremism are to mention. Combined with internal generational conflicts, cultural and religious tensions arise in the communities. In my contribution, empirical results and corresponding research designs will be discussed in detail, so that conclusions can be drawn concerning relevance, tensions and transformations of mosque communities in post-migrant societies and policies.

1062

RN34 | T04_01: Theoretical and Methodological Issues and Challenges I

Blueprints of and on Contested Spaces: Developing Methodological Tools for Exploring Constructions of Sense of Safety in Religious Spaces

Jenni Spannari, Anne Birgitta Pessi, Henrietta Gronlund

University of Helsinki, Finland

individuals, communities, and in societies. However, social, political, and health-related global transformations, and polarization have eroded deeply not only safety but our sense of safety. Religious spaces have a huge potential for creating embodied sense of safety – but also tensions and unsecurity. Thus they form an intriguing context to explore the foundations of sense of safety. Religious embodied social spaces have symbolic weight, and combine layers of emotional regimes (Riis & Woodhead 2011), thus making the contestations related to them observable in lived physical realities.

This paper focuses on the ways in which sense of safety is constructed and contested in relation to, and in religious spaces. Our aim is to develop a methodological approach to explore constructions of sense of safety in religious spaces. We will in first discuss sense of safety and space, specifically in relation to religion, and the need for a methodological approach for investigating it empirically. After that, we will introduce methodological and conceptual approaches from three especially prominent fields, which provide viewpoints of space and sense of safety, that can further our attempt of developing the methodological approach. These are environmental psychology, urban studies, and research on recognition and politics of belonging from political philosophy. After this, we will introduce a preliminary model of investigating sense of safety in religious spaces, and four different empirical cases to briefly demonstrate how the model can be applied.

The Relationship Between Transforming Religiosity and Volunteerism in the Aid Provided to Ukrainian War Refugees in Hungary

Marton Tamas Csanady

Károli Gáspár University of the Reformed Church in Hungary, Hungary

The religious data of the Hungarian census published in the fall of 2023 (KSH 2023) show a significant change compared

to the results of previous censuses (Csanády 2023). The general decline that started earlier continued. What is new is that in the last decade, Protestants (Lutherans and Calvinists) have recorded a much smaller decrease than Roman Catholics.

The regime change of 1990 resulted in serious crisis in the operation of voluntary organizations. After Hungary became a member of the European Union (2004), the level of participation in the work of voluntary organizations began to increase again (Marinova 2011). In recent decades, members of churches and religious communities have played an important role in the work of voluntary organizations (Csanády 2022). In the past few years, there has been a fierce political struggle regarding the evaluation of the operation of voluntary organizations. This is especially true for helping refugees since the 2015 refugee crisis.

In the course of our presentation, we will try to find answers to the following research questions: (1) Who are the people (in a sociological sense) who voluntarily help the refugees from Ukraine. (2) What is the relationship between different forms of religiosity, belonging to different denominations and the willingness to help refugees?

Our analysis is based on data from a research conducted in August 2022. We carried out a nationwide online representative survey in Hungary with 1,200 respondents. Among other things, the research focused on volunteerism and the perception of the Russian invasion of Ukraine.

During my presentation, I would like to present the correlations between the 2022 census results and our 2022 research results.

1063

A Phenomenological Study on Religious Vegans and Their Experiences of Veganism

Dilara Yaşar

İstanbul University, Turkiye

The original aspect of the research was to approach veganism from a specific sample such as "religious veganism".The phenomena of religion and veganism are analysed through the veganism experiences of religious vegans who have been able to combine these two phenomena.The questions of the research include the way religious vegans define their vegan identities, the processes of meeting veganism and becoming vegan, their approaches to the intersection of their beliefs and veganism, their presentation of their vegan identities in society and the reactions they receive from their environment. The research was carried out within the scope of TUBITAK Undergraduate Students Research Support.

The phenomenon of the research is the "veganism" behaviour, which people have heard frequently especially in recent years but have limited knowledge about its foundations and reasonsIn this study, semi-structured in-depth interviews were conducted with 12 vegan participants living in Istanbul, who were reached by criterion sampling method. Two focus group discussions were held, which were thought to reveal the common experiences of vegan

participants. The raw data collected from the field were coded in MAXQDA qualitative analysis programme.

Ethical vegans share a sense of responsibility for the earth and all life. While some vegans associate the vegan lifestyle with their identity and spiritual world, others do not seek a spiritual meaning. In this research, it has been observed that the concept of "religiosity" is not inclusive. It is concluded that vegan participants have high motivation to be in common communities, especially through social media. No significant link was found between the phenomenon of veganism and the phenomenon of religiosity.

Experiencing Catholic Primary School as a Muslim Student: School's Project and Children's Adaptations

Emilie Grisez[1,2]

1CRIS, Sciences Po-CNRS; 2Ined

What is the experience of Muslim students attending a Catholic school? How do they approach religious education? Catholic schools have been little studied in sociology, to the point that they represent a "secret garden" in the realm of research (Grace, 2002). Yet, delving into their distinctive features, particularly the integration of academic and spiritual formation, offers a heuristic approach to analyze transformations and tensions regarding religious beliefs. This study focuses on the perspective of students who, at first glance, may not seem directly impacted by religious education, aiming to uncover how they navigate these educational practices.

The paper relies on comparative ethnographies of three French Catholic schools: an urban school catering to upper-class Catholic and few Muslim families; a rural school with a mix of working-class Catholic, atheist and Muslim families; and a suburban school primarily attended by working-class Muslim families. Between April 2022 and July 2023, I spent one day a week at each school, accumulating over 1,200 hours of observation. I conducted interviews with pupils (n=50), their parents (n=45) and the educational staff (n=15), all coded using NVivo. Additionally, a survey was distributed in the classes (n=150) and analyzed on Stata.

While all three schools embrace openness and inclusivity, the experiences of Muslim students differ across contexts. In minority situation, they face challenges from teachers and peers who compare practices and beliefs with their own. Conversely, in majority settings, being Muslim can be regarded as an asset among students, while teachers actively promote an openness to Catholic culture.

RN34 | T05_01: Controversies and Challenges in the Catholic Church

Scottish Catholics and the Criminal Justice System

Sarah Anderson[1], Maureen McBride[2]

1Edinburgh Napier University; 2University of Glasgow

This paper presents findings from qualitative research which explores Catholics' experiences of the Scottish criminal justice system. There is a long history of anti-Catholic discrimination within Scotland, which can be understood in the context of anti-Irish racism linking back to mass Irish migration from the mid-19th century. Though there has been a significant decline in structural inequalities and in tensions between the Catholic minority and Protestant majority (Devine and Rosie, 2010), Scottish Catholics still lag on a range of socio-economic indicators, are over-represented among experiences of religiously-aggravated hate crime and imprisonment, comprising 23% of the prison population despite making up approximately 14% of the Scottish population (Scottish Government, 2018, cited in Runnymede Trust, 2020). They are more likely to experience poverty, live in poorer quality housing, and have higher morbidity rates (Law, 2016). Data from the authors' respective doctoral research projects (McBride 2018, Anderson 2019) indicate a lack of trust in the criminal justice system both historically and in contemporary Scotland, with Catholic participants reporting experiences of heavy-handed policing and unfair treatment within the criminal justice system more broadly. A 2023 pilot project has explored prison-staff perception of these dynamics within the contemporary prison environment. The authors draw from across these projects and current policy discourse to propose a research agenda for this underexplored area. While focused on the Catholic population, this research has wider relevance in understanding the dynamics of religious and racialised minorities in the criminal justice system in the Scottish context, of particular importance given the dominance of US-based theorising in this area.

The Battle for the Church of St. Francis in Pilsen (Czech Republic) between "Hipster-Culture" and "Tradition" Discourses: Catholic Youths and Civic Engagement – A Case Study

Jan Váně, Jan Kaňák

University of West Bohemia, Czech Republic

Civic engagement, as part of the period of life called emerging adulthood, is usually also associated with religiosity. Previous research has suggested that civic engagement increases with higher religiosity. It is also assumed that the level of involvement is influenced by the degree of the hierarchical nature of a particular parish. We investigate the aforementioned area within the relatively time-bounded event (1996–2022) of the planning of the building of the St. Francis Church in Pilsen (Czech Republic). We would like to present the answer to the question: How do particular forms of religiosity enter civic engagement during the emerging adulthood of Catholic youths during the Battle for the Church? Data generation and analysis were carried out by applying the elements of constructivist grounded theory. The analysis of 14 interviews and 36 other documents shows that the degree of civic engagement of Catholic youth is influenced not only by the hierarchical structure of the parish but also by the process of hegemonization of a particular discourse. Although the presence of the so-called hipster-culture discourse in parish leadership promotes active youth involvement, it raises concerns about superficiality, and reinforces tendencies for the dominance of the "tradition" discourse. The tradition discourse, coupled with an emphasis on the technicality and professionalism of church planning, ultimately leads to a diminution of youth activity.

Sexual Abuse and the Catholic Church: Insights from Three European Catholic Countries

Siniša Zrinščak[1], Brian Conway[2]

1University of Zagreb, Croatia; 2Maynooth University, Ireland

This paper examines the evolution of church-related scandals in three Catholic-majority societies, focusing on the Croatian, Irish and Italian cases. Although these three countries represent Catholic-majority societies, they also reflect quite different stories concerning Catholic sex abuse, with significantly more cases in Ireland and over a much longer timeframe compared to Croatia and Italy. The paper proposes a new theory for understanding Catholic sex abuse in different contexts, focusing on the role of historical institutional factors. More specifically, we examine the impact of historical legacies (the (non)experience of communism), legal context (role of legal cultures), state capacities (welfare state development and state involvement in family life), and media landscape (religion-media interactions) on how abuses emerge and develop into scandals. The paper draws on various sources, including Vatican documents, national church documents and media reportage. These data are supplemented with multiple secondary sources. The paper reveals the importance of social contexts in understanding the trajectory of scandal within large-scale religious institutions.

Denouncing the Sexual Abuse Scandals in the Catholic Church through Apostasy

Julia Martínez-Ariño

University of Groningen

Across the world, cases of sexual abuse within the Catholic Church have come to light, generating outrage, disgust and rejection of the institution. In this presentation, I examine the discourses of rejection of the Church by self-identified and formally recognized apostates in Argentina and Spain. While their motivations to leave the Catholic Church formally are diverse and include references to the interference of the Church in politics, its opposition to the recognition of sexual and reproductive rights and its financial benefits, among others, in this contribution I will focus in particular on the references to sexual abuse within the Church. Based on narrative interviews with apostates —that is, people who have formally requested that their personal data be removed from the Church's records— in Argentina and Spain, I will argue that just as with the case of the fight for the legalization of abortion, apostatizing from the Church is seen as a strategy to denounce not only the Church abuse scandals in themselves but also the way in which the institution has dealt with those cases in the two countries under investigation. In these contexts, institutional disaffiliation has little to do with matters of faith and religious practice and more with the implications of belonging to an institution one disagrees with and condemns. Theoretically, the contribution will be framed withing the growing literature on nonreligion and institutional disaffiliation, on the one hand, and conceptual tools from social movement studies, on the other hand.

1065

RN34 | T05_02: Prejudice, Trust and Mistrust around Religion

More Tolerance or More Prejudice? What is the Tendency of In-tolerant Attitudes Towards Other Religious Belongings in Switzerland?

Boris Wernli[1,2], Christophe Monnot[3]

1FORS, Switzerland; 2UNIL, Switzerland; 3University of Strasbourg, France

Longitudinal data from the Swiss Household Panel (SHP), a random sample of the resident population, allow us to study personal attitudes in Switzerland towards different religious belongings and worldviews ("Christianism," "Islam," "Hinduism," "Buddhism," "Judaism," and "Atheism"). With four waves of surveys (2012, 2015, 2018, 2021) gathering around 40,000 observations, we are able to measure personal attitudes towards different religious belongings. Moreover, we can also identify the evolution over the last twelve years. Several hypotheses of change will be tested related to age, cohorts, and periods, controlling for socio-economic variables (gender, education, income, migratory background, etc.), religious (affiliation, attendance, personal prayer) and political (ideological positioning, values, partisan choice). The focus of this paper will be the analysis of difference in attitudes towards Christianism and Atheism in a rather secularised country with a Christian tradition. We will also test the attitudes towards Islam, Hinduism, Buddhism, and Judaism, in the context of increasing immigration and inter-community tensions in a society that is progressively becoming multi-ethnic.

Religiosity and mis/trust in contemporary Serbia

Danijela Gavrilovic

Faculty of Philosophy, NIs, Serbia

Contemporary Serbia is a deeply divided society with many long-standing and unresolved problems that persist for many years, deepening old and opening new divisions in society. During the socialist period, Serbia was a relatively atheistic country, while after the fall of socialism, religiosity was revitalized (Gavrilović, 2023), merging with the revitalization and escalation of ethnic identification. Thirty years later, religiosity became and remained an important element of social life in Serbia. It is the source of legitimacy of the government and the behavior of individuals. Although it is about traditional religiosity, which is not characterized by a high level of religious practice, religiosity in Serbia stabilizes in this period at a very high level.

This paper deals with the connection between the level and type of religiosity of the inhabitants of Serbia with trust in national and European institutions, individual social actors, as well as interpersonal trust (Coleman, 1988; Giddens, 1990; Putnam, 1993; 2007; Uslaner, 2002). Trust is one of the key social phenomena that affect the functioning of society because it is related to interpersonal relations, cooperation, solidarity, and stability. Earlier research indicates that there is a connection between religiosity and interpersonal trust, but it is reflected in a higher level of trust among those who declare themselves non-religious, agnostic, or atheist (Jovanović & Gavrilović, 2012).

The analyses utilized primary data from the projects "Closing the Gap Between Formal and Informal Institutions in the Balkans" (Horizon 2020, No. 693537; 2016-2019), "European Inventory of Societal Values of Culture as a Basis for Inclusive Cultural Policies in the Globalizing World" (Horizon 2020, No. 870691; 2020–2023), and the European Values Survey 2017.

Temporal Changes in Institutional Trust among Young Refugees in Germany

Daniel Engel

University of Siegen, Germany

While a large part of German public discourse focuses on the integration of refugees and possible obstacles, like religion, there is little empirical data on dynamics of institutional trust, especially among young refugees. This contribution is devoted precisely to this marginalized group of young refugees, which has received little attention in research to date. It helps to gain a bet-ter understanding of the situation of young refugees and their everyday experiences.

This proposal is situated in the context of an ongoing sociological doctoral project, that relies on quantitative longitudinal data, that was gathered in the research project 'Religion as Resource and Risk (ReReRi)'. It focuses on the importance of religion for integration and coping with life. The sample scope aimed for young refugees, age 16 to 24, from the countries Syria, Iraq and Afghanistan, who arrived in Germany in the year 2015 or later.

The doctoral project broadened the focus of the ReReRi-study to include the newly designed and validated scale 'Attitudes towards Democracy', which contains the subdimensions 'Institutional Trust', 'Willingness for Political Participation' and 'Political Religiosity'.

The study's longitudinal approach allows for an analysis of temporal changes in trust relations. Results indicate a decrease of institutional trust over time. While religion plays only a minor role, perceived institutional support as well as a sense of belonging to Germany show the largest effects. This suggests, that institutional trust is most strongly affected by experiences in the host country, rather than individual characteristics such as religious affiliation or religiosity.

Tension and Trust in the Professional Blogs of Muslim Women

Gyuzel Sabirova

Sorbonne University, France

The focus of this work-in-progress is a sociological study of the role of social networks as a place of educational and entrepreneurial opportunities for Muslim women represented in the Russophone segment of social media. Through the analysis of individual cases of Muslim women living today in different countries of the West and East, the practices of negotiation of trust will be analyzed. Social networks for Muslim women are becoming a place to maintain a sense of belonging to communities through inclusion in a shared textual and visual space; of educational and professional activity where concept of trust is taking one of the central roles. The topic of the influence of social networks on women's Muslim identities is sufficiently represented in the academic literature. But the case of women from the post-Soviet space deserves special attention. The return of religion after 70 years of atheism, state policies to control Islam and ethnic minorities, contemporary political contexts: these circumstances determine the fluid nature of Muslim identities. We are dealing with an extremely diverse phenomenon. The paper is based on the traditions of social media research, gender theory, the discursive theory of Islam, and methodology of narrative and discursive analysis of blogs.

RN34 | T06_01: Religion, Gender and Sexuality

Second Generations and the Mosque in Italy: Feminisation Without Feminism

Giammarco Mancinelli

EPHE, France

Over the past year, I conducted my PhD research on youth Muslim organisations operating in northern Italy. Based on my fieldwork, I would like to introduce the idea that the return to the Sacred Text is an instrument of emancipation and empowerment for young Muslims women active in the Islamic youth associationism. This contributes to the feminisation of these associations without pursuing feminism.

Firstly, many female interviewees denounce a double standard in treating brothers and sisters and demand a more equitable environment. They do not legitimise their stances based on Western feminism; on the contrary, it is the Quran that is mobilised. Within the framework of a general process of de-ethnicisation (Roy, 2002), young Muslims ascribe the gender barriers, characterising the communal life of the first generations, to the cultural heritage of their parents' countries of origin. (Samad, 2004.; Ijaz e Abbas 2010). Through a re-appropriation of the Coran, considering the opposition between religion and culture, young Muslim women involved in Italian mosques renegotiate their position and roles in communal life (Acocella e Pepicelli 2015; 2018).

Secondly, among the first generations Islamic associations, the presence of women was non-existent in the steering committees (Saint-Blanchat 1995; Conti 2014). When we address to the associations of the second generations, we find that not only are women better represented – and sometimes the majority – in mosque events, but they are also well represented among the organisers, decision-makers, experts and leaders.

Our case is an example of how, in post-secular societies, processes historically linked to secular feminist struggles (equal representation in leadership and representatives' roles; critique of gender-based double standards) can unfold without feminist claims by the protagonists

Living Religion in the Workplace. Roman Catholic Women in Secularising Big-city Work Environments in Poland.

Anna Szwed

Jagiellonian University in Krakow, Poland

The religiosity of Polish society has been undergoing a noticeable transformation in recent years. Although Catholicism

1067

still remains the dominant religion in Poland, the rates of people declaring themselves as believers are falling, and the position of the Roman Catholic Church in the public sphere and trust in the Church are being challenged. The processes of socio-religious change, accompanied by simultaneous political polarisation of Polish society, are particularly noticeable in large cities.

My presentation sheds light on the problem of navigating faith and work in big-city environments. Its aim is to discuss how Roman Catholic women negotiate the presence of religion in workplace and how they cope with tensions resulting from ongoing secularisation and Catholicism losing its hegemonic position. I refer to the results of the research which encompassed 48 in-depth interviews with educated, devout Roman Catholic women living in big cities in Poland. Using lived religion approach as a theoretical framework I show how religion is lived at work at intrapersonal and interpersonal level. I present strategies religious women use to combine or to compartmentalize religion and work, pointing out how different types of audiences and situational context influence and modify practices of disclosing/hiding religion which result in visible and invisible presence of religion in the workplace.

Muslim Women's Veiling and Unveiling in Contemporary Türkiye

Ayça Demir, Figen Uzar Özdemir

Zonguldak Bülent Ecevit University, Turkiye

This study examines the meanings Muslim women attach to their practices of veiling and unveiling in contemporary Turkey. Islamic veiling has been studied by many scholars whereas unveiling of women has recently been given attention in the academia. Most of these studies conceptualize women's veiling as static and women who practice veiling as veiled/headscarved women. This conceptualization sees women as victims of an encapsulating religion/culture and does not leave space for the agency of women. In order to understand women's agency and how women negotiate with patriarchal dynamics which try to dominate them, studying Muslim women's performance of veiling as well as unveiling becomes equally important.

For this aim, we conducted semi-structured interviews with women from different ages, social classes, and professions who use/d the veil in a period of their lives. We asked them the reasons behind covering/uncovering their bodies and the meanings they attached to these performances. We found out that veiling/unveiling is related to Muslim women's life trajectories, their strategies of coping with suppressing social relations, their understandings of themselves as Muslims and women. While turning points in women's lives such as starting university, a new job, and becoming a mother can affect women's veiling and unveiling, spatio-temporal performances based on social roles and interactions also play a role, such as unveiling of a woman while there is no unrelated man nearby or veiling of a young woman around her neighborhood and her unveiling when she goes to the school.

Islam, Science, Gender, and Politics: Religious Muslims' Attitudes Toward Controversial Scientific Issues in Turkey

Mehmet Alper Yalcinkaya, Gülşen Seven

Ted University, Turkiye

In recent years, the perceived popularity of conspiracy theories and what scholars have called "science-related populism" have generated debates about the politicization of science and the factors influencing the credibility of scientific experts. In this context, some religious social and political movements have also been characterized as potentially serving to undermine the authority of science. Therefore, how religious people and religious politicians perceive science and specific scientific perspectives continues to constitute an important area of research.

Studies suggest that attitudes toward science can be informed by religious, gender and political identities, but also that broader perceptions of science may not be identical to attitudes toward particular scientific issues. In this paper, we report our findings from our project on how religious people in Turkey perceive three scientific issues that have generated controversy in recent years: vaccination (especially mRNA vaccines), gender and sexuality, and climate change. Focusing on these three issues, we discuss the ways in which not only science in general but particular types of scientific expertise, including expertise in the social sciences, are perceived by religious Muslims in Turkey, and the degree to which scientists are seen as trustworthy. We compare the views of religious political elites and ordinary religious citizens, and analyze the extent to which elite views shape the views of religious political parties' assumed constituencies. Based on our findings, we discuss the ways in which both political identity and gender may inform religious peoples' attitudes toward controversial scientific topics.

Religion, Gender, and Politics: Transformations and Tensions in contemporary Greece

Chara Karagiannopoulou[1], Niki Papageorgiou[2]

1Panteion University, Greece; 2Aristotle University of Thessaloniki, Greece

Immediately after the liberal political party Nea Demokratia (ND) took power in Greece (June 2023), the Prime Minister announced his intention to draft a bill to legalize same-sex marriage during his term in office. This gave rise to a dynamic debate between those who support and those who oppose the announced reform. Among those in favor are mainly center-right, socialist, and left political parties to be found while among those who are against are conservative right and far-right parties, as well as the elite of the Orthodox Church of Greece (COG). Thus, Greece experiences both a thorny debate and strong multi-dimensional and

multi-level tensions that take place within the religious and the political camps as well as between religion and politics. This paper adopts a feminist and intersectional approach to trace and analyse the intersections of religion, politics, and gender in the political and religious discourses produced by the political and religious elite. It aims, with the use of content analysis, to answer the following research questions: a) which are the loci where tensions occur? b) how does religion, politics and gender intersect and form tensions? c) which are the convergences and divergences of the political and religious discourses about the issue of legalization of same-sex marriage in Greece?

RN34 | T06_02: Theoretical and Methodological Issues and Challenges II

Conspirituality As A Post-Political Critique: Challenging The (Neo)liberal Institutional Order of Modernity Through The Conflation Of Conspiracism And Spirituality.

Suzanne Klein Schaarsberg

Tilburg University, Netherlands, The

As global challenges such as climate change, digitalization and inequality prevail in contemporary societies, critique on the (neo)liberal institutional order of modernity has grown. This paper explores spirituality as a counter-cultural resource that can (and is) being mobilized by social movements to both challenge and offer alternatives to the modern social order. Whereas often spirituality is perceived to be an individualizing practice with little relation to political questions, this paper challenges this assumption by researching how ideas about order are shaped through discourses conflating conspiracy theories and spirituality, also known as 'conspirituality'. Through digital ethnography undertaken with the Dutch movement 'That's the Spirit', it teases out how conspiritualism challenges the modern institutions of religion and science underlying the (neo)liberal order of modernity by putting forward a conceptualization of order based on occultism, spiritual warfare and intergalactic power relations. It highlights how conspiritualism critiques the post-political condition of the (neo)liberal order of modernity by actively re-imagining global governance, political subjectivity and politics. I argue that the (attempted) exclusion of spiritual, occult and esoteric knowledges from post-political public spaces itself signifies a truly political moment (in the sense that it establishes what 'politics' can be) in establishing the (neo)liberal order of modernity. Gaining insight into these conspiritual narratives thus not only allows us to understand what aspects of (neo)liberal modernity spiritual movements perceive as problematic, but also opens our eyes to non-secular reals that are present in today's Western societies that are in themselves challenging the modern imagination of a secular 'politics'.

1069

Theorizing and Mapping Religion and Non-Religion in Norway

Tore Rafoss

KIFO, Institute for Church, Religion, and Worldview Research

My paper explores how one can theorize, typologize, and map variants of religions and non-religious worldviews in contemporary Norway. Norwegian society – like many

other Western societies – is now characterized by a complex religious landscape. Secularization, individualization, and immigration have changed Norway from a largely Protestant country, to a country with a heterogeneous population regarding religion. Many Norwegians still maintain some kind of Christian faith, but there is a growing number of Norwegians who belong to non-Christian religions, and an increasing number of people for whom religion plays little or no role in their life. Additionally, there is a significant group of people who are drawn towards alternative beliefs and practices.

My theoretical starting point is the work of Jörg Stolz et al., especially the idea that religion and worldview are shaped by two underlying dimensions: a religious/non-religious axis and an alternative/non-alternative axis. My empirical starting point is survey data (N = 4024) that examines religion and non-religious belief in Norway. (The survey was conducted by KIFO, Institute for Church, Religion, and Worldview Research, Oslo, Norway, where I work as a researcher). Using both inductive and deductive statistical methods, I have identified five different groups with different types of worldviews: the religious, the somewhat religious, the distant, the non-religious, and those with alternative beliefs. One important goal is to accurately theorize and describe the worldview of the growing number of non-religious Norwegians.

Axial Age/Secular Age: Habermas and Taylor on Social Transformations and Religion

Andrew Peter Lynch

University of Sydney, Australia

Throughout their respective projects, Jürgen Habermas and Charles Taylor attempt to show the impact of social transformations on religion, particularly in the modern era. Both scholars utilise Karl Jasper's theory of the Axial Age in their writings, and they have each made significant contributions for discussions in the sociology of religion about a secular age in the context of modernity. This paper will provide a comparative analysis of how Habermas and Taylor develop theories based on temporal epochs to understand the relationship between religion and social transformations. Specifically, their use of the concept of 'ages', or meta-narratives of social and religious change, and how these help us to understand religion in socio-historical contexts, will be discussed, including their demarcation of religious time into periods such as the Axial Age and a secular age. For Habermas, the Axial Age was crucial for establishing the major world religions. However, he situates current post-secular discourses within the context of post-metaphysical thinking and its impact on the public sphere. For Taylor, a secular age has identifiable traits that demarcates it from previous times, including the Axial Age. A secular age is a temporal and social order in which social agents have greater freedom to choose a (non)religious stance. The paper will argue that Habermas and Taylor's use of temporal periods have key similarities, but also important differences, and it will discuss the relevance of these for each authors'

interpretation of the tensions evident in sociological debates about religion in pluralistic and multifaith societies.

Bringing Back the Transversals/ universals: for a Renewed Socio-anthropology of Islam

Francesco Piraino

Harvard University, United States of America

The socio-anthropology of Islam has been revolutionized by the "discursive tradition paradigm" elaborated by Asad and Mahmood. These authors questioned Western ethnocentrism and (neo)colonialism present in social sciences, proposing a new socio-anthropology of Islam focused on power and knowledge. This paradigm has been criticized for its rigidity, which does not allow it to grasp emotions (Marranci) and everyday life (Schielke), because it is too focused on power structures (Vicini) and on secular/religious divide (Bangstad). This paper proposes a different perspective arguing that the "discursive tradition paradigm", by focusing mainly on power relations and orthodoxy, artificially separated Islam from other religious and cultural discourses and traditions.

By re-elaborating the ideas of Shahab Ahmed (What is Islam?), this paper will discuss the categories of Text, Con-Text, and Pre-Text. The latter is crucial because it allows to analyze dimensions such as social justice, mystical experience, aesthetics, and philosophy, which are often belittled or considered as secular and exogenous to Islam. This paper argues that these dimensions are transversals/universals, which means that they are part of the Islamic tradition, but at the same time they transcend it, belonging to other traditions as well.

Bringing back these dimensions does not mean to deny the "discursive tradition paradigm" (the Text and Con-Text), but to add another layer – the Pre-Text – able to better situate Islam with other traditions/discourse. This approach will allow a better understanding of phenomena such as the Nation of Islam, the philosophy Abu Zayd, and some trends of Sufism, and contemporary Muslim artists, which put the accent on social justice, philosophy, experience, and beauty rather then orthodoxy.

1070

RN34 | T07: Secularization in Global Context

"Signals of Transcendence." An Empirical Study on Experiences of Breach of Secularized Reality in Organizations, Associations, and Communities Supporting Fragility.

Monica Martinelli[1,2], Benedetta Nicoli[1,2]

1Università Cattolica Milano, Italy; 2ARC – Centre for the Anthropology of Religion and Generative Studies, Università Cattolica Milano

According to Berger and Taylor, modern societies rely on predominantly secularized definitions of reality that appear exclusive and self-sufficient, making the sacred cosmos constructed by religion increasingly implausible. However, even under such conditions, experiences occur that can breach the secularized reality and encourage references to transcendence. After defining such experiences based on relevant literature, the paper presents research that aims at empirically investigating this object in some organizations, associations, and communities supporting fragility (illness, end of life, poverty, migration, etc.), on the hypothesis that the encounter with fragility, under certain conditions, questions the exclusivity of immanent definitions and makes transcendent interpretive frameworks more plausible. By deploying case studies and adopting innovative tools and techniques to reconstruct the lived experience of social actors and their meanings, the research sheds light on the "liminal" conditions characterizing the realities under examination that favor experiences of breach of secularized reality and sustain them through time. Results suggest that the encounter with fragility provides a focus to empirically investigate the antecedents of religious experience and highlight the utility of the concept of breaching experiences for the sociological study of religion.

The Global Expansion of Chinese Redemptive Societies-A Case Study of I-Kuan Tao in Argentina

Wei-Yi Hsiao

National Chengchi University, Taiwan

I-Kuan Tao, one of the largest and most influential Chinese Redemptive Societies since the postwar period, boasts over one million followers in Taiwan. Since the 1990s, it has also spearheaded a wave of overseas missionary work. In Argentina, with its unique national conditions, nearly 4,000 Chinese immigrant missionaries have been drawn to the movement. This article explores how I-Kuan Tao has taken root, developed, and spread in a predominantly Catholic country over 30 years, including through two major financial crises. It investigates how local Argentinians have come to understand and accept the doctrine and religious practices of I-Kuan Tao. We find that many followers converted due to disillusionment with Catholicism, as they felt the church failed to provide adequate answers and thus sought alternative spiritual paths. I-Kuan Tao's family-centric doctrine and ethical practices, bearing similarities to Catholicism's focus on family, help fill a void left by the church, especially in demonstrating the model of a happy family. Additionally, as a syncretic religion, I-Kuan Tao's creative interpretations of the Bible and God initially led local believers to feel not that they were converting, but rather returning to a more primitive form of Christianity. This has allowed them to gain new understandings and fulfillment in their needs for God, family, and ultimate concern. Our research offers new perspectives on the spread of Chinese redemptive religions in predominantly Catholic countries and the localization and development of religious immigrant communities.

Urbanization and Religion in Türkiye: Blurring of the Border between the Secular and the Religious

Ozlem Ulker Shahavatov

Yalova University, Turkiye

In Türkiye, the urbanization experience of the religious people has brought out a hybrid culture in which the secular and the religious are intertwined. In this paper, it will be discussed how religious people have produced an alternative urban lifestyle to the cultural world of the secular city, by adopting the rules drawn by religion. There has been an effort to offer a religious alternative to almost every urban secular cultural activity in which its secular version is not compatible with religion. It has been tried to give an Islamic form to hotels, holidays, beaches, fashion, film, cinema, newspaper-magazine, entertainment centers, restaurants, schools, art centers, banking, financial institutions etc. All these institutional and cultural alternatives have both religious and secular structure. While the city's secular culture transforms the traditional lifestyle and mentality of religious people, the alternative forms transform the secular cultural structure of the city. This paper examines the alternative institutions, spaces, forms which are produced by religious people to explore both their religious and secular structure, what extent they are compatible classical urbanization/modernization theories and whether these alternative forms, institutions are opportunity or obstacle for the encountering of religious and secular citizens in common public spaces of city which is cosmopolis.

1071

Too Many Halal Butcheries". Food, Religion, and Symbolic Boundaries in a Gentrifying Parisian Neighborhood.

Víctor Albert Blanco

ISOR-UAB, Spain

This presentation aims to explore the role of food in shaping representations of Islam and Muslims in French urban space. During the last decades, Islam has become the main religious minority in France and other European countries. Its visibility has often been object of social controversies, fueled by identitarian and far-right political movements. These controversies are not confined to an abstract public sphere but are intricately connected to tangible spaces and locations. Drawing on a qualitative fieldwork conducted in a Parisian neighborhood since 2016 (including interviews, ethnographic observations, and document analysis), I show that food plays a role in the (often negative) representations of Islam and Muslims. In this gentrifying neighborhood, where Islam is present through many worship places and other material and symbolic traces, non-Muslim inhabitants perceive food and its related objects (halal butcheries, halal food in school menus, etc.) as markers of social difference. While these representations are influenced by discourses and debates propagated at national and European levels, they are also inscribed in urban space and in the neighborhood social life and conflicts. The ongoing gentrification process affecting the neighborhood is crucial for comprehending these representations and their associated practices. The presence and visibility of Islam, including objects related to food, are seen as challenging the tastes and preferences of the new (non-Muslim) neighborhood inhabitants. By analyzing these representations and their spatial dimension, this presentation aims to contribute to the literature on the intersection of religion and gentrification taking food as a material object.

RN34 | T07_02: Religion in Different National Contexts

Religious Identities and Practices in Russia under Conditions of Post-globalization

Dmitry Ivanov

St. Petersburg state university, Russian Federation

Religiosity expanded dramatically in the late USSR and post-Soviet Russia. Surveys by the main pollster agencies showed regularly the growth in numbers of people identifying themselves as orthodox Christians and Muslims. Resurgence of religiosity has been mostly symbolic and only in a small part practical. Empirical data provided by recent national surveys reveal the high level of identification with distinct religion (70-80% of respondents) and the low level of involvement in religious practices (10-15% attending temples, praying, fasting etc.).

Now the turn to post-globalization is the change impacting all aspects of social life including religiosity. Post-globalization is a set of tendencies towards: 1) localization of globality in networked super-urban enclaves where flows of things, symbols, and humans made social life really global – open, borderless, mobile, multicultural; 2) widening economic and social gaps between super-urban points of access to networks and flows of resources and surrounding towns and rural areas; 3) rising new barriers (trade wars, sanctions, anti-migrant walls, quarantines, military confrontations etc.) restricting transnational networks and flows.

Post-globalization influences religious identities among Russian people in two ways. Localization of globality in super-urban enclaves is evident in metropolitan areas (Moscow and St. Petersburg) where people (especially the youth) demonstrate relatively weak religious identity being immersed in the intense social life becoming an augmented Modernity. Religious identity is stronger in small towns and rural areas where social life looks like an exhausted Modernity. Facing new barriers and confrontations after Russian invasion of Ukraine in 2022, people declare stronger identifications with national institutions and traditions including religious ones. The most recent surveys reveal the rising levels of religious identity and more approval of Russian orthodox church.

Reliosity in Italy. A qualitative approach

Roberto Cipriani

Roma Tre, Italy

More than twenty-five years after the previous survey, the results of the new research on religiosity in Italy have been published. The state of religion, or rather religions, in Italy during 2017 was analyzed. This is not just an update of the 1995 survey. This time the more challenging mixed

1072

methodology was used, that is, both quantitative (with 3238 questionnaires administered throughout the country according to criteria of statistical representativeness) and qualitative (with 164 in-depth interviews collected in various Italian cities).

Determinants of Changes in Religiosity over the Life Course on the Example of Poland, Ireland, Czech Republic and USA

Piotr Paweł Laskowski, Łukasz Kiszkiel, Konrad Talmont-Kaminski

Department of Sociology, University of Bialystok, Poland

We conducted a survey with a quota sample in four countries (N=900 per country): Poland, the Czech Republic, Ireland and the US. The survey took place in December 2022. The aim was to determine the factors influencing the direction of changes in respondents' religiosity at three points in their lives: at age 12, 25 and at present. The study used retrospective questions relating to various aspects of individuals' functioning in society, which, according to theoretical assumptions, could shape respondents' current religiosity. Among the information collected was a range of demographic data, data related to the social environment in which the respondents grew up and information about their caregivers. From the data, we try to determine the conditions under which the change in religiosity occurs and at what point or points in time it happens, distinguishing between the countries studied. Variables, came mainly from international surveys: ESS, WVS/EVS and ISSP, which means that our quota data can be calibrated against population data. These variables were also used for the retrospective component. In the presentation, we will discuss the factors that can influence a respondent's religiosity.

Has There Really Been A Religious Revival In The Ex-Yugoslav States? A Longitudinal Analysis Of Religious Affiliation, Church Attendance And The Number Of Churches In The Western Balkans.

Maruša Novak

University of Lausanne, Switzerland

The role of religion in communist Yugoslavia, especially during the turbulent Balkan wars of the 1990s, has attracted considerable scholarly interest. Numerous researchers (Saggau 2018; Zrinščak 2006; Henkel 2009; Elbasani 2015; Karcic 1997; etc.) have suggested a strong religious revival in the 1990s. However, despite extensive discussions about the religious resurgence, there is still a lack of strong empirical evidence for this trend.

The aim of my paper is to provide an empirical account of religious trends in the Western Balkans from the 1950s to the present day. The discussion will include key aspects such as religious affiliation, worship attendance, and the number of traditional churches.

The paper attempts to answer two research questions: 1) Has there been a religious revival in the ex-Yugoslav states? 2.) If so, what kind of revival has taken place and how is it linked to religious minorities?

The hypotheses are that religiosity increased in the 1990s, with the religious revival being earlier and stronger among religious minorities than among religious majority groups. Data from censuses, international surveys, and opinion polls in individual countries are used.

Public/Private Religion in Context: When Psychologists Turn to Religion to Invigorate Their Practice

Orly Tal, Michal Pagis

Bar-Ilan University, Israel

Much has been written on the subjectification of religion, as religion turns inward and focuses on the self. This process has been influenced by the penetration of psychological discourses into the religious sphere turning religion into a private, individual matter. In this paper, we investigate the opposite trajectory in which religion penetrates the psychological sphere and ask: Does this process reflect a continual privatization, or are we witnessing a new dimension of the de-privatization of religion? Based on ethnographic research among Israeli licensed therapists who integrate Buddhist or Jewish traditions into clinical practice, we illustrate that religion is made visible or invisible depending on context. In the context of institutional training and professional forums, religion is very visible and is used to produce a public, social, and moral vision for an invigorated psychology. Yet, in the dyadic setting between therapist and patient, religion is used by therapists to improve their clinical approach and practice while remaining invisible to the patient. We discuss the difference between these contexts as related to formal institutions, professions, and workplaces and the implications of this study to theories on privatization and de-privatization of religion.

Rationalizing the Nonrational: How Science and Islam Interact in Healing from Spirit Possession

Fareen Parvez, Grazielle Valentim

University of Massachusetts, Amherst, United States of America

How people heal from spirit (jinn) possession provides a productive arena to observe the complexity of the relationship between science and religion among Muslims. Drawing on qualitative research in Morocco, we argue that patients and Islamic healing practitioners maintain a respectful distance from biomedicine while also oscillating between scientific and non-scientific approaches to spirit possession. This relationship emerges out of (1) the process of rationalization of the field of Islamic healing and accompanying practices of boundary-making between legitimate and illegitimate Islam and (2) the inability of biomedicine to meet people's spiritual needs. This article heeds the call in the sociology of religion and science to examine non-Christian and non-US societies and to attend to people's actual practices rather than elite discourses and polemics.

The Soul in the Hospital Ward. Religion and Spirituality in Italian Hospitals: A Theoretical Analysis and Practical Implications

Martina Vanzo[1], Stefania Palmisano[2]

1Catholic University of Sacred Heart, Italy; 2University of Turin, Italy

The authors deal with the current role of religion within Italian healthcare institutions. This analysis is based on the findings of a project conducted in Turin, Italy, from 2020 to 2022, focusing on the integration between spirituality, religion and care as well as the management of religious diversity in hospitals. Additionally, preliminary data from a PhD project on palliative care is considered.

Italy, historically a predominantly Catholic country, is currently undergoing a significant transformation in its religious landscape, mirroring broader changes across Europe. This shift is attributed to increased migration and the rise of new spiritualities, introducing variegated religious beliefs and practices.

Public healthcare institutions, particularly hospitals, are a unique point of view for observing the debate on how the management of religious diversity is translated into practice by the administrations; furthermore, these arrangements often create conflicts but also opportunities for dialogue with the religious communities themselves. Multiple initiatives are implemented to uphold the right to religious freedom for patients experiencing suffering. This effort is further contextualized within the ongoing discourse on effectively integrating spirituality and religiosity into the treatment pathways for people facing serious diagnoses.

The COVID-19 pandemic compels us to reconsider these issues, as it has brought to light disparities in the management of different religions and highlighted areas of conflict. Therefore, it is crucial to contemplate the contemporary role that religion plays and assess whether it adequately addresses the needs of both citizens and administrative bodies.

Unpacking Religion's Role in the Organisational Identity Construction – the Case of Catholic Universities in Poland

Marcin Zwierzdzynski, Dariusz Szklarczyk

AGH University of Krakow, Poland

This paper examines the organizational identity of four state-subsidized Catholic universities in Poland, emphasizing the role of religion in its construction. Through a mixed-methods approach, combining ethnographic research and content analysis with online surveys and individual interviews, the study investigates the interplay of institutional logics, including religion, in shaping organisational identity.

Our findings reveal notable differences within studied universities; for instance, religion's role is perceived differently by students and employees, and its functions vary in development strategies and social media engagement. Differences are also visible between universities: for some, religion is a key identity resource, and for others – an "ornamental addition" to education and research. Consequently, no universal organisational identity or "recipe" for Catholicity emerges.

We address two key questions: how these universities construct their identity in relation to religion and why variations exist. Our hypotheses scrutinize the assigned role of religion, highlighting its dual function in organizational identity as both a tool for formation and a subject of adaptation to the secular world. In this sense, our research complements sociological theories of religion and offers a new perspective on organisations, particularly higher education institutions.

This research contributes significantly to understanding the unique position of Catholic universities at the intersection of institutional fields. It provides insights into the identity tensions faced by these institutions and, by extension, sheds light on the broader role of religion in contemporary society and the public sphere.

Between Faith and Commitment: The Work-Life Balance of the Volunteer Members of The Seventh Day Adventist Reform Movement

Violeta Yadira Orbea Rea

Corvinus University of Budapest, Hungary

Voluntary work is one of the most powerful tools that religious organizations have to expand their principles, organize filial churches worldwide, and perform social projects that are usually focused on offering social help. Furthermore, those who provide free labor to the church's cause must devote time to this activity plus numerous work and non-work activities that are part of the daily routine. This paper explores the work-life balance (WLB) of eight Seventh Day Adventist Reform Movement (SDARM) church members who regularly perform voluntary work in the religious context to determine the influence that volunteer work has on the planning of work and non-work activities. The main question is: how does voluntary work performed in the religious context influence the WLB of the SDARM members? And based on what factors do they build the concept of "balance" in their lives? Through semi-structured interviews, the information obtained shows that: 1. Voluntary work was perceived by them as a commitment of high responsibility, to which time and planning must be dedicated. However, the time allocation for the voluntary work differed between male and female participants. 2. Most of the voluntary activities are performed during the Sabbath, which this community considers a holy day. Therefore, a conviction of faith is linked to helping others and growing spiritually while carrying out this task. 3. The church environment offers a safe place where the participants are allowed not only to perfect their professional knowledge but also acquire new skills, which can be useful for their workplace or other situations. 4. Among the participants, voluntary service to the church was considered to build a concept of "balance". It helped volunteers to plan the amount of time dedicated to work and other non-work activities. This research contributes to the understanding of WLB in the church context and explores the types of voluntary activities between male and female members.

1075

The Separation Wall Has Been Breached

Malki Poryes

Ben Gurion, Israel

Covid-19 accelerated the rise of Internet use in the Israeli ultra-Orthodox society. The ultra-Orthodox leadership viewed this as a break in the enclaved culture and a crack in its protective shell. With its inherent lack of oversight and control over the content, cyberspace offers a chance to experience different cultures and worldviews, and interactions between the sexes. Youth in ultra-Orthodox society are perceived as especially delicate and prone to danger when coming in contact with the outside world,

subsequently youth are distanced from exploration actions. They expected to safely move over the liminal stage of adolescence and commit to the life of a respectable adult in society. Surfing online can risk their future prospects by sanctions such as being expelled and ruining their and their good name. In order to enter this forbidden space, they must take precautions and keep their anonymity. Nevertheless, despite attempts to prevent young people from using the Internet, the age of Israeli ultra-Orthodox surfers is steadily decreasing.

This qualitative study explores Youth studies and identity negotiation in the prism of media consumption. It focuses on internet and social media usage by religious youth risking their social status by doing so. The findings show a new generation of youth with critical thinking toward authority: they perceive religious leadership as an hegemony rather than authority that derives its power from a holy practice and Tora study. They look at ultra-Orthodox practices of separatism as irrelevant to our day and age. Their negotiation brings forth a fresh understating of being part of an ultra-Orthodox community as an identity component rathe then a matter of strictly observing the Jewish law and conforming to society.

Beyond Appearance: The Impact of the Religiosity on Plastic Surgery Among Pious Muslim Women in Turkey

Ece Esmer

Kadir Has University, Turkiye

This paper draws on qualitative research to explore how religious salience affects the perception of plastic surgeries—both reconstructive and cosmetic procedures—among pious Muslim women in Turkey and how these women reconcile potential conflicts between beauty-intensive norms, Islamic values, and their agencies.

The ISAPS Report indicates a continuous rise in plastic surgeries in 2022, with a 41.3% increase over last four years. According to the report, Turkey, as a Muslim-majority country, ranks 9th globally in terms of plastic surgeries. This upward trend in plastic surgeries in Turkey raises question of how it can be interpreted, particularly in conjunction with the Islam, notably cautious among the Semitic religions regarding religious rules and values related to these procedures. According to Islamic law, cosmetic surgery is deemed impermissible when its objective is to enhance appearance of already functional and "normal body" structure solely for the purpose of attractiveness. Despite the Islamic bioethical principles and sharp framing of Muslim women's visibility in public spaces by Islamic law, they personally choose to reshape and make areas of their bodies visible to others in response to cosmetic and aesthetic concerns. This research will use the feminist grounded theory and ethnographic research methods in three plastic surgery clinics in Istanbul, strategically selected with an intersectional approach, and conduct 30 in-depth interviews with pious women who have experienced these procedures in these clinics. The preliminary findings suggest that pious Muslim

women in Turkey have to navigate reconciling societal expectations and religious principles when considering aesthetic alterations, thereby contributing to intricacy of their situation. This study aims to delve not only into societal expectations' roots and effects from feminist perspective but also ask how Islam plays role in these conflicts. Additionally, it intends to address how Muslim women's perceptions of the "body", "bodily autonomy" and "choice" take shape in the context of plastic surgery and how pious women negotiate these ideas considering shifts between religious and non-religious values and practices in modern life.

Ece Esmer, a PhD student in Gender Studies at Kadir Has University has not participated ESA PhD Summer School before.

Mystics in Action: Transformations In The Sociological Study Of Mysticism

Ali Qadir, Tatiana Tiaynen-Qadir

Tampere University, Finland

Influential thinkers of the early 20th century like William James went to great lengths to formulate mysticism as a highly personal, indescribable, noetic, and transient experience. Weber famously conceived of mystics as isolated, quietist, contemplates. This definition of mysticism has since been critiqued and relativized from a sociology of knowledge perspective, which led to it falling out of academic fashion 40 years ago. Yet, the term only grew in popularity and research on mysticism, albeit scattered, divided and marginalized, continued across disciplines other than sociology. There is a recent revival of the study of mysticism in society challenging earlier ideas and embedding mystics fully as part of society. Reviewing this recent transformation, this paper proposes a critical realist approach to investigate the societally grounded claims and actions of mystics. It shows that not only are mystics fully grounded in society by virtue of their mystical language and community of practice, but also that they are unexpectedly active in social action, including healing, charity, peace activism, and environmental preservation. When their accounts are studied in detail, in most cases it appears that mystics fulfil their contemplative visions in pro-social action. At the same time, seemingly paradoxical mystical language has often fed mystification and supported unquestioned, extra-rational authority of religious figures. The paper briefly illustrates the social grounding of mysticism as well as the complex social contributions of mystics in both dimensions by way of a brief case study of two modern, cosmopolitan, mystics/ artists and peace activists, Nicholas and Helena Roerich. In this way, the paper shows the benefits in analyzing mysticism as embedded in forms of life and as part of social change.

New age Spiritualities and Sustainability: The Case of Ecovillages

Tiago Miguel Pinto

Faculty of Arts and Humanities of the University of Porto, Portugal

This presentation examines the relationship between New Age spirituality and sustainability attitudes and behaviours, specifically within ecovillages.

New Age spiritualities have emerged as a dynamic force in the field of religious exploration, promoting interconnectedness and environmental consciousness. The beliefs associated with the New Age are grounded in a holistic worldview that emphasises the intrinsic connection between humanity and the natural world. This alternative spiritualities fosters a profound respect for the environment, encouraging the adoption of sustainable living practices such as organic farming, renewable energy use, and eco-friendly communal living. These practices are great examples of an emerging ecological ethic, which has a transformative influence that extends beyond individual choices and permeates wider societal perspectives.

The phenomenon of ecovillages lies at the heart of the New Age-environment nexus. In these intentional communities, cultural and spiritual practices intertwine, fortifying a deep connection with nature. Ecovillages prioritize cooperation, resilience, and self-organization, fostering a collective consciousness dedicated to environmental stewardship and sustainable living. Their impact is increasingly evident as their popularity and prevalence rise. Ecovillages are incubators for innovative solutions that transcend the traditional boundaries of community living, embodying spiritual ideals and influencing broader societal approaches.

In this way, an understanding of beliefs is crucial New Age spirituality within ecovillages and its pivotal role in shaping a sustainable future for both individuals and society at large.

Humor against Hegemony: Ridiculing the Serbian Orthodox Church

1077

Miloš Jovanović

University of Niš, Faculty of Philosophy, Serbia

The paper deals with the analysis of the interpretations and "framings" of the Serbian Orthodox Church in comic content shared on the internet.

The Church in contemporary Serbian society is an organization with a considerable reputation among the citizens, endowed with great trust. It has numerous privileges and utilizes a fair amount of resources provided by the political oligarchy. The Church enjoys a prominent public presence, both through the formal involvement of clergy and Church representatives in the work of secular institutions, and through the informal everyday practices of people. The hegemonic position of the Serbian Orthodox Church, as a self-proclaimed moral and spiritual leader, makes it a particularly suitable target for mocking and comic treatment using irony, satire and parody.

The undertaken analysis conceptually relies on Pierre Bourdieu's theory of symbolic struggles, Gramsci's notion of 'hegemony' and Peter Berger's constructivist approach to humor. Using netnography as the method, the study will demonstrate the delegitimizing potential of ridicule in social struggles. The analysis data is comprised of visual and textual content that appeared as a reaction to Church related events. Most often thematized were "blunders", "inappropriate" behavior, "problematic" statements and attitudes of Church dignitaries, as well as the practices of the Church representatives seen as opposed to the Christian teachings and the moralities preached by the Church (material opulence, moralizing and interference in the private lives of the people, aggressive outbursts, supporting

disavowed politicians, superstition, sex misconduct and other scandals).

"The Best Of All friends": Christian Charismatic Empowerment In Times Of Crises

Igor Jurekovič

University of Ljubljana / Faculty of Arts

Lalive d'Epinay, in a pioneering study conducted in Chile, characterized Pentecostalism as a haven of the masses. Our presentation aims to delve deeper into the concept of haven by examining it from the perspective of personal empowerment, which is derived from a person's relationship with Jesus Christ. We will discuss the preliminary results of a field research among Christian Charismatics in Slovenia that was carried out in three different churches: a neocharismatic church, a Pentecostal church, and the Charismatic Renewal of the Catholic church. Semi-structured interviews with religious leaders, semi-structured narrative interviews with believers, and participant observation sessions make up this research. Despite significant differences in some theological and liturgical respects, the fundamental similarity among the aforementioned communities is the individual encounter with Jesus Christ as an immanent being. The respondents frequently discuss this encounter and the ensuing personal relationship with Jesus Christ as a means of achieving self-empowerment. Two primary aspects of this empowerment will be identified and examined: first, self-reported experiences from worship sessions; and second, personal accounts of one's relationship with Jesus Christ. In the first case, we will talk about the weekly worship experience as a means of providing relief, and in the second, we will talk about how study participants build a relationship with Jesus Christ, who over time – and with effort – becomes a friend and a source of empowerment for Christian Charismatics.

The 'Schengen Laboratory': Retrieving human mobility rights from EU historical legacies, 1985-2015

Cristina Blanco Sío-López

University of La Coruna (UDC), Spain

This paper analyses the relevant role of the European Parliament (EP)'s debates in the critique of the increasing externalization of migration and citizenship policies as part of the historical discussion on the EU's free movement of persons. More particularly, this piece looks at the role, actions and discourses of fundamental players at the European Parliament (EP) articulating differential resilient responses to evolving crises of human mobility rights since the inception of the Schengen Area in 1985. These contributions constitute, indeed, inspiring new points of departure to frame the long-standing implications of externalization when articulating citizenship and migration policies around the respect to fundamental rights and freedoms.

Furthermore, this paper aims to recover empowering historical critiques towards the so-called 'Schengen Laboratory' which could be relevant today to find inclusive ways of responding to the citizenship, asylum and migration external dimension challenges currently being posed with regards to the EU's free movement of persons.

The main questions to be addressed are: What are the evolving modes of exclusion in transnational mobility in Europe and beyond? How can historical critiques be relevant to today's challenges to free movement of persons? What are the neglected differential solidarity and diversity dimensions of European integration? In this light, can we articulate responses to humanitarian dilemmas beyond security-centred conceptions of transnational mobility? And normatively, are narratives on 'shared values' in the EU and beyond, sufficient to mediate countervailing factors of exclusion?

This enquiry on EP sources is based on archival research at the Historical Archives of the EU in Florence, at the Historical Archives of the EP in Luxembourg and at the EP Research Services.

Migrant Mobility, Border Regime(s) And The Politics Of Enmity In South-Eastern Europe

Dimitris Parsanoglou[1], Nicos Trimikliniotis[2], Vassilis Tsianos[3]

1National and Kapodistrian University of Athens, Greece; 2University of Nicosia, Cyprus; 3Kiel University of Applied Sciences, Germany

This presentation focuses on one aspect of the transformation of the European border regime, as it is materialised and specialised in the South-Eastern European border zone, namely Greece and Cyprus. As a starting point we take the finding that daily practices of materialising the border, i.e. of "doing the border", have been decisively transformed in recent years. Violent acts, such as pushbacks have become the de facto norm at many parts of the EU's external borders. The quasi normalisation of violent border practices, resulting to the suspension of the rule of law, can be a starting point to explore social and spatial logics underlying broader political dynamics in the region.

We believe that the multiple and structural violations of international and European law at this part of European borders are not an accident nor a simple deviation of the rule of law paradigm. Rather we argue that due to the failure of the migration management paradigm, as evidenced by the migrations of 2015-16, border control practices re-establish national logics that the European project – and in particular the Europeanisation of migration and border policies – had only superficially suspended in the context of post-national transformations.

In the present phase of the European border regime, formal and informal forms of "politics of enmity" (Mbembe 2016) accompanied with new forms of "ex-territorialisation" (see the recent Italian-Albanian agreement), occupy a growingly significant space. This presentation, which is based on ethnographic research conducted in the Greek-Turkish land border at the Evros region and along the Green Line in Cyprus, re-examines the ways in which "border work" is reproduced in the current, post-emergency period.

EU Border Externalisation and the African Postcolony: A Grounded Theory on the Relationship of Race, Gender, and Nationalism in Postcolonial Contexts

Céline Barry

Technische Universität Berlin, Germany

The violence of imperial border and migration regimes is intensifying. Borders racialize, borders sexualize. They delineate the spheres of rights and non-rights, of being and non-being; they shape our participation in economic life and delineate our ability to survive under racialized

1079

capitalism (Walia 2021; Bhattacharyya 2018; Tyzler 2019; Freedman et al. 2023).

Simultaneously, the process of externalizing Western borders into the territories of the South blurs the geopolitical color-line between North and South. This process is particularly evident in the interplay between the EU and African states. Postcolonial, race-critical, and intersectional border and migration studies foreground the entanglement (Conrad/Randeria 2002) of the EU's neoliberal, racialized, and gendered border policies and postcolonial tensions in African contexts (de Genova 2017; 2018; Korvensyrjä 2017; 2023; Derrider et al. 2020; Stock et al. 2019; İşleyen/El Qadim 2023; Erel et al. 2016; Sarahoui 2023; Barry 2017).

The racist crisis in Tunisia in early 2023, triggered by President Saied's discourse on the "great replacement" by black migrants and the subsequent fatal expulsions at the Tunisian-Libyan border, poignantly exemplifies the violent effects of neocolonial bordering in Africa. In this context, Sub-Saharan migrants face intersectional forms of oppression and exploitation along class and gender hierarchies.

Building on these events, my contribution explores the entanglement of postcolonial nationalism, race, and gender in the backdrop of EU border externalization. Drawing on fresh results from my Grounded Theory (Charmaz 2006) on African migrant struggles, I reflect on the Tunesian crisis from a Black Mediterranean, postcolonial-feminist perspective (Smythe 2018; Danewid et al. 2021; Dhawan/Castro Varela 2015). In view of a decolonized future (Fanon 1961), I critically reassess racialized and patriarchal constructs of the African nation.

that different pathways seem to channel migrants into the same path characterized by low-waged, precarious work. Thus, while international migration is a classical instrument to regulate and control labour, recent dynamics turn labour into an instrument for the control of migration and most notably the migrants.

1080

On The Tightening Connections Between Labour And The (Internal) Border: A City Comparison

Margit Fauser

Ruhr University Bochum, Germany

The linkages between the labour and the European border regime have become tighter in recent decades. Together with the right to work, the duty to work is expanding for a variety of migrant groups, reflecting internal bordering through which paid employment, and (legal) residence closely together, with greater variation across EUrope. Losing ones' job quickly results in losing ones' papers, and not having a job hampers application or renewal of residence permits, and access to social rights. Yet, while the tightening of restrictive interconnections between legal stay, deportability, municipal registration, access to health care and social services can be observed as a general trend, this is true in largely different ways across Europe.

This contribution aims to shed light on the labour-border nexus through a comparative perspective using data from documentary analysis of legal frameworks and narrative interviews with labour market counselling and training agents and administration in two European global cities, Frankfurt am Main and Madrid. Among other aspects, the analysis shows the different roles played by concepts of formal work, informal work, any work, and good work in narratives and law. At the same times, the analysis reveals

RN35 | T01_02: Migration and education 1

Exploring Migrants' Contextual Educational Attainment and their Children's Non-Ambitous Educational Choices

Jannike Gottschalk Ballo, Marianne Takvam Kindt

NIFU, Norway

High educational aspirations and "bold choices" among children of immigrants is a well-established finding in Norway and across European countries. While research on high-achievers has received a lot of scholarly attention, less is known about the low – to middle-achievers. This paper asks: what characterizes children of immigrants who opt out of "ambitious" educational tracks? Many will argue that immigrants are not a random sample of the population of the sending country, but rather that they are positively selected. The Barro-Lee international education dataset provides a measure of immigrants' education relative to their same-sex peers in the sending country. Substantial research exists on the relation between parents' contextual educational attainment and their children's positive drive to higher education, but little is known about the importance of relative parental education in shaping children's non-ambitious choices. The objective of this paper is therefore to investigate the role of parental educational attainment relative to educational levels in the sending country in explaining application patterns and enrolment in vocational upper secondary tracks for children of immigrants. The study utilises the Barro-Lee Educational Attainment dataset linked to rich and detailed full-population Norwegian administrative register data. Tentative descriptive findings show that descendants that enrol in vocational education have lower grades than their native majority peers, and that this gap is greater for boys than for girls. Findings regarding parents' sending country and relative educational status are still to be determined.

The "Risky Choice": Children of Immigrants' Narratives About Vocational Upper Secondary Options

Marianne Kindt, Jannike Ballo

NIFU

Children of immigrants have a strong preference for academic tracks, even when they are low performing. As vocational tracks can offer a viable pathway into the labour market for students who struggle in school, it is important to understand the mechanisms behind the ethnic inequality in access to vocational upper secondary options. However, little attention has been given to understand why children of immigrants tend to opt out of vocational education. This article aims to fill this research gap by asking: how do middle-to low-performing students with immigrant background talk about their educational choice, and what social status do they assign to vocational options? We draw on a thorough longitudinal qualitative dataset consisting of 62 self-authored texts (of whom 21 has immigrant parents), 31 in-depth interviews with the same students when enrolled in their last year of academic upper secondary education (13 with immigrant parents), and 21 (8 with immigrant parents) follow-up interviews one year later. By constructing narratives that frame the vocational pathway as "easy and unidimensional" and the academic track as "demanding and filled with future opportunities", students construct the vocational pathway as the "risky choice". However, these narratives are shared by all interviewees regardless of their parents' birthplace. Thus, while negative stigma might be one factor pulling children of immigrants away from vocational paths, it does not necessarily explain the differences between native majority and children of immigrant's educational choices. The possible different mechanisms producing ethnic variety in educational choice at lower levels, warrants further investigation in future research.

An Exploration of to What Extend Digital Engagement Influences the Life Chances of 'left-behind' Children in China

Melody Zhang

The University of Manchester, United Kingdom

Chinese urbanisation process create many opportunities for migrant workers, however, accompanied with the problems of large number of senior citizens and children in their home in rural areas and small cities, these children are called 'left-behind' children (LBC). The population of LBC is over 40 millions who lives in rural areas out of the total LBC population of 69 million while urban LBC's number growing to 28.26 million from having no formal statistics in government and NGO databases (UNICEF, 2018). This research adopt the idea of digital skills as a form of cultural capital (Paino and Renzulli, 2012; Ollier-Malaterre, Jacobs and Rothbard, 2019; Yates and Lockley, 2020) to explore the LBC's life course experiences under the influences of digital technology.

Based on the interviews with 15 rural LBC and 18 urban LBC, this research argues that despite the digital expansion enables people in both rural and urban areas to access internet, urban LBC are more likely benefits from formal IT education in schools compares to their rural counterparts reported more addition towards social media. This research also interviewed 11 service providers from NGOs to explore their role as external support in LBC's digital engagement and emphasised that although a lot effort, money and human resources being put into addressing LBC's cultural struggles through donating digital equipment and money, training rural teachers to use digital devices, assigning volunteers, their work are stilly profoundly limited by geographical and policy constraints.

Migrant Families and Educational Itineraries: Innovative Approaches for Social Mobility

Fiammetta Fanizza, Fiorella Spallone

Foggia, Italy

In the light of what Mario Draghi defined as "lost generation", this paper considers the young immigrants' effects of social inclusion in southern Europe. In particular, this paper considers the trajectories of personal training and orientation of the children of immigrants in Italy with the intention to propose concrete actions and ways of escaping from social inequalities, especially in little towns and peripheral territories.

In this regard, the paper presents an Italian best practice, called Poliferie, a non-profit association that deals with social mobility through the provision of an innovative high school graduate orientation. According to the point of view of those who are sure that guidance has inherent value still underestimated, Poliferie highlights the advantages of using parental orientation as a tool through which to understand the paths of education, citizenship integration, social mobility.

RN35 | T01_03: Migrant mobilization, (dis)trust and the public sphere 1

'I Do Not Trust Any of Them Anymore': Institutional Distrust and Corrective Practices in Pro-asylum Activism in Finland

Päivi Pirkkalainen[1], Lena Näre[2], Eveliina Lyytinen[3]

1University of Jyväskylä, Finland; 2University of Helsinki; 3Migration Institute of Finland

This paper focuses on the question how restriction of immigration policies and deportations of foreigners transform European societies and affect the citizens of deporting countries, in particularly their sense of trust and broader relation to the state. Drawing on qualitative research on Finnish citizens who engage in pro-asylum activism, we examine how institutional distrusting evolves as a reflexive process. By analysing citizens' trust judgements on institutional practices and actions that follow, we argue that distrust in institutions enhances activists' attempts to engage in corrective practices, in other words taking over the functions of institutions when noticing mistakes or unfairness in institutional practices. Corrective practices reinforce activists' distrust in the asylum-related institutions and make them question the 'myth' of Finland as an equal and inclusive country. Despite negative consequences of institutional distrust for individuals, activists continue their work indicating that they continue to trust the democratic system in Finland and its capability to absorb their claims in the long run. Activists continue to defend the human rights of asylum seekers and refugees in the harsh political climate of growing right-wing populism and anti-immigration sentiments indicating that institutional distrust and generalized trust can coexist. We demonstrate, however, that in this political climate activists' demands, though far from radical, are largely unheard by the institutions. We conclude that institutions should be more responsive to their criticism and trust should be taken as a specific development target in public institutions if we want to preserve what is left of the trust-based Finnish society.

1082

From Institutional (Mis)Trust to Interpersonal (Mis)Trust. Asylum Seekers' Representations of Non-Profit Organizations in France

Lucie Lepoutre

Ecole des hautes études en sciences sociales / Centre Maurice Halbwachs, France

In France, non-profit organizations are key actors in social and legal assistance for asylum seekers. The state finances some of them to provide information and support for accessing social rights and asylum procedures. Some non-profit organizations are thus directly involved in policy-making, collaborating with the state. The complexity of the asylum system tends to blur roles' repartition between the state and the non-profit operators. Many asylum seekers struggle to understand the differences and links between actors. Confusions take place in the context of political tensions regarding migration and general mistrust against asylum seekers (not to be legitimate for the international protection they are applying for). Asylum seekers' status puts them into uncertainty and precariousness concerning their residency or the continuity of social rights. Therefore, the communication suggests that fear of being rejected by France negatively affects institutional trust and interpersonal trust toward social workers. Interactions between institutional trust and the interpersonal trust process need to be explored further so that determinants of mistrust towards social workers will be better understood: Do asylum seekers understand the role of non-profit organizations? Is there a possibility for developing interpersonal trust despite institutional mistrust? How do interpersonal and institutional trust issues reciprocally contribute to each other? What are the socialization processes at stake for trust building in non-profit organizations? Answers to these questions rely on empiric materials from my Ph.D. thesis on social and legal assistance for asylum seekers in French non-profit organizations: 98 interviews with asylum seekers and non-profit workers insist on the reciprocity of trust challenges, and ethnographic observations underline their practical implications for assistance and the way asylum seekers experience it.

Tension, Trust, and Transformation in the Context of Syrian Diaspora Mobilization in Germany

Irene Tuzi[1], Lina Omran[2]

1Bielefeld University, Germany; 2Humboldt University, Germany

In recent years, a dynamic Syrian civil society has emerged in Germany, catalyzed by the transformative events of the 2011 Syrian uprising. Initially uniting Syrians abroad in collective efforts for social and political change in their homeland, the escalating conflict and growing sectarianism in Syria (re)shaped the patterns of the Syrian diaspora mobilization.

Moreover, while Germany has long claimed to promote a secure and neutral environment conducive to reconciliation, reflection, and dialogue among diverse entities in the Syrian diaspora and within the German society at large, the reality has proven to be more multi-faceted and complex. In particular, the conflictual relationship between the host country and the diaspora, along with the fragmented nature of the Syrian diaspora landscape, has led to tensions challenging the claimed "social cohesion" and "social inclusion".

Using an intersectional and transnational lens, this research explores trust dynamics, societal tensions, and potential transformations within the process of Syrian diaspora mobilization in Germany. Based on a mixed-methods approach, including mapping reviews, surveys, focus group discussions, interviews, and digital ethnography, this study draws on perspectives within the diaspora literature that conceptualize diasporas as complex, diverse, and dynamic social entities formed through active transnational mobilization processes.

The findings presented here show that the dynamics of (dis)trust and the tensions within the Syrian diaspora in and vis-a-vis Germany are multifaceted and influenced by a combination of internal and external factors that mirror in part broader societal tensions.

Care-Control Relations in Austrian Refugee Services – the Role of Workers' Migrant Background

1083

Ildikó Zakariás

HUN-REN Centre for Social Sciences, Budapest, Hungary

The arrival of various groups of asylum seekers, refugees and displaced people to Western Europe in the last decades implied an increased emphasis of integration policies on economic performance, education and participation in the labour market. Consecutively a multitude of institutions have also been created, assisting refugees to obtain language skills, qualifications and ultimately, employment. The creation of such institutions, while having the mandate to channel newly arriving potential workforce towards the labour market, also created further needs for labour. Teachers, trainers, social workers, social pedagogues, as well as a great number or volunteers were recruited in these institutions, a high proportion of whom being themselves of migrant background, and in the case of Austria, arriving from Central and Eastern European countries.

The presentation displays preliminary results of an ethnographic research exploring the relationship between members of various migrant groups in such educational and welfare institutions in Austria, and the reshaping of patterns of solidarities – or the lack of it – in these settings. How do migration and asylum policies translate into institutional discourses and into individual narratives and affects, when institutions responsible for their implementation are animated by persons who are themselves transnationally mobile? What typical affective relations of care

and control become mobilised by workers and what are the implications of such relations on the governance of various migrant groups? How do personal migration experience, migrant background and migrant identities of workers in these institutions shape discourses about other migrants, and their accommodation in Austria?

Power and Violence at Europe's Southern Border: Resistance to the Securitisation of Migration in the Canary Islands

Megan Denise Smith[1,2]

1Pompeu Fabra University, Spain; 2Institut Barcelona d'Estudis Internacionals (IBEI)

As Europe's southern border, Spain plays a key role in shaping European Union (EU) migration policy. This is observed through the bordering practices and ad-hoc measures it establishes as the status quo, often in border regions such as the Canary Islands, designed to stem migration flows to the Spanish mainland. These formal and informal practices can range from detention and deportation of individuals to more subversive forms such as the introduction of complex administrative procedures to regularise their immigration status or access their rights. What is referred to as the 'securitisation' of migration encompasses a wide-range of techniques of power often underpinned by crisis narratives, which frame individuals migrating as either 'risky' or 'at-risk.' Such representations can create spaces where violence, discrimination and xenophobia are provoked, condoned or protracted against migrants, asylum-seekers and ethnic minorities alike. Combining theory and empirical research, this paper explores how the securitisation of migration in the Canary Islands coalesces into these different forms of violence and how migrants are resisting such dynamics at the micro-level. It investigates the evolving spatial and temporal restrictions for migrants as well as the role of social networks and solidarity organisations in host communities in pushing back against these techniques of power. By examining the different manifestations of resistance among migrants at the every-day level, this research contributes to a growing body of critical literature that aims to reveal the mechanics and techniques of power of the Spanish and EU border regime and its possible social consequences.

Border Control Infrastructures In Ruins And (Failing) Attempts Of Accountability

Susana De Sousa Ferreira[1], Nina Amelung[2]

1Universidad Complutense de Madrid, Spain; 2Instituto de Ciências Sociais, Universidade de Lisboa, Portugal

The torturing and murdering of a Ukrainian citizen in 2020 by border police officers working for Portugal's border control agency SEF at the detention installation of the Lisbon airport, led to criminal investigations, a political turmoil questioning the government's accountability for human

rights violations and the political decision to abolish the border control agency, and ultimately reorganize the police and migration management system as such.

In this paper, we look into a sequence of breakdown and attempts of inventing a more legitimate border control infrastructure in Portugal. The focus of the analysis centers on the ambiguous socio-material and epistemic practices around the 'crisis event' in the detention center as a particularly delicate, usually invisible infrastructural space of containment in Portugal.

We analyze the different socio-material and epistemic practices at the detention center as an infrastructural space of the state, and how the media and reporting practices of civil and international organizations turn an infrastructural crisis step by step public. We discuss how the attempts of holding security professionals, a border control agency and finally a state accountable and state responses to them foreground and background specific 'matters of concern'. These range from the risk of human rights violation to the need for maintenance of infrastructure in times of permanent security threats.

Overall, we discuss the paradoxes of infrastructures in ruins, attempts to retrofit them into present and imagined future contexts, and how instead of mitigating risks they create new risks when border control infrastructure-in-crisis persists over time.

Temporary Status, Age, And The Future: Temporal Borders And The Separation Of Transnational Refugee Families Across Germany And Turkey

Paladia Ziss

University of Birmingham, UK

This paper analyses how temporal structures in asylum and refugee governance shape the process and experience of separation amongst transnational refugee families. Methodologically, it draws on eight months of multi-sited ethnographic fieldwork in Frankfurt and Istanbul in 2021 as part of a bigger PhD project on how the politics of time shape refugee reception and settlement across the transnational social field of Germany and Turkey. Specifically, the paper engages empirical material from narrative interviews with 30 refugees from Syria, Turkey and Afghanistan, as well as participant observation with four refugee families with members in both Frankfurt and Istanbul. Theoretically, it builds on conceptualisations of displacement and borders as temporal as much as spatial phenomena (Mezzadra and Neilson, 2013; Ramsay, 2018, 2020; Tazzioli, 2018), and emerging literature on how nation state governance shapes transnational families (Amelina and Bause, 2020). The paper argues that asylum governance in Germany and, to a lesser degree, Turkey, operates as a form of temporal bordering, in which temporary legal status, application deadlines, and cut-off points like age of maturity are employed to govern the spatial mobility and future trajectories of individual refugees. These practices of temporal bordering in turn affect family members living in a different state. The paper shows that, amongst transnational refugee families,

spatial separation across Germany and Turkey becomes existentially threatening and harmful, if it is accompanied by temporal separation, a collective sense that the possibility for sharing futures together with loved ones was foreclosed.

Challenges and Perspectives on Migration Policy in EU Border States: A Comparative Analysis of Greece, Italy, Spain, and Bulgaria

Sonia Parella Rubio[1], Massoud Sharifi[2]

1UAB, Spain; 2UAB, Spain

In recent years, the European Union (EU) has seen an increase in migratory flows, and several Member States on the EU's borders are experiencing difficulties in managing these migratory movements. Because of their geographical position on the borders of the European Union, Italy, Spain, Bulgaria, and Greece are more affected by migrants crossing their borders than the other main immigration destinations within the EU. The influx of migrants has raised questions about migration policies and integration programmes, highlighting the shortcomings of existing immigration systems. This article explores the complexities surrounding migration policy in these four EU border states, highlighting three key areas: the dynamics of migration flows, the management of migration, and the perspectives of policymakers involved in developing migration policy.

Drawing on a diverse set of data sources, including 4 focus groups, 17 qualitative interviews and an online survey of 79 respondents, the researchers collected in-depth information directly from policymakers actively involved in the formulation and implementation of migration-related strategies.

Italy, Bulgaria, Spain, and Greece have significant similarities and differences when it comes to dealing with migratory flows. The evolving nature of the migration phenomenon has prompted policymakers in these countries to adapt reactive approaches to migration management. The changing dynamics of public opinion, the country's political landscape, and European migration policy are the main factors that have played a key role in shaping and implementing policy decisions. These policies reflect the complex interplay between domestic policy, the EU measures on immigration, and the need to find pragmatic solutions

RN35 | T02_02: Migration and education 2

Child-Centred Approach to Migrant Children's Integration

Mateja Sedmak, Barbara Gornik, Zorana Medarić

Science and Research Centre Koper, Slovenia

In this article, we will critically discuss the integration of migrant children in educational settings in the European context. From the prevailing adult-centred perspective (of educators, researchers and policy makers), successful integration is perceived as migrant children adopting the local language and cultural values, achieving academic success, progressing to the next grade, avoiding dropping out of school and eventually finding a job. Furthermore, the "traditional" view of integration assumes integration into an imaginary homogeneous national culture. In this paper, we will critically reflect on and challenge all these traditional notions basing on a child-centred approach that recognises (migrant) children as active participants and as the main source of information about their lives and thus about integration (Mayeza, 2017). This means that we shift the focus from an adult-centred perspective to children's experiences of migration and integration, viewing them as experts, skilled communicators, rights-holders and meaning-makers (Clark and Moss, 2005; Fattore, Mason & Warson, 2007). What integration is from a child-centred perspective does not necessarily coincide with adult-centred perspective This is illustrated using data collected as part of the MiCREATE – Migrant Children and Communities in a Transforming Europe Horizon 2020 project in eight European countries (UK, Slovenia, France, Poland, Austria, Denmark, Spain, Greece) and Turkey in 2019-2022 through comparative multi-method research. The MiCREATE project used a child-centred methodological approach in the form of participant observation, focus groups and the collection of autobiographical life stories. Children from primary and secondary schools were involved in the study.

Parents' Attitudes Towards Immigrants in the 2022 Edition of PISA (Programme for International Student Assessment): A Comparative European Perspective

Francesca Fauri, Giancarlo Gasperoni

University of Bologna, Italy

Adults' attitudes towards immigrants are intrinsically enlightening, insofar as they reflect basic community values involving inclusivity and openness to other cultures: but such attitudes also, obviously, contribute to shaping their children's worldviews. The OECD's Programme for International Student Assessment (PISA) focuses primarily on assessing – via a large-scale international sample survey – the competency levels of 15-year-olds engaged in schooling or training; it also collects copious information on socio-economic-cultural circumstances. In a (limited, unfortunately) subset of countries, students' *parents* are also surveyed. This study consists of a secondary analysis of data from the 2022 edition of PISA (released in December 2023) relating to parents' views on immigrants and, more specifically: general equality of rights among immigrants and natives, immigrant-origin children's educational opportunities, immigrants' voting privileges, and acceptability of immigrants' preserving their customs. The analysis adopts a comparative European perspective involving Croatia, Georgia, Germany, Ireland, Italy, Latvia, and Portugal (for a total of over 35,000 cases). The paper will highlight differences between these countries, as well as the relationship between attitudes, on the one hand, and, on the other, families' migratory status, parents' educational attainment, households' socio-economic milieu, children's educational outlooks, schools' organizational contexts and countries' immigration profiles. Preliminary analyses show that, unsurprisingly, immigrant parents tend to have more immigrant-friendly attitudes (especially if their children are also immigrants, rather than being born in the receiving country) than natives and that the safeguarding of educational opportunities for children is the most supported provision among those submitted to parents' consideration.

The Comparison of First and Second Generation Migrants' Transnational Ties: Case of Lithuania

Ingrida Geciene-Janulione

Vytautas Magnus University, Lithuania

After regaining independence in 1991, one-fifth of the Lithuanian population emigrated abroad (Migration trends, 2023). While there have been numerous studies on the first generation of Lithuanian migrants who left the country after independence, there is a lack of knowledge regarding the ties of second-generation migrants. Hence, the aim of presentation is to reveal the connections of second-generation migrants with Lithuania in comparison of the ties of the first generation.

Although second-generation migrants have been studied extensively worldwide, the primary focus of research has been on their identity, integration, and upward mobility. Transnational theory offers insights into the growing visibility and transnational claims of the second generation of migrants. While some authors argue that the second generation is less transnational than the migrant generation or engages in different forms of transnationalism (Maruyama & Stronza, 2010; Tie et al., 2015, Agyeman & Kyei 2019, etc.), others suggest that symbolic ties persist through "memories, nostalgia, and imagination" (Glick Schiller, 2004, 458) and continue to influence the transnational lives of the second generation (Levitt, 2009, 1231).

In the presentation the results of project "The connection with Lithuania of the second generation migrants who left the country after the regaining of independence" will used.

During the project it was conducted 24 in-depth interviews with first and second generation migrants in 4 countries (Ireland, UK, Norway and Germany) by using matched interview method. These interviews reveal the nature of transnational connections of both generations and identify factors influencing transnational ties, including aspects such as identities, family and school socialisation, and the timing and context of migration.

Illuminating Migration And Education: Individual And Social Learning.

Thomas Geisen[1], Pat Cox[2], Zvi Bekerman[3]

1University of Applied Sciences and Arts Northwestern Switzerland, Switzerland.; 2MIDEX Research Centre, University of Central Lancashire, UK; 3The Hebrew University of Jerusalem, Israel.

If, in researching migration, conceptualizations of migration are separated from methodological nationalism (Glick Schiller/Wimmer, 2002), then there is a need for theories which reflect and analyse this (still) new paradigm (Cox/Geisen, 2014). Whereas migration (international or internal), can be understood as a series of interlinked non-linear processes, which are perfused by issues of intersectionality (Crenshaw 1989; 2015), including (but not limited to) 'race', ethnicity, gender, religious faith. For migrant peoples, the intersectional dimensions of age, education and qualifications reflect their pre-migration experiences, influencing their aspirations for their children's education, and for continuing their own (Morrice, 2021).

In the minority world, the hegemony of influential groups in maintaining dominant knowledge forms in educational settings is frequently occluded (Gramsci, 1971). Education (knowledge transmission) is principally considered to occur in public regulated spaces within schools, colleges and universities, in person or online. Learning may occur in these public spaces or more privately, where self-understandings and alternatives for life in the social world can emerge (Bekerman, 2008).

Mergner's theories of the social processes of learning (2005), wherein the desire to learn is in tension with self-generated learning limits, positions migrant and non-migrant students and educators of every age as both learning subjects and acting subjects, able to recognize and transcend their own learning limits.

To illustrate the relevance of Mergner's theorizing for issues of migration and education, each of the three speakers presents a recent research example: in Switzerland on distant care; on bilingual schools in Israel; on educating refugees as co-researchers on a live research project in the UK.

Accommodation Camps or Total Institutions?

Christina Skourti, Dimitrios Parsanoglou

Department of Sociology , Faculty of Economic and Political Sciences, National and Kapodistrian University of Athens

Greece hosted in 2015-2016, as a first reception country of refugee population, a significant number of asylum seekers. First reception took place mainly on the islands of the Eastern Aegean Sea, namely Lesvos, Chios, Samos, Kos and Leros, while their short or long-term accommodation took place mainly in Hospitality Structures in the mainland. These structures were initially characterised of openness and multiple trauma management, while other basic needs, e.g. health, education etc., were added among their functions. The present study focuses on the character of these structures in terms of Goffman's concept of "Total Institutions". Based on ethnographic research conducted at one of the main structure in the area of Athens, we will investigate, on the one hand, the functionality and productivity of the structure as a total institution and as a specifically designed space; on the other hand, we investigate the effects of the organisation of this space on the refugee population, hosted in the structure for a certain period of time, very often much extended than the initial provision.

1087

In this sense, our presentation attempts to disentangle the social relations produced within a total institution, as well as the transformations of the institution in the course of time, particularly during and after the emergency period triggered by the "refugee crisis".

Accommodation Centres for Asylum Seekers as Sites of Conflict and Collaboration: Strategies for the Prevention of Violence

Noa Milman, Sifka Etlar Frederiksen

German Center for Integration and Migration Research (DeZIM), Germany

The escalating use of mass accommodation facilities for asylum seekers by governments has raised pivotal concerns about safety and well-being. These facilities, despite varying conditions across European countries, consistently present risks of violence due to overcrowded living conditions and limited privacy. Recognizing the inherent challenges of mass accommodation, this research underscores the pressing need for violence prevention and resident safety in the era of increasing "campization" (Kreichauf, 2018).

Based on in-depth qualitative interviews conducted in seven languages, involving 20 employees and 60 asylum

seekers, our study focuses on two German accommodation centers. This multilingual approach, carried out by a team of nine interviewers, offers comprehensive insights into the experiences and perspectives of both residents and staff.

Our findings underscore the critical role of institutional responses and collaborative efforts with service providers. We shed light on the often-overlooked contributions of low-level, underpaid employees, including security personnel, who in this case extend their impact beyond their formal job descriptions. Furthermore, our analysis highlights interconnected strategies of staff and residents, stressing the active and vital roles played by asylum seekers themselves in violence prevention. We delve into the intertwined strategies employed by both groups, emphasizing the agency of residents and revealing the previously underestimated cosmopolitan perspectives of low-level employees. In conclusion, we contextualize these findings within the broader discourse of violence and protection in refugee accommodations (Scherr, 2022) and crimigration (Aas, 2011) and offer recommendations for future actions. Our study significantly contributes to a nuanced understanding of violence management and safety provision in mass accommodation facilities for asylum seekers, with implications for improving the lives and well-being of vulnerable populations.

Who is Smuggler? Contradictory Positions and Unsettled Roles in Smuggling Networks on the Balkan Route

Mustafa Ammar Kılıç[1,2], Muhammed Yasir Bodur[3,4]

1Tekirdağ Namık Kemal University; 2Koç University; 3Sakarya University; 4İstanbul Medeniyet University

In the last two decades, different ethnic groups, including Afghans, Pakistanis, Syrians, and Moroccans joined the human smuggling network on the Balkan migration route. Expansion of global conflict geographies and border closures in the EU's "humanitarian corridor" following the so-called 2015-2016 refugee crisis, with migration flows persisted, pushing individuals toward more perilous flight ways to Western EU countries, increased illicit economy along the route.

Numerous studies have examined Turkey-to-EU clandestine migration, yet the overlook of the facilitative guides and their role in reshaping migration corridors, the multi-layered structure of smuggling networks, and how migrants perceive these remain a significant gap.

The smuggling network's complexity on Balkan route weaves through diverse practices, challenging the simplistic perception of smuggling as solely the work of "bad guys." To foster an analytical and responsible understanding, we propose two approaches: firstly, acknowledging the smugglers' porous, permeable, and heterogeneous inner world. Secondly, redirecting attention from fixed roles in a potentially criminal and mafia-like smuggling composition to the

ordinary actors navigating survival through alternative and flexible channels within the network.

We elucidate this complexity by identifying 4 distinct (and contradictory) positions and roles that make clandestine migration possible and sustainable along the route: organized smuggling networks (executives of operation), independent guides (temporarily recruited migrants), peripheral actors (indirect participants like middlemen, taxi drivers, truckers), and beneficiaries turning a blind eye (law enforcement officers, bus drivers, ticket booth attendants). The study reveals the permeability between the identified positions and roles, challenging the fixed categories of smuggler and migrant.

Our multi-sited field research in Turkey, Greece, Albania, Macedonia, Serbia, and Bosnia-Herzegovina in 2022 involves in-depth interviews with smugglers and migrants and participant observations at borderlands.

Bordering Practices And Hierarchisation Of Mobilities: Two Airports Border Case Studies

Alessia Rambelli[1], Anna Tagliabue[2,3]

1Università Cattolica del Sacro Cuore, Milan, Italy; 2Università degli Studi di Palermo, Italy; 3Université Paris Nanterre

1088

The aim of the paper is to study airport border spatiality and temporality in the construction and selection of different categories of travelers. Indeed, despite many recent studies on border control and dynamics of hierarchisation of people on the move, airports remain a less investigated site in the field of Critical Border Studies.

Airports are in fact particularly interesting sites to observe the way in which mobility is controlled and constructed (Adey, 2003). During our observations, airports emerged as liminal spaces and as an opaque threshold which give complexity to the study of border control.

The originality of our approach lies in bringing into dialogue two doctoral qualitative researches dealing with humanitarian corridors and airport transit zones. In this context, our contribution will be based on two observations in 2023: the first one concerns a humanitarian corridor arrival at Roma Fiumicino airport, while the other one regards border practices in Orly airport transit zone nearby Paris. Thus, airports become not only spaces of transit but, in certain cases, places of detention too. Since these places are opaque and difficult to access, we could do our observations through two non-profit organizations which raise interesting methodological questions that may be discussed.

Drawing on these two cases, we will tackle the following questions: why are airports borders important to study? How the temporal and spatial bordering reveal some dynamics of hierarchisation of mobilities?

RN35 | T03_02: Diasporic and intergenerational approaches to migrants' decision making

Immigration of Russians to Serbia: Motives and Consequences

Gordana Dragomir Vuksanovic

Novi Sad Business School, Serbia

After Russia's attack on Ukraine, both Ukrainians and Russians are fleeing their homelands. Serbia is one of the main destinations for Russian emigrants. It is estimated that 150,000 (Tanjung, 2023) to 300,000 Russians immigrated to Serbia in a year and a half (Andric, 2023).

Although it condemned the Russian aggression against Ukraine and voted in the UN for a resolution demanding the immediate withdrawal of the Russian army from Ukraine, Serbia did not impose sanctions on Russia. At the international level, maintaining ties with Russia is interpreted as direct opposition to the political decisions of the European Union. As a result, the alignment of Serbia's foreign policy with the policy of the European Union decreased from 64% in 2021 to 45% in 2022 (Andric, 2023). Fleeing from the current regime, Russians are immigrating to a country that does not want to impose sanctions on the same regime.

The aim of the work is to indicate:

– Various factors that encouraged Russians to choose Serbia as their future destination.

– Political, economic and demographic changes observed in Serbia due to the immigration of Russians.

Electronic editions of the press published in the Serbian language in the period from February 24, 2022 to the end of 2023 are used as a data source. In addition to the press, scientific and professional literature is also used.

Relevant data were extracted using content analysis method.

The results of the research show that the belief of two brotherly peoples has been shaken. In the prejudices that Russians and Serbs have about each other, there are more negative than positive characteristics.

From Residents to 'New Citizens': Aspirations, Identities and Decision-Making of Internal Migrants in China

Shiyang Chen

The University of Liverpool, The United Kingdom

Since China's marketisation in the 1980s, the massively increasing internal migration has been invigorating the economic development of Chinese cities while also posing challenges to urban social governance. By 2020, there were 376 million Chinese migrants (27% of the national population) living in a city other than their de jure city of household registration (hukou) and hence excluded from the obligatory provision of public services by the local states. Since 2011, the central Chinese government has initiated a 'new citizenship' campaign break down the institutional barriers and corresponding inequalities between local and migrant residents, whereby 100 million migrants are expected to access at least education and medical services. That opened the way for municipal governments to establish their own competitive migration programmes, many of which devised 'points schemes' to 'screen out' eligible migrant-applicants from non-eligible ones. Existing research on Chinese internal migration has overwhelmingly tended to homogenise migrants as a uniformly impoverished urban underclass and the state as a unified powerful entity. The 'agency' of both individual migrants and different state actors has been largely neglected. To inquire into the role of agency in this issue, this paper revisited Parsons' action and social system theory to test migrant responses to the local implementation of 'new citizenship' policies: their aspirations, identities and decision-making regarding place of settlement and access to public services. The survey and interviewing data showed a diverse array of ways migrant agency can be embodied, echoing Parsons' tripartite action-orientations though not always organised in a socially 'integrated' way.

Migration as an Individual or Family Decision? Examining Migration Decision-Making through an Intergenerational Approach

Tuen Yi Chiu

Lingnan University, Hong Kong S.A.R. (China)

International migration has become a ubiquitous phenomenon. Since migration of the younger generation will affect the extent to which ageing parents can receive old-age care, migration decision-making within the intergenerational care context becomes an important social and research topic. In migration scholarship, few have scrutinized how older and younger generations negotiate migration decisions and make intergenerational care plans in the pre-migration context. This paper addresses this issue by examining the migration decision-making process between ageing parents and adult children in Hong Kong, a place

1089

that is undergoing a new wave of exodus. A mix of qualitative in-depth interviews and visual care mapping are used to capture the views of both generations on migration and intergenerational care expectations. Specifically, this paper discusses whether migration is regarded as an individual or family decision, and whether and how ageing parents and intergenerational care considerations are involved in the migration decision-making process. Furthermore, it examines how the quality of intergenerational relations, filial ideology, and care needs of the generations affect the (non)involvement of ageing parents in the migration decision-making process. Overall, the findings of this paper contribute to the ongoing intellectual debate about the changing intergenerational contract and shed light on the dynamic relationship between migration and intergenerational care. They also help reveal whether ageing parents are embracing or resisting the new trend of independent ageing that has emerged in recent years. Methodologically, the findings illuminate how an intergenerational approach could benefit the analysis of migration decision-making in the family context.

Diasporic Memory and Heritage: Intergenerational Narratives of Kurdistani Jews in Israel

Bahar Baser[1], Duygu Atlas[2]

1Durham University, United Kingdom; 2Freelance Academic

The State of Israel has been the recipient of two waves of mass migration: first in the 1950s and later in the 1990s. Within the framework of these Zionist homecomings, Operations Ezra and Nehemiah airlifted thousands of Kurds to Israel in the early 1950s. After a traumatic departure from their homeland due to pogroms and threats, Kurdish Jews, along with other Mizrahi migrants, started a new life in Israel. So far, many studies focused on the experience of larger groups of migrants, and "peripheral groups," such as the Kurds, have not received their deserved attention in history books. This paper examines the ways in which the Kurdistani Jewish community mobilizes in Israel and contributes to understanding the cultural trauma that they have endured after their departure from Kurdistan, intergenerational transmission of collective memory, and formation of diasporic identities that are shaped by transnational dynamics. It demonstrates how Kurdistani Jews are linking past and present, and recreating Kurdish heritage in transnational space that is first weaved in the Levantine migration corridors and then enriched by other global/regional trends. The findings are based on extensive multi-sited fieldwork in Israel which resulted in focus group and individual interviews with members of the community.

RN35 | T03_03: Migrant mobilization, (dis)trust and the public sphere 2

Migrants' Precarity And How The Welfare State Negotiates Its Different Roles

Astrid Ouahyb Sundsbo

Western Norway University of Applied Sciences, Norway

Individual characteristics of migrants (such as lack of local language competencies and low formal qualifications, health) as a key explanatory factor for migrants' lower labour participation and precarity in advanced Western societies. Less is known about how the structure of the welfare system and its underlying institutions may contribute to persistent inequalities. This paper discusses the role of welfare state arrangements in (re-) producing migrant's often precarious work inclusion, based on insights from Norway. In Norway, as in many other Western European societies, the welfare State model has undergone a shift towards increased focus on workfare/labour activation policies and pressure to monitor and reduce costs. The paper offers an analysis of what may be considered as the Janus face of the (Norwegian) welfare state as regards migrants' labour inclusion. On the one hand, it has an obligation to uphold the ideal of equal premises for all to participate and live self-determined lives. On the other, the Norwegian welfare state is a major employer of migrants (women in particular) through its hegemonic role in providing care services for children and elderly people; jobs that are characterized by low wages, high shares of part-time work and loose contracts. Migrant(women)'s available labour force or "hands" thus represents an opportunity for the "care crisis". The tension between the different missions of the welfare state is presented and discussed in the paper. The analysis draws on SLB-theory and institutional ethnography, and empircal insights from ethnographic research (observations and interviews with employees and service managers within the social services over two years) where dilemmas and negotiations in navigating between these different dimensions have been identified.

1090

Forging Links and Advocating Rights: Solidary Mobilisation in a Context of Repressive Migration Policy in Brussels

Naïké Garny[1], Adriana Costa Santos[2]

1KU Leuven, Belgium; 2UCLouvain Saint-Louis Bruxelles, Belgium

Based on the analysis of collective action in the reception of migrants at local scale (Brussels, Belgium), this article

seeks to understand the processes of politicisation of citizens (Vandevoordt, 2020), as well as the local development of hospitality approaches and practices (Deleixhe, 2018), to examine how they operate paradigm shifts and challenge migration policies on a global scale. The experience of citizens' "hosting – at-home" solidary mobilisation (Costa Santos & Garny, 2022) is analysed around two main concepts: Tilly's (1986) "repertoire of actions" to observe concrete participation of citizens as means of politicisation; and "framing processes" (Snow et al., 1986) to investigate the construction of meanings and representations around migration issues through this mobilisation. To take the cognitive analysis (Surel, 2019) further, we studied the evolution of migration categories and their use at local level (Frigoli, 2010); and the personal and individual "concern" of those involved in public policies (Ravon, 2008), who challenge traditional charity practices and moral protest. While identifying the main paradigms of European migration policy (Deleixhe, 2022; Hamidi & Fischer, 2017), based on border control, suspicion and repression of movements, we verified how it gives rise to mobilisations that end up transforming it (Vertongen & Costa Santos, 2022), proposing approaches based on solidarity and forging of social links. Through participant observation in this context, we sought to answer the following questions: how do local actors get politicised through humanitarian practices? How do these local practices contribute to rethink migration policy on a global scale?

Inclusive democracy: Analysing the Role of Opportunity Structures in Migrant Political Participation

Massoud Sharifi[1], Sònia Parella Rubio[2]

1The Autonomous University of Barcelona, Spain; 2The Autonomous University of Barcelona, Spain

This article examines the participation, mobilization, and representation of migrants in four European cities: Girona (Spain), Sofia (Bulgaria), Avezzano (Italy), and Athens (Greece). The study focuses on two main questions: How do migrants mobilize and participate in the local public and political spheres in these cities? Furthermore, integrally connected with the first goal, the study aims to identify factors that could determine the forms and intensity of migrants' participation and mobilization. Drawing from resource mobilization theory, we posit that the involvement and representation of migrants in the political arena depend on political-institutional opportunity structures.

The data for this study was gathered from diverse sources, including 24 focus groups, 55 qualitative interviews, and an online survey (with a sample size of 148 respondents). These methodologies involved interactions with migrants, members of civil society organizations, and public administration officials. The findings suggest that migrants predominantly engage with migrant associations and the voluntary sector, showing minimal involvement and representation in formal political processes and policymaking.

Two critical factors emerge as influencers of political mobilization and participation among migrants: i) political rights and inclusion policies; ii) repertoire of actions. The

study reveals the disempowerment experienced by many migrants due to the challenging process of obtaining legal status, leading to a reluctance to engage in political issues. The second aspect, repertoire of actions, examines the restrictions and limitations placed on individuals or groups in terms of the array of options and strategies available for political participation.

REFUGE-ED Dialogic Co-Creation Process

Teresa Sordé Martí[1], Emilia Aiello[2], Teresa Sordé Martí[3], Teresa Sordé Martí[4]

1UAB, Spain; 2UAM, Spain; 3UAB, Spain; 4UAB, Spain

An increasing body of literature indicates that engaging end-users in intervention research, encompassing design, execution, and assessment, yields numerous favorable outcomes. These include enhanced intervention effectiveness, longevity, and personal development among collaborators. The significance of this approach, along with the recommendation for researchers to adopt co-creation in implementation and policies, has been acknowledged within the EU Framework of Research Innovation. Moreover, it has been proposed that this strategy is particularly pertinent when working with individuals from marginalized groups, whose perspectives are often overlooked in research and policy deliberations. Despite this recognition, there has been limited exploration of the practical aspects of co-creation. This paper presents a review of the methodological framework employed by the H2020 REFUGE-ED project (2021–2023), conducted in collaboration with migrant, refugee, and asylum-seeking communities. The project implemented the 'REFUGE-ED Dialogic Co-Creation Process (RDCP)' in 46 educational settings (including unaccompanied minors reception centers, schools, and asylum camps) across six European countries: Bulgaria, Greece, Ireland, Spain, Sweden and Italy. Given the imperative for evidence-based approaches in education and mental health and psychosocial support practices, we posit that the RDCP holds potential for sustainability and replicability in various contexts, specially serving migrant and refugee communities.

RN35 | T04_01: Novel directions in return migration research

Empowering Returns: Unveiling the Transformative Role of Women Migrant Returnees in Shaping Migration and Gender Equality in the EU-MENA Region

Stellamarina Donato[1], Consuelo Corradi[1], Giorgia Mavica[2]

1LUMSA, Italy; 2University of Catania, Italy

This study investigates the experiences of women migrant returnees within the EU-MENA region, focusing on unraveling the intricacies associated with their return and their crucial contributions to the development and empowerment of local women, fellow migrant women, and potential returnees. Recognizing the diverse challenges inherent in women's migration journeys, such as gender-specific barriers, societal norms, cultural expectations, and legal and institutional constraints, the study asserts that despite these hurdles, women's returns can catalyze transformative processes that amplify opportunities for empowerment and agency.

This transformative potential is particularly evident as these women play a crucial role in connecting knowledge and resource disparities between the EU and MENA regions. They become valuable contributors with the potential to inform policies and practices related to migration, development, and gender equality.

To achieve its objectives, the study employs qualitative research methods, including case studies, comparative analysis, and in-depth interviews. Emphasizing the voices and narratives of women migrant returnees ensures a comprehensive understanding of their experiences, aspirations, and contributions within the context of women's migration in the EU-MENA region. Consequently, this research serves as a valuable resource in shaping a more informed and inclusive discourse on the intersections of migration, gender, and social transformation in the region.

Return Decision-Making as a Process. The Case of Polish Return Migrants.

Małgorzata Dziekońska

University of Bialystok, Poland

Return migration, as defined in this paper, is the movement back to the migrants' country of origin after a significant period of residence in another country to remain in the country of origin, perhaps permanently. How decisions to make such a return are made is still little recognized in migration research. What draws the researcher's attention in this regard is the intentions or plans to return, as well as the declared reasons for return, but not the decision-making process. In my paper, I show this process noting the dual reference point of economic and social conditions of the receiving and sending countries as an essential context; I also identify the reasons for return. I base my analysis on the results of qualitative research; the research method was in-depth, semi-structured interviews with 33 Polish return migrants. Margaret Archer's reflexivity became the theoretical framework for my study. Drawing on the study's findings, I distinguish four stages of return decision-making and show that the process is multidimensional, multi-stage, and lengthy – it can take up to several years. I also demonstrate how return intentions change as the stay prolongs and how decision-making is related to migrants' life stage and ultimate concerns. I further highlight the role of economic and non-economic factors in this process, such as complex intercultural relations, family ties, etc., in the home and host countries.

Return and Readmission Policies in Italy: Evolution and Features of the Preferred Answer to Migration

Francesca Cimino, Fabio Perocco

Ca' Foscari University of Venice

1092

In the last two decades, Return and Readmission (R&R) policies have become increasingly important in the political and policy agendas of the European Union (EU) and its Member States, to the point that nowadays they are the preferred answer to the migratory movements from the Global South to Europe. Through the adoption of soft law documents, the EU has developed a common policy based on R&R policies to deal with irregular migration. Despite the EU and the Member States' efforts to promote returns and readmissions, data suggest that the percentage of returns is considerably low compared with the number of undocumented migrants: in 2022 in Italy, 138 420 migrants were found undocumented, 28 185 were issued an order to return, and 2915 were returned to their home country (Eurostat, 2023).

Based on the Horizon Project MORE (Motivations, experiences and consequences of returns and readmission policy: revealing and developing effective alternatives), this paper presents the results of a study on development, characteristics, and trends of R&R policies in Italy in the last twenty years, through the analysis of the following sources: laws which introduced news and change on the topic; soft laws generally related to agreements with third countries, such as bilateral agreements, memorandum of understanding, treaties, and deals; press communications whenever the texts are not publicly available; scientific literature and grey literature; experts interviews. The paper presents a comprehensive sociological study on the little-explored topic of R&R policies, providing knowledge on the subject and contributing to the migration scholarship, specifically on migration policies.

The Interplay of Settlement Intentions and Integration Among Ukrainian Refugees in Germany: A Longitudinal Autoregressive-Cross-Lagged Analysis

Leona Przechomski[1], Katherina Sytkina[1], Andreas Ette[2], Eldad Davidov[1,3]

1University of Cologne, Germany; 2Federal Institute for Population Research, Wiesbaden, Germany; 3University of Zurich, Switzerland

The Russian invasion of Ukraine in February 2022 triggered an unprecedented wave of Ukrainian refugees seeking safety outside their country, constituting the largest movement of Ukrainian citizens since World War II. Over one million Ukrainian refugees officially registered in Germany as of 2022.

In our study, we explore the dynamics following the refugees' arrival in Germany. We investigate whether a positive integration into German society within the first year and a half after Ukrainian refugees' arrival increases their intentions to stay in Germany and, conversely, if strong intentions to stay contribute to greater integration. Despite its importance, this nexus remains relatively unexplored. Its investigation provides valuable insights into the determinants of integration and settlement intentions, shedding light on the factors influencing Ukrainian refugees' decisions regarding both settlement and integration.

In our analysis, we employed a representative longitudinal survey of Ukrainian refugees who arrived after February 2022 in Germany and conducted autoregressive cross-lagged analyses.

Our results yielded two main preliminary findings. First, Ukrainian refugees' intentions to stay in Germany were hardly predictive of their integration. Second, integration into German society affected Ukrainians' settlement intentions similarly weakly. Thus, our study suggests that factors shaping Ukrainians' settlement intentions extend beyond societal integration and that their integration progresses independently of their settlement intentions. This research enhances the current understanding of refugee settlement and integration, providing valuable insights for policymakers and practitioners working towards facilitating a successful settlement and integration of Ukrainian refugees into German society.

RN35 | T04_02: Anti-migrant attitudes and protest in the european context

Did the Pandemic Crisis Worse Attitudes towards Immigration? Results from a Quantitative Study on 16 European countries

Vera Lomazzi[1], Veronica Riniolo[2]

1University of Bergamo, Italy; 2Università Cattolica del Sacro Cuore, Italy

The impact of the Covid-19 pandemic – and of its consequent economic crisis – on the intergroup relationships has not been deeply investigated so far, often because of lack of data. Recently released data from the 10th round of the European Social Survey, combined with round 9th, allows for investigating this issue by using data collected before and after the pandemic outbreak. Building on the Group Conflict Theory, the Group Relative Deprivation, and Schwartz's and Inglehart's Value Theories, we aim addressing the following research questions: 1) How do attitudes toward immigration and the perception of ethnic groups as a threat change after the Covid-19 pandemic in EU countries? 2) to what extent contextual factors, such as the Political Opportunity Structure (POS), the economic conditions, and the collective salience given to the topic immigration contribute explaining these changes? Our analysis shows that, after the pandemic crisis and in opposition to our initial hypotheses, negative attitudes towards ethnic groups decreased in several EU countries, but not in all countries and not with the same intensity. The role of contextual factors, such as economic conditions, is crucial to explain this heterogeneity. The consequences of the crisis may have impacted on the priorities of EU citizens and immigration was no longer at the centre of the public debate. Therefore, alongside descriptive statistics, we apply multilevel modelling to contribute explaining these changes while controlling for individual factors.

When in Rome, do as the Romans do? Exploring anti-migrant attitudes among migrants in Europe

Hanna Sakhno

University of Groningen, Netherlands

This study investigates the seldom-explored attitudes of migrants towards immigration in Europe, where 12.5% of the population is of migrant background (UN, 2023). Contrary to the focus on natives' perspectives in existing literature, such as competitive threat theory, we examine migrants' viewpoints, essential for understanding community dynamics and political engagement (Just & Anderson, 2015).

1093

Migrants often mirror natives in economic/social preferences and trust levels (Algan et al., 2012; Dinesen, 2012; Maxwell, 2010), influenced by either acculturation to host society values (Gonnot & lo Polito, 2023) or retention of origin culture values (Tabellini et al., 2010). However, the presence of anti-migrant sentiments among migrants presents a paradox: shared experiences may promote solidarity, yet cultural differences can lead to closer ties within specific migrant groups.

Our research examines how migrants' identification with the dominant migrant group in their host society affects their attitudes towards those alike. Utilizing data from the European Social Survey (2004-2019) and OECD migrant inflow records, we created a migrant identification index. This index, combined with socio-economic and cultural variables, assesses immigration attitudes, especially among first – and second-generation and European or non-European migrants.

Findings indicate that stronger identification with the dominant migrant group reduces anti-migrant sentiment, particularly among first-generation and non-European migrants. This highlights the role of group identification in shaping migrants' immigration attitudes.

"Exclusionary Protest" And The Far Right In Ireland: Participant Justification For Opposing Or Supporting Migrant Rights In The Republic Of Ireland November 2022-July 2023.

Barry Cannon, Shane Murphy

Maynooth University, Ireland

Anti-migration protests, particularly against asylum seekers, and counter-protests, increased substantially in the Republic of Ireland since the mass arrival of refugees to the country after the Russian invasion of Ukraine in February 2022 and a post-Covid 19 spike in asylum applications. This paper reports on a study of people's motivations for attending such protests, adding to sparse existing work on that phenomenon in Ireland. Irish (Peillon 2002; Layte and Landy, 2018; Fanning, 2021; O'Donohoe 2023) and European literature on the subject (Eckardt 2020; Rea and Martiniello, 2019; Gootjes et al. 2021; Grillo, 2005; Hubbard, 2005; Fleischmann, 2020) finds evidence of ideological, political and structural motivations for attending such protests, with substantial slippage between each. In this study, we analysed 144 media articles on such protests from three major Irish print media outlets, published between November 2022 and July 2023, and featuring protestor quotes indicating motivation. We found that anti-migrant protestor motivations were, in descending order, security, resource scarcity, lack of consultation and suitability of sites. Contradictorily, however, many such protestors repeated far right inspired racist and xenophobic tropes while simultaneously disowning the far right and denying racism. Migrant supporting protestors on the other hand professed humanitarian motivations, while sharing similar political and structural

concerns with 'moderate' anti-migrant protestors. Our research therefore finds continuity with existing literature on motivations in recent Irish migration related protest, while raising questions on how to disentangle political and structural concerns around migration from racist and xenophobic discourse on the subject.

From Babylon to Portugal: Israelis in Alentejo

Tamar Barkay[1], Zohar Iancu[2]

1Tel Hai College; 2The Catholic University of Portugal

In recent years, there has been a notable trend of Israelis immigrating to Portugal, influenced by lifestyle, political, and economic migration patterns. A significant aspect of this trend is a movement towards rural areas, including Southwest Alentejo, where a counter-culture community, built upon anti-capitalist, sustainability, and post-national values, has emerged over the past decades. To explore this trend, the paper adopts three standpoints developed within migration, culture, borders, and diaspora scholarships: First, territorial and symbolic boundaries mirror their interrelations. Second, such interrelations construct inclusion and exclusion mechanisms. Third, drawing boundaries is a key practice in the construction of collective identities. Rooted in this analytical framework and based on an extensive ethnographic fieldwork, the paper portrays migration experiences of Israeli immigrants in Alentejo, highlighting the ways in which they cross and re-delineate geographic and symbolic boundaries through their interactions with immigrant and local individual and communities. We suggest that, shaped by dialectic relationships with Israeli culture and involved in questioning collective identities, this boundary work contributes to the construction of Alentejo as a radical alternative for what they commonly term the 'Babylonian mindset'—Western-urban-capitalistic culture, prevalent also in Israel. This understanding allows viewing Alentejo as a 'heterotrophic space,' fulfilling both the alternative 'rural vision' and the desire to belong to a concrete locality beyond the surveillant eye of the nation-state—where actual life diverges from utopia. As a whole, the paper lays an empirical groundwork for studying the interconnections between migration experiences and perceptions of belonging and collective identity.

Who stands with Ukraine? Labour migration, Social Reproduction and Displacement during Russia's War on Ukraine

Daria Krivonos

University of Helsinki, Finland

The article offers a longer-term perspective on the movement of Ukrainian nationals focusing on the links between post-2022 movements into the EU nation-states and the prior movement of Ukranian nationals as "migrant workers". The presentist focus on Ukrainian displacement in the context of Russia's full-scale invasion overlooks a much longer history of invisibilized circulation of Ukrainian migrant workers. The article shifts the focus away from Ukrainian refugees as the recipients of humanitarian aid and assistance to show how Ukrainian migrant workers precariously employed in the EU service economies are the ones bearing the costs of social reproduction in the context of Russia's full-scale invasion. As the Temporary Protection granted to Ukrainian citizens gives little access to more expansive refugee protection and welfare rights, coupled with fatigue of 'host societies', the question to be asked is who will reproduce the lives of Ukrainians fleeing the war. Drawing on fieldwork in Warsaw in 2020-2023, I examine how the burdens of social reproduction are effectively displaced on Ukrainian migrant communities confronted with the responsibility to ensure their own reproduction and survival.

Exploring Employment Circumstances, Integration, and Socioeconomic Inequalities: Informing Policies and Support Programs for Displaced Populations

Lilit Yezekyan, Mariam Babayan

Caucasus Research Resource Center (CRRC) Armenia

The displacement of populations due to conflicts presents formidable challenges, especially concerning employment, integration, and socioeconomic disparities. This academic research project aims to delve into these specific challenges to inform the development of effective policies and programs catering to the needs of displaced individuals. Through a thorough exploration of employment situations, social integration, and socioeconomic inequalities, the study seeks to yield valuable insights that can guide the implementation of support measures.

Employing a qualitative approach, the research involves a desk assessment of needs and an evaluation of the situation concerning the forcibly displaced population from Artsakh after the 44-day war in 2020. The study scrutinizes the experiences, challenges, and barriers encountered by the displaced population in accessing and securing employment, integrating into new communities, and overcoming socioeconomic disparities.

The primary goal of this research is to lay the foundation for public discussions among representatives from the public, political, and media spheres, focusing on the specific needs of displaced populations. By addressing knowledge gaps related to employment circumstances, integration, and socioeconomic disparities, the study aims to contribute to the improvement of support measures implemented by relevant stakeholders.

Producing Invisibility: Migrant Perspectives on Gig Work as Invisible Work

Maizi Hua

University of Olso, Norway

The phenomenon of migrants participating in the gig economy has garnered attention from scholars. Critics view gig work as invisible work that keeps workers out of the public eye and subjected to low wages, particularly for already vulnerable migrant workers. However, most scholarship on this topic has focused on how gig work makes workers invisible; less is known about migrant workers' perspectives on their invisibility at work. This paper aims to contribute to the discussion by analysing empirical data obtained through in-depth interviews with 23 migrant food couriers in Norway and one year of participatory observation involving seven couriers. The findings reveal that migrant couriers in foreign countries face various forms of scrutiny from local immigration and law enforcement agencies, as well as from their remote relatives, acquaintances, and globalised platform companies. In response to these circumstances, it is not unusual for migrant couriers to strategically adopt the role of "invisible workers" and engage in low-profile performances during gig work that often go unrecognised. This deliberate invisibility "produced" by migrant gig workers highlights their unease regarding their immigration status, anxieties related to the gig work they engage in, and resistance to pervasive surveillance from their gig work.Departing from the prevailing exploitation perspective, this paper seeks to comprehend the invisibility of gig work through the lens of migrant couriers. By utilising firsthand data obtained from migrants' work experiences and practices, it explores how invisibility can transform into a "weapon of the weak."

1095

RN35 | T05_02: Gendered perspectives to migration

The Speech Of Migrant Women. Audibility In Public As A Performative Exercise of Citizenship

Rosa Gatti

Università di Napoli Federico II (IT), Italy

The paper aims to reflect on the relationship between citizenship and migrants' recognition by paying attention to the dimension of their public audibility (not only to their visibility). Paraphrasing and reversing the question "can the subaltern speak?" (Spivak 1988), the paper asks whether migrant women' voices are heard, that is, whether their speaking produces listening in the public, whether it makes them recognizable as subjects capable of acting and counting. On the basis of the theory of acts of citizenship (Isin 2008), we also ask whether the words spoken in public by migrant women represent a particular performative exercise of citizenship, in other words, whether speaking makes them citizens, beyond their legal status. To answer these questions, the paper focuses on the speech acts of migrant women observed in an institutional context, the Immigrant Table of Naples (IT) during the Covid-19 pandemic crisis, through a long-term ethnographic fieldwork (2018-2022) conducted with visible migrant women in the role of representatives of ethnic organizations and/or communities. The paper shows how migrant women, by making themselves audible in public, create themselves as active political subjects by publicly claiming their membership in the social and political community and transforming their relationship with institutional political power. The words of migrant women at the Table of Immigrants allowed for reflection on the dialectic of recognition and the performative exercise of citizenship, configuring themselves as a particular political act of citizenship. The analysis will show how migrant women are capable of challenging the boundaries of national citizenship by creating new forms of belonging and coexistence.

Bodies As Intimate Border(s)/(ing): Emergent Female Subjectivities Of Female Refugees From Turkiye

Ebru Ustundag[1], Nezihe Basak Ergin[2]

1Brock University,Department of Geography and Tourism Studies, Canada; 2Giresun University, Department of Sociology, Turkiye

The study explores the emergent subjectivities of female refugees from Turkiye to Canada via Mexico and the USA, representing one of the unique immigration experiences in 2023. While the dominant literature on "refugee studies" focuses on the singular understanding of female refugees, this paper explores gendered migration experiences, encounters and struggles through the lens of theories of border/ing and intersectionality (Biswas, 2022; Chaplin, 2019; Crenshaw, 2013; Misra et. al., 2021; Ustundag and Rose, 2024; Yuval-Davis, 2015) as well as geographies of intimacy (Bunnell et al., 2012; Heinonen, 2022, Kern, 2020; Kosch and Miles, 2021) based on the focus group interviews with female refugees from Turkiye in Canada. By questioning the limits of dualities of migration policies and practices, we contribute to the recent debates on understanding border(s)/(ing) as "gendered struggles" (Mezzadra and Neilson, 2013), as well as questioning the politics of "temporary" migrant conditions and becomings (Bridgen and Mainwaring, 2016; Brun and Fábos, 2015; Yıldız and Sert, 2021).

Navigating Civic Engagement: Examining Women's Leadership in Portuguese Immigrant Organizations

Joana Bessa Topa[1], Carla Cerqueira[2]

1University of Maia & CIEG/ISCSP-ULisboa, Portugal; 2Centre for Research in Applied Communication, Culture, and New Technologies (CICANT), Lusófona University,

The civic participation of migrant women within civil society organizations and immigrant associations is a topic that remains relatively underexplored in Portugal. This study adopts an exploratory approach, focusing on female immigrant leaders and the challenges they encounter in facilitating the integration of immigrants into Portuguese society. Through qualitative interviews with eight diverse immigrant organizations in Portugal the research uncovers the nuanced experiences of migrant women. The findings highlight that the experiences and leadership roles of migrant women are shaped not only by their backgrounds and qualifications but also by the challenges encountered upon arriving in Portugal. Despite facing constraints, particularly in terms of organizational sustainability, these leaders contribute significantly to immigrant integration. The study underscores the role of immigrant organizations in providing autonomy and empowerment to migrant women, offering them a voice, visibility, and recognition in host societies and their communities. Ultimately, the research underscores the importance of acknowledging the contributions and challenges of immigrant women, emphasizing the crucial role played by immigrant organizations in fostering integration and advocating for immigrant rights in Portugal. It calls attention to the need for government financial support for these organizations, recognizing their pivotal role in shaping a more inclusive and supportive society.

1096

GenMigra: Polycrisis, Migrant Family Tensions during Pandemic and the Lasting Impacts on Gendered Inequalities and Lack of Trust

Daniela Sime, Hannah Haycox, Emmaleena Käkelä

University of Strathclyde, United Kingdom

The COVID-19 pandemic has hit during economic and political crises globally, exacerbating existing gender inequalities. Unexpectedly, migrant women around the world were faced with significant care duties, restricted mobility options and increased securitization measures. This paper reports on findings from a four-country comparative study (GENMigra, www.genmigra.org) which examines the compounding impacts of Covid-19 pandemic and other crises (e.g. Brexit, Ukraine war, austerity) in Brazil, UK, Germany and Poland. The paper draws on the concept of polycrisis (Zeitlin et al., 2019) and uses an intersectional perspective to explore migrant women's experiences of poly-crisis, answering two key research questions:

1. What inequalities have emerged or worsened for migrant women since COVID-19 and what role have state policies and interventions played in mitigating or increasing inequalities?

2. What are gender-responsive policy solutions to support the transformation of support for migrant women, especially those most vulnerable?

Drawing on interviews with organisations supporting migrant families in the UK (15 interviewees), migrant women and their families (50 interviewees), we examine the extent to which personal crises (unemployment, bereavement, family breakdown, isolation, slow state violence) were felt alongside colliding structural crises. We examine the elements of tension between transnational family demands and restrictive immigration/pandemic measures, the impact of cumulative crises on tensions in family relationships, the role of the civil society in filing gaps in welfare provision and the consequences for migrant women's increasing lack of trust in state institutions.

We problematize further the gendered consequences of this polycrisis, examine migrant solidarities in a hostile environment and propose that future policies need to adopt an intersectional lens to identify transformative solutions which tackle the loss of trust in governments and state institutions.

RN35 | T05_03: Migration, diversity and the city

Social Integration of China's Internal Migrants into Urban Communities

Luping Wang

University of York, United Kingdom

The Hukou system, a household registration system related to the legal status of Chinese citizens, presents challenges for the vast internal migrant population in China. This research explores the relationship between Hukou and the internal migrants' social integration into urban communities, which to some extent shares the theoretical context with transnational migration issues due to the similar institutional barrier.

Existing literature often relies on cross-sectional data to analyze this relationship, of which the lack of time dimension complicates the assessment of the impact of acquiring local Hukou on social integration. Furthermore, the prevalent practice of employing Hukou as the sole criterion for determining migrant status can hardly distinguish Hukou effects from other variables affecting social integration.

To address these methodological intricacies, this article adopts a comprehensive mixed-methods approach. Preliminary quantitative analyses utilize panel datasets spanning the Chinese Labor Dynamics Survey 2012 to 2018. The random effects analysis suggests a positive correlation between Hukou status and migrants' social integration level. However, a subsequent fixed-effects analysis underscores the absence of a direct causal relationship between Hukou and social integration.

An in-depth qualitative analysis, grounded in interviews conducted in Shanghai, one of the biggest internal migration destinations, delves into the mechanism of this indirect relationship. Findings indicate that Hukou may indirectly shape migrants' social integration through variables such as children's education, encounters with discrimination, and institutional uncertainty stemming from migrants' Hukou status. Residential segregation, education and parents' education are also found to be related to migrants' social integration.

1097

Moving Lusitalia: the Story of a Place

Heidi Rodrigues Martins

Centre de Documentation sur les Migrations Humaines, Luxembourg

Based on our study "Moving Lusitalia" [European Capital of Culture ESCH22] we want to show that by adopting a spatially-defined unit of analysis instead of ethno-national categories such as "immigrants" we can make visible social dynamics and complexities otherwise obscured by the ethnicity bias and the methodological nationalism (Levitt & Glick-Schiller, 2004; Dahinden, 2012). Since its creation, in the 19th century, with the development of the steel industry, the history of the Quartier Italie in Dudelange has been entwined with the one of migrations to Luxembourg.

Constituted by two streets and inhabited by twenty-height different nationalities, this place witnesses the social history of Luxembourg and of the migrations that forge(d) it. By means of a multidisciplinary approach and dawning on comprehensive interviews (Kaufmann, 2016), walking interviews (Kusenbach, 2003), we carried out a rhythmanalysis (Lefebvre, 1992), thinking space and time together. The aim of this paper is three-fold. Firstly, we show how different temporalities (personal, familiar, social etc.) and spatialities (geographical, social, imaginary) connect, (re)defining the Quartier' frontiers, through the inhabitants' (im)mobilities and quotidian rhythms. Secondly, looking at the continuum individual-object, we will make you discover the story of the "inherited furniture" that travelled across generations and across national borders – a story manly told my women. And, finally, as the project consists in an exhibition and a webapp (movinglusitalia.org), we will show how such research approach and output can contribute to transform people's relation to places, reduce local tensions and build trust regarding institutions such museums and cultural institutions.

Enclaves of Non-belonging: Migration, Spatial Segregation and Identity Recompositions in the Altındağ Metropolitan District of Ankara

Cosimo Pica

University of Tours, France

In Turkey, the birth of the republic was accompanied by a material and discursive appropriation of space, built on the annihilation of the other in spatial representation through the tactic of renaming and reconstructing places (Jongerden 2009; Öktem 2009), particularly in urban space. The construction of Ankara as a capital city is a case in point, with the idea of Turkishness spatially inscribed through the symbolic and architectural reproduction of the Turkish republican national identity and the exclusion and spatial segregation of those who do not adhere to its principles.

From this perspective, on the basis of my case study of the metropolitan district of Altındağ in Ankara, a marginalised multi-ethnic area that represents both the historic heart of the city but also the 'other of the nation' (Dölek 2019), I analyse the relationship between space, migrants and the identity recompositions that are taking place.

Adopting Stravides' (2016) description of the city as an archipelago of enclaves, enclosed spaces produced by power in a permanent attempt to recuperate surplus forms, we can define Altındağ as an "enclave of non-belonging", a place demarcated by a border in urban space that designates those who live there as not belonging to the description of formally recognised citizens.

With this presentation, I intend to discuss how these places reflect new forms of coexistence through the "quiet encroachment of the ordinary" (Bayat, 2013) and practices of popular solidarity that can challenge the delimitation of national identity by recomposing new configurations and definitions.

RN35 | T06_01: Diversity, Labour market and precarity 2

International Mobility of Social Professionals in a Local Context – Recognition of Qualifications Acquired Abroad for Access and Equal Participation in the Labor Market

Tanja Ehmann, Meike Günther, Maik Eimertenbrink

Catholic University of Applied Sciences Berlin, Germany

Access to and participation in the labor market is ascribed a central role for integration, especially in terms of economic independence and securing a material basis, residence and social participation. An important factor for equal participation in the labor market is the recognition of qualifications. The legal basis for recognition of qualification is Directive 2005/36/EC of the European Union or, in Germany, the Professional Qualifications Assessment Act (BQFG). The formal recognition of a foreign qualification is mandatory for working in a regulated profession. It not only means a formal assessment and classification, but also forms a source for all further decisions on career planning. It has been shown that the probability of employment increases for people with a migration background, particularly in regulated professions, whose qualifications have been recognized. Despite these positive effects, however, not all people apply for it. The reasons point to obstacles in the recognition procedure. The path to recognition is a question of time and financial resources (Böse & Schmitz, 2022). One way of adapting time resources to the needs is to make the qualification more flexible through modular or part-time models, which improve the compatibility of work, family and compensatory measures or, for some people, makes it possible in the first place. In the presentation I introduce a training program called "International Social Professions Course" (ApaLe) which is intended to facilitate the path to formal equivalence of the professional qualification and talk about the challenges for participants. Furthermore, I discuss the results of monitoring ApaLe (2019-2023) and of a survey of career paths of former participants.

1098

Migration and the Italian Labor Market: Diversity Management Practices in SMEs

Stella Pinna Pintor, Roberta Ricucci

University of Turin, Italy

In the current global context, characterized by major economic, social, cultural, and political crises, migration processes are

a key element of profound change. Among the various areas of society where significant changes are emerging is the labor market, which must necessarily deal with an increasingly diverse and multicultural workforce. The literature on diversity management – in its sociological, economic, and critical perspectives – reveals profound differences in the ability of the labor market to attract and integrate immigrant workers in different political and national contexts.

This paper aims to present some preliminary results of ongoing research on policies and practices for managing the cultural, ethnic, and religious diversity of immigrant workers in SMEs in Italy. The sample of companies was defined from a dataset containing 485 SMEs that previously participated in a project (AMIF 2014-2020) for the labor integration of immigrants. Taking into account the intersectional character on the one hand and the risk of essentializing the concept of 'diversity' on the other, 20 statements were collected from managers and entrepreneurs of SMEs and 10 from workers and employees of the same companies. The aim is to examine the practices of multicultural diversity management by placing them in the Italian national, local, and entrepreneurial context. In this way, the intent is to contribute to the sociological literature on this topic with a country-specific perspective to overcome the purely Anglo-Saxon approach to the issue. The research is based on qualitative methods and the data was collected through semi-structured interviews.

Civil Society's Ways of Working to Enhance Employment Opportunities in Conditions of Socioeconomic Disadvantage and Diversity

Gabriella Elgenius[1], Jenny Phillimore[2]

1Göteborgs universitet; 2University of Birmingham

This paper will focus on how civil society organisations work to enhance integration or employment opportunities in superdiverse neighbourhoods that face socioeconomic challanges. Countless integration initiatives have focused on the delivery of "employability skills" yet have failed to address the inequalities facing minoritized populations including migrants and residents in areas facing socioeconomic challenges by focusing predominantly on human capital at the expense of structural factors that undermine access to work and integration. We use a broad definition of civil society in our projects to include voluntary 'non-profit' formal organisations as well as informal initiatives, foundations, and social enterprises. Civil society adopts an "employment" approach by using community assets that priorities equipping individuals to cope with structural disadvantages and focusing on the development of resilience through resistance, confidence building and offering hope. There is much to learn from civil society action and ways of working as it engages with key principles of integration and the multidimensional and context-specfic process. This paper will explore types of civil society action and ways of working with help of an extensive material collected over the period 2019 – 2023 in seven neighbourhoods in England and Sweden. Projects are sponsored by two Swedish research councils Forte and VR.

Cumulative Disadvantage? An Intersectional Analysis of Gender, Parenthood, and Immigration Background in Hiring Decisions among German Employers

Christian Hunkler[1], Zerrin Salikutluk[1], Yuliya Kosyakova[2], Daniel Auer[3], Philipp Jaschke[2], Maximilian Sprengholz[1]

1Humboldt University Berlin, Germany; 2IAB, Nürnberg, Germany; 3Collegio Carlo Alberto, Torino, Italy

Previous research documents that female immigrants from Muslim-origin countries often exhibit lower employment rates. This disparity is likely influenced by the motherhood penalty. Regardless of background, mothers tend to face reduced employment opportunities or lower average salaries. While previous research investigated supply-side explanations, e.g., preferences for family vs. labor market work, the role of employers is often neglected.

Adopting an intersectional perspective, this study asks whether employers exhibit a propensity to hire female candidates less frequently if they have children and migrated from a "Muslim country". To disentangle gender, parenthood, and immigration background (Muslim vs. non-Muslim), we employed a factorial survey experiment involving a representative sample of German employers. Nearly 5,000 firm representatives evaluated candidate profiles, wherein we randomly varied gender, number of children, and whether the candidate was "German" or was born in Syria, Russia, Ukraine, or Turkey.

Our findings reveal marked differences in the simulated hiring decisions. First, we find a motherhood penalty and a fatherhood bonus, replicating a well-documented pattern in earnings inequality research. Second, the motherhood penalty in hiring is more pronounced for lower-end positions, while the fatherhood bonus is evident primarily for specialist positions at the upper end. Third, we uncover a complex pattern of cumulative penalties for Muslim mothers in lower-level positions, while the motherhood penalty for specialist positions is mainly driven by majority mothers. The fatherhood bonus is more pronounced for Muslim – than for majority fathers. This suggests that employers' beliefs may contribute to the intersecting labor market disadvantages of Muslim mothers.

RN35 | T06_02: Discrimination: currenttendencies and ambiguities

Xenophobia As The 'New Racism', Grounded in Racial Capitalism And Mediated By Intersectionality

Natasha Rachel Dyer-Williams

University of Edinburgh, United Kingdom

This paper comparatively examines the contemporary conceptual definition of xenophobia in the transnational contexts and literatures from South Africa and the UK in order to ground it in its emergence from racism and foundations in global systems of exploitation; racial capitalism and colonialism. Using a relationally comparative approach (Hart, 2014) and drawing from qualitative, ethnographic and creative fieldwork with Congolese and Zimbabwean women in both Johannesburg and London, the analysis departs from the point of establishing how the literatures on xenophobia have emerged in both South Africa and the UK, including their conceptual evolution and distinction from racism, and relationship to violence and histories of immigration. Looking at the similarities and differences between these interrelated concepts and phenomena in the different geographical literatures creates a better understanding of contemporary identity-based discrimination, and enables an interrogation of how they actually relate to the lives and experiences of African women in these contexts. This leads to the argument that not only must the concept of xenophobia be grounded in racism, racial capitalism and colonialism, but its accurate analysis requires an intersectional lens to understand the diverse and multi-faceted experiences of migrants, in particular here, of the different gendered and class-based experiences of African migrant women of different nationalities and backgrounds. In this way, we move closer to a more accurate definition of xenophobia as a social phenomenon grounded in historical exploitative systems and mediated by identity and experience, that can inform policy and practice designed to support migrants living in politically 'hostile' societies.

Tense Or Not Tense?: Highly Qualified Turkish Migrants' Interpretations of Unpleasant Interactions in Germany

Anlam Filiz

Turkish-Germany University, Turkiye

Highly skilled migrants in Europe find themselves in contexts where the rise of far right political actors creates an unpleasant atmosphere for migrants of all backgrounds. Especially non-white highly skilled migrants experience discrimination and bias in their daily lives despite their upper-middle class status. However, they do not always interpret such unpleasant interactions as a reflection of their difference. Many specifically refrain from describing such instances as racist. This engenders a puzzle as to how daily tensions are understood by the actors involved.

Based on semi-structured interviews conducted in 2022 with 29 highly qualified migrants from Turkey in Germany, this paper focuses on how they interpret unpleasant experiences in their daily lives. It analyzes when they understand these interactions as discriminatory and when not. Thus, the paper examines the connection between unpleasant experiences and difference in a post-migration society from the perspective of highly skilled migrants. For this, it uses affect theory. The paper interprets difference as socially constructed, historically situated, and affectively experienced. It considers language, bodily appearance, housing search, and work as major areas where potentially discriminatory encounters of difference emerge. It argues that such encounters shall be conceptualized as intersubjective and affective. Accordingly, the interpretations of these experiences are also contingent upon these intersectional positions shaped by class, gender and other axes of inequalities.

"These Tiny Differences" – Subtle Forms Of Discrimination Experienced By Highly Skilled CEE Migrants in Vienna

Clara Holzinger, Anna-Katharina Draxl, Elisabeth Scheibelhofer

University of Vienna, Austria

The social phenomenon of deskilling is particularly widespread among migrants, but so far only few studies explore the concrete micro-level processes involved. Applying a qualitative approach in a current research project (https://demico.univie.ac.at/), we strive to retrace "deskilling" from an individual perspective and to examine the phenomenon from different actors' angles. We focus thereby on highly educated migrants from CEE countries in the Austrian capital. Based on the research principles of Constructivist Grounded Theory, we opt for a multi-perspective and longitudinal methodical triangulation, combining a qualitative panel study with migrants, interviews with institutional actors, and ethnographical observations.

Our paper focuses on subtle forms of discrimination that CEE migrants experience at the labour market in Vienna. As recent publications show, CEE migrants in EU countries face racism and are constructed as "others". However, while being less confronted with overt discrimination based on skin colour, religion or legal background, our interviewees face rather subtle processes of exclusion based on migration background and language. These experiences of discrimination are often ambiguous and hard to grasp (and admit) for both our research subjects and ourselves as researchers. In order to give particular attention to the interaction

1100

of various discrimination mechanisms (especially gendered differences), we apply an intersectional approach and aim to move beyond an ethnic lens and instead consider the embeddedness of migration experiences.

We aim not to focus only on discrimination experiences of migrants, but also emphasise the importance of individual agency in its social context and thus analyse strategies employed to counteract discrimination.

"Are We from Third Countries or Third World?": Heterogeneous Experiences and Perceptions of Migration Barriers among International Students in Austria

Qiong Miranda Wu

Central European University, Austria

Despite the growing number of international students globally, the tensions and contradictions associated with perceiving them as both "desired" and "unwanted" persist (King and Raghuram 2013). In contrast to students from EU/EEA countries who have intra-European mobility, international students from non-EU/EEA countries, commonly known as so-called "third-country nationals", must navigate through more restricted immigration processes to obtain visas and residence permits. Drawing on data from 52 in-depth interviews with third-country national student migrants studying in various universities in Vienna, I investigate the life trajectories and migration experiences of these student migrants. The analysis of narratives examines the hierarchical obstacles in the visa process upon arrival and unequal barriers to settlement during their study periods. The comparisons of experiences among student migrants from third countries demonstrate that they are not a homogeneous group, but rather diverse subgroups with distinct socially constructed disparities. These dimensions of differences are critical in determining who is considered as "desired" and who is treated as "unwanted." I find that third-country national student migrants' perceptions of the barriers to migration are also shaped by their citizenship and country of origin, as well as their race and ethnicity, social class, immigration status, German language proficiency, and previous international experience. The findings challenge a simplistic view of the marginality of student migrants from third countries and provide intersectional insights into the intricate nature of student migration.

RN35 | T06_03: Migration, media and multilingualism

Contesting Linguistic Classifications in Postmigrant Societies

Mareike Heller

Ludwig-Maximilians-University Munich, Germany

In postmigrant societies (Foroutan 2008), the diversity of linguistic repertoires is debated both as a hindrance and as a resource for social cohesion. Historically, the standardization of a 'native language' has been at the core of European nation states (Bonfiglio 2010) and their educational systems (Balibar 1991). In Germany, a monolingual habitus (Gogolin 2008) is still deeply rooted in the field of education. This creates a tension between translingual everyday practices and the devaluation of non-German languages.

The study examines how the valuation of being Germanophone is produced and contested through a case study of Berlin schoolchildren: During school registration, students are categorized according to whether they do or do not communicate with their parents in a 'non-German language of origin'. This statistical classification determines the allocation of funds, but also serves as an important status cue, especially for middle-class parents choosing schools for their children.

Through a situational analysis (Clarke et al. 2018), this paper illustrates how the state's administrative infrastructure perpetuates the understanding of multilingualism as a deficit, even in the face of other assessments. Based on participatory observations and document analysis in primary schools, the paper explores the materiality of categorical work (Bowker/Star 2000). The analysis reveals how street-level bureaucrats transform normative orders by adapting procedural logics and alleviating fears. But the administrative framework of the interaction silences the expression of multifaceted linguistic affiliations, while the material artifacts transmit homogenizations and unequal valuations of different languages beyond the interaction. By focusing on the interplay of material artifacts and human actors, the paper advances the discussion on the role of state statistics for diversity politics.

Living with Multiple Languages, Being Forced to be Monolingual: Turkish Skilled Migrants in Norway

Meltem Yilmaz Sener

VID Specialized University, Norway, Norway

Based on an analysis of 44 semi-structured, in-depth interviews with Turkish skilled migrants living in/around Oslo and Drammen in Norway, this article aims to point out the tension between the monolingual emphasis of public discourses and the multilingual reality of migrants in the context of Norway. It demonstrates that these migrants

1101

perceive the monolingual emphasis as a norm that they are expected to conform to, but that does not take their different life situations into consideration. The difficulty or impossibility of living according to that norm (because of their age, short duration of stay, the will to preserve the mother tongue, their multilingual realities) makes their lives difficult and creates confusion and anxiety in them. While they are trying to do their best to maneuver through the complexities of their multilingual lives, they are facing a system that tends to simplify their linguistic realities. This study demonstrates that there are multiple languages in migrants' lives and many of them see it as a richness that they want to preserve. Migrants also see it as a violation of their right to retain their mother tongue when they see reactions against their speaking of the native language. Overall, the monolingual emphasis in Norway both ignores the multilingual reality of migrants' lives as well as putting unrealistic pressures on them. This study also highlights the importance of a pluralistic approach to a migrant group with respect to their linguistic practices.

Refugees In The Ukrainian Media Discourse: Victims, Heroes, Witnesses?

Daria Batychko

Graduate School for Social Research, Institute of Philosophy and Sociology of the Polish Academy of Science, Warsaw, Poland

Media representations of war victims shape public perceptions of the conflict, the justness of resistance and mobilization. Therefore, they are crucial to understanding the phenomena in Ukraine. According to UNHCR, as of November 2023, more than 6,2 mln. refugees from Ukraine have been recorded globally with 4.2 mln. of them benefiting from the EU temporary protection directive and there are nearly 4.9 mln. of internally displaced people (IDP) currently residing in Ukraine. These numbers highlight the necessity to study the question of the Ukrainian IDPs, its status and belonging policy that has been developing since 2014 and should be taken into account nowadays while developing the long-term refugee migration policies in hosting countries to avoid tensions between the refugee groups due to inequality concerns.

The writing is aimed to analyze the tendency in portraying refugees including IDPs in the Ukrainian media discourse for the periods before and after the beginning of the full-scale invasion to see the impact of various factors on their representation. The method of content analysis (with both qualitative and quantitative components of it, based on theoretical frameworks developed by Teun van Dijk, Ruth Wodak and other experts in the area of discourse analysis) will be used to analyze the published articles by the Ukrainian verified media sources on refugees' topic to support the following research questions: How are refugees and IDPs being portrayed in Ukraine? What aspects of these fugures portrayal are constant and what aspects are changing in the analyzed time frame? What are the main differences in portraying refugees fleeing from Ukraine and those "internal refugees" staying in Ukraine under IDP status?

The research will offer a typology of representations of IDPs (as victims, heroes, witnesses). The analysis is expected to prove an assumption that the following factors are most likely to influence the portrayal of refugees in the Ukrainian public discourse: media sources affiliation, period and language of publications, the Ukrainian military campaign progress, the foreign governments' decisions on the exceptional Ukrainian refugee policies and support packages in humanitarian and military aids for Ukraine.

RN35 | T07_01: Diversity, Labour market and precarity 3

Trends in Precarization of Migrants in Europe: 2000 – 2020

Sarah M. Ludwig-Dehm

HETS Geneva, Switzerland

Although previous research has highlighted the fact that migrant workers are especially vulnerable to precarious working and living conditions, quantitative studies on this subject are scarce. We aim to fill this gap and add to the scientific literature on migrants' precarization in two ways: first, we will give an overview of the trends in precarization of migrants across numerous European countries over 20 years. Second, we aim to identify groups of countries, that experience similar trends regarding migrants' precarization.

For this purpose, we use data from the Labor Force Survey (LFS) as well as from the Statistics on Income and Living Conditions (SILC) survey. These two large-scale surveys include numerous European countries as well as detailed information on precarization, including unemployment, fixed-work contract, unusual work times, low salaries, poverty, and material and social deprivation. Using these datasets, we will, in a first step, show trends in the before-mentioned indicators within each country for natives and different groups of migrants, like EU/EFTA migrants, European non-EU/non-EFTA migrants, migrants from outside Europe. In a second step, we will compare these trends and identify clusters or groups of countries in which we see similar trends in migrants' precarization.

The outcomes of this research project will be valuable for future research in several ways. The trends will give an overview of how migrants fare during crises, also compared to natives. Additionally, identifying groups of countries will allow for easier analysis in cross-national studies, for example concerning the effects of migrant policies and laws.

Employment of Immigrant Women in Europe: Contextual Effects of Origin-Country Work Experience

Andrey Tibajev[1,2], Olav Nygård[3]

1Institute for Futures Studies, Sweden; 2Erasmus University Rotterdam, The Netherlands; 3Linköping University, Sweden

We study the employment probability of immigrant women in Europe, focusing on the effect of origin-country work experience. Based on theories of migrant selectivity and the role of destination-country conditions, we expect that this effect will be context-dependent and matter more when both the country of origin and destination have low female labour force participation (LFP). Data on immigrant women comes from the European Social Survey and is combined with data on origin – and destination-country female LFP from the International Labour Organization. We analyse the data using multi-level regression models with a three-way cross-level interaction between individual origin-country work experience, origin-country female LFP, and destination country female LFP. Results show that individual origin-country work experience substantially increases the probability of having employment, but only for immigrant women both coming from and living in a country with overall low female LFP. If either origin – or destination-country female LFP is high, there is zero effect. For immigrant women, origin-country work experience in countries with low female LFP is indicative of unobserved characteristics that facilitate a transition to future employment. These characteristics matter the most when immigrated to a country that also have low female LFP, implying an absence of gender egalitarian values and institutions pushing all women to employment.

The Commodification of Care in Central and Eastern Europe. The Case of Romanian Transnational Families

Denisa Luciana Ursu

Babeș-Bolyai University, Romania

1103

Transnational elderly care services provided by Romanian women have increased in Western Europe after Romania's entry in EU, the intensification of neoliberal policies after the 2008 Recession and the accentuation of labour migration. Thus, women provide 24-hour care for elderly people in the host family. Throughout the paper I will consider women migrating to provide residential care for the elderly in Western Europe, but I also propose an analysis of the local family as the nucleus within which migration is managed – emotionally and economically. The commodification of care is therefore one of the problems of transnational families. This paper aims to provide an answer to the next research questions: How does this work affect the person involved in migration, i.e. how do the dynamics of work within transnational families change and what are their new characteristics? Starting from how exactly migration occurred – the network through which carers entered the elderly care market (reasons for leaving, transition and mobility) – I propose to survey several cases of carers coming from such Romanian transnational families focusing on the distribution of work within the family of origin, specific aspects of migration culture, potential changes in habitus, social mobility acquired as a result of migration, through the perspective of the sociology of migration and the family, transnationality, and feminist intersectionality. The aim of this research is to make a contribution to studies on the reorganization of elderly care in the absence of social care-based solutions, to analyze new arrangements and specific market-based structures (care homes, nursing homes), and to point out the commodification of care in the West as a problematic aspect of transnational families in Romania.

Labour Market Participation of Native and Second-Generation Youth: Exploratory Evidence in Southern European Countries.

Ivana Fellini, Francesca Megna

University of Milan-Bicocca, Italy

In 2022, Italy (19.0%), Greece (15.4%), and Spain (12.7%) were well above the NEET EU-27 average share (11.7%). Low youth participation is structural of Southern European labour markets, but scarce is the knowledge of the differences between native and second-generation youth, as the latter are only now starting to enter the labour market of these "new" immigration countries. While second-generations could assimilate to native youth's discouragement due to possible harder access to employment and discrimination, they could also develop a stronger labour market attachment, due to ethnic differences in higher education and different expectations and aspirations.

The paper aims to compare the participation of native and second-generation youth (in an extensive definition) in Italy, Spain, and Greece to assess whether assimilation or rather recurrent ethnic penalties can be detected. We exploit a pool of yearly EU-LFS microdata, which, since 2021, releases the country of birth of respondents' parents, allowing proper identification of second-generations (country-born individuals with at least one foreign-born parent). Foreign-born individuals arrived before 14 years old, namely generations 1.50 and 1.75, will be also considered.

The analysis firstly explores differences in the participation rates of native and second-generation youth and differences in the composition of native and second-generation youth by labour market condition (employed, unemployed, discouraged, student, inactive, etc.). In a second step, multivariate models are run to control for socio-demographic composition effects (gender, age, education, area of origin, citizenship, etc.) in order to highlight possible actual differences in the participation choices of native and second-generation youth.

RN35 | T07_02: Emergent spaces of belonging

None, Either One or Both? Belonging to Destination and Origin Countries Among Muslim Refugees from Syria and Eritrea

Lenore Sauer[1], Andreas Genoni[1,2], Nadja Milewski[1]

1Federal Institute for Population Research (BiB), Germany; 2National Center of Competence in Research (NCCR) for migration and mobility studies, University of Neuchâtel, Switzerland

A significant discussion in Europe revolves around the incorporation of Muslims into the broader society. A popular argument suggests that their integration is hindered by the incompatibility of the Islamic way of life with mainstream European culture. This debate is fueled by large shares of refugees from predominantly Muslim countries following the so-called Arabic Spring and the Civil war in Syria. We contribute to this discussion by examining the feelings of belongingness among these refugees in Germany.

Our empirical analyses draw on data from the quantitative survey "Forced Migration and Transnational Family Arrangements – Eritrean and Syrian Refugees in Germany" (TransFAR), collected in 2020. With 1,450 respondents, this survey covers two major recent refugee groups to Germany. Refugees from these two countries are not only Muslims but also Christians, who represent a minority group in Syria and a majority group in Eritrea (where Muslims are the smaller group). This design allows us to investigate the role of religion for refugees' feelings of belongingness while controlling for their ethno-cultural origin. Preliminary results show that more than 50 percent report strong belongingness to Germany and weak belongingness to their country of origin. Every third feels strong belongingness to both countries. As expected, we found differences in belongingness by country of origin and religion. Linear regression analyses suggest that these differences can partially be explained by human and social capital factors, i.e., mainly educational attainment and interethnic contact with Germans, and whether they live in East or West Germany.

1104

Queer Diaspora and Belonging: New Wave LGBT Migrants from Turkey to Berlin

Öykü İnal

Freie Universitat Berlin, Germany

While Germany and Turkey share a long history of migration dating back to the 1960s, according to Çömlekçi and Bozkanat (2019), a new wave of migration has emerged since

the last decade, characterized by differences in the migrant profile and the main motivations behind the decision.

Especially after 2013, the increasing economic and political insecurities in the country led a well-educated and skilled group to look for alternative places to live outside Turkey (Sanchez-Montijano, Kaya, Sökmen, 2018). For many of this group, the main motivations for migration were based on political and ideological concerns based on "political instability, the violation of human rights, societal and political polarization, gender problems, social pressure, lack of ecological consciousness, pessimism about the future of the country, Islamisation, and the absence of welfare policies in Turkey" (Sanchez-Montijano, Kaya, Sökmen, 2018)

The new wave of migration also included a large number of LGBT people, whose experiences were often different from the rest, and whose arrival created new forms of belonging/non-belonging. Based on in-depth interviews and the experiences of 8 participants who are gay men who migrated to Berlin after 2013, the study aims to understand more about the experience of queer migrants in Berlin by asking the following questions: How does this group of young migrants negotiate and create a sense of belonging, community, and identity in the city? To what extent do they feel a sense of belonging to the pre-existing Turkish communities that have a long history in Germany? To what extent is this LGBT-friendly city and its communities friendly to them?

Young PRC-born Migrants' Civic Engagement in Sydney: (Re) construction and Negotiation of Multilayered Senses of Belonging

Boya Li

Western Sydney University, United Kingdom

The paper explores the dynamic and complex relationships between migrants' senses of belonging and civic engagement through the process of homing, focusing on young PRC-born migrants in Sydney. To unpack the relationships, the paper employs the concept of 'home,' suggesting that belonging is akin to a sense of being and becoming 'at home,' while civic engagement is part of the practices of 'homemaking.' The research centres on migrant individuals' everyday civic engagement, including participation in interest-based groups, neighbourhood activities, and religious practices. Using Bourdieu's concept of habitus along with the theory of affect, the paper examines how multi-layered senses of belonging shape these young migrants' civic engagement in Sydney and the extent to which these practices strengthen and transform their multi-layered senses of belonging. The data were collected from 230 survey responses, 30 in-depth interviews, and 41 hours of observation of civic activities in Sydney. The results reflect a multilayered, interactive and affective relationship between migrants' civic engagement and their 'senses of being and becoming at home associated with their migration trajectories.

Tranches Of Incorporation – High-skilled Migrants And Their Relational Forms Of Belonging

Gregor Schäfer, Claire Maxwell

University of Copenhagen, Denmark

The search for belonging or feeling part of a group is a universal desire. Every individual seeks to find comfort, stability and recognition across their relationships and within the social units that organise their lives. Sociological concepts such as 'community' or 'belonging' focus on these dynamics and try to explain how, why and when people negotiate relations of belonging. These are underpinned by the production and maintenance of social and symbolic boundaries. Migrants face a potentially more difficult task in this context because of the many upheavals migration entails, but also because differences in citizenship status, ethnic or cultural origin and other institutional arrangements are likely to hinder some of these relations being formed. In this paper, we focus specifically on processes of belonging for 'highly skilled migrants' (HSM) – a growing category of migrants found across many parts of the world. We examine the categorisations that HSM produce to organise, negotiate and justify the social and symbolic boundaries that produce their relations of belonging. We do this by reconceptualising belonging as constituting various tranches of incorporation, drawing on the theoretical lenses of 'figuration' and 'recognition'. This conceptualisation is empirically developed through an analysis of 52 interviews with HSM and their spouses in Denmark. The findings show that recognition, and thus belonging, is found across various figurations of their professional and/or private lives, and that these tranches operate at various scales – local, transnational and/or global.

RN35 | T07_03: Theorizing new issues on migration

Reflexivity on Dominant Perspectives: A Reverse Sociology of Migration

Bernadette Nadya Jaworsky[1], Radka Klvaňová[2], Ivana Rapoš Božič[1], Olga Zhmurko[1]

1Masaryk University, Czech Republic; 2Mendel University, Czech Republic

Heeding the call for more reflexivity in migration research, we develop a new epistemological and methodological approach that we call the "reverse sociology of migration." We anchor this approach in our critical, cultural sociological background, centered on meaning-making. It is a move that privileges the voices and perspectives of marginalized groups and reverses the ethnographic gaze; accordingly, we strive to situate the "mainstream" instead of the "migrants" at the margins. We thus focus our analytical lens on the meaning-making processes of people with a migratory background. In our current, three-year qualitative research project among residents with a migratory background in the Czech city of Brno, we apply this epistemological outlook in every step of our research design. We exercise reflexivity in theorizing established or new migration labels, and the symbolic boundary work performed in the face of such labels, as well as refine strategies for data collection, such as comprehensive and go-along interview scenarios. A reverse sociology approach perceives research participants with a migratory background as active agents of boundary work and allows us to explore how they express their positioning in relation to the institutions of the "host" society as well how they draw boundaries towards different "minority" and "majority" ethnic groups. We assert that the sociology of migration benefits from this reversal in understanding how knowledge about migration is constructed.

A Relational Perspective on Agency within Forced Migration: The Networks of Ukrainian Forced Migrants in Romania.

Mihaela Nedelcu, Malika Wyss

University of Neuchâtel, Switzerland

Agency in the context of forced migration has been studied to contrast the extreme vulnerability experienced by forced migrants in conflict zones, on perilous journeys, and in host countries with adverse migration regimes. While the agency-structure dichotomy remains particularly prominent in this area of research, this paper argues for a relational perspective on agency. Drawing on relational sociological theory, this perspective focuses on both the relational settings and personal networks in which individual actors are embedded in order to understand their 'agency', which is constituted within relationships, interactions and interdependencies that unfold across time and space (Burkitt 2016).

This study of relational agency in the context of forced migration is empirically grounded in a qualitative case study of Ukrainian forced migrants in Romania. A qualitative social network analysis, based on twenty semi-structured interviews and related ego-maps, provides evidence of the composition and geographical dispersion of the Ukrainian interviewees' networks, as well as the flow of resources and support within these networks. By considering several criteria, such as the type of actors (individual-collective), their geographical dispersion (local-transnational), or the type of relationship (personal-institutional) in the ego-networks of the Ukrainian forced migrants interviewed, the data analysis will highlight different relational agency paths.

Considering The Features of Migrants' Legal Consciousness

Ramunė Miežanskienė

Kaunas University of Technology, Lithuania

The XXI century has been marked by the multilevel scientific inquiry on the topic of migration which also includes studies on legal consciousness. A trendline of investigations has addressed how migrants think, feel and act in the new legal environment. However, there is also a need to put more consideration into the discussion about new residents' interaction with the welcoming system of legalities and the outcomes it produces. Therefore, this research addresses the topic of immigrants' integration with a particular focus on one of the spheres of social life – immigrants' legal relationship in the welcoming country and the features of legal consciousness as a result of this synergy. The main objective of the study is to address this aspect by setting particular tasks of 1) discussing new residents' experiences in the welcoming legal system 2) and the features of legal consciousness as a result of this interaction. The study's design involves literature analysis and derives insights from the set of 54 semi-structured interviews with immigrants while focusing on the case of Lithuania. The conducted analysis reveals that the context and features of Lithuanian migration policy, and administrative and institutional culture, societal interactions provide input toward the features of migrants' legal consciousness. They could be characterized by (but not limited to) the following features of self-positioning, analogy, generalization, retrospection, paralysis, allusion, and transnational legal consciousness. The latter is also informed by the limited range of experiences, self-ascription of individual rights or responsibilities and reproduced behaviour. The features of immigrants' legal consciousness singled out in the analysis enables to identify the new focus for integration policies and ways of strengthening the legal integration of newcomers.

1106

Navigating the Climate Crossroads: Understanding, Addressing, and Cooperating on Climate-Induced Migration

Filipa Alexandra Rodrigues de Almeida Saraiva

University of Coimbra & CES, Portugal

In the midst of an international context characterized by a permanent state of permacrisis and where the primacy of violence prevails to the detriment of cooperation, this article delves into the consequence of two evolutionary phenomena – climate migration. Recognizing the profound impact of environmental change on human displacement, we navigate the theoretical framework of international relations and migration, focusing on the continuum of the emergence of climate migrants, broadly defined as people who are forced to move for environmental reasons, whether sudden or progressive, temporarily or permanently, internally or externally. Amidst a dearth of protection caused by the lack of recognition provided by the 1951 Convention, climate-induced displacement can be defined as a form of adaptation or a failure to adapt.

The purpose of this conceptual study was to comprehend how migrant movements are affected by climate change and to pinpoint potential remedies. Determine the existing international framework, identify actions done regarding migrant climate change, present general trends on climate change forecasts, and analyze established conceptual methods were the four particular goals that were produced. An elastic approach, which combined qualitative and deductive methods, a literature review, and exploratory interviews, served as the foundation for the study structure.

Employing a comprehensive approach, we assess three international agreements—the Protection Agenda, the Global Compact for Migration, and the Cartagena Declaration—as tools to formulate realistic and effective policies. Ultimately, we aspire for readers to grasp the multifaceted solutions available to address climate migration and comprehend the intersection of human displacement with the adverse effects of climate change.

RN35 | T08_01: Migrants, welfare professionals and institutional ambiguities 1

"I Want You To Tell About Yourself." Producing Simplicity In Asylum Decision-Making

Erna Bodström

Migration Institute of Finland, Finland

This paper addresses the way socio-cultural factors affect asylum decision-making. Asylum and related practises are at the centre of building tension and trust. On the one hand, asylum seekers and the legitimacy of their reasons for seeking asylum are at the core of polarised debates on migration and, on the other, the legitimacy of the asylum system is dependent on the trustworthiness of the authorities. Yet this trustworthiness has been put in the question by researchers and activists alike.

Research has found that asylum decision-making is often hindered by cultural misunderstandings. The current paper argues that the misunderstandings do not simply just happen, but are actually produced by authorities through a failure to grasp the complexities of the asylum seeker's experiences and society of origin, that is, through simplification.

Therefore, the paper asks: how is simplicity produced in asylum documents? The data consists of interview records and asylum decisions made for asylum applicants in Finland in the immigrant-politically turbulent years 2016–17. The data is rich in narrative styles and argumentation strategies, yet rare in its kind and hard to access.

The paper contributes to understanding power asymmetries of asylum decision making, as well as their consequences for the asylum system. The findings are relevant also in other European Union countries and in the current time, as the asylum procedure in Finland is guided by the Union level guidelines, and as research indicates that similar features of decision making are persistent over time and place.

Guarantee of a Fair Hearing? Asylum Interpreters' Ambiguous Task of Making the Voices of Exiles Heard and Scrutinized

Maxime Maréchal

Université Paris Cité, France

Language researchers have demonstrated, with cases studies of multiple national contexts, that asylum procedures crucially rely on language interpreting in the credibility assessment that is at the core of the decision-making process. But this activity has rarely been considered as a policy issue

1107

at the European level. Still, the systematicity of the intervention of interpreters in national asylum procedures can only be explained by its definition as a "guarantee" in the "Procedures" directive within the Common European Asylum System.

Indeed, at the Ofpra (Office Français de Protection des Réfugiés et Apatrides, the French first instance of the procedure), interpreters are now present in 90% of the interviews. But this systematization is recent, and its seemingly protective function is confronted with the inquisitive and accelerated processing of applications. The communication will therefore analyze how the European norms have been adapted to the imperatives of efficiency and accuracy which prevail at the Ofpra.

To this end, I will offer a sociohistorical scope on the institutionalization of interpreters' function, based on interviews with professional interpreters and on (administrative) archive analysis. This will enable to follow the gradual implementation of the provision of interpreters at the institutional level, highlighting how this crucial activity has long been neglected and informally submitted to institutional imperatives. Besides, observations of interpreted asylum encounters provide insights on how interpreters cope with the tension which is at the core if their translative task: giving voice to asylum seekers and contributing to the bureaucratic process which reduces their story to administrative artifacts.

Trusting "by default". Emergency health care for migrants in Amiens (France)

Laure Hadj

Université Picardie Jules Verne, France

The paper is based on sociological research (ANRS 2019-2023) into access to care pathways for asylum seekers housed in Amiens. The second largest city in the Hauts-de-France region, Amiens is located on a migration route that serves Paris – Lille and Calais by rail.

Analysis of 60 semi-structured interviews with asylum seekers (a third of whom are non-French speakers), reveals that they resort to interchangeable or « disposable » social ties (Desmond, 2016). These ties characterize brief, fragile, sometimes ephemeral relationships and are based on trust "by default".

Relationships of trust "by default" correspond to requests for help and support from a friend, social referent or healthcare professional in a context of poverty. Another relationship, established with a 'stranger', is disengaged from any recommendation or social network. We will show that the respondents develop these relationships of trust "by default" on their arrival in Amiens. They seek to build their own social security in the face of non-existent or partial health and social care. Based on the experiences of French-speaking and non-French-speaking men and women, we will propose a typology of "default" relationships of trust expressed in health emergencies (According to our survey, a health emergency corresponds to a care emergency in the institutional sense (pregnancy in progress, contagious diseases...) and to an emergency felt by the respondent and experienced most often at night or outside consultation hours (respiratory problem, child fever...). It will contribute to the factors that explain inequalities in access to care.

Sociolinguistic Barriers and Potentials among Ethnic Minority Students in Danish Healthcare Training

Nana Clemensen

Aarhus University, Denmark

Like other European countries, Denmark experiences a growing healthcare crisis these years, especially in terms of elder care. Sustained by political incentives, a large diverse group of ethnic and linguistic minority students have enrolled in vocational healthcare training, but many drop out before graduation due to language barriers in their encounters with patients and healthcare personnel. Based on linguistic ethnographic data from Danish healthcare training schools and fields of internship, this paper explores such language barriers and how minority students, along with their teachers and other practitioners, respond to them. The paper combines sociolinguistic perspectives on the roles of power, identity and student investments in second language learning (Duff 2011, Cekaite 2020, Norton 2013) with linguistic-anthropological theories of translanguaging and the rise of new healthcare and language learning practices in a globalised world (Jacobs & Diamond 2017, Kim & Kreps 2022, Mao & Ahmed 2018). Through sociological ideas of immigrant drive (Portes 2012), these linguistic theories are are linked to larger concerns of Danish migration policies, interests and demands of Danish society and healthcare institutions, and immigrant students' personal and vocational ambitions in Denmark. Finally, drawing on Foucault-inspired ideas of discursively produced caring subjects (Foucault 1988, Skeggs 2012), the paper explores the precarious role of healthcare workers in Danish society, comprising social concepts of gender, ethnicity and class, and how minority students negotiate such subjectivities.

RN35 | T08_02: Migration and health in the time of crisis

Loneliness in the Afro-diasporic Community in Germany

Anne-Kristin Kuhnt[1], Sabine Diabaté[2]

1University of Rostock, Germany; 2Federal Institute for Population Research, Germany

This paper aims to examine the well-being of the Afro-diasporic community in Germany in comparison to people of German origin, with a particular focus on loneliness as a key determinant of life satisfaction and social inclusion. Prolonged periods of loneliness are associated with a higher risk of health problems, including physical and mental illness. Research on this topic is relatively scarce in the context of Germany, which is one of the major migration destinations in Europe.

We focus on Afro-diasporic migrant adults aged 18-50 (N=213) and compare them with native Germans (N=14,269) from the German Family Demography Panel Study (FReDA 2021). In a first step, we present descriptive findings on the prevalence of emotional loneliness by origin (Afro-diaspora: 21.1 %, natives: 13.1 %) and cognitive loneliness by origin (Afro-diaspora: 19.4 %, natives: 13.4 %) – gender differences to the disadvantage of women become obvious here. Especially social rejection is reported more frequently by Afro-diasporic migrants (21.30 %, natives: 16.32 %). In a second step, we estimate the outcome variables (emotional and cognitive loneliness) of cross-sectional regression analyses. The models focus on compositional differences between migrants and natives (education, income, place of residence) as well as on cultural factors influencing loneliness (e.g., religion, intergenerational solidarity). Preliminary results indicate that loneliness is significantly higher in the Afrodiasporic community compared to the native German population. In addition, intersectional risks such as low socioeconomic status, being female, and having less education increase the likelihood of higher loneliness.

What It's Like To Be A Muslim Student In Poland –Social Network Analysis Of Students From Muslim Countries in Poland

Maria Stojkow

AGH University, Poland

The speech will concern the social networks and the adaptation experiences of students from Muslim countries at Polish universities. Understanding the characteristics of the social networks of Muslims living in Poland seems extremely important in the face of discrimination and the continued institutionalization of Islamophobia. The presentation will show the extent to which religion and religiosity matter in the friendship choices of Muslim students at Polish universities. Even at diverse universities that provide opportunities for interfaith friendships, Muslim students are disproportionately likely to be friends with Muslims rather than non-Muslims, so it is essential to examine whether segregation in religious friendships results from Muslims' group prejudices or from non-Muslims' reluctance to befriend them.

Examining the social networks of Muslim students in a country that is still very homogeneous will show the barriers they encounter when trying to integrate into Polish society. Even seemingly open groups do not make this integration happen to a significant extent. The social network analysis will focus on the strategies that young people from Muslim countries who came to Krakow to study take up to make friends, get the necessary information, cultivate religious rituals or avoid discrimination. The speech will be based on individual in-depth interviews conducted from September to January 2023 among Muslim students – bachelor's, master's, and doctoral students living in Kraków.

Inherent Vulnerability or Structural Vulnerabilisation? Unraveling Systemic Inequalities Faced by Women with a Migration History Amidst the COVID-19 Pandemic and the Pitfalls of 'Fempowerment'

Niklas Luft[1], Karolina Barglowski[2]

1TU Dortmund University, Germany; 2University of Luxembourg

Amidst the COVID-19 pandemic, the policy responses concerning women with a migration history have gained significant attention. This presentation, informed by critical policy analysis as well as interviews with experts and women with a migration background, navigates the complexities of these interventions, taking into account the discourse on 'fempowerment'. This perspective frames women with a migration history as intrinsically vulnerable, requiring individual empowerment to deal with their challenging situation. The reflexive policy approach draws on intersectionality theory and postcolonial insights and posits that prevailing policy interventions rely on an individualized conception of vulnerability, inadvertently reinforcing social disparities. By focussing on personal transformation, these structural disparities often remain overlooked, leaving the intertwining dynamics of genderization and migrantization unchallenged.

Germany's pandemic-related measures have intensified social disparities, leaving women with a migration history grappling with employment instability. Often they found themselves in indispensable sectors, yet without the opportunity of remote work options. Using Germany as a case study, this presentation challenges the 'fempowerment' discourse, spotlighting its inadequacy in redressing structural

1109

inequalities. Through an intersectional approach, it highlights that vulnerabilities are more a product of systemic conditions and social processes than the innate characteristics of the supposed deficient agency or 'cultural difference' of individuals. Concurrently, a postcolonial lens illuminates the inadvertent reinforcement of racial hierarchies by policies, deepening exclusionary narratives. In sum, this presentation seeks to deconstruct dominant notions of vulnerability and accentuates the urgency of holistic comprehension of social inequalities that are important in thinking about more just and inclusive post-pandemic strategies.

The Relevance of Multi-level Governance on Contrasting the Structural Inequity Health Determinants of Exploited (or At-risk of Exploitation) Migrant Workers: A Comparison Between the Project P.I.U. Su.Pr.Eme. in the Region of Sicily and the Project Common Ground in the Veneto Region

Francesca Cimino[2], Rafaela Pascoal[1]

1University of Palermo, Italy; 2Ca' Foscari University of Venice

Informal labour is prevalent in low-qualified work positions often fulfilled by migrants in Italy. Labourers are often vulnerable to exploitation by working without adequate protection equipment, being often exposed to exploitative conditions, and being underpaid. In the last decade, the country's high numbers of exploited migrants led the central government to implement national policies and actions to contrast the phenomenon and the informal economy (Omizzolo 2023). In the Northern Regions, the multi-level governance was mainly implemented through the project Common Ground, aimed at assisting migrants at risk of exploitation or currently exploited in the regions of Veneto, Piedmont, Emilia Romagna, Liguria, Friuli Venezia Giulia, while in the Southern regions, the project P.I.U. Su.Pre.EmE applied expansive policies to provide integrated social services to migrants living in informal agricultural settlements.

Applying the Conceptual Framework for Action on the Social Determinants of Health (Irwin & Solar 2010), this study, through a mixed method research based on administering 70 questionnaires and conducting 15 semi-structured interviews to street-level bureaucrats (Lipsky 1980) of the projects aims at 1) analysing the role of multi-level governance on the facilitation of health endowment of migrants working in an exploitative situation; 2) understanding the recognition of the institutional representation through the private sector implementing the P.I.U. Su.Pr.EmE and Common Ground projects within multi-level governance; 3) comprehending the influence of the regional socio-economic context in the entitlement of migrants in Sicily and Veneto.

RN35 | T09_01: Migrants, welfare professionals and institutional ambiguities 2

Fighting Against Institutional Discrimination. The Role Of Pro Bono Legal Advocacy For Migrants' Access to Welfare At Local Level In Italy

Maurizio Ambrosini, Samuele Molli

university of Milan, Italy

Institutional discrimination is a typical battleground of local policies of immigration. Welfare benefits represents one of the main fields where ID has emerged in Europe as well as in Italy, especially at local level, where administrations have wide margins of discretion in providing services. In this line, the paper considers ID in relation to welfare rights in Italy and focuses on how it is identified and contrasted at territorial level by pro bono lawyers.

The proposal relies on data gathered for a research project. Starting from a reach dataset on legal disputes, the article presents 15 cases, related to four key welfare areas: housing, health system, supports to family and childcare, emergency bonuses. Data consist of 95 juridical documents and 20 semi-structured interviews with pro bono lawyers who coordinated the 15 anti-discriminatory actions that compose our sample.

The paper examines three recurrent criteria of exclusion, termed as «direct, indirect and semi-direct discriminatory barriers». Secondly, it analyses the sociopolitical reasons behind the introduction of bans. Precisely, these represent «rhetorical tools» that administrations use for conveying a message of protection of welfare against immigrants, in line with the motto «Italians first». Thirdly, we focus on lawyers, examining their point of view, their relations with the context and beneficiaries, the difficulties they face: in particular, why lawyers have expressed solitude and perplexity. The study has indeed identified a series of practical and political obstacles, especially in terms of perception of discrimination and of exposing people and associations to a lawsuit against public institutions.

A Cross-National Study on the Discretionary Authority of Street-Level Bureaucrats in Integration Policy Implementation

Paul Schreiber[1], Nikos Kourachanis[2]

1Ruhr-Universität Bochum, Germany; 2Panteion University Athens, Greece

This paper examines the discretionary authority of individuals within administrative bodies, highlighting the interconnectedness of migration, integration, and administrative

1110

decision-making. Building on the theory and concept of Street-level Bureaucracy (cf. Lipsky, 2010; Hupe & Hill, 2021) and utilizing collected qualitative empirical data, this comparative study focuses on the discretionary power of street-level bureaucrats (SLBs) in Berlin and Athens, emphasizing their significance in integration policy implementation.

Employing a relational hermeneutic approach (Straub & Ruppel, 2022; Straub & Ruppel, 2023), the study combines a qualitative content analysis of semi-structured interviews, conducted with individual administrative personnel within integration offices in both cases, with an analysis of policy changes over time. The analysis provides comparable categories between the two cases, giving insight into the discretionary power wielded by SLBs in postmigrant urban settings, while critically engaging with the concept of discretion, challenging the traditional binary understanding of 'law' versus 'discretion' in bureaucratic practice (cf. Loyens & Maesschalck, 2010; Belabas & Gerrits, 2017; Affolter, 2021).

The paper concludes with a discussion on the discretionary power of SLBs in Berlin and Athens, linking this to the broader implications for integration and migration studies, and reflecting on governance responses at various levels, from local to international. With its European relevance and comprehensive methodological approach, this study contributes to the broader understanding of the challenges and dynamics of migration and integration policies in Europe.

The Multidimensional System of Welfare Obstacles for Young Refugees – The German Case

Marina Ruth

University of Duisburg-Essen, Germany

The German welfare state is characterized by strong links between employment and the access to systems of social security and an „employment centered transition regime" from school into training and work. This creates structurally rooted normality expectations for life courses which can result in tensions between structure and agency.

Taking up the concept of civic stratification, young refugees transitioning from school into training and work are confronted not only with this welfare regime but also with residency law categorizations which are socially constructed. They shape biographies and imply differentiated chances for participation and exclusion. Risks of exclusion arising from this are to be referred to as "welfare state obstacles".

Against this background the proposed paper will examine the question of which welfare state obstacles can be identified for young refugees in Germany and how these obstacles are shaped. Coming from a processfigurational and relational sociological research perspective and taking into account considerations from life course sociology, interdependences, interrelations and processes are of great importance to answer the research question.

Based on a combination of document analysis of framework conditions in Germany and secondary analysis of 55 qualitative interviews with municipal actors in integration policy the findings will show that welfare state obstacles for young refugees transitioning from school into training and work consist of four interrelated and interdependent dimensions: arrangements, accesses, interfaces, and the realization of structural framework conditions. This model of multidimensional welfare state obstacles has the potential to be transferable to other contexts and regions and can therefore contribute to a deeper understanding of mechanisms of exclusion.

RN35 | T09_02: Interconnections between Geographical and social mobility

Brain Drain or Scientific Mobility? Exploring the Strategies of Scientific Migration in Times of Crisis and External Constraints: Some Insights from Russia after 2022

Elizaveta Chefanova, Alena Nefedova

National Research University Higher School of Economics, Russian Federation

The authors examine the strategies employed by migrant scientists during times of crisis, with a specific focus on analyzing the associated risks and exploring the potential for their return. The classic theory of "brain drain" (Lee, 1966) suggests emigration from a country without the intention of returning. However, during external threats such as political persecution or economic crises, the duration and planning of migration may be reduced, leading researchers to relocate to other countries as temporary hubs with a potential desire to return. Additionally, highly skilled professionals worldwide tend to develop organizational, cognitive, and community dimensions of careers simultaneously (Gläser, Laudel, 2015), and migration may result in a downshift in these areas.

The empirical data consists of three parts: Firstly, quantitative survey data on migration strategies of highly productive scientists and graduate students were collected in 2022. Secondly, the results of digital analytics were obtained from TG-chats of scientific personnel who migrated from Russia. Thirdly, more than 20 in-depth interviews were conducted with migrant Russian researchers.

The findings reveal that the strategies employed by Russian researchers can be categorized into different types: there are scientists who had long-term plans to leave and already had connections within foreign academia, and external factors served as catalysts for their emigration. Another group consists of scientists who didn't initially intend to leave but were compelled to do so due to external factors, but forced to do so with forthcoming professional challenges. Lastly, a subset of migrant researchers chose to maintain working connections with Russia while residing in two countries, frequently commuting for personal and professional matters. During the presentation, all three groups strategies will be discussed in more details.

Diaspora Engagement in Public Diplomacy: Case of Latvian Diaspora Professionals Working in International Organizations

Baiba Bela

University of Latvia, Latvia

Today, diplomacy and international policymaking are primarily a 'game of skill' not simply a game of power in which size, power and geographical location are crucial. In this context, the diaspora network can play an important role and allow policy makers 'punch above their weight' (Beeson and Higgott, 2014 in Stone & Douglas, 2018). Countries with limited financial and human resources can strategically and purposefully increase their international influence and better defend their interests through diaspora engagement in public diplomacy (Pinto, 2022).

Public diplomacy is relatively new concept and new instrument for the implementation of foreign policy. There are very few studies on public diplomacy. This paper will focus on diaspora engagement in public diplomacy, reflecting on new relationships and bonds of solidarity that are built. It explores cooperation of Latvia's diaspora professionals, who are working in international organizations, with Latvia's state institutions, with particular focus on new relationships and networks related to public diplomacy. The study was carried out in the summer of 2022 by conducting a survey of Latvia's diaspora professionals working in international organizations (N = 150), focus group discussions (six discussions, 18 participants) and nine in-depth, semi-structured interviews. The results through light on This study allows to explore and contribute to the understanding of the dynamics of engagement – understanding the structures, policies and methods of creating and engaging diaspora in the public diplomacy, the constellations of actors involved, the communication strategies and visions, new methods of engagement, individual predisposition to engagement.

1112

National Class Frames in Motion: Chinese Tradesmen in Boomtime Australia

Catriona Stevens

Edith Cowan University, Australia

This paper proposes the concept of national class frames in motion as an analytical framework to explore dimensions of social class in transnational contexts. National class frames in motion refers to the diverse ways that first generation migrants interpret their own intra-ethnic classed positions, as well as the positions of others, through the lens of homeland class maps and class discourses, while simultaneously

contesting and changing the meanings of those nationally bounded class frames as they move with them through new transnational contexts. Because migrants are socialised into class frames that are formed and forged in homeland national contexts, these same national class frames necessarily have ongoing meaning during and after their movements across borders; they are transported, reformed and reinterpreted in receiving country contexts.

This paper explores this concept through the experiences of trade-skilled workers from China who migrated to Perth, Western Australia, during the exceptional economic conditions of the last resources boom. This unusual cohort of working-class migrants, quite unlike most middle-class Chinese nationals and former nationals living in Australia, provide an excellent case study through which to interrogate class as an analytical lens, assess its validity and test its limits. These case studies further provide new insights into intra-ethnic class contestations, particularly when in contemporary China spatial mobility is now so deeply imbricated with culturalist dimensions of class.

Cross-Border Commuting in the Polish-German Border Region: A Mobility Infrastructure Perspective

Iepke M. Rijcken

Paris Lodron University Salzburg, Austria

In an era marked by right-wing populist narratives advocating for restricted migration policies, Western democracies struggle with the tension between the economic benefits of open borders while maintaining national sovereignty and minimising the costs of migration (Lutz 2023). The phenomenon of intra-European cross-border commuting seems to be an attractive alternative; (cheaper) workers come temporally to meet labour market demands without the complexities of integration. However, what assumptions underlie these ideas, what challenges and opportunities arise for cross-border commuters, and what infrastructures are in place, facilitating their labour trajectories? Using Polish-German cross-border commuting as a case study, this paper aims to move forward the migration infrastructure approach (Xiang and Lindquist 2014).

The Polish-German border region has been a notable example of dynamic and consistent labour mobilities within the European Union (Morokvasic 1994; Okólski 2001). Traditionally engaged in seasonal work in Germany, recent observations indicate a significant shift in Polish labour dynamics, with decreased involvement in agriculture (Schneider and Götte 2020) and increased employment in the production and service sectors (Bundesagentur für Arbeit 2022). Focusing on the automotive production sector and distribution centres in Brandenburg, Germany, the mobility infrastructure approach offers an insightful framework to analyse the interplay of technologies, institutions, and actors shaping the practices of cross-border commuting. However, the mobility infrastructure approach has thus far paid little attention to the nuances of daily and weekly cross-border commuting. This study argues that the recurrent and repetitive nature of these movements entails distinct needs and facilitation compared to seasonal work.

Building on my ongoing ethnographic research, I show the challenges, related to bureaucratic hurdles, negotiations of everyday social lives and bodily exhaustion, while also highlighting the economic opportunities of cross-border commuting in this regional context. By unravelling the complexities of cross-border commuting, this study contributes to advancing the mobility infrastructure approach and offers a deeper understanding of the intra-European labour mobilities to inform broader discussions surrounding migration policies.

1113

RN35 | T09_03: Citizenship and coping mechanisms in the margins

Race, Superdiversity and Migration: the Case of Undocumented African Migrants in Istanbul

Doğuş Şimşek

Kingston University London, United Kingdom

This paper aims to answer how undocumented African migrants make a home in 'superdiverse' Istanbul in the face of racism, migrant surveillance, and everyday policing. The global migration regime has changed, and more people migrate within the Global South than from the Global South to the Global North. Since the rapid increase in migration, not only have the cities in Western Europe become increasingly superdiverse, but also migrant-receiving cities in the Global South have become superdiverse. Racism is the key to understanding structural and social inequalities affecting the lives of migrants, and it has been a real struggle for many migrants during their journey, settlement and adaptation processes, even in some cases, it is the reason for return migration. Focusing on the links between race and superdiversity, this paper explores the processes of racialization in the case of undocumented African migrants in Istanbul. Drawing on in-depth interviews with undocumented African migrants in Istanbul, I explore how they make a home in Istanbul, how they negotiate and interpret their experiences of racism and discrimination in Istanbul, and how they develop emancipatory practices despite the racism they experience. I agree that the experiences of undocumented African migrants in Istanbul are very much related to race that shapes social systems (Bonilla-Silva 2001) leading to racism and can better be understood through long-standing patterns of power – the continuity of colonialism. Race, criminality and migrant background are not mutually exclusive categories as experienced by African undocumented migrants in superdiverse Istanbul.

Living and Working with an Irregularised Status in Highly Regularised Societies: The Cases of the Netherlands and Finland

Paula Elina Merikoski[1], Minke Hajer[2]

1University of Helsinki, Finland; 2Utrecht University, the Netherlands

European states are more and more exclusionary and hostile in their migration policies and non-citizens are increasingly formally excluded yet present, living in irregularised situations. In this paper we examine how anti-migration policies shape everyday experiences of irregularity. We depart from the understanding that irregularity is a politically and legally produced situation, resulting from state policies and politics that restrict access to residence and fundamental rights while profiting from precarious labour (e.g. de Genova 2004; Sigona et al. 2021). We rely on the conceptualisation of 'irregularity assemblage' to analyse how legal and policy frameworks influence the lives of migrants and examine how irregularity is experienced and how it affects the everyday life of irregular migrants and their families.

This empirical paper draws from findings from thematic policy analysis and semi-structured expert interviews conducted in the context of a research project I-Claim – Improving the living and working conditions of irregularised migrants in Europe (EU Horizon).

The cases of Netherlands and Finland present some notable similarities, both being traditionally strong welfare states yet currently increasingly employing exclusionary policies. The labour markets in both countries are highly regularised, with low levels of informality, and the number of people living and working in these countries in an irregularised situation is relatively low. However, the migration histories and patterns and some key legislations are different. By comparing these similar yet in some ways different contexts, we explore how different policies shape the experiences of living and working in an irregular situation in two highly regularised societies.

Integration and Citizenship for Low Literate Refugees

1114

Turid Sætermo, Linda Dyrlid

NTNU Social Research, Norway

As a result of the present geography of conflicts and a prioritization of particularly vulnerable refugees for settlement, Norway – like several other European countries – now settle a higher proportion of low literate refugees. Despite having settled in a peaceful society, these then often find themselves in a difficult and paradoxical situation: They should remake their lives in a society where competence requirements are high and access to employment narrow, while the pressure on them to become economically independent is strong. A parallel development is the turn towards meritocracy in citizenship regulations, and like several other European countries Norway has introduced citizenship tests. This can contribute to jeopardize the political rights of low literate refugees. Meanwhile, arguments against immigration are voiced on the basis of 'failed integration' and growing inequality. This paper asks: How do low literate refugees cope in a society where literacy is the norm? What can their situations tell us about the relations between integration, citizenship, and democracy? The paper is based on qualitative interviews with low literate refugees who have been settled in Norway. They were conducted as part of a 4-year research project focusing on integration and low literature refugees. In the discussion of our research findings, we draw on theoretical perspectives on meritocratic citizenship and integration, and the notions of deservingness.

Growing Old, Feeling Like Citizens? Migrants' Descendants' Trajectories Into Adulthood In Italy In The Light Of Lived Citizenship

Andrea Calabretta[1], Stefano Allievi[1], Sveva Magaraggia[2]

1University of Padua, Italy; 2University of Milan-Bicocca, Italy

Despite the growing number of migrants' descendants reaching adulthood in Italy – especially young people of North African origins, as their parents were among the first immigrants to arrive in the country – their trajectories have been little researched. This gap is quite striking, as they risk inheriting a marginal economic and professional position, while experiencing processes of social and symbolic exclusion, once again particularly evident for young people of North African origin due to anti-Arab and Islamophobic prejudices (Fullin, 2016).

The paper presents the preliminary results of the research project 'Growing old, feeling like citizens?' developed by the Universities of Padua and Milan-Bicocca (Italy). The project aims to improve understanding of how Muslim young adults of North African origin experience citizenship in everyday life and relationships (Kallio et al., 2020), using this analytical perspective to explore several interrelated social dimensions, such as labour market integration, social exclusion processes, sense of belonging, intimate self-realisation, wellbeing and personal aspirations (Müller, 2022).

The project adopts a multi-site research design and a qualitative methodology. The fieldwork is carried out in Lombardy and Veneto and entails 80 biographical interviews and 8 focus groups, ethnographic observation, and semi-structured interviews with local and national key informants.

The paper provides new insights on how young Muslim people construct and live their citizenship in Italy in their transition to adulthood and on the challenges they face in this crucial process due to their youth, migrant background and religious affiliation.

RN36 | Sociology of Social Transformations: East and West

RN36 | T02: Perspectives on social values and imaginaries

Exchange of Ideas and Interdisciplinary Cooperation. Polish Sociologists and Historians About Social Transformation

Agnieszka Kolasa-Nowak

University of Maria Curie-Sklodowska, Poland

Recently there are a lot of surprising and deeply disturbing trends like new populism, deepening social and political divisions, conflicting visions of reality, intensifying symbolic and discursive struggles, and finally the rebirth of old identities, prejudices and conflicts. Old divisions have returned on the East-West axis of Europe. Social researchers are trying to respond to these new challenges by providing adequate diagnoses and understanding of this dynamic situation.

My paper concentrates on the Polish academic community. I want to describe the explanatory strategies, cognitive and political goals, attitudes and involvement of Polish social scientists. I focus on those who deal with macro-processes of social change, using a long time perspective and a broad comparative approach. I conducted in-depth interviews with young Polish scientists from main public universities who represent two key disciplines: sociology and history. The paper will present results of this research. My aim was to evaluate the scope and character of exchange and cooperation between different academic communities, disciplines and research traditions. By following the achievements and academic careers of young researchers, I also want to determine the role of Eastern European social sciences in global discussions on new transformations. How do they assess the ability to describe and universalize the Eastern European experience? What audiences are they targeting? How do they see scientific communication with the West? What are the difficulties in agreeing on the interpretations of social processes, historical experiences and imaginaries among historians and sociologists in Poland and abroad?

"And I Also Remember How People Were Tracked Back Then": Experiences and Imaginaries of Surveillance in a Generational and Cross-Cultural Perspective

Veronika Kalmus[1], Rita Figueiras[2], Göran Bolin[3]

1University of Tartu, Estonia; 2Universidade Catolica Portuguesa, Portugal; 3Södertörn University, Sweden

Most previous studies on online surveillance are conducted in long-time liberal democracies with limited experiences of explicit and intrusive state surveillance. An intriguing question is: What role does the historical legacy of totalitarianism or authoritarianism, embodied in generational experiences and values, play in the formation of attitudes and imaginaries regarding contemporary state and corporate surveillance? We will analyse results from an original study among two generations (born in 1946-1953, and in 1988-1995) in three European countries with different historical surveillance regimes – Estonia, Portugal, and Sweden. The study combined a quantitative online survey (N=3,221) with qualitative focus group and individual interviews (71 participants in total).

Our analysis revealed significant cross-cultural differences in personal and mediated experiences of surveillance. Nevertheless, in all countries, tolerance towards online state surveillance was more characteristic of the older age group, and it was predicted by trustful, obedient, and less individualistic attitudes towards state authorities and other institutions.

Qualitative interviews revealed that participants, especially in the older group of Estonians, clearly distinguished between the historical totalitarian/authoritarian and contemporary "democratic" surveillance regimes, imagining the former as restrictive and dangerous, and the latter as loose and even partly beneficial.

We posit a theoretical hypothesis of the "surveillance survival paradox": personal experiences of the past (totalitarian/authoritarian) surveillance regime do not lead to a greater fear or criticism of the contemporary regime; rather on the contrary. Perceptions of the past surveillance regime as more direct, dangerous, and terrible overshadow sensitivities towards more abstract and covert risks related to the contemporary datafied world.

(A)moral Familism in Poland: the Problematic Legacy of Distrust

Barbara Małgorzata Pasamonik

The Maria Grzegorzewska University, Poland

Edward Banfield in his book Moral Basis of a Backward Society (1958) introduced term "amoral familism" to describe social relations and values in the southern Italian societies.

Amoral familism is characterized by a sharp division between the public and private spheres, the dominance of the

1116

private sphere and informal ties, presentist orientation, value dimorphism and ethical dualism. These features appear in certain social, economic, historical, cultural contexts. In Poland, researchers began to diagnose amoral familism in the 1980s as a response to the economic crisis and the atrophy of the state (Tarkowska, Tarkowski 1990). Amoral familism is also present in contemporary diagnoses of Polish society (Rychard 2015, Leder 2020). To explore the enduring presence of familism in Polish social reality I propose to abandon the value-laden epithet "amoral" and consider familism as an evolutionary adaptive strategy, predominant in times of shortages or crises, strategy that is still observed in certain geographic regions.

Familism can be analyzed using measures of (1) trust in the private sphere/strong family ties vs. generalized trust (European Social Survey, Public Opinion Research Center, Statistics Poland), 2) family collectivism vs. institutional collectivism (GLOBE), (3) particularism vs. universalism (Trompenaars and Hampden-Turner). I use these measures to investigate familism across Poland and with comparison to other European countries. The uneven distribution of social capital in Poland and Europe, including its low level in poorer rural areas seems to confirm adaptive value of familism.

The Transition From Weekday To Holy Day In Israeli-Jewish Society: Verbal And Ritual Adaptations

Stav Shufan

Bar Ilan University, israel, Israel

This study explores temporal shifts among Jews in Israel, particularly the transition from a Gregorian-universal time perception during weekdays to a Jewish framework on weekends. Employing a multi-sited qualitative phenomenological approach, interviews with 66 individuals from religious, traditional, secular, and Haredi communities reveal a broadly accepted concept of Jewish Shabbat time, validated at personal, familial, and social levels. This concept is enriched with thoughtful verbal and ritual expressions.

On one hand, Friday practices and rituals signify the gradual shift to Shabbat. This includes not just the observance of traditional laws like candle lighting, but also behavioral changes such as completing tasks early and dedicating time to family from Friday evening. These gradual adjustments illustrate a significant temporal movement in mainstream Israeli-Jewish culture. On the other hand, despite a common understanding of Shabbat time, the terminology used to describe parts of Shabbat varies: secular Jews often use terms like "Friday evening," whereas religious Jews prefer "Shabbat eve." Similarly, "Saturday evening" is used by secular groups, in contrast to "Motzei Shabbat" among religious communities.

The study illuminates the varied interpretive spaces prevalent in Jewish culture in Israel. This diversity, along with the tension arising from transitions between distinct temporal frameworks, offers a detailed perspective on time, illustrating that it is not merely quantified but also lived and interpreted within this particular cultural context. The observed

alterations in Jewish-Israeli culture exemplify its intrinsic temporal fluidity, acting as a bridge between the concept of time as an abstract, unbiased, and objective phenomenon, and its diverse social roles and interpretational aspects.

RN36 | T03: Transformations of identities

Redefining EU-citizenship for planet-centred morphogenesis

Tea Golob, Matej Makarovič

Faculty of Information Studies, Slovenia

In the paper, we argue that there is a need for a bottom-up civic change, but framed within proper institutional, structural, and cultural settings. This interlocking relationship between actors/agents and structure is considered on a level of EU, which is a political entity with normatively strong environmental and sustainable orientation, but clearly, facing a certain lack in implementing all policies successfully. While there is a complex intertwinement of factor influencing this situation, we believe that more could be achieved with enhanced civic and political participation of citizens. Accordingly, we suggest a redefined concept of European citizenship, which is seen as a crucial building block of a new European social imaginary. The latter can provide grounds for coherent European Union to successful face current societal challenges. For that purpose, we distinguish between narrative-affectual and performative aspects of citizenship, which we intertwine with the planet-centric awareness.

Russia's War against Ukraine and Polish-Ukrainian Relations: The Impact of Outside Aggression on Mutual Perception

Kaja Gadowska

Jagiellonian University, Poland

This paper examines the consequences of Russia's war against Ukraine for Polish-Ukrainian relations with particular focus on the impact of frames of war on the Polish perception of Ukrainian national identity.

The invasion of Ukraine by Russia has forced millions of people to seek refuge and safety abroad. Of all the world's countries, Poland has hosted the largest number of war refugees from Ukraine (adding to large Ukrainian diaspora of economic migrants already present), and this historic exodus of people has created long-term and far-reaching social, economic, and policy consequences for the country.

Based on analyses of source materials, public polls, and press content, this paper discusses the relations between Poles and Ukrainians in a historical perspective – from the Spring of Nations through the First and Second World Wars and post-war order to the present. Frames forged by the historical memory of the two nations bore drastic differences, which became obscured at the outbreak of the Russo-Ukrainian War by a sense of kinship and shared experience in the face of a common enemy. However, as the war has dragged on, dormant resentments and stereotypes have begun to be revived, hindering the success of policies and measures to integrate refugees into their host communities. This paper will explain how the shifts in public attitudes towards Ukrainians reflect the lingering persistence of pre-existing frames, but also how they affect and are affected by perceptions of the war.

Identity Transformations of National Minorities in Eastern Europe – the Formation of the "third Value" on the Example of Poles in Lithuania

Izabela Bukalska

Cardinal Stefan Wyszyński University, Poland

The paper is a summary of the first part of research project conducted under the grant of the Ministry of Education and Science in Poland POPUL/SN/0304/2023/01.

Presentation is based on research conducted in accordance with procedures of grounded theory methodology, based on IDI with leaders of Polish organisations in Lithuania and creators in the field of literature and art.

It's worth asking the question: how the identity of national minorities evolves after separation with their nation state (as the effect of historical decisions)? Is the assimilation the only scenario, and is the fight against it the only possible activity of minority elites?

1118

The research leads to the conclusion, which is also the main thesis of the speech: despite unquestionable progress of assimilation process, over time, identity develops among national minority, with a strong reference to the country of origin, immersed in the culture of the country of residence, but not a simple synthesis of two identities. Referring to the concept of the Polish-American sociologist Danuta Mostwin, a "third value" of identity is then created.

In case of Poles in Lithuania, apart from historical factors, there are two important time censuses in XXI century: Lithuania's entry into the European Union and the improvement of international communication tools during the Covid-19 pandemic. New generations, with high intercultural and technological competences have "entered the game". Examples of initiatives will be provided. Worth mentioning – different linguistic competences (Polish, Lithuanian, Russian – different media reception) may cause different attitudes towards war in Ukraine.

Similar conculsions were drawn by author during research among Hungarian minorities in Central Europe. The process is worth attention, also with reference to other cases.

RN36 | T04: Resilience in social transformations

Resilience as Success Criterion of Post-Communist Restorations

Zenonas Norkus[1], Jurgita Markevičiūtė[2]

1Faculty of Philosophy, Vilnius University, Lithuania;
2Faculty of Mathematics and Informatics, Vilnius University, Lithuania

In analyzing modern social systems, two types of systemic change should be distinguished: revolutions in the proper sense, driven by the new ideas of social justice, and restorations, driven by the idea of reversal to a past alternative stable equilibrium. In the last case, we have to do with a sequence of three systems or alternative equilibria: original (A), intermediate (B), and restored (C), where C affirms, constructs, or claims continuity with A. Restoration qualifies as complete endurance success, if C endures longer than A and B, avoiding a new revolution or restoration of B. The endurance success of C depends on its performance success: the ability to outperform the original or intermediate system. However, shocks can move to alternative equilibria even well-performing social systems. Therefore, the endurance and performance success criteria, based on the comparison of performance and endurance of A, B, and C should be supplemented by the restoration resilience criterion: A successfully restored social system C is more resilient in comparison with the original system A both in the sense of its capacity for rapid recovery after shocks and its lesser susceptibility to systemic change, shifting it into an alternative equilibrium. We provide a demonstration of how this criterion works, comparing the resilience of Baltic States in 1918-1940 and since their restoration in 1990. They are selected as paradigmatic cases of modern social restorations.

Measuring Food Resilience of the Baltic Countries in the Long Run

Jurgita Markeviciute[1], Zenonas Norkus[2]

1Faculty of Mathematics and Informatics, Vilnius University, Lithuania; 2Faculty of Philosophy, Vilnius University, Lithuania

Food resilience refers to the capacity of a country to withstand and recover from shocks, stresses, and disturbances while providing sufficient and nutritious food for the population. It involves the ability of the food system to adapt and respond to various challenges, such as natural disasters, economic crises, climate change, and other disruptions. Food resilience issues are most salient for developing countries. However, one of the purposes of the Common Agricultural Policy (CAP) of the EU is to increase food resilience of its member countries too. It is the legacy of painful experiences of two world wars, when populations of many European countries starved. Home gardening, alternative food networks (AFNs), food relocalisation, urban and peri-urban agriculture, local food, „locavorism", multi-functional agriculture and food sharing are recent venues to enhance food resilience in the EU. The aim of our contribution is to explore the measures of food resilience, applying them to food supply and food consumption in the Baltic countries since early 20th century. Currently, food balances of the UN Food and Agriculture Organization (FAO) provide a picture in most details. However, food self-sufficiency ratio is most useful summary measure. Depending on available data, it can be calculated after expressing the nutritional value of different kinds of food in calories or using monetary data (the value of production, exports and imports). Baltic countries are selected because prominence of agricultural and food production issues in their modern history, including „Denmarkization" during interwar time, the alleged successes of their collectivized agriculture during of Soviet occupation, and its collapse in the 1990s.

Democracy Resilience in Comparative European Prospects (comparing Ukrainian, Britain, German, Lithuanian, Russian and Belarussian cases)

Olga Kutsenko[1,2], Andrii Gorbachyk[1]

1Taras Shevchenko National University of Kyiv; 2Berlin Technical University

The paper explores the challenging question about social factors ensuring the resilience of democracy, enabling it to resist authoritarian tendencies, and recover from negative influences. We define a resilience as a complex phenomenon of institutional and social quality of democracy, that links the impact of political stress (events and processes) on regime at different levels and domains, with the capacity of democracy to resist authoritarian tendencies and even to empower in the face of extremely unfavorable challenges. If the institutional quality of democracy sets the normative and procedural framework for the regime functioning, then the social quality determines the capacity of sustainable functioning democracy thanks to its rootedness in the value consciousness, in social structure and civic practices. We focus on the social quality of democracy in (pre-)wartime Ukraine in comparative perspective outlined by (1) the stable democracies with different historical backgrounds (such as in Britain, Germany, and Lithuania), and (2) post-Soviet autocracies (Russian and Belarusian). The study is grounded on the socio-spatial and agency-structural theoretical approaches that allows to reveal the key social factors of resilience and tension in functioning democracy. The EVS and WVS integrated database is used for empirical analysis. The all-Ukrainian sociological survey's data conducted during the war are used to highlight the dynamics of the social quality of democracy in wartime Ukraine. Indicators

1119

of legitimacy of violence and legitimacy of illegal practices are added to the arsenal of more traditional indicators of support for democracy that allow deeper understanding the democracy resilience preventing (or not) the autocratization as well as the probable alternatives of further social and political transformations at least of Ukrainian society in comparative European prospects.

RN36 | T05: Borders and (semi)peripheries

Bordering Communities of Post-Soviet Armenia: Re/production of Border-Proximity

Harutyun Vermishyan

Yerevan State University, Armenia

The article examines the evolving dynamics of Armenia's bordering communities in the aftermath of both the First Nagorno-Karabakh War (1988-1994) and the more recent Second Nagorno-Karabakh War in 2020. These conflicts, characterized by territorial disputes, ethnic tensions, and geopolitical complexities, have significantly influenced Armenia's border regions, transforming them into lively spaces of border-proximity. Within this context, the study explores how these communities perceive their daily lives and interactions amidst the enduring impact of conflict, where borders extend beyond mere geographical boundaries to become integral facets of everyday life. Grounded in the theoretical frameworks of Georg Simmel and Lefebvre's spatial concepts, my research aimed to conceptualize the border as a multidimensional phenomenon, encompassing physical, social, and symbolic dimensions. Moreover, I endeavored to characterize border-proximity as a routine mode of interaction. The study involved twenty (20) narrative interviews with residents of bordering communities. It reveals the contrasting dynamics of Tavush and Syunik regions in Armenia. In Tavush, residents actively shape the border influenced by historical memory and ethnic identity, whereas in Syunik, external factors like military presence and recent conflicts largely define the border, causing disruption among residents. In summary, the article underscores the dynamic nature of Armenia's bordering communities, emphasizing how residents actively contribute to and adapt to the borders that shape their lives. It illuminates the intricacies of border-proximity and the complex interplay between internal and external agency in border formation.

Unfolding Convivial Futures from Liminal Positions: the Case Study of Transitions in the German-Polish Border Region

Magdalena Nowicka, Piotr Goldstein

German Centre for Integration and Migration Research DeZIM e.V., Germany

In response to the call to disturb linear reasoning in studies on transformation in Europe, this contribution uses the concept of liminality to discuss the condition and futures of Poles and Ukrainians commuting between western Polish towns and villages and the workplaces in Brandenburg.

1120

Liminality is a useful analytical tool to study the past, present and the future as folded and unfolded in the lives of people in quest for wellbeing and happiness. It is employed here in three ways: First, it is used to analyse the societal state of conditional belonging that results in the region's connectivity and partial rejection. I will argue that the Polish-German border region's position vis-à-vis western Europe is that of liminality, and the promise of belonging to the imagined community on equal terms is a powerful driver for social transformation and individual cross-border mobility. Second, I will follow the anthropological approach to uncover the continuities and uncertainties related to commuters' life trajectories. In this approach, liminality relates to the stage of passage between the old and a new state, and disorientation, ambiguity and incompleteness it encloses. Focusing on liminality helps me also to highlight the mundane daily rituals of passage between home and workspace, work and family, etc. Third, at the interpersonal level, liminality is the psychological capacity to bridge between self and the other. It helps me to understand how the commuters and the locals engage in relationship with (unfamiliar) people, and becoming empathic of their situation, and contribute to everyday east-west (b)ordering.

The Concept Of (Latent) Globalising City. The Case Study Of Polish Second Cities

Kubicki Paweł[1], Nowak Marek[2], Fiorenzo Fantuz[2]

1Jagiellonian University, Krakow, Poland; 2University of Adam Mickiewicz, Poznan Poland

The paper will present the assumptions of the project "The (latent) globalising city" (LGC) which is based on a 3 years collaboration between researchers from the Jagiellonian University in Krakow and the University of Adam Mickiewicz in Poznan. The concept of the globalising city is related to the second cities from regions considered to be semi-peripheral (Wallerstein 2004), which have only recently been integrated into a global network of flows, and which are developing an institutional sphere and patterns of culture characteristic for "banal cosmopolitanism" (Beck 2002). LGC project proposes a conceptualisation of the "globalising city" with reference to the phenomenon of the transformation of cities by migratory and refugee phenomena. It attempts to understand the mechanisms that differentiate the dynamics of internationalisation of cities, taking into account perspectives less represented in the analyses of sociologists.

The transition processes are described in the form of two antinomies in contrast to the classic concept of the "global city".

(1) Global vs multiscalar perspective (Brenner 2019). In the case of the global city the framework of reference is the global scale. The globalising city, however, is still dominated by the local (nation state) and regional (European or/and Central European) scales.

(2). The Longue durée perspective vs ahistorical modernity. Many studies on the phenomenon of the global city have a rather ahistorical character and rather focus on contemporary processes constituting capitalism. However, a city-centred European spatial order, hierarchy of centre–periphery relations has also developed in the longue durée process (Braudel 1979).

The presentation will use material from the in-depth interviews with migrants and refugees carried out in Krakow and Poznan.

Peripheral Societies in the Global Itineraries of People Movement

Romina Gurashi[1], Shkelzen Hasanaj[2]

1Università degli Studi Internazionali di Roma (UNINT), Italy; 2University of Siena

Starting from the 1990s on, following the end of the Albanian regime, the main route of irregular migration was the sea route between Albania and Italy; over time, especially since the experience of the Arab Springs, many other routes developed. One of these is the Balkan route.

The first part of our research (quantitative reconstruction of the phenomenon) is devoted to the issue of the transformation of migration routes through the Western Balkans. The object of analysis is not only the specificity of the Balkan route, but also its interrelation with other migration routes.

In the second part of the research, quantitative research was carried out with the aim of analyzing motives and difficulties that lead migrants and asylum seekers to choose the "overland" route through Albania which found itself changing from being a traditional country of emigration to being crossed by significant flows of migrants in transit. We also explored in detail the impact and governance of the policies and behaviors taken by the authorities toward migrants and asylum seekers that have prompted thousands of individuals to travel the Albanian route and in some cases to make the decision to settle in Albania.

Our starting research question was to explore how and whether reception policies influence the movement of migrants in transit through Albania.

The analysis, launched in 2021 at the Laboratory on Inequalities (LSD) and still ongoing, is the result of ethnographic research partly conducted "in the field," through interviews collected in Albania at the country's main institutions.

RN36 | T06: Gender and parenting

New Forms of Masculinity and Femininity in Post-transitional Croatia: Scales Development and Validation

Iva Žunić[1], Ksenija Klasnić[2]

1Ivo Pilar Institute of Social Sciences, Croatia; 2University of Zagreb Faculty of Humanities and Social Sciences

This paper discusses how a contextual sensitive femininity and masculinity scales were developed for a more complex analysis of gender identities in recent literature described as "new masculinity" and "new femininity" for a better understanding of the changing gender dynamics in post-transitional Croatia. In this paper we are led by the principles of the theoretical approach known as "gender and development", according to which gender relations are the best indicator of the development possibilities of contemporary societies and that changes in these structures herald future practices. During the last decades, femininity and masculinity have been measured in Croatia based on gender roles and "traditional" or stereotypical characteristics displayed by man and woman. Considering the results of previous surveys which support the fact that "gender conservatism" has overall decreased in the period of post-socialist transition, the goal of this study was to develop and validate two new scales for measuring new forms of masculinity and femininity in post-transition society. New Masculinity Scale (NMS) and New Femininity Scale (NFS) items were developed based on expert interviews with cognitive elements and focus groups with undergraduates at two universities (University of Zagreb and University of Split). The resulting scale was used in a nationally representative survey. Factor analysis was applied to determine the existence of different subscales of femininity and masculinity in Croatia which were then analysed according to generational differences.

Intensive Parenting and Modernisation Changes in Post-Transitional Croatia

Augustin Derado, Inga Tomić-Koludrović, Mirko Petrić, Iva Žunić

Ivo Pilar Institute of Social Sciences, Croatia

Along with other post-Yugoslavian countries except for Slovenia, Croatia was until relatively recently a blind spot on the map of Europe-wide social science and policy overviews of changing gender, work and care arrangements (Roosalu and Hofäcker, 2016; Blum, 2016: 39). In the meantime, the topic of intensive parenting has been addressed by several empirically based publications in Serbia and Croatia (Stanojević, 2018; Trifunović, 2018; Čulić, 2019). However, these have concentrated mostly on one of its forms (new fatherhood) and on the description of the phenomenon rather than on its place in the context of a wider societal transformation taking place in these societies.

This paper attempts to place both forms of intensive parenting (new fatherhood and intensive mothering) into the context of wider modernisation changes in post-transitional Croatian society. It is based on a relational mixed methods approach that includes multivariate analyses of primary data from a nationally proportional survey (N=1200) and excerpts from individual and partner semi-structured interviews (N=20) in which the intensive parenting topics emerged. The results suggest that intensive parenting practices are directly addressed by interviewees of higher socio-economic status, but that attitudes and values connected to parenting have generally changed in a direction that is more compatible with intensive parenting norms than had previously been the case. A contribution of the paper in terms of the general theory of intensive parenting is that intensive mothering can also be an indicator of modernisation changes rather than of retraditionalisation.

The Production of Knowledge on Sexual Harassment of Women in the Media Discourse During Post-socialist Transition in Poland

Paweł Bagiński

University of Warsaw, Poland

1122

On the basis of press discourse and oral history interviews with feminist activists working with various forms of violence against women in the 1990s and 2000s, I will show how the production of knowledge on sexual harassment was a part of the post-socialist transition with the characteristic transfer of American/Western norms, values, identities and institutions. Media frequently portrayed sexual harassment as an allegedly new problem which appeared during neoliberal transformation. Hence these discourses are useful for tracking the genealogy of norms of sensitivity to gender-violence. By analyzing discourses about the American tendency to exaggeration, gendered "oversensitivity", unreliability of women and male ignorance, I will discuss some aspects of the social construction of sexual harassment and connect them with the normative shift associated with the post-socialist transition in Poland.

RN36 | T08: Inequalities and vulnerabilities

Re-designing Space of Social Services in the Period of Sociopolitical Tensions

Violeta Gevorgianiene, Eglė Šumskienė, Laimutė Žalimienė, Rasa Genienė, Eugenijus Dunajevas

Vilnius University, Lithuania

Background and purpose. Vulnerable individuals are the first to feel the impact of sociopolitical, economic and other tensions. The social service system designed to help them must persist in delivering services despite emerging challenges. The pandemic and the war in Ukraine led to emergence of new social actors engaging in para-professional activities aimed at providing social support. These emerging actors pose a challenge to the social service system requiring it to undertake "boundary work" (Liu et al. 2020), fostering collaboration with other social groups involved in the assistance. The presentation aims to explore how various social actors engage in "boundary work" while responding to the urgent needs of vulnerable individuals during sociopolitical and economic tensions. Study design. We conceptualize the social service system as a social space, with external actors seen as members of other social spaces. The collision of these spaces necessitates "boundary work" when addressing the needs of the vulnerable individuals. Our study involves 20 focus groups with social workers and 10 interviews with professionals from other fields, supplemented by ecological maps to visualize transformative factors. Findings. During sociopolitical tensions, the social service space not only redesigns its models of service delivery but integrates with other social spaces (transportation, culture, etc.). Creative engagement with external social actors is founded on mutual trust, strengthening the resilience of the entire social service system.

Who Were the Victims of China's Zero-COVID Lockdown? Insights from Nationwide Survey Data

Chih-Jou Jay Chen, Xin-You Chen, Yu-Hsiang Chiu

Academia Sinica, Taiwan

During the three-year COVID-19 pandemic from 2020 to 2022, China not only faced threats to the lives and health of its people but also experienced economic downturns and work stoppages due to its zero-COVID policy and extensive lockdowns. This paper examines the victims of China's stringent zero-COVID policy and lockdown measures, exploring who they were and why. We analyzed data from internet surveys conducted in China in 2022 and 2023, encompassing approximately 18,000 cases. The survey results revealed that 37 percent of the Chinese population experienced lower incomes during or after the pandemic compared to their pre-pandemic incomes in 2019. The income-reducing groups included private sector workers, migrant peasant workers, and rural farmers. Conversely, certain groups, such as public sector workers, business owners, urban residents, and Communist Party members, either maintained or increased their incomes during the pandemic. These groups, beneficiaries of China's socialist command economy system, were shielded from economic losses due to their advantaged positions in terms of state sector employment, urban household registration status (hukou), and CCP affiliation. Meanwhile, China's market economy dynamics created a specific victim group during the pandemic; individuals with university and postgraduate education, aged between 35 and 54, suffered more from the pandemic, tending to experience income losses compared to other groups. These higher-income earners were direct victims of layoffs and salary reductions during the pandemic-induced economic downturn. This paper suggests that the victims of China's Zero-COVID Lockdown emerged from social transformations characterized by both socialist command economy and capitalist market economy elements.

1123

Ordinary Recognition Gaps. Worthiness and Disrespect in the Post-Transformation Society

Piotr Kulas

University of Warsaw, Poland

The presentation delves into recognition gaps in the post-transformation society. The study asserts that people in Poland, whatever their status, claim respect as full-fledged citizens, equally contributing to society. Respondents of different statuses share a similarly egalitarian picture of a worthy person. Moreover, most people in Poland declare middle-class belonging. However, the differences have not ceased to exist. The presentation explores the main instances of misrecognition stemming from economic inequalities and cultural and legal injustices, both exploited by politicians/activists and those social sufferings seen as more personal and hardly translated into political goals. It starts from the first and then turns to the latter, only to show how prevalent and rooted in everyday experience they are.

It finds that the most reported misrecognition forms occur on equal footing, primarily manifesting as intra-class phenomena. They are labelled as "ordinary recognition gaps." They occur in daily encounters in horizontal relations and are often perceived as psychological rather than societal issues. The presentation argues that these ordinary recognition gaps are not individual idiosyncrasies but effects of symbolic boundaries. Interestingly, people's adherence to the purported universality of worthiness obscures awareness of these boundaries.

The presentation builds on Honneth's tripartite theory, Fraser's critical dualism on recognition and redistribution, and uses Lamont's studies on respect and symbolic boundaries. It draws on data from two representative surveys conducted in 2020 and 2021 and tens of in-depth interviews conducted in Poland (2021-2023) with people of working and middle classes (with a focus on those experiencing social mobility), and the intelligentsia. Overall, the presentation contributes to the sociological understanding of the lack of recognition as a pivotal social factor influencing tensions in contemporary societies.

Lagging-behind regions as a source of political discontent? West Gernamy, East Germany, and Czechia compared

Tomáš Kostelecký, Josef Bernard

Institute of Sociology, Czech Academy of Sciences, Czech Republic

The paper addresses the question whether and eventually to what extent regional inequality contributes to the rise of anti-democratic sentiment, anti-system and radical political parties. The political radicalisation that may eventually lead to democratic backsliding is observed in many European countries, both in the Eastern and the Western side of the continent. The paper examines whether and to what extent such rise of potentially anti-system phenomena may be related to the territorially uneven development. The paper analyses the data from population surveys conducted in both Germany and Czhechia to measure the regional differences in attitudes on democracy, and potential signs of political radicalisation. Attitudes are analysed in the context of contextual data about the demographic, economic and social development on subnational level and voting patterns (from national elections) to test the hypothesis that regional inequality is significant factor contributing the the rise of radiclised attitudes and support of radical/anti-system/anti-democratic parties. Data from West Gernamy, East Germany, and Czechia are compared to enable researchers to take into account whether the communist history and post-communist development matter in this respect.

RN37 | Urban Sociology

RN37 | T01_01: Multiculturalism and migration patterns in the urban fabric

How to Study Multicultural Urban Streets? An Inquiry into Lisbon's Rua do Benformoso

Duygu Cihanger Ribeiro

Middle East Technical University, Turkey; University of Aveiro, ICS Lisbon University, Portugal

This study focuses on the socio-spatial dynamics of urban streets from an urban studies perspective, employing field research on Rua do Benformoso, a multicultural street nestled in the heart of Lisbon. With a distinctive migrant population and a rich ethnic profile, Rua do Benformoso occupies a strategic location proximate to key tourist attractions in the city. Through the lens of visual methodologies such as mapping, on-site drawing, and photography, this research seeks to present and learn from the interplay between the physical design of the street and its uses by the diverse inhabitants. The findings aim to discuss the ways in which multiculturalism is manifested in the urban fabric, offering insights into the social interactions and spatial practices that define public spaces. The study contributes to our understanding of how urban streets, particularly those with a multicultural character, function as vibrant socio-spatial arenas within the urban landscape that defy the dichotomies between visibility and invisibility, planning and spontaneity, being in place and being out of place in a city.

New Metropolitan Geographies: The Settlement of the Foreign Population Between Peripheralisation and Centralisation

Maria Grazia Montesano[1], Tommaso Rimondi[2], Maurizio Bergamaschi[2]

1University of Grenoble Alpes; 2University of Bologna

Several studies have shown the growing importance of the metropolitan dimension in the territorial distribution patterns of immigrants in Southern European cities (Martori, Apparicio, 2011; Arbaci, 2019;Benassi et al., 2020; Daconto, Montesano, 2022). The present work intends to analyse the settlement process of the foreign population in the metropolitan city of Bologna, assuming that different moments or phases can be identified. Adopting a diachronic perspective and using quantitative and georeferenced methodologies, census data from 1991 to 2021 are analysed, taking into account the territorial classification between inner areas and poles proposed within the National Strategy for Inner Areas. The empirical analysis conducted revealshow at least three phases can be identified in the settlement process of foreigners in the metropolitan area: a first phase of centralisation, with the foreign population concentrated in the central municipality, a second phase of peripheralisation towards the areas of the Apennines, and a third characterised by the abandonment of the mountain areas and a rapprochement towards Bologna. The third and last phase is also marked by a trend of depopulation of mountain areas involving the entire resident population, both Italian and foreign, which confirms that it is not possible to talk about a process of 'ecological succession' in the bolognese Apennine (Guerzoni, 2018). In general, we believe that the proposed analysis underlines the importance of adopting a situated and contextual approach to the centrifugal and centripetal trends affecting the foreign population. The processes of peripheralisation and centralisation require a multidimensional understanding that takes into account the specificities of territories.

Exploring the Housing–Migration Nexus: an Analysis of Informal Housing Arrangements Between Colombian Newcomers and their Hosts in Rotterdam

1125

Maxime Felder

University of Amsterdam, Netherlands, The

Lodging has long been a response to the housing problem in cities, especially for newcomers. This practice declined during the 20th century in the context of the gradual privatisation of domestic space and increasing control over people's mobility. Formal alternatives emerged, such as residential hotels and migrant workers' homes, but staying with a host remains the default solution for many newcomers to post-industrial cities. While some forms of lodging have received a great deal of attention (e.g. refugees hosted by citizens) and are sometimes encouraged by the authorities, more common housing arrangements are less well known.

Based on interviews with Colombian newcomers in the city of Rotterdam, I will analyse how they experience informal housing arrangements and what forms of reciprocity are involved with their hosts (mostly relatives or fellow Colombians). I will show how these arrangements are an urban phenomenon, shaped by both migration and housing dynamics. Rather than being encouraged as a form of social support or as an efficient use of housing space, I show that accommodation is restricted in different ways. Focusing on forms of reciprocity and obligation leads me to question the sharp distinction made by authorities and sometimes academics between altruistic arrangements on the one hand and commercial or even exploitative arrangements on the other. I will argue that these situations need to be understood within a broader set of transnational relations

and in terms of how the relationship between host and guest evolves.

Fragments Of Citizenship: Contested Mosque Architecture In The North of England

Oznur Yardimci, Daryl Martin

University of York, United Kingdom

In this paper, we examine the tensions underlying the planning process for the construction of a mosque building in the English city of York, in order to examine how it exemplifies changing trajectories of citizenship in the UK. We argue that the politics of religious architecture, and the politics of mosque planning and architecture in particular, serve as a litmus test for the ways multiculturalism is experienced, as well as the divisions associated with new discourses of nativism in contemporary Britain. We explore written objections during the planning process for this mosque alongside contemporaneous letters to a local newspaper, and find that objections ranged around concerns about the effect of the mosque on the everyday experience of urban infrastructure, the symbolic identity of the mosque within the wider city, and how the mosque would affect questions about citizenship within a wider national context. The objections to the mosque application reflect how urban architecture and the built environment plays a mediating role in mobilising shared notions of who belongs and who does not. We conclude by arguing for the need for a rematerialised sociology that takes architecture and urban infrastructure seriously as a way of illuminating the wider politics of public space, its tensions and its exclusions.

RN37 | T01_02: Gentrification and struggle in the reconfiguration of urban spaces

The Ambiguous Role of a Lisbon Grassroots Association Within a Rapidly Transforming City, Exploring Both Its Resistance and (Unintentional) Contribution to Urban Change

Priscilla Santos[1], Daniel Malet Calvo[2], Jordi Nofre[3]

1ISCTE-University Institute of Lisbon, Portugal; 2ISCTE-University Institute of Lisbon, Portugal; 3Nova University Lisbon, Portugal

This paper explores the ambiguous role of a grassroots cultural and activist association in Lisbon (Portugal), within the city's rapidly expanding frontiers of gentrification and touristification. The association fights for the right to the city, among other causes such as feminism and climate change. However, in 2014, strong institutional pressure led to the association's displacement from its former location in the gentrified and touristified Bairro Alto to Intendente. Previously characterised by urban decay and poverty, with degraded buildings and racialised, stigmatised and marginalised populations, Intendente was then undergoing urban regeneration. The City Council aimed to attract cultural and activist associations as part of its strategy to change the area's image. Now, the area has been revalued, and the association faces a new threat of displacement due to high rent prices.

By combining documentary research and an exploratory ethnography carried out in 2022, which included interviews with key informants, we take a retrospective view of this association's history of displacement, illustrating ten years of Lisbon's city changes. We explore the tensions and negotiations between multiple actors (City Council, landlords, and activists) and how the association navigates between resisting urban neoliberalism and contributing (unintentionally) to spatial and social changes in this 'grey zone' of the tourist city. We aim to contribute to existing literature on the interplay between urban movements, touristification and gentrification, providing clues to shed light on how grassroots associations resist, survive and/or collaborate within the manifold processes of urban change.

1126

The Subsumption of Rog: From Autonomous Factory to Cultural Center

Nathan Siegrist

University of Gothenburg, Sweden

The literature on post-socialist neoliberalism has highlighted how neoliberal urbanization processes often differ from the well-studied Western European counterparts. This chapter responds to recent calls to shed light on the role of urban movements in re-configuring local implementations of post-socialist neoliberal urbanism. Empirically, it details conflicts surrounding the industrial factory area of Rog in post-socialist Ljubljana, Slovenia. Abandoned in the transitionary period, the factory site was squatted in 2006 and became sustained as a squatted "autonomous zone" seeking to contest the ongoing inner-city gentrification of Ljubljana, up until its eviction in 2021. Parallel to the squat, the municipality launched a public-private regeneration plan for the area, proposing to construct high-end apartments and a hotel to replace the squat. After the 2008 global financial crisis, the economic support for this partnership collapsed and the development plans were subsequently reconfigured into a model self-described as "public-civic", connecting to the legacy of the squatters. Rather than luxury domicile, the area would now be dedicated to artistic and creative enterprises within a new cultural center, explicitly branding Ljubljana a "creative city". However, the squatters firmly rejected the "public-civic" regeneration as an instance of municipally-driven gentrification re-tailoring the inner city for predatory tourism and high-end consumption. Drawing on ethnographic fieldwork, this chapter connects these conflicts to existing literature on neoliberal urbanism and urban movements while highlighting unique complexities of activist-constructed alternatives to gentrification, and how these can become subsumed under municipal cultural branding strategies seeking to attract capital investments.

Practices of Resistance to Neoliberal Urbanism. The Case of Screamo Independent Music Scene in Milan and in Italy

Valeria Marina Borodi

University of Milan-Bicocca, Italy

Neoliberal urbanism is an open-ended phenomenon that exploits and (re-)produces uneven socio-spatial differences and it is characterised by geographical variability, translocality and multiscalarity (Peck, Theodore & Brenner, 2009). Particularly, since the early 1990s, cities have become points of tension and critical nodes in the evolving scalar politics of neoliberalisation.

One mechanism not only unleashed by neoliberal urbanism, but also a symbol of it, is gentrification, which can lead to both the marginalisation of critical culture through a widespread exercise of discrediting, exclusion, and censorship and the co-optation of cultural practices, leading to their neutralisation and depoliticization (Kern, 2022; Tozzi, 2023).

As a cultural product, music itself can be understood as a field of struggle, where practices of resistance – i.e., the activities, techniques and resources performed by individuals to voice their dissent, to regain possession of space, to construct meanings of aggregation and participation, and more generally, to undermine forms of power – are performed. Particularly, I will present the results of the exploratory interviews to privileged witnesses active in independent collectives belonging to the screamo independent music scene in Milan and in Italy. The aim is that of understanding how their independence is enacted and shaped in relation to the mechanisms of co-optation and the geographical distancing from the city centres and from the urban contexts (e.g., through eviction policies against self-organised and self-financed social centres). Indeed, the innovative aspect of the research – conducted with an ethnographic approach through multi-sited ethnography and exploratory and biographical interviews – is that it simultaneously considers the urban features that shape music scenes and their agency in shaping cities and urban contexts.

Residential Changes, Roots and Their Impact on Everyday Life in Madrid.

José Ariza[1], Margarita Barañano[2], Pedro Uceda[3], Daniel Sorando[4]

1127

1Universidad Complutense de Madrid, Spain; 2Universidad Complutense de Madrid, Spain; 3Universidad Complutense de Madrid, Spain; 4Universidad de Zaragoza, Spain

Madrid is a city in southern Europe in which roots play an essential role in the development of social life, becoming socio-existential supports against vulnerability. This translates, among other issues, into the fact that housing changes mostly occur in the closest environment, whether in the same neighborhood or in surrounding areas. These residential strategies allow the social fabric that supports socio-residential supports to be maintained in the space. However, in recent years the city has been immersed in a new real estate cycle characterized by the rise of the rental option over ownership and a high increase in its price. This is contributing to promoting residential rotation and making it difficult for individuals to carry out such proximity mobilities in certain places in the city. This research, framed in the period 2010-2019, explores which neighborhoods of Madrid are, as well as their characteristics, in which local residential movements are maintained and which are suffering the consequences of the current real estate cycle. To do this, the mobility matrices and the distances traveled in people's residential changes are analyzed. The results show how nearby residential changes are prioritized, while the number of residential changes towards more distant spaces in the city increases, especially in the central districts as a result of the gentrification and touristification process.

RN37 | T01_03: Citizen participation in the urban space

Making Connections In Urban Planning: A Case Study Of Bubny-Zátory In Prague

Aneta Soukopová

Charles University, Czech Republic

Citizen participation and democratization have recently played an important role in urban planning. This paper explores these phenomena by focusing on the actor structure and citizen engagement in urban planning of the Prague district of Bubny-Zátory, which is one of Prague's largest brownfield sites. This study draws on previous scholarship in the areas of citizen participation and urban planning, theoretically framed by reflexive modernization theory (e.g. Lissandrello and Grin, 2011, Beck and Giddens, 1994). The research aims to analyse the dynamics of urban planning by exploring the agendas of the diversity of actors who participate in the project planning process. The study uncovers the social network structure that connects a particular set of actors and the related perceptions, beliefs, and involvement in decision-making more broadly. The goal is to better understand the form and place that citizen participation takes in the whole process of the Bubny-Zátory project. The main research tool is qualitative network analysis, which reveals different actor groups that are characterized in part by shared history, culture, and collective ties with other actors (Knoke, Yang 2008). The analysis draws on dozens of semi-structured interviews with actors and participant observations. The interviews also involve the creation of visual materials and mental maps of the actor structure. To also understand the online space of shaping discussions about the city, an element of quantitative web analysis was added to the research design to track the actor structure on social networks (Twitter/X). The study reveals the communication and power structures of urban planning in Prague, shows the spaces through which citizens could intervene in the process and, thus, point out the possible limits of the setting of citizen participation in Prague. The research has the potential to have policy implications for the city of Prague. The mixed methodology of the study also opens academic discussions of qualitative network analysis as a suitable tool for exploring broad and complex topics with multiple actors with different agendas, such as in urban planning or other public policy areas. I haven´t joined any previous ESA conference, but I joined RN37 Summer School, in 2023 in Genoa.

Citizens' Assembly as a Tool for Engaging Residents in Adaptive Processes to Climate Change: Analysis of the pros and cons.

Kamil Rafał Brzeziński

University of Lodz, Poland

The proposed presentation addresses two increasingly significant issues: observable climate change, particularly demanding mitigation and adaptive actions in urban areas (IPCC 2021, 2022), and the concept of growing popularity of the deliberative democracy, increasingly practised through innovative participatory mechanisms that enable citizens and authorities to jointly deliberate rational decisions, considering the idea of the common good (Cohen 1997; Bohman 1997; Fung 2007; Mansbridge et al.; Juchacz 2015; Sroka 2018; OECD 2020).

Taking into account both of these elements, the purpose of the presentation is to introduce the idea of a citizens' assembly and analyse its potential advantages and disadvantages as a tool for involving residents in co-decision processes regarding adaptive actions to climate change. The discussion will be limited to Polish cities, particularly Łódź, and the implementation of the second citizens' assembly in this city, focused on the reduction of harmful greenhouse gases. The presented empirical material (evaluation surveys, FGI with panel participants, IDIs with experts) is the result of an interdisciplinary project: "Participatory Adaptation of Cities to Climate Change – A Guide for Effective Action by Authorities and Residents for Polish and Eastern European Cities." The project is conducted by scientists from the University of Łódź representing disciplines such as biology, economics and finance, spatial planning, and sociology.

1128

Urban Actors Mediating Digital Technology and Urban Space in Tallinn, Estonia

Olli Ilmari Jakonen

Tallinn University of Technology, Estonia

Urban spaces face transformative pressures as digital technologies are embedded into cities as part of smart urbanism. While existing research has considered the role of urban actors in implementing digital technologies as part of the smart urbanism framework more broadly, work on the role that urban space plays for individual stakeholders and the implications this has on how they contribute to digital cities has been insufficient. This article therefore explores the interests of urban actors in mediating digital technology adoption in urban space. It draws on literature on the spatial impact of digital technologies, digital urban growth, and urban governance theory to frame the agency of urban actors to mobilise resources and collaboration to protect their interests. The paper provides insight into how interests in digital technology adoption and in use of urban space

intersect between actors and how these interests converge between local key stakeholders in local technology governance of Tallinn, Estonia. Based on a thematic analysis of interviews with representatives of local organisations, it is argued that the of potential digital technologies to transform and dislocate functionality from urban space should be understood against the backdrop of interests of local urban actors. It is therefore suggested that smart urbanism may also be viewed as a framework through which actors of the city attempt to seize the benefits of digital technologies without compromising their interests in urban space.

Public Sideshow Situations: The Role Of Informal Interactions In Urban Development Projects

Sebastian Koch

Universität Konstanz, Germany

In order to combat housing deprivation and space scarcity, a new climate-neutral and energy-efficient quarter is being realized in the city of Constance, Germany. The planning principles of this urban development measure are developed interactively and practically in planning discussions, workshops, meetings and events within the city administration. Results and further procedures are presented to the citizens in public events like participation workshops, public walks and information events. Citizens' and stakeholders' initiatives, concerns and needs find their way into the thematically predefined public events in an unexpected and unplanned manner. Citizens intercept city officials and start informal conversations outside the formal structure and sequences of these planned public events. Within these spontaneous emerging "sideshow communication arenas", the confrontation with different topics often overwhelms and exceeds the knowledge of the contacted person. As a result of these sideshow situations, some of the adressed concerns are taken into consideration in the further planning process as well as the formal design of future events. The proposed paper focuses on these interactions between city officials and the public, their inherent topics and interactional management, their origins in debate culture, knowledge asymmetries and paradoxical demands of the legal situation in urban planning, and the interactions' future impact. Through an ethnomethodological and interactional focus on these practices, captured and analysed in empirical video based data, the social transformation process is made visible in individual practices and demonstrates their significance in urban transformation.

RN37 | T02_01: Present challenges in urban housing – policies, market, identity and precarity A

Urban Transformations and Socio-spatial Inequalities in Large Housing Estates in Croatia

Anđelina Svirčić Gotovac[1], Jelena Zlatar Gamberožić[2], Sara Ursić[3]

1Institute for Social Research in Zagreb, Croatia; 2Institute for Social Research in Zagreb, Croatia; 3Institute of Social Sciences Ivo Pilar

The paper compares the layout of socialist and post-socialist large housing estates (LHEs) in Croatian large cities at the neighbourhood level, which depends primarily on existing daily basis equipment and public infrastructure. The main differences occured during the last three decades of transition and prevalence of market-led economy in Croatia, when the construction of multi-family buildings became mostly private and transformed the housing policy as well. The construction of urbanistically planned housing estates as housing units became mostly abandoned at the beginning of 1990s, and the share of public and social housing was significantly reduced. For the analysis, the qualitative methods of semi-structured interviews with experts (N=26) and focus groups with residents (N=5) were conducted in Croatia during 2022. The study analyses attitudes of experts and residents on how socialist and post-socialist LHEs in Croatia fulfill residents' daily housing needs. Both groups of respondents point to elementary differences in these two types of estates at the level of neighbourhood. Basic facilities used daily by the residents (school, kindergarten, public transport, green spaces, etc.) often lack in new estates, making old estates often better equipped with more public and green spaces. Due to a large density of private construction, new housing estates experience a kind of social and spatial inequality caused by reduced residents' needs. The trust in the process of urbanism and urban policy is also generally missing and participation of residents is very low, which is the main critique of the new and market-oriented transformation of urban space.

Housing and Temporalities. Waiting, Disciplining, Capacity to Aspire

Tommaso Frangioni[1], Daniela Leonardi[2]

1Polytechnic of Milano, Italy; 2University of Torino, Italy

Housing is one of the major challenges faced in urban areas. The housing question has acquired an unprecedented visibility in the wake of the Covid-19 pandemic. This is one of the reasons why housing interventions have been

1129

developed in many European countries in recent years, and a growing public debate on how to address evictions and homelessness, and how to provide affordable housing has arisen. In our contribution, we focus on the processes of precarization revolving around housing issues, developing an analysis of its temporal dimension, by looking at how housing policies are implemented at the street level.

Our everyday experience is deeply intertwined with the experience of time and with the multiple ways in which it is represented, controlled, imagined, shaped. Also the relationship we build with the state is structured through representations and practices of time. Precarization can be understood as an indefinite expansion of the present countered by a restriction of future horizons.

Our contribution is based on two qualitative fieldworks in Torino, concerning the reception system for homeless people and the housing policies aimed at evicted people. We observed the centrality of three temporal dimensions: waiting as a tool that concurs to shape the bureaucratic encounters; the discursive regime of emergency; and the institutional category of chronicity. They can be seen as intertwined mechanisms of domination (Auyero, 2012) structuring both the process through which street-level bureaucracies build their "social cases" and the biographic trajectories of poor people. They concur in creating precarization in house-deprived subjects.

Navigating Precarious Housing in the Age of Commodification, Financialization and Rentism: Understanding Tenure Differences and Regional Disparities in Spain.

Josep Maria Caroz Armayones[1,2], Carlos Delclós[5], Joan Benach[1,2,3], Mireia Julià[4]

1Health Inequalities Research Group, Employment Conditions Knowledge Network (GREDS-EMCONET), Department of Political and Social Sciences, Universitat Pompeu Fabra (UPF), Barcelona, Spain; 2JHU-UPF Public Policy Center, Department of Political and Social Sciences, Universitat Pompeu Fabra (UPF), Barcelona, Spain; 3Ecological Humanities Research Group (GHECO), Universidad Autónoma, Madrid, Spain; 4ESIMar (Mar Nursing School), Parc de Salut Mar, University Pompeu Fabra-affiliated, Barcelona, Spain;f SDHEd (Social Determinants and Health Education Research Group), IMIM (Hospital del Mar Medical Research Institute), Barcelona, Spain; 5Universitat Autònoma de Barcelona, Spain

The "housing question" has become a major issue in high-income countries. The neoliberalization of the welfare state has unleashed processes of commodification, financialization, and rentierism, with substantial implications for housing conditions. Within this context, the concept of precarious housing has emerged to describe the rising prevalence of insecure and unstable housing situations. Currently, the conceptual development of this perspective

has some important theoretical and empirical limitations, most notably regarding housing tenure. This present paper seeks to fill these gaps by exploring the link between housing tenure and housing precariousness, and its connection with the dynamics of commodification, financialization and rentierism. The Spanish scenario is an optimal scenario for conceptual development due to the housing transition that the country is undergoing. We perform a multilevel analysis of pooled cross-sectional data from the Spanish Living Conditions Survey (ECV) 2007-2019 to identify associations between housing precariousness and regional levels of tenure, commodification, financialization and rentierism. Our results show that the distribution of precarious housing, which is concentrated among market rate and social tenants, is only a compositional effect. Our explanatory analysis did not identify a clear distinction between homeowners and tenants. Rather, precarious housing conditions exists across the homeowner/tenant divide. We also find that commodification, financialization, and rentierism have a heterogeneous but substantial impact on average precarious housing levels by housing tenure, thereby paving the way for novel research opportunities.

Reclaiming Public Space For Social And Environmental Transformation: The Estuário Collective In Cacilhas (Portugal)

1130

Patrícia Pereira

CICS.NOVA, Leiria Polytechnic Institute, Portugal

Cacilhas is an old industrial and port area in the city of Almada, just 8 minutes by boat from the historic centre of Lisbon. During the second half of the XX century, the area was associated with middle-class populations, working mainly in the service sector in the centre of Lisbon, and with workers in industrial and naval activities. Recent studies point to a current process of urban transformation, with investment in housing and rehabilitation of public space, intensification of tourism, rising housing and commercial prices and rents, arrival of new residents and displacement of low-income residents.

Estuário Coletivo was created by a group of neighbours out of a desire and a demand: a children's playground and community garden. 5 years after it was built, the collective continues to organize events, activities and projects among neighbours, aimed at strengthening local ties and bringing social transformation.

In this communication, which is part of a broader study of the recent transformations in the area, using ethnographic and walking methods, I will give an account of the complex process of creating and consolidating this informal collective. I will focus on how they are collectively producing public space and increasing political participation through art and intergenerational work.

RN37 | T02_02: Socio-spatial dynamics at the neighbourhood level A

Collective Care Efforts and Social Change in Japanese Cities

Meric Kirmizi

Ondokuz Mayis University, Turkey

This study, based on in-depth interviews with twenty women and five men in major Japanese cities such as Osaka, Tokyo and Saitama about the social aspects of their professional or voluntary work, presents a picture of women's contributions to social change in Japan towards a more diverse, equal and resilient urban society. By examining different cases of social contribution to these shared goals for positive change, it also aims to understand the social reproduction of cities and urban life in Japan. The study examines both the achievements of female (and male) social entrepreneurs in creating social change against entrenched and intensifying discrimination, environmental crisis and social inequalities, and the obstacles they face in their social endeavors. The concepts of feminist city, commons, caring city, neighborhood, coexistence and moral economy are used as a theoretical background to analyse the individual cases studied. It is found that Japanese women of all ages and backgrounds are equally committed to social change in Japan towards a more equal society. However, they have to work in the midst of strong countervailing forces arising from the country's political-economic and socio-cultural context, which slow down their efforts and raise concerns about their future sustainability.

Alienation And Resonance: "Making Home" In Deprived Urban Neighbourhoods

Mary P Corcoran

Maynooth University, Co.Kildare, IRELAND, Ireland

At least some of the current housing crisis in Ireland is attributable to a decades-long retrenchment of the state from its role as a housing provider, compounded by the neglect of housing estates within its remit and the privatization of much of the existing housing stock. Over the years, as social housing became residualised, many urban housing estates fell into a cycle of decline.

This paper interrogates the liveability and lifeworld of deprived urban neighbourhoods, arguing that the vicissitudes of the external environment amplify a preoccupation with home as shelter, safety and security. Enforced privatisation manifests as an "inward orientation" that has implications for associational life, something that has been exacerbated during and in the aftermath of the pandemic. It also raises issues about the decline in neighbourhood social infrastructure (Klinenberg 2018). On the other hand, residents also manage to generate resonance across social, material and existential axes (Rosa 2019), by drawing on an emotional rootedness in their locality, history and heritage, and the desire to sustain community against all odds.

This paper draws on a data set accumulated over four decades from national projects investigating quality of life in social housing in Ireland (3 waves of study); European comparative projects; local collaborative projects on the creative practices of home-making, and a 2023 exploratory project on creating a dashboard for residents' of an inner-city Dublin neighbourhood. I offer an empirically grounded account that centres theorizations of home in understanding how community is achieved, sustained and/or eroded by urban policy-making.

Building Familiarity through Conflict: Neighborhoods as a Lens to Old and New Challenges in the Super-Diverse (Post-)Covid City

Dilek A. Tepeli, Verena Muckermann

Ruhr-University Bochum, Germany

1131

Neighbourhoods as the focal point of everyday life offer interesting insights into the challenges in the super-diverse (Post-)Covid city. Here, the entanglement of structural inequalities and individual problems becomes unavoidably apparent. The COVID-19 pandemic impressively showed that emerging and persistent inequalities and segregations along the common conflict lines of class, gender, and ethnicity, besides the lack of social cohesion and increasing individualization of citizens, eventually reach into our homes – and those of our neighbours.

Based on Norbert Elias' figurational sociology (1976; 1977), our research project focuses on psychosocial conflicts in neighbourhoods as half-public "limbo" spaces, where the personal, intimate life and the public merge, and where societal challenges of our time are negotiated on a micro level of everyday life. Employing qualitative research methods, we investigate how neighbourly interaction is created, lived, and framed, and how neighbours within the German Ruhr-Area navigate through (global) challenges represented by the people next door.

By focusing on the role of emotions and affects in neighbourly conflict dynamics (i.e., the need for connection and belonging), our research shows that besides common conflicts (i.e., noise, dilapidation), some disputes might also foster familiarity between neighbours in uncertain times and reduce individualization and loneliness.

Thus, we argue for understanding social conflicts in neighbourhoods as a productive (heuristic) tool to capture and handle the challenges of our time. Moreover, by interpreting neighbourly conflicts as a resourceful bottom-up approach to (global) challenges, we call for including the

From Sharing Cities to Sharing Neighbourhoods: Evidences on Local Dynamics of Non-Commercial Sharing

Carsten Keller, Floris Bernhardt, Helena Cermeño

University of Kassel, Germany

After the economic crisis of 2007/8 many expectations and hopes have been formulated that the rising Sharing Economy will contribute to sustainable urban development and empower civil society. Meanwhile, the concept is discussed more critically. At least parts of the Sharing Economy are referred to as "platform capitalism", with Airbnb and Uber among its most prominent examples. The notion of the Sharing City, which emerged at the beginning of the 2010s, is already critically formulated against the commercial Sharing Economy. The potential of sustainable and just urban development is attributed primarily to non-commercial or "commoning" practices. Most existing studies on sharing, however, focus on commercial sharing and do not take their local settings into account. In our proposed contribution, we ask for the differences between commercial and non commercial forms of sharing and the role of the local context like the neighbourhood. On the basis of qualitative expert interviews and a quantitative survey among residents of neighbourhoods in seven European cities we point out systematic differences between commercial and non-commercial sharing practices in terms of content, motives, organisation and actors. In addition, the neighbourhood emerges as a key entity of non-commercial sharing. We point out differences in terms of actors and organisation of sharing between two types of neighbourhoods and conclude that the potential of sharing for just and sustainable urban development lies particularly on the neighbourhood level.

The empiric research was carried out in the frame of two research projects: "StadtTeilen" and "ProShare", see https://stadtteilen.org/en/ and https://jpi-urbaneurope.eu/project/proshare/.

RN37 | T02_03: Urban Tourism: Actors, Activities, Impacts A

Night Taxi Drivers as 'Culture Brokers': Implications for the Nocturnal Tourism

Guilherme Costa[1], Manuel Garcia-Ruiz[1,2]

1Instituto Universitário de Lisboa, ISCTE-IUL; 2Centro de Investigações e Estudos em Sociologia (CIES-Iscte)

This study deepens into the pivotal role of night taxi drivers in shaping Lisbon's nocturnal economy and night experience. Serving as the primary point of contact for tourists and visitors, these drivers emerge as influential "culture brokers" as they facilitate, mediate, and physically transport people through the nocturnal urban tissue. Our research, grounded in an ethnographic approach conducted since 2022, employs in-depth interviews, participant observations with drivers, and a detailed mapping of nighttime activities to unravel this dynamic.

We explore the reasons behind the night taxi drivers' mediation on the tourists' nocturnal experiences, selectively granting access to various locales for dining, entertainment, and nightlife and influencing and shaping their image of the city. Our findings highlight the drivers' intricate relationship with the nocturnal city, often prioritizing personal gains through pre-established connections with nightlife establishments.

The study contributes to a deeper understanding of the night taxi drivers' dual role: as facilitators of urban night experiences and as agents influencing the economic and cultural fabric of nighttime Lisbon. We argue that these drivers play a crucial yet understudied role in shaping urban nightscapes, impacting tourist consumption patterns and the broader nocturnal economy and cultural ecosystem.

1132

Any Chance For a Balance: Between Tourism-Driven Dynamic and Living in Heritage Space?

Liis Ojamäe[1,2], Katrin Paadam[1], Triin Talk[3], Riin Alatalu[3]

1Tallinn University of Technology, Estonia; 2Tallinn University, Estonia; 3Estonian Academy of Arts

The presentation aims to provide an insight into the socio-spatial impacts of tourism in Tallinn Old Town, where the post-socialist neoliberal context has enabled unrestricted tourism growth and increasing vulnerability of the local community. Our study conducted in 2020-2021 reveals that the pre-COVID high season tourist flows into Tallinn Old Town exceeded in relative terms even the numbers of tourists visiting Venice – a destination well documented as

struggling with overtourism (Talk et al., 2023). Quite contrary to the UNESCO claims to preserve the human environment and it's social and functional diversity, the neoliberal laissez-faire attitude towards tourism management paves way towards mono-functionality of historical sites which tend to be consumed rather than inhabited (Minguez et al., 2019). These developments might further enhance emptying heritage sites of residents by simultaneously reducing the attractiveness of a destination as it loses its authentic character where history meets the modern everydayness.

The COVID years, with major break in tourism activities, provided an opportunity to reconsider the strategy for the development of urban heritage sites by seeking a balanced approach in the interest of residents and other stakeholders. Tallinn Old Town case exemplifies the significance of local time-space specificities to be considered in building an understanding of contemporary touristification and its impact on local communities in heritage areas. Possible strategies for tourism impact management will be discussed together with local residents' perceptions about ways to balance the role of tourism and liveability with heritage as well as the cultural and economic vibrance of the area.

Visiting and Living Porto and Barcelona Lessons from a Comparative Overview on the Eco-social Impact of Touristification in Two Southern European Cities

José Miguel Ricardo[2], Ligia Ferro[2], Ana Belén Cano-Hila[1], Montserrat Simó[1], Victoria Sánchez[1], Karla Berrens[1], Marc Marc Pradel Miquel[1]

1University of Barcelona, Spain; 2Universidade do Porto

This communication is framed in research-funded project ECOSOCITIES (2022-2025), which studies eco-social resilient discourses and practices in southern European cities (PID2021-123912NA-I00). In the first stage of our research, we have explore how during the last three decades the economic model of Barcelona has turned more and more dependent of the tourist industry. Thus, in turn, entails its own problems for locals as rents rise and life becomes more expensive. We have also identified that Porto is nowadays at a similar stage Barcelona was around 1990s in terms of tourism development. Nevertheless, after the pandemic, tourist promotion has gained an increasingly role in Porto's economic and urban model. This paper seeks to comparatively examine the consequences of touristification and gentrification dynamics on urban space social configuration and changes, as well as social movilization and resistance against this transformations. We base the analysis on quantitavie and qualitative data. Thus, we analyse socio-demographic changes of structure and substitution; besides to quantifying tourism and changes of trade and services, and the evolution of the real estate market and access to housing. Data is complemented with a content analysis of the local public policies, and the strategies and discourses of civil society to tackle the gentrification process in the most

touristic areas of both cities. We want to map the practices Porto is developing since the pandemic for showing how Porto's approach to touristification, albeit similar to Barcelona's, is socially and ecologically more sustainable.

Using Disadvantaged Neighbourhoods as Urban Laboratories: The Impact of Urban and Sustainable Redevelopment on Affordable Housing in Amsterdam

Eva Swyngedouw, Mirte Jepma

Universiteit van Gent, Belgium

Just like many Western cities, Amsterdam faces a substantial housing affordability crisis. Over the past three decades, surging housing costs have forced middle – and low-income households to relocate outside the city while homelessness rates have increased. Notably, the share of social housing has declined by almost 15% in less than ten years, primarily due to the sale of social housing in affluent central neighborhoods on the private market. Concurrently, less prosperous areas such as Nieuw-West are chosen as strategic sites for experimenting with solutions to housing affordability and sustainability challenges. In this paper, we delve into a case study of the Wildeman neighborhood to examine how the municipality, social housing corporations, residents' committees, and residents understand, negotiate, and respond to two intertwined housing development plans. On the one hand, the national masterplan for Nieuw-West aims to improve the area's livability and safety by creating affordable, high-quality, and mixed-income social housing. However, these densification efforts, in practice, involve demolishing buildings and displacing residents without a guaranteed return. On the other hand, the 'Warm Amsterdam' project, initiated by the municipality and social housing corporations seeks to achieve a natural gas-free status by 2040. However, these initiatives undertaken in the name of a more sustainable future are often perceived as a costly threat to the housing situation of current residents. Building on these insights, we contend that housing affordability for the urban poor becomes further jeopardized when disadvantaged neighborhoods are used as 'living labs' for experimenting with urban redevelopment and sustainability policies.

1133

RN37 | T03_01: Present Challenges in Urban Housing: Policies, Market, Identity and Precarity B

Inconspicuous Innovations and Resilience of Urban Housing: The Case of Wooden Prefabricated Houses from the Post-War Period

Slavomíra Ferenčuhová

Institute of Sociology, Czech Academy of Sciences, Czech Republic

The question how to locally address current global problems like climate change or energy crisis often leads to searching for innovative expert-led solutions and strategies to adapt urban living to the situation. However, as suggested by previous research, people respond to these challenges also in their routine practices, everyday lives, and in their existing material settings, including by developing 'unconscious', 'haphazard' (Toole et al. 2016) or 'inconspicuous' adaptations (Ferenčuhová, 2022) in their homes. Such mundane responses of urban residents often escape scholarly interest as unimportant and temporary 'coping strategies', partly because of their limited scale, questionable impact, and a lack of connection to individuals' informed attitudes towards the global issues in focus.

My contribution seeks to explore everyday 'inconspicuous innovations' developed by residents of a specific type of architecture: post-war prefabricated wooden houses constructed in the 1950s in former Czechoslovakia (and across the world). These houses were built as a temporary solution to a different crisis in European cities at the time–that of severe housing shortage during post-war reconstruction. Yet, despite their limited expected lifespan, many of the houses are still standing today, while they have been adapted by their residents to better serve their current needs. Using data from focus groups with residents in several Czech cities where these neighbourhoods are standing (collected in summer 2022), I will study resilience of this specific housing, especially by describing innovations the residents make to the materiality of the houses and to their everyday dwelling routines in face of current challenges.

Affordable Housing In The Sustainable City? A Case Of Swedish Policy Entanglement

Hannah Saldert

University West, Sweden

The challenges in making cities both environmentally friendly, economically viable and socially just at the same time, becomes especially visible in housing policy. Housing is a key issue in planning for sustainable cities from an environmental and economic perspective, simultaneously, from an equity perspective housing policy is going in a direction where fewer can afford a home. While this is a global phenomenon, Sweden is an interesting case because of its reputation as one of the world's most equal and socially just countries. Until now, Swedish housing policy have been able to keep housing affordable and accessible for "all" social groups. However, this is now changing. Sweden is one country where the equality gap is widening the most, the housing shortage is acknowledged as an urgent issue, and both social and structural homelessness are growing. Sweden is also known for being a forerunner in sustainability policy. Therefore, this paper aims to give further understanding of the development of Sweden as a green welfare state, by exploring policy assemblages in housing and sustainability policy. This is explored by reviewing Swedish housing and urban sustainability policy since the publication of the Brundtland report in 1987. This paper will show how the discourses of affordable and sustainable housing relate to each other while being developed in parallel. Despite the holistic understanding of sustainable development, the expected outcome of the analysis is that, so far, the Swedish welfare ideal is crumbling while the sustainability discourse become stronger.

The Ambiguous Entity Of Housing Affordability – An Analysis Of Housing Affordability Definitions In The Finnish Housing Policy

Elina Sutela

University of Turku, Finland

Housing affordability is a global urban policy concern, and there is a consensus that affordability should be promoted to ensure housing rights for all. However, the definition of affordability – and thereby suggested policies – remains somewhat contradictory and ambiguous as academics from different disciplines, policymakers, and practitioners approach the concept from various viewpoints. Confusion leads to misunderstandings and complicates discussions over targets and policies. Furthermore, different approaches often have implicit political-ideological underpinnings. Finland is one of those countries where confusion over definitions leads to problems and conflicts in preparing, monitoring, and implementing housing policy. Using Finland as a case study, I analyse affordability definitions and

1134

illustrate the consequences of conceptual ambiguities in housing policy implementation. The thematic content analysis is based on legislation, policy documents and expert interviews. The main contribution of the paper is introducing a novel theoretical framework identifying three approaches to defining affordability: normative definitions, consumer choice and definition by housing tenure. The results show that normative definitions – which consider affordability as an intersection of household income, housing costs and housing standards – are recognised, but not treated as policy objectives. The main aim of the housing policy – to increase housing supply to support a balanced market – implies that the housing question is primarily to be resolved by the market, and that affordability is therefore defined by consumer choice. Social rental housing is often explicitly described as "affordable". However, limiting the issue to one tenure is problematic, and the conflation of "affordable housing" and "housing affordability" leads to confusion between policy objectives and their implementation. My paper for the Summer School is a combination of the integrative chapter of my doctoral thesis (unpublished) and a research paper published originally in Finnish. I also present a plan how to expand the original article into an international comparison analysing the definitions of affordability in different European countries. I have not participated in the ESA Summer School before, and I am in the final stages of my PhD.

The Rise and Fall of Toronto High-Rises: Normalizing Abandonment as the Common Sense

1135

Elham Akbari

York University, Canada

Abandonment is often associated with decaying and deserted structures, yet Toronto's residential landscape tells a different story. Magic hands at play conceal dying processes behind pale concrete walls and normalize gentrification, segregation, and spatial inequalities within shimmering skylines of all-glass high-rises by the spell of profit and progress. Amidst Canada's escalating housing crisis, scarcity of affordable spaces, and the post – COVID-19 speculative bubble; I explore the integration of everyday processes that prioritize profitability (home as an asset) at the expense of disposing livability (home as a shelter) as the common sense. The first section tells a tale of two life-worlds: a stigmatized story of decay in post-war suburban towers with worn-out rentals, racialized poverty, and crime, alongside a trendy narrative of condo boom with massive gentrification, displacement, ever-shrinking unit sizes, short-term rentals, and speculative vacancies. Building upon the literature that juxtaposes condofication and post-war social housing revitalization in Toronto, I identify a dynamic nexus of physical, financial, and functional abandonment processes across both high-rises and argue that abandonment is a multi-dimensional and dynamic process of transformation beyond the final and static state of vacancy. The next section offers a theoretical review focusing on political economy views, assemblage thinking, and feminist perspectives to conceptualize abandonment processes. Consequently, I highlight shortcomings of structurally deterministic interpretation of political economy emphasizing a need to analyze macro processes and micro interactions from a multi-scalar and relational perspective. This approach reveals the silent role of material objects, affective power dynamics, and marginalized subject-positions that shape evolving forms of abandonment and are shaped by them.

RN37 | T03_02: Urban Transformations: Between New Opportunities and New Inequalities

Urban Regeneration and New Forms of Spatial Inequalities in Southern Italy.

Monica Musolino

University of Messina, Italy

Starting with the Fascist regime's reconstruction following the devastating earthquake of 1908, the city of Messina became a laboratory for the experimentation of a class division of urban space. Subsequent urban policies consolidated these processes of marginalisation, segregation and stigmatisation. The more recent regeneration interventions have further contributed to transforming some areas (some shantytowns) into a veritable laboratory of urban change. Given these premises, the presentation focused on the analysis of a specific area, that is a former slum at the centre of urban regeneration policies, with the aim of showing the contradictory and, to some extent, unpredictable outcomes associated with the emergence of new forms of spatial marginalisation. The data and cases to be discussed are part of a ten-year field research carried out through a mainly qualitative methodology and in an action-research perspective. We will show the socio-spatial effects, still in the making, of multiple historical, economic and cultural tensions: memorial traces of the outsider art, interventions against poverty (i.e. social cohousing), rapid settlement of large-scale distribution and international brands, maintenance of a popular residential presence and the occupation of dilapidated buildings by new families in a housing emergency, development of a mobility hub. The main results of the research show that if, on the one hand, this overlapping of functions has contributed to restoring a new centrality to the area, on the other hand, it has laid the foundations for new forms of spatial inequality, which appear of great interest for a possible comparison with similar cases in other European countries.

Lost places or Spaces of Possibilities? Inhabitants' Experiences of Urban Voids in Shrinking Cities

Bettina Knoop

TU Dresden (IHI Zittau), Germany

Urban voids, defined as abandoned or underutilized spaces within the urban fabric, are often acknowledged as sites of potential and possibilities in contexts of urban growth. However, the perception of these spaces shifts significantly in shrinking cities, where they are commonly regarded as symbols of failure and burdens for city development. Both perspectives are primarily influenced by economic valuations. Drawing on seminal works such as "Terrain Vague" by Ignasi de Solà-Morales and related concepts emphasizing the social potentiality of abandoned spaces, this presentation explores the dichotomy in perceptions of urban voids from the perspective of local actors in shrinking contexts.

Walking interviews with inhabitants of the shrunken Eastern German city of Görlitz provide insights into perceptions and everyday experiences with urban voids. In contrast to the negative narratives around shrinking cities and vacant spaces within them, the results indicate that notions of potentiality prominently shape perceptions. However, the interviews also reveal that legal, institutional, physical, and financial constraints commonly impede the appropriation of urban voids and thus the realization of potentials for action identified by local actors. As those potentials fail to materialize, the prevalent image of urban voids as symbols of failure is perpetuated.

The presentation concludes by proposing that facilitating access to urban voids for actors in shrinking cities could catalyze local dynamics and bottom-up transformation processes that are not primarily growth-driven but instead focused on increasing agency, place attachment, and ultimately, the quality of life in shrinking cities. By examining urban voids from the perspective of inhabitants, this research contributes to a nuanced understanding of the complex dynamics surrounding these spaces, offering a pathway for positive transformations in shrinking urban environments.

1136

Accumulation by dispossession as a state project – "Garinim Toranim" and their Effect on Development Towns in the South of Israel

Reut Reina Bendrihem[1], Sigal Nagar Ron[2]

1The Open University and Sapir college, Israel; 2Sapir college,Israel

Processes of urban change based on accumulation by dispossession, need to be understood in their local context. Although many argue that these processes are solely done according to economic principles, we claim that the dispossession from the city led by state logic, sponsored by the stat and acted by its sub-agents. We will demonstrate this through a case study from southern Israel: Since the Israeli government evacuated settlements in the Gaza Strip in 2005, many of the religious Jewish residents' have moved to live in development towns in southern Israe, as Garin Torahani. The Garin Torahani (or Tora side) are religious Zionist movement families organized as NGO. The settlement of the Garinim Toranim in the periphery is a kind of religious entrepreneurial project that has two main goals. The first is "sanctification" of the space. That is, settling the space and making it a Jewish space. One task is directed against the non-Jewish population. The second goal is acculturation, which aims to "re-educate" the local Jewish residents by spreading Torah content. This task is mainly directed toward the secular, Jewish population. In order

to disseminate this ideology, there is a need for resources. And, indeed, "the garinim" have acquired numerous public resources, such as public housing, buildings for schools, and governmental budgets for their activities. The Garinim Toranim settlement and their establishment in the towns create an effect of accumulation by dispossession that excluded the veteran residents, mainly Bedouins and Mizrahim (African-Asian descendants), who are excluded once again, and pushed to the societal, economic, and political margins of Israeli society.

RN37 | T03_03: Socio-Spatial Dynamics at the Neighbourhood Level B

Interethnic Contact and Community Cohesion in European Ethnically Diverse Neighborhoods

Rui Carvalho

Brown University, United States of America

European countries have been receiving growing numbers of international migrants in the last decades. This inspired several studies examining the effects of migration-driven ethnic diversity for the livelihoods and cohesion of European neighborhoods. Overall, these studies have found a negative association between migration-driven diversity and cohesion. However, some works have shown that these negative effects are moderated by the quality of social (mainly interethnic, i.e. migrant-autochthonous) contacts among neighbors. But these works usually consider just one dimension of cohesion (trust), and measure interethnic contact as casual (weak) interactions. I add to this scholarship by uncovering what types of interethnic contact (strong ties, weak ties, conflictual relations; organizationally-driven ties) affect which dimensions (sense of belonging, solidarities, safety, civic participation) of community cohesion. I utilize data from a survey applied to the migrant and autochthonous dwellers of eighteen multiethnic neighborhoods in six European cities (Bilbao, Spain; Lisbon, Portugal; Rotterdam, Netherlands; Thessaloniki, Greece; Vienna, Austria; Warsaw, Poland). I find that: (a) weak interethnic ties are positively associated with stronger neighborhood belonging, but have no impact on other dimensions of cohesion; (b) strong interethnic ties are positive for all dimensions of cohesion; (c) negative interethnic ties are associated with lower neighborhood belonging, but do not affect other dimensions of cohesion; (d) the effects of strong interethnic ties for cohesion vary mostly across sociodemographic features, while the effects of weak ties depend mainly on one's practices; (e) only local organizations that foster both civic participation and interethnic contact have a positive effect for community cohesion.

1137

Neighbourhood effect. Considerations from the Moving to Opportunity experiment

Marco Castrignano[1], Carolina Mudan Marelli[2]

1University of Bologna, Italy; 2University of Bologna, Italy

The cultural and political influence of the theories on poverty concentration and neighbourhood effects in the United States is widely recognised in the American sociological literature, but is still little discussed in a scientific context such as the Italian one, although it is also manifested more

or less consciously in some political approaches and pro-grammes in our country. With the aim of contributing to triggering a debate in our disciplinary sphere as well, this contribution focuses on the largest experiment in geo-graphical and social mobility based on theories of concen-tration and neighbourhood effects, the Moving to Oppor-tunity, in an attempt to initiate a critical reflection on the implications of the concept of poverty concentration and the neighbourhood effect when these are translated into policies and programmes.

Urban Regeneration, Gentrification and Tourism in Vulnerable Neighbourhoods. The case of El Cabanyal – Canyamelar in Valencia

Álvaro Mazorra, Juan José Villalón

Universidad Nacional de Educación a Distancia (UNED), Spain

This study examines the processes of gentrification that have occurred in the El Cabanyal-Canyamelar neighbour-hood, a historically degraded and vulnerable area in the city of Valencia, Spain. Employing a mixed methodology approach, the research involves the analysis of statistical data, the development of semi-structured interviews as the primary technique for qualitative research, and a historio-graphical review of Valencia. The study aims to identify and describe the fundamental causes and effects of these trends on the social and urban structure of the zone. Additionally, it focuses on exposing and analysing the main experiences and discourses created by the key agents associated with the neighbourhood in relation to its transformation.

Within this context, the results indicate that, whiles the challenges addressed during the environmental regener-ation have impacted fundamentally issues related to the urban regeneration of the space, there has been an ex-traordinary slowdown in addressing questions closely tied to the degradation of social relations. As a result of this dy-namic, the rehabilitation of the neighbourhood has encour-aged the emergence of new gentrification and touristifica-tion trends, leading to the displacement of disadvantaged groups that once resided in the area.

Racialized Perceptions of Place and Lending Risk: A Historic Investigation of Institutionalized Racism in Chicago

Megan Evans

Max Planck Institute for Demographic Research, Germany

While the racial consequences of Home Owners' Loan Cor-poration (HOLC) residential security maps are clear, how HOLC appraisers perceived the neighborhoods they were assessing through the prism of race is less understood. By investigating the written descriptions and language deci-sions HOLC appraisers made when discussing the neighbor-hoods they chose to redline, this study interrogates how discourse on the presence of Black residents was relevant in decisions on lending risk, i.e., redlining, in Chicago. Using a mixed-method approach, including computational text analysis, content analysis, and geospatial analytic tech-niques, this study finds the discussion of Black residents in neighborhood area descriptions was a better predictor of lending risk than the observed Black racial composition. Analyses indicate it was not simply the physical presence of Black residents within a neighborhood that mattered, but whether spatial proximity to nearby Black neighborhoods was indicative of future neighborhood turnover and sub-sequent decline. Findings provide insights into the social process through which the racialization of lending risk oc-curred, identifying the language used in service of preserv-ing neighborhood racial identities. The results suggest that the prism of race is a longstanding feature of Chicago's res-idential landscape, influencing how housing market actors perceive and interact with the urban environment.

1138

RN37 | T04_01: Socio-Spatial Segregation A

Forms of School Segregation? An Exploration of Students' Allocation Between and Within Lower Secondary Schools in Italy

Debora Mantovani[1], Federica Santangelo[1], Giancarlo Gasperoni[1], Emanuele Murgolo[2]

1Alma Mater Studiorum-Università di Bologna; 2Pompeu Fabra University

The paper analyses the distribution of students between schools and classes in lower secondary schools in a set of Italian municipalities, identifies the characteristics of students/families and schools associated with these two phenomena, develops a typology of schools based on the relationship between school size and catchment area and on the incidence of disadvantaged and/or foreign-origin students.

Italian municipal administrations associate each residential address with a specific public educational institution in order to facilitate the distribution of students between schools. School basins' purpose is to guide students and families in deciding which school to attend, without constraining their educational choice. In such a context, school segregation may be at play.

The data used in the analyses refer to students enrolled in the last year of secondary school in the school year 2014/15 and include the addresses of students' homes, attended schools and all other schools located in the same municipality. The data also include student-related information: students' migration status, gender, parents' level of education, scores achieved on national standardized tests in Italian and mathematics , and other socio-demographic characteristics.

Preliminary findings suggest that, although residential segregation is weak, some forms of between-school segregation are detectable. Students with advantaged and/or native parents residing in poor areas are more likely to avoid schools with high concentrations of disadvantaged and/or foreign-origin students. An uneven allocation of disadvantaged and/or foreign-origin students is also detectable "within" schools.

Socio-territorial Analysis Of School Dropout And Educational Poverty (Erasmus Plus Project). Catania As Case Study

Licia Lipari[1], Carlo Colloca[2], Valentina Pantaleo[3]

1University of Catania, Italy; 2University of Catania, Italy; 3University of Catania, Italy

The essay put forwards an empirical study on the dropping out of school and educational poverty

as part of an Erasmus Plus project. Both phenomena are closely linked. The incidence of social, cultural, and economic poverty all influences a child's educational attainment, along with socio-territorial characteristics, families of origin and social networks. Understandings of the phenomenon of dropping out of school is one of the most urgent policy and practice issues, as increasingly numbers of young people fail to complete their secondary schooling, especially after the COVID-19 pandemic. Furthermore, this is an important aspect to reduce the growing spatial forms of inequality in our cities.

In Italy, Catania is an interesting case study as it stands out for its high degree of social and material vulnerability and for a significant rate of school dropout.

We present the main results of research carried out between 2023 and still ongoing. The research is divided into two parts. The first concerns the socio-territorial analysis of the city of Catania to map the distribution of socio-economic fragility in the different neighborhoods. A secondary analysis is carried out on different databases of the National Institute of Statistics with Geographic Information System. The second part is the result of questionnaires administered to students at some high schools in Catania and their parents and it concerns the analysis of the main factors that influence school dropout: socio-demographic condition of the children's families of origin; the context in which they live; the way they spend their daily lives.

Intergenerational Inequalities in Neighborhood Income Across the Birth Cohorts from 1950s to 1970s in Finland

Aleksi Karhula, Hannu Lehti

University of Turku, Finland

The neighborhood context is transmitted from one generation to the next resulting in intergenerational inequalities. This relates to the more general transmission of economic and cultural resources in a society. Despite recognizing this influence, gaps persist in understanding the comprehensive origins impact on adult neighborhood contexts. Even more pronouncedly this is the case regarding the strength

of transmission in relation to interplay of social and genetic origins – an approach that has recently gained attention in the sociological studies of intergenerational inequalities. It is clear that social origins affect neighborhood selection through unequal distribution of economic possibilities and intergenerational transmission of cultural norms. However, interplay between social origins and genetics is as well likely to play a role in the transmission relating for example to inheritance of personality traits affecting housing decisions. It is important to study both factors to cover origins influences in full extent.

This study employs twin models to elucidate the considerable influence of social and genetic origins on adulthood neighborhood attainment. Neighborhood attainment is measured through ranked median neighborhood incomes in economic regions. The analysis explores variations across age groups and birth cohorts spanning from the 1930s to the 1990s. Additionally, two pivotal transmission mechanisms are investigated: childhood neighborhood environment and adulthood income. Preliminary results show significant impact of origins that is not mediated by the income in adulthood indicating some other mechanisms of transmission besides economic resources. In the study, we further uncover the roots of socioeconomic segregation and delineating intergenerational inequalities linked to neighborhood context.

Educational Landscapes and Exploded Urbanism: A Comparative Study of Timișoara and Cluj, Romania"

Norbert Petrovici[1,2], Vlad Alexe[1], Cristian Pop[1,3]

1Babes-Bolyai University, Romania; 2Bucharest University of Economic Studies; 3Romanian Academy

In Romania, the educational system, originally designed for inclusivity, faces a paradox: it is affected by segregation influenced by urban dynamics. This study investigates this contradiction in the cities of Timișoara and Cluj. We examine how residential patterns, school placements, and parental choices – often bypassing district regulations with temporary addresses – contribute to educational segregation, a trend particularly pronounced in larger cities of Romania. Our research utilizes spatial regression analysis to probe these trends within the context of "exploded urbanism" (Petrovici, et al., 2023), a concept describing the demographic shift from core to periurban areas that lack social amenities.

Building on Boterman's (2019) concept of "educational landscape," our study shows how school segregation both mirrors and intensifies spatial inequalities under "exploded urbanism". We conduct a spatial regression analysis using lag models to identify the factors influencing the size of educational institutions in Timișoara and Cluj. The research integrates demographic, socioeconomic, and educational factors to shed light on the urban dynamics affecting the pupil-to-school ratio in these cities.

Our findings indicate a significant impact of the residential population within the school's area, local employment opportunities, and the prestige of schools on student enrolment. We consider variables such as the school-age population, workforce demographics, and school prestige. The study also emphasizes the role of parental choice, particularly among the middle class, in school selection and its implications for educational segregation. Our analysis uncovers an intricate relationship between the educational landscape and urban inequalities, emphasizing the role of economic geography in the context of exploded urbanism in perpetuating educational segregation.

1140

RN37 | T04_02: The Right to the City Today

Urbanidades Comestíveis – Uma Aproximação às Paisagens Alimentares Urbanas e Sua Relação Com o Espaço-tempo Social Produzido em Três Territórios do Rio de Janeiro

Mónica Guerra Rocha[1], Carlos Fortuna[2]

1Centro de Estudos Sociais | Faculdade de Economia – Universidade de Coimbra, Portugal; 2Centro de estudos Sociais – Universidade de Coimbra, Portugal

Comer constitui um ato sociológico enraizado nas práticas cotidianas dos sujeitos.

O sistema alimentar é estruturado a partir de condicionantes materiais, simbólicas, culturais e políticas e da mesma forma que configura relações entre os sujeitos (espaço social alimentar) e destes com os espaços (sitopias).

As relações estabelecidas entre sujeitos, territórios e comida, no espaço, ao longo do tempo, compõem paisagens alimentares. As paisagens alimentares são assim produto dos processos de produção do espaço-tempo social enraizados nos cotidianos e nas dinâmicas compartilhadas da cidade. O comer urbano localizado constitui um fato social na medida em que resulta de um conjunto de fatores sociais generalizados, externos e coercitivos que determinam o que se come, onde, quando, de que forma.

Nesta comunicação busca-se, a partir de uma revisão de literatura, investigar elementos estruturantes das paisagens alimentares de três territórios diversos da cidade do Rio de Janeiro e interrogar os processos da sua produção. São identificadas temporalidades, territorialidades e convivialidades produzidas a partir da relação entre sujeitos-comida-territórios.

Perante uma cidade-mosaico de diversidades, produzida e reproduzida a partir da composição de paisagens profundamente desiguais, resultado de um longo palimpsesto histórico de violência e segregação, operacionaliza-se a paisagem alimentar enquanto dispositivo para uma aproximação a invisibilidades e dialéticas existentes na produção/reprodução de urbanidades e no reconhecimento da disputa cotidiana pelo direito à cidade.

The Right To The Creative City: Interdependencies In Cultural Ecosystems

Marianna d'Ovidio

Dept. of sociology and social research – Università Milano Bicocca, Italy

The paper discusses the concept of interdependencies in the cultural ecology, as a theoretical tool that allows shedding new light on emerging inequalities and power tensions in urban areas and regions. The ultimate aim of the paper is to offer a theoretical lens that can be useful to explore socio-economic inequalities, connected to agencies of cultural workers, and, ultimately, contribute to a discussion about the right to the (creative) city in a (post) crisis context.

Notably, "the arts and cultural ecology" is defined by Markusen et al. as the complex interdependencies that shape the demand for and production of arts and cultural offerings. More recently, the concept of cultural ecosystem has been employed by many authors with the aim of recognising the interplay of all the subjects that are involved in cultural production, offering and consumption, without reifying conceptual boundaries between groups.

The paper mobilises the idea of interdependences to analyse the power tensions in three very different realms of cultural production: the contemporary art system in Milan, the fashion industry in Italy, the culture production in Lombardy. In each of these areas, the paper explores interdependences between territorialised subsystems that rarely have been observed together: independent spaces for contemporary art and art institutions, symbolic and material production in the fashion industry and the digital and the physical space for culture.

It will be shown that the concept of interdependence allows observing power tensions between actors starting from the exploration of available resources, negotiation mechanisms, conflicts, cooperation and interactions embedded in specific urban contexts.

Living Solidarity – Tenant Organizing as a Means to Tackle Social Divisions and Addressing Racism in Urban Communities

Raoul Nozon, Peter Bescherer, Josephine Garitz, Lukas Leslie

Jena University, Germany

In the face of escalating housing market financialization, rising rental and utility costs, and increased urban precarity, particularly impacting lower-income households, urban residents grapple with intensifying challenges. These issues are exacerbated by the surge in right-wing movements in Europe and the United States. Concurrently, housing movements and tenants' unions are organizing communities to

confront shared struggles for housing equity, exemplified by Berlin's "DW Enteignen" campaign.

Our study examines such organizing initiatives, focusing on two community projects situated in Berlin and an East German city, addressing housing challenges within their respective neighbourhoods. We are interested in the emergence of solidarity within such movements: How do housing movements grapple with issues of racism and other forms of discrimination within their own ranks? And what role does organizing as a strategic practice of building and nurturing tenants' networks play in surmounting prevailing tensions?

Our research is guided by the premise that social divisions cannot be overcome by logical arguments alone. Tenant organizing approaches – when imbued with the ambition of building solidarity amongst *all* affected tenants and empowering those affected by discrimination – have the potential to address the social context in which racism emerges and unite tenants around a shared goal.

Seeking to directly engage with tenant organizing projects, we employ methods of reconstructive social research ranging from qualitative interviews and ethnography to activist research. Our focus lies on directly engaging with the first-hand experiences of organized tenants, seeking to understand the interpretative frameworks that shape their understanding of precarious living conditions.

The Rich and the City: A Situated Intersectional Analysis on High-Income Urban Experiences in Barcelona

Belén Masi

Universitat Pompeu Fabra (Barcelona), Spain

The right to the city is a key concept in urban studies, widely addressed, reinterpreted, and redefined over time. However, the exploration of what occurs with privileged individuals who enjoy this right and can inhabit, utilize, circulate, and transform the city without significant barriers is a less investigated question. Barcelona is a cosmopolitan and diverse city, yet simultaneously exclusive and segregated, where migration has drastically modified both ends of social stratification. Specifically, skilled migration and its integration into the upper classes have impacted the urban fabric and the appropriation of the city, necessitating a redefinition of urban phenomena such as residential segregation and gentrification, among others. A profound understanding of this phenomenon requires adopting an intersectional perspective (Crenshaw, 1991), moreover a situated intersectionality sensitive to geographical, social, and temporal locations perspective (Yuval-Davis, 2015) with a focus on privilege (Ahmed, 2007).

The present research explores the urban experience of high-income individuals in Barcelona, taking into account how class, race/ethnicity, and gender shape this experience and concurrently influence and mutually constitute each other. It employs the Relief Maps methodology (Rodó-Zárate, 2014) as a tool for studying intersectional inequalities, that captures experiences in three dimensions: social (gender, race/ethnicity/origin, class, age, disability, etc.), geographical (spaces), and psychological (emotions). The findings contribute to ongoing discussions on urban studies, intersectionality, privilege, and the multifaceted nature of the right to the city, enriching our understanding of how the privileged and the urban environment mutually shape each other

1142

RN37 | T04_03: Digital Challenges in the City

Unexpected Urban Inclusions: Newcomers and the Hybridization of Space Over Time

Nerea Viana Alzola

University of Geneva, Switzerland

Cities embody dissonances that have the potential to trigger tensions. Furthermore, the emergence of new forms of nationalism and authoritarianism poses significant threats to the inclusivity of urban contexts.

Sociology can contribute to understanding such challenges by acknowledging transformations across time, such as the digitalization experienced by ordinary people in cities since the late 20th century. While sociologists have extensively investigated the phenomenon of digitalization, the multifaceted dimension of inclusion has received comparatively less attention. How does the inclusion of newcomers in cities manifest unexpectedly across macro, meso, and micro levels? What does the multi-level analysis over time reveal about this concept?

This research introduces a 'hybrid inclusion' conceptual framework, developed through sociologically oriented, multi-situated ethnographies in Geneva and Hamamatsu. Exhibiting distinct socio-historical configurations, both cities present some similarities. At the macro level, they promote an ideal of inclusion rooted in diversity and international networks, shaping their policies and visions. At the meso and micro levels, the study reveals an ambivalent disconnection between this ideal and everyday practices. Inclusion manifests in unexpected and hybrid forms, bridging the past and the present, the physical and the digital configurations of space.

During the conference, I will present how the observations from my doctoral research have influenced this framework on inclusion. I will focus on its relation to global and local influences, online and offline practices, and time. Considering urban digitalization as a complex catalyst, my aim is to actively contribute to the sociological discourse on shaping future cities that are more open and inclusive for all.

An urban scenario of inequality: Digital and Spatial segregation in Madrid.

Pedro Uceda Navas, Margarita Barañano Cid

Complutense University of Madrid, Spain

This article seeks to demonstrate, through a quantitative analysis, the relationship between spatial segregation and digital disconnection in the different districts of Madrid. In the recent decades there has been Growth of socio-spatial inequality, due to neoliberal dynamics, which are concentrated even more in large urban áreas, which is why the hypothesis of this work is that there is an unequal relationship in the districts of the city of Madrid of digital uses that coincides with the disadvantaged and most vulnerable areas of the city. The relevance of this article lies in the lack of studies that carry out the relationship between Internet use and spatial segregation in the city, especially at the infra-municipal level.

To analyze this concept of digital divide, variables have been used socioeconomic, educational, and gender, mainly; and has been put in relation to the spatial distribution of Internet uses, extracted from the National Institute of Statistics of Spain.

The results show that, in the city of Madrid, digital connection and uses are unevenly represented in the different districts. The privileged spaces in the city center have a greater intensity of digital uses, while in the disadvantaged areas of the city, located on the periphery, the Internet is used with less intensity. These results are linked to the level of education or the greater presence of the immigrant or elderly population.

Urban Digital Twins as Incipient Regimes of Visibility: Evidence from Rotterdam and The Hague.

Thomas Swerts[1], Carola van Eijk[2], Isa Sanchez Cecilia[1], Achilleas Psyllidis[3], Roy Bendor[3]

1143

1Erasmus University Rotterdam; 2Leiden University; 3Delft University of Technology

Advances in digital technologies are transforming how European cities are managed, planned and governed. Urban Digital Twins (UDTs), or technologies aimed at virtually replicating cities, are hailed for their potential to enhance the efficiency of management processes. Cities across Europe increasingly invest in digital infrastructures like UDTs in the expectation that such technologies enable us to see, experience and interact with the urban environment in new and exciting ways.

Scholarly attempts to grasp the significance of this emerging phenomenon are hampered by technical determinism and techno-optimism. Existing literature on UDTs tends to overly focus on definitional questions while offering a rather descriptive account of applications that ignores potential tensions or conflicts. In this paper, we circumvent these pitfalls by combining insights from urban sociology, science and technology studies and public administration to shed new light on UDTs as 'incipient regimes of visibility'.

By tracing the development of UDTs in Rotterdam and The Hague, we investigate how UDTs constitute a virtual order of things that determines which urban processes, spaces, experiences, and communities 'count' – or are left unaccounted for – in the digital representation of city life. Based on extensive qualitative research, we show that the meaning of UDTs is volatile and context-dependent, that technological and socio-technological challenges hamper their development and implementation, and that bureaucrats' internal and external expectations diverge. Extending the lessons learned, we argue that UDTs are still ambiguous

as incipient regimes of visibility and that 'future thinking' about UDTs need to coincide with critical thinking about questions of inclusivity and participation.

A Sociological Exploration of Technological Solutions and Inclusivity in AGH University

Karolina Rożek

AGH University of Science and Technology, Poland

This presentation disseminates research results on the University's infrastructure needs, conducted from February to July 2024 by a student team as part of the AGH Rector's Grant Award. Utilizing diverse qualitative methods and conducting a comparative analysis of smart campuses, the research aims to delve deeper into the matter from a sociological perspective, understanding the contemporary academic community's needs. The outcomes of the previous grant, centered around smart city initiatives and campus research, highlighted the necessity for revising technological solutions within the university. Focusing on inequalities in access to technology and digital skills, the study employs surveys and interviews among students, faculty, and administrative staff to identify discrepancies in technology access and digital skill levels. It includes an examination of institutional policies aimed at addressing digital inequalities and explores how these policies are perceived within the academic community.

Within the framework of Science, Technology, and Society (STS), the study explores how academic communities interpret and shape technological innovations, scrutinizing their influence on social inequalities and digital exclusion. The presentation emphasizes the intriguing observation of how the academic community, wielding influence in shaping technological innovations, translates proposed principles into implementation. This observation gains added significance given AGH University of Science and Technology's role as a technical institution fostering numerous innovations within its walls.

The aim of this presentation is to contribute valuable insights and recommendations for refining technological solutions within academic settings, promoting inclusivity, and enhancing the overall quality of education.

RN37 | T04_04: No City for Young People? Youth Urban Issues

Rhythmanalysis of Freight Graffiti in the edgelands of the Port of Rostock

Johannes Diesing

Justus-Liebig-Universität, Germany

The arcticle provides a rhythmanalysis of illegal graffiti on freight trains in the area of the Port of Rostock and its surrounding. The rhythmanalysis according to Henri Lefebvre shows how subcultural practice of illegal spraypainting graffiti on freight trains clings to different timings of linear social times of the harbour and thereby identifies and spatially and temporarily occupies niches in the edgeland zone. This analysis of the timing of the sea port and thereof adjusted timings of spraying graffiti is conducted by methods of ethnographic fieldwork and a comprehensive collection of data from the Port of Rostock.

Much Ado About Sweden – Untangling the Obscure Travels of Concepts "Street Gang" and "Gangsta Culture" into Finnish Policy Doxa

1144

Elina Sutela, Erica Åberg

University of Turku, Finland

The aftermath of the COVID pandemic brought forth a new challenge in many cities: increased restlessness of urban youth and rise in youth violence. In Finland, increases in urban youth crime resulted in an extensive public debate around youth gang culture. To describe these emerging activities, journalists and politicians adopted two concepts new to the Finnish context: "street gang" and "gangsta culture". However, their exact definitions remain ambiguous, and they are attached with a bundle of implicit assumptions conceivably ill-fitting to Finland. As Maloutas (2013) has argued, not all concepts travel well from one context to another, and a prerequisite for mobile concepts is high-level of abstraction. We argue neither "street gang" or "gangsta culture" can be considered such universal concepts, and without proper decontextualisation, their journeys carry a risk of ignoring national specificities. Moreover, as shown by Slater (2018), concepts used by journalists and politicians have powerful political implications that can eventually translate into policy doxa. Using the Finnish public discourse as a case study, and building on Maloutas (2013) and Slater (2018), we analyse how and to what extent these two concepts can travel between urban contexts, and the symbolic power attached to them. We claim these concepts originated from British popular culture and

Anglo-American gang studies and their path to Finnish public discourse was heavily influenced by recent acceleration of armed gang violence in Sweden. Finally, we reflect on whether obscure usage of these concepts overemphasise securitisation of urban space and stigmatise and target ethnic minority youth.

Love Your Neighbourhood and Leave It. How Welfare Professionals Reproduce Cross-Pressure and Marginalize Youth in a Disadvantaged Helsinki Neighborhood.

Lotta Maria Junnilainen

University of Helsinki, Finland

Urban scholars have long observed that citizens´ experiences of living in disadvantaged, marginalized neighborhoods are often complex and ambivalent: a place called home is both "good" and "bad", a source of social support and stigma. Drawing on five-year ethnographic research in Steephill, a neighbourhood in Helsinki, Finland, my paper presents how this cross-pressure gets reinforced on behalf of welfare professionals, who aim to promote the local youth and their opportunities. As teachers, youth workers and other policy practitioners translate current urban policies and ideals of good citizenship into mundane everyday practices, they end up pulling the local youth in opposite directions: toward their neighborhood and away from it. On the one hand, they work hard to produce communitarian citizens, who are community-minded, participate locally and feel attached to their "home area". On the other hand, they promote citizenship that is self-reliant and autonomous, framing the area as a "risk environment" the young people would be wise to leave behind them. The article argues that engagement in these contradictory practices of "attaching-work" and "detaching-work" reproduces cross-pressure the young people already struggle with, and on that account, deepens their marginalized position. It further suggests that cross-pressure should not be understood as emerging from within the neighborhoods only, but relationally in interaction with powerful others.

RN37 | T05_01: Present Challenges in Urban Housing: Policies, Market, Identity and Precarity C

Representations of a "Good Life" in the Post-socialist City: the Case of the New Housing Estates in Vilnius

Dalia Čiupailaitė-Višnevska

Vilnius university, Lithuania

Housing, as the primary component of the urban landscape, plays a significant role in shaping the opportunities, resources, and experiences of individuals and households within an urban context. Its location, spatial layout, and relations with other uses and places of the city facilitate specific 'spatial practices' (Lefebvre, 1991) of urban life. This presentation delves into an analysis of the marketing messages of the new residential complexes constructed in Vilnius, Lithuania, between 1990 and 2022, as a locus of the new urban identity in a city within a temporally and spatially post-socialist context. The post-2000 period of mass housing construction, without a centralized urban development and housing policy, has brought with it a commodification of production and distribution. These newly established estates have significantly altered the city's spatial structure and contribute to a narrative surrounding what defines a good life within a post-socialist city, along with how one's home and the city ought to be perceived and lived. In this research, I approach housing estates as narratives. Firstly, they serve as material narratives that facilitate the appropriate way to live in the new conditions. Secondly, they function as symbolical narratives, conveying stories propagated by real estate developers about a desirable life in a post-socialist city. The study revealed themes reflecting both continuity and discontinuity with socialist "space" (Lefebvre, 1991), cultural salience of the privatism principle (Hirt, 2012)), and highlighted increasing securitization of housing and rupture between the home, tailored to the new middle class, and the city as a shared space.

Housesharing in Spain. An Analysis of the Current Supply of Rooms

Nayla Fuster[1], Henar Baldán[2], Guadalupe Quintana[1], Francisco E. Cabrera[1]

1CISA, University of Málaga, Spain; 2University of Granada, Spain

Spain is usually considered as one of the countries in Western Europe with the highest number of homeowners, but after the economic crisis of 2007 and the bursting of the housing bubble, this is changing. Available statistics show that the number of young (and not so young) people living

1145

in rented accommodation has increased, and there are increasingly more non-traditional forms of cohabitation, such as sharing housing with friends or acquaintances. However, the current data do not allow us to analyze in depth the reality of the shared rooms for rent market in Spain. In this paper, our objective is to carry out an analysis of the rental situation of shared apartments in Spain. We present the main results of a research carried out using Big Data techniques; analyzing offers of shared apartments hosted on a website designed for this purpose. We have thousands of offers from the beginning of 2023 to the present. The data allows us to analyze key aspects such as price, size or location of the property. But also, more specific aspects such as the preference for one type of tenant or another (couples, smoker or not, male or female, with or without pets) and expected lifestyles (pre-established rules in terms of schedules or cleanliness).

Unravelling the Trajectories and Housing Experiences of the Brazilian Immigrant Communities in the City of Porto, Portugal

Catarina Figueiredo, Lígia Ferro

University of Porto, Portugal

The city of Porto has undergone intense social and urban transformations linked with the expansion of the processes of gentrification and touristification, which emerged alongside important changes in the housing market, and with the simultaneous substantial growth of the immigrant population, for which the arrival of Brazilian citizens in the city played a central role. In this context, a research was conducted to understanding the trajectories and housing experiences of Brazilian immigrants in the city of Porto. From a qualitative approach, centered on individual semi-structured interviews, it was possible to achieve a better understanding of these trajectories and experiences through the narratives of the immigrants involved. In this paper, we aim to present some of the findings of this research and to contribute to the discussion about the relations between contemporary migrations and urban housing.

Acknowledging the diversity of the Brazilian communities and the trends of its latest immigration wave to Portugal, it was possible to grasp the material and immaterial ways and conditions in which these immigrants live in the city. Through their trajectories and experiences, it was possible to understand the specific difficulties they encounter, as well as the social processes and arrangements built around them by the Brazilian communities, as well as the vital role of social networks in the definition and configuration of these trajectories and experiences. Social networks reveal the complex connections between the local social and urban context and wider transformations expressed in multiple scales.

The Symbolic Capital Of Housing: Theoretical Imagination And Empirical Realities in the Study of Lithuanian Cities

Tadas Šarūnas

Vilnius university, Lithuania

Recently sociologists working in realm of urban studies have received strong arguments to reapproach sociology of P.Bourdieu (L.Wacquant, 2023). Those following this path must engage in application of his concepts – such as social space and symbolic space – for analysis of urban phenomena. They also have to find ways how to link them with analysis of physical space of the studied cities. We already have some inspiring examples of how followers of such research programme could rethink historic specificities of their cases (Marom, 2014). We also have compelling evidence, that these concepts function well in quantitative analysis of symbolic load of urban locations (Rosenlund, 2017). But current operationalizations of housing capital often miss out on symbolic dimensions of housing, described by Bourdieu (Bourdieu, 2005).

This presentation will give a summary of previous attempts to operationalize symbolic capital of housing in urban locations. Through the case of Kaunas – a medium size city, which received a nomination of European capital of culture of the year 2022 – we will discuss challenges, that such operationalizations pose for building of a fully-fledged empirical case study. At the same time we will sum-up new opportunities, that integration of census and property register data provide for empiric analysis of housing capital. This process of data integration, which is taking place in Lithuania and most of the other European countries, provides us with a new source of affordable data. It expands our possibilities for empirical study of relationships between housing capital and urban developments.

1146

RN37 | T05_02: Urban Tourism: Actors, Activities, Impacts B

The Small Town Tourist Bubble – Tourism, local life, and rhythms

Allegra Celine Baumann[1], Claus Theodor Müller[2]

1TU Darmstadt, Germany; 2TU Berlin, Germany

Before the Covid-19 pandemic, overtourism was one of the main topics for tourist destinations, not only in cities, but also in rural areas. Local governments were searching for solutions to deal with tourism related problems and to solve conflicts between tourists and locals. However, it seems that some places bypassed most of the common overtourism problems due to their peculiarity: the existence of tourist bubbles. An ideal example is the famous German small town Rüdesheim am Rhein. While big cities like Venice or Barcelona were much discussed in the overtourism debate, small towns have not been in the focus of research yet. Rüdesheim has a long international tourist tradition, especially because of its wine production, and is well known for the street 'Drosselgasse', where tourist restaurants and wine shops are located, and which forms, following our argumentation, a tourist bubble.

Based on stakeholder interviews, statistical data, and the analysis of local policy and media, we argue that the old town of Rüdesheim represents a tourist bubble, which is rarely frequented by residents, allowing it to be staged as a disneyfied showcase for German tradition, local food and, especially alcoholic, beverages. Businesses in the narrow alleyways of the old town, are heavily dependent on the different temporal rhythms of tourism, not only the tourist season, but also the schedules of river cruise ships. Hence, tourist and local life in Rüdesheim is spatially and temporally separated, which leaves less space for conflict, but also for contact between locals and tourists.

Social Innovation in Tourism: a Two-level Systematic Literature Review

Olga Tzatzadaki, Maurizio Busacca

University Ca'Foscari of Venice, Italy

In recent years, 'social innovation in tourism' (SIT) has emerged as a key topic in studies on tourism innovation. However, a comprehensive systematization by a literature review is yet to be proposed. This paper aims to fill this gap by presenting the findings of a systematic literature review which selected 65 articles and conference proceedings from Scopus and WOS. The analysis, conducted at two levels, examined, in the first-level analysis, the temporal, geographical, and thematic placement of the papers, while in the second-level one, the focus was to identify the social needs and target groups related to SI, ecosystems and actor networks involved in their production, and, finally, local governance.

At the first level, the results indicate that i) the discourse on SIT follows the general discourse on SI, but intensifies in conjunction with shock events affecting the tourism sector, such as Covid-19, and ii) the debate is more intense in countries with a significant tourism economy, but the case-studies are characterized by undertourism or by spatial conflicts. At the second level, the analysis reveals that a) SI initiatives primarily address employment and income needs, viewing tourism as a sector for job placement; b) the quality of the tourist experience and the quality of relationships with the local context are key strategies for achieving these outcomes through win-win strategies for tourists and the local community; c) the focus is on finding solutions for the development of the tourism sector rather than addressing the economic and social problems created by tourism; d) there is a significant emphasis on the local community, but without specifying the power and interest relationships among community members, turning it into rhetoric.

Instrumentalization of Light Festivals by Portuguese Municipalities: An Ethnographic Perspective (2015-2023)

1147

Manuel Garcia-Ruiz

Instituto Universitário de Lisboa (ISCTE), Centro de Investigações e Estudos em Sociologia, Portugal

Over the past decade, light festivals have become significant cultural events in Portuguese cities, serving as a distinct platform for artistic expression and urban entertainment. This study delves into how Portuguese municipalities have harnessed these festivals, exploring their transformation into instruments for urban development, tourism promotion, and the stimulation of nighttime economies.

This work is a critical analysis of how cultural practices can be co-opted by economic and political interests, more focused on economic development, city branding, and express night-time touristification.

The methodology used was a multi-sited ethnography conducted in Cascais and Loulé from 2015 to 2023. This included semi-structured interviews, online mapping, and documentary analysis. Such an approach enabled a comprehensive understanding of the phenomenon from the viewpoints of organizers, promoters, entrepreneurs, participants, and local residents.

The findings of this study are significant, indicating that the commodification of these festivals is linked to the ongoing financial instability and precariousness faced by organizers, as well as to disputes of interest by local governments, which end in a power imbalance. I argue that these conflicts and the continual reduction in specific funding lead to the commodification of the festivals, distinctly illustrated by the shift in focus from cultural programming and mediation

to light installations that prioritize entertainment over cultural value.

Liveability, Foundational Economy and Urban Space of "Cities in the Middle"

Antonello Podda, Davide Arcidiacono, Angelo Salento

University of Cagliari, Italy

With this abstract, we aim to present the initial findings of a collaborative research project involving three units from the University of Cagliari, the University of Catania, and the University of Salento. This research is funded by the PRIN " GC-LIFES. Grounded cities. Liveability, Foundational Economy and urban Space of cities in the middle". The relationship between the uses of urban spaces, global/local competition, and citizen liveability has been less investigated in small and medium-sized cities without a highly competitive profile. In general, mainly in Italy, urban and territorial studies have neglected "middle" areas: those which are not purely rural or metropolitan, and those made up of small-medium sized cities that, although not lacking in social and cultural dynamism, are not included in major flows of economic and technological innovation. Our study focuses on the cities of Cagliari, Catania, and Lecce, cities neither in the centre nor on the margins; neither in a dimension of full dynamism, nor in one of absolute stagnation; submitted, on the one hand, to areas capable of attracting resources and inhabitants, on the other hand capable of attracting resources and inhabitants from marginal contexts. The purpose of this research is precisely to begin to fill this lack of analysis and knowledge on this medium-size cities, following a twofold path: on the one hand, analysing transformations that have a decisive effect on the well-being and lifestyles of the citizens and, on the other, identifying some conditions for strengthening liveability and fostering a just transition.

RN37 | T05_03: Socio-Spatial Segregation B

Creative Youth in a Changing Neighbourhood: Public Policies, Projects and Associations in a Segregated Area in the Lisbon Periphery

Pedro Varela[1], Otávio Raposo[1], Lígia Ferro[2]

1Cies-Iscte University Institute of Lisbon; 2Department and Institute of Sociology – University of Porto

As part of the PERICREATIVITY project and starting from the ethnographical fieldwork in a neighbourhood on the outskirts of Lisbon, that has undergone profound social changes, this presentation aims to delve into the history and activity of the neighbourhood's projects and associations. Namely, the ones promoted by young people, understanding their complex relations with public policies planned for this area. In the 1960s, this neighbourhood was built as a public housing project in the municipality of Cascais for fishing families. Then, other buildings and temporary homes were constructed to rehouse people living in the nearby precarious self-built areas, many of them of Cape Verdean ancestry. Today, it is a racially diverse community, including white and Black residents, some Roma people, and others. While this neighbourhood was initially situated in an isolated area, it is now nestled within one of the wealthiest regions on the periphery of Lisbon and, in recent years, has garnered attention from the local and state authorities. Today, the neighbourhood suffers from an intense gentrification process that prevents new generations from staying there. Despite having a reputation as a marginal and violent area, this community has seen a remarkable change both internally and in its image to the outside. With a strong dynamic of associations and projects (residents, youth, cultural, sports or welfare), this area has been where young people have promoted urban art and artistic practices through local support of public policies. We aim to understand the complex relations of autonomy and dependence towards the local power.

1148

Analysing Segregation with Agent-based Models on Surveyed Neighbourhood Preferences

Daniel Schubert, Sören Petermann

Ruhr-University Bochum, Germany

Social inequality continues to increase in cities. The issue of segregation is currently being discussed and focussed on considering the shortage of residential space in cities. Inner-city ethnic segregation processes depend on the distribution of neighbourhood preferences. The question to

be answered in the presentation is whether these different preferences lead to segregation.

Most studies refer to the segregation model developed by Schelling (2006). This model assumes that actors perceive their neighbourhoods from their own point of view and leave them if their preferences are not fulfilled. The assumption is that the actors are not aware of the consequences of their individual decisions. The fact that the characteristics of the individual actors influence each other can lead to a connected process of spatial segregation.

The General Social Survey in Germany (ALLBUS) is a representative trend study of the German population. In 2016, a vignette study was used as an in-depth topic to survey neighbourhood preferences regarding the composition of the neighbourhood. To this end, the 13 vignettes with different proportions of social groups were presented to the respondents, who were asked if they wanted to live in this neighbourhood.

However, these preferences do not explain the spatial distribution. To examine these distributions, a segregation model was created in Netlogo. Using agent-based modelling, we can implement these results from the ALLBUS data in models and analyse the results. In a first step, we can investigate which patterns result from the use of individual preferences for the spatial distribution in the model. This allows us to explore whether individual preferences alone are sufficient to explain segregation.

Crime and Socio-Spatial Segregation: An Investigation into Drug Dealing in Sardinia

Antonietta Mazzette[1], Daniele Pulino[2], Sara Spanu[2]

1OSCRIM Coordinator; 2University of Sassari, Italy, OSCRIM

The examination of illicit activities within urban settings has been a longstanding focus of urban studies, with an emphasis on the spatial dimension. Previous research has underlined the unique characteristics that either foster or deter crime in specific locations (Brantingham, Brantingham 1978, 1981; Eck, Weisburd 1995). This approach has consistently highlighted the intricate connection between crime, segregation, and spatial marginalisation.

Drug dealing, as a pervasive phenomenon, extends its influence across various urban areas where both illegal and legal activities coexist. This cohabitation often involves the sharing of spaces and resources, occasional encounters, and more frequently, a mutual tolerance. The physical proximity and social distance between these 'parallel worlds' trigger spatial and social segregation, leading to self-segregation. On the one hand, illicit practices in urban areas have the potential to discourage alternative and legitimate uses of spaces. On the other hand, a lack of social control can boost illicit activities, placing vulnerable individuals at risk of engaging in deviant behaviours. The pervasiveness of drug dealing exacerbates segregation and self-segregation, reshaping the peripherality of central urban areas (Petrillo 2013, 2018). This phenomenon challenges the conventional association

between crime and spatial periphery. Furthermore, the widespread nature of drug dealing raises concerns regarding the limited opportunities for young people, who may be persuaded by "easy profits" and subsequently recruited into criminal groups. These findings have emerged from an extensive study on drug dealing in Sardinia conducted by OSCRIM (Social Observatory on Development and Crime in Sardinia, University of Sassari, Italy) from 2017 to 2022. The research highlights that urban drug dealing manifests distinct forms of segregation and marginalization in metropolitan cities (Cagliari) and smaller municipalities (Olbia).

Contemporary Socio-spatial Segregation Dynamics in Spanish Metropolitan Areas. Persistence, characteristitics and urban landscapes: An Analysis of Spatial Autocorrelation and Segregation Indices

Miguel Rubiales-Pérez, Cristina López-Villanueva, Fernando Gil-Alonso

Universitat de Barcelona, Spain

1149

This study presents an in-depth analysis of recent trends in socio-spatial segregation within the five major Spanish metropolitan areas (Madrid, Barcelona, Bilbao, Sevilla, and Valencia), employing a methodology centered on spatial autocorrelation indices, but also keeping track of traditional segregation indices such as the Index of Segregation (IS). The research utilizes socioeconomic data from different administrative records and Spain's latest census data recently published.

Utilizing spatial autocorrelation indices to understand the degree of concentration of these groups and their morphology, our analysis explores the main metropolitan regions across Spain, revealing that segregation levels remain consistent across these areas, with a detailed examination of fragmentation processes that are occurring. We discover that in several metropolises, segregation persists robustly, indicating entrenched socio-spatial divisions. The study delves into the complexities of these divisions, uncovering detailed processes of urban fragmentation such as those produced in the urban space that serves as a boundary between the areas of concentration of groups, the islands resulting from singular interventions by the administration, and the fragments of neighborhoods undergoing rapid social transformation. This exploration includes an assessment of how different social groups are spatially distributed and segregated.

Our findings suggest that despite changes in data collection methods and urban dynamics, the core patterns of segregation remain largely unaltered. The research contributes significantly to the understanding of urban segregation in Spain, offering a nuanced view of the persistence and morphological characteristics of segregation in contemporary urban landscapes. It provides a critical foundation for future urban planning and policy-making aimed at addressing socio-spatial disparities

RN37 | T06_01: Urban Transformations: Growth, Memory, and Infrastructure

How To Design The Past? Social Consequences Of Urban Retroversion In Poland

Krzysztof Olechnicki, Tomasz Szlendak, Malwina Krajewska, Wojciech Goszczyński

Nicolaus Copernicus University, Poland

The main research question of this paper addresses social consequences of urban revitalization plans founded on expert construction of the past. We are particularly interested in so-called retroversion – one of the most extreme forms of reference to history when planning the future of urban areas. This method of city reconstruction has been used since the early 1980s in Poland.

Retroversion is not a literal reconstruction, but a creation: historical in its assumptions, postmodern in its implementation. It is not about historical authenticity, but about the impression of antiquity, expanding public space and recreation of old city ambience: focused on building of attractive center and social functions that satisfy the nostalgic need to be in the city. In other words, it is a creation of working "New-Old Town".

Our case study is Elbląg, a city whose historic center was destroyed during World War II and only after several decades did the reconstruction of the historic center begin on a larger scale. We consider it as a laboratory where modernity mixes with city's past. The paper focuses on not previously undertaken social assessment of retroversion by vital groups of city users: residents, tourists, experts (so far only the architectural dimension was evaluated).

We will discuss the social functionality of urban spaces subjected to these processes exploring questions such as who the city is for, who can use it and on what terms, and what influence individual interest groups have on its creation.

We assume that the phenomena observed in Elbląg can, to varying degrees, also be discovered in other European cities where development plans refer to the imagined local past.

Rethinking Urbicide: Exploring Spatial Destruction, Fragmented Collective Memory, War's Disorientation, and the Lingering Specter Of Death

Sibel Bekiroğlu

İzmir Kâtip Çelebi University, Turkiye

This research endeavors to delineate the boundaries of urban spaces and contemplates the repercussions of transcending these limits through destruction. Urbicide, introduced by urban planners, architects, and researchers, serves as a conceptual tool to comprehend the emergence of a new urban paradigm resulting from the devastation of urban structures during the war. Despite its utility in defining this novel situation in global conflict zones, this conceptual tool remains incomplete in providing a systematic definition. This research contributes significantly to existing literature by conducting a comprehensive examination of the concept of urbicide. The study extensively explores four key elements of the concept—space, time, constitutive violence, and power relations. The objective of this work is to achieve a profound understanding of urban phenomena in areas affected by destruction, employing sociological methodologies rooted in the established body of urbicide literature. Within this framework, it focuses exclusively on the destruction of urban fabric and violence, with a specific emphasis on assessing the impact of a necropolitical approach on collective memory.

FDI-Driven Urban Growth and Spatial Disparities in the Wake of Planetary Urbanism: Examining Romania's Urban Evolution

Norbert Petrovici[1], Florin Poenaru[2]

1Babeș-Bolyai University, Romania; 2University of Bucharest, Romania

Henri Lefebvre's 1970 vision of total urbanization materialized by the 2010s, as urban populations globally outnumbered rural ones. This paper explores Neil Brenner's concept of "planetary urbanism", which advocates for critical interventions that dissolve inherited spatial ontologies in favour of a processual view of uneven urban transformations, considering their historical depth. We use Romania as a case study and employ a longue durée approach to examine how foreign direct investment (FDI) has shaped urban landscapes since 1990, considering the socialist investment landscape from 1950 to 1990 and subsequent investments. Our research, based on OLS regression and unfolding analysis, highlights the dramatic urban transformations in Romania, marked by the emergence of industrial hubs and the concurrent decline of other regions. The global urban condition, exemplified by the rapid spread of the SARS-CoV-2 pandemic, underscores the interconnectedness of

urban centres. This paper investigates the mechanisms through which cities expand their influence, shaping sub-urban, peri-urban, and rural areas. We provide an analysis of Romania's urban geography during its socialist industrial phase and its subsequent transition. This period witnessed significant job losses in some regions and the concentration of industrial capabilities in others, leading to pronounced urban disparities. The paper argues that the dependent reindustrialization post-EU accession in 2007 was built on the uneven urban and socio-demographic foundations of the socialist era. By examining Romania's experience, we contribute to the broader discourse on planetary urban development, emphasizing the need for sociological research to address the complex, material realities of urban growth and capital accumulation.

Political Preferences And Public Infrastructure In A Post-socialist City – The Case Of Split, Croatia

Sven Marcelic

University of Zadar, Croatia

This paper will try to contextualize spatial aspects of public infrastructure concerning voting preferences in the city of Split in Croatia. The concept of capability approach as developed by Sen and Nussbaum, but also of exclusion and political geography will be used to discuss voting outcomes in the context of access to the health system, educational institutions, and culture in a post-socialist city.

Addresses of 152 polling stations and different types of public infrastructure (educational, health-related, cultural) were geolocated using GIS, and the distance between the former and the latter was calculated using infrastructure locations as hubs. This data was then used in a regression analysis using voting outcomes in parliamentary and presidential elections in Croatia in 2019. and 2020. Furthermore, cluster analysis was applied to divide city space into three areas: leaning center-left, center-right, and far-right.

There is a positive and significant link between right-wing voting and an increase in distances in all categories of public infrastructure, explaining 25-35% of variance depending on a political option. Thus, a higher density of health, education, and cultural amenities is correlated with left-leaning areas and lower density increases the probability of voting for the right.

It is concluded that the lack of public infrastructure reflects higher levels of social exclusion and reduces the capabilities of the local population, providing an explanatory framework for the connection between lower density and access to infrastructure with right-wing political preferences.

RN37 | T06_02: Urban Well-being and Diversity: Exploring Mental Health, Culture, and Emerging Lifestyles

Urban Flourishing: Unveiling the Intersection of Culture and Well-being in Creative Cities

Una Bluke, Ance Kristala

Latvian Academy of Culture, Latvia

Human well-being, integral to the fabric of a flourishing society, is increasingly intertwined with attributes of creative cities – openness and tolerance, strong community, connectivity, cultural diversity etc. Creative cities often are seen as "playgrounds for a hip, young, well-educated, affluent, technologically savvy class of workers – a 'plug-and-play-ground' for twenty – and thirty-something members of the creative class" (Gertler, 2004, pp. 1). Contradicting this notion and viewing creative cities as urban havens for everyone, we explore their potential as catalysts for elevated citizen well-being. On the one hand, the role of culture and arts in creative cities is socially, politically and economically recognized as significant. Multiple studies have highlighted the impact of culture on various aspects of well-being – social inclusion, social connectedness, self-actualization and other (e.g. Mundet et al., 2017, Perkins, Williamon 2014). Blessi, et.al. (2016) notes that – the more socially significant, accessible, and universally recognized culture in the city and society becomes, the greater its impact on well-being. On the other hand, the research on the impact of culture and arts on individual's well-being is ambiguous and contextual, denying straightforward causality between them. In order to unravel these contradictions, in this paper we aim to explore the relationship between well-being and culture in the context of four creative cities in Latvia. Providing a data analysis of representative survey conducted in 2022 "Quality of Life in the Cities" and data from Cultural and Creative Cities Monitor, we investigate the relationship between different aspects of creative city, culture and resident's perceived level of well-being, and critically examine feasibility of these measurements.

1151

Irrecognizable Neighborhoods. Smart-workers, Immigrants, Flâneurs, Dog-sitters, Riders, ... And Others

Giampaolo Nuvolati

Università degli Studi di Milano-Bicocca Dipartimento di Sociologia e Ricerca Sociale, Italy

The neighborhoods of our cities are increasingly seeing the presence of figures who do not fit into the more traditional categories. These subjects use public spaces in different ways, claiming diversity in equality, leaving us to speculate about forms of empathy, reciprocity, conflict, distrust, and indifference. We think that the issues of tensions, trust, and transformations not only concern macro, but also micro, everyday urban phenomena and intersect with different uses of space and time. The paper aims to address from a theoretical and methodological perspective some issues related to the changes of cities and the construction of micro communities with high variability. Sociology today must question how to capture the changes that lurk in the interstices (so-called "third places"), including the re-functionalization of them. It must also ask the question of the sensitivity of local governments in relating to and governing these processes or leaving them completely free to reproduce. The traditional themes of gentrification, technology, decontextualization and re-contextualization of action constitute indispensable elements in explaining the origin of certain phenomena, but they must be constantly updated from an analytical point of view in order to capture trends that are increasingly changing because they are less tied than in the past to fixed social and economic frames. While the ethnographic method is probably the best suited to address these issues, it is equally true that new strategies of analysis must be considered today, related especially to the possibility of georeferencing new data concerning social phenomena.

Doing Research on Neurodiversity: a Critical Literature Review

Miriam Serini

Università degli Studi Milano Bicocca, Italy

Referring to neurodiversity means challenging the psycho-biomedical model and to de-medicalize non-normotypical conditions: the expression neurodiversity is meant to emphasize how neurodiversities are atypical forms of brain functioning, independent of a pathologizing negative value judgment (Caniglia 2018).

There is an emerging need within research to embrace an intersectional approach in order to study neurodiversity: neurodiversity theories built on crip and queer approaches seek to challenge the conventional, stigmatizing, and pathologizing approaches that dominate the scientific debate (Vanolo 2023). By using neurodiversity as an epistemological and ethical implication we can decentre dominant perspectives, questioning the compulsory able-bodiedness and able-mindedness as well as cognitive affective and sensory "normates", problematizing the neurotypical domain in institutions and practices by questioning the boundaries the predominant neurotypicals and the "others" (Rosqvist, Chown, and Stenning 2020).

Within urban studies, it is important to focus on how the socio-spatial context can influence the way marginalized groups inhabit space (Valentine 2008) and in this regard Kenna (2023) has emphasized the importance of using a relational lens in studying the urban environment in relation to neurodiversity: the city can be a difficult environment for those who are neurodiverse, and we need to consider the processes and practices through which spaces acquire meaning and can become inclusive or exclusionary.

Through this theoretical paper, the author aims to explore the main existing paradigms in neurodiversity research and how they can interrelate and provide innovative lenses for the study of neurodiversity in urban space. It is necessary to expand research beyond sensory sensitivities and the built environment to consider the broader urban environment and experiences in a range of urban spaces.

Urban Space Transformations as an Instrument for Social (Dis) Integration: Examining the Case of Kharkiv (Ukraine) in 2023

1152

Anna Ivanova

Justus Liebig University Giessen, Germany

One of the most visible transformations of Ukrainian public space after the outbreak of the full-scale Russian invasion has become the physical destruction of the urban space. However, the war has not been the only source of change. Prominent transformations happened in the state's memory politics, which focused on "decolonizing" Ukrainian public space from Russian and communist influence. Concentrated primarily on removing undesired symbols, "decolonization" affected all the spheres of public life, including the urban space.

The state's decolonization politics covered the whole country; however, it didn't consider the cultural, linguistic, (geo)political and class dividedness of Ukrainian society. Kharkiv, the industrial Russophone city in the Eastern borderland of the country, expressively visualizes all these cleavages. Holding the leading position in terms of civilian infrastructure destruction, Kharkiv lags behind most Ukrainian cities in the decolonization process in terms of scale and pace. Decolonization discourse appeared to be not universally supported: various counter-discourses emerged on the streets, preventing official political discourse on decolonization from establishing complete hegemony.

My research aims to answer the following question: How do the "decolonizing" transformations of Kharkiv's urban space interact with the cleavages of Ukrainian society? Relying on Lefebvre's approach to space as a triad of representations, practices and material infrastructure, I analyze discourses on space transformation (toponymic legislation and counter-discourses). Applying ethnographic

observation (via de Certeau's "walking in the city"), I capture transformative practices, actors involved, and effects on the urban space.

Referring to illustrative cases from Kharkiv, this research demonstrates how urban space transformations become instrumentalized in a struggle for "the right to the city" between state and city authorities, activists and local inhabitants. This, in turn, contributes to the deepening of cleavages and the growth of social polarization.

All in all, I examine how politics directed at social cohesion can lead to the opposite result in a deeply divided society, focusing on the role of space and everyday life in it. I am applying to the ESA Summer School for the first time. My research will immensely benefit from participation in the school due to the mentoring and networking opportunities that ESA provides.

RN37 | T06_03: Urban Vulnerability and Social Dynamics A

Socio-spatial Patterns of Energy and Housing deprivation: An analysis on Portugal freguesias

Luca Biserna

Dipartimento di Culture, Politiche, Società, Università degli Studi di Torino, Turin, Italy

This work aims to infer, through the lens of Spatial Justice and Recognitional Enegy Justice, the different specificities of spatial and local Housing Deprivation and Energy Poverty across the Southern region of Europe, namely in the cities of Italy, Portugal; Spain and Greece. These two topics are analysed together because of their strong interrelation and cohexistence, involving a variety of demographic, socio-economic, infrasructural and Foundational Economy issues. In fact, precarity of housing goes hand – in – hand with a lower capability to satisfy basic energy – related needs.

The main contribution of this research, based on the upcoming EUROSTAT 2021 Census round and other national energy and housing – related datasets and surveys, is to identify if and which are the common representative factors of vulnerability across Southern Europe and which are the different sub – groups of vulnerability between the selected urban contexts. By identifying which are the most representative factors and their spatial allocations, this research wants to anchor an essential socio-spatial dimension to vulnerability concerning Housing Deprivation and Energy Poverty, delineating a structure of spatial and demographic patterns of inequality . Its urban comparative function can add new knowledge to the fields of Urban Sociology and Socio spatial analysis, which have not produced yet consistent comparative works for this european region.

Through the analysis of an ad-hoc index composed by 20 indicators and 185 southern european cities as observable individuals, the work will show the different urban clusters of Housing Deprivation and Vulnerability to Energy poverty across the four nations. A particular focus will be given on gender and age, and which are the additional implications of vulnerability for these groups in the analysed urban contexts.

1153

Photovoice Elderly Seville: Vulnerability, Loneliness And Old Age In The Urban Environment

Gonzalez-Salgado Ignacio de Loyola[1,2], Lara Merchán Ana[1,2], García González Juan Manuel[1,2]

1Universidad Pablo de Olavide, Spain; 2Demography and Social Research in Health group.

Aging in urban settings has been addressed in scientific literature, both internationally and nationally. However, this topic has been scarcely explored from the intersection of variables such as vulnerability, loneliness, and old age in the urban environment using participatory action research such as photovoice. The objective of this research was to study the perceptions of people aged 65-80 living in the districts of Macarena and Cerro-Amate regarding aging, vulnerability, and loneliness within their surrounding environment, and the possible ways to improve their situation. This research drew on the Photovoice technique. The districts of Macarena and Cerro-Amate were selected among the 11 districts in Seville using an ad-hoc index based on sociodemographic indicators. The research will recruit a maximum of 40 participants from these two districts, 20 from each district. Participants can be included in two different photo elicitation groups regarding age (e.g., 65-72 and 73-80). After taking pictures, the participants will discuss their categories and themes in successive meetings based on the pictures they have taken. While the project is still in progress, we do not have definitive results yet. However, we expect to understand how loneliness and vulnerability in old age are affected by socioeconomic vulnerable urban environment through photo elicitation. In addition, we expect to empower participants giving them tools to identify their surroundings and assets that may be improved.

Croissant Pauvre: Navigating Old Tensions Amidst New Transformations

Eleonora Clerici

Sapienza, University of Rome, Italy

Brussels (Belgium) underwent historical and economic changes (Kesteloot, 2005, 2013), shaping its socio-spatial configuration and generating a disadvantaged inner city known as the croissant pauvre (the poor croissant). Already synonymous with economic, social, and ethnic tensions and inequalities (Van Hamme et al., 2016; Costa, de Valk, 2018; Van Ham et al., 2021), this area disproportionally witnessed the health, social, and housing repercussions of the Covid-19 pandemic (Observatoire de la Santè et du Social Bruxelles, 2020; Verhaeghe, Ghekiere, 2021, 2022). Additionally, further transformations, such as gentrification (Vermeulen, Corijn, 2013), altered the croissant pauvre, modifying its composition and displacing vulnerable households (Van Criekingen, 2008; Godart et al., 2023).

This paper seeks to scrutinize the tensions and transformations moulding these neighbourhoods. The theoretical framework intertwined the concepts of 'abyssal exclusion' (Santos, 2014) and 'advanced marginality' (Wacquant, 2008), providing a more comprehensive understanding of socio-spatial disparities.

This paper adopted a mixed-method approach. The data from Monitoring des quartiers unveils the socioeconomic and ethnic composition of these neighbourhoods. Further, 33 semi-structured interviews, conducted between January and March 2022, with associations and experts working with the most vulnerable population delve into the recurrent socio-spatial tensions and the new transformations.

The results present the socioeconomic, ethnic, and spatial division within Brussels, spotlighting the intersectional segregation in the croissant pauvre. While persistent tensions related to ethnicity and socioeconomic factors are evident, interviews shed light on emerging issues resulting from current transformations. This study contributes to understanding the complexities of urban inequalities and their implications for vulnerable communities.

Assessing The Energy Poverty And The Housing Conditions Of The Migrant Population In The Basque Country

1154

Irune Ruiz Ciarreta, Oier Ochoa de Aspuru, Iraide Fernández, Unai Ahedo, Julia Shershneva

Universidad del País Vasco/ Euskal Herriko Unibertsitatea, Spain

Urban vulnerability is a significant problem that can have serious health consequences for those living in affected areas, especially concerning energy poverty. However, this issue is not uniformly distributed, instead, it is more prevalent in specific spaces, such as old or lower-quality housing, disproportionately affecting certain individuals or social groups. A dynamic closely linked to the residential concentration of poverty and origin.

In this context, using the data from the 'Foreign-Origin Population Survey,' a statistical operation conducted by the Basque Government's Department of Social Affairs, we assessed the living conditions of the migrant population in the Basque Country, with a particular focus on energy poverty and its associated risks.

The preliminary results of the analysis show that a significant number of migrant households lack adequate infrastructure, experiencing issues such as dampness or cracks in the walls. This is especially true in the case of certain origin groups, such as the African born population, among whom the figures are higher. From a public policy design standpoint, these types of analyses play a crucial role, enabling, among other things, a better identification of critical cases, as well as a more effective allocation of resources.

RN37 | T07_01: The Gender Factor in the City

Urban Mobility As A Key Factor For Gender (In)equality. Unveiling The Socio-spatial Implications Of Gendered Mobility In Cities

Patrizia Leone

University of Bologna, Italy

Mobility is a multi-layered concept involving movement, meanings and practices. It is largely acknowledged that men and women do not move in the same way and persistent urban socio-spatial constraints prevent women to be equally socially and spatially mobile. This contribution wants to broaden established thinking on urban mobility showing how and why mobility is gendered in given contexts and understand the interconnections between spatial and social mobility. It aims to reveal how everyday experiences of mobilities enables, disables and modifies gender and subjective identities. As part of my PhD project, this contribution is based on an extensive literature review over mobility, urban space, gender and intersectional studies and will present preliminary results of a place-based qualitative study. Findings show that different mobility patterns between women and men are result of gender roles and everyday life power geometries. Gender division of labour, care and reproductive work, subjective identities, multiple intersectional inequalities and gendered built environment are central to understand the embodied dimensions of gendered mobility and access to the city. Furthermore, the ability to be socially and spatially mobile is strongly shaped by capability and accessibility according to gender, generation and ethnicity. Besides, mobility and space play a central role in the constitution of gender as a social construct. To conclude, gendered mobility can be used as an indicator of gender equality and a category to conceptualize how space is built, reproduced and represented. Power, hierarchies and gender roles are crucial factors to build inclusive, sustainable and feminist cities.

The Dynamising Role of Women in the Local Space

José Juan Osés[1], Manuel Basagoiti[2], Vicente Díaz[3], M. Victoria Gómez[4]

1University Carlos III, Madrid, Spain; 2University Carlos III, Madrid, Spain; 3University Carlos III, Madrid, Spain; 4University Carlos III, Madrid, Spain

Everyday life refers to the places where women and men live, work, consume, relate to others, forge identities, confront or challenge established routines, habits and codes of conduct. Among these places, and despite the general consensus about the decline experienced by local environments, in many cases neighbourhoods retain or have developed new relevance as the main context in which daily routines take place and spatio-temporal permanence develops from routine rhythms, circles of social interaction and attachment to place (Vaiou and Lykoggiani, 2006). Reality also shows how, to a large extent, women's activities and practices are more often local in nature than those of men, assiduously constituting the pole around which everyday life is organised in urban neighbourhoods. Using qualitative methodology based on participant observation and 33 in-depth interviews (18 individual and 15 group interviews), our research set out to explore the community role of women in three neighbourhoods with differentiated characteristics in the city of Madrid: a neighbourhood in the central area in a process of transition and change, a second with a medium-high socioeconomic level and a third showing indicators of vulnerability. The purpose was to analyse whether these behaviours occur in a general and majority way or whether they have to do with intrinsic characteristics of the residential areas and the conditions of the neighbourhoods. The results show the prominence of women in the three cases, not only because of their involvement in local associative movements but also because of their participation in collective activities in the neighbourhoods.

Women Walking And Its Potential In (re)affirming Their Right To The City

Letizia Carrera, Paolo Contini

University of Bari Aldo Moro, Italy

1155

The act of women walking through the city provides strategic opportunities for the political rethinking and (re)designing of urban spaces and gender cultural patterns that take shape within them. In this perspective, women's walking takes a fundamental value as political and social challenge. Women observe urban spaces, even today, from the borders, and their specific experiences make them able to grasp both the critical problems that affect it and its potential. Their slow, thoughtful walking can reveal how gender-normative structure is considered normal in the widespread cultural models and how gender order, in its material and immaterial urban structure, tends to confirm the male cultural model.

Women walking and their specific gazes can suggest ways in which established patterns may be superseded opening the city to every difference. Some interesting examples of female physical, urban, common and intergenerational (and intergender) experiences tested in several European cities are Slutwalks, "Take Back the Night", "Women's Heritage Walks", "Gender Walkshops". They have enabled women – and every walker – to recognise the sexed character of urban spaces and to focus on the full reappropriation of them. Women walking, thus, can assume both a political and a social value to regain the full right to the city, living and deciding in one's own city.

These innovative forms of participation movements can reinforce, or activate, a process of wide cultural change carried out by women who work, and walk, together to generate, literally step by step, a transformation of gender patterns and its related inequalities.

Alienating Marginalization. Experiences of Young Women in Marginalized Suburban Areas

Tanya Jukkala

Mälardalen university, Sweden

This paper concerns experiences of marginalization among young women living in marginalized (and stigmatized) suburban areas in the south of Stockholm. The paper builds on an empirical material of 34 interviews/"walk-alongs" with 42 young women (16-30 years), conducted in the years 2020-2022.

Three themes relating to experiences of marginalization appear in the young women's narratives: The first theme focuses on how the young women deal with prejudice and discrimination relating to them being young women from a marginalized area. The second theme focuses on how the young women deal with norms and the presence of young men which form part of their everyday life in terms of being young women in a marginalized area. The third theme focuses on different forms of resistance and positive learnings which are also highly present in the young women's narratives.

The young women's experiences of marginalization are understood through the theoretical concept of alienation, focusing on alienation in the sense of being limited in one´s freedom as well as in terms of objectification – a specific kind of limitation which constrains an individual's freedom to emerge as a person. An intersectional perspective is applied, connecting alienation to specific social positions relating to the interplay between social categories such as age, class, ethnicity, gender, sexuality etc. In addition, the potential of positively experienced transformative aspects of alienation are emphasized.

RN37 | T07_02: Inside and Outside the City Borders: Suburbanization Trends A

Mobility Dependency In Peri-Urban Regions: The Case Of Creil And La Roche-sur-Foron

Maya El Khawand

Université Gustave Eiffel, France

Over recent decades, improvements in travel conditions have led to socio-spatial transformations in territories. These changes also have led to significant social inequalities accessing amenities, either in terms of access to fast travel modes, which highly depends on personal characteristics (Preston, Rajé, 2007) or to residential locations with good amenities or efficient public transport services. The evolution of urbanized spaces and the social valuing of mobility led to the increase need to travel more frequently, sometimes further, and faster (Kaufmann, 2008). This "mobility dependency" affects precarious social groups in two ways: limited accessibility for those lacking mobility access and substantial financial costs with longer travel times, for mobile individuals. (Fol, Gallez, 2017).

With the climate emergency and rising energy prices, accessing amenities and services in the territory is becoming increasingly challenging especially for the low-income and minoritized people. This is even more relevant in rural and peri-urban areas. We hypothesize that in these areas, the application of urban-centric planning doctrines (i.e., densification, polarization, etc.) tend to aggravate mobility dependency, especially for less advantaged people. In these areas, the railway service promotes the territory with good regional accessibility and a micro-local accessibility neglecting accessibility needs at local and inter-communal levels.

This communication explores the disparities between the vision of local actors (potential accessibility) and the needs and practices of the population, particularly women (effective accessibility). Employing qualitative methods like semi-directive interviews, focus groups and walk-alongs, we draw on two case studies of contrasting urban environments and diverse principles of urban planning-transport coordination in the peripheries of Paris and Geneva.

1156

Popular, Plotting or Provisional Urbanization? Delineating the Socio-spatial Effects of Emerging Peripheries in Belgrade

Stefan Srdjan Janković

University of Belgrade, Serbia

Recent discussions on extensive urbanization have brought to light various theoretical challenges in explaining the emergence of urban peripheries, among other considerations. The urban developments on the outskirts of Belgrade, initially established to accommodate waves of refugees after the Yugoslav Wars and currently housing nearly a quarter of a million residents, pose additional complexities. Despite similarities with recently discussed bottom-up popular urbanism and market-driven plotting urbanism, we contend that neither fully elucidates the intricate network of actors involved, especially the role of the state. Instead, we propose provisional urbanism as a distinctive morphogenesis, capable of accounting for overlapping incremental construction, loose, spontaneous, and informal territorial regulation, as well as the emerging commodification of peripheries. Drawing on 2019 ethnographic data, secondary sources, urban plans, and official documents, we present a detailed analysis of peripheralization in four settlements on the northern outskirts of Belgrade (Altina, Plavi horizonti, Belarice, and Busije) since the late 1990s. In delineating this provisional urbanism and its sociospatial effects, we identify three phases: 1) state supply of land, accompanied by popular construction methods; 2) the emergence of peripheral settlements with severe infrastructural deficiencies; 3) a recent shift towards market-driven urbanism. We argue that provisional urbanism yields ambiguous effects. While it perpetuates peripheralization in terms of housing and everyday mobilities, specifically due to infrastructural gaps, it also stimulates bottom-up initiatives and reliance on mutual aid networks. Furthermore, we explore how these evolving peripheries impact existing morphologies and redefine centralities, particularly in the current housing crisis in Belgrade.

The Suburbanization Case of Post-Soviet Yerevan

Armine Ghalamdaryan, Aram Vartikyan

Yerevan State University, Armenia

The Industrial Revolution marked a crucial phase in modern city development, with industrialization and urbanization progressing hand in hand. This transformative era influenced central cities' growth and expanded into broader urban agglomerations, including suburbs. Post-Soviet Yerevan witnessed suburbanization during its independence, shifting from socialist Soviet urban planning to a capitalist-liberal model, focusing on real estate privatization. Yerevan's capital status is underscored by its disproportionate territorial development.

In the research framework, document analysis and expert interviews were conducted, with the primary method of information collection being narrative interviews. The gathered data underwent analysis using the methodology of narrative semiotics, and the theoretical framework applied was based on Pierre Bourdieu's concept of the spatialization of capital.

Narratives portray "Old Yerevan" as a meaningful space holding the city's treasures in memories. However, the present city loses appeal due to pollution, overcrowding, and facelessness.

A new struggle for physical space, exemplified by suburbanization, emerges. Dominance in this struggle hinges on capitals—economic, social, cultural, and symbolic. Initially, these capitals create the prerequisites and conditions for the migration from the capital city to the suburbs. Subsequently, they allow the realization of various benefits associated with suburban living. Among these benefits, factors such as cleanliness, seclusion, and romanticism (including beauty and closeness to nature) are deemed particularly important.

This transformation results in a shift in the hierarchy of physical space: in the relationship between the city and its suburbs, the latter takes precedence as the place associated with prosperity and positive attributes. Living in the suburbs becomes a means of realizing superior positioning in the competitive social domain.

The Effect of Social Networks on Spontaneous Suburbanization

1157

Gergely Mónus

Corvinus University Budapest, Hungary

Urban development is traditionally understood as an economic process. Local economic opportunities attract migrants, and population growth induces the appearance of services and amenities. Such models of spatial mobility build on historical migration processes in developed central countries, but are harder to apply in other regions, such as post-socialist societies. In large urban zones of Eastern Europe, urban development in some case can start in localities that do not offer much for newcomers in terms of services, housing, or workplaces. Urban researchers call such phenomena as spontaneous development. In our analysis, we argue that such processes can possibly be explained through the ideas of social networks and social capital. Under the circumstances of scarce housing supply and inflexible labour markets, the influence of social factors on migration decisions could get stronger. Qualitative research on this topic has already uncovered many aspects of such migration systems, but large scale, macro level studies are rare in the topic. In a case study of Budapest and its functional urban area in the 2000's, we aim to model migration flows between the city and its neighbouring settlements. We utilize the database of the first online social network site of Hungary (Iwiw), to measure social connections. By merging administrative migration data to this large online database, we became able to test the effect of social capital bridging two locations on the volume of migration flows.

RN37 | T07_03: Urban Identities and Social Dynamics: Methodological Insights and Case Studies

Scouse, Not English: The Widespread Disdain For The UK State Amongst People From Merseyside.

Melissa Crane

The University of Manchester, United Kingdom

This paper will draw on twelve months of ethnographic fieldwork (2022-2023) in the area of Kirkby, Merseyside UK. I spent this time with interlocutors who are combining various heterogeneous means of income generating to get by in times of immense precarity. All participants combine state welfare with informal work and many also work formally. One of the key issues that regularly arose during fieldwork was the disdain that people in the area have for the British State, particularly the Government and Monarchy. This disdain often extends to any organisations in which the arms of the state are seen to extend, for example education, health and welfare services. People from Merseyside are widely referred to as Scousers, identifying strongly with the city of Liverpool. I use ethnographic examples from football matches at Anfield Stadium as well as within the area of Kirkby, to demonstrate how Scouse is often pitted in direct contrast to English. At Anfield, the national anthem is met with protest and anti-English rhetoric. This has been the case for many years and has links to events dating as far back as 1911. I explore the commonly expressed notion of 'Scouse, not English' and the systematic state failings that have led to this mentality. Why do thousands of people in Merseyside increasingly not identify as English, despite being born and raised in England and what impact does this have on their daily lives?

Residential Histories and the Study of Home Creation. Methodological Insights.

Kristel Edelman[1], Katrin Paadam[2]

1University of Turku, Finland; 2Tallinn University of Technology, Estonia

Residential histories have only rarely gained a prominent methodological position in the field of urban and residential/housing studies. In the current article, we discuss resourcefulness of this specific methodology adopted for contributing to an understanding of the process of home creation as interrelated with construction of identities, particularly, in everyday life circumstances. We argue that residential histories enable detailed, non-linear interpretation of representations of individuals' entire residential experiences which are intertwined with unique experiences in other fields of social conduct. Discussion on methodological insights draws as on previous research on urban housing/residential histories but more specifically on research which focusses on home creation in intercultural partnership (involving choice of residence and home design). Our study supports the understanding that process of home creation significantly contributes to individual well-being in changing everyday life situation, more in the context where different cultures meet in the privacy of home, assuming adjustments also on wider realm of new culture and society.

The analysis is based on data from 44 individual biographical narrative interviews and on-site (as well as virtual) tours at homes of intercultural couples who reside in various residential settings of European cities, in one of the partner's countries of origin. While we provide insights into possible directions analysis could take, we emphasise the role of local partner and the role of newcomer in a process of home creation where trust is on the bases of partner relations. We also analyse partner's relations with their home spaces to gain deeper understanding of how everyday practices of home design contribute to construction of positive identity and dispositions towards encountering potential challenges along the way of creating home across cultures.

Emotions, Institutions, Architecture – Three Routes on the Spatial Social Map of The City. An Example of the Use of the Walking Interviews in the Studies on Identity, Learning and Use of the City.

1158

Helena Anna Jedrzejczak, Małgorzata Osowska

Educational Research Institute, Poland

The city can be interpreted as a space of identity, daily life, learning, simultaneous continuity and change. Just as Lynch's image of the city consisted of landmarks, nodes, edges, districts and paths, ours will be three 'routes': emotions, institutions and architecture / urban planning.

We will present the conclusions from the analysis of two small Polish cities with different histories, identities, cultural and educational offers, as well as urban layout and socio-demographic characteristics. In each of them, we carried out 10 walking interviews with the original theme of informal learning in the city space. Due to the participatory nature of this research technique, the theme evolved towards experiencing the city.

Based on the analysis of the research material from interviews and use autoethnography as a complement to this, we outlined three 'routes' on the 'map' of each city. "Routes" are ways of experiencing the city, using it and broadly learning in the broad sense.

The 'route of emotions' is the feelings that the selected points and spaces evoke in participants. The 'route of institutions' is, on the one hand, the public institutions that

support citizens in learning and using the city and, on the other hand, the social institutions that play a similar role. The 'route of architecture and urbanism' is the spatial conditions that influence the possibility and willingness to use the city, its accessibility and aesthetics.

Those routes allowed us to analyse: (1) identity understood as a relationship to tangible and intangible heritage and rootedness in space, (2) elements and features of space that influence the perception of a city, and (3) inequalities in access or willingness to use spaces, institutions and events.

Flows of Change: Riverfront Development as a Catalyst for New Urban Identities in post-Fordist Cluj

Andrada Tobias, Gyongyi Pasztor

Babes-Bolyai University, Romania

Our paper focuses on the riverfront development and its impact on new urban identities in Cluj-Napoca. After the post-Fordist turn and undergoing socio-cultural transformations, Cluj-Napoca provides a ground to examine the revitalization of its riverfront spaces intersecting with the construction, negotiation, and expression of new urban identities.

The Cluj–Someş river relationship has been rather conflictual than harmonious. Over time, Cluj turned its back on the Someş. In the Middle Ages, the short distance between the citadel and the river was far enough to pose a flooding threat and close enough to be used for activities such as transporting wood, milling, and waste storage. However, long time the Someş constituted a physical and symbolic barrier for the people of Cluj-Napoca between an urban, hygienic, "civilized here" and the opposite "out there." The modernizing city treated the river as a given but unused element just like the socialist regime. Today there is a pressing need to integrate Someş into economic, social, and cultural life.

Our interdisciplinary research, framed by critical theory and supported by surveys, interviews, and focus-groups, reveals how riverbank spaces can become arenas for social encounters, cultural expressions, and the negotiation of new identities (Sennett, 2011; M. Law, 2015; Crawford, 1999). By analyzing opinions and social practices emerging around these spaces and policy proposals, we aim to elucidate the role of riverbank development in shaping the social fabric and collective identity narratives of Cluj-Napoca. The research also targets inclusion-exclusion mechanisms and negotiations embedded in the construction process of identity narratives assuming that the riverbank project can either reinforce or challenge existing socio-economic disparities in the city in line with the economic changes taking place glocally.

RN37 | T08_01: Urban Dynamics: Media, Policy, and Practices in Shaping City Life

The Commodification of Urban Experience Through Out-of-home (OOH) Marketing: the Joint Contribution of Urban Media Studies and Historical Sociology

Cesare Silla[1], Simone Tosoni[2]

1University of Urbino, Italy; 2Catholic University of Milan, italy

Since the birth of consumer capitalism at the turn of the 19th into 20th centuries in North America, urban experience has been informed by the presence of advertising discourse addressed to people engaged in traversing urban spaces, contributing to the commodification of the urban experience. Ultimately, OOH marketing techniques aim to extract value from the "common" represented by urban life, by constituting citizens and city users into urban audiences for their quantification and sale to advertisers.

1159

By analyzing the portfolios of the major players in OOH marketing, especially digital, this paper maps these techniques to understand their main mechanisms of operation and to clarify how they conceptualize their target audiences. Building upon previous work conducted by the authors on the origin of consumer capitalism and urban communication from a sociological perspective, the presentation advances a theoretical framework on how to study the development of out-of-home advertising.

Eleven distinct urban audience-building strategies emerged, each of which mobilizes a particular approach ("breaching," "flow interception," "engagement"), or a combination of them, and conceptualizes its targets from both zoning of the city by consumption bands and the identification of different patterns of mobility in space (that of the "the commuter," "the shopper," and "the tourist"). We analyze these eleven strategies through a historical comparison with their older analog antecedents, and we will show how urban experience since the beginning of consumer capitalism is not only "branded" but also "grammaticalized" – and in some cases properly disciplined – by urban marketing techniques (modern and contemporary).

"Urban Politics" As A Practice: The Nexuses Of Everyday Urban Life, General Understandings And Visions Of Urban Future.

Marta Smagacz-Poziemska

Jagiellonian University, Poland

The main, but also quite general, goal of my presentation is to demonstrate the usefulness of the theory of social practices (Schatzki 2002) in analyzing and understanding urban processes. I want to demonstrate this utility by addressing the question "Where is urban politics?" posed a decade ago by Rodgers, Barnett, and Cochranet (2014) and formulated in the context of the global financial crisis and its consequences for the positioning of cities in power relations. The authors emphasized the need to seek and develop theories that would capture the city in a dynamic, relational arrangement of what is social, environmental, and material; human and non-human. I ask the same question now, as crises and sources of uncertainty become increasingly serious and intertwined (environmental, democratic, economic, geopolitical crises). Using the theory of social practices as conceptualized by Schatzki (2002) to problematize and analyze urban processes, I aim to answer the question of where urban political narratives are anchored and from what sources they draw. Based on the material from mix-methods research conducted in two Polish cities (case studies: Krakow and Walbrzych), I will reconstruct the main features of "urban politics" as a practice: the connections between daily life routines in the city and resources from the past (materialized and present in city narratives) and visions of the future that are interpreted and translated into political programs.

Rodgers, Scott and Barnett, C. and Cochrane, A. (2014) Where is urban politics? International Journal of Urban and Regional Research 38 (5), pp. 1551-1560.

Schatzki, T. R. (2002). The site of the social: A philosophical account of the constitution of social life and change. Penn State University Press.

RN37 | T08_02: Stigmatized Urban Spaces: Tourism, Politics, and Community Dynamics

Gazing at "Le Vele": Ruin Porn and Slum Tourism in a Stigmatized Housing Complex of Southern Italy

Sara Iandolo[1], Daniela de Michele[2]

1University of Turin, Italy; 2University of Naples Federico II, Italy

The proposed intervention analyzes the phenomenon of ruin porn (Lyons, 2018) and the peculiarity of Italian slum tourism drawing from ethnographic insights acquired through guided walking tours around the stigmatized housing complex (Horgan, 2020) of "Le Vele" in the neighborhood of Scampia in Naples, Italy.

Scampia, built in the 1960s as part of a public housing program, became internationally popular because of "Le Vele" (the sails), a complex of seven mega-buildings inspired by Le Corbusier architecture. "Le Vele" were illegally occupied during construction (Marelli, 2019), while low building quality, state withdrawal, and organized crime presence fueled a ruination process (Stoler, 2013) that turned them into symbols of failure and urban decay. After decades of heated debate over demolition or preservation, four of the seven "Vele" were torn down between 1997 and 2020. The significative history of these buildings, together with the success of the TV series Gomorrah, fostered guided tours organized by various actors: from neighborhood associations to informal and official tour guides. Starting from participant observation of different guided tours, the analysis of tourists' discourses and the inhabitants' reactions, we will reflect on the specificity of Italian peripheral tourism, examining the contradictions, negotiations, claims and conflicts associated with it. The intervention will also draw on the socio-material meaning of urban ruins (Stoler, 2013). Indeed, gazing at these majestic ruins, tourists experience the fragility of our political and economic system and the ephemerality of human life, while for inhabitants, ruin porn generates a cyclical trauma consciousness (Lyons, 2018).

1160

Doing and Undoing Communities: The Spatial Politics of Józsefváros's Municipalities in 2009-2018 and since 2018

Tünde Virág[1], Vera Messing[2]

1HUN-REN Centre for Economic and Regional Studies; 2HUN-REN Center for Social Sciences

This chapter aims to contribute to "centring neglected Eastern European perspectives on urban marginality" by focusing on the construction and dismantling of the imaginary "Roma/Gypsy ghetto". It provides analysis and example of governing an urban area that had been historically characterized by high levels of ethnic, religious and social heterogeneity, yet still stigmatized as an ethnic "ghetto" by the mainstream society for several decades. We take the analytical concept of Wacquant's ghetto and anti-ghetto (2008, 2012) and study the interconnected mechanism of invisibilisation and racialization of different local groups. We will show the significance of local approaches to challenging the image of the "Roma ghetto" in an urban neighbourhood where a large Roma population has long shared spaces with other ethnic groups in the district of Józsefváros, in Budapest. The empirical study, which included structured interviews with local municipality and NGO actors, offers an excellent case to compare the working and the consequences of contrasting spatial politics and the opportunities and limitations of local governance in a centralized de-democratizing regime. The first one of FIDESZ's order and border approach to local space in the period of 2009-2018 and the second, is the municipality composed of civil organizations in the period since 2018, that is greatly inclusive and participatory.

The State of the Fragmenting City

Troels Schultz Larsen, Kristian Delica

Roskilde University, Denmark

Over the past few decades, but especially after the pandemic, we have seen an intensification of the political and bureaucratic production of and reliance on forms of stigmatization in the governance of urban marginality. Building on a neo-Bourdieusian approach (Wacquant 2022;2023), our key argument here is that we should not see (territorial) stigmatization as merely the result of discursive struggles (in the media and (populist)politics) or the unfortunate side effects of policies. Rather, we must view them as integral to contemporary forms of urban governance (Schultz Larsen & Delica 2021). Viewing forms of (territorial)stigmatization as integral to the governance of the (post) COVID city, opens a number of new questions and avenues of inquiry. How did territorial stigmatization become integral to urban governance? Is this, in fact, a new phenomenon? How do we link the analysis of the effects of territorial stigmatization and policies of de-stigmatization with the analysis of its production, if this is part and parcel of urban governance? To address these questions, we argue that we must link the study of the urban with the study of the state, as the state is the site for the struggles over not only the urban but also the struggles over the governance of governance, that is, the struggles over the principles of urban governance. In this paper we present our efforts to produce a neo-bourdiusian model which can bring the struggles over the state, the urban and the street in to a coherent analytical framework geared for empirical confrontation. And demonstrate its value in the case of Denmark (and the ghetto-list) and Denmarks surpising transition from humanistic forerunner toward to right-wing inspiration.

On the Unintended Consequence of Area Stigmatisation: Selective Flows of Residents in and out of Swedish Vulnerable Area

Juta Kawalerowicz[1], Gabriella Elgenius[2]

1Stockholm University, Sweden; 2University of Gothenburg, Sweden

In this paper, we use Swedish register data and regression analysis to estimate the extent to which putting an area on the police-denominated list of vulnerable areas (herein utsatta områden) affects the flow of residents in and out of these areas. We hypothesise that putting areas on a publicised list makes these areas less sought after incentivises residents to move out. Recent research observed that putting areas on the vulnerable areas list is associated with a drop in housing prices (Andersson et al., 2023), this research is an extension of this inquiry and will focus on flows of residents. Even though area policies such as the police list of vulnerable areas list may be well intended with the objective of focusing resources on improving living conditions in these areas, they may unintentionally create a situation where the outcome is a further concentration of poverty, which may only escalate existing problems (Wilson, 1987). Moreover, we address the lived experiences of residing in an area on the police-denominated list and outline key themes that contribute towards explaining the quantitative patterns above. We do so with help of a large-scale qualitative dataset and semi-structured interviews collected 2019 – 2023 with residents, civil society actors and other stakeholders in five vulnerable areas in Sweden.

Youth in Vulnerable Neighborhoods of Madrid. Experiences and Urban Supports

Erik Dueñas-Rello, Jose Santiago

Universidad Complutense de Madrid, Spain

This communication will share the results from an investigation about the experiences of young people living in six vulnerable neighborhoods in the city of Madrid: Embajadores, Bellas Vistas, Moscardó, San Isidro, Entrevías, and Palomeras Sureste. The youth collective is one of the most affected by processes of job precarization. Added to this is the increase in the rental market prices in Madrid over the last decade, which impacts on the problem of late emancipation.

We will discuss the specific risks affecting young people, leading to the formation of vulnerability zones (according to Castel) resulting from urban segregation processes. Through a summary of statistical data, and the analysis of semi-structured interviews with 12 young individuals and 45 key informants, we will show how the studied neighborhoods gather to a greater extent different issues: labor precarity, difficulties in accessing housing, and even a higher prevalence of socioemotional problems. These factors will be framed in the pandemic and post-pandemic context in which the interviews were conducted (year 2022).

We then conclude by addressing how the neighborhood becomes a central support in confronting situations of crisis, such as those experienced during the pandemic period. We propose to study the different urban supports that young people mobilize to absorb the forms of vulnerability they face, but also to establish roots as a form of identification and a sense of belonging that arise from daily practices (Blockland) stemming from the same condition of vulnerability they experience. This communication is part of CO-MURES project (H2019/HUM-5738).

Neighborhood Social Vulnerability and Cognitive Function in an Older Cohort of Minoritized Adults in the U.S.: A Longitudinal Analysis

Sandra P. Arevalo

California State University-LongBeach, United States of America

Background: There is limited evidence on residing in vulnerable neighborhoods and cognitive function in diverse older adults. We examined longitudinal associations between four indices of social vulnerability and cognitive function in a cohort of older Latinx adults residing in the Northeast of the U.S. (N=1,500).

Methods: We used mixed-effects linear regression analysis with three waves of data (wave 1, n=1500; wave 2, n=943, wave 3, n=444). Neighborhood vulnerability was measured from the CDC/ATSDR Social Vulnerability Index (SDI) developed with 16 U.S. census variables data. Four factors of SDI were included (Socioeconomic Status, Household Characteristics, Racial/Ethnic Minority Status & Language, and Housing Type/Transportation). Participants were matched to census block groups and linked with SVI. A factor score of global cognition was derived from a battery of cognitive tests administered at 3 in-person visits. Mixed-effects linear regression models were fit to assess changes in global cognition scores (GCS) at baseline and over time adjusted for age, sex, education, health behaviors (smoking, alcohol use, BMI, high blood pressure), and health conditions (heart disease, diabetes, and depressive symptoms).

Results: At baseline, mean age was 57.1 y SD=7.6, and 71.5% were female. In adjusted analyses, no significant associations between GCS and the four factors of SDI at baseline were found. However, a protective effect of Neighborhood Racial/Ethnic Minority Status & Language on GCS was observed in wave 2 ($\beta=0.97$, SE=0.05, 95% CI $0.006-0.189$).

Conclusion: Beyond individual characteristics, neighborhoods with higher proportions of ethnic minorities may positively impact the cognitive function of older diverse adults despite the socioeconomic vulnerability that characterizes them.

1162

Bound by Hybrid Lifestyles: Challenges Faced by Young Generations in Lisbon and Oslo

Maria Assunção Gato[1], Mina Di Marino[2]

1ISCTE-Instituto Universitário de Lisboa, Portugal; 2Norwegian University of Life Sciences, Faculty of Landscape and Society, Norway

Northern European countries have been catalysts of many spatial, generational and social transformation dynamics, including new ways of sharing (e.g., housing, workplaces, mobility, services, etc.). Southern European countries have been following these trends at their own pace, and with the necessary context adjustments. In both, young people navigate spatio-functional, social, and digital shifts, leading to intricate interactions and relationships, often referred to as hybridity. Simultaneously, they grapple with generational tensions and challenges in accessing suitable housing and employment with a proper income. Furthermore, there is a growing expectation for them to allocate increased attention to climate change and sustainable issues.

In general, young adults display heightened receptivity to emerging trends and lifestyles characterized as hybrid, encompassing co-housing strategies with increased mobility, flexible workplaces, diverse spatial arrangements, and various socio-cultural influences, coupled with a pronounced digital dependency. Despite ongoing discussions surrounding hybrid cities, there remains an uncertainty about how

this concept manifests in the lifestyles adopted by young adults who serve as key protagonists in these trends. Additionally, it is unclear how these lifestyles intersect with climate change and sustainable issues, especially in distinct cities such as Lisbon and Oslo.

This presentation seeks to address these gaps through a comparative study between the two cities. By doing so, it aims to illuminate the hybrid nature of new urban lifestyles, highlighting the challenges faced by a generation that, despite being exceptionally well prepared for the demands of the digital transition, finds itself hampered by the extractive economic model prevalent in urban areas.

Body, Mobility On Bicycles And Everyday Racism

Henrique Chaves[1], Inês Vieira[2], Judite Primo[2]

1GOVCOPP-UA, CEM-USP, CIES-IUL; 2CeiED, Lusófona University

In Lisbon, on 11/18/2023, around 300 young people and children crossed the city on bicycles doing stunts. It was a "Bike Ride" by the Wheelie Gads movement, in Portugal since 2020, with dynamics parallel to those observed in other cities around the world. Almost all participants were male, many were non-white people and lived in peripheral neighborhoods of the Lisbon Metropolitan Area. Their acrobatic and group crossing made them more visible, arousing interest and applause; other cyclists in the city have a more precarious experience, namely delivery workers, also mostly male, of immigrant origin and racialized. Both groups share an intense use of the city's streets (the first for leisure, the second for work), in a means of mobility supported by their male, young and non-white bodies. In contrast, bicycle users in Lisbon are mostly white people, with greater gender balance (despite the majority being male) and move in more central areas, with better infrastructure dedicated to cycling mobility around their homes, jobs and schools. Bicycle mobility thus reflects coordinates of differentiation and inequality of racialized bodies in the city and the metropolis.

In this communication proposal, based on different ongoing research projects, we intend to discuss and relate issues of urban mobility (especially cycling), including public policies and the way in which they can segregate and make territories and people invisible, and racial issues, enhancing the identification of situations of everyday racism based on mobility.

RN37 | T09_01: Inside and Outside the City Borders: Suburbanization Trends B

The Post-Industrial Metropolis And New Suburbanisms: Placing Almada In A Global Diversity Of Sburubs

Pedro Reis Cortez

CICS.NOVA, Portugal

The processes of globalization, neoliberalism and post-Fordism have challenged the classic dichotomies between urban and suburban, thereby also changing the suburban landscape. Almada, a suburban city on the south bank of Lisbon with a history of working-class settlement and political activity, has seen major transformations in recent years, now being part of the post-industrial metropolis and being affected by gentrification process. This essay analyzes these changes in the suburban landscape of Almada, in comparison with other forms of contemporary "post-suburbs". However, there is no consensus within academia regarding the notion of suburbia: while some authors focus on the geographical aspects of these territories, others define suburbia by specific sociocultural characteristics. If today we live in a "suburban planet", where the majority of the population live on the urban fringes, we must take into account the different types of suburbs around the world when we define them. To position Almada in this global diversity of suburbs, I first resort to an literature review on the notion of suburbia and the different models of suburban development, from the Anglo-Saxon model to the most recent processes of mass suburbanization in the Global South, also discussing the ideas of global suburbanisms and post-suburbs. In the last part, an data analysis of statistics and official documents that help to classify Almada as a suburb based on its location, density and sociocultural aspects. The results place Almada as a center of business, commercial activities, education and development, and a site of gentrification, challenging the idea of the dormitory suburb. The main contributions of this research are in overcoming the classic dichotomies between urban and suburban, analyzing Almada as a site of suburban gentrification, doing it so with an analysis of the phenomenon on its metropolitan scale.

1163

Who Owns the Streets? Understanding Social Representations Of Youngsters Use Of The Streets In Public Policies, And Their Consequences

Beatriz Lacerda[1], Ferro Lígia[2], Raposo Otávio[3]

1Faculdade de Letras e Instituto de Sociologia, Universidade do Porto, Portugal; 2Faculdade de Letras e Instituto de Sociologia, Universidade do Porto, Portugal; 3CIES, ISCTE-Instituto Universitário de Lisboa, Portugal

In Portugal during the late 1990s, concerns escalated, fueled by the media, regarding the "uncivilized" emerging youths. The evolution of the urban landscape in the large cities of Porto and Lisbon, influenced by growing migration, gave rise to new social dynamics in the public space, especially in the most peripheral areas. This era proved to be a fertile time for artistic expression in neglected regions, with the particularity of producing opposite social representations: "marginality of the street" simultaneously became identities of resistance and a symbol of conflict and disobedience.

In response to these fears, public policies were implemented to support these young people, whose educational and professional paths were marked by failure. The "Choices" programme emerged as the main policy, designed to take young people off the streets, encapsulating them in a stigmatized image of a rebellious "gang of teenagers" and the Street as a place that produces these "devience".

Over two decades later, amid a recent pandemic that has reshaped public space usage, the same public policy persists in these regions. However, these young people are now portrayed as apathetic and purposeless, even if associated with violence. Intervention programs are now designed to extract them from their homes re-integrating them into public spaces, streets, and communal living.

This paper will present initial outputs from PERICREATIVITY project, such as discursive analysis of institutional documents targeting youth in segregated territories and analyze the changing media representations of youth and "their" streets over the past two decades. Additionally, initial insights from ethnographic fieldwork in a social neighborhood in Porto will be shared. The study follows the daily lives of a group of youngsters involved in a social intervention program, allowing access to their subjectivities and practices in public spaces. These initial findings are crossed with the perspectives from the technicians who monitor them and the participant observation of the territorial dynamics of the area. This serves as a preliminary effort to update the social representations of the segregated youth and its appropriation of the streets, as well as the image of the "streets" in public policies.

Peripheral Portugal: conceptualizations and epistemologies on the Lisbon and Porto's suburban territories

Otávio Raposo[1], Lígia Ferro[3], Rita Cachado[1], Gabriela Leal[2], Pedro Varela[1], Mateus Sadock[1]

1ISCTE-Instituto Universitário de Lisboa; 2NOVA FCSH-Universidade Nova de Lisboa; 3Instituto de Sociologia e Departamento de Sociologia da Faculdade de Letras da Universidade do Porto

The notions of suburb and periphery have historically been used to describe socially precarious spaces, highlight urban problems and situate deviant lifestyles. As urbanization processes have intensified, reproducing injustices and reinforcing stratification and social inequalities in cities, those who occupy marginal and peripheral positions in the current neoliberal order have been creating new symbolical meanings to characterize their margins. In Portugal, the debates on these matters started in the 1970s and 80s, a period of strong suburbanization and urban growth. In this paper, we aim to analyze how peripheries and suburbs have been conceptualized by social science over the last few decades in Portugal. We will also analyze the media, political, and governmental narratives that exclusively mark these territories as places of poverty and danger. We pay particular attention to the new debates influenced by recent urban epistemologies emerging from the growing affirmation of anti-racist struggles and peripheral identities in the Portuguese post-colonial landscape.

1164

As part of the PERICREATIVITY project, this paper starts from the theoretical reflection and ethnographical fieldwork in Lisbon and Porto's outskirts to think about the topic of peripheries beyond the apocalyptic and dystopian perspectives, proposing alternative routes of recognition that broaden the production of knowledge about the urban experience.

Young People's Mobilities, Roots and Senses of Place in Vulnerable Neighbourhoods of Madrid

Carlos Rivas Mangas, Margarita Barañano Cid

Complutense University of Madrid, Spain

In this exploratory study, we undertake an analysis of the various senses of place held by young people living in vulnerable neighborhoods of Madrid. The communication is supported by a specific analysis of the empirical evidence produced by the COMURES-CM research done between 2020 and 2023, including a content analysis of the interviews conducted in 6 vulnerable neighbourhoods in Madrid.

Based on a relational understanding of places, spatial life narratives are analysed, paying attention to the combination of mobilities and rootedness. The chapter classifies the

research results around three types of mobility: migrations, residential mobilities and day-to-day displacements.

Local spaces, generators of senses of belonging and attachments, have gained special relevance for young people who live in vulnerable neighborhoods. This is evident in their desire to live close to their friends, the narrative presence of public familiarity, their senses of home, their appropriation of local spaces and participation in neighborhood associations during the Covid-19 pandemic.

Beyond the theses that support a detachment of young people from their neighbourhoods due to the hyper-mobility that characterises this group, what is highlighted here is the wide range of the senses of belonging and the different forms of rootedness and tensions in social and everyday life.

RN37 | T09_02: Urban Policies and Social Dynamics: Intercultural, Participatory, and Crisis-Responsive Approaches

The Role of Cities in Intercultural Policies: A Comparative Case Study of Vantaa and Botkyrka's Local Policies

Sarah Khan

Åbo Akademi University, Finland

This research explores how cities shape intercultural policies, focusing on Vantaa and Botkyrka, two Nordic cities in Finland and Sweden, with distinct policy variations. Despite similar governance structures, these cities exhibit policy variations, prompting an investigation into the underlying forces driving intercultural policies.

1165

Diversity, viewed as both an asset and a source of tension, poses challenges in urban areas, necessitating inclusive local government policies to combat discrimination against immigrants and ethnic minorities. This study addresses gaps in understanding these complexities and aims to unravel the intricacies of intercultural policies in cities.

The research addresses "How" and "Why" questions about intercultural policies using a comparative case study approach. Botkyrka, with a high Intercultural Cities index, contrasts with Vantaa, which is currently experiencing an immigration influx. The study explores factors influencing policy variations within both cities' socio-economic, legal-political, and religious-cultural domains.

Employing an interdisciplinary method involving document analysis and semi-structured interviews, the research seeks to uncover the rationale behind each city's policy preferences. Outcomes may include a nuanced understanding of sociological dimensions shaping intercultural policies, identifying drivers like perceptions of outsiders, politicization of immigrants, triggering events, shared identity, and stakeholder influence. These findings contribute to existing literature, inform future studies, and provide policymakers with insights for effective intercultural policies.

The project comprises three main articles. The first examines interculturalism in Vantaa and Botkyrka's policies, the second explores why specific policies are more intercultural than others, and the third identifies drivers and stakeholders behind intercultural policies, comparing Vantaa and Botkyrka.

Policies of the Possible: Top-down Participatory Processes and Space for 'Inconspicuous Innovations'

Terezie Lokšová

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

Participatory urban governance and the involvement of citizens in local decision-making are being revived in the face of global challenges, such as climate change. Participatory processes are often believed to foster social cohesion and channel valuable local knowledge. However, public involvement is not free from tensions between experts and inhabitants and between formal and informal practices that tend to compromise the desired effects. This presentation considers three decades of the formal attempts for public involvement in urban design and planning in Czech cities to understand how the relationship between the expert approaches and local mundane practices and knowledge has been shaped.

My research is based on semi-structured interviews with expert practitioners (architects, planners, consultants, facilitators) and media analysis (1989-2022). It demonstrates how the position of the locals and their knowledge, as well as the notions of good, innovative, relevant participatory practices, developed over time: Firstly, the early 1990s expert discussion of modes of local administration or conceptual architectural issues have been overridden by NGO-driven emphasis on democratization and small-scale projects in public space. Later, the emphasis shifted from public sector capacity-building to project management and private know-how. Throughout the process, urban policy mobility, mainly from Western cities, influenced how cultures of public participation on the municipal level developed, shaping the policies of the possible in multiple ways.

Through this temporal development, I discuss how the potential for inclusion of the local voices has been selectively constrained to open channels for future recognition of local voices and mundane practices that may be a source of already present 'inconspicuous innovations' (Ferenčuhová 2020, project proposal, https://cescame.soc.cas.cz) potentially helpful in addressing local expressions of global issues.

Urban Policies And More-Than-Human Actors In Times of Crises

Katarzyna Faustyna Krzemińska

Jagiellonian University, Poland

The presentation addresses changes in urban policies during the climate crisis, the COVID-19 pandemic and other local crises covering the period 2020-2024. The author will present the results of a comparative study of two cases: Polish cities Kraków and Wałbrzych.

Using social practice theory, the author explores how urban policies are done, in particular by including more-than-human actors in the design, implementation or negotiation of their place in thinking about the city. The interconnected climate and pandemic crises, following inflation and changes in political power make urban institutions operate in a state of constant uncertainty. The pandemic and climate change are affecting perceptions of the role of the city, urban life and urbanity as a practice in terms of green spaces, which are currently the places of increased civic activity concerning more-then-human inhabitants. In particular, there are numerous artistic and grassroots initiatives in Poland's biggest cities towards protecting such areas in order to positively affect city's biodiversity, increase the availability of public spaces etc. The question posed in the presentation is whether this turn in perceiving green spaces (and in consequence their more-than-human inhabitants) by city dwellers affects the process of doing official urban policies – eg. planning, (re)negotiating, and implementing them.

The presentation is based on empirical research in the form of comparative case study using a number of IDIs conducted with executives from different municipal units in both cities. Additionally, the author uses the analysis of strategic documents and interviews with inhabitants of the areas surrounding selected cases.

1166

RN37 | T09_03: Socio-Spatial Dynamics at the Neighbourhood Level C

Becoming 'Digital' Neighbours in Vertical Cities. An Analysis of Digital Residential Interactions in Densely Populated High-rise Condominiums in Central Santiago, Chile.

Vicente Ernesto Yanez Garrido

The University of Manchester, United Kingdom

Housing verticalisation has aroused multidisciplinary interest worldwide in an attempt to grasp, through local and comparative cases, how contemporary urban configuration affects the way urban settlements are inhabited. Santiago de Chile, commonly regarded as an example of market-driven urbanism, has been immersed in a process of radical housing densification, presenting a mushrooming of high-rise condominiums coupled with an increase in rental tenure. This has been accompanied by a series of concerns, such as loss of attachment, lack of mechanisms to integrate tenants into management, subsequent governance difficulties, and social problems stemming from the high density of construction and co-ownership style, which become some of the key challenges of today's urban management.

Drawing on a year-long ethnography in high-rise condominiums in a densely populated area of Santiago's central district, consisting of participant observation and more than 50 in-depth interviews, I will focus on the emerging digital spaces inside these condominiums. I intend to analyse how digital platforms emerge as instances of spatial appropriation in a context where tenants' opportunities for participation in management are limited and owners, many of whom are private or large investors, are absent. I will show how the digitalisation of relations between residents to some extent disrupts the presumed isolation and detachment of building residents, creating arenas that lead to previously non-existent community relations that ultimately lead to a sense of togetherness. I will also explore how the digital nature of relationships also has an adverse effect on the way residents engage with common issues in high-rise.

"A Concrete Desert?" A Proposal for Answering Questions About Late Socialist Block of Flats (LSBF) in the Context of the Phenomenon of Their Vitality in Poland

Marek Nowak[1], Sławomir Palicki[2], Lucyna Błażejczyk-Majka[1]

1Adam Mickiewicz University, Poznań, Poland; 2Poznań University of Economics and Business

The issue of late socialist block of flats (LSB) has been marked by ambivalence for years (Wiest 2011; Kabish, Possbeck, Soeding, Schlink 2022; Pluciński, Nowak, Błażejczyk-Majka 2022). At the level of public discourse, the sources of this ambivalence was strongly linked to the ideological underpinnings contested since the early 1990s in Central and Eastern European countries.

The object of this article is an attempt to interpret the available research data (referring alongside other studies to the 2018 study carried out in Poznań; Nowak, Siatkowski 2022) to answer questions about the contemporary condition of LSBF. In doing so, we treat the presence of block housing as a natural experiment of a form of housing that has gained mass scale at the regional level since the late 1960s. The results of this natural experiment: elements of the diagnosis, allow us to evaluate the block housing as a form of habitation in a broader perspective of historical and socio-economic-institutional conditions. The context of the contributions will be contemporary trends and forecasts aiming to consider contemporary cities' challenges.

The authors answered 3 questions: what might have determined the relative vitality of the LSBF? What contribution to vitality did and does the housing organisation have? What contribution to this relative endurance is made by neighbourhood relations and the peculiar urban handicap, which was, for example, the preservation of a relatively dispersed building form? The answers aim to indicate elements of a recommendation that take into account the issues of length of residence, the specifics of social management and the needs of redundant spatial development.

1167

Living Among Similar: Residential Compounds as New Ways of Living in Urban Space

Henar Baldán[1], Nayla Fuster[2], Joaquín Susino[1]

1University of Granada, Spain; 2University of Málaga, Spain

Residential compounds are increasingly present in contemporary cities. The recent emergence of gated communities, a popular expression of a phenomenon dating back to the end of the 20th century in the United States, highlights a trend among the upper and upper-middle class. However, its rapid global expansion has led to the mutation and diversification of this residential phenomenon, seen in both

physical forms (pseudo-gated or symbolic-gated communities) and social forms (middle-class and/or working-class). In Europe, and more specifically in Spain, this residential phenomenon is manifesting itself strongly and in a very diverse way. According to this, this communication aims to concisely present results from over four years of empirical research on residential compounds in Granada's metropolitan area, Spain. First, a quantitative study to determine the magnitude of this residential phenomenon in Granada and its possible impact on the residential segregation of the population according to socio-economic status. Second, a qualitative study, through interviews, which explored residential values, the importance of security, the search for social homogeneity and neighbourly relations between residents in residential compounds. Finally, some of our results show that residential compounds are an increasingly important residential option – 642 compounds were identified in Granada – and not only among the privileged classes. Moreover, qualitative results show residential values centre around comfort and peace of mind rather than security. This explains the proliferation of such urbanizations in countries where citizen insecurity isn't the driving force, as seen in Europe.

Reflecting a broader securitarian discourse prevalent in Western politics since the early 2000s, security is the primary binding factor for NWG members. As a result, NWGs risk exacerbating tensions among residents, calling for the exclusion of vulnerable individuals who are perceived as threats from urban spaces.

From Security Concerns to the Creation of Homophilic Urban Bonds. A Mixed-Methods Analysis of Neighbourhood Watch in the City of Modena (Italy)

1168

Anna Capretta[1], Sara Del Pezzo[1], Guixia Hu[1], Niccolò Morelli[2]

1Università degli Studi di Padova, Italy; 2Università di Genova, Italy

Within the frame of growing socioeconomic inequalities, urban contexts across Europe have seen the emergence of new forms of vulnerability and tensions among residents. This has led to an increase in security concerns, which have become a key issue to be addressed in urban policies. Neighbourhood Watch Groups (NWGs) have emerged as noteworthy community-based crime prevention initiatives, mobilizing residents' engagement in safekeeping and improvement of quality of life in urban areas. The main focus of the present research is on the role played by NWGs in shaping urban bonds among their members. To do so, this study examines the phenomenon of NWGs in the city of Modena, Italy, where 93 groups are present. The present research employs a mixed-methods approach, drawing on both the quantitative data depicting the socio-demographic composition of Modena's population and the qualitative analysis of the interviews conducted with group coordinators, as well as representatives from local institutions involved in organizing the groups. Lastly, the study relies on digital observation of the NWGs' WhatsApp group chats. Our findings reveal that NWGs effectively foster urban bonds among members. These bonds tend to be homophilic, attracting only individuals with similar socio-demographic characteristics and sharing common security interests.

RN38 | Space, Society and Rurality
RN38 | T01_01: Rural-urban mobilities and inequalities

Mobilities And Immobilities: Life Trajectories Of Rural Youth In Peri-Urban Areas. A Case Study In A Southern European Region.

Gonzalo Reguera-Zaratiegui, Jesús Oliva-Serrano, Andoni Iso-Tinoco

Public University of Navarre, Spain

The emigration of rural youth in disadvantaged territories worsens the decline and depopulation of these areas. Disparities in access to opportunities and welfare services are a determining factor in the complex processes of social decapitalisation suffered by rural territories. Inequalities and difficulties in access to resources condition the life transitions of young people towards qualifications and professional insertion, conditioning their life choices of staying in the territory or migrating to a city. Daily mobility intensification allows for hybrid rural-urban strategies, combining commuting and residence, for access to training and employment in distant areas.

In this paper we explore the transitions of young rural adults, aged 16-34, based on fieldwork carried out in a peri-urban district in southern Europe. This research is part of the project "Rural Access" which is funded by the Spanish R&D&I Programme (PID2019-111201RB-I00). In total, one focus group and 32 in-depth interviews were conducted with profiles of young people of various nationalities, experts, and key informants. The interviews have been conducted in 16 locations to cover the territory of the case study.

The daily strategies of residence, training, employment, and mobility, as well as the aspirations and future expectations of young people have been explored. The results obtained show the importance of the sociological approach to understanding the phenomena of decapitalisation of young people in rural areas. The strong interconnections between physical and social mobility are revealed. We show the multidimensionality of territorial structures of opportunities and how they affect qualification, rootedness, or emigration. Finally, we have developed a criterion to analyse four moments of these rural youth transitions, which are also the subject of public policy discourses on social cohesion.

Urban or Rural? Residential Mobilities between Aspirations and Reality

Aura Moldovan[1], Annett Steinführer[1], Cornelia Tippel[2], Frank Osterhage[2]

1Thünen Institute of Rural Studies, Braunschweig, Germany; 2ILS – Research Institute for Regional and Urban Development, Dortmund, Germany

Urban-rural migration has been increasing in Germany over the past decade. And it is not just suburbs near larger cities that have been attracting in-migrants. Farther located rural areas considered having a less good socio-economic situation are also recording increasingly positive migration balances (Osterhage and Albrecht 2021). For such residential mobilities, housing cost and availability are relevant (Baldenius et al., 2020), leading to new chances and tensions for rural development. Additionally, these mobilities are also an expression of housing desires and normative beliefs regarding "good living" (Peter et al. 2022).

In our contribution, we take a closer look at the interrelation between residential location decisions and the subjectively interpreted spatial categories of "urban" and "rural". We build on empirical material from a larger research project (KoBaLd) that investigates residential (im)mobility decisions of both in-migrants and rural stayers in Germany. As part of a large population survey (n=3,600) conducted in 2020, respondents have been asked about reasons for having moved or stayed in the past and for future moving aspirations, as well as about the perceived degree of urbanity/rurality of their places of origin, destination and aspiration. Results show that while overall there is a preference towards more rural places of residence (small and medium-sized towns, villages), this varies depending on life stages and biographical experiences, including where respondents grew up. We aim to highlight the links between residential choices and images of "urban" and "rural" living, as well as the compromises respondents had to make during their decision process.

1169

Car Dependence, Socio-territorial Cohesion and Rural Peripherialization. Evidences from the Spanish Case

Jesus Oliva[1], Luis Camarero[2]

1PUBLIC UNIVERSITY OF NAVARRA, Spain; 2NATIONAL UNIVERSITY OF DISTANT EDUCATION

The car is the most common means of transport used by residents of rural areas in Europe. Indeed, the increase in car-based mobility has been observed in many countries and in a sustained manner over successive rural generations as opposed to urban dwellers. Its diffusion has intensified rural-urban relations, configuring a much permeable territory in which to live and work as well as networks of flows that define new social structures in the territory.

Envisaging future rural scenarios depends to a large extent on understanding how this autonomous, routine and predictable displacement (Urry) define the social life. An issue frequently ignored by approaches to regional development and which the global crisis and the transition towards sustainable economies bring to the centre of the debate.The paper presents the results of a 4-years research project funded by the Spanish R&D&I Plan that explores accessibility in the different rural policy areas (depopulation, services,..). On the one hand, the automobility system made it possible to attract residents and the provision of essential rural services by displacing professionals from the city. On the other hand, for rural the required mobility entails higher cost of access to opportunities and services. The findings show the impact in sociological terms that mobility has on the exclusion and social participation of rural citizens. In conclusion, it is suggested to study the car not as a mere mode of mobility but as a crucial political issue to ensure that rural policies facilitate social and territorial cohesion.

RN38 | T01_02: Rural heritage, memory and modernity

Tension and Transformations in a Mining Community post-UNESCO Recognition – the case of Roșia Montană, Romania

Bruno Ferreira, Adriana M. Szabo

Arizona State University, China, People's Republic of

Existing literature has highlighted the tensions surrounding the concept of heritage and how representations of heritage and its functions are locally negotiated. Notably, a recent shift in ideology from simply preserving heritage to leveraging it for sustainable development brought community engagement and multi-stakeholder involvement to the center stage of the conservation discourse. On the ground, however, research suggests that negotiating multiple stakeholder perspectives often leads to tensions between and within community factions that scholars define as dissonant or contested heritage. Yet, less is known about using heritage as a transformative tool at the crossroads of environmental protection, community development, and identity politics. To bridge this literature gap, we examine the case of Roșia Montană in Romania, which became a UNESCO World Heritage Site (WHS) in 2021, after a two-decades-long conflict over plans for a foreign-run, open-pit gold mining operation. Disagreement over the very idea of seeking UNESCO recognition was the catalyst for heightened tensions in the community, splitting loyalties along an ideological line that separated paternalistic models of development, reliant on the primary sector, from environmentally minded, heritage tourism-centered paths to community development. To ensure the study's trustworthiness, we draw on multiple data sources from a longitudinal study (2019–ongoing): in-depth interviews (n=46), participant observation, and news coverage of the dispute. Our research indicates that despite efforts from community activists to harness the transformative potential of the UNESCO label through tourism microentrepreneurship, former mining-reliant households see the WHS recognition as a means to antagonize their identity and way of life. We conclude by discussing the role of WHS nominations in the context of contentious community interpretations of heritage and its value.

Moshav : a Modern Village – The Story of a Built in Paradox

Avraham Shnider

The College of Management, Israel

In contrast to other countries, modernism in Israel did not lead to the abandonment of farming through accelerated industrialization and urbanization. Until the turn of the

twentieth century, farming in Israel followed a family-based model, akin to other pre-modern societies. The early twentieth century witnessed the establishment of modern agricultural villages managed as cooperatives. Two distinct forms of modern agricultural villages emerged in Israel:

The Kibbutz: collective organization or commune

The Moshav: Operating as a cooperative, it combines individual and collective values, albeit without receiving the same level of attention as the kibbutz.

The social ideal pursued by the Moshavim (plural of moshav) was a settlement form that integrated individual and collective values. In the classic Moshav, each family cultivated a private farm, resembling a pre-modern village. However, activities such as purchasing raw materials, allocating resources, selling crops, and obtaining credit were managed collectively by the cooperative for all Moshav farms. The cooperative functioned as a modern organization adhering to bureaucratic regulations.

For the spatial design of the inaugural Moshav, Nahalal, architect Richard Kauffman selected a geometric shape symbolizing equality – the circle. This design drew inspiration from a conceptualization of Buckingham's modern idea of a utopian city. The distinctive spatial shape, coupled with the amalgamation of pre-modern and modern values, earned the Moshav a place on UNESCO's list of preservation sites.

Presently, the majority of Moshavim have lost their collective organizational structure due to privatization. Some have also shifted away from agriculture, resulting in many becoming rural suburbs. Nevertheless, the establishment of a modern village, combining family farms with a bureaucratic organization utilizing modern architecture, remains a unique manifestation of the modern idea.

Identity and Space: World War II Memorials and Local Political Identities in Croatia

Marko Grdesic

University of Zagreb, Croatia

Which factors can explain the spatial variation in local-level political identities that is a feature of many countries? This contribution suggests that we need to pay attention to the politics of memorialization in general and the role of historical monuments in particular. The case of Croatia is used in order to show that the presence and condition of World War II monuments is an important determinant of local-level political identities, as measured by electoral results. These monuments were built by the Yugoslav socialist regime but were frequently damaged or destroyed during the 1990s. A spatial regression approach is used in order to accommodate the common problem of spatial auto-correlation. A new data-set is assembled which places more than a thousand World War II monuments in roughly five hundred geographical units in order to predict all national elections which took place in Croatia in the past decade. This analysis aims to contribute to the spatial analysis of political phenomena, with a special emphasis on the geographical embeddedness of collective memory.

Structural Amnesia in Hazelnut Production in Giresun Province of Turkey

Pınar Melis Yelsalı Parmaksız, İlhan Zeynep Karakılıç, Ayşe Yılmaz

Bahçeşehir University

This presentation will focus on how memory interplays in the structural transformation of the hazelnut production in Giresun province of Turkey. Although hazelnut production holds significant importance due to the unique qualities of the hazelnut variety in the region and its importance in the global hazelnut market, it continues to be done on the family-owned lands with small-scale agricultural practices in the region. However, as a result of migration, structural transformation and aging population, agricultural production and accompanying rural lifestyles changes especially under the influence of global environmental risks and the need for sustainable agricultural practices within the region. This presentation is based on a field research conducted in Giresun province during the summer of 2023. More than 30 interviews were made with experts and hazelnut producers. It was observed during the interviews that structural amnesia was dominating the lives of older generations of producers. Structural amnesia is used by Paul Connerton to elucidate the complex interplay between memory and social dynamics referring to a framework for understanding how social structures and practices contribute to the selective loss of historical or cultural memories within communities. This presentation will examine how structural amnesia manifests in hazelnut production in Turkey's Giresun province. It will also explore the implications of evolving rural memory, particularly in terms of potential approaches to reclaiming rural memory amidst the transformation of hazelnut production in the region.

1171

RN38 | T02_01: Counterurbanization and gentrification

Drivers and Sustainability of Counterurban Mobility in (Post) Pandemic Poland

Karol Korczyński, Katarzyna Kajdanek

University of Wrocław, Poland

Mobility, in almost all its scales and dimensions, is one of the most important aspects of social activity affected by the COVID-19 pandemic. While the significant short-term changes in mobility behaviours during the lockdowns have been studied in depth, the long-term shifts are still not fully understood. The pandemic had a particularly significant prolonged impact on internal migrations. Numerous quantitative research have revealed changes in counterurbanization, defined as migration from cities to rural areas beyond the commuting hinterland, although these changes have varied across research areas. Multitude and complexity of macro – and micro-scale factors of individual mobility-related decisions raises the need for qualitative research. Few works have so far addressed the topic of post-pandemic internal migration in Central Europe. This constitutes a research gap, as this region is characterised by specific socio-economic conditions.

The talk is a presentation of the conceptual and methodological framework as well as preliminary results of a research project which main objective is to understand the characteristics of individuals and households in Poland making the decision to move from metropolitan areas to the periphery, as well as their motivations and decision-making processes resulting from their life experiences and structural conditions. The main research method used in the project is narrative interviewing implementing a life course approach. The talk includes review of the main findings of internal mobility research in the context of the COVID-19 pandemic and the life-course approach, an overview of current determinants and directions of internal migrations in Poland and preliminary findings from the conducted qualitative research.

The Rural Wellbeing Advantage Reexamined: An Empirical Analysis of Subjective Wellbeing Components Across European Countries and Settlement Types

Jascha Wagner[1], Gundi Knies[1], Mikko Weckroth[2]

1Thünen-Institut, Germany; 2Natural Resources Institute Finland

Research into subjective wellbeing (SWB) and its social-ecological determinants shows continued debate on the question whether rural areas have higher levels of SWB than urban areas. Besides findings suggesting potential variations by countries and for specific social subgroups, most studies on rural-urban differences have relied on single-item questions measuring the evaluative dimension of SWB (i.e., assessing life satisfaction). In contrast, sociological theories of rural-urban differences in SWB suggest domain specific variation. For instance, higher degrees of Gemeinschaft (e.g., higher social cohesion and collective efficacy) in rural areas might lead to higher social wellbeing or basic psychological need satisfaction. To contribute to this ongoing debate, we use data (about 40 survey questions and over 50,000 total cases) from the 2012 European Social Survey module on SWB to develop a fine-grained model capturing five major dimensions of SWB (i.e., evaluative, affective, basic psychological need satisfaction, mental resources, and social wellbeing). We construct Mazziotta-Pareto Indices to assess SWB not only across countries but also along the rural-urban continuum and for specific social subgroups. In line with past research, we find support for rural-urban differences in SWB (i.e., rural areas show higher degrees of SWB). However, our analyses help to refine this relationship by highlighting that this is not a clear-cut linear process but SWB differs by types of rural-urban areas and SWB dimension. We, moreover, find that without the consideration of SWB subdimensions, we might receive a distorted picture of rural-urban differences for specific social groups (e.g., some subgroup differences are not universal but bound to specific subdimensions of SWB).

1172

The End of the Rural as We Know it: Theorizing Gentrification beyond the Urban

Gözde Orhan

Altinbas University, Turkiye

This study aims to analyze the effects of the middle-upper class migration from the cities to the rural in recent years by looking at the spatial design and reconstruction in Aegean villages of Turkey. The concept of gentrification is usually theorized on an urban scale; however, gentrification is when the upper classes carry their consumption habits to their new settlements and circulate in these new spaces,

so it is possible to consider gentrification in the rural context as well (Phillips, M. 2002; Gosnell, H. and Abrams, J. 2009). Can the settlement of the middle-upper classes in the rural, the return to the countryside, and the gentrification of village be seen as a move towards living the village life as we know it? Or is this a new urbanization experience on a rural scale, another form of creating a safe space that allows the gentrifiers to create their own class-specific comfort zones? Starting from these questions, the study will examine how the pastoral fantasy (Cadieux, K. V. 2005) of urban "immigrants" is constructed and what their motivations are for transforming rural spaces. It underlines the inclusiveness and actuality of the concept of gentrification by addressing the social and spatial consequences of migrations to Turkey's Western Aegean villages. The focus of this ethnography is on the dynamics between recently arrived upper-class individuals and local villagers in Aegean villages, including the changing perception of "village", instances of cooperation and conflicts, and cultural and social transformations.

The Significance of the Swabian Identity in Rural Gentrification

Kyra Tomay, Tamás Ragadics

University of Pécs, Hungary

Several rural areas all over the world have experienced the inflow of urban better-off. Rural gentrification may take various temporary or permanent forms: lifestyle migration, second home ownership or being a short-term visitor. Scholarly interest in rural gentrification is documented by the growing body of publications. In the framework of the research project „The role of gentrification in rural development" (FK-138098) we are investigating different rural areas, where gentrification has taken place, mainly using qualitative research methods. The theme of our research is the migration of middle class and professional/intellectual groups to rural areas: the study of rural gentrification, and the exploration of its consequences. In this section we will present two case studies from the south-west of Hungary, both settlements are villages with a Swabian identity, traditionally inhabited by German minorities. In the presentation, drawing on some 50 semi-structured in-depth interviews, we will explore what makes a Swabian village attractive to the urban middle class to choose the settlement as their new, or second home? How can the Swabian identity be an advantage for both the immigrants related (Germans or Hungarians with German origin) and those who are completely unrelated? In the meantime, we also wonder how they can integrate into these Swabian communities, and how the community regulates and coordinates immigration, and how it is possible that in none of these cases have we seen the radical transformation of the village by newcomers that gentrification can cause in small villages like these, which is widespread elsewhere.

RN38 | T02_02: Identities in question

Saving the Countryside by and for Whom? Images of Rurality and National Identity in Movements for and Against the Re-industrialization of the Swedish North

Katarina Giritli Nygren, Sara Nyhlén

Mid Sweden University, Sweden

Today we witness how geographical and social peripheries are mobilized as "change agents" in the current industrialization and green development in the Swedish sparsely populated north (Norrland). In this article our aim is to explore how images of rurality and national identity is framed in movements both for and against the establishment of a new 'so called' green industry in the Northern Swedish countryside. The prospect of this new establishment has been vividly debated in the local community, both in struggles for (because of job opportunities) and against it (because of the destruction of nature and livelihood opportunities). Combining digital ethnography with critical whiteness and settler colonial perspectives we analyse what kind of images of rural life and identities that is mobilised in the different standpoints. Our analysis shows that both the resistance to and the mobilization of such ideas of renewal and escape are rooted in both the nostalgia for a pre-industrial past marked by simpler ways of life distant from the dirtiness and immorality of the city, and the welfare nostalgic dreams about industrial investments. It also shows how different development goals are invoking different worldviews and ideas on what is best for the local community, making visible the rural as a conflicted space.

The Crisis of Rurality in Armenia: Modernization or Decease.

Aram Vartikyan, Harutyun Vermishyan

Yerevan State University, Armenia

The village's biography in the Armenian history is marked by controversial episodes. The industrialization contrasts the desirable urban lifestyle with the traditional rural existence. The Soviet-Armenian village finds itself in the collectivization's scaffold. The village rolls back and loses effective social positioning's possibility for a long time. Nevertheless, the agricultural production-industrial system became the focal point of the Soviet modernization. The village had modern infrastructures, including schools, cultural centers, and production assets. Soviet State's collapse and the de-modernization severely affects the village and rural life. The winners in this competitive privatization struggle were oligarchic groups. A significant portion of the peasantry, excluded from an imperfect and unregulated market, found

1173

temporary or permanent salvation in emigration. Lands and farms are barren in the absence of previous industrial infrastructures. The life of the peasant is characterized by a short-term perspective and adaptation. The results of the quantitative and qualitative research allow us to find out the alienation from the primary basis of rurality – the land. Failures are at the heart of the told narrative. Peasant renounces his children's rural future. Rurality exists in a simple mythology of traditional positive attachment to place. The anti-oligarchic liberalization of the Velvet Revolution has given rise to a new figure of the peasant—farmer-entrepreneur. He logically triumphs within the realm of capitalist modernization, making profitable competition. We are witnessing the proletarization of the peasants-abandoning lands and transforming into hired workers. However, effective mechanization and modernization pose threats to this evolving role of the peasant too.

English Fox-Hunting and the Countryside Culture Clash

Patrick Finn Lees

University of Warwick, United Kingdom

At the end of the 1990s and the beginning of the 2000s, cultural conflict in the UK was epitomised by the issue of fox-hunting. For many, fox-hunting was a cruel and barbaric practice, associated with the aristocratic elite, while for others efforts to ban the practice were evidence of an out of touch urban middle class willing to ride roughshod over the interests of rural England, motivated more by class and anti-rural bigotry than genuine concern for foxes.

While the issue receded from national prominence following the passage of the Hunting Act in 2004, tension between the hunting community and their opponents has not gone away. Drawing on my ethnographic research conducted with anti-hunt activists in England, I will explore how those on both sides of the debate understand one another, and the place that rural and urban identity play in forming these understandings.

Drawing upon Imogen Tyler's recent theoretical work on stigma, I will argue that while the rural and the urban are often understood in highly negative terms by opponents and supporters of hunting respectively this is not reducible to mere bigotry, but rather the result of strategic attempts to present a particular side of the argument as legitimate. I will hope to show that, for the anti-hunt lobby, successful transformation of countryside practices relies not merely on the negative representation of rurality, but also often on seeking community with sections of the rural population, leading to fluid approaches not only to interacting with rural people but also to understanding their own identities.

Contingent Whiteness: Race, Class and Political Subjectivities in Peripheral Space

James Pattison

University of Lincoln, United Kingdom

This paper contends that whiteness' contingency in its relation to class and other socio-political factors is significant for the emergence of nationalist-populist politics in urban peripheries. Events such as Brexit are cross-class phenomena, however, a significant proportion of working-class Britons voted to leave the European Union (Virdee, 2023). Some analysis has specified transformations associated with increasingly precarious employment, welfare state retrenchment and decline in trust of traditional politics, while criticising accounts which highlight the role played by racism (Telford, 2022). However, the prioritisation of class over race denies their interconnectedness, reflecting the logic of whiteness and reproducing the invisibility of race as a structuring force (Arkins and French, 2023). Drawing on a long-term project on the deindustrialising English coalfields and theoretical insights from critical race theory (Meghji, 2022), I will trace the historical trajectories of (former) coal mining communities' status within national and imperial identity, which has seen a fluctuation between incorporation into, and exclusion from, the boundaries of whiteness. It is this contingent whiteness, and the rewards and privileges it bestows, which is exploited by reactionary politics. The English coalfields are distinct socio-spatial locations to explore these processes. Often developed in rural areas, deindustrialisation coincides with peripheralization from urban centres compounding disadvantage in the present. Additionally, coalfields have been imagined as bounded communities, belying their racialised construction through British colonialism and interactions with the outside world, which surface in representational struggles and tensions between depictions of a white rural idyll and racially degenerate urban space (Pattison, 2023).

1174

RN38 | T03_01: Depopulation and resilience

Depopulation, Restructuring and Resilience: Unlocking the Conundrum of Transformation in Rural Greece

Apostolos G. Papadopoulos[1], Pavlos Baltas[2]

1Harokopio University, Athens, Greece; 2National Centre for Social Research (EKKE), Greece

In Europe today, there is a debate about population decline caused by low fertility rates and emigration. Depopulation affects countries, regions and sub-regional areas and is defined as a sharp population decline that falls well below an adequate population size and indicates that an area has lost its demographic reproductive capacity. However, there are other trends affecting rural areas, such as the influx of internal and/or international migrants, which play an important role in the restructuring of rural areas and the social resilience of smaller and/or larger areas.

This paper discusses the socio-economic and territorial aspects of rural depopulation in relation to the restructuring and resilience of rural areas. It is equally important to consider the spatial dimensions of such changes. Our study focuses on the changes and dynamics that can be observed at the municipal and regional level in Greece and attempts to discuss in more detail the demographic and socio-economic changes in rural Greece. The main source of demographic data for our study is the Greek censuses (1991, 2001, 2011 and 2021). The demographic and socio-economic trends in Greece are interlinked and show different regional and local dynamics. As a case study, the Region of Central Greece is examined in terms of demographic developments in relation to population dynamics and prospects for resilience. Overall, the general picture of rural decline is compared with the regional and local level of restructuring and resilience in rural Greece.

Integrating Social and Solidarity Economy with Geocreativity to Counter Rural Depopulation

Ricard Espelt

Universitat Oberta de Catalunya, Spain

The presentation will focus on presenting the CULTUR-E framework, a project aiming to combat rural depopulation in Spain by integrating cultural engagement with socio-economic development. The project seeks to assess and enhance the socio-economic impacts of cultural activities in rural areas, including the development of a new statistical index and a scoreboard for quantifying these contributions. Incorporating Social and Solidarity Economy and GeoCreativity disciplines, the framework is contextualized within rural areas, emphasizing community-driven, ethical, and sustainable economic activities that leverage rural cultural assets for local development.

Best practices and successful models of cultural engagement in rural settings will be highlighted, showcasing their adaptability and replicability. These examples will demonstrate the role of cultural activities in fostering community cohesion, strengthening local identity, and contributing to economic vitality. The framework aligns with European policies, particularly the Rural Pact and the Social Economy Action Plan, and Spanish rural revitalization policies, aiming to enhance public policy with strategies specific to rural community needs.

The paper will describe CULTUR-E's use of innovative quantitative and qualitative methodologies, including advanced data management techniques, to analyse cultural activity impacts. This approach is anticipated to offer insights into public policy effectiveness and help address rural depopulation challenges. The presentation will emphasize the project's social relevance and its potential in influencing policies for sustainable rural community development.

Exploring Loneliness Interventions From A Place-based Perspective: A Realist Review

Dorien Gryp[1], Leen Heylen[1], Jasper De Witte[2], Wouter Schepers[2], Freya Häussermann[3], Tine Van Regenmortel[2]

1Thomas More University of applied sciences, Belgium; 2KU Leuven, Belgium; 3Vrije Universiteit Brussel, Belgium

This presentation discusses the current research on how interventions from a place-based perspective can prevent and alleviate feelings of loneliness. Not only personal features, such as the socio-demographic profile or the life course, affect the risk for loneliness. The place where you live can have an impact as well, both the physical and social environment (Barreto et al., 2023; Diez-Mair & Roux, 2010). For instance, people living in an area with a bigger proportion of green spaces, such as parks, have a smaller probability of experiencing loneliness (Astell-Burt et al., 2022). However, so far little attention has been devoted to exploring how interventions in the physical and social environment can prevent or alleviate loneliness. Nevertheless, understanding how place-based interventions can be meaningful in addressing loneliness would broaden the scope of loneliness interventions.

We conducted a review of international scientific literature on loneliness interventions from a place-based perspective. We applied a realist approach as we aim not only to understand whether interventions from a place-based perspective affect loneliness, but also 'for whom', 'how', and 'under which circumstances'. This review focuses on the contexts (C) that shape different outcomes (O), and the underlying mechanisms (M) that explain how and why certain patterns of outcomes take place (Pawson et al., 2005). After composing a search string to explore databases, screening and appraising documents, 24 articles were included for data extraction and analysis. This resulted in CMO-configurations,

1175

clustered by program activity. The aim of this review is to build a theoretical framework of different types of loneliness interventions from a place-based perspective and their contexts, mechanisms and outcomes that can guide future research, policy and interventions.

Rural Resilience in the Swedish Northern Inland

Jörgen Sparf[1,2], David Olsson[3], Dimitri Ioannides[1]

1Mid Sweden University, Sweden; 2NTNU Social Research AS; 3Karlstad University

Rural communities worldwide face numerous challenges that threaten their resilience in the face of rapid changes, including demographic shifts, economic disparities, cultural preservation, and social cohesion. Ageing populations and youth outmigration affect the continuity of rural societies, impacting workforce dynamics and community vitality. Economic disparities amplify vulnerability as rural areas struggle with limited access to resources, education, and healthcare, further exacerbating inequalities within these communities. Additionally, the preservation of cultural heritage faces pressures from globalization, technology, and urbanization, leading to identity crises and the loss of traditional practices. However, rural communities also possess characteristics that make them relatively resilient compared to other communities, such as strong social cohesion, local pride, high interpersonal trust, and unique natural and cultural resources. This paper examines threats and strengths related to rural resilience by studying three extremely rural communities in northern Sweden and discussing their implications for building resilience. Through interviews with civil servants involved in resilience promotion, we analyse the challenges and strengths these communities face. Our findings confirm many of the threats highlighted in previous rural resilience research, particularly the vulnerability of certain groups, such as older people. However, our results also suggest that place-based factors and local policies support resilience. Through positive examples, these may even transform deep-rooted societal values and worldviews about the rural world and consumers' preferences and how they link to production systems. The results imply that reviewing how urban-centric policies can be better adapted to rural contexts can create favourable conditions for resilience in rural communities.

RN38 | T03_02: Trust and tensions

Trust in Rural and Urban areas of the EU Countries

Maja Biernacka[1], Pawel Starosta[2]

1University of Bialystok; 2University of Lodz

Understood as a firm belief in reliability of others and institutions , trust plays a crucial role in the way people interact and operate in their social environment.While maintaining a distinction between generalized trust and trust in institutions which depends on what entities are given credence to, the paper is designed to reframe the concep of trust and investigate it in socio-spatial perspective.In particular , we aim to analyze its interplay with respondents' crucial life circumstances , including their domicile and rural-urban specyfic employment.

We ask three research questions:

1.What are the levels of generalized trust and trust in institutions in rural an urban areas and rural – urban employment across the EU countries which were subject to research?

2.What are the patterns of consistency of generalized trust and trust in institutions in the EU countries.

3.Which factors most differentiate the levels of generalized trust and trust in institutions in rural v urban areas and rural v urban – specific employment in the EU countries?

Among other factors we examine socioecenomic status of respondents , their sence of belonging to the local community,subjective wellbeing, and level of civic participation. We examine the above basing on the data from 10th round of the European Social Survey(2021).

1176

Educational Centers In Multicultural Rural Contexts: Between Ethnic and Cultural Tensions And Opportunities For Intercultural Coexistence.

Yaiza Pérez Alonso

Universitat de València-Estudi General, Spain

Multiculturalism is a reality that is increasingly present in multiple rural contexts. This multiculturalism originates mainly from the structural needs of the economic sector (agriculture and its industry) and is consolidated by a lower cost of living than in the cities. The presence of new neighbors of different ethnic and cultural origins in rural municipalities pose new challenges in intercultural coexistence that affect the different areas of daily life (social, labor, educational, health, etc.). In our communication we focus on the study of the management of multiculturalism in educational institutions in Carcaixent, a municipality in the province of Valencia (Spain). These educational institutions

(schools and high schools) become spaces of daily interaction and in them you can observe the tensions and distensions in the process of social inclusion, as well as the receptivity of the host society and the social relations between diverse ethnic groups.

This communication will present the main problems observed in the socio-educational inclusion of immigrant students and reflect on the effects of structural racism in the educational field and its social consequences. Likewise, opportunities for educational centers to promote intercultural coexistence in rural contexts will be explored. This communication is part of Project PID2021-124346OB-I00l "Participation, neighborhood relations and coexistence in multicultural neighborhoods in a pandemic. A comparative analysis".

Policy Mobility, Rurality And Trust: Insights From The Baltic Sea Region

Vassilis Kitsos

University of Greifswald, Germany

The paper will situate the concept of trust in transformative processes in rural areas and from a regional perspective. It will further suggest a theoretical exercise by bridging the above with the recent literature on policy mobility.

A starting point for this study has been the observation that, despite a breadth of policy mobility scholarship on the "urban", the "rural" has attracted less scholar attention. This gap is remarkable considering (a) the importance of rural spaces throughout Europe (b) the intensity of both urban and rural transformation and (c) the persistent urban/ rural friction and on a broad range of topics. For that reason, trust becomes paramount for the transformation of the "rural" through a number of processes and in sectors such as health provision, public finances and social innovation.

From the perspective of the region, the Baltic Sea offers a rich terrain in which a breadth of actors and institutes that promote policy sharing face growing mistrust. In this environment, the research scrutinizes the mobility of ideas and policies, discourses and agency in selected rural policies in eight countries, identifies successes and failures and offers recommendations. Since the empirical part of the research lies ahead, the presentation will offer draft empirical findings, and will mainly seek to develop a theoretical argument.

The paper is part of the project "Fragmented Transformations", subproject "Policy mobility in the rural Baltic Sea Region" at the Interdisciplinary Center for Baltic Sea Region Research at the University of Greifswald.

Autonomy And Loss In Small Towns On The Periphery

Pavel Pospech, Ondrej Klima

Masaryk University, Czech Republic

This paper discusses the ways that inhabitants of small towns in a highly remote region of the Czech Republic experience their peripherality. Based on a set of interviews conducted in the case study region, we have identified two key narratives: the narrative of autonomy and the narrative of loss. These narratives are both competing and complementary.

The competing element comes from the different sentiments expressed through the narratives: while the narrative of autonomy comes with self-reliance and optimism, the narrative of loss expresses feelings of decline and disappointment with the community. The complementary element comes from the way these narratives are weaved together to produce a sense of self-identity: our interviewees understand their peripherality as a condition which, despite the decline of the community, can be overcome with individual activity and hard work. This brings about a sense of pride.

These perceptions perpetuate the image of the neoliberal subject who can "pull themselves up by their own bootstraps" in spite of the lack of institutional support. It also fosters a strongly individualistic perspective in other areas, including attitudes towards technologies and similar issues.

The paper is based on interviews conducted in 2023 with inhabitants of two small towns in an inner periphery of eastern Czech Republic.

1177

RN38 | T04_01: Restructuring through tourism

From Agriculture to Tourism and New Urbanite Residents: The Change of Turkey's Rural Western Mediterranean Under Ecosocial Crises

Mehmet Bozok

Maltepe University, Turkiye

This study focuses on the urban-rural transitions that occur in rural Mugla, which is part of the Mediterranean basin in southwestern Anatolia and is currently experiencing the most severe ecosocial crises as a result of preceding four decades of ecosocial crises. Using the concept of "manthropocene" developed by Hultman and Pulé (2019; 2021), based on the multi-stage qualitative studies I conducted in the region between 2018 and 2023, I argue that as the Mediterranean's ecosocial crises deepen, the rural and urban become increasingly interconnected with waves of population movements. This province has long been known for its yielding agriculture, beekeeping, goat herding, and vast biodiversity.

I argue that the first wave of ecosocial crises began in the 1980s, with the development of mass tourism and the construction of three large thermal power plants. While the region experienced its first wave of urban-originated lifestyle migrants during this time, agriculture remained at the center of economic activity. The second wave is the COVID-19 pandemic (2020-2022), when the urban population migrated to escape the urban problems caused by climate change, 2021 mega wildfires, uncontrolled construction and aggressive mining projects. I argue that as Turkey's ecosocial crises worsened alongside its neoliberal transformation, the rural and urban became more intertwined as urban people arrived to the area as dwellers, entrepreneurs, or officers, and rural people began to abandon traditional agriculture to become low-skilled laborers.

Rural Tourism As a Factor And Outcome Of The Empowerment of Rural Women – a New Conception Of Gender, Space And Rurality

Marina Nedeljković

College of Vocational Studies for Educators – Sirmium Sremska Mitrovica, Serbia

The subject of the research is the role and importance of the development of rural tourism as a factor and outcome of the empowerment of rural women and strengthening their entrepreneurial, creative and innovative abilities, in the context of new conceptions of rural development, which emphasize the internal development factors of a local community, the active role of all its actors and wider engagement and mobilization of general capital of a rural area. In this way, we analyze the sociological aspects of the relationship between the development of rural tourism and gender-balanced and sensitive rural development, with the aim of empowering rural women and the assumption that there is a strong connection and relationship between these two concepts. One of the prerequisites for the development of entrepreneurship and the strengthening of the socio-economic position of women, as a particularly sensitive group in rural areas, all in the context of the revitalization of rural areas and the revitalization of their everyday life, is certainly the maximum motivation and encouragement of the use of human resources (capital), and continuous work on increasing the importance, support and general interest of rural women in the process of diversifying the rural economy, developing rural tourism and generating income from non-agricultural activities in rural areas.

Exploring Ecological Rural Communities: Insights into Sustainable Living and Rural-Urban Dynamics

1178

Saim Buğra Kurban

Mimar Sinan Fine Arts University, Turkiye

Ecological rural communities have gained increased attention in recent years as there is a growing enthusiasm for sustainable living. Typically, these communities are made up of ecological farms, villages, or rural communes and are increasingly formed through the cooperative efforts of individuals with urban backgrounds and professional occupations. Since the 2000s, there has been a significant rise in these groups within Turkey. This research is founded on fieldwork data gathered from four distinct ecological communities situated in rural parts of Anatolia.

In this context, the main questions posed for this study on these communities are briefly as follows: What motivates and inspires ecological community founders, residents, and volunteers to promote sustainable and equitable ways of living? How do these motivations change over time? Additionally, how do ecological communities put in place economic and governance structures that support sustainability while challenging capitalist norms? However, the influence and interconnections of these communities also play a significant role in their local areas as well as on a broader scale nationally and globally. In that context, what types of tensions and transformations are these communities experiencing?

Furthermore, it could be argued that these communities are also conducive to the discussion of assumptions about the contrast between urban and rural areas. Furthermore, it is important to examine these communities within their wider contexts and connections to understand how we continue to perceive rural and urban regions. These

communities can provide insights into the merging of the rural-urban divide.

Extended Urbanization of Turkey's Eastern Black Sea Valleys: A Case of Fırtına Valley

Onur Açar

Artvin Çoruh University, Turkiye

The Fırtına Valley of the Eastern Black Sea Region of Turkey has a dense rural fabric with numerous forest villages, rivers, pastures and meadows. The valley territory has been undergoing a multifaceted transformation during the twentieth century. After long centuries of its agrarian period, the first round of this transformation was brought by a state-led tea industry by the second half of the twentieth century. While the tea industry influenced mostly villages of the valley closer to coastal line, the second critical transformation has started since the 1980s, targeting primarily the peripheralized inner and higher zones of the valley. The leading dynamics of this latest round of neoliberal transformation process are driven by profit-oriented tourism investments and new spatial enclosures designed by nature conservation institutions. This transformation process, which started with very slow steps in the 1980s, continues to gain speed and intensity in the 2000s with regional-scale tourism projects such as the Green Road. This study analyzes these transformations of this predominantly rural geography as a production of an "abstract space(territory)" within the conceptual perspective of "extended urbanization" developed systematically by Christian Schmid and Neil Brenner. It is argued that this extended urban process increases the connections of the region with various centers throughout the twentieth century, amplifying mobilities of people, goods and images more than ever before. This emerging urbanized landscape has also produced conflictual meanings and uses of land as the place increasingly took an exclusionary character where the potential for radical difference is being gradually tamed by the private entrepreneurialism.

RN38 | T04_02: Food as connection

Rethinking Rurality and Local Food Production Through Women's Experiences in the Hungarian Food Sovereignty Movement

Luca Sára Bródy

HUN-REN KRTK Centre for Economic and Regional Studies, Hungary

This study addresses the ongoing scholarly debate surrounding civil society in Central and Eastern Europe (CEE), highlighting the need to transcend the limitations imposed by a Western-centric conceptual framework. In particular, our research delves into the realm of food sovereignty in Hungary, revealing the strength and networks of local food-related practices. Our research is based on a qualitative study conducted between 2020-2021, involving 25 semi-structured 'oral herstory' interviews with women actively engaged in food sovereignty initiatives. The objectives of this research are threefold. Firstly, we challenge the prevailing perception that local food production in CEE is merely a necessity. Secondly, we emphasize the significance of rural local food production. Lastly, we aim to contextualize and illuminate the experiences of women within this movement, considering their broader social and historical context. Our findings converge on two focal points: the movement's encounters with the political-economic landscape of the past three decades and the evolving power dynamics within the movement. By doing so, we aim to contribute to a more nuanced understanding of civil society in CEE by inviting scholars to revise the importance of women's positionality in mundane everyday food-related practices, and to reposition CEE marginality in future food-related research.

1179

Food Self-Provisioning in Croatian Rural Areas – Refurbishing a Common Practice into Social Resilience

Vladimir Ivanović, Tijana Trako Poljak

University of Zagreb, Faculty of Humanities and Social Sciences, Department of Sociology, Croatia

Food self-provisioning (FSP) is a long-standing practice in Croatian rural areas of Croatia that could be used to improve the capacity for social resilience of rural residents and help position rural areas as places of good living. This paper presents the results of a nationwide survey conducted among a representative sample of Croatian rural residents (N=831). The aim of this paper is to determine what the possible predictors of this practice are and whether there are significant differences between rural residents who

grow their own food and those who do not. To achieve this, we used the reliable Flourishing Index (FI) and relevant socio-demographic characteristics to find out which of these characteristics are significant predictors of food growing in Croatian rural areas. Using binary logistic regression, we found that the most important and significant predictors of this practice are age and FI, with older and more satisfied rural residents more likely to practice FSP. The most important reasons for practicing FSP are growing fresh and healthy food, followed by protecting the environment, saving money, and believing that the practice is a fulfilling way to spend leisure time. These results suggest that FSP has the potential to increase well-being and life satisfaction, as it could be a way to motivate more rural residents to utilize the natural environment and grow fresh and healthy food. Furthermore, this could be a long-term strategy to improve social resilience and a way to protect the environment in rural areas, as well as help alleviate the financial pressure of rising inflation and provide food security which, with rising global ecological and other challenges, becomes increasingly important for everyday rural life.

Food Self-Provisioning: A Bridge for the Integration of Urban and Rural Development

Yi Qie[1], Hongwu Sun[2], Huidi Ma[3]

1University of Oxford; 2Jiangsu Academy of Agricultural Sciences; 3Chinese National Academy of Arts

Food self-provisioning (FSP) is one of the most important legacies of agricultural civilizations. In today's world of uncertainties, the practice of FSP enhances resilience and promotes sustainable growth. FSP also has the function of creating and altering spaces in both tangible and intangible ways. With the mutual flow of populations and consumption spaces, FSP promotes balanced development and a symbiotic relationship between urban and rural areas.

FSP disrupts and reconnects the dualities of urban/rural and human/nature. Rural life experiences have become increasingly popular among urban residents, who spend their holidays at farmhouses, orchards, and farmers' markets. Farming-related activities bring people close to nature, where burnt-out urbanites rediscover the integration of the mind and the body through unalienated leisure. FSP is thus viewed as a nurturing practice to enhance one's vitality, creativity and mindfulness.

The philosophy of FSP also contributes to community building by educating its participants on virtues such as diligence, thrift, and solidarity. During the COVID-19 pandemic, FSP not only relieved the stress of food shortage for many households, but also promoted mutual assistance and friendship among community members.

This article starts with sociological empirical evidence but then moves further to explore the significance of FPS as a bridge for integrating urban and rural development. The authors will discuss the future potential of FPS in the framework of sociological imagination, the practical challenges of its popularization in China, and the capacity of "space" as an enabling mechanism for social change.

RN38 | T05_01: Reflections on immigrant inclusion

Unraveling The Structure Of Agricultural Labour In Two Contrasted Farming Systems In Spain

Carmen Capdevila

Universitat de Barcelona, Spain

Farming systems have undergone diverse social transformations in recent decades (e.g., the decline of family farms, lack of generational renewal, the increase of salaried workers, etc.). These transformations pose challenges to their social sustainability, significantly impacting rural areas. In this study, I explore the dynamics of farm labour in two contrasting farming systems in Spain. On one hand, the intensive fruit system in Bajo Cinca County, a rural region primarily dedicated to export markets through large distribution, and on the other hand, the Baix Llobregat County, a peri-urban area focused on vegetable and fruit production for national markets. The objective is twofold: first, to comprehend the evolving dynamics of employment relationships based on farm morphology, and second, to identify social hotspots where the well-being of farmers and workers is compromised. This research relies on a series of in-depth interviews with farmers and relevant stakeholders from diverse backgrounds. The results reveal variations in the use of family labour, the involvement of migrant workers, the situation of women, and the profile of farmers, depending on farm characteristics (such as size, marketing channel orientation, production strategy, etc.). While there is a general trend towards a decrease in family labour, even within family farms, this labour becomes formalized and assumes new roles on the farm. Simultaneously, there is an increase in salaried labour, predominantly comprised of migrant workers. Furthermore, beyond common concerns like physical conditions and income, other crucial aspects related to living conditions, work-life balance, and mental health emerge as influential factors affecting the well-being of both farmers and workers. These considerations significantly influence decisions regarding the continuity of the farm.

1180

Rural Cosmopolitanism, The Fragility of Social Ties and The Vulnerability of Immigrant Population

Ion Martínez Lorea, María jesús Rivera

Universidad Pública de Navarra, Spain

The concept of "rural cosmopolitanism" imagines a rural space that is the opposite of the recurrent image of a small territory, closed in on itself, where nothing happens. In other words, it refers to a porous and changing space in which the arrival of new populations gives rise to a multifaceted scenario, with multiple connections and exchanges

at very different scales. However, this view implies that the migrations of foreign populations are secondary or even invisible, especially when they are highly labour-intensive and precarious in nature. The aim of this contribution is to understand the intricacies of rural cosmopolitanism that is the result of the arrival and settlement of a labour force of foreign origin in rural areas. The discussion presented in this contribution is based on the case study of La Valdorba (Navarre, Spain), an area that has experienced a significant increase of foreign population linked to its agro-industrial development. After an analysis of census data, which allowed us to trace and characterise this arrival, the research was complemented by qualitative fieldwork. This consisted of a series of semi-structured interviews and focus groups with the local and foreign population. In so doing, we were able to observe the emergence of a new social space and the positioning of migrant workers within it.

Language, Intercultural Communication and Integration of Migrants in Rural Communities in Ireland

Pilar Luz Rodrigues, Andrea Ciribuco

University of Galway

In 2017, Ireland had the 4th highest share of migrant population in rural areas in the EU with 11.9%, more than twice the EU average (JRC 2019). And although Dublin had the highest number of non-Irish residents in the most recent census (CSO 2022), Ireland has been home to unique cases of migration to rural areas. The town of Ballyhaunis, for example, is the most diverse municipality in the country, with 37% of the population non-Irish. Nevertheless, most of the literature on migration has focused predominantly on migration to cities and urban areas, with less attention paid to rural settings (Morén-Alegret and Wladyka 2020; Woods 2016). In view of such gap in the literature, this paper aims to improve our knowledge of the experience of migrants and refugees living in Ireland's rural areas with respect to integration with local communities. Specifically, the paper examines how language learning among migrants may generate challenges and opportunities for intercultural communication and integration. It explores the linguistic repertoires of migrants and refugees living in rural areas, as well as the strategies they use to overcome language barriers. The study also investigated opportunities for cultural activities where locals and migrants come together, for shared conversation on rural development, including via translation/interpreting. The paper relates preliminary findings from a project funded by the Irish Research Council, with fieldwork and semi-structured interviews conducted since February 2023 with migrants living in the West and South East of Ireland, including areas officially recognised as Irish speaking regions (Gaeltacht areas).

Dreaming of Being 'My Own Boss': The Dynamics of Ethnic Entrepreneurship in Rural Greece

Loukia Maria Fratsea

Harokopio University, Greece

Since the early 1990s, the integration of migrants into the labour market and the employment characteristics and living conditions in rural areas have been the subject of a growing number of studies in Greece. In this context, the employment and living conditions of migrants in rural areas, their livelihoods and the impact of migrant labour in the agricultural sector and in rural areas in general have been at the centre of academic and public debate. Nevertheless, research on the various forms of ethnic entrepreneurship in rural Greece is rather limited, as the entrepreneurial activities of migrant groups have primarily been perceived as an urban phenomenon.

Methodologically, the paper draws on empirical research conducted between 2017 and 2022 with 30 migrants living in villages and small towns in the region of Western Greece. Based on the life stories of Albanians, Romanians and Bangladeshis, this paper takes an in-depth look at their trajectories in the labour market, starting from their place of origin and along their migration journey. Different forms of entrepreneurship represent an important strategy for social mobility in different economic sectors in rural Greece. Survival entrepreneurship in the years after arrival can turn into building successful businesses or into farming and crop cultivation. The participants' narratives reveal their aspirations that drive them to move from what they call "jobs for migrants" to becoming their "own boss", revealing complex hierarchies in the rural labour market. The paper argues for a more nuanced understanding of ethnic entrepreneurship and social inclusion in rural Greece.

RN38 | T06_01: Rural governance

Governance For Local Development – Approaches Regarding Rural Areas

Madalena Corte-Real[1], Elizete Jardim[2], Ana Paula Oliveira[3]

1ISEC Lisboa, Portugal; 2ISEC Lisboa; 3ISEC Lisboa

In the European context, there is a widespread consensus regarding the imperative need to enhance governance practices in public policies. In order to promote territorial cohesion, namely the development of rural territories, agendas call for the transfer of powers to communities and local civil society organizations with more inclusive decision-making processes and more participatory solutions. Following this goal, in the Portuguese context, the State claims the promotion of decentralization, towards territorial configurations and integrated area-based initiatives.

Within this framework, this work considers the evolution of European Union initiatives, such as LEADER, which are designed to support rural development projects with the overarching goals of enhancing the quality of life and diversifying the economy. LEADER operates through a bottom-up community-led approach, wherein local action groups play a pivotal role in designing and executing development strategies. Focusing on a case study in central Portugal, this investigation seeks to contribute to the reflection on the evolution of the LEADER program. It aims to shed light on the dynamics of relationships and the role played by the partnership approach in promoting territorial development.

The primary objective is to analyse how the program has evolved and to understand the influence of various stakeholders in reshaping the local landscape. The research encompasses a comprehensive analysis of different dimensions at various stages of the program, including undertaken initiatives. Employing a qualitative approach, the study incorporates semi-structured interviews with diverse stakeholders. The hypothesis underlying the research suggests a potential restriction of autonomy in the structuring of local development actions, prompting critical reflections on the evolving landscape of governance within this context.

Rural Anchor Organisations And Community Resilience

Ruth McAreavey

Newcastle University, United Kingdom

Across Europe there is evidence that rural space has become more highly desired than before the pandemic as urban dwellers escaped to the perceived safety of the countryside. Whether or not this is a permanent trend remains to be seen, but it has brought to the fore the interconnections between urban and rural space and the diversity across those different dimensions. Increasingly attention is directed towards 'left behind' places and yet the question of why some communities are resilient seems pertinent. Drawing from extensive empirical evidence from a study based in England, the article identifies key traits of a resilient rural community. The research reveals that the process of resilience is not something that can be easily pinned down, nor is it a matter that is ever finished. It shows how the specificity of place, including the existence of anchor institutions, can enhance community resilience. In contrast to urban anchors, in a rural context, a network of local institutions scaffold together to create an anchor network. However, in places with few anchors and weaker community infrastructure the capacity to upturn deep-seated challenges is limited; there is a need for major strategic intervention, including external investment and engagement.

Rural and urban energy transitions: discourses of Local Energy Communities on energy and territory in Navarra, Spain.

Andoni Iso

Universidad Publica de Navarra/Nafarroako Unibertsitate Publikoa, Spain

Energy transition processes have different impacts on territories. The decarbonisation of electricity generation systems is tackled by promoting the installation of low-emission technologies, but these can occupy large areas and generate major impacts, such as dams or large wind or solar farms. These are owned, in the case of Spain, by large electricity companies that preferentially evacuate it to other urban areas.

In this context, European policies, based on different objectives: the involvement of the population in the energy transition, diversification of energy market players, favouring faster electrification or the use of spaces already built, for example, promote the figures of Citizen Energy Communities and Renewable Energy Communities. These are grouped under the concept of Local Energy Communities (LECs).

In Navarra, there are 24 LECs in different rural localities and neighbourhoods of the main city of the region, either in project or operational form. The processes of formation of the LECs are participatory processes with an important weight of training in technical, legal and organisational aspects. Thus, different discursive positions are generated on aspects such as energy models or the sustainability of the territory. This paper presents an analysis of the documentation generated during the participatory process of setting up Local Energy Communities in rural and urban environments. The documentation studied are minutes, LEC statutes, websites, and all audiovisual production generated by the LEC

1182

Future-Oriented Regional Development In The Focus Of Regime Analysis

Alexandra Von Brunn, Dr. René John

Institute for Social Innovation (Berlin), Germany

Ongoing urbanization and globalization effects pose new complex challenges for regions remote from agglomerations in Germany such as demographic changes, a shortage of skilled workers, digitalization, climate change, biodiversity loss, economic degradation, and energy transitions. Those often lead to social fragmentation and tensions, even though tensions can be regarded as productive expectations for future discourses instead of solely as conflicts. However, remote regions hold a special function for social change as spaces for experimentation (see new-regionalism, Soja, 2009). They are innovative in their capability to shape options for endogenous regional development and thereby, foster future social change. Thus, the aim of this project is to investigate endogenous development in regions remote from agglomerations and contrast four cases from the north-western and eastern part of Germany. It is embedded in the joint research project "ATRAKTIV – Building transformative capacities to activate regional innovation systems".

To guide the investigation, the heuristic of regional regime analysis will be applied. In this session, we will explain the heuristic alongside the three aspects of (1) regionality in terms of localization, (2) innovativeness via debates on ideas, which then translate ideas into (3) governance practices so they can become binding decisions on future development. On that basis, we will provide first glimpses of empirical data at regional localization of relevant actors as the source for formulations of challenges and solutions. These are inputs for the regional future discourse in terms of mutual debates organized by intermediary actors. Such debates help to pack-up the loose ideas into tight programs for the regional development to be decided through regional governance.

RN38 | T07_01: Class and diversity

From The Countryside To The City And Back? The "Creative Class" Turns Rural

Thomas Doerfler

University of Jena, Germany

Is there a shift in the living preferences of Western knowledge societies – an epochal movement of the creative class out of the city? I will try to track this question by the following thesis: Creativity is an urban phenomenon, when we look at the debate in urban & regional studies since Florida (2002) and Landry/Bianchini (1995). What was regarded as deindustrialized ruins of the past turned to creative laboratories of the future. Cities became the motors of modernisation, due to their unusual and experimental life – and work-styles the ground for nearly all debates about the future of (western) societies (smart, post-growth, just cities etc.).

But the corona pandemic has unexpectedly brought about a movement in the opposite direction, and initial figures indicate that we could be dealing with another, the next fundamental change in Western societies (BBSR 2022; ifo 2021): cities are no longer seen as a promise for a better future, as they have been for almost three decades, but are once again perceived as trouble spots of social and economic ruptures. Within a few months, the public image that the media had painted of 'creative', 'cosmopolitan' cities and centers turned around: The city as a space of opportunity became a prison for the pandemic society. First publications spoke of "pandemic urbanism" in order to emphasize the problematic nature of urbanity in pandemic times (Harris, Connolly, Keil 2022).

By giving examples from from the Berlin region I will show how these developments lead to a ‚flight to the rural', which brings about new social tensions between ‚urbanists' and ‚locals' at the countryside: as the „creative class" turns regional, is there a rural gentrification ahead?

Diversity and LGBTIQ* experiences in Rural Spaces

Carola Bauschke-Urban, Zentgraf Jana-Christina

Fulda University UAS, Germany

Diversity in rural areas differs from diversity in urban and metropolitan spaces, as rural areas tend to lack diversity in terms of social differences and inequalities such as race, ethnicity, religion, socioeconomic status, physical ability, sexual orientation, gender identity and other socially signifying categories. There is evidence that also rural population is diverse, rural spaces and their diversities are highly under-researched. Yet, the backwardness of rural spaces

1183

is generally assumed, which also manifests in a predominance of conservative and traditional values. Anti-diversity politics as well as the growing support and justification of minorities such as LGBTIQ+ people, refugees, migrants and other minority groups, more and more becomes a factor of the growing tensions enforced by extreme right and anti-democratic movements, which tend to enlarge to a greater extend in rural spaces rather in urban and metropolitan areas. Adorno coinded the term 'provincialism' as a mindset that justifies the downgrading of marginalized and diverse groups. The more than 40 interviews, which mostly lasted for several hours, represent qualitative interviews with of rurally situated LGBTQ* persons of all genders, sexualities, ages and sexes. The main findings of this biographical study show that invisibility and strong social exclusion of rural queer people is a shared experience of the queer people in this remote rural area. As everyday interaction is coined by hiding their queerness, their experiences of exclusion highly intersect with age, education and sex. These biographical narrations relate to the potential of diversity for social transformation in rural spaces. The paper will thus discuss the sociology of rural spaces against the background of rural diversity and the experiences of queer minorities.

Unveiling Gender Disparities in Post-Disaster Rural Transformation: A Grounded Theory Exploration of Land Use/Property in Hatay, Turkey

Emek Aydin

Kadir Has University, Turkiye

This research question emerged from the unpublished preliminary findings of the Elazığ field of the TÜBİTAK-funded (Scientific and Technological Research Council of Türkiye) project. It has been observed the new houses built by TOKİ (Housing Development Administration of Türkiye) after the earthquake in Elâzığ were constructed as multi-story houses in different areas from the pre-disaster settlements, different from the old, single-story settlement pattern of the villagers. Moreover, while the authorities see the transformation as an opportunity to "urbanize rural areas", in Elazığ, where a large proportion of women are propertyless and landless, and property and land ownership is largely in multi-shareholder common ownership; only property owners were able to benefit from the new housing, and its gender implications were not assessed. Since the context of the research in Elazığ was only disaster preparedness, this research is an emerging study that examines the rural transformation of post-disaster reconstruction efforts and land use from a gender perspective in terms of property regime by using grounded theory. The research is based on data from Hatay, a doctoral dissertation field focusing on disasters that have occurred in the last decade and directly affected agricultural areas/land use. Hatay had 1.03% of Turkey's agricultural land, a 16% share in agriculture and gross national product, and a 29% share in employment. It is one of the cities in Turkey most severely affected by the February 6 earthquakes. After the disaster, it was seen that critical agricultural lands in Hatay were expropriated for the construction of buildings such as mass housing and state

hospitals with the hasty expropriation. With this respect and within the context of the research question, focusing on the expropriation of olive groves where many women engage in agricultural activities, in-depth interviews will be conducted with at least five affected women. In Turkey, there is limited study examining rural transformation and land use from a gender perspective regarding property regime due to post-disaster reconstruction efforts. In this respect, the research topic is both innovative and original.

1184

RN38 | T08_01: Turbulence in places and spaces

Generations Apart: Transformation Of Childhood And Real Life In Hard-to-reach Rural Areas

Ondřej Klíma, Pavel Pospěch

Masaryk University, Czech Republic

We present a cultural analysis of how people in hard-to-reach rural areas of Czechia use the concepts of "real life" and "childhood." Employing a cultural-sociological framework, we analyse a series of interviews conducted in these regions to uncover the deep meanings and hidden structures of what "real life" is and how it shapes the meaning-making process. Our methodology is grounded in the practice of the thick description, allowing for a deep understanding of the cultural contexts and individual experiences that inform these concepts.

We focus on the ways through which perceived distances between the adult generation and their children are experienced and coded and how references to „real life" are used in this process. We suggest that this divergence in understanding is rooted in cultural, economic, and technological shifts that have differentially impacted rural areas of Czechia. Our findings suggest that variations in these definitions are deeply entwined with the lived experiences and cultural context of the symbolic rural-urban divide.

We contribute to the broader discourse on how rural communities negotiate identity and reality in a rapidly changing world, as well as the discourse on the rural-urban divide. By highlighting the unique perspectives of the rural Czech population, this study provides valuable insights into the complex interplay between place, culture, and generational change. It also offers a critical examination of the role of childhood experiences in shaping adult perceptions of reality, providing a fresh perspective on cultural continuity and transformation.

Territorial inequalities and Left-behindness in Italy. A critical analysis from the "Exit" project

Giorgio Pirina, Fabio Perocco

Ca' Foscari University of Venice, Italy

The debate on territorial inequalities in Italy has a long tradition, which has been reflected in a diverse range of terms, such as inner areas, rural areas, mountain areas, depressed areas, marginal areas, sacrifice zones etc. Despite this variety, it is nevertheless possible to link the issue of territorial inequalities and marginality to the lack of investment in infrastructures and services (mobility, education, health, digitalisation, etc.) due to political and economic choices, but also to specific geographical situations and the extremely small size of many municipalities in terms of population.

This paper presents the initial findings of the European project "Exit – Exploring sustainable strategies to counteract territorial inequalities" (Horizon Europe), which aims to anlayse with an ethnographic methodology the factors of territorial inequalities in places that are characterized as "left-behind". Data come from four focus groups with regional and national experts and stakeholders on territorial inequalities in Italy and the (in)effectiveness of public policies to address them, and two ethnographic field studies in two areas: Murano Island, an urban post-industrial area in Venice (Veneto region) and Gennargentu-Mandrolisai mountain and rural area (Sardinia region).

According to the research paricipants, policies to counteract territorial inequalities were implemented through various channels, including EU funding, and interventions took on different forms such as top-down, bottom-up, and place-based approaches. However, the desired outcomes were only partially achieved due to the incompetence of local institutions, reduced public investment in the South, the absence of strategic plans, and limiting factors such as corruption.

Turbulent tides in the Dender: Suburban Tensions, Loss, and Belonging in a Polarized Region

1185

Willemien Van Damme

KU Leuven, Belgium

'Real' rural areas in Flanders (Northern Belgium) are rather rare. Yet Flanders is presented in the minds of its inhabitants as a rural region. In the Dender region, the rural quality has deteriorated over the years, partly as a result of deindustrialization and globalization. The region is mainly known in the public debate because of the strong growth of extreme right-wing populist parties and ethnic diversity. Changing economic and social geographies have given rise to friction and feelings of resentment and otherness between the 'established' and 'outsiders' (Elias and Scotson, 1994). In this research, we focus on the rationales behind subtle, but rapidly accumulating tensions between the two social groups. Based on interviews with established people (16), people who have lived there for generations, and outsiders (11), newly arrived people with a migration background, we explore the meaning of home and the sense of belonging in this polarized region. By connecting Elias and Scotson's (1994) concept of figuration with Hochschild's (2016) 'deep story', we analyze the story of the suburban housing dream to better understand the emotions of loss, hope, and pride and attempt to transcend the polarization between the two groups. This study contributes to social science research on ethnic diversity, whiteness, and the interrelated rural-urban dichotomy by encompassing how the suburban housing dream plays a role in the figuration of established and outsiders and how this is intertwined with their everyday experiences.

RN38 | T09_01: Farming and environment

"For Generations Farmers Have Preserved the Environment, Now You Are Endangering It": Affective-discursive Practices in European Farmers' Reaction to Changes in Agricultural Policy

Melika Mahmutović, Dora Matejak

University of Ljubljana, Faculty of Social Sciences, Slovenia

The farming sector faces a perplexing conundrum: it is one of the sectors most affected by climate change while simultaneously contributing to around 20% of global greenhouse emissions. To alleviate the pressures of agricultural production on nature and climate, the European Union (EU), and consequently the Slovene government, has positioned farmers as crucial actors in providing sustainable food and safeguarding the environment. Accordingly, it has announced the establishment of new rules and regulations that farmers will have to follow. However, farmers are increasingly contesting these requirements, "defending" themselves and conventional agricultural practices as profitable, just, traditional and thus sustainable, issuing demands aligning with the logic of agrarian populism. Despite the obvious potency of farmers' action, scholarship problematizing its manifestation in the context of the impending climate crisis is scarce. In this paper, through the analysis of 2023 farmers' protests in Slovenia, we illustrate the peculiar tension between farmers' self-representation as both champions of environmental protection and those suffering from overblown environmental rules. Through the analysis of media reports and interviews with Slovene farmers, and by using the concept of affective-discursive practices, we examine the interplay of affects and discourse in meaning-making around the climate crisis among farmers which shows mobilization based on anger, fear and anxiety. The paper contributes to knowledge on the climate crisis and agrarian populism in not just Slovene but the European context, uncovering complexities and intricacies of dislocation of farmers' identity as well as the affective narratives behind their opposition to the increasing environmental regulation.

The Struggle for Liquidity: Shaping Rural Markets through Everyday Financial Resistance

Robin Smith

Copenhagen Business School, Denmark

This paper introduces local forms of debt resolution schemes to show how Croatian farmers retain their economic agency and resilience against structural forces by tycoon-owned conglomerates that otherwise dominate the national agri-economy. It shows how rural economies can resist outside pressures to maintain local ways of doing business.

Liquidity is at the center of a power struggle between national conglomerates and family businesses in Istria, a rural agrarian economy in western Croatia. These corporations use their size and dense political connections to coerce smaller clients, like Istrian winemakers, who are also competitors of their various subsidiaries, into financial arrangements that deprive them of cash. Supermarket chains hold the payment of their debts hostage, forcing families into negotiating sub-optimal repayment arrangements that may ultimately still deprive them of the liquidity necessary to make ends meet. These maneuvers threaten to upend longstanding business arrangements, some of which have existed for generations, as families are threatened by liquidity crises.

However, my long-term ethnographic research here demonstrates how families resist through adhering to longstanding values. They devise repayment strategies in-kind or with the help of third parties, so that business can continue despite chronic low liquidity, and rely on verbal contracts and a local economy of trust. By analyzing these informal practices, this paper illuminates how rural economic actors can at once be transformed by external forces while maintaining connections and values that distinguish them from urban, national, and transnational economic actors.

Back to Nature? Future Pathways of Bereg, an Agricultural Area in Rural Hungary

Veronika Fabók[1], Ágnes Kalóczkai[2], Péter Kajner[3], Eszter Tormáné Kovács[4], Zsolt Pinke[5]

1Mungo-Consulting Ltd., Budapest, Hungary; 2Centre for Ecological Research, Institute of Ecology and Botany, Vácrátót, Hungary; 3WWF Hungary, Budapest, Hungary; 4Hungarian University of Agriculture and Life Sciences, Institute for Wildlife Management and Nature Conservation, Department of Nature Conservation and Landscape Management, Gödöllő, Hungary; 5Eötvös Loránd University, Budapest, Hungary

Many post-socialist rural spaces that have been dismissed by capital experience "emptiness" as their material, social, and political relations are restructuring and as they are heading into an uncertain future (Dzenovska 2018, 2020). Bereg, our case study site is situated in eastern Hungary, where we conducted interviews and surveys among land users and local stakeholders. The inquiry was part of a conservation project that aims to restore wetlands in the area. Bereg is a predominantly agricultural area, where the relative shortage of capital manifested in a decreasing population, the outmigration of the youth, the aging of the farmer population, and the struggle of many farms to maintain their farming activity due to the pressures of the market and the struggles of finding agricultural workforce. This led to the rewilding of some parts of the area, as some of the farmers turned a number of agricultural lands into forests

1186

with the help of subsidies. Other areas were going through spontaneous growth of shrubs and trees due to the abandonment of agricultural activity. As part of the change in human-nature relations, land users also increasingly experienced and struggled with the disappearance of water from the landscape. This was caused by the effects of climate change and the land use patterns of the past, that aimed to drain surplus water from the area to favor industrial agriculture. Restoring wetlands in unprofitable agricultural areas and returning to a previous state of the landscape would be beneficial both for ecosystems and land users. It would also be another step towards rewilding the area, which means an unknown pathway for the local society in a rewilded landscape.

RN38 | T09_02: Land use changes and resistance

From the Portuguese Southwestern Alentejo to the Colombian Guajira: Differences and Similarities in regions affected by large extractive investments

Mariana Anginho Évora[1], Claudia Puerta Silva[2]

1Iscte – Instituto Universitário de Lisboa, Portugal; 2Universidad de Antioquia, Colombia

Different fields have a long tradition of studying extractivism. The concept is related to post-development and political ecology theories and refers to appropriating and exploiting natural and human resources, usually from the Global North towards the Global South. It helps explain how rural regions change due to significant global investments. São Teotónio (Alentejo, Portugal) and Barrancas (La Guajira, Colombia) are two places that can serve as examples of large-scale social and environmental changes following international investments in extractive industries. While São Teotónio has been facing investments in the agricultural sector for the last twenty-five years, Barrancas saw the construction of the coal mine El Cerrejón in 1985, which continues to function today.

While the case studies involve two different forms of extractivism in distant and culturally distinct regions, we may detect many mutual characteristics in the new dynamics of these two places. This paper aims to understand the similarities and differences, departing from data collected during fieldwork experiences in São Teotónio and Barrancas.

Although the discourses of investing companies and governments focus on the importance of these production projects for the development and the economy of populations, regions, and nations, the local population's quality of life has drastically changed. Some issues experienced by the populations of both places include dispossession of the population from their native lands and material resources, displacement, no access to potable water, food crisis, impacts on biodiversity, social division, and deepening of inequalities.

"The Mixed Blessing of Public Employment in Lusatia – Opportunities and Challenges for a Coal Region in Transition"

Annika Runge, Anika Noack

Federal institut for research on building, urban affairs and spatial development, Germany

In 2020 the German government committed to phase out coal by 2038. To support coal-mining regions in transition various measures have been taken. One of them is the relocation of public sector jobs to former coal-mining regions. A significant share of jobs is being relocated to Lusatia – a rural, structurally weak and demographically declining former coal region in Eastern Germany, bordering Poland and the Czech Republic.

While the local population, particularly in more marginalized and lagging-behind areas, expects to significantly benefit from these measures, there are severe concerns within the private sector that public employment could crowd out private sector employment. Lusatia's reliance on both national and international migration to meet labor demands is expected to intensify due to these relocations. If unresolved, this conflict could result in eroding public trust in the transition process and diminishing support for the associated political measures.

This paper, drawing on an organizational survey, investigates the relocations' impact on migration and local labor markets and examines spatial strategies addressing the emerging conflict.

Initial results show that the relocations have not yet triggered much inward migration. This suggests growing labor market tensions and intensified competition for skilled workers. Against this backdrop, strengthening the urban-rural linkages between Lusatia and its neighbouring agglomerations Berlin and Dresden could boost the transformative capacities of the structurally weak region. Initiatives such as the Berlin-Lausitz Innovation Corridor represent steps in this direction.

Reading Rural-urban Linkages through Collective Action against Rent-seeking Policies

Fatmanil Doner

Public University of Navarre (UPNA), Spain

The linkages between urban centers and rural regions involve many interactions through migration, employment, food networks, land use, service provisioning, and resource management. Nevertheless, the tendency to have a mutually exclusive categorization of poverty, development, and growth as 'rural' or 'urban' especially among policymakers and scholars limits our capacity to understand these interactions as drivers of socioeconomic and political change. Rural-urban linkages provide opportunities for people's livelihood strategies and maneuvering through mobility, migration, and diversification. At the same time, linkages bring about vulnerabilities by the exploitation of labour, land, and natural resources especially when there is a big discrepancy between urban centers and rural outskirts.

This study intends to analyze rural-urban linkages with the critical elements of collective action against rent seeking policies in development combining theoretical and empirical work. The case study will be Istanbul where the Turkish government's strategy to push through its various mega-projects such as Istanbul Airport, Canal Istanbul, Istanbul-Izmir Highway, and Yavuz Sultan Selim Bridge etc. threatens the environment, rural spaces, and natural resources. Therefore, possible costs and consequences of these projects have created a sense of collective action linking rural and urban dwellers to resist mega-projects together.

In this regard, this study will examine the perception of development in Turkey, the functioning of rent seeking policies in mega projects, and how the organization rural-urban residents has expanded the resistance against these projects. The methodology will be based on semi-structured interviews and focus groups with the rural residents living in the periphery of Istanbul and the urban based NGOs.

JS | RN001_RN12: Bringing ageing societies with a sustainable future

Building sustainable societies requires attention to ecological, economic, social and ethical aspects. This session asks if and how issues of ageing of populations are taken into account in developing sustainable societies. Debates about climate change as one of the major challenges of our times have moved to the centre of public debates in Europe and worldwide, while in research on ageing many questions remain yet to be investigated in-depth. First, the consequences of climate change on older people are undisputed, in particular regarding the risk of poorer health outcomes, increased mortality, and significant health inequalities. In addition, natural disasters, expected to multiply by climate change, intersect with myriads of other threats to older people's wellbeing and health. Second, older people may develop various coping strategies to deal with climate challenges, such as heat waves or natural disasters. These strategies may reflect inequalities in resources and opportunities of older people. Climate change adaptation plans and policies currently mostly ignore this heterogeneity. Third, older generations are often blamed for being responsible for creating the problem of greenhouse gas emissions and not contributing to climate change movements. The question remains how a social contract across generations could look like to tackle climate change and mitigating greenhouse gas emissions, and which positive visions of a sustainable future for all generations may be derived. The session highlights the urgency of challenging intra-generational and inter- generational inequalities and the need to develop inclusive innovations to guide more effective and fair research, policy and practice in ageing societies.

Building sustainable societies requires attention to ecological, economic, social and ethical aspects. Co-creating Home-based Solar Powered Fall-technologies With Older Adults In Finland

Katri Keskinen, Annika Valtonen, Federica Previtali, Pinja Majava, Sakari Ilomäki, Johanna Ruusuvuori

Tampere university, Finland

In line with care policies in many Nordic and welfare countries, care services for older adults are primarily targeted towards home care and supporting older adults living longer and independently at home. However, falls at home continue to be a common and serious risk for community dwelling older adults. While the selection of assistive technologies has expanded vastly, these devices are often not designed to match the needs and wishes of older users.

Our research on human-centred smart technology design (SOL-TECH) addresses this issue, by adapting participatory research methods with older adults to co-design a person-centred fall-tech device powered by solar and indoor lighting. This presentation draws from qualitative interviews (n=49) with older adults and their close ones, video diaries (n=14) by older adults, observational data from home visits and notes, drawings and other materials produced in three co-creation workshops.

Some of the current technologies foster negative and ageist images of ageing or fall short in their accessibility and usability. Including older adults and their voices in the creative process, our results portray how older adults imagine their futures and what kind of assistive technologies they would prefer to have in their homes and where these would be placed. We conclude the presentation with a discussion on the benefits and challenges of using participatory research to co-design technologies with and for older adults.

Absolute Healthcare Poverty in Bangladesh: Out-of-Pocket Healthcare Costs and Inequitable Healthcare System

Md Sher E Khoda

University of Jyväskylä, Finland

The purpose of this study is to shed light on the inequitable health care system in Bangladesh and its impact on older people. The novel concept of care poverty developed by Teppo Kröger and absolute healthcare poverty discussed by Lisa Raiz have been adopted as the basis for understanding the unmet healthcare needs of older people in Bangladesh. Currently, over 14 million people in Bangladesh are over the age of 60 in Bangladesh. However, there is no formal healthcare provision for this population. At the same time, private health insurance is rarely available and excessive out-of-pocket health care costs lead to intolerable health deprivation, especially for the economically poor. Despite this situation, very little research has been conducted by academics, NGOs and the government on health care scarcity and its impact on older people.

To fill the research gap and to address the impact of excessive healthcare costs on this population, empirical interview data was collected from 44 older people in Bangladesh in 2021. The empirical data were analysed using a thematic content analysis method. Ethical approval was obtained and carefully followed according to the guidelines of the Finnish National Board on Research Integrity (TENK) and the University of Jyväskylä.

The main findings suggest that there is no specific healthcare or public/private health insurance available for older people. Most economically poor older people are to some extent excluded from primary healthcare services due to excessive costs and other factors, including distant healthcare facilities, lack of transport and institutional mismanagement.

Assessing Climate-related Vulnerabilities at the Interface of Health and Social Inequalities

Ilonka Horvath, Felix Durstmüller, Katharina Brugger, Andrea E. Schmidt

Austrian National Public Health Institute, Austria

Introduction
The impact of climate change on health exhibits complex interrelationships, varying across time and space. The study highlights challenges in developing quantitative tools for assessment of climate-related vulnerabilities and intersectionality with health and social inequalities.

Methods
Using a framework by World Health Organization as a starting point, we developed the "Climate-Resilience Health Check" (KLIC Health) for Austrian municipalities and regions in two steps: (1) Following a data mapping, a set of indicators on 5 different vulnerability dimensions (demographic, socioeconomic, health, socio-political, geographic/climate) was compiled. Vulnerability indicators were visualized as maps and spider charts to facilitate communication. (2) Participative foresight methods were developed to allow for identification of policy options for strengthening climate resilience of regional health systems.

Results
(1) We created a quantitative tool for research and policy at the interface of climate and health with 28 indicators. Quantification of intersectional perspectives and calculation of an index was not possible to start with. Pre-defined categories on socio-political indicators had to be adapted, calling for equivalent indicators (e.g. related to gender equality). (2) Public participation methods were developed. Mixed methods allowed for in-depth understanding of regional contexts.

Conclusions
We identify several learnings relevant for quantitative climate health adaptation endeavours in other countries, related to data availability, possibilities for intersectional perspectives on climate and health vulnerabilities and the lack of sociological perspectives in climate-health policies. Mixed methods elements with stakeholder involvement have proven successful at the interface of climate adaptation, social inequalities and health system resilience.

Interconnected Gerontology: Bringing In "The Ontological Turn" To Gerontology.

Janicke Andersson, Klara Öberg

Halmstad university, Sweden

Contemporary processes such as climate change and technological developments makes the incongruity of human exceptionalism in gerontological research all too evident. Consequently, in this article a new perspective in gerontology is

suggested: "interconnected gerontology". This perspective is constructed on perspectives influenced by the "the ontological turn". This concept provides a theoretical contribution that investigates how altered ontological perspectives can be used to question an anthropocentric worldview as it blurs the boundaries between humans-nonhumans and nature-culture. Such perspectives raise questions that touch upon the direct foundations of human essence, human exceptionalism and rights to nature and resources. At large an interconnected gerontology creates new perspectives of interconnectedness in aging that paves way for important insights and essential questions such as how we live, and age interconnected in sustainable, just, and equal ways.

JS | RN12_RN21_ T01: Methodological Landscapes of Quantitative Environmental Sociology

This joint session aims to discuss methodological solutions and developments that apply in environmental social research. Various reviews show that both qualitative and quantitative methods and their combinations are used in environmental social research. At this conference, we invite you to propose innovative solutions and to discuss issues related to data collection, processing, analysis and use. We do not limit our call to any specific methodology, thus feel free to suggest the topics you are working on. Of course, there are emerging topics, that might ignite more of scholarly attention. Quantitative methodology has recently been full of innovations related to the use of artificial intelligence and machine learning. We welcome abstracts that address the various applications of AI and machine learning in environmental social research. We also invite you to discuss the ethical issues and the implications, as well as impact of environmental social research. Furthermore, we are interested in the processes of open science, data sharing infrastructures and citizen science. All these topics have recently received a lot of attention from the European Commission and the academic community. We are interested in what is being done in these directions in environmental social research, e. g. what citizen science projects are being implemented, what are the lessons and effects of such projects, what data are opened to support the green transition, etc. We also welcome summaries from/about international surveys or media monitoring programs, e. g. European Social Survey or International Social Survey Program module ISSP Environment IV. Let's turn this session into a rich discussion on the ontology and methodology of environmental social science.

Does Information Increase the Acceptance of Carbon Taxes? Findings from a Pilot Study Experiment of the German Longitudinal Environmental Study (GLEN)

Felix Wolter[1], Katrin Auspurg[2], Henning Best[3], Christiane Bozoyan[2], Andreas Diekmann[4], Claudia Schmiedeberg[2]

[1]University of Konstanz, Germany; [2]LMU Munich, Germany; [3]RPTU Kaiserslautern, Germany; [4]University of Leipzig, Germany

The paper presents findings from a pilot study of the German Longitudinal Environmental Study (GLEN), a large-scale panel study starting in April 2024 and scheduled for a duration of 12 years.

Carbon tax is a key measure for reducing greenhouse gas emissions and achieving climate neutrality. However, they are relatively unpopular as "push" measures and, without compensation, burden in particular low-income groups. The situation is quite different, however, for a carbon tax with redistribution of revenues. Will such a tax be accepted to a greater extent than a tax whose revenues flow into the state budget? Does knowledge about redistribution play a role?

We present results of a survey experiment asking about the acceptance of carbon taxes: a control group received no information about what will be done with the tax revenues and a treatment group was informed that revenues will be redistributed to low-income households.

Overall, acceptance of a carbon tax is only marginally affected by information about redistribution. However, interaction effects play a role; for individuals who are very concerned about energy prices, acceptance increases in the knowledge condition. One conclusion from the experiment is that knowledge alone is not enough to reach greater acceptance of CO2 reduction measures

We will also shortly present key features of the GLEN, funded by the German Research Foundation (DFG). The aim of the project is to collect high-quality longitudinal data on environmental behavior, environmental attitudes, acceptance of political measures and environmental inequality. With GLEN, we want to integrate the social sciences as an integral part of climate and environmental research and thus place the "human factor" at the center of environmental and climate protection issues.

1192

The Climate Gluing Protests: Analyzing Their Development And Framing In Media Since 1986 Using Sentiment Analyses And Frame Detection Models

Markus Hadler[1], Alexander Ertl[2], Beate Magdalena Klösch[1], Markus Reiter-Haas[2], Elisabeth Lex[2]

[1]University of Graz, Austria; [2]Graz University of Technology

Recent climate-related protests by the social movements Extinction Rebellion, Just Stop Oil, and others include actions such as defacing artwork and gluing themselves to objects and on the streets. In this study, we employ quantitative methods, specifically sentiment analysis and frame detection models, to analyze a corpus of news articles from the 1980s onward. Focusing on the evolution of gluing protests over time, our research traces the development of this type of protest and its representation in the media. Using a dataset spanning several decades, we examine how gluing protests were initially associated with various issues, including abortion and criminal convictions, before gaining prominence in environmental and climate activism in recent years. Our analysis reveals a predominantly negative media coverage of gluing protests, with comparatively less negative sentiment found in public media. Furthermore, we examine the prevalence of protesters' prognostic frames of 'what to do', which appear to be limited, and with policy and security issues taking precedence. In conclusion, our study not only sheds light on the evolution of gluing protests, but also contributes methodologically to the quantitative landscape of environmental sociology. By employing advanced sentiment analysis and frame detection models, we provide nuanced insights into the media representation of these protests over several decades.

If Not Today, then Tomorrow? Contrasting Present and Future Concerns over Climate Change in Australia

Roger Patulny[1], Rebecca Olson[2], Jordan Mckenzie[3], Fiona Charlson[2], Mary Holmes[4], Andreas Hernandez[5]

[1]Hong Kong Baptist University, Australia; [2]University of Queensland; [3]University of Wollongong; [4]University of Edinburgh; [5]University of New Mexico

Climate anxiety is now entrenched in many societies, though the predictors and motivations behind it vary. Many population majorities now accept climate science, and the serious reality of the threat it poses. However, it is not clear whether such future-oriented concerns are being drowned beneath everyday concerns over material prosperity, particularly in times of high unemployment, rising prices, and housing unaffordability. We use data from the 2022-23 Australian Social Attitudes Survey, a nationally representative dataset, to examine perceptions about the greatest social challenges Australia faces today and into the future (i.e. over the next 30 years), with a particular focus on climate change as the most serious threat. Analysis reveals the importance of political voting patterns (i.e. ideology) over other factors, with left-leaning Green party voters significantly more likely to name climate change as the greatest challenge both today and in future, while right-leaning National Party/Other voters are significantly less likely to do so. However, when looking at 'future switching' - i.e. those who see climate change as the most important future but not present challenge - demographic effects are as important as political ideology. Higher education positively predicts switching to climate change as the biggest challenge, while experiencing financial hardship negatively predicts it, regardless of political ideology. This suggests that while political ideology may drive anxiety (or lack thereof) over climate change today, an informed self-interest (i.e. based on educated, material prosperity) may be starting to drive greater recognition of the danger climate change poses into the future.

1193

JS | RN01_RN13_T04: Diverse Family Structures in Old Age (I)

Family structures have undergone significant diversification, mirroring the changing landscape of societal norms and transformations pertaining to marriage, divorce, and parenthood. While these shifts are widely recognized, there remains a dearth of knowledge regarding their implications for individuals as they advance in age. In response to this gap, this joint session, organized by RN01 and RN13, delves into the intricate dynamics surrounding diverse family structures in later life, including traditional nuclear families, single seniors, same-sex couples, multigenerational households, and chosen families. The objective is to deepen our understanding of how these diverse family setups influence the well-being, health, and support of aging individuals.

The Associations Between Generational and Marital Placements over the Life Course and Wellbeing in Later Life

Julia Sauter[1], Bettina Hünteler[2,3]

[1]Oslo Metropolitan University, Norway; [2]University of Cologne, Germany; [3]Max Planck Institute for Demographic Research, Germany

This study explores the intricate association between family and partnership transitions and later-life wellbeing and health. Drawing on life course, family systems, and role theories, the research investigates to which extent transitions into and out of various intergenerational family roles and marital statuses impact individuals as they age. This approach allows to consider the complexity arising from the interconnected effects of multiple life course events. The study mobilizes the concept of 'generational and marital placement trajectories' to capture individuals' vertical positions in their intergenerational family structure as well as their marital transitions over time. Analyzing data from the second and third waves of the Norwegian Life Course, Ageing and Generations (NorLAG) survey (n=2276) through sequence, cluster, and regression analyses, the study examines associations between generational and marital placement trajectories from age 23 to age 65 (individuals born between 1939 and 1952) and two outcomes to measure later life wellbeing, namely self-rated health and life satisfaction. Seven different trajectories were identified. Results reveal that individuals who remained childless and either single or were married had lower levels of life satisfaction than those who transitioned to parent- and grandparenthood.

With regards to self-rated health, individuals who had a late transition to parenthood and were mainly married over the life course were better off than individuals in all other trajectories. This research contributes to existing literature by elucidating how the occurrence, timing, and sequencing of transitions in multiple kin relations, family roles and marital statuses throughout the life course are linked to individuals' later-life wellbeing and health.

Older People's Social Networks Across Europe: Families, Families and Families Again?

Laura Cataldi[1], Tiziana Nazio[2]

[1]University of Eastern Piedmont, Italy; [2]University of Turin, Italy

In the literature, social networks are often subsumed in the concept of personal social capital, particularly as a source and locus for relational resources. Personal networks are associated with better health conditions and the well-being of individuals and older people. They are a function of family structures and their changes over time (Hollstein 2023), e.g. widowhood affects both the size and the properties of social networks. SHARE data from wave 8 across a total of 25 European countries reveals that personal core networks are predominantly made by family members, either "ascribed" (to the family of origin) or "gained" (through unions and births) and only to a much lesser extent by non-family members (friends, neighbours, co-workers, etc.). Importantly, familial network resources are more persistent through the natural process of network loss that occurs with ageing. This phenomenon becomes particularly noticeable from the age of 75 onwards (especially so for women). The centrality of family-related core relations not only applies to traditionally familistic countries such as the Mediterranean ones but also to the Eastern European, Continental, and Nordic countries (in order), albeit to a lesser extent. From a gender perspective, empirical results reveal that care remains mostly a responsibility -and burden- of the families and especially women therein. Ultimately, personal networks and family structures convey different capacities to afford care. Having or not having a familial social network available is one of the structural conditions of inequality among individuals and older people affecting health and well-being.

Navigating Singular Paths: Parental Care in Chinese Only-Child Families

Ying Shen[1], Oana Ciobanu[2], Matthias Kliegel[3]

[1]Vrije Universiteit Amsterdam; [2]University of Applied Sciences and Arts Western Switzerland (HES-SO); [3]University of Geneva

The aim of this study is to investigate how being the only child shapes care provision and care experience evaluation. Using thematic and discourse analysis, we analyzed semi-structured in-depth interviews with 23 adult only children (aged from 21 to 51, 16 females and seven males)

1194

whose parent(s) were in need of care in China. Data were collected in 2023 mainly through social networks and social platform recruiting and snowballing. The analysis reveals four dimensions of care experience evaluation: connection and disconnection, pain and satisfaction, personal growth and emptiness, and pragmatism. The reasons for providing care could be classified into three categories: inherent, intentional, and situational. We observed a connection between reasons and the evaluation of caregiving experiences. Specifically, children who primarily engaged in caregiving due to situational reasons were very likely to encountering negative experiences, including feelings of pain and emptiness. In addition, there was a strong impact of parents' health and care needs on children's life paths in a cross-generation and cross-domain approach. The identity of being the only child makes the gender in providing care secondary. Informed by the family systems theory and the life course perspectives, this paper's findings deepen the understanding of how lacking siblings impact children's care provision, parent-child relationships in adulthood, and children's individual functioning. It potentially sheds light on how the macro-level one-child policy or reduced fertility rate shaped intergenerational interdependence at the micro-level with potential social consequences.

Perceptions of Fairness of Support Between Adult Children and Old-aged Parents

Anna Willems, Anina Vercruyssen, Dimitri Mortelmans

University of Antwerp, Belgium

Contemporary Western family dynamics, shaped by increased life expectancy and reduced fertility, have become more intricate. Smaller family units allow for heightened intergenerational exchanges, yet the oldest old increasingly rely on adult children for support (Vergauwen & Mortelmans, 2021). Amid this complexity, understanding perceptions of familial support is crucial. Exploring family mechanisms and filial support, we examine 'reasonable' support and 'fair' exchanges between adult children and parents using the distributive justice theory (Cook & Hegtvedt, 1983). Through 80 multi-actor interviews with adults (aged 65 or older) and their children, we uncover factors influencing perceptions of (un)fairness in family support and its relation to dynamics.Three prevalent support principles emerge, each tied to distinct mechanisms. Advocates of fair exchanges (equity) often have normative motivations, intrinsic factors, and expect reciprocity. The need principle justifies support intensity differences, while the child's view of equality varies based on relationship quality. Social activities and emotional connections contribute to parent-child relationships. In subsequent analyses, patterns in dyad relationships are explored, cross-referencing child and parent perceptions. This study contributes to parent-child support literature, examining diverse perceptions within dyads through multi-actor interviews. The mechanisms of solidarity among family members constitute a crucial element in the discourse surrounding the responsibility for the support of frail older adults and the determination of the acceptable extent of support individuals are willing to provide or receive.

JS | RN01_RN13_T06: Diverse Family Structures in Old Age (II)

Family structures have undergone significant diversification, mirroring the changing landscape of societal norms and transformations pertaining to marriage, divorce, and parenthood. While these shifts are widely recognized, there remains a dearth of knowledge regarding their implications for individuals as they advance in age. In response to this gap, this joint session, organized by RN01 and RN13, delves into the intricate dynamics surrounding diverse family structures in later life, including traditional nuclear families, single seniors, same-sex couples, multigenerational households, and chosen families. The objective is to deepen our understanding of how these diverse family setups influence the well-being, health, and support of aging individuals.

Financial Support by Older Adults to Family Members: A Configurational Perspective

Myriam Girardin, Marie Baeriswyl, Michel Oris

Unversity of Geneva, Switzerland

Most research on financial inter vivos transfers from older parents to their family members is focused on the giver–receiver dyad, usually between an older parent and an adult child. This presentation aims to investigate older adults' financial support beyond this level of intergenerational dyads using an egocentric network perspective (that is, the configurational approach). Data were from the VLV study, a large survey addressing family life and health conditions of older people in Switzerland. Findings show that older parents' propensity to provide financial support is associated with the density of practical help exchanges within the family (mainly for men) and with the position (mainly for women) and the role they play within their family configuration.

Childlessness and Loneliness in Later Life: A Study Using SHARE Data

Sunwoo Lee

Palacky University Olomouc, Czech Republic

This study examined the relationship between childlessness and loneliness in old age, exploring how socio-demographic and health variables affect this association. The study employed the individual-level data from Waves 6 (2015), 7

(2017), and 8 (2019-2020) of the Survey of Health, Ageing, and Retirement in Europe (SHARE). In total, 51,712 older adults aged 60 years and older at baseline (mean age 71.72 ± 8.27 years; 55% female; 9.1% childless) were followed up over a 4-year period. The analysis included the number of children (ranging from 0 to 6+), the Three-Item Loneliness Scale, socio-demographic and health factors, and the quantity and quality of social networks. Results indicated that childlessness correlates with a higher likelihood of loneliness compared to having one to four children. Childless older adults tend to have smaller social networks, and lower levels of social network satisfaction and social connectedness. Social network satisfaction moderated the association between childlessness and loneliness, but network size and connectedness did not. Within the subsample of childless older adults, those who were married (living together with spouse) or partnered reported less loneliness than their never married or widowed peers. These trends persisted over two follow-up assessments. Among those who remained childless across three measurement points, loneliness did not increase at the first follow-up but significantly increased during the second follow-up, correlating with an increased widowhood rates and deteriorating health. The findings suggest childlessness as a potential risk factor for loneliness. However, its impact might be more nuanced and possibly be mitigated by high satisfaction with social network. Being partnered/married, along with relatively good health appeared to protect childless older adults from loneliness, while transitioning to widowhood may exacerbate loneliness.

Being Never-Married in Later Life – The Process of Making Meaning of a Non-Normative Living Arrangement

Luisa Bischoff

German Centre of Gerontology, Germany

As the diversity of family structures and living arrangements has been growing continuously over the past decades, the share of never-married individuals in older age has been increasing as well. Nevertheless, marriage remains a key milestone in the normatively expected life course – in Germany and other European countries. This societal norm carried even more weight in the historical time, within which earlier born cohorts were growing up. The contribution asks, how older individuals experience and make meaning of being never married in later life.

This question is addressed by analysing narrative processes of meaning making in in-depth interviews with never-married individuals over 50 years of age, who were living in relationships over their life courses. The interviews were conducted as the qualitative part of the mixed-methods project "Becoming Single in Older Age".

In the data, the interviewees make meaning of their experiences by taking in affirmative or aversive positions towards normative expectations, like the ideal of romantic love and the understanding of marriage in a romantic sense or as a governmental institution. The different patterns of positions are related to how the interviewees identify with devaluing stereotypes of singlehood and to whether being

never married is narrated as a self-determinant choice or an inflicted fate. The meaning ascribed to their living arrangement is in turn entangled with their current well-being and the anticipation of their future.

The contribution illustrates what it means to be never married in later life, sheds light on the heterogeneity within this non-normative living arrangement and negotiates the timeliness of societal norms concerning singlehood as well as marriage.

Social Support as Driver for Positive Aging and Warm Solidarity within the Context of Intragenerational Co-Housing of Elderly Persons

Sofie Vanassche, Dries Van Gasse, Elke Claessens

University of Antwerp, Belgium

Intragenerational cohabitation (IGC) of elderly persons is increasingly popular and has the potential to combine care, support and independence in aging. Since IGC of the elderly is a relatively new phenomenon in Flanders, there is little to no empirical evidence on the experiences of the elderly within this new form of living. This study therefore poses the question of how the elderly experience mutual exchange and support within a context of intragenerational cohabitation.

In-depth interviews were conducted with 28 respondents between the ages of 58 and 89 who live with at least one other person over 55 (who is not their spouse or partner). The interview data were processed according to the principles of the Grounded Theory approach. To monitor interpretation-bias, the coding process was run in parallel by 4 subgroups of coders.

Respondents reported several benefits associated with IGC, several of which can be subsumed under the term social support. IGC hereby creates a natural context for providing e.g. practical help to each other, which involves spontaneous social interactions. It is striking that respondents often mention activities that they themselves are good at or derive satisfaction from, in which they can help or involve others. When the necessary preconditions in terms of privacy and personal boundaries, reciprocit, adapted infrastructure and safety are met, IWG can be a catalyst for positive aging, within which older people feel they can contribute to the community from their strengths and interests, and provide help, support, and experiences to those around them.

JS | RN01_RN16_T08: Towards more resilience after the crisis? Resources, challenges and interdisciplinary perspectives of healthy ageing in Europe

Older people are often characterised as the most vulnerable in our society, while they are also an important resource for resilient societies. Transformation in European welfare states, health, social care and long-term care systems, combined with lack of health workforce, rising prevalence of multimorbidity and tightening public budgets raises the question: What can be learned from the COVID-19 pandemic and other crisis (e.g. the climate crisi) as regards strengthening the resilience of older people, with a focus on healthy ageing and well-being? This joint session, organized by networks on Sociology of Health and Medicine (RN16) and Ageing (RN01), is dedicated to the problems and perspectives of healthy ageing arising from these transformations. Our objective is to shed light on the challenges faced by older adults, offering perspectives on healthy ageing experiences during and after the pandemic, and contributing to improving the quality of life for older persons.

Older people are often characterised as the most vulnerable in our society, while they are also an important resource for resilient societies. The Covid-19 pandemic posed a serious and specific threat to the physical, mental and social health of the older adult population in Europe, especially those affected by multiple health or socio-economic challenges. Yet, studies across Europe also demonstrate the potential for resilience among older people, partially contradicting the stereotypes of frail and vulnerable older people. With welfare states, health, social care and long-term care systems across Europe being in transformation, due to a lack of health workforce, rising prevalence of multimorbidity and tightening public budgets, the question remains as to what can be learned from the COVID-19 pandemic and other crisis (e.g. the climate change) as regards strengthening the resilience of older people, with a focus on healthy ageing and well-being. This

joint session, organized by networks on Sociology of Health and Medicine (RN16) and Ageing (RN01), is dedicated to the problems and perspectives of healthy ageing arising from these transformations. Our objective is to shed light on the challenges faced by older adults, offering perspectives on healthy ageing experiences during and after the pandemic, and contributing to improving the quality of life for older persons.

Aging in the Digital Era: a Study on the Impact of Exergames on Elderly Health and Wellbeing in Italy

Valeria Quaglia, Alessia Bertolazzi

University of Macerata, Italy

In recent decades, the proportion of elderly people has significantly increased. It is projected that the percentage of people aged 65 and above will continue to rise from 10% in 2022 to 16% in 2050 (United Nations 2022). The development of digital health technologies in recent years has improved elderly people's access to the healthcare system, as well as their possibility to live independently and maintain their health. One relevant approach to health promotion for older adults is the use of gamification, although the literature also highlights challenges associated with its implementation. This presentation is based on a research study from Italy that focuses on an experimentation that involves the provision of 'exergames' (a blend of 'exercise' and 'games') and their effects on the health and wellbeing of the elderly. Exergames are interactive games that use displays, specialized software, and sensors to enable physical exercise and enhance cognitive function. The study aims, on the one hand, to assess the effectiveness of exergames in various settings, including nursing homes, senior groups organized by a social cooperative, and independently living elderly. On the other hand, this study aims also to critically examine the relationship between the elderly, technology, digital games and health. The methodology involved conducting semi-structured interviews with all elderly participants (n.15) and all educators (n.3) involved in the project; furthermore, participant observation was conducted in all the locations of the experimentation. Additionally, documents produced by the educators were analyzed. The preliminary findings indicate that exergames seem to have limited physical health benefits. However, the presentation will discuss their significant role in reducing social isolation, promoting socialization among peers, and improving mental health among the elderly.

Friendships And Social Activities As Stumbling Blocks For The Elderly? The Corona Pandemic, Social Capital And The Association Between Subjective And Functional Health.

Stefan Stuth, Oliver Huxhold

German Centre of Gerontology, Germany

Elderly people often report good subjective health even though their functional health is deteriorating (Spuling, Wurm, Wolf, & Wünsche, 2017). The discrepancies become possible, because individuals combine evaluations of their physical and functional health with the evaluation of their general life situation (Jylhä 2009). These factors compensate for the deteriorating objective health of the elderly. Comfort and happiness is drawn from social relationships, and creative and social activities instead from physical comfort alone (Peck, 1968, p. 91). However, during the Corona-pandemic almost all social and cultural activities were shut down. We assume that the moderating impact of social relationships and social activities on the relationship between functional health and subjective health is precluded due to the corona shut-down. Subjective health ratings should become realigned with the elderly's rating of their functional health.

Analyses are based on the German Aging Survey (DEAS). The DEAS is a nationwide representative cohort-sequential panel-survey of the community-dwelling population in its second half of life (40 years and older). We use the longitudinal data of 2014, 2017, and 2020/21 as a balanced panel to test for moderating effects of time and social capital on the association between functional health and subjective health.

We find the assumed effect for elderly whose social network consists mainly of friends and who were very active in their leisure time. For socially affluent elderly the advantages of social capital became a stumbling block. However, elderly with low social capital or a social network centered around the family were not affected.

We conclude with remarks on healthy ageing, protection measures during pandemics and the role of social capital.

Addressing the Challenges of Ageing and Bridging Gaps through Technology and Intergenerational Bonds: a Quantitative Study on the Elderly Population of Cremona

Cecilia Capozzi, Niccolò Morelli

Università di Genova, Italy

Ageing population poses new challenges to the national healthcare system: on one hand, the need to identify needs before they become chronic and/or severe, and on the other, to anticipate a more effective continuity of care. Studies on self-sufficiency and autonomy of the elderly population play an important role. However, these studies have primarily focused on small sample sizes or individuals with already compromised health. This contribution aims to bridge this gap by presenting the results of a comprehensive survey involving 1,300 individuals representing the over-60 population in the municipality of Cremona – one of the Italian municipalities with the highest number of elderly individuals. The survey considers factors such as age, gender, neighbourhood, and income. Through the questionnaire, we explore levels of self-sufficiency, health status, living conditions, cultural and relational capital, and the relationship with technology.

The results underscore vulnerable situations related to social isolation and early stages of cognitive decline that have not yet been adequately addressed by services.

In terms of technology, four distinct clusters emerge, structured along the lines of the digital divide and the inclination towards using digital services. These clusters exhibit significant differentiation based on structural inequalities and the degree of intergenerational social relations.

These findings advocate for treating old age not as a universally fragile category but as a life phase where biological characteristics, social inequalities, and lifestyles can profoundly impact health and quality of life. Consequently, we propose to target specific groups and design interventions to promote intergenerational relationships, including through social volunteering.

The Essential Parts Of A Caring Neighbourhood

Monica Maria Wouters[1], Dr. Leen Heylen[1], Dra. Manon Steurs[2], Prof. dr. Dominique Verté[2], Prof. dr. Paul Van Royen[3], Prof. dr. Emily Verté[2]

[1]Thomas More University of applied sciences, Belgium; [2]Vrije Universiteit Brussel (VUB); [3]University of Antwerp

Like in many other countries, Belgian policymakers are facing an ageing population and the impact of the place of residence on the health and wellbeing of their residents. This results in additional and more severe social and health care needs. As an attempt to tackle this situation the policy concept of 'Caring Neighbourhoods' was introduced in Flanders. In these neighbourhoods quality of life is central and all stakeholders involved strive to develop a neighbourhood where residents know and help each other, people with support needs receive support, and services and facilities are accessible and available. The approach contains of three pillars: (1) Neighbourhood participation and inclusion, (2) Connecting informal and formal care and (3) Intersectoral collaboration.

From March 2022 until February 2024 we monitored the process of the 132 Flemish Caring Neighbourhoods, to identify those aspects facilitating or hindering the development of a Caring Neighbourhood. We applied a mixed-methods research design, containing of three research rounds, each addressing a different aspect: the governance, the process and the outcomes. During each round we combined focus groups with the professionals that were in charge of the Caring Neighbourhood initiatives, a focus group with the coaches supporting the initiatives and short online follow-up surveys targeting all initiatives. As a result we were able to define the key steps that comprise a Caring Neighbourhood: (1) neighbourhood-analysis, (2) collaboration, (3) vision development, (4) interventions and (5) reflection. The presenters will reflect on these steps and the corresponding points of attention.

JS | RN02_RN03_T09: Interpreting Lockdown Societies through Biographical, Performative and Art-based methods

Biographical Experiences of Young Musicians and Families Through Musical Walks

Lyudmila Nurse[1], Chika Robertson[2]

[1]Oxford XXI think tank, United Kingdom; [2]Music Mind Spirit Trust, United Kingdom

This presentation is drawn upon the authors' continuous inter-disciplinary research with young musicians and their families in South-East England since 2009, and their recent study the 'Musical Steps' conducted during Covid-19 lockdowns in 2020-21 in England. In the study they recorded ways the young musicians explored new societal landscapes and emotions through learning to listen to the "music within their steps" while walking on their own or with family members. Analysis of self-recorded observations and essays by the young musicians and reflections revealed new cultural perspectives of sound, space and silence on their walks and musical repertoire inspired by the walks (Nurse and Robertson, 2020; 2022) in time of lockdowns.

Methodologically the team adapted the walking biographies method (WIBM) developed by O'Neill and Roberts (2019) to collect biographical and musical reflections on the walks, which contributed to the young musicians' well-being and development of their musical repertoires (Nurse and Robertson 2022). Musical walks examined participants' reflections upon their identities, family's cultural background and personal history and music performances; explored new channels of communication through engaging with others through nature, walking and sharing cultural songs and stories. Work on the musical walks was also evidence-based information that was used in the development of music teaching pedagogy (by Dr Chika Robertson in: Nurse and Robertson 2022) and art-based methods in biographical research.

Exploring Autosociobiographies: An Arts-Based Approach to (Auto-) Biographical Narration

Barbara Wolfram

Film Academy Vienna/ mdw - University of Music and Performing Arts Vienna, Austria

In my paper focusing on family dynamics and biographical narration, particularly mothers, fathers, and siblings, this arts-based research traces family trajectories across generations, offering some understanding of our present selves through the practice of autosociobiographical exploration. I want to introduce the arts-based research method of autosociobiographical exploration that I have predominantly developed for and used in the audio-visual arts to explore (auto-)biographical narration. Autosociobiographies, coined by Annie Ernaux, delve into autobiographies within sociological structures such as social class, gender, nationality, age, time, sexuality, and body.

Over the past five years, including the challenges posed by Covid, at Film Academy Vienna, mdw, I've explored cinematic autosociobiographies, drawing from my background in biographical documentary theatre and filmmaking as well as psychology. In four "family" themed cinematic autosociobiography laboratories, I have studied how artistic expressions foster trust and connection within diverse group settings, using arts-based exploration to discuss biographical experiences and societal issues. Autosociobiographical exploration employs techniques like sociological biographical interviews, co-creative focus groups, embodied memories, and artistic translation, predominantly used in audio-visual forms. The goal is to uncover social constructs shaping biographical trajectories and artistic practices, critically contextualizing possibilities and discriminations.

My paper establishes a theoretical foundation for this research practice, builds links to sociological traditions of biographical research and connects to concrete short movies/artistic artefacts developed in our cinematic laboratories. The paper also provides practical insights into the newly used method of autosociobiographical exploration. Autosociobiographies have the potential to reveal unconscious biases, discriminations, and power hierarchies through artistic expressions. As a group-based artistic research method emphasizing co-creativity and dialogue, it also raises questions about global power hierarchies and advocates for a decolonized artistic practice.

How Covid-19 Affected The IdentityTrajectories Related To Drinking And Mental Health Among Young People: A Qualitative Longitudinal Study

Jukka Törrönen, Josefin Månsson, Eva Samuelsson, Filip Roumeliotis

Stockholm University, Sweden

Introduction: Our starting point is that when the Covid-19 pandemic disrupted the established habitual everyday life practices of young people by transporting their lives to home, by limiting their interaction in public venues and highlighting the importance of communication technologies in their lives, it created distance from their pre-pandemic practices, questioned their self-evident nature and opened them up for reformation.

Methods: The data is based on longitudinal qualitative interviews among young people in Sweden who drink heavily or moderately (n = 23; age 15–27 years). The participants

were interviewed three times before the Covid-19 pandemic and twice after, between 2017 and 2023. The data was analysed by exploring how the Covid-19-related lockdown affected the identity trajectories related to drinking and mental health among young people. The analysis draws on actor-network theory, assemblage thinking, and narrative positioning analysis.

Results: The analysis indicates that the lockdown shifted young people's identity trajectories towards processes of becoming authentic, boring, anguished, depressed, normal, stress-free, self-caring, self-confident, and shielded. For some, the lockdown led to engagements with assemblages that promoted replacing drinking with competing, healthier activities. For others, the lockdown integrated them into assemblages where drinking became an influential capital, helping them overcome isolation and mental health problems, and translating the exceptional situation into normalizing forms of social interaction.

Conclusions: The results demonstrate that drinking is a heterogeneous activity. It can either enhance or diminish young people's capacities for well-being, depending on the assemblages and trajectories of becoming in which it is embedded.

JS | RN02_RN07_I_T4: Culture wars I: Democracy in a postruth society

Culture war – The post-race 'Race War' narrative of the German Populist Radical Right

Viola Dombrowski

University of Koblenz, Germany

Over the past year, the 'Culture War' narrative has made a resurgence, not only in Germany but many other 'western' nations, gaining traction even among mainstream political figures and media outlets.

Focusing on the German context, the primary proponent of this narrative is the German populist radical right party Alternative für Deutschland (AfD). Based on a discourse analysis of the contents of 169 Twitter accounts of party officials, this presentation explores the integral role of the 'Culture War' narrative in constructing a crisis, in which a complex cartography of demarcations, self-positionings, and other-positionings is fabricated.

To establish this narrative as an imposed threat by 'the elite,' the AfD strategically weaves together two core frames: 'gender-ideology' and 'multi-culti-ideology'. While the former is portrayed as an internal threat, challenging the integrity and defensiveness of the people by purportedly eroding the traditional family model, the latter is presented as capitalizing on this weakened state, by furthering an alleged uncontrolled mass-immigration of the 'Muslim other'. This vulnerability would then ultimately to the demise of 'the people,' referred to as 'Volkstod' (ethnocide).

In this juxaposition of 'the people' against a 'foreign other', the AfD revives the myth of the 'race war,' clad in new semantics, to construct a collective identity of 'the Germans'. In doing so, they draw upon a long tradition of Kulturkampf narratives by the New Right and 'Konservative Revolution'. Activists and intellectuals of which are now actively sought out for guidance by AfD politicians. The presentation will focus on re-constructing the AfDs 'Culture War' narrative and its functions as well as the re-articulation of 'race-' to 'Culture War'.

The Playful Politics Of War And History. Analyzing Spanish Civil War Boardgames And Creating One

David Manuel Sánchez Sánchez[1,2], Carlos Moreno Azqueta[2]

[1]Universidad Complutense de Madrid, Spain; [2]Universidad de Castilla-La Mancha, Spain

The Spanish Civil War (1936-1939) remains a controversial episode in the history of Spain, embedded between the push to create a democratic memory of the war and subsequent dictatorship and the efforts to maintain it away from public debate or to distort its facts and legitimize the far-right coup. To understand how the civil war is presented in popular culture, we analyzed the board games based on it through the popular website "boardgame geek" and found both an overwhelming majority of wargames and a renewed interest in the topic in the form of new games with innovative mechanics.

We argue that the genre of the wargame presents various risks for the construction of a democratic memory of the civil war: it tends to present the two forces as basically equivalent, reduces ideology to aesthetic components, and erases the memory and experiences of the civilian population. For that reason, we decided to create a new boardgame based on the Spanish civil war that tries to adopt a sociological viewpoint of the historical events and experiences of the people, and we present here the results and struggles of both the analysis and the creation process, with a playable version on our bags. In the game, the players embody journalist relating the war and encouraging the UK intervention in defense of the republic, exploring the common lives of civilians, and dealing with the ethics of journalism. The presentation will both present the results of the analysis and the process of making the game.

Paradoxes of Some Recent Culture Wars in Greece

1202

Sokratis Koniordos[1], Dimitri A. Sotiropoulos[2]

[1]University of the Peloponnese, Corinth, Greece; [2]National Kapodistrrian University Athens, Greece

In this presentation we aim to analyze four recent culture wars in today's Greece. These were wars over vaccination against Covid-19; challenges to Greek identity by the inflow of migrants and refugees; emerging non-conventional family relations and gender identities which have provoked reactions; and national identity challenges posed by Greece's foreign relations, including the 2018 Prespes Agreement and EU-Greece relations. Our research was based on available sample surveys, official documents and four focus groups, one per culture war. We claim that cultural conflicts in contemporary Greece have not grown into all-consuming culture wars. Though embedded in mistrust, such wars have remained at the level of soft conflicts or tensions. Despite voicing traditional views, Greeks adopt a pragmatist stance on cultural conflict. Moreover, in contemporary Greece such wars have started after initiatives primarily taken "from above", i.e., by state authorities. In addition, from their outset culture wars in Greece have been interwoven with on-going, political party conflict.

JS | RN02_RN07_I_T5: Culture wars II: Gendered and contested art

Gender and Culture Wars: Three Case Studies from Italy

Donatella Selva[1], Emiliana De Blasio[2]

[1]University of Florence, Italy; [2]LUISS University, Italy

The phenomenon of culture wars is only partly new, but we are now witnessing a broadening of the spectrum of topics on which culture wars are fought: in particular, from religious and bioethical topics (such as, for example, with regard to the end of life), there has also been a shift towards attributing an identitarian relevance to gender issues. We understand culture wars as specific ways of articulating contemporary political debate, beyond the more or less cultural character of the issues. The conflicts are articulated through three steps: processes of politicisation, affective polarisation and, we could add, domestication of a neoliberal governmentality. In other words, what characterises culture wars are the communicative and cultural processes activated in specific moments by mutable social actors and on variable issues; in such processes, emotions play a key role.

To illustrate this argument, we have analysed three specific episodes occurred in Italy between 2019 and 2023. The first case deals with the gendering of political actors as a device for the construction of positive and negative polarities (heroes and anti-heroes), taking as an example Carola Rackete and Matteo Salvini in the summer 2019. The second case is the debate surrounding the Zan Bill in 2019-2020, aimed at fighting homotransphobia, when processes of affective polarisation arose between conservatives and far-right, from the one side, and progressists, from the other side. The third case deals with Giorgia Meloni's communication about gender issues, such as women's leadership, motherhood, work-life balance and violence against women.

Contested Art. Art Activist Practices in the Context of Brexit

Marie Rosenkranz

Humboldt-University Berlin, Germany

In the US, there already was an activist turn in the arts in 1970s (Sholette, 2022). In Europe however, a comparably influential emergence of activist art practices is only happening now, and it is closely linked to the culturalization of European politics. Many political debates are currently structured along clashing concepts of culture, and - as I would like to argue - this ist playing a significant role in the development that the field of art is also more and more often becoming a venue for political practives and conflicts.

This contribution looks at the phenomenon of art activism from a praxeological perspective: what do artists do when they act in an activist way? How does the culturalization of politics affect the nature of art activist practices? In order to pursue these questions, a series of activist approaches in the art field that emerged around the Brexit referendum were examined – in the period from 2016 to 2020 in the UK –, including image-based campaigns, collectives, and artist networks.

Dance Spaces In Upper-Secondary Schools: What Happens Within?

Joana Mesquita[1,2], Eunice Macedo[1,2], Helena Costa Araújo[1,2]

[1]University of Porto, Portugal; [2]Centre for Research and Intervention in Education of the Faculty of Psychology and Educational Sciences

This paper establishes a dialogue between the field of education and the one of dance, anchoring the debate on the ethical, aesthetic and solidarity principles of education with the arts; a view in which the arts are a way of life and of building relationships rather than a technical approach.

By associating the expression, movement, balance, and knowledge of the body with relationships with the social environment, dance presents itself as a form of language between people, through movements that arise in space and time, motivated by a body with a history and a voice and which may – or not – relate to other bodies. Recent educational research argues that the promotion of dance in schools can encourage young people to develop inclusive, participatory, and empowering spaces. In this sense, it seems pertinent to understand the social dynamics that take place in dance spaces.

This paper is part of a research that links young citizenship, well-being, and dance, with the main objective of understanding whether and how young people's dance experiences in upper-secondary education can influence their well-being and their view of themselves as citizens. After mapping upper-secondary educational institutions offering dance in the district of Porto, Portugal, 6 public educational institutions were selected for participant observation over 10 weeks. This paper presents the results of this observation, which sought to reflect on: What relationships are established in dance spaces? How do young people organize themselves? What space is there for young voices? What power relations are (de)constructed?

1203

JS | RN02_RN07_III_T04: Transformations in fields of cultural production (I)

The art market is a field for tensions, inequalities and professional networks. These papers approach the field of production within the arts.

Transformations In The Space Of Film Festivals. Competitions, Differentiations, And Their Impact On Films From The "Periphery"

Eunyoung Won[1,2]

[1]EHESS, France; [2]CESSP, France

This paper proposes an analysis of operational principles of the space of international film festivals and their effects on films and their creators, focusing on the case of South Korean cinema in the 2000s. Drawing from Pierre Bourdieu's field theory and Julien Duval's approach to cinema as a field of cultural production, this study delves into the transformations in the space of film festivals as a sub-space of the global film field. Our investigation relies on an analysis of interviews with festival programmers and a study of data related to selected films in film festivals. If the most prestigious film festivals in terms of transnational symbolic power and seniority in the film festival world (Berlin, Cannes, Venice) play a role as the most significant instance of legitimation and consecration of a film and a filmmaker, the pursuit of exclusivity by presenting "world (or international) premiere" films intensifies competition and underscores a hierarchical structure of this space. Furthermore, the differentiation of film festivals into specialized (genre- or region-specific) ones, which functions in part as a survival strategy in the space of struggles, constitutes an alternative instance of legitimation and recognition for a film product from a "peripheric" region, thus contributing to the amplification of film circulation circuits. This research on the transformations in the space of film festivals will contribute to a better understand of the evolving global film field.

Gatekeeping Work: Recruitment of Production Teams in the Performing Arts

Sara Malou Strandvad, Wike Been

University of Groningen, Netherlands, The

With cutbacks to public subsidies, outsourcing of tasks, and an ever increasing influx of aspirants, the centrality of project-based work in the cultural and creative industries has become manifest over recent decades. Research on labor in this sector has argued how the omnipresent precarious working conditions and inequalities are amplified by this practice of a project-based organization of work. Even though the decision making of employers is central to the theoretical reasoning involved, the actual decision making of employers within projects has received relatively little attention. This presentation fills this gap by studying project managers, in their role of employers, and their recruitment practices. In doing so, it sheds light on what underlies the decisions to ask workers to join a certain project and the working conditions being offered to them, paying attention to recruitment decisions around artists as well as support staff.

The presentation builds on empirical data from interviews with project managers of performing arts organizations in the city of Groningen in the Netherlands. Based on existing research (Bechky 2006, Blair 2001), the hypothesis is that reputations and experiences from previous jobs are essential and may overshadow other rationales for decision making. Revisiting the literature on hiring practices in labor sociology as well as the decision making of gatekeepers and intermediaries in the cultural and creative industries, the presentation will help us understand how employers make decisions within a project-based labor market and what consequences their practices have for working conditions and labor market inequalities.

What Makes a Digital Studio? Studying Sites of Cultural Production in the Digital Age

1204

Ronja Trischler

TU Dortmund, Germany

All cultural artefacts are produced somewhere. While the studio has been and continues to be a preferred site of production for some fields, cultural production, as a cooperative endeavor (Becker 1980), is usually distributed in space and time. The degrees of distribution are affected by digitalization, as new modes of designing, sharing, storing and modifying digital products – and of engaging audiences – emerge. This paper addresses the question of 'site' in the empirical study of contemporary cultural production and outlines an analytical framework for digital studio studies. It extends the idea of 'studio studies' to focus on the local, material production (Farías/Wilkie 2015, based on the study of scientific laboratories, see Woolgar/Latour 1986). Therefore, it draws on my ethnography of digital visual effects for film and television (Trischler 2021) and broader discussions in digital ethnography (Pink et al. 2016, Hine 2015, etc.) about a methodological localism of 'field sites' that has been challenged by the mediatization of research objects and practices. The paper proposes a systematic approach to follow cultural objects in the making through the material semiotic practices of production. The specialized production of 'sites' can then be reconstructed as one of the practical methods of cooperative production that contributes to the inclusion and exclusion of certain materials and actors, among others. This practice-based approach bypasses misconceptions of both the digital as immaterial and 'creativity' as a condition of cultural production, which reproduce a misleading binary between 'creative'

individuals and 'rational' technologies. Furthermore, in this view, sites of cultural production can be understood as specialized sites of social reproduction in the digital age.

Dynamics of Heteronomization in the Contemporary Art Field

Lorenzo Sabetta, Matteo Puoti

Sapienza-University of Rome, Italy

How does fields end or, less dramatically, lose their autonomy? Can fields regress to the point of threatening their existence as full-fledged fields?

Bourdieusian field theory is abundantly clear as for the creation and constitution of fields of cultural production, whose development depends on the progressive quest (and struggle) for independence, internal criteria of legitimization, and specific forms of symbolic capital. With regard to the field of visual art, this process started with Manet and reached the apex with the historical avant-garde movements. However, little or nothing have been said regarding the opposite process of heteronomization, through which previously independent fields turn back and begin importing rules, norms, and values from other fields. Contemporary art provides an ideal case-study for illustrating this process, which is still surprisingly neglected in sociological literature (only unsystematic and scattered allusions are offered, mostly by Steinmetz and Lemieux).

Based on 130 semi-structured interviews with Italian art-workers, this paper makes a case for envisioning contemporary artists as more workers than artists, forced to juggle incompatible duties (utterly unrelated to artistic concerns) and increasingly proficient at organizing their careers (following strategies proper of other fields). The variety of non-artistic work roles entailed by successful artistic trajectories is thus analyzed accordingly, as part of a process of losing autonomy owing to pressure from journalistic, fashion, economic, and social media fields. Also, the figure of contemporary curators (acting as brokers between separated domains of social structure) is examined as embodying this force of heteronomization of the contemporary art field.

JS | RN02_RN07_III_T07: Transformations in fields of cultural production (II)

This session features papers that deal with issues of visibility, status and aesthetics in fields of cultural production.

From "Cultural Diving" to "Cultural Surfing": Organic Integration and the Making of Global Movies

Jun Fang

Colby College, United States of America

How do cultural producers balance local particularities with universal appeal in creative production? Using ethnographic data from a global film studio and interviews with rarely accessed industry insiders in Beijing and Los Angeles, I explore how Chinese and Hollywood studios co-develop global movies with Chinese elements. My findings reveal that executives sought "organic" stories to navigate uncertainties, but their understanding of what constitutes an organic coproduction has evolved in an increasingly risky market. Due to perceived risks of deteriorating U.S.-China relations and global cultural markets, executives have shifted away from what I call "cultural diving." That is, in earlier attempts, they favored stories drawing on the historical common ground between the two countries, which were seen as "naturally suitable" to bridge the two cultures profoundly and bind their audiences. Instead, they have resorted to "cultural surfing": primarily developing genre movies that integrate Chinese elements at a relatively superficial level and are forward-looking to attract a younger audience. In this, they rely on genres, such as "sci-fi plus" and animation, that are more "organic" to blend cultures, appeal to heterogeneous audiences, and bypass China's state censorship. Drawing on cultural sociology, globalization studies, and economic sociology, I argue that cultural producers engage in organic integration, negotiating the cultural object's aesthetic properties (i.e., content, genre, structure) to craft a coherent whole that evokes emotional resonance among local and global audiences. This article offers useful analytical tools to explore further the dynamics between local aesthetics and global profitability in the new global cultural economy.

In Search Of Visibility: Gender And Minorities On Stage

Laurie Hanquinet, Carla Mascia

Université libre de Bruxelles, Belgium

In the quest for success, artists must attain visibility among peers and audiences, a concept explored in this article within the context of Brussels' theatrical scenes. The study

1205

employs a three-dimensional conceptualization of visibility, revealing the paradox of openness coexisting with mechanisms that render non-white and non-male artists invisible. Methodologically, it combines quantitative data on artist profiles and theatre programs (n=539 and n=230, respectively) with qualitative insights from 14 individuals, offering a comprehensive assessment.

The first dimension scrutinizes representativeness, exposing underrepresentation of women and individuals from visible minority groups in the studied theatres. Despite comprising over half the population, women lack proportional visibility, and there are numerical indications of similar disparities among visible minority individuals.

The second dimension, relative contribution, introduces a visibility index, revealing that racial minorities and women receive fewer roles and less stage presence compared to perceived white counterparts. Though no statistical correlation emerges between gender and origin, entry barriers limit non-white and non-male presence in the performing arts, inhibiting voices to denounce discriminatory processes.

The qualitative dimension delves into opportunities based on perceived origins, addressing representation issues. While some artists note a diversity-conscious climate, many, especially women and racialized artists, recount instances of being confined to gender or racial stereotypes. The prevalence of roles associated with white characters without clear justification further underscores the challenges artists face in breaking free from traditional molds.

Real Estate-Led 'Artwashing' in Berlin: From Programmed Gentrification to Tension in Artist Networks

Claudia Seldin

Technische Universität Berlin, Germany

Since the 1970s, the cultural industry has planned a pivotal role in urban renewal. In recent decades, several scholars have denounced the instrumentalization of the cultural sector within urban branding/placemaking schemes, highlighting negative consequences, such as museification, overtourism, gentrification, and the displacement of artists. Still, the focus of research on cultural urban planning seems to fall on local and regional State policies, only superficially tackling the instrumentalisation of the arts by the private sector as a global trend.

This presentation aims to fill in this gap by discussing the phenomenon of 'artwashing' as a strategy of the real estate market in Europe. It seeks to answer the questions: what are the broader consequences of real-estate-led 'artwashing' for urban space, societies and artists? How do artists perceive their instrumentalization in programmed gentrification schemes? My hypothesis is that the use of temporary art to sell land triggers a type of programmed gentrification able to deepen inequalities and power struggles within artist networks.

To illustrate this argument two ethnographic case studies from Berlin (Germany) will be presented: the 'A-Fence' and 'The Shelf' projects by developers Covivio and Pandion, respectively. Both follow global trends, using temporary art to revamp degraded sites and the very image of their companies, often tied to the city's increasing land and rental prices. One of the cases led to the counter-creation of a resistant artist network with the goal of protesting gentrification while seeking to inform other artists about hidden agendas of real estate 'artwashing.' These examples show us the tensions present in the instrumentalization of art in the neoliberal European capital today.

A Relational And Horizontal Aesthetics As A Means To Popularize Knowledge And Public Initiative In Relation To Environmental Issues

Anna Schober de Graaf

Klagenfurt University, Austria

This paper explores the audience-oriented aesthetics in the work of contemporary Latin American artists and photographers (for example Pablo Albarenga, Cecilia Vicuña, Jonathas de Andrade) who popularize shifting ethical attitudes and knowledge acquired by marginalised communities related to the environment, climate change, construction projects and exploitation of resources in general. All the case studies examined are characterised by a tendency to blur the sharp boundaries between art and activism and to foreground collaborations. This network-character manifests itself in a "horizontal aesthetic" (Linda Nochlin), which attempts to counter hierarchical structures and foregrounds the materiality of the bodies and objects exposed.

The presentation will focus on how the human body and portraits are used to calculate experiences of "resonance" (Hartmut Rosa) for the audience, which are always particular and universal at the same time: they no longer prescribe, or visualise norms, but are connected to a political universal based on knowledge transmission, persuasion, infatuation and the generation of resonance.

Furthermore, the specific "relational" aesthetic of this work will be located within a "long" pictorial tradition of audience address operating through the use of anthropomorphic figures and an aesthetic of corporeality. Religious as well as political-secular motif traditions and stylistic models are addressed – especially those that have emerged from the body-based protest culture of the globalised environmental movement since the 1980s. But also, historic breaks and transformations are discussed by analysing the deviations of these artistic initiatives from the aforementioned pictorial traditions.

1206

JS | RN02_RN07_III_T08: Transformations in fields of cultural production (III)

This session features papers that deal with issues of transformation in relation to engagement with media, technology and the arts.

The Sacralization Of Digital Media

Guido Nicolosi

University of Catania, Italy

Even if it sounds counterintuitive, media, technology and spirituality can be considered as intertwined. As argued by Aby Warburg, because of the elusiveness of natural phenomena, man transforms himself into the cause of those same phenomena. So, by dancing to make it rain, the shaman becomes the cause of the rain. Even today, due to the elusiveness of technological phenomena, man (a passive user who does not know and cannot produce technology) transforms himself into the cause of those phenomena. Jacques Ellul has already extensively developed the theme of the sacralization of technology in a profoundly critical manner. We suggest that the roots of this link can be traced on the relationship between art and spirituality (Gell). Today we have a scientific literature calling new attention to the many ways religious practices and imagination are inextricably bound up with the materialities of media and the labour of mediation, not just textual or iconographic systems of representation, but also much broader terrain of sensorial techniques, tools, material artifacts, etc. We also know that information technologies have always been used for spiritual, mediumistic, extrasensory and extraterrestrial experiences. Probably, starting from the anthropology of art, a new history of technology should be written, considering the close ties between rationality and irrationality or their hybrid roots. This paper is both a theoretical and empirical reflection which aims to study the often denied or underestimated relationship that exists between technologies and religion, with particular attention to new digital technologies. The focus is on the sacralization of devices, the attribution of action capacity to AI, the use of new media technologies for spiritual purposes (memory, death, God, etc.).

Harmonizing Tradition and Technology: The Future of Artisanal Craftsmanship

Yuko Oki, Koki Arai

Kyoritsu Women's University, Japan

In the shift towards a sustainable society, re-evaluating the role of traditional craftsmanship with mass production is crucial. This paper investigates the cultural importance of artisanal skills, advocating their preservation and transmission to future generations. Traditionally, craftsmanship has relied on tacit knowledge transfer, such as observational learning. However, the introduction of modern technology has enabled the fusion of these time-honored techniques with contemporary innovations. This blend results in unique, higher-quality products, thereby expanding market opportunities.

A prime example of this synergy is violin craftsmanship. In Cremona, Italy, violin making is sustained through formal education and apprenticeships with master craftsmen, producing instruments of unique character. In contrast, Yamaha in Japan utilizes advanced technology to analyze historical masterpieces and employs 3D CAD modeling to achieve distinctive quality. This approach demonstrates how combining skilled craftsmanship with technology can balance consistent quality and cost-effectiveness.

This paper argues that for contemporary craftsmen, technology acts as a catalyst for enhancing creativity and skill development. It underscores that modern innovations are deeply rooted in traditional expertise, highlighting the significant influence of past techniques on contemporary creativity. By exploring the relationship between traditional craftsmanship and modern innovation, this study emphasizes their integration's importance in shaping the future of artisanal industries. This integration not only preserves cultural heritage but also propels the artisanal sector towards innovative and sustainable growth. Ultimately, this study reveals that the future of artisanal industries lies in harmonizing traditional craftsmanship with technological advancements, fostering both cultural preservation and sustainable innovation.

1207

Exploring Participatory Engagement Of Young Audiences In Museums: Challenges and Patterns

Baiba Tjarve, Elīna Vikmane, Līga Vinogradova, Laura Brutāne, Lote Katrīna Cērpa

Latvian Academy of Culture, Institute of Arts and Cultural Studies, Latvia

The context of the study is a changing paradigm in museums towards participation and engagement of communities (ICOM, 2022). In museum theory the development towards a more participatory museum has been emphasized for quite some time, but it is widely acknowledged that the actual practice lags behind (Ross, 2004; Simon, 2010; Nomikou, 2015). The authors propose a study of dominant patterns and attitudes towards participatory engagement in museum education and qualitative markers that reveal advancement of relationships from the perspective of youth communities of practice in Latvian museums. In the framework of the research project 'Striving Towards Participatory Engagement in Museums: Inquiry into Museum Education Practice in Latvia (MEET)' three cases studies of youth communities collaborating with museums in Latvia have been analyzed testing several approaches of participatory research (e.g. audio diary and mapping techniques,

negative brainstorming, peer to peer interview) as it allows to experiment with new formats that involve direct interaction, dialogue, and participation in a two-way communication (Haywood & Besley, 2014), where people make their concerns heard to researchers and contribute to setting the agenda for research and interpreting results. Authors have identified the following challenges in museums that use participatory engagement approach: difficulties in managing power dynamics between museum professionals and participants; a need for flexible project management; a lack of specific skills both of participants and museum professionals; a dispute of who represents the museum; a question of responsibility and ethics; and finally - debate on losses and benefits of the participatory engagement of communities.

Framing and Understanding the Transformative Role of Art in Society: Findings from a Research on Building Communities Through Dance Practices

Giulia Allegrini, Orkide Izci, Roberta Paltrinieri

University of Bologna, Italy

This contribution presents a research aimed at understanding the social impacts of artistic practices implemented in the European project "Performing Gender: Dancing In your Shoes". The project wanted to promote social change by engaging communities, cultural organizations, artists, policymakers, and academics (from 8 different countries) in two main areas of investigation. The first was exploring gender, from an intersectional perspective through body practices. The second was exploring the role of the dance practices in building communities through a co-creation approach.

The research assumed the following theoretical perspectives: the arts as a space for the enactment of citizenship, by impacting on the development of cultural capabilities and on a world picture-making process; the role of creative performative spaces in building "singular-plural" communities and the role of identities and one's placements within this process; a critical interpretative approach of participation and artistic co-creation, regarding the role of power dynamics shaped between two poles of transformation and exploitation.

Within this framework we present our findings on the transformative effects of the artistic process. Interviews and focus groups – with community members, dance makers, audience developers, artistic directors – were adopted as qualitative methods to analyse their self-representation, negotiation of roles, identities, positionalities in creating a sense of belonging, trust and community, and the meanings attributed to their experiences in terms of individual and collective changes. On the basis of this analysis, a reframing of social impacts evaluation has been developed and will be presented, particularly in relation to the value generated by collaborative artistic practices.

JS | RN02_RN07_T09: On Becker

Becker's contributions to the sociology of the arts and culture.

Art Worlds 2.0: Extending Becker's Work into the Age of AI

Laura Robinson[1], Jeremy Schulz[2], Katia Moles[1]

[1]Santa Clara University, United States of America; [2]UC Berkeley, United States of America

Honouring Becker's legacy to sociological visualization, we pay homage to Becker's impact on visual culture and ethnography in the age of AI. From Art Worlds to methods pieces (1974 in ASR, 2000 Contemporary Sociology), Becker's work is the cornerstone of advancing the incorporation of visual media into ethnographic work and sociology writ large. We bring Becker's arguments to bear on the emergent wave of AI driven image creation such as Open AI's DALL-E2. We probe new ethical vistas generated by digitization to ask questions about the interdependence of digital production and reception that extend Becker's theorization of Art Worlds in the first stages of AI. In light of the 2023 EU AI Act, the research grapples with the interdependence between tech giant's production of digital art tools, the algorithms that feed on digital artefacts to produce "new" artistic content, and the feedback loop generated by human audiences and prosumers. We draw on Becker's analysis of the interplay between institutional power and authority, shifts in the social value accorded to media genres, and audience reception, we examine these dynamics with regard to AI generated art. We engage with questions including: How should ethnographers study processes through which cultural production and reception are being rapidly transformed by AI? What are the ethical implications of studying artifacts in digital venues where they may be disseminated, replicated, and/or edited with increasing ease and anonymity? How must sociologists draw on Becker's work to grapple with the re-imagining of artistic authorship in the age of AI?

Remembering Howie Becker

Mark Douglas Jacobs

George Mason University, United States of America

The only time I met Howie in person was in 2007, at a meeting in Ghent of the ESA Research Network on culture, which had just split off from the Research Network on art, and selected me to be vice-chair. I was also at that time the newsletter editor of the American Sociological Association's section on culture. I was interested to read a notice about Howie's new book, "Art from Start to Finish: Jazz, Painting, Writing, and Other Improvisations." Howie accepted my invitation to speak at the Research Network's mini-conference in Ghent, which would then be featured (along with

1208

statements by his co-authors) in the ASA's Culture Section newsletter.

I had the pleasure of sitting at Howie's table where dinner was served before his presentation. From having read much of Howie's earlier work--"Outsiders,"

"Art Worlds," "Tricks of the Trade," and "Writing for Social Scientists," I knew he was a wonderful writer. Of course, Howie also took the art of photography with the utmost seriousness. In what Gary Alan Fine calls "the second Chicago School," Howie was a charter member.

I was first introduced to Howie's work at Columbia, where "Outsiders" was required in the sophomore sociology course. Howie's description of marijuana use in groups of teenagers made a powerful and surprising argument that the effects of marijuana were more social than pharmacological. His teaching and writing were so powerful in part because they were unusually reflexive. His own intelligence, artistry, and engagement helped the new field of sociology mature. His last work," Art from Start to Finish," opens a line of inquiry into the nature of beauty and the meaning of life.

How Can Becker's Sociology Of Art Be Used To Explain The School Worlds?

Marie David

Nantes université, France

H. S. Becker's Art worlds (Becker, 1982) proposes a new sociological approach to art, artists, works of art and all the activities that contribute to art. This study, which has become an important reference for the sociology of art, led Becker to construct several heuristic concepts for studying art: the (art) world, conventions, support staff, chains of cooperation and bundles of tasks, for example. He also applies concepts from interactionist sociology, notably the division of labour, collective activity and negotiated order.

But this analysis of the art worlds can be used to study things that have nothing to do with art. This is what I did in my PhD (David, 2017), studying the worlds of school knowledge, to answer the question: how is school knowledge collectively constructed? In this study, I am interested in the 'artists' of knowledge transmission, those whose work is considered to be the cardinal activity: teachers. I also look at what the 'support staff' in the transmission of knowledge do: curriculum developers, inspectors, members of recruitment panels, headteachers, and so on. Finally, I look at how the work of the school's 'customers', the pupils, contributes to the collective construction of school knowledge.

In this paper, I will present the way in which I have mobilised Becker's work to study the worlds of school knowledge, in my thesis and in the book based on it (David, 2024), and I will show how my study opens up a new perspective for the study of the knowledge that is transmitted in educational institutions.

Symbiotic Aesthetics: Artistic Tradition and AI-Driven Innovation in the Contemporary Artscape

Koki Arai, Yuko Oki

Kyoritsu Women's University, Japan

This study offers a multifaceted exploration of the profound impact of artificial intelligence (AI), specifically Stable Diffusion and ChatGPT, on the domain of art. It begins by revisiting key art theories, including Becker's distinction between "art" and "craft" and Danto's focus on contextual art. Historical perspectives from the Arts and Crafts Movement to the Renaissance art scene are integrated to examine the symbiotic relationship between artisans and market dynamics. The study also examines the interplay between photography and painting, representation theory, and economic factors affecting the arts. It reassesses AI's impact on artists, suggesting that artists are influenced by AI due to their innate creativity. It also discusses reactions to AI-generated artworks on platforms such as Pixiv, and reevaluates the prevailing view of AI's impact on artists by asserting that artists are susceptible to it because of their innate creativity.

In art and craft, it is appropriate to look back at Becker's pioneering and groundbreaking summary 45 years ago (Becker, 1978). This article positions "art" and "craft" as two contrasting kinds of aesthetics, work organization and work ideology, differing in their emphasis on practicality, virtuosity, and beauty standards.

The key findings of this study challenge the conventional belief that the work of artisans is largely replaced by AI and that the work of artists is less affected. Instead, the study suggests that artists, who rely heavily on sensibility and creativity in their work, may be more affected by AI than craftspeople. (241words)

JS | RN02_RN20_T02: Methods in the Arts: Collaborative and Material Methods (I)

The presentations reflect upon the collaborative aspects of doing qualitative reserach with collectives such as immigrants, young people or artistic audiences.

Blueprint for the Future: Insights from Artistic and Creative Collaborative Research with Migrants and Cross-border Workers

Piotr Goldstein[1], Iepke Rijcken[2], Magdalena Nowicka[1]

[1]German Centre for Integration and Migration Research (DeZIM), Berlin, Germany; [2]Paris Lodron University of Salzburg

Drawing on our roadmap for a playful exploration of different visual and participatory methods with research participants/partners, this paper proposes an exploration of insights derived from artistic and creative research practices. Drawing from the theories of the play ethic and conviviality, our collaborative approach pushes us to have confidence to be spontaneous, creative and empathic, and centre our research methodology around the passions and enthusiasm of all involved. We advance a convivial research approach, which integrates methods of cooperative knowledge production while enhancing a deeper understanding of how people can live together and cooperate despite differences. Working with migrant and cross-border workers in the Polish-German border region, we organised creative collaborative workshops in our project. Through workshops on story-telling and cyanotypes, an old photo printing and photocopying method (from which the word 'blueprint' originates), we produced meaningful dialogues together with our research participants/partners. Key topics of activism and engagement, identities, recognition of qualifications, and fluid perspectives on the future emerged organically during these sessions. Moreover, the influence of the Russian-Ukrainian war and the relationships formed with Ukrainians appeared to play a pivotal role in shaping the narratives and perspectives of our participants/partners. As we demonstrate, these creative practices led us to non-verbal experiences and emerging topics, which we could not have come up with in advance. Our playful and creative methodology helps to reflexively engage and discover multiple life-worlds and perspectives on the future.

Artistic Collaboration and Sociological Inquiry: Navigating Arts-Based Research

Ance Kristāla, Lote Katrīna Cērpa, Sabīne Ozola

Latvian Academy of Culture, Latvia

This paper reflects on the experiences of seven emerging artists and five early-career sociologists engaged in an arts-based research (ABR) project "The Journey to Utopia". The project aimed to represent artists' subjective views and interpretations of socially significant issues through artworks and analyse how the incorporation of social research methods change the creative process. Based on data from in-depth interviews with artists about their experience in the project, we as researchers engage in reflexivity on the process of ABR, seeking to comprehend the merits and limitations of the approach from the perspectives of both - artists and researchers. ABR is an approach engaging artistic practices at some stage of the research, allowing to uncover new ways of knowing, in comparison to the "conventional" research methods. Therefore, this study identifies collaborative, artistic and scientific outcomes of collaborative ABR projects. The interviews with the artists revealed reflexivity and discussions about social issues as an integral part of this ABR project, affecting the process of creating artworks, forcing the artists to delve deeper into the desired message and concept of the artwork. Simultaneously, involvement in the ABR project and collaboration with sociologists enabled the young artists to reinforce their identity and self-perception as artists. For sociologists, the ABR project provided a comprehensive exploration of nature and variability of the ABR approach, facilitating necessary adjustments in research design in collaboration with artists and contributing to the further interpretation of the acquired data, thereby enriching analytical insights on artists' identity formation, creativity and artmaking.

1210

Methodological Challenges Applying Qualitative Research Methods With Young People In Culture And Arts

PhD Līga Vinogradova, Dr.art. Baiba Tjarve, PhD Elīna Vikmane

Latvian Academy of Culture, Institute of Arts and Cultural Studies, Latvia

According to the latest data (Kultūras barometrs, 2022), young people in Latvia are active cultural consumers and participants. This group also acquires symbolic and material value as potential market participants, electorate, decision-makers, and audience. However, in traditional social research methodologies adults are prioritised as informants, while opinions of young people are often disregarded. According to the United Nations Convention on the Rights of the Child (1989), young people have a say in matters which affect them; and researchers agree that appropriate methods may facilitate dialogue with young people (Brady

& Graham, 2019; Groundwater-Smith, Dockett & Bottrell, 2015). Our aim is to analyze which qualitative research approaches help revealing opportunities for a more profound exploration of youth opinions. Our analysis is based on several research projects on culture and arts involving the participation of young people carried out by Latvian Academy of Culture (LAC) in 2023-2024. Different qualitative research methods were applied in each of the projects. Focus groups and in-depth-interviews were employed to explore the attitudes and needs of 25 young people (age 15-23) regarding informal education. Young people's involvement in museums (age 15-19; n=16) were studied using participatory research approaches such as audio diaries, reverse brainstorming and creative storytelling for individuals with visual impairments, as well as road maps with students participating in rural museum activities. The results indicate that young people are more engaged in research and better reflect on their experiences if researchers apply (1) participatory methods; (2) creative approaches; (3) peer-to-peer techniques; (4) short time assignments.

A Story We Can Wear. Textile Storytelling and its Social Functions
Kalina Helena Kukiełko

University of Szczecin, Poland

My paper aims to introduce the concept of storytelling through textiles, encompassing ready-made clothes, tailoring materials, and various handicrafts like embroidery, crochet, and knitting. These elements often integrate seamlessly into clothing or the everyday environment, providing a distinctive and intimate form of expression. Unlike traditional storytelling through words or sounds, here, the narrative unfolds through textiles crafted or repurposed to convey stories by their authors. Clothing and accessories not only serve as objects but become the subjects of a story, offering a pretext to explore a broader social context where textiles play a culturally or socially significant role. This perspective, presented by Leanne Prain in her book "Strange Material," delves into the world of textile storytelling. Prain, known for her involvement in yarn bombing through a popular blog, actively engages in connecting people and building communities through art and craft. The paper highlights Prain's examples of artistic creations within textile storytelling, providing instructions for items fostering integration, nurturing social memory, or bringing joy. I argue that Prain's concept can effectively fuel a discourse on the contemporary importance of fashion, especially in terms of social responsibility and sustainability. The focus should extend beyond consumer awareness of the fashion market to acknowledge the role of textiles in shaping interactions and relationships. This paper seeks to present textile storytelling as a form of socially engaged art, underscoring the potential of storytelling in the social sciences.

JS | RN02_RN20_T09: Methods in the Arts II: Music and Visual Methods
The presentations reflect upon the use of qualitative and visual methods in the fields of music and visual arts.

Stuff, Sounds and Stories: Musical and music-related things as life documents
Ana Goncalves

CRIA, Iscte, Portugal

The biographical research methods mainly focus on subjective accounts of lived experience and personal documents to dig out life trajectories and past events. Family photographs and other particular possessions are among the wide range of life data usually gathered by auto/biographical researchers.

The prime task of this communication is to explore how biographical narratives constitute a unique process that evokes those and other materials that store and elicit lifetime memories. I am especially interested in understanding how musicians' life narratives are constructed around musical and music-related things and how that stuff is so complexly intertwined in their identities.

All these issues will be discussed and illustrated through empirical cases taken from a recent research project conducted in Lisbon, Portugal, based on musicians' life and family (hi)stories. That research was enriched not only by documentation originating in the field (interviews, genealogies) but also by materials from the past (documentary films, vinyl and digital recordings), including the memorabilia safeguarded for generations (family photographs, historical recordings, collections of lyrics and music scores). Such a variety results from a few years of painstaking and patient work, counteracting the dispersion of sources.

1211

Harmony- and sound-oriented Interactions. Potentials of videographic investigation of Making Music Together
Theresa Vollmer

University of Vienna, Austria

When people make music together, they coordinate and synchronize their actions so precisely that they construct an audible collective phenomenon: Shared music. This is an outstanding achievement that is characterized by the fact that a sui generis meaning unfolds in the consonance of communicative actions that extends the meaning of the individual voices.

This form of communication challenges qualitative social research to focus on the simultaneity of sound-generating actions, as well as the hearing (conditions) of the participants during joint music-making. Therefore, the sensuality of communication (of subjective hearing and intersubjective sound) plays a special role. Videography (which includes participant observation) offers a research program that places this communication within a new range of interpretive social research. At the same time, further developments are needed, such as the transcription of interaction coordinated by sound.

Based on my (completed) doctoral research on making music in string ensembles and current research on singing together in choirs, I present and discuss the potential of an videographic research design that integrates the sensual, subjective perspective of the participants (1), the sound-generating interactions (2) and the socio-cultural context of joint music-making (3), in order to be able to analyze making music together in situ. In this way, my contribution can also open up a horizon against which the connection between the methodology of investigating making music together and the significance of "tension" and "trust" in musical communication in particular can be discussed.

Cognitive Abduction as a Resource for Conceptualizing Axiological Data in Ethnographic Fieldwork

Alger Sans Pinillos[1], Dafne Muntanyola[2]

[1]University of Pavia, Italy; [2]Autonomous University of Barcelona

1212

How do artists attend to perceptually and make specific decisions regarding time and space during their creative process? Our proposal applies cognitive abduction to provide sociology with a solid basis for theorizing about axiological information. Axiological data remains an epistemological challenge because there is no criterion for empirically contrasting the theoretical constructs about values. Artists present a diversity of values with different scenarios in the same context. For example, the impact of digital technology on photographic art makes photographers who grew up and learned from the analog method nostalgic, which involves a cognitive aspect of value when understanding creative decision-making. Moreover, data such as feelings and emotions are crucial because they define and orient the researcher's questions in light of the nuances of the answers received. They also prepare researchers to be open to surprise and uncertainty in the results they may compile. However, it is challenging to characterize axiological information adequately to give it the weight it represents for theories. We propose abduction as both a cognitive strategy and a theoretical resource to address the problem of the objectivity of values observed when analyzing qualitative data collected from artists working in Barcelona. Abduction is the hypothesizing process that provides plausible solutions to anomalous and surprising situations and suggests a course of action for future research. It is an ideal theoretical resource to characterize qualitative field research in sociology.

JS | RN09_RN17_T06: The expansion of AI on employment in Europe

The joint session addresses the impact of AI on the European labor markets. Presenters will focus on how AI is affecting job vacancies and widening the digital divide. Additionally, the development of new forms of managerial control based on AI will be discussed.

Generative Artificial Intelligence in the Workplace: Inequalities in AI Use, Attitudes and Skills

Giedo Jansen, Marie Labussière

University of Amsterdam, Netherlands, The

We are currently witnessing the breakthrough of Artificial Intelligence (AI) to the general public. For the first time, the use of AI is accessible to ordinary citizens. Generative AI tools like ChatGPT – which can create original images or text – may help employees automate tasks and enhance efficiency. Yet, the debate on AI lacks granular evidence on the actual penetration of AI in the workplace. Moreover, AI technologies are assumed to necessitate new, AI-specific skills going beyond technical skills ("button knowledge"), including strategic and ethical skills to critically evaluate AI's potential biases and misinformation, or fusion skills to combine human knowledge and machine capabilities within work-processes. But, theoretical and empirical clarity is needed regarding what relevant AI-skill requirements are for ordinary (non-expert) end-users, how to measure these skills, and to what extent workers do (not) possess these skills. This study investigates the actual usage of GenAI tools among the general workforce. Drawing upon theories and measures from the "digital inequalities" literature, the study examines whether there are differences in AI use between different sociodemographic groups (e.g., age, gender, race, socio-economic status, education), and whether these differences can be explained by AI attitudes, AI access/restrictions, and AI skills. In particular, this study develops and validates a new scale for workplace GenAI skills that reflects the multidimensional nature of AI competence. To address the research questions, our study is among the first to collect large-scale survey data (N= 2500) comparing users and non-users of GenAI among working-age respondents (18-67) in the Netherlands.

Is AI Creating A New Regime Of Control At Work?

Alex James Wood

University of Bristol, United Kingdom

A growing body of research investigates the application of AI systems to work and the corresponding growth of 'algorithmic management'. Algorithmic management has in turn been argued to produce novel despotic regimes of workplace control across a broad range of industries (Delfanti, 2019; Griesbach et al., 2021; Schaupp 2022; Vallas et al., 2022). This paper investigates these claims by reviewing detailed case studies of manufacturing, call centres and retail undertaken in the late-1980s–2010s and comparing these to contemporary research on algorithmic management. Doing so highlights how workplace regimes during the late-1980s–2010s often entailed employer-controlled flexibility, surveillance (whether electronic-, customer- or team-based), strict discipline, and limitations on labour protections and that AI and associated technologies do not seem to be giving rise to a distinct control regime. Algorithmic management heightens levels of surveillance (by automating performance monitoring and creating new methods of evaluation), enhances discipline (by automatically selecting workers for sanctions) and strengthens employer control of flexibility while limiting worker voice (by autonomously allocating workers to shifts and tasks via opaque processes). But when understood comparatively it becomes apparent that these tendencies do not constitute a qualitative break from common management trends present, at least in liberal market economies, since the 1980s. The paper concludes that research suggesting algorithmic management is producing a new type of workplace regime overstates the impact of AI-associated technologies in this regard and that algorithmic control should instead be understood as reinforcing and heightening extant tendencies towards 'flexible despotism' (Wood, 2020).

A Double-Edged Sword: Does The Use Of AI And Other Digital Technologies Reduce Or Exacerbate Existing Gender Inequalities In The Labour Market?

Britta Matthes, Carola Burkert, Grienberger Katharina

Institute for Employment Research Nuremberg (IAB Nürnberg), Germany

The use of artificial intelligence and other digital technologies (digitalisation for short) has an impact on the labour market and therefore also on existing gender inequalities. There are arguments that they can either exacerbate or reduce existing gender inequalities. We provide descriptive evidence that women are less likely to perform highly substitutable occupations than men. This in no way means that women are more likely to benefit from digitalisation. Not

1213

only do the technological possibilities vary greatly within the professions, but the potential for substitution is not always realised immediately.

The results of the multivariate analysis show that there is a negative correlation between occupation-specific substitution potential and employment trends for women and men. Employment shrank above all in occupations with high substitution potential and a low proportion of women. This leads to the conclusion that digitalisation has the potential to reduce gender-specific inequalities. This will depend crucially on how the new technologies are designed and implemented.

JS | RN11_G8ISA_T01: Emotions and Sciences

From Recipes To Cosmetics: Maternity And The Atypical Uses Of Breast Milk

Cecile Vermot

Supbiotech, France

In recent years, several websites have opened up, promoting the benefits of breast milk beyond breastfeeding (recipes, cosmetics, remedies, jewelry). Some of these web pages or online groups enable women to exchange information on preservation and processing practices. Others are becoming more professional, offering paid services. The aim of this research is to understand how the use of breast milk, beyond breastfeeding, contributes to the construction of motherhood in breastfeeding women, and what these practices say about these women's relationship to this substance produced by their bodies at this specific moment in their maternity. How do these women apprehend their milk? To what extent are these practices linked to their experience of breastfeeding? What are the emotional implications? How are they perceived by those around them? Do these practices involve situated knowledge? The initial results of the empirical survey show that: A) this atypical use of milk is constitutive of an emotional materiality. For them, milk is food, white gold, medicine, an emotional bond (etc.), but it also materializes work (extraction, preservation, processing); B) social networks enable these women to construct situated knowledge about their milk and to exchange in a benevolent space.

The Emotional Fabric of Trust in Scientific Knowledge

Elgen Sauerborn

Free University of Berlin, Germany

Whether individuals trust sciences is not solely determined by the quality of scientific information, expertise, or reputation. Another influential factor in shaping people's perception of scientific knowledge is emotions. Thus, the level of trust or distrust towards scientific knowledge is shaped by both cognitive and affective factors: trust connects what people know (or don't know) with what they feel.

This is particulary evident within two sociological spheres: first, trust in sciences is reflected in people's attitudes towards scientific knowledge. Second, there is a link between trust and actions. However, these two facets do not always perfectly align. Many individuals who claim to have strong trust (or a lack thereof) in sciences don't consistently act in line with those beliefs.

This inconsistency is noticeable in areas such as decisions about vaccinations, medical choices, dietary habits, mobility, and consumer behavior. Emotional and affective elements may explain this discrepancy. Drawing on empirical data from a Mixed Methods study that involved an online survey and in-depth interviews with individuals from diverse educational backgrounds, I seek to explore these emotional dynamics of trust in science.

Epistemic Injustice: an Approach from Feminist Epistemology and the Study of Care

Magdalena Correa, Raquel Latorre, María Teresa Martín

University of Almería, Spain

Epistemology is the field of knowledge dedicated to knowledge. To be more precise, it is concerned with the interrogation of the validity associated with scientific knowledge. Conceptually, it is established in the contemporary era as the theoretical framework or philosophy of knowledge (opposing ontology as the theory of being) in the philosophical works of James Frederick Ferrier.

One of the most important theoretical branches derived from epistemology, alongside the academic work of authors such as Sandra Harding, Helen Longino, or Donna Haraway amongst others, pertains the ways in which the knowledge and being of women have been sidelined in traditional science in order to prioritise the production of knowledge from white, male, abled and western subjects. From this notion of feminine knowledge as less legitimate, female life experience is associated with instinct, nature, emotivity, and myth. In this way, knowledge from and about womanhood is overshadowed, discredited and thrown away. Care as a field of study is one amongst many instances of this phenomenon.

Through this work we seek to explore the notion of epistemic injustice as proposed by Miranda Friker in regards to the production, maintenance, and transformation of knowledge from and of femininity in traditional science, emphasising care as a particularly valuable field of study, and highlighting options derived from situated knowledge.

Race, Gender, and Affective Orientations in a 'Globalized' Vaccine Research Project

Katriina Emilia Huttunen

University of Helsinki, Finland

This paper examines the meanings of race and gender created in a scientific project within a context where the project under study – a diarrhoea vaccine trial – did not focus on questions of racialization or gendering. However, the vaccine project generated both race and gender in its everyday practices.

The subjects and staff of the trial we analyse were Finnish, but the trial involved an important phase that was carried out in Benin, West Africa. Here, we explore how both, affective desires to help 'African children' through scientific

1215

participation, and rationalized trust in science surfaced, and, we argue, were crucial for the trial's success.

The analysis is based on ethnographic fieldwork in Benin in 2017-2019 and interviews with trial participants and staff.

We suggest that in the context of this vaccine trial, the making of gendered orders and racialized Finnishness are closely intertwined and cannot be understood disconnected from global and localized relations of medical knowledge-production. Furthermore, affective orientations and practices are crucial in the making of these gendered and racialized, and biomedical, orders.

1216

JS | RN12_RN22_I_T03: Risk and challenges of nuclear energy in the framework of sustainability and environmental change: unpacking the current debate

The debate on nuclear energy in Europe has been constantly marked by a series of advances and setbacks. The Chernobyl disaster in 1986, a catastrophe that epitomized the risk society conceptualized by Ulrich Beck, put a halt to the first era of large-scale implementation of nuclear technology. In 2011 the Fukushima disaster provided once again a serious reminder of the risks generated by human-made nuclear fission, resulting in significant public opposition, and prompting various countries to switch off their nuclear power plants. The debate has been revived in recent years by geopolitical tensions and economic pressures, paving the way for nuclear power to be accepted as a clean alternative to other fossil energy sources. Nonetheless, the EU's decision to include nuclear power plants in the taxonomy of environmentally sustainable investments has been highly controversial, with social movements and civil society organisations denouncing it as 'greenwashing'. This joint session brings in new reflections and research for better understanding perceptions, discourses, and practices on nuclear power in the framework of sustainable energy transition.

Close To The Problem But Far From The Decision-making: Nuclear Risk Perception, Transboundary Danger And Political Agency In 21st Century Europe

Kristin S. Scharffscher[1], Aistė Balžekienė[2]

[1]University of Stavanger, Norway; [2]Kaunas University of Technology

The growing controversies over nuclear power in Europe are related to heightened geopolitical tensions, climate change policies and energy transition imperatives (Ho & Kristiansen 2019). Added to this is the fact that many nuclear power plants are located close to a national border.

Risk perception differences between citizens of countries with nuclear power plants and citizens of countries without reveal a problematic facet of nation-oriented power structures as well as the transboundary nature of modern risk, danger and trust. Applying relational risk and danger theory (Boholm & Corvellec 2011, Christoffersen 2018) and cosmopolitanism (Beck 2005/2016), we intend to explore the extent to which risk proximity coupled with levels of trust and decision-making disenfranchisement influence on people's perception of nuclear risk.

Using data from the International Social Survey Programme module "Environment" (2020-2022), we will map reported risk perceptions pertaining nuclear power in 17 European countries. The data material comprises countries with nuclear electricity production (including Germany, Finland, France, Sweden and others), and without nuclear power plants (Austria, Denmark, Lithuania, Italy and others).

Constructing national energy futures: SMR-promises in Finland, France, Sweden, and the UK

Markku Lehtonen, Hanna-Mari Husu, Matti Kojo, Tapio Litmanen, Mika Kari, Sarah Tornberg

Universitat Pompeu Fabra, Spain

1217

The so-called small modular reactors (SMRs) are the latest in the long series of nuclear technology promises. SMRs promise to be a low-carbon solution that is faster, cheaper, safer, more flexible, and more compatible with the foreseen renewables-led energy systems. Successful deployment of any techno-scientific innovation requires the construction of promises, through the juxtaposition of promise-narratives and counter-narratives. Promising is needed to enrol key stakeholders (investors, policymakers, researchers, vendors, and the public at large) and thereby turn the promise into institutional and material realities. Promise-constructors seek to consolidate the image of SMRs as an "obligatory passage point" on the way towards energy transitions, whereas critics deploy counter-narratives to undermine the legitimacy and credibility of the SMR promise.

The paper analyses the evolving discursive battles between SMR promise-constructors and deconstructors in four countries: Finland, France, Sweden, and the UK, which are all either developing SMRs or considering their deployment. We draw on four types of material: 1) reporting in national press media in 2010-2023, 2) expert and stakeholder interviews; 3) policy documents identified through the media analysis or mentioned by the interviewees; and 4) participant observation of nuclear-sector events (including webinars). Using the NVivo software and the socio-informatic toolbox centred around the Prospéro software to assist the analysis, we characterise the narratives and their evolution, key policy milestones, and trends and turning points in the debates.

The analysis pays particular attention to how the actors use past experience, legacies and imaginaries concerning nuclear technologies to justify their arguments. It highlights the scarcity of counter-narratives in Finland, and the general trend towards SMR promise serving as a steppingstone back to the construction of large nuclear reactors.

Narratives Of Local Opposition In Different Nuclear Waste Disposal Contexts: The United States And The Czech Republic

Martin Durdovic

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

This comparative case study employs the narrative vector concept derived from P. Ricœur to study qualitatively local opposition against two projects of deep geological repositories of nuclear waste (DGR) developing in different contexts in terms of stage (hosting vs. siting), size ('large' vs. 'small'), and democratic tradition (long vs. short). The transatlantic comparison covers oppositional narratives by local communities against expanding the Waste Isolation Pilot Plant in the United States and against DGR siting in the Czech Republic. From 2016, both cases exhibited an analogical phenomenon of an implementer-initiated deviation from the initial DGR project set-up whereby inconsistent behavior on the implementer's side impaired the DGR mission's acceptability for the local population. Identifying narrative elements and vectors in textual data from local oppositional web pages and regional or national news websites allows studying how different contexts shape oppositional narrative interpretations. Against the backdrop of literature on 'participative turn' and 'multi-level governance-ecosystem framework' in nuclear waste management and the NIMBY concept, this paper demonstrates the value of juxtaposing DGR projects with different parameters for a more profound understanding of the governance challenges entailed.

Nuclear Energy, Between Past and Future. Constructing risks and uncertainties of nuclear energy in Taiwan and Poland through the lens of reflexive public reason.

Tadeusz Józef Rudek[1], Róża Rudek[1], Katarzyna Rabiej-Sienicka[2]

[1]Jagiellonian University, Poland; [2]University of Warsaw, Poland

Taiwan and Poland sit at opposite ends of the Eurasian continent. Both countries are at the forefront of global uncertainties related to the rivalry for global political and technological dominance. However, while some risks and uncertainties related to the state of global affairs are similar on both edges of Eurasia, others are different. This is particularly evident when we look at the discourses on nuclear energy - framed as an old and dangerous technology in Taiwan - and as a future civilising achievement in Poland.

We argue that the differences in perceptions of nuclear energy lie in the construction of risk and uncertainty. This involves the co-production of sociotechnical imaginaries and expert systems, the production of knowledge, and the mechanisms responsible for dealing with risk and uncertainty.

The findings of the paper are based on a comprehensive discourse analysis of newspapers in Poland and Taiwan, complemented by research on energy transition in both countries. The study delves into the intricacies of the sociotechnical imaginaries surrounding this transformative process (Rabiej et al., 2022). In addition, the research draws on the application of reflexive public reason (Rudek, Huang, 2023). Together, these elements contribute to a nuanced exploration of the dynamics shaping perceptions of nuclear energy in the unique contexts of Poland and Taiwan.

Nuclear narratives: the role of value orientations, interests and practices in Epistemologies of Risk in Italian Nuclear Debates

1218

Mimmo Lanzirotta, Giulia Salaris

Sapienza University of Rome, Italy

In recent years, the debate regarding the potential intensive use of nuclear energy has reignited, intertwining with the urgency of ecological transition. This contribution presents an exploratory study aimed at understanding and reconstructing 'epistemologies of nuclear risk' in the Italian debate. In-depth interviews with two categories of key actors—nuclear experts and representatives of environmental movements—allow us to analyze how nuclear risk is recognized, defined, measured, and assessed, the rhetorics justifying (or opposing) the adoption of nuclear energy within the Italian context, as well as the definitions of sustainability they refer to. Part of a more extensive research commitment, our preliminary analysis highlights three main themes as central for the interpretation of nuclear narratives in the debate. First, the importance of the interviewees' value orientations, as well as interests and practices underlying their positions. The analysis revealed that the seeming interaction is essentially a reciprocal shaping of rigid positions, limiting the significance of the debate. Secondly, the different ontologies underlying risk epistemologies, which assume risk as either controllable and measurable or not. Lastly, the emergence of a generational gap on nuclear energy which is perceived as a key for opening up the debate and facilitating a renewed image of nuclear energy within the sustainability project/umbrella, suggesting a promising line of inquiry for future research.

JS | RN12_RN22_II_T05: Environmental risk perception across Europe

This joint session aims to explore the multifaceted dimensions of how individuals and societies perceive and respond to various environmental risks, fostering a comprehensive understanding of the challenges and opportunities for sustainable futures. This session aims to delve into the intricate dynamics between societal tensions, trust-building processes, and transformative actions within the context of environmental risk perception in Europe. Environmental risk perception plays a pivotal role in shaping policies, behaviors, and attitudes towards environmental issues. Session will include empirical studies using both quantitative and qualitative data, especially with comparative cross-national focus.

Environmental Risk Perceptions of Citizens and their Engagement in Environmental Change at Local Level. A Citizen Science Project Case in Romania, South-Eastern Europe

Lucrina Stefanescu[1], Filip Alexandrescu[2]

[1]Babeș-Bolyai University, Faculty of Environmental Science and Engineering, 30 Fantanele Street, 400294 Cluj-Napoca, Romania; [2]3Research Institute for the Quality of Life, Romanian Academy, Calea 13 Septembrie no. 13, 050711, Bucharest, Romania

Citizen engagement in addressing environmental challenges is pivotal for sustainable change. By actively involving individuals in monitoring, reporting, and participating in remediation efforts, communities become integral contributors to environmental solutions. Public engagement allows real-time monitoring of environmental risks along with the possibility of updating stored information faster and in a shorter time. To enable communities to engage in environmental monitoring, a mobile app was created within a citizen science project. The app is currently operational in four small communities within the Apuseni Mountains region in Northwestern Romania, an area marked by both active mining and promising tourist potential. Despite the region's attractiveness to tourists, environmental challenges persist, including water and soil pollution from mining activities, sewage discharge, extensive littering along river banks, and illegal waste dumping in watercourses. Although a highly active environmental NGO operates in the studied communities, it has failed so far to mobilize a critical mass of citizens and stakeholders to tackle the environmental issues in the area.

To comprehend the promise and pitfalls of citizen mobilization, 21 semi-structured interviews were conducted with concerned citizens. The study revealed that multi-faceted social relations within closed mountain communities, coupled with a lack of trust in local authorities, pose significant barriers to citizen engagement in reporting problems and engaging in collective action. Broader contextual factors and local socio-political dependencies hinder the emergence of a local movement capable of generating environmental change. Our argument is substantiated by data derived from interviews, field observations, and the usage of the mobile app provided to citizens for environmental monitoring. Our results point towards an embedded form of environmentalism, discursively astute but socially fragmented due to local inter-dependencies.

Personal And Public Responsibility For Climate Change And Trust In Public Institutions

Antti Kouvo

University of Eastern Finland, Finland

There is a lot of evidence that a disruptive development phase like the green transition puts citizens' trust in public institutions to the test. At the same time, trust has been considered a significant resource that helps to strengthen justice in the midst of revolutionary developments. We investigate how different types of institutional trust are associated to attitudes about personal and public responsibility in mitigating climate change. Our hypothesis stems from the institution-centered theory. According to that, the trust in the impartial public institutions of society, such as the officials and the judiciary, have a stronger association with attitudes indicating the common good than trust in purely political institutions. Partly because of this, the variation between countries representing different institutional designs is significant as well. We assume that instead of political trust, trust especially in impartial institutions has a stronger association with both expectations towards public institutions and the perceived personal responsibility on the climate. The study examines the associations between trust and climate attitudes between 21 European countries and different demographic and socio-economic groups (European Social Survey 2016, N=5,2147). In addition to descriptive methods, we apply multilevel models to simultaneously examine variation between countries and individuals. Compared with political trust, trust in impartial public institutions has slightly stronger positive association with perceived personal responsibility in reducing climate change. Also, the difference between perceived personal and public responsibility on climate seems to be smaller in countries with high trust compared with countries with lower trust and to be explained better by high trust in impartial public institutions. The theoretical and policy implications of the findings are discussed at the end of the paper.

1219

Risk, Environment And Territory. The Case Of The Pisano Foundries

Ciro Prospero, Amalia Caputo, Stefania Mutalipassi

Università degli Studi di Napoli Federico II, Italy

Industrial activities have made it necessary to reflect on the damage to human health and the environment by exacerbating the logic of risk distribution locally and globally. Industrial production activities potentially economically enhance the realities within which they are located, however, the communities most exposed to pollutants do not necessarily benefit from the wealth gained.

Starting from these stimuli, the contribution intends to address the perception of risk in the areas adjacent to an Italian industrial plant considered emblematic for its characteristics, that of the Fonderie Pisano.

The underlying empirical work is configured as an exploratory study by means of a convergent mixed methods research design: a longitudinal analysis of the content present on Social Network Sites (SNS) related to the Fonderie Pisano and semi-structured interviews with residents in the area surrounding the industrial plant. In the first case, the aim is to investigate how individuals shape and respond over time to the unequal exposure to risks related to industrial emissions; the privileged place of observation is Facebook, a context where discussions and information exchanges take place. The interviews provide a detailed understanding of the risk perception of those who live in the area on a daily basis, with a view to integrating it with the findings of longitudinal analyses.

Social Acceptance of Water Reuse For Climate Adaptation: The Case of Lisbon

Marcella Melo Silva da Conceição, Carla Gomes, Luísa Schmidt

Institute of Social Sciences of the University of Lisbon

Climate change is an imminent reality, posing significant challenges across various planetary realms, with water resources standing among the most impacted. The European territory faced with higher temperatures and prolonged droughts has been spreading, therefore threatening an increasing number of people as well as key economic sectors. The water crisis requires a societal transformation towards sustainability, which involves maximising alternative water sources to bolster community resilience and reduce vulnerability. The practice of water reuse expands the resource supply but also introduces sustainability principles, closing the cycle of water use within a circular economy. This communication is based on doctoral research that draws from theories of social acceptance to build an interdisciplinary analytical framework on water reuse. The analysis focuses on the critical pillars of the social acceptance theory: risk perceptions, trust, and justice, investigating how these elements are highlighted and interconnected in regulatory documents and policies in the field. The findings are focused on the case of Lisbon and are supported by a policy analysis of instruments related to climate adaptation and water reuse on the European, national, and local levels. The study aims to provide relevant insights for future policy on water management and climate adaptation, which seek to contribute to strengthen the adaptive capacity of cities across Europe.

What Does Decoupling Mean? A Few Points Of Clarification

Malcolm Fairbrother

Uppsala University, Sweden

As Dunlap put it almost a decade ago, "the current major theoretical cleavage" in environmental sociology "is over the ability or inability of ecological modernization processes to halt environmental degradation" (2015: 802). That remains true today, with some sociologists and other social scientists suggesting that better policies and new technologies could solve climate change and other pressing environmental problems, and others strongly disagreeing.

Scholars subscribing to the latter view suggest that a wider social transformation is required. One such possible transformation is economic "degrowth." Vocal advocates of this agenda argue that economic growth cannot be "decoupled" from greenhouse gas emissions and other damaging environmental impacts. This claim represents a challenge to the many researchers, activists, and policymakers who believe decoupling is in fact possible, including sociologists who are optimistic about the potential for ecological modernization.

This paper thus responds to recent challenges from the degrowth perspective (e.g., Hickel's (2020) "What does degrowth mean? A few points of clarification"), and defends the thesis that growth can indeed be decoupled from greenhouse gas emissions and other damaging environmental impacts. The core thesis of decouplers is that economic growth need not lead to increasing environmental harms, if states take appropriate policy measures leading to the discovery and deployment of more benign ways of producing the goods and services we want to consume.

The paper identifies and discusses key propositions distinguishing the degrowth and decoupling perspectives, and a list of (sometimes under-appreciated) commonalities. While degrowth as an agenda rests on some superficially eye-catching claims, in practice advocates of degrowth appear not to believe the strongest versions of those claims. More moderate versions are not so far from decoupling perspectives.

JS | RN13_RN14_T02: Work family dynamics and gender inequalities in post pandemic European societies (I)

Work-life balance in the pandemic and post-pandemic Europe.

Working from Home and Work-Family Conflict: Pre- and Post-Pandemic Evidence

Inga Laß[1], Mark Wooden[2]

[1]Federal Institute for Population Research (BiB), Germany;
[2]The University of Melbourne, Australia

Objective: This study investigates the association between working from home (WFH) and both work-to-family (WTFC) and family-to-work conflict (FTWC), and whether these associations changed following the COVID-19 pandemic.

Background: The COVID-19 pandemic saw a marked increase in the incidence of WFH in many countries, which many argue has been beneficial for families. Convincing evidence in support of this hypothesis, however, is scarce.

Method: Panel data from 19 waves of the Household, Income and Labour Dynamics in Australia (HILDA) Survey (covering the period 2001 to 2021) are used to estimate fixed-effects regression models of both FTWC and WTFC where the explanatory variable of interest is the share of usual weekly work hours worked from home. The sample is restricted to working parents aged between 18 and 64 years (9,859 persons; 54,893 observations).

Results: For both genders the level of WTFC declines with the proportion of time worked from home. By contrast, the association between WFH and FTWC differs between mothers and fathers, with FTWC lower for mothers but higher for fathers when working mostly from home. These associations remained largely unchanged during the pandemic.

Conclusion: The study suggests that WFH is particularly beneficial for mothers' reconciliation of work and family life but has ambivalent effects for fathers. This in turn may mean mothers will make greater use of WFH arrangements than fathers post pandemic.

Work-life Balance and Gender Equality in Post-pandemic Times. The Case of Local Public Workers of the Cávado Region in Portugal

Margarida Martins Barroso, Sandra Palma Saleiro, Sara Franco Silva

Iscte-University Institute of Lisbon, Portugal

The initial reflections on the impacts of the COVID-19 pandemic were, to a certain extent, optimistic about its transformative potential, predicting long-term changes in the world of work, specifically through the spread of flexible work arrangements. However, in the aftermath of the health crisis, it is still unclear to what extent the pandemic has in fact meant a turning point in relation to previous predominant work-life dynamics, namely those based on rigid work organisation regimes and in an unequal distribution of unpaid work.

Based on the results of a survey applied to 2375 workers from local public administration in the Cávado Intermunicipal Community, Portugal, this article discusses the impacts of the Covid-19 pandemic on work organisation and its relationship with gender equality and work-life balance. Along with the changes experienced by a significant part of the workers, the results show a pattern of permanence in work arrangements and in the distribution of family responsibilities. The results also reveal that the effects of the pandemic have been felt differently according to gender and occupation, negatively affecting women in lower-skilled occupations, and benefiting higher-skilled men. Our findings are thus in line with previous studies that have already noted the limited scope of the transformations brought by the pandemic, and its reinforcing effect on structural inequalities.

Female Entrepreneurship And Its Influence On Work-Life Balance Among Women: A Qualitative Study In Italy

Letizia Medina, Sara Mazzucchelli, Maria Letizia Bosoni

Università Cattolica del Sacro Cuore, Italy

For women, the world of work often poses a challenge, both in entry and throughout the career process, due to gender roles and the caregiving burden. Entrepreneurship in many countries presents an opportunity for women to counter gender disparities and manage the work-family balance more effectively. This study aims to understand the various factors driving Italian women to initiate entrepreneurial activities. It is part of a broader multidisciplinary project employing mixed methodologies for data collection. This article focuses on the qualitative aspect.

Four focus groups were conducted, two with unemployed women with a low caregiving burden and two with a high

1221

caregiving burden, all intending to start a business. Additionally, 20 online semi-structured interviews were conducted, including 10 with Italian entrepreneurs and 10 with foreign entrepreneurs. The sample comprises female entrepreneurs from small and medium-sized enterprises, with diverse caregiving responsibilities and belonging to various entrepreneurial sectors. Content analysis using NVivo software was conducted to identify the characteristics of Italian female entrepreneurship. Lemmatic analysis using T-Lab was also performed to comprehend the key factors associated with female entrepreneurs and their work-family balance experiences. The results emphasize the factors promoting the creation of female entrepreneurship, identifying multiple levels, from micro (personal) to macro (institutional, contextual). Furthermore, the findings reveal a discrepancy between female entrepreneurs and unemployed women regarding the perception and experience of whether entrepreneurship acts as a hindrance or a facilitator for work-family balance.

Work-family Balance, Tech-control and Self-efficacy Among Women and Men Lecturers: Teach-experience at University During Pandemic

Brunella Fiore[2], Alessandra Decataldo[1]

[1]Milan-Bicocca, Italy; [2]Milan-Bicocca, Italy

Among the sectors most affected by the Covid-19 pandemic, "Education and Training" experienced severe disturbances in balances, routine practices, cultural and regulatory models, with serious consequences for all stakeholders. The integration of digital methodologies necessitates proficiency, understanding, and a willingness to embrace emerging technologies; however, not all institutions (schools and universities) and stakeholders are prepared to embrace this transformation. The pandemic required stakeholders (including lecturers) to redesign teaching activities using distance learning methods, even if they were not prepared to do so. In addition to the difficulties of accepting and using information technologies, lecturers faced the challenge of planning and designing new forms of teaching that would ensure students' attendance and guarantee high levels of learning.

The contribution aims to examine how the perception of self-efficacy in academic teaching is shaped by the interplay between technological control and the pursuit of a balance between professional and family responsibilities for women and men. Through an in-depth analysis of the challenges and opportunities presented by technology in the teaching domain, as well as the dynamics influencing the work-family equilibrium for lecturers, this work aims to outline a framework for self-efficacy perception. This paper reflects on the experience of lecturers at the University of Milan Bicocca, discussing the outcomes of a survey administered to them. Data were analyzed through Structural Equation Modelling (SEM), focusing on the impact of two main dimensions tech-control and work-family balance on lecturers' perceived self-efficacy in digital teaching (in light of gender and perception of anxiety).

JS | RN13_RN14_T07: Work family dynamics and gender inequalities in post pandemic European societies (II)

Support for careers and its gendered consequences.

Better At Home? Teleworking As A New Form of Precariousness in Women's Employment

Salvador Manzanera-Román[1], Pilar Ortiz García[2]

[1]University of Murcia, Spain; [2]University of Murcia, Spain

The use of digital technologies has changed the forms of work and employment, making them more flexible and, on occasions, precarious. The pandemic has boosted telework in the European Union and Spain. This research identifies this progress by considering the gender differences that occur in one of its formulas, habitual teleworking. To do so, a quantitative methodology has been used, based on data from the European Labor Force Survey published by Eurostat for the period 2012-2021, as well as the European Working Conditions Survey of the European Foundation for the Improvement of Living and Working Conditions in 2021.

The results indicate that habitual teleworking has been more prevalent among women than men, although until 2019 the differences were always minimal. However, there are differences between EU countries, which can be grouped into three models: 1) Feminized habitual telework model with an increase in differences in the post-pandemic period (France, Belgium, Portugal, Greece, Czech Republic and Poland, among others); 2) Habitual telework pattern feminized after the pandemic, whereas previously it was more male-dominated (Ireland, Sweden, Finland, the Netherlands, Italy, Spain, etc.); 3) Masculinized pattern of habitual telework in the post-pandemic period (Germany only).

On the other hand, this intensification and feminization of teleworking is moderated by variables such as the composition of the household, in such a way that living with a partner and having children increase the probability of women's habitual teleworking, increasing the precariousness of women's employment.

Gendered Career Consequences of Caring for a Sick Child

Ayhan Adams, Katrin Golsch

Osnabrück University, Germany

The contribution addresses the effects of work absences due to caring for a sick child on employment outcomes.

1222

Additionally, potential outcome differences between fathers' and mothers' use of absence days due to sick child care are studied. These special absence days represent an understudied aspect of the link between work and family life. According to the idea that children are the key to gender inequalities (Cortés & Pan 2023) and the everyday nature of this phenomenon for working parents, sick child care allows to deepen the knowledge about the compatibility between work and family and gender-specific effects in the work-family interface. The study uses longitudinal data from the German socio-economic panel (SOEP, 2010-2021). It conducts linear fixed effects regressions to analyse the interrelatedness of changes in sick child care days and income, work effort, and supervisor recognition. The first results reveal significant negative within effects of the number of sick child care days on income for mothers but not for fathers. This aligns with the idea of a motherhood wage penalty and a gendered expectation and recognition of care duties in employment.

Cortés, Patricia, and Jessica Pan. 2023. "Children and the Remaining Gender Gaps in the Labor Market." Journal of Economic Literature, 61 (4): 1359-1409.

Mental Health Among Employed Parents with Nonstandard Schedules : the Gendered Role of Work and Family Support.

Anne Lambert[1], Chhavi Tiwarii[2]

[1]National Institute for Demographic Studies, Ined, France;
[2]University of Florida, USA

An increasing portion of the UE labour force is now engaged in nonstandard work schedules, broadly defined as work outside of the typical 9 am–5pm, Monday–Friday schedule. The increasing prevalence of NSWS reflects ongoing changes in globalized economies, including population ageing and demand for personal care services; the growth of the digital economy; and work-on-demand; and working-time deregulation. Additionally, the Covid-19 pandemic has led to changes in work patterns and increased felxibility, with persistent trend deviations.

The increasing prevalence of nonstandard work schedules has disproportionately affected women across several countries. While evidence shows that NSWS negatively impact workers' physical health and family well-being, their impact on mental health remains understudied. To address this gap, we conducted a study with a sample of 11,069 employed parents in France. We explore gender disparities in the association between different types of NSWS (early mornings, nights, late evenings, and weekends) and poor self-rated mental health. Additionally, we investigate whether lack of social support in the work and family domains explains these differences for both men and women. Results show a significant link between NSWS and poor mental health, with women being more affected than men, especially in the case of weekend work. The lack of social support explains a substantial part of the association. Moreover, we fint that its role varies for women and men in different social classes. While women managers suffer from

a lack of supervisor support, women in lower class jobs are more impacted by lack of family support. These results emphasize the importance of considering the ways gender operates, alongside with class, to shape the effects on mental health of work hours.

Parenting leave futures

Patricia Hamilton

University of York, United Kingdom

In the 105 years since the International Labour Organisation adopted the Maternity Protection Convention, innovation in the parenting leave policy landscape has been limited. Parenting leave policies are constrained by maternalism, especially in Anglophone countries (Baird & O'Brien, 2015; Moss & O'Brien, 2019), and a vision of good parent-citizenship that centres work. Drawing from longitudinal qualitative interviews with thirteen black parents conducted in the UK during the pandemic (April 2020-July 2021), I employ black feminist theory (Combahee River Collective, 1977; Nash, 2021) and parenting culture studies (Faircloth, 2013) to consider what parenting leave policies that prioritise care over work might look like. The paper examines the policy changes proposed in parenting leave scholarship and by the civil sector, including the six-month solution suggested by Kaufman (2020) and the 6-6-6 model put forward by lobby group Maternity Action and their potential to alter seemingly intransigent leave-taking patterns. These policy futures are contextualised within broader transformations in family and work life in the midst of the pandemic and the gendered, race and class inequalities it exacerbated.

1223

JS | RN13_RN23_T03: Family practices in heteronormative societies (I)

Growing Old Outside the Couple: Ageing Imaginaries Queering Shared Living

Chiara Bertone

University of Eastern Piedmont, Italy

The paper draws on the contribution of queer perspectives on relationships of care, intimacy and support to the development of new views of ageing challenging heteronormative representations. It is based on participatory research with women living outside the couple (55-80 years old) exploring their current practices and imaginaries of ageing: a research group of 8 co-researchers conducted and analysed over 40 interviews. A focus on women's visions of their future reveals a strong sense of precariousness in facing a possible loss of autonomy. The solution of shared and collaborative living emerges as an alternative future that could fulfil the desire for sociality and as a possibility of maintaining forms of autonomy even in the reduction of self-sufficiency, but a gap emerges between aspirations and the possibility of translating them into practical projects, in which economic and relational resources play a key role. However, in women's overflowing, often unrealistic imaginaries of shared living, we also find a challenge to a model of domesticity that certain forms of co-housing reproduce, in which sociality is assumed to take place primarily in the private space of the household, in stable long-term relationships. Queer perspectives can help to read other logics in their aspirations, such as those associated with friendship, the porosity of boundaries between public and private, and the contingency of relationships, for the construction of broader imaginaries of ageing.

The Everyday Life of LGBT Families in Slovenia: "But Who is the 'real' Mom?"

Nina Perger, Alenka Švab

University of Ljubljana, Faculty of Social Sciences, Slovenia

This paper presents the preliminary results of a sociological study on the everyday life of LGBT families in Slovenia. The study was conducted in 2023 with five focus groups including 17 individuals from LGBT families. Three main thematic areas were covered: 1. perceptions of family and family practices, especially those related to family formation, parenting and the division of family labour; 2. family members' experiences with interactions and relationships in different social settings and with different institutions, and 3. the challenges and coping strategies and the role of support networks available to them, including the significance of legal changes.

In this paper, we focus on the distinction between biological and non-biological parental status within LGBT families, given the socially prevalent notion of family as biologically related. The data show that these distinctions are made socially relevant. As such, they tend to be present in the LGBT families, even if only in the form of concerns that only later – through affirming interactions – turn out to be irrelevant. For some LGBT families, however, this distinction can greatly shape the experience of "doing" the LGBT family. Namely, the distinctiveness of biological and non-biological parental status tend to be be socially enforced, either by the immediate social surrounding – which is particularly the case for reorganised LGBT families, where one of the partners was previously in a heterosexual relationship –, or internally, by taking seriously the social verdict inherent in the ever-haunting and polymorphous question "But who is the 'real' mom?".

Failure, Privilege, and Power: A Critical Examination of Family in Contemporary Social Policy Literature

Volkan Yilmaz

Ulster University, United Kingdom

1224

This paper critically examines the prevailing tendency in contemporary social policy literature to uncritically regard the family as an unwavering haven in a heartless world. While theories of market failure and government failure are well-established, the notion of family failure appears conspicuously absent from the literature. We routinely invoke market failure to justify the implementation of social policies and government failure to identify shortcomings in social supports and services. Yet, there remains a curious lack of scrutiny when it comes to the family. This paper is an empirically informed conceptual intervention that challenges an overly optimistic view of families in contemporary social policy literature. The paper addresses the following questions: When does a family fail? How, and for whom, does it fail? How should the discipline of social policy approach the unit of the family in a way that also speaks to contexts where family formation is a privilege for some (e.g. heterosexuals), where family formation sometimes occurs through forced marriages and sexual abuse of children, and where divorce is financially or legally challenging for women to initiate? This paper seeks to offer a more nuanced and power-conscious social policy approach to the notion of family.

'You Have Much More Pressure to be Liked'. Discrimination and Normalization for LGBT*-families in Germany

Mona Motakef[1], Julia Teschlade[2], Christine Wimbauer[2]

[1]TU Dortmund, Germany; [2]HU Berlin, Germany

Over the last 20 years, LGBTQ+-families have become more visible, in politics, law, and social science research and everyday life. Furthermore, conceptions of what constitutes the family have pluralized and legal recognition of same-sex relationships and families has increased in many democratic countries. In Germany, same-sex marriage is legally recognized since 2017. However, legal barriers for LGBTQ* and multi-parent families still exist. Starting from these developments and observations, this presentation draws from qualitative interview data conducted as a part of the DFG research project "Ambivalent Recognition Order? Doing Reproduction and Doing Family beyond the 'Nuclear Family'". We focuses discriminations and day-to-day practices of normalization of LGBTIQ-families. We argue, that normalization practices of LGBTIQ*-families are arduous efforts within heteronormative societies. The work of demonstrating one's family relationship as genuine is more complex and requires more "work" on the part of the LGBTQ+ parents. The need to display family is significantly increased for the families we interviewed. The narrative of "feeling pressure to succeed" is a powerful summary of what many LGBTQ+ families experience in their everyday life. By highlighting "work" which is usually not recognizes as work as such, we make a contribute to the debate of discrimination of LGBTQ+ families in Germany. While LGBTIQ*-families display their normality, family norms are widened – not only by overt political struggles, but by everyday sub-political practices.

Teschlade, Julia/Motakef, Mona/Wimbauer, Christine (2023): Discrimination and normalization as an effortful social practice: an analysis of LGBTQ+ families in Germany. In: Sexualities : studies in culture and society.

Marriage According To The European Court Of Human Rights: A Right Or "A Margin Of Appreciation"

Alexandra Sipos

HUN-REN Centre for Social Sciences, Hungary

„Men and women of marriageable age have the right to marry and to found a family, according to the national laws governing the exercise of this right" states Article 12 of the European Convention on Human Rights (ECHR) – but what does it mean in practice? The paper posits that the European Court of Human Rights (ECtHR) interpretation of the ECHR on how partnerships and kinships can or should be recognized reflects tensions and transformations within the legal field and society too.

The paper gives an overview of the development of the ECtHR's extensive case law on same-sex partnership recognition in comparison with marriage equality. This refers to the state in which both different-sex and same-sex couples have access to the institution of marriage, thus the abolishment of the distinction based on sexual orientation in the exercise of the right to marry. Indeed,

To examine the case law development, three cases are selected due to their relevance in shaping such development. Firstly, Schalk and Kopf v. Austria (2010), where the question of marriage equality was examined by the Court. Secondly, Oliari and Others v. Italy (2015) in which the State obligation to provide recognition to same-sex partnerships was scrutinized. Thirdly, Maymulakhin and Markiv v. Ukraine (2023) where the ECtHR stated that the non-discrimination clause is violated if no legal recognition is provided for same-sex couples. Preliminarily, it can be concluded that some examined decisions were not fully consistent with the previously established case law of the Court. Furthermore, the ECtHR was reluctant to rely on Article 14 on non-discrimination regarding same-sex couple recognition.

Virtual Bonds: Mapping the Landscape of Queer Informal Care in Digital Spaces

Ekaterina Osipova, Laura Wiesböck, Ella O'Connor

Institute for Advanced Studies (IHS), Austria

This paper emphasizes the importance of incorporating digital practices into the academic discourse on informal care. Informal care can be understood as (1) unpaid arrangements and support systems that are (2) provided by non-professional individuals and (3) tailored to the specific needs

1225

and experiences of persons, whose condition or wellbeing would deteriorate or not improve without the assistance of others. With the growth of digitalization, spaces of care are fundamentally changing due to altered relations of proximity and distance. However, considering that dominant narratives on care largely neglect digitally mediated relationship constellations, a substantial amount of informal care carried out virtually remains largely invisible to society.

This is especially the case for individuals situated within queer contexts, whose approaches to care are not centered on heterosexual nuclear families within the domestic sphere. Given the challenges arising from care disparities of formal state support structures, systemic discrimination, and violence, as well as rejection from traditional care modalities, such as the family of origin, many queer persons resort to and engage in a variety of community-based informal care practices online. Consequently, the research project QUEERDEM (funded by the Cultural Department of the City of Vienna) is aimed at conducting a comprehensive virtual ethnography to explore forms and practices of informal care in digital spaces, which play a vital role in fostering community, facilitating the exchange of social support, and providing access to vital resources. In this paper we will present first outcomes of the study.

Beyond the Role of Men in Families: Drivers of Family Policy Change in Less Developed European Societies

1226

Attila Bartha

HUN-REN Centre for Social Sciences, Hungary

This study investigates the drivers of family policy change in less developed European societies. The main research question is the following: what have been the major societal and policy factors shaping family policy reform trajectories in more fragile societies of Europe (mostly Southern and Eastern European countries)? The research attempts to bring some conceptual, methodological, and empirical novelties as well. While previous studies concentrated on the lived experiences of women related to the perception of family policy ideas, this research has a focus on the lived experiences of men; we consider men not only from the traditional heteronormative as well as male breadwinner perspectives but also remaining open to diversity of masculinities and male roles in paid labour, care, and family settings. In addition, while previous research concentrated on North-Western Europe, this study investigates societal factors driving family policy changes in the less developed European societies. The main method of the empirical research is congruence analysis: first we (re)construct theoretically anchored ideal types of family policy changes and then, by using official documents, legal sources, and publicly available international institutional data we investigate the closeness of the more fragile European societies to the particular ideal types. The preliminary findings of the research underline two indirect factors that might be the drivers of family policy changes and shape the role of men in the change: the relative status and prestige of public education employment and the strength of collaborative governance mechanisms in shaping broader family and gender equality policies.

RN23_T05_02: Reproductive Rights and Contraception

Correlates Of Pregnancies Ending In Induced Abortions: A Population-Based Analysis From The Life-Stage Perspective

Aidée Baranda Ortiz[1,2], Mikolaj Stanek[1]

[1]University of Salamanca, Spain; [2]University of Basque Country, Spain

Induced abortions (IAs) constitute a fundamental element contributing to women's reproductive sexual health by granting them control over their motherhood, allowing them to decide whether they wish to avoid, postpone, space, or conclude their motherhood. The objective of this study was to analyze the sociodemographic variables influencing women's decisions to opt for an IA based on their life stage

For this research, records of IA, births, and late fetal deaths were combined, providing comprehensive information on all pregnancies and their respective outcomes. Binary logistic regression models applied to each age group (15-19, 20-29, 30- 39 and 40-44 years) revealed that in the early reproductive stages, the probability of opting for IA was higher in women who did not have a partner than in those who had one. In contrast, in the later years of the reproductive cycle, women with more than 2 or 3 children are more likely to undergo an IA.

In conclusion, delineating women according to their age groups and other sociodemographic characteristics that make them particularly susceptible to unwanted pregnancies, combined with a detailed analysis of the personal motivations influencing the decision to opt for an IA, could guide the formulation of specific public policies aimed at these specific strata of the female population.

Asymmetric Attitudes Towards The Rights of Gays, Lesbians And Same-sex Couples in Europe

Tamás Bartus[1], Ivett Szalma[2,1], Judit Takács[2]

[1]Corvinus University of Budapest, Hungary; [2]HUN-REN Centre for Social Sciences, Institute of Sociology

There is a vast literature on how various socio-demographic characteristics can shape attitudes towards the rights of gays, lesbians, and same-sex couples. Most studies assume that support for and opposition to these rights are the endpoints of a single scale on which variables have a symmetric effect. Our paper examines whether the effects of the individual-level variables are asymmetric. To disentangle the support and opposition effects, we apply a new method, asymmetric ordered logistic regression.

We use the European Value Survey (EVS) and the European Social Survey (ESS) to focus on items whether homosexuals are as good parents as heterosexuals (EVS), whether gays and lesbians should have the right to adopt children, and whether they have the right to live their lives as they wish (ESS). We find that many socio-demographic variables including gender, cohort, age, and parenthood shape the support for same-sex rights, but do not seem to shape opposition. Religiosity, often seen as the main counteracting force against the advancement of same-sex rights, increases opposition and decreases support at the same time. The effect of political ideology is two-faceted: identification with the left increases support (but does not decrease opposition), while identification with the right increases opposition (but does not decrease support). Evidence on the effect of education and relative income effects is mixed and sensitive to the attitude under study. These results suggest that the understandings of the opposition against and the support for the rights of gays, lesbians and same-sex couples may require different theoretical explanations.

Consensual Non-Monogamies, Polyamory and Parenting. Critical and Queer Perspectives

Daniel Cardoso[1], Christian Klesse[2], Maria Pallotta-Chiarolli[3], Michel Raab[4], Cornelia Schadler[5], Mimi Schippers[6]

[1]Lusofona University, Portugal; CICANT - DOI 10.54499/UIDB/05260/2020; [2]Manchester Metropolitan University, UK; [3]Deakin University, Australia; [4]Biko; [5]University of Vienna, Austria; [6]Tulane University, USA

This contribution explores key themes in current research on Consensual-Nonmonogamies (CNMs), polyamory and (multi) parenting from international perspectives. The paper highlights modes of oppression and discrimination and heteronormative and mononormative societies around the themes of exclusivity, gendered parenting roles, relational development framed as intimate growth, and a pervasive reproductive futurism. CNMs and polyamorous parenting practices negotiate a complex social terrain shaped by social and health policies, law, housing development, creating new avenues for parenting roles, and the (re)organization of care work and the division of labour in child-rearing. Reflecting on the key findings presented in a novel special issue of the journal Sexualities on CNM and parenting that will appear in print in June 2024 as issue number 27(4), which is comprised of studies from the USA, Belgium, The Netherlands, Germany and Austria, the paper argues that critical knowledge on CNMs and Multi-Parenting is an important and necessary ingredient of an exciting evolving queer sociology of kinship, familial practices, and intimacy.

Exploring the Intersectionality of Identity and Culture in Sexual Consent Practices

Sarah Zreim

McGill University, Canada

When we teach students about consent, we often focus on the verbal aspect of it, "yes means yes" and "no means no". Simplified mantras such as these fail to take into consideration how power and identity intersect, or the potential for people with marginalized identities to experience harm or victimization before, during, and after a sexual encounter. In this sense, identities—and culture more broadly—are often overlooked when students learn about consent. Within the context of sexual consent, there is a growing need to add nuance to consent education to ensure students are aware of the complexities of consent, rather than ignoring the influence of identity and culture. Students must also recognize the intersectional nature of consent, namely, how consent relates to identities and operates as a cross-cultural communication tool. I investigate the cultural context of sexual consent; through conducting a scoping review to identify and synthesize empirical research on sexual consent practices. This research aims to answer the

following: "To what extent do identity and culture impact sexual consent practices?" The findings provide a robust foundation for developing action research initiatives aimed at creating more inclusive and culturally sensitive consent education programs.

Can Queer Theory Teach Us About X? Intimacy, Affects, and "Sexuality"

Martin Stempfhuber

Paris Lodron Universität Salzburg, Germany

Pace the insistence of some of its leading proponents that queer theory (or queer theories) "teaches us nothing" (Lee Edelman), some motives of queer theorizing continue to haunt diverse projects of theorizing in the social sciences. In this paper, I want to address two of these motives that seem to be central for the project of queer theories as critical theories of intimate and/or public life. The more influential impulse is the insistence on the importance of affect (and affects). Queer theories offer unique vocabularies for the affective dimension of contemporary social practices and dynamics. The impetus of this insistence is a critical one and seems to be ideally suited to address questions of tension, (dis)trust, and transformation. The second suggestion concerns the role of queer "sexuality" – not only for private and intimate relationships or "intimate publics" (Lauren Berlant), but also as a critical theoretical figure that can help to disturb and stimulate projects of social theorizing: sex as "the unbearable" (Berlant and Edelman). This paper proposes that these two motives can indeed offer crucial contributions to some of the most urgent debates in the social sciences – can, indeed, teach us something. Queer affects and "sexuality" address the problematic reduction of intimate and public life to questions of identity politics. They insist on the irreducible role of negativity and contradiction for the theorizing of (anti-)sociality. And they hint towards queer "ontologies" that can enrich projects of sociological research with an interest in critical theory.

Secrecy, Intimacy and Power: Challenging the Dichotomy of Consensually and Non-Consensually Non-Monogamous Relationships

Christian Werner Klesse, Jenny van Hooff

Manchester Metropolitan University, United Kingdom

This paper explores the role of secrets in the creation, maintenance, and disruption of intimacy. It engages a dialogue between key insights from within the research and theoretical work on consensual and non-consensual non-monogamy to highlight the 'power of secrets' in mobilizing or disrupting intimate relationships. The distinction between consensual non- monogamy (e.g., polyamory) and non-consensual non-monogamy (such as affairs) tends to focus on mutual disclosure and transparency as key markers of difference. The lack of disclosure is read through morally charged concepts such as lying, deceit or betrayal. This paper challenges the dichotomy of secrecy and transparency, showing that strategies of secrecy are implicated in the production of both monogamies or non-monogamies, whether consensual or non-consensual. We argue that the model of 'disclosing' intimacy has been over-used and conflated with intimate and sexual ethics, at the expense of a critical investigations of the power relations that structure the terms of discourse and interaction. We demonstrate that consensual and non-consensual non-monogamies are closely connected by potentially sharing an investment in operations of secrecy, and that a focus on practices of secrecy needs to be placed right at the heart of the critical study of intimacy to allow for more nuanced and complex understandings of the ways we can build and maintain intimate bonds.

Intimacies At The Bar Top: A Socio-Spatial Approach To The Public Sphere from its Everyday Practices

Francisco Javier Rueda Córdoba

Universidad Complutense de Madrid, Spain

This work stems from the results of a PhD about bars, restaurants and cafeterias in a European city: Madrid. The theoretical purpose of the research was to question the hegemonic liberal notion of a rational, reflexive and abstract Public Sphere (which emerged in 18th Century Coffee Houses according to Jürgen Habermas), and to propose an embodied, situated and ordinary depiction of it. On the other hand, the methodological purpose was to apply an empirical and socio-spatial analysis to allegedly abstract political concepts such as Democracy, Conflict, Publicness, or Power, analyzing how the city inhabitants use them and how they come into live phenomenologically, in a constant interaction with bodies, things and situations. Bars were chosen as a case study due to their everyday relevance and "intermediate nature": private spaces with public concurrence and the right to refuse admissions.

Exploring this "intermediate nature", three key concepts that often appeared in the fieldwork (consisting in semi-structured interviews, observations and cartographies) constantly challenged public atmospheres: privacy, domesticity and intimacy. Each of these concepts was applied to different situations and sets. This contribution focuses on the latter (intimacy), and will explore how intimacies are constructed, allowed and monitored in these semi-public spaces. It will delve into how intimacies can even appear among strangers; who has the right to create intimate atmospheres and who suffers from them; how finally the production of intimacies is often a key strategy used by marginalized groups to create resistance choreographies, propose counter-publics, and question the violence of hegemonic public and semi-public spaces.

Diversity in Intimacy Relationships in the context of (forced) migration

Vanessa Maria Rau

Max-Planck Institute for the Study of Religious and Ethnic Diversity, Germany

With the arrival of large numbers of refugees since 2015, urban diversity in Germany has increased. Throughout the last year and especially since the outbreak of the war in Ukraine, large numbers of Ukrainian refugees have further diversified German society.

The question of sexuality and romantic relationships of refugees has barely been addressed in academic research. In the case of refugees from Arab speaking or African countries, refugees' alleged sexuality has been discussed in the context of sexual assaults, not seldom bearing orientalist and racist stereotyping. My study of intimacies between refugees and permanent residents looks at the lived experience and negotiation of difference, diversity and boundaries in terms of status, race, class and gender, religion and the negotiation of power and hierarchies in Love relationships. Taking the biographical example of couples, this paper demonstrates how differences attract but also distract each other and severely challenge a relationships and livelihoods. While often focusing on 'cultural differences' as the obstacle for 'Love' to work, I rather suggest, that the migration regime and structural inequality predominantly affects intimacy in the most severe ways. In my paper, I will show how the concept changes in the course of migration trajectories and the experience of intimacy in diverse relationships and migrants and migration influence existing societal ideas of relationships and intimacy. Focusing on the individual biographical experiences of refugees and permanent residents and their negotiation of differences, I will discuss the power relations and hierarchies involved in practice of relationships and Love as well as the negotiation of the (internalized) norms that emerge from specific socio-political environments.

JS | RN13_RN30_06: Family and intimate lives of young adults during multicrisis (I)

Ongoing and emerging social crises have multiple implications for the lives of contemporary young adults (18-35-year-olds). This session spotlights intimacies and families, looking at the relational dynamics among European younger generations. The JS reflects the conference themes by seeking new empirical and theoretical perspectives on transformations of family transitions (i.e., partnering and parenting patterns) and young people's choices around love (including meanings of trust). We also invite authors to explore how intimacies and family lives of young adults are shaped by multi-layered tensions, e.g., those evident in gender politics, intergenerational conflicts and relational implications of risk during multicrisis. "Family and intimate lives of young adults during multicrisis" is organised in two parts: Part I on 29 August and Part II on 30 August.

Gendered Intimacy: Young Adults Talk about Emotional Relationships

Smiljka Tomanovic

University of Belgrade, Serbia

The focus of the paper is on how are emotional relationships perceived in social biographies of young adults in Belgrade, the capital of Serbia. The analysis and interpretation will be based on case studies of 24 to 28 years old young adults from the longitudinal qualitative study that followed 20 subjects from their preschool age to their mid-twenties. The research was done in several research waves every seven years via semi structured interviews that aimed at reconstructing main areas of their life trajectories: education, work, housing, family and social relations, and emotional life during the period prior to the interview, and at their perceptions, reflections, feelings at the moment of the interview. Besides reflecting on their emotional relationships in the past and present, respondents also talked about their future partnership and anticipated family formation through methodological tool "future life timeline" that prompts them to "imagine adulthood". I will analyze and interpret their accounts in time perspective – connecting past, present and future. My argument is that the young adults perceive and interpret their experience of emotional relationships within the anticipated female and male (family) roles associated with their more or less typical gender (gendered) identities. The more their gender identity is detradionalized, there is a greater feeling of dissatisfaction with their emotional life. I also argue that (hetero)normative gendered identities are reinforced by the context

of prolonged (chronic) post socialist crisis that comprises re-patriarchalization of gender relations.

Low Fertility Cultures: Reading young people's reactions to falling fertility under compressed modernity in China

Ruth Holliday, Qiqi Huang

University of Leeds, United Kingdom

Since the 1990s low fertility and even population decline has begun to affect many countries around the world. Three main factors are said to contribute to this – lower infant mortality as poorer nations develop better healthcare, feminism (women staying longer in education and having better access to the labour market) (Vollset et al. 2020) and austerity (young people unable to achieve secure employment or access housing or childcare) (Hall 2019). Many studies draw attention to the causes of, and policy responses to, low fertility rates, however, this article charts some of the ways that falling birthrates impact on young people's cultural expectations and reactions. In particular we explore the stubborn refusal of Chinese birthrates to increase, despite the end of China's infamous One-Child Policy, and the introduction of subsequent pronatalist policy initiatives designed to boost reproduction. We argue that exploring a "compressed modernity" (Chang 2022) like China, brings to the surface cultural shifts (shocks) that are harder to identify in slowly evolving western modernities. By carefully examining Chinese online subcultural reactions, we hope to show how reproductive cultures can rapidly change, undoing normative ideals of the aspirational, heterosexual, carer/ breadwinner family and creating "trouble" for both gender and couple relationships. We use this material to reflect back on the UK case where a romantic ideal of intimacy and family endures - for the moment - and ask: what are younger people's orientations to work, family and intimacy likely to be in the low fertility cultures of the future?

Let's Adopt a Dog! A New Stage for the Young Couple in the Frame of Family Life Course Studies

Dr Magdalena Anita Gajewska, Dr Magdalena Anna Żadkowska, Dr Natalia Treder- Rochna, Dr Elżbieta Chruściel

University of Gdansk

Our research project, 'Couple and Dog: Relationships and Interspecies Ties in Private Life and Public Space,' delves into the intricate dynamics between childless couples and their canine companions, framed within the context of life course studies (Aeby and Gauthier 2021; Cooney 2022).

The sociology of couples (Kaufmann 1993, Żadkowska et al. 2018) tends to observe the couple's trajectory. In sociological perspectives on couples' trajectories, we explore

1232

the transformative impact of dogs on daily practices and relational bonds within young couples (Finch 2007; Schmitt et al. 2018).

Building upon existing studies on couple and animal companionship (Irvine & Celia 2017, Simpson 2021), our study, employs an interdisciplinary approach(sociology & psychology). The initial phase comprises 24 online conjoint interviews with young couples. The subsequent stage involves 13 childless couples and their dogs. It included: interviews, and cortisol level measurement (animal and human companions), coupled with surveys assessing depression, relationship patterns, and interpersonal reactivity.

Our presentation aims to shed light on the pivotal role that companion animals play in the life stage of young couples (Gajewska & Żadkowska 2023). We delineate how daily practices related to dog companionship influence the relational and intimate bonds, drawing parallels to the life course studies framework. Specifically, we investigate how the presence of a dog engages partners in building a shared life transforms their experiences into an embodiment of adulthood (Arnett 2005), and shapes their responsibility for the well-being of canine companions. We explore how couples navigate conflicts and challenges related to the care of their furry family member, offering insights into the nature of interspecies relationships within young couple dynamics (Żadkowska 2016, 2024).

"Intergenerational Perspectives on Leaving Home in Migrant Families. Findings from Young Polish Adults and Their Parents in Germany."

Zuzanna Kapciak[1], Paula Pustułka[1], Justyna Bell[2]

[1]SWPS University, Poland; [2]Oslo Metropolitan University, Norway

The paper addresses the topic of transitions-to-adulthood and intergenerational relations. Successful transitions during adulthood are increasingly connected with extensive family assistance. In the article, we will discuss intergenerational support in transitions-to-adulthood in Polish migrant families in Germany, with the focus on young migrant adults leaving the parental home. Focusing on this often-first and crucial big transitional marker, we aim to capture scope and types of support flows from parents to children. Moreover, the paper will verify whether the recent typologies of leaving home offered by Sørensen & Nielsen (2021), as well as by Pustulka et al. (2022), can be applied to understand pathways to housing autonomy in the context of migrant/transnational families.

The data stems from the IRIMTA project (funded by the Polish National Science Center, no: 2022/47/O/HS6/00976). The study employs a multi-perspective qualitative research design, with 20 intergenerational dyads consisting of young adults (18-29 years old) and their parents interviewed. This will result in 40 interviews with individuals who have

migration experience as Poles in Germany. The dyads enable mapping out intergenerational family support in a multiperspective manner: from the young adult child's and the parent's perspectives, thus offering a nuanced understanding of familial assistance in transitions-to-adulthood in migratory settings. The analysis specifically intersects the types of young adult figures (i.e., temporizer/gymnast/protector/runaway - Pustułka et al. 2022) with the typology focused on the characteristic of parental involvement (i.e., the bulging heart/the soft nudge/the slammed door; Sørensen & Nielsen 2021).

Housing Orientations And Lifestyles Of Young People In Times Of Crisis.

Andrea Orio, Stefania Leone

University of Salerno, Italy

The emerging changes in housing-related phenomena are closely tied to the impact of economic crises on the labor market and the housing sector (Lennart et al., 2016), new housing features linked to climate and pandemic crises (Rogers and Power, 2021), and the uncertainty of young people about their future (Woodman, 2011; Leccardi, 2020), shaping an ever-evolving scenario.

These changes, on the one hand, challenge a "home-centric" family model (Eve, 2009) but, on the other hand, give rise to new housing preferences among young individuals in line with evolving lifestyles (Zarruba et al., 2021). Some key trends are the perception of home ownership as a risk (Fuster et al., 2019), more time spent outside the home (Nuvolati, 2008) and residential aspirations more connected to nature (Leone and Orio, 2023).

The aim of this research is to provide new empirical and theoretical perspectives on transition models toward family life and housing choices among young adults. The research questions are: 1) in a scenario characterized by multiple crises, which uncertainties, risks and opportunities affect young people's emerging housing orientations? 2) what connections exist among housing orientations, family transitions and lifestyles?

Data were collected through a structured survey administered to a sample of young adults aged 18 to 34, exploring their conceptions and meanings of house in personal, family, and public spheres, as well as the role house plays for the new generations. Statistical analysis of the data is conducted through a mix of techniques within a multivariate analysis framework.

War and the Military Service in the Post-Collapse Communist Bloc: Which Impact on Marriage and Divorce?

Sara Tafuro, Elena Bastianelli

Università degli Studi di Firenze, France

A large scientific literature explores the correlates and determinants of union formation and dissolution around the world. However, a want of knowledge is evident for what concerns the impact on marriage and divorce of such a stressful and all-consuming event like war is. The implications of active participation in the conflict (namely, serving in the army) are even less explored, and that is often due to a lack of data. In the working paper we propose here, we use a unique data source: the Life in Transition Survey (LITS), i.e. a longitudinal dataset providing data for individuals in former soviet countries (mostly in Eastern Europe and Central Asia) from 1989 to recent times. Hence, during and after the collapse of communist regimes and its ensuing wars.

We test how the interviewee's yearly participation in the military service impacted on him marrying and divorcing on the years before, during and after that. Preliminary results show, most interestingly, that serving in the army corresponded to a lower chance of divorcing in the next few years. We also compare the effect of serving in the army with the effect of experiencing war in one's environment (i.e. in one's country at a given year) on marrying and/or divorcing at various years: the results are similar to those observed in the previous part of the study. We also propose a socio-cultural interpretation of these results, which contradict the findings of the few existing studies, all conducted in the US.

JS | RN13_RN35_T02: Kin-keeping within transnational families

Defining Transnational Families across Countries and Time: Analysis of Academic Discourse on the Phenomenon between 2003 and 2023

Irma Budginaitė-Mačkinė[1], Isabelle Albert[2], Heidi Martins[3], Mieke Schrooten[4,5], Dragan Stanojević[6], Anna Wojtyńska[7]

[1]Vilnius University; [2]University of Luxemburg; [3]Centre de Documentation sur les Migrations Humaines (CDMH); [4]Odisee University of Applied Sciences; [5]University of Antwerp; [6]University of Belgrade; [7]University of Iceland

Families separated by geographical borders yet bound by a sense of familyhood represent a complex family form receiving growing academic attention. Notwithstanding the growing attention to transnational families across diverse academic disciplines and increasing internationalisation of the higher education and research institutions, the endeavour to establish comprehensive definitions and conduct multidisciplinary and multi-local research on "transnational families" remains a formidable task. This paper explores the evolving concept of transnational families (TNFs) in today's globalized and digital society and aims to reveal how differing regional conceptualisations of the nation-state, migration regimes and family norms shape the understanding of "transnational" and "family". Drawing on Goffman's (1986 [1974]) theoretical framework, we analysed academic publications on TNFs from 2003 to 2023 in multiple languages and disciplines. The study was inspired by the discussions within the COST TraFaDy network and was conducted by a multidisciplinary and multilingual team analysing the academic discourse on TNFs in Belgium, Iceland, Lithuania, Luxembourg, Portugal and Serbia – and represents variation in terms of migration waves, migration regimes and family norms. The analysis reveals distinct imagined orders (frames) within the depictions of transnational families in different contexts. The study contributes to ongoing academic debates, highlighting the evolving understanding of transnational families amidst changing global dynamics.

Affinities Matter. A Novel Orientation for Studying Potent Personal Connections as Forces Shaping Transnational Mobility and Family Life

Anna Simola[1], Vanessa May[2]

[1]UCLouvain, Belgium; [2]University of Manchester, UK

Existing studies on the 'drivers' of intra-European mobility focus overwhelmingly on individual life projects and economic rationales, leaving largely unexplored the significance of people's personal connections with their kin and places of origin. Our paper introduces and develops an orientation for conceptualizing and studying human mobility that builds on Jennifer Mason's (2018) work on affinities defined as personal connections that have potency. Our argument is that such potent connection not only have an enormous influence on people's experiences of moving-in-the-world, but matter also in directing and patterning their movements. We draw from in-depth interviews (N=33) with Spaniards and Finns living in Belgium to offer insights into how an affinities orientation can be applied to better understand transnational (family) life in conditions of free mobility. Bringing the affinities orientation into dialogue with existing migration literature, we suggest that it offers a genuinely relational, multidimensional, multisensorial, and anti-categorical way of understanding people's living connections. These do not only take shape in relation to people's significant others, but also the places, environments, and other elements that matter to them. Crucially, we consider affinities of positivity as well as of alterity and negativity, thus highlighting relational complexity and the ways affinities can form conflicting crosscurrents in people's lives. Furthermore, the orientation is sensitive to the ways people's personal lives are experienced and remembered in historically changing social, cultural, and natural environments, thus allowing a contextualized analysis of the unfolding of people's personal lives over time and the intergenerational dynamics of such processes.

Better Together? Migrating as a Family in Covid and Brexit Times

Elisabetta Zontini

University of Nottingham, United Kingdom

In the UK the COVID pandemic coincided with another major challenge for migrant and transnational families, namely Brexit. How did migrant families navigate this double challenge to their mobilities? How did they maintain resilience and cohesiveness in these turbulent times? How did they narrate their experiences?

This paper draws on a collaborative project undertaken with an Italian NGO for a video-documentary on migrants who moved to the UK as part of a family/couple project with insights from the practitioners who advise migrants in a rapidly evolving policy context. The transformative aim of

the collaborative project was to highlight the challenges of family migration while simultaneously documenting their ordinariness and resilience, offering lessons, and pushing for more humane and family friendly policies. The documentary highlights the challenges and opportunities of family migration (broadly understood) and the strategizing that that involves. It also shows how forced immobility (imposed by Covid and the hardening of borders) affected transnational relationships and impacted participants differently, mainly according to their generation/life course stage.

The paper discusses the tensions between the trust participants have in the potential for social mobility offered by the receiving society and the reality of everyday experience of family life across borders. While Covid restrictions have receded, Brexit-related immobilities and separations are increasing, sharpening some of the challenges and contradictions highlighted in the paper.

Intimacy Lost? Ruptures, Affect and Perception of Distance Among Polish Migrants in Iceland

Anna Wojtynska

University of Iceland, Iceland

Expansion of communication technology allows people to stay in almost constant touch at far, creating impression of immediateness that led some to talk even about death of distance (Cairncross, 1997). The new media has been extensively utilized by members of transnational families to maintain a sense familyhood and collective welfare (Bryceson and Vourela, 2002; Madianou & Miller, 2011). Some of the recent studies about migrants' transnationalism describe how frequent contacts enable migrants to feel simultaneously at home and participate care exchange in a satisfactory way (White and White 2007; Baldassar 2016). King-O'Riain (2015: 256) pointed out that regular usage of communication technology allows families to create "space of transconnectivity (home/away space)" as they practice "simultaneous and ongoing belonging across significant temporal and geographical distances". Similarly, Liccope (2004: 136) concluded that by using mobile and home telephones individuals manage to create a form of virtual connectedness that might efficiently substitute for physical co-presence and so "boundaries between absence and presence eventually get blurred" (cf. Laurier 2001). These studies, however, tend to overlook (or depreciate) inevitable ruptures and discontinuity inherent in transnational living (Werbner 2013). Geographical distance, especially in times of uncertainty, turbulence and multicrises, can become acute challenge for transnational families that may be in need of additional assistance and emotional support. Based on the ethnographic research among Polish labour migrants in Iceland, I focus on the notion of risk and loss of intimacy related to periods of separation that emerged as significant issue in migrants' accounts. In this presentation I present migrants' narratives of distance and proximity in order to critically engage with somehow too optimistic picture of new media communication.

JS | RN13_RN35_T03: Social protection of transnational families

The Problem Of Social Protection Of Transnational Families In Europe

Vida Česnuitytė

Mykolas Romeris University, Lithuania

The presentation is inspired by the issues studied within the working group WG3 "Social rights and social protection of transnational families" of the COST Action CA21143 „Transnational Family Dynamics in Europe (TraFaDy)". As a result of global mass migration, lot of families in nowadays are forced to organize their lives across the state borders. One of the main tensions raised by such situation is social integration of so-called transnational families in the countries of destination. The phenomenon of social integration is multi-layered, therefore, the presentation is focused on selected social integration aspect only – social protection of transnational families' members in European countries. The problem is that most current social protection schemes were created for the citizens of national countries, and are based on social solidarity and social transfers at national level. When members of the family migrate to other country, a question emerges: who protects them in case of social risk – home country or country of destination? In case of social risks experienced by the migrants – European Union citizens, the latter question is more or less solved. Though, for social protection of migrants from Third countries, schemes still need to be transformed and adapted.

The presentation is based on the systematized social protection documents existing at national, international and supranational levels. Also, illustrations on social protection of immigrants settled in Lithuania provided.

Social Protection of Migrant Workers and Their Families in Migration Regimes between the Former Yugoslav Countries

Sanja Cukut Krilić[1], Jelena Predojević Despić[2]

[1]ZRC SAZU, Slovenia; [2]Institute of Social Sciences, Serbia

Continuing economic disparities, the collapse of key industries, skills and demand mismatches on the labour market and political instability have been among the key drivers of emigration from the former Yugoslav countries in the last decades. Within these flows, Slovenia represents an important country of immigration due to existing historical, cultural and linguistic ties, geographical proximity and existing migrant social networks. There exists a continuous reliance on labour migration and on posting of workers in Slovenia as both a receiving and a transit country to other

1236

countries of the EU. The posting of third-country nationals, particularly citizens of the former Yugoslav countries, has also increased significantly since 2010, especially in the construction sector. In this manner, the social protection issues of migrant workers have become an area of increased research interest. Nevertheless, less attention has been paid to the implications of such migration flows for transnational family lives. Drawing on statistical data and qualitative interviews with posted/migrant workers and their families from the former Yugoslav countries (especially Bosnia and Herzegovina and Serbia), the paper would explore the social protection issues created by this channel of labour mobility and migration using the life course perspective. Not neglecting the importance of formal social protection mechanisms, it will point to the importance of informal networks in living transnational family lives. It will explore how migration and employment policies produce hierarchies of vulnerabilities (for instance, labour rights violations, cultural, language and information barriers, economic dependencies, work place safety issues, lack of labour rights enforcement, conditions for family reunification) that are a product of various mechanisms in sending, transit and receiving countries.

Investigating Separated Families: Towards A Transnational Analysis of Policies, Bureaucracy And Everyday Life

Laura Odasso[1], Milena Belloni[2], Mieke Vandenbroucke[2]

[1]CY Cergy Paris Université, ICM, France; [2]Antwerpen University, Belgium

Family migration has become the dominant legal mode of entry in Europe in the last four decades. Several studies have analysed the policies and practices regulating the right of different kinds of families (migrant, mixed, refugee) to be reunited. However, these policies have mostly been investigated within the frame of a specific state. This project, instead, topicalises the policies and related bureaucratic/administrative practices transnationally. We do this by focusing on two aspects: 1. The material culture of migration bureaucracy; 2. Family and community resources to navigate the complexities of procedures. These two aspects, we argue, are key to understanding the contemporary process of family reunification and can only be fully understood if they are analysed interdisciplinary and with a transnational lens. In order to advance the research on this topic, this paper brings together three disciplinary angles (sociology; anthropology; linguistics; development studies), in different national contexts (Italy, Belgium, France, Ethiopia, Uganda). The exchange between empirical research and different theoretical perspectives, will allow us to draw some conclusions for a future agenda on the study of this topic.

Family Reunification and Administrative Citizenship: A Transnational Perspective

Milena Belloni, Gert Verschraegen

MIGLOBA, University of Antwerp, Belgium

Whereas literature on migrant family reunification primarily examined the relationship between migrants and policies of destination states, typically located in the Global North, this chapter investigates the process of applying for family reunification through a transnational lens. Drawing on multi-sited ethnography among Eritrean refugees, we focus on the case of family members, who await reunification in the first country of asylum, and show their limited capabilities to perform what we term "administrative citizenship". This concept sheds light on the material processes of identification and documentation that shape legal membership. As this chapter illustrates, refugees' life circumstances compel them to interact with different state systems, administrations and identification systems. Their interactions are often marked by limited opportunities to perform their administrative identity due to deficient or discriminatory registration systems at home and in exile. As we show, lack of documentation – or accepted documentation – by the assessing state emerges from refugees' unique social, political and administrative position of outsiders in relation to their country of origin, their often precarious status in their first countries of asylum, as well as from the limited capacity of their bureaucratic dossier "to travel" across borders.

1237

JS | RN13_RN35_T04: Transnational families in turbulent times

Emerging Challenges in Turbulent Times: A Comparative Analysis on Discrimination, Social Protection and Coping Mechanisms of Transnational Families in Europe

Tugba Aydin Halisoglu[1], Heliona Mico[2], Zahide Erdogan[3], Ozan Selcuk[4], Sviatlana Karpava[5], Anila Sulaj[6]

[1]Tarsus University, Turkiye; [2]University - Epoka University, Albania; [3]Ankara Hacı Bayram Veli University, Turkiye; [4]Recep Tayyip Erdogan University, Turkiye; [5]University of Cyprus, Cyprus; [6]Agricultural University of Tirana, Albania

Crises such as pandemics, war, and mass migration are special periods that leave states in a security and human rights dilemma. From a human rights perspective, it is evident that vulnerable groups such as immigrants are more affected in these periods when discriminatory policies are on the rise. Analyzing these problems faced by immigrants in many areas such as education, employment, and health is also important in terms of their impact on transnational families. This study aims to analyze how these discriminatory problems are experienced by transnational families migrating from Turkey, Albania, and Cyprus to European countries and how they are reflected in academic studies focusing on turbulent times in terms of discrimination and social protection mechanisms. The bibliometric analysis method will be employed to analyze academic studies within the timeframe of 2011-2023. The search will focus on keywords such as anti-discrimination, emigration, Turkey, Albania, Cyprus, TNF, and social protection. The discussion will center around the problems faced by these families in the context of discrimination. A comprehensive search strategy will be conducted in major electronic databases such as Web of Science, Eric, Scopus, and Proquest to locate relevant studies. This study will also be significant in comprehending the coping mechanisms used by transnational families in turbulent times.

Transnational Families in Crisis: Examining the Impact of COVID-19

Judit Vegh[1], Alexandra Deliu[2], Anna Wojtyńska[3], Armela Maxhelaku[4], Bogdan Voicu[5], Brunilda Zenelaga[6], Dorit Olenik Shemesh[7], Iulia-Elena Hossu[8], Magdalena Ślusarczyk[9], Margarida Martins Barroso[10], Martina Wilsch[11], Sviatlana Karpava[12], Tali Heiman[7]

[1]Eötvös Loránd University (ELTE), Doctoral School of Psychology, Hungary; [2]Romanian Academy, Research Institute for Quality of Life; [3]University of Iceland; [4]Faculty of Law, University of Tirana; [5]Lucian Blaga University of Sibiu, Department of Sociology; [6]Department of Sociology, University of Tirana, Albania; [7]Education and Psychology Department, The Open University of Israel; [8]Babeș-Bolyai University-Centre for the Study of Transnational Families; [9]Jagiellonian University; [10]Centre for Research and Studies in Sociology, Iscte-University Institute of Lisbon; [11]Institute of Ethnology and Social Anthropology, Slovak Academy of Sciences; [12]Department of English Studies, University of Cyprus

This review paper analyses the impact of the COVID-19 pandemic on transnational families (TNFs). Based on an extensive scoping review of 104 publications retrieved from Web of Science and ERIC databases, we inspect the potentially lasting effects of COVID-19 on TNFs and their implications for future global crises.

1238

Subsequent to a screening process, we analyzed a subset of articles to derive insights into eight main themes that piqued academic interest in TNFs before the pandemic: communication, social networks, psychological aspects, children's education, language policy, uncertainty, uses of time, and care. We scrutinize the changes brought about by the pandemic in each of these areas, shedding light on the altered communication patterns, shifting social support networks, psychological well-being, educational challenges, language practices, and evolving coping strategies. Our findings suggest that the pandemic catalyzed a significant shift in the way TNFs communicate, emphasizing the importance of technology and innovative solutions to maintain relationships.

Navigating these new challenges, we offer a nuanced analysis of the lessons learned, potential areas for improvement in family policy, and the ways in which TNFs evolve to meet the demands of an increasingly uncertain world.

Our research is based upon work from COST Action "Transnational Family Dynamics in Europe (TraFaDy)". The review was conducted by members of the Working Group 1 – Kinkeeping within TNF.

Ukrainian Refugees in Turkey: Experiences and Struggles

Faruk Çam

Aydin Adnan Menderes University, Turkiye

This study aims to reveal the relationships between the daily life practices and social security policies of Ukrainians who came to Turkey as a result of the Russian-Ukrainian war. While the majority of refugees passed to neighboring countries and European countries through these countries, some of them came to Turkey based on their personal backgrounds and networks. Turkey continues to implement geographical limitation to the 1951 Geneva Convention and the 1967 Protocol. In Turkey, refugee status is given only to foreigners who come to the country because of events that took place in Europe. Although there are no legislative obstacles to granting refugee status to Ukrainian refugees, when looking at the statistics regarding Ukrainians, it is seen that Ukrainians received residence permits to stay in the country. Looking at the literature, there is a gap regarding Ukrainian refugees in Turkey. In order to fill this gap, semi-structured interviews were conducted with Ukrainian refugees living in Manisa and Aydın provinces, and comprehensive information was obtained about their daily life practices, their relations with social security, and the effects of their legal status. Ethics Committee Approval was obtained before starting the study. The temporary nature of Ukrainians' legal status causes their stay in the country to be based on temporariness. It would be necessary for the literature to conduct more detailed studies according to age, gender, marital status and profession in order to shed light on the problems faced by Ukrainians living in Turkey and being within the country with a residence permit.

Ukrainian Forced Migrant Youth Negotiating Family Relationships Across the Borders in the Times of War

Anastasiia Mykhailova, Anzhela Popyk, Sofiia Horova

Universuty SWPS, Poland, Poland

Russia's brutal invasion of Ukraine forced many young Ukrainians to seek safer places beyond the borders. Poland become a major destination place due to its proximity and cultural/linguistic similarities.

Living on different sides of the border with their family members, who stay in Ukraine, became an everyday practice in their young lives. Cross-border lives, however, bring multiple changes and challenges to the already familiar family practices. This paper seeks to demonstrate how Ukrainian Forced Migrant Youth negotiate family communication and relationships across the borders in times of war, which brings uncertainty, bewilderment, loss and grief.

The project was held in June 2023-June 2024 in international collaboration with the University of Birmingham in the UK and the University of Viadrina in Germany. It aimed to study the forced migration experiences and visions of post-war reconstruction of Ukraine among the youth in Poland, the UK and Germany. Young Community Researchers were trained and navigated in doing the research at every stage: designing, recruiting/running, data analysis, and disseminating.

The study was approved by the Ethics Committee of the University of Birmingham.

1239

JS | RN13_RN35_T05: Parenthood in transnational families

Child Custody Across Borders. Methodical Challenges in Examining Cross-Border Custody Conflicts in Transnational Families

Ulrike Zartler, Johanna Kiermaier, Viktoria Parisot, Marlies Zuccato-Doutlik, Agnes Dürr

Universität Wien, Austria

In light of rising mobility and increasing numbers of transnational families, questions and conflicts about cross-border custody in transnational post-separation families are becoming increasingly relevant. So far, this issue has mainly been studied from a legal perspective, while essential sociological questions have remained unanswered. Aside from the complexity of the issue, this research gap is also related to methodical challenges.

In our presentation, we show how we tackle the methodical difficulties within a qualitative study on the subject. We introduce the approach of the study "Child Custody Across Borders", that is being conducted in Austria since spring 2023. The study provides systematic insight into the reasons, experiences, practices, and consequences of trans- and international child custody and residence negotiations. Theoretically, it is based on the divorce-stress-adjustment perspective, the praxeological approach ('doing and undoing family'), and the theory of ambiguous loss.

Methodically, this study relies on several research strands. In the presentation, we will focus on the methodical challenges and our experiences within two major approaches: (1) case studies of families who experience(d) international child custody conflicts, based on interviews and ecomaps (n~36) with parents, children, and other members of cross-border post-separation families and their social networks, analysed through the Grounded Theory coding scheme; (2) an in-depth analysis of court records involving return applications (from parents intending to relocate a child currently living in Austria to another country) to Austrian courts from 2011 to 2021 (n~250 by means of a thematic analysis, n~30 by means of a situational analysis). Furthermore, ethical questions of these research approaches will be discussed.

Are Multi-ethnic Children From Transnational Families Mitigating Ethnic Segregation In Friendships? Evidence From Four European Countries

Ruonan Ji

Department of Sociology, University of Oxford

Despite the growing number of multi-ethnic children from transnational families across Europe, limited research exists on their friendships and their potential role in understanding ethnic segregation. Previous studies on ethnic segregation in friendships have assumed individuals possess a clearly defined singular ethnic identity, neglecting cases of multi-ethnic children born into transnational marriages, who inherently cross ethnic boundaries. Utilizing survey data on general and classroom friendships of teenagers in four European countries and employing multilevel models, this paper investigates how multi-ethnic children differ from mono-ethnic children in terms of who they make friends with and the extent to which they mitigate ethnic segregation. Building on a binary categorization between native and immigrants, the paper distinguishes between four categories: mono-ethnic native, mono-ethnic immigrant, multi-ethnic native, and multi-ethnic immigrant. Results indicate that, when controlling for other factors, there is no significant difference between multi-ethnic and mono-ethnic children in terms of the total number of reported best friends, challenging the marginalizing perspective. Additionally, multi-ethnic children contribute to mitigating ethnic segregation between native and immigrant populations, with both multi-ethnic native and multi-ethnic immigrant children having more native friends than their mono-ethnic immigrant counterparts within or outside the classroom opportunity structure. In highlighting the friendship dynamics of multi-ethnic children from transnational families, this paper emphasizes the need to recognize their unique social positionality. Recognizing and understanding the social integration role played by multi-ethnic children can inform policymakers and practitioners in their efforts to foster inclusive environments within educational institutions and communities.

1240

Single-Mother Families, Family Policy, and Migration

Greta Skubiejute

Mykolas Romeris University, Lithuania

The paper critically examines the profound impact of social construction and family policy design on single-mother families, encompassing goals, tools, and rules. Informed by social construction and policy design theories, it vividly illustrates the diverse perceptions and approaches towards single-mother families across the Welfare States. Special attention is given to the challenges and opportunities faced by these families when mothers and children live in different countries due to maternal emigration.

A comprehensive literature review scrutinises how single mothers and their children are systematically constructed as policy targets in various Welfare States. Using Lithuania as a case study, empirical findings from legislative analysis and interviews with single mothers exemplify how policy design in this post-Soviet Welfare State directly impacts opportunities and the well-being of these families.

The findings underscore that the perceived value and morality of single-mother families significantly influence political narratives and the selection of policy tools, either supporting or burdening these families. The paper highlights how welfare states contribute to a divisive categorisation between deserving and undeserving families, emphasising that the lack of investment and trust conveys a negative message to the latter, perpetuating a cycle of dependency, poverty, and citizen passivity.

Moreover, interview findings suggest that being a single mother in Lithuania often leads to migration, resulting in mothers and children residing in different countries at least temporarily. This additional aspect places an extra burden on these families, a phenomenon further explored and presented at the upcoming conference.

New Masculinities in Transnational Digital Fatherhood? Information and Communication Technologies, Transnational Families, and Long-distance Fatherhood

Tingyu Kang

National Chengchi University, Taiwan

Transnational parenthood, where a parent and their children live in different countries, is now largely mediated through information and communication technologies (ICTs). Existing studies have primarily focused on ICT use in transnational motherhood, with scant attention given to ICTs in transnational fatherhood. However, several studies have examined other practices of transnational fatherhood. Focusing mainly on male migrant sending countries, they identify migrant fathers primarily as emotionally distant breadwinners, maintaining mainly economic connections with their children. Interestingly, in the meantime, another line of research on the paradigm of "new father" identifies a new hegemonic masculinity of caring, child-oriented fatherhood in many societies, challenging the preexisting normative breadwinner fatherhood.

This study addresses this, exploring masculinities in ICT-mediated practices of transnational fatherhood by interviewing Taiwanese fathers working as professionals in the Netherlands, mainland China, USA, and Vietnam while their children remain in Taiwan. Has the paradigm of new father arrived, at least in this particular cultural, class, and national context? How is this new paradigm practiced through various uses of ICTs?

The findings suggest they predominantly embrace a caring, warm, child-oriented masculinity as normative, thus portraying their physical absence as guilt and failure. Daily and extended ICT use with children is portrayed as compensation for this. None of them identify with the role of a disciplinary, authoritative father, which had been considered the norm. This is partly shaped by the affordance of ICTs, as the temporal and spatial limit of ICT-mediated interaction makes it difficult for them to enact a disciplinary parenting style.

JS | RN13_RN35_T08: Migration and transnational families

Being Treated as a Failed Citizen: Gendered Misrecognition and Cultural Violence in Migrant Mothers' Encounters with a Neoliberal Welfare State

Camilla Nordberg[1], Sirpa Wrede[2]

[1]Åbo Akademi University, Finland; [2]University of Helsinki

Merging political discourses that frame migrant women outside the labour market as lacking social value with neoliberal politics that emphasise active citizenship produces a disadvantaged position for women migrating for humanitarian or family reasons. Drawing on a longitudinal ethnographic study of non-working migrant mothers' encounters with welfare state bureaucracies in Finland, the paper considers how the broader dynamics of stigmatisation become visible at the street level in the context of a neoliberal reframing of social programs in the Nordic context. It argues that, rather than disappearing, social engineering has become reshaped through activation approaches considering immediate labour market potential as a fundamental criterion for successful citizenisation.

Accordingly, the aim was to examine how advanced liberal engineering structures the research participants' citizenisation trajectories. Firstly, we analysed organizational scripts, finding that service users' failure to autonomously navigate the institutional context and adjust to its logic resulted in disruptions and exclusion from societal support. Secondly, we analysed instances of cultural violence, finding that the paternalistic treatment of migrant mothers, ignoring their social context and shaming them for failing to follow scripts of integration, stemmed from both interpersonal and institutional racism. Juxtaposed with the misrecognition of non-working migrant women's social value, the optimising of public sector professional work results in the overburdening of public officials left to cope with inflexible and insufficient resources. We conclude by arguing that advanced liberal engineering hampers citizenisation, and that this institutionally produced precarity is exacerbated by public officials who have lost belief in the value of their work.

Interreligious Islamic-Christian Marriages in Italy: An Ethnographic Exploration

Rina Manuela Contini[1], Minoo Mirshahvalad[2]

[1]University of L'Aquila, L'Aquila, Italy; [2]University of Religions and Denominations, Qom, Iran

In the context of global migration, interreligious marriages transcend individual unions, evolving into encounters between nations, cultures, and diverse worldviews, impacting family dynamics. In Italy, Islamic-Christian marriages predominantly involve Muslim men of North African origin marrying Italian women. However, political, cultural, and religious constraints often dissuade Muslim women from engaging in exogamous marriages, with the additional complexity of many Islamic countries requiring non-Muslim men's conversion for marriages involving their female citizens.

This study focuses on Muslim women in Italy navigating these challenges, examining the transformation of cultural practices, roles, and identities within family relationships, emphasizing issues of conflict arising from diverse cultural backgrounds, communication styles, and immigration statuses. Conducting semi-structured interviews with 50 couples comprising women from Muslim-majority countries and non-Muslim men across Italian cities, the research highlights pre and post-marriage challenges discussed by women and emphasizes non-Muslim families' reactions to husbands' conversion to Islam.

The paper sheds light on obstacles and opportunities for Muslim women in these unions, exploring the impact of forced conversions on non-Muslim men and delving into changes in relationships with families of origin, cultural practices, intercultural dialogue, and the re-conceptualization of culture and family bonds. Grounded in a socio-constructivist approach, the study critically analyzes how encounters between individuals' beliefs, religions, and behaviors are socially constructed and enforced by customs and codes.

The analysis incorporates Islamic law on women's exogamous marriages, offering a comprehensive understanding of power relations and resilience within interreligious marriage pairs. This research contributes valuable insights to the European Sociological Conference ESA 2024 in Porto, JS_RN13_RN35 on Transnational Families in the Context of Global Migration.

The Caregiving Practices Of Nicaraguan Transnational Families

Oier Ochoa de Aspuru

University of the Basque Country, Spain

Families constitute one of the basic social institutions, responsible for actions such as primary socialization or maintaining the wellbeing of their members. Since the first transnational studies, different works and perspectives have investigated the way in which transnational families

1242

organize and provide care work for both their migrant and non-migrant members. In this context, the present work seeks to contribute to this growing transnational literature by analysing the way in which said transnational families negotiate and adapt to their roles, and more specifically, what are the elements and reasons that influence the choice of one caregiving strategy over another.

This work focuses on the case of Nicaraguan transnational families with members in the Basque Country. This origin shows very specific migration patterns, with the majority being women who emigrate to work in caregiving roles. Through a qualitative approach, 24 Nicaraguan women in different situations (legal, employment, personal situations, etc.) and with close ties to their home country were interviewed, as well as their relatives either in Nicaragua or in other countries.

In the context of migration, this work makes two key contributions. First, it proposes a typology of care strategies encompassing the wide array of arrangements these families display. Second, and based on said typology, the research shows that, when choosing between different strategies, families' preferences for care strategies are shaped by the recipients' needs, rather than the caregiver's attributes. As a result, this work highlights the high degree of resilience transnational families' display.

JS | RN13_RN35_T09: Integration of transnational families

Unveiling the Nexus of Media, Mobility, and Integration: Transnational Families as Pioneers of Global Inclusive Dynamics

Heike Monika Greschke[1], Irene Tuzi[2]

[1]Bielefeld University, Germany; [2]Bielefeld University, Germany

In European public discourses and sociological research, migration and integration are often intertwined, a connection that appears to intensify during periods of increased migration figures. During these phases, research is predominantly conceptualized within the framework of integration policy, considering the nation as a cultural entity and the state as a social unit.

However, in the context of recent migration and refugee events, it has become clearer than ever before how strongly migration is interwoven into communication technology networks and, how much it depends on access to these networks. Applying a media and migration sociological perspective, this paper examines the significance of communication technologies for migration processes. For this purpose, a concept of migration is proposed that focuses on the interplay between physical, medial, and social mobilities (Greschke 2016). It investigates, on a case-specific basis, the ways in which mobility possibilities, aspirations, and practices are embedded in globally stratified structures of order, how they react to them, and simultaneously modify them.

Using the example of transnational families, the implications of the interactions between migration and media practices for migration and integration research will be examined. Transnational household strategies, I argue, can be understood as micro-politics of redistribution (Greschke 2018). These strategies are rooted in the mismatch between "being" and "belonging" (Levitt/Glick-Schiller 2004). Consequently, it must be questioned to what extent the integration paradigm, insofar as it ties residency rights to exclusive social (and cultural) expectations of belonging, can adequately address the integration performances of transnational families.

1243

Critical Approaches of Integration: Schooling Experience Narratives of Transnational Families

Zsuzsanna Arendas[1], Klara Trencsenyi[2], Erzsebet Fanni Toth[3]

[1]HUN REN Center for Social Sciences, Hungary; [2]CEU PU Vienna Austria; [3]Sigmund Freud University, Vienna, Austria

Our paper is an empirically informed one, which talks to the critical stream of integration studies, more specifically, taking account of critical migrant perspectives of (state) institutional practices of integration in an EU member-state (of public schooling in Vienna).

The proximity of the two countries, Hungary and Austria (Vienna) divided only by a few hundred kilometers, creates a situation in which close connections between the country of origin and Vienna are maintained. People travel between the two places for work, families stretch across the two sides of the border. During these processes situations of 'in-betweenness' are created due to simultaneous attachments, socio-cultural connections to both localities.

Since our research focuses on families with children, in-betweenness has clear limitations when it comes to schooling of children. Children need to get enrolled to school in Austria. Schooling is the main terrain of social integration and schools often become primary sites of disciplining the new arrivals, "molding children" into society. Experiences of parents with children of schooling age contribute to the critique of integration on various levels, tell about the policy practices of the state in the name of 'integration', about ethnic hierarchies and structural discrimination manifesting itself through schooling trajectories of first or second generation immigrants, but also about an EU state's imaginary about a desired society characterized by homogeneity where locally and historically there is plenty of diversity.

As a research method, we use individual interviews, focus group interviews, also innovative participatory video making methods to address students' and parents' experiences of migration and integration, as well as to empower them to share their own narratives through creative audiovisual tools.

Tensions Between Transnational Aging Caring And Adult Children's Individualistic Life: The Discussion Among Chinese Migrants In Portugal

Yaqun Li[1], Jean Martin Rabot[1], Rosalina Pisco Costa[2]

[1]University of Minho, Portugal; [2]University of Évora, Portugal

Aging poses a significant social challenge in China, particularly for Chinese migrants in Portugal who grapple with the conventional expectations of self-sacrifice in caring for senior family members left behind in their home country. This paper aims to explore, in the global mobility context, the multicultural impact on the reconfiguration of senior caring support and the pursuit of individualistic life. Drawing on the individualization thesis, the paper explores concepts of filial piety, cultural adaption, and the impact of migration on transnational familial dynamics, the research employs a qualitative method to capture the nuanced patterns of practicing filial responsibility across different generations. Thematic analysis is employed to identify recurring patterns, conflicts, and coping mechanisms related to the transnational aging caring dilemma. Ethnographic observation and in-depth interviews with 21 Chinese migrants in Portugal, representing diverse socio-economic and educational backgrounds (ages 22 to 67), shed light on the practical dimension of aging care and the struggle to balance filial responsibility with individual aspirations. The analysis reveals that aging parents' attitude towards filial piety and government policies on welfare shaped the decision-making process of young Chinese migrants. Limited care support resources in rural area of China compel these migrants to provide significant financial support to their parents, exacerbating the tension between filial practice and individual life. The findings contribute to a deeper understanding of the complex interplay between cultural expectations and the challenges faced by Chinese migrants in navigating transnational aging caring responsibilities within the multicultural context of Portugal. It suggests that younger Chinese migrants prioritize their individualistic lives over filial obligations, necessitating the development of effective solutions to align with the expectations of care support.

Navigating Boundaries: A Qualitative Exploration of the Well-being, Health Policies, and Social Dynamics of Syrians in Turkey

Nafiye Çiğdem Aktekin, Motassem Bowarshi

Acıbadem University, Turkiye

The presentation delves into the intricate landscape of transnational families within the specific context of Syrian refugees in Turkey. Focusing on their well-being, the health policies implemented by the Turkish government, and the reception of these policies by the local population, the study offers a qualitative perspective on the experiences of Syrians living in İstanbul, Turkey.

The qualitative research draws on interviews conducted with Syrian refugees, healthcare professionals operating in centers catering to Syrians, and residents of districts in Istanbul predominantly inhabited by Syrians. Through these narratives, the presentation aims to shed light on the nuanced dimensions of the transnational Syrian experience in Turkey.

Key areas of exploration include the conceptualization of well-being among Syrian refugees, their interactions with the Turkish healthcare system, and the impact of government health policies on their overall health. Additionally, the study examines the social dynamics within Turkish communities, exploring how the local population responds to

the presence of Syrian refugees and the policies designed to support their health and well-being.

The findings contribute to a deeper understanding of the challenges faced by transnational families, specifically Syrians in Turkey, and offer insights into the effectiveness of health policies in meeting their diverse needs. The presentation ultimately seeks to stimulate discussions on refining existing policies, fostering social cohesion, and enhancing the resilience of both Syrian refugees and the communities hosting them in the dynamic landscape of global migration.

JS | RN15_RN28_T09: Boundaries, Barriers, and (Multiple) Belongings through Sport

Athlete Activism And The Political Polarization Of Sport Audiences In Germany

Swantje Müller, Michael Mutz

Justus-Liebig-Universität Giessen, Germany

Many scholars believe that sport has the capacity to promote integration, social cohesion and collective identification, both through active participation and mediatized sporting events. Run-ning counter to these notions, however, recent diagnoses assume an increasing politicization of sports. One aspect of politicization is the rise of athlete activism that ranges from symbolic actions (e.g. Colin Kaepernick´s anthem protest against racism in the U.S.) to more disruptive actions (e.g. the strike of Spanish female soccer players for higher wages). Athlete activism and other forms of politicization of sport have the potential to create boundaries, foster polarization and may result in a fragmentation of sports audiences along political lines.

While political polarization is a sociological concept that has not been extensively studied in sports sociology, it is important to consider its implications. This paper thus aims to provide a more thorough conceptual understanding of polarization as well as an empirical foundation for studying political polarization in relation to sport audiences. Conceptually, we identify three readings of polarization and examine these in relation to the sports audience. Precisely, we describe to what extent specific (either more progressive or more conservative) forms of political activism in sport divide people into strong supporters and strong critics. We further analyze, if the support or rejection of athlete activism reflects established ideological factions and political cleavages. Finally, we explore if politicization leads to a disintegration and fragmentation of the sports audience, for instance, because people prefer watching sports events only with those acquaintances, who share their own political opinions. Analyses are based on survey data (N=1.000; collected online) representative of the German adult population.

Beyond Borders: the Cultural Nexus of Suburban Football in Luanda (1950s-1980s)

Pedro David Gomes

CICS.NOVA (New University of Lisbon), Portugal

The spread of suburban football in Luanda between the 1950s and 1970s responded to the growth of the colonial city, as well as to the intersection of two major cultural fields: a) sport policies and sporting competitions organized by colonial powers, many of them influenced from the mid-1960s onwards by the Lusotropicalist thesis; b) the globalized urban popular culture, particularly through football-related media, especially Brazilian football.

Supporters of suburban games formed their club identities, their fan culture, around four connections: with neighborhood teams; with federated clubs in downtown Luanda; with major clubs in the metropolis; and sometimes with international clubs/teams, notably from Brazil. Black suburban players also played, sometimes simultaneously, for downtown clubs; several would even play in the Portuguese championship, and becoming part of the sociability networks of the African diaspora.

Despite apoliticism being a common "survival" strategy for footballer in the metropolis (Cleveland 2017), and in the wake of using the black footballer's body as an alibi for Portuguese colonialism (Cardão 2018), in some diasporic leisure spaces, another nationalist dimension – anti-colonial and pro-independence – was imagined and forged in opposition to the nationalism of the portuguese government. After independence, many players joined the "Caravana Havemos de Voltar" [We Shall Return Caravan], returning to Angola to help rebuild the new country.

Starting from the idea that nationalism and cosmopolitanism are "poles of a dialectical relationship" (Cheah 1998; Van der Veer 2002), this presentation seeks to explore to what extent these players, navigating between different cultural references, constituted distinctive forms of cosmopolitan cultural capital. And if this cosmopolitanism can be considered "nationalistic", and in opposition to / or converging with the "cosmopolitanism of downtown."

Scouting For New Nationals: How Globalization Reshaped The Membership In National Sport Teams

Pippo Russo

Università di Firenze, Italy

Globalization had a big impact in a field so deeply carachterized by the nationality element as the sport field is. More and more we see a general process where national teams are formed by non national born athletes, with a new national acquired status that makes them available to play for a different national team. This great transformation is due to a whole cultural redefinition where citizenship as a legal

profile has been reshaped from an essentialist basis to an integrative one. This change had consequences too on the logic that run the sport talent selection for the composition of national teams, and in particular we had a third criterion in addition with the ones of formation and rectruitment: the criterion of scouting. The presentation aims to show this new model features and how it fits with the culture of globalization.

Becoming a Young Woman in the High Atlas Mountains: A Study of Experience and Embodiment through the Lens of the Yoga Practise

Jordan Ashley Katz

Goldsmiths University of London, United Kingdom

This paper explores how the experience of yoga (learning both the practise and how to teach) can operate as a sociological method, creating an innovative portal into the lives of adolescent Amazigh girls in the High Atlas Mountains in Asni, Morocco. Amazigh - meaning 'free people' in Tamazight and used here in preference to the less favoured identifier Berber, which translates as 'Barbarian' from Latin - are the indigenous population residing in Northern Africa (Maddy-Weitzman, 2015).

While girlhood studies conducted in the Global South have mostly focused on processes that young women experience such as traditional markers (Switzer, 2013) to punctuate "becoming woman" (i.e., menstruation, sexual activity, marriage, etc), my research explores how "becoming" through embodiment (connecting the internal and external world) might be experienced, felt, and reflected upon through mindfulness techniques (meditation, breathing exercises, self-care, and journaling) which the yoga practise offers. In turn, these create a dialogue exchange on the individual experiences of being a teenage Amazigh girl in the context of their shared experience of residing communally in the same boarding house.

In addition to using yoga (through in-person training and weekly Zoom classes across 16 months) as my primary research method, I employ other qualitative research methods to assess the journeys of the young women in the yoga teacher training programme, including group and individual interviews, observation, 'place-making', and personal reflection. My research examines how teenage, Amazigh girls understand their own identities growing up in a traditional landscape and creates a space for them to examine their dreams of independence, individuality, and self-expression through the imagining of their future selves.

1247

JS | RN16_RN22_T01: Algorithms in action: opportunities, risks and perspectives in medicine (I)

Beyond the Silicon Valley scene, Artificial Intelligence (AI) has started to be integrated in public health, ranging from cardiology, neurology to radiology. Algorithms might be used to mitigate healthcare-associated infection (HAI) risks, promote accurate hospital-wide surveillance and to improve infection control performance in real time, making treatment faster and more effective in clinical settings. Moreover, algorithms are gaining a fundamental role in the diagnostic and the prognostic processes, supporting clinicians work. However, remarkable gaps are often discovered between the intended and actual applications of algorithms designed for different purposes. Sociological analysis has highlighted that AI can suffer from bias, which has striking implications for patients and their needs. This session brings together empirical and theoretical papers addressing the following issues and other related topics: • Rationales for using algorithms in the healthcare domain; • Analysis of current AI practices in different health settings; • Algorithmic justice; • Algorithms and the 'omics' medicine; • Algorithms and social discrimination; • Sentiments and emotions in algorithms; • Integration of algorithms in clinician work; • The future of work: will clinicians be replaced by algorithms?

Exploring Determinants of Acceptance and Adoption: A Study on Medical Doctors' Perspectives Towards Artificial Intelligence in Healthcare

Aysu Kes- Erkul[1], Enes Emre Başar[2]

[1]Ankara Science University, Turkiye; [2]Anadolu University, Turkiye

As AI continues to reshape various industries, its impact on healthcare is of particular interest. The attitudes of medical doctors (MDs) towards using AI in their practices play an important role in terms of the penetration of AI to healthcare. This paper aims to investigate the factors affecting the acceptance and intention to use Artificial Intelligence (AI) applications among medical doctors in Turkiye.

The methodology employed for this research involved an online survey conducted with 275 MDs in Turkiye, utilizing a convenience sampling technique. The study leveraged Partial Least Squares-Structural Equation Modeling (PLS-SEM) for theory confirmation, with SmartPLS 3 facilitating data analysis. Descriptive statistics were computed using SPSS 25 software.

Key findings indicate that Trust emerges as the most influential positive factor ($\beta = .651$; $t = 25.876$; $p < .01$) in enhancing the intention to use AI applications. Additionally, Perceived Usefulness ($\beta = .613$; $t = 22.851$; $p < .01$) and Perceived Ease of Use ($\beta = .644$; $t = 14.577$; $p < .01$) significantly predicted Intention to Use. Notably, Technological Anxiety ($\beta = .067$; $t = 1.014$; $p = .093$) and Facilitating Conditions ($\beta = .071$; $t = 1.041$; $p = .102$) did not emerge as significant predictors for Intention to Use.

In conclusion, this research highlights the essential role of trust, perceived usefulness, and perceived ease of use in determining MDs' acceptance and adoption of AI applications. The findings suggest that increased knowledge and experience with artificial intelligence may enhance trust and ease of use, fostering greater utilization of AI in the healthcare sector.

Digital Health Coaching For A New Human Tech Perspective - Humanistic Pragmatic Support In Uncertainty-Transformation Transition

Stefano Luca Patania

Associazione Italiana Health Coaching, Italy

We present a Human-Tech combination for Healthcare AI application in this moment of Uncertainty, activating Transformation through Humanistic Trust. Crozier said: "intervention in a crisis situation is based on the shock of the facts... that calls into question the vision established by the system and the obscure interpretations usually given". This "awakening" allows a sociological strategical analysis and systemic approach, supported by new evolutionary Health Coaching. The Digital Humanism Manifesto overcomes competitive medical-AI overlapping. A new model of Human-Tech synergy and complementarity drives heuristic thinking enhancing those new skills required by social transformation, through a digital ontological Health Coaching. A maximum enhancement of one's humanistic qualities fosters a common action in favor of Health objectives. This provides a self in transition from the bureaucratic to the interactive frommian social character in a Learning Health Organization. Through Health Coaching we support clinicians to the fulfillment of their creative potential imagination, through language, performative acts and intention, integrating the notional academic preparation. Objective Humanistic Ethics was inserted as part of social philosophy to complete this new coaching session model, overcoming cognitive individualism and bureaucratic silos prison. We demonstrated to transversally enhance many deep skills, applying digital Health & Executive Coach. Authenticity big

1248

growth underlines the deconditioning power of this approach. Emotional Regulation and Centeredness, requested to address Risk and Uncertainty was improved, too. This greatly increased the reality perception oppressed by social acceleration. We applied Mc Luhan's tetrads as an impact predictive model of this healthcare worker development innovation

Algorithmic biases and socio-digital inequalities: the Socio-digital Walkthrough of the App Campania in Salute.

Francesco Amato, Biagio Aragona, Mattia De Angelis

University of Naples Federico II, Italy

Digital applications and services such as the Campania in Salute App allow citizens to access numerous digital health services such as the choice of the general practitioner, income self-certification, exemption from co-pays, and consultation of electronic health and vaccine records.

The analysis of such technologies requires the development of specific methods that takes materiality seriously. We propose an interdisciplinary method, born in Human Computer Interaction, the Socio-Digital Walkthrough (SDW), which points the interaction between users and technologies to address how the complex intertwine between individuals and platform characteristics may lead to socio-digital inequalities.

We argue that through the application of SDW, it is possible to detect how demographics, levels of digital literacy, and prior knowledge of the individual interact simultaneously in the relationship with technology, its affordances, and its ethical-privay principles. Furthermore, SDW allowed us to detect the attitudes, emotions, and feelings that arise in the experience of interaction between the individual and technology.

This method applied to healthcare applications can highlight the algorithmic risks embedded in these digital technologies, tackling the emergence of socio-digital inequalities and unexpected outcomes.

Enacting Algorithmic Technologies In The Co-design Of EHealth Interventions

Riccardo Pronzato

University of Bologna, Italy

Recently, the co-design approach has emerged as a fruitful strategy to produce technologies for health interventions that can empower patients and caregivers and address their needs (Dietrich et al., 2021). Within this framework, eHealth interventions are often provided through digital platforms, which have become infrastructural elements in societal dynamics (van Dijck et al., 2018). While computational systems operate in ways that can seem neutral and helpful, there is consensus among scholars that these technologies are not neutral intermediaries, as there are specific socio-cultural norms, business goals and political relations embedded in their design and functioning (Schwennesen, 2019; Pronzato, 2023; Torenholt and Langstrup, 2023). In this regard, following a STS sensibility (Mol, 2002), Seaver (2017) claims that algorithmic technologies can be considered "as culture", i.e., artifacts "culturally enacted by the practices people use to engage with them" (p. 5). By bridging health sociology with perspectives from critical algorithm studies, and focusing on the co-design of an e-learning platform for informal caregivers of patients with dementia (project AGE-IT, PNRR PE8 "Age-It"), this contribution argues for the merits of investigating how co-designed algorithmic technologies are enacted by the practices and interpretations of different stakeholders, e.g., IT designers, public institutions, caregivers, doctors, etc. By "re-politicising co-design" (Huybrechts et al., 2020), this approach can help explore how forms of social discrimination potentially arise from algorithmic production (Eubanks, 2019), promote algorithmic justice and indicate ways to co-design AI systems where the perspectives of workers, caregivers and patients are involved (Donia and Shaw, 2021).

The Impact of Artificial Intelligence on Medical Trust in Morocco: Sociological Study among Doctors in the Cardiology, Intensive Care and Oncology Departments in the University Hospital Center of Rabat

Abdelhadi ELhalhouli[1], Nawal Ait aali[2]

[1]Sultan Moulay Slimane University, Beni Mellal- Morocco;
[2]Mohamed V University, Rabat-Morocco

Through this article, we aim to identify and explore the impact of artificial intelligence on trust between doctors and patients in the medical healthcare in Morocco. Therefore, the first objective of our article is to show the positioning of artificial intelligence in the medical field in Morocco.

The second objective is to present the results of the sociological study among doctors working in the following departments: cardiology, intensive care and oncology in the university hospital center (CHU) of Rabat. This quantitative study approached doctors' perceptions of the opportunities presented by the introduction of artificial intelligence into their medical practice, as well as their perceptions of the risks linked to medical diagnosis and therapeutic trust with their patients.

Finally, we aim to present the analysis of a set of statistics related to the departments mentioned above. These statistics are taken from datasets published by the Ministry of Health in Morocco. This data concerns the number of deaths, the number of healing in each department, the used treatments, the used technologies, etc. Subsequently, these statistics were the subject of a comparative study with data from the sociological analysis whose objective is to show the role of artificial intelligence, in particular Machine Learning and Deep Learning algorithms, in the healing of patients and the correct diagnosis in the Moroccan context.

Use, Trust And Perception Of Artificial Intelligence In The Clinical Practice

Chiara Binelli, Laura Sartori

University of Bologna, Italy

1250

The paper investigates trust, confidence, awareness, and socio-technical imaginaries of artificial intelligence (AI) in the clinical world using an innovative survey instrument and in-depth interviews.

The survey targets several groups of medical professionals with different professional exposure to AI and tech expertise, and elicits information on the risks and benefits, hopes and fears, and possible impacts of AI tools' adoption in the clinical practice.

The analysis of the survey data will allow to reconstruct the instances and interests of doctors who accept (or not) the introduction of an Automated Decision-Making system based on Machine Learning in their daily work routines. The socio-technical imaginaries that influence choices and shape perceptions will allow to assess power asymmetries, the potential of reproducing bias and social inequalities, and the variety of institutional contexts where AI is used.

In addition to a detailed battery of questions on AI acceptance and use, the survey includes a randomized experiment to assess the impact of providing information on the type of AI tools in use on the likely acceptance and better use of the AI tools themselves and uses quantitative subjective expectations to elicit the subjective expected future impact of the adoption and use of different AI tools. In addition to the survey, we will conduct in-depth interviews to provide a fine-grained picture of the factors that build (or prevent) trust and acceptance towards technological innovation in the clinical world along with specific socio-technical imaginaries that support the rationales for using AI tools in the healthcare domain.

Project Europe. Remaking European futures Through Digital Innovation Politics

Ine Van Hoyweghen[1], Gert Verschraegen[2], Luca Marelli[1,3], Jim Dratwa[4]

[1]KU Leuven, Belgium; [2]University of Antwerp, Belgium; [3]KU Leuven, Belgium / University of Milan, Italy; [4]VUB, Belgium

Amidst the unfolding of global economic and geopolitical challenges, the European Union (EU) has increasingly projected its future as tightly interwoven with its 'power to innovate'. From Artificial Intelligence (AI) to Blockchain, from Digital Health to Personalized Medicine, emerging fields of digital innovation have been targeted for major investments as well as governance and regulatory efforts from the part of the Union. EU-driven initiatives in digital sciences and technologies, cutting across other prominent innovation sectors such as the life sciences, are widely seen as holding the promise to address complex societal challenges and transform the way we live, move, communicate, and are cared for. Moreover, while they aim to provide the knowledge and material infrastructures for an ever more closely integrated and globally competitive European knowledge economy, they are heralded as the 'European way' to digital innovation, tailored on what are framed as distinctive European values and principles such as privacy, solidarity, and fairness.

Bringing an STS-inflected approach, we explore how the constitutive elements of our 'post-digital' societies, such as AI algorithms and genome sequencing, increasingly take up the role once assigned to coal and steel as building blocks for the European integration process. Through a comprehensive mix of substantive theoretical reflection and empirical case-studies, we tackle the issue of how novel digital orders are co-produced along with distinctively European social, political and economic identities, institutions and practices, and provide an understanding of how 'Europe' is re-imagined and recast, or contested and unmade, alongside the emergence of novel digital worlds.

Vulnerability Assemblages – Situating Vulnerability in the Political Economy of AI

Victoria Kontrus[1], Roger von Laufenberg[1], Vera Gallistl[2]

[1]VICESSE Research GmbH, Austria; [2]Karl Landsteiner University of Health Sciences, Division of Gerontology and Health Research

Next to bias, transparency, and fairness, vulnerability is one of the terms recently used to discuss ethical aspects of AI However, current discussions on AI vulnerability, tend to individualize vulnerability, largely neglecting its political dimensions, that are rooted in systems of inequality, discrimination, and disadvantage. This paper explores how notions of vulnerability underpin the development and implementation of AI. It uses AI systems for older adults in long-term-care institutions (LTC) as one example of how AI for groups that are constructed as vulnerable is created, marketed, and implemented. The paper draws on data from a multiple-perspective qualitative interview study (Vogl et al. 2018). Results uncover how AI designers use narratives around missing data on vulnerable populations as justifications for the creation of synthetic data, which was artificially manufactured rather than generated by real-world events. While this was a profitable business model for AI development companies, these practices of synthetic data creation ultimately situated LTC residents as voiceless in the development of AI. This contribution shows how vulnerability is situated in a political economy of AI which understands the absence of data on vulnerable groups as a possibility of value creation, rather than a chance of fostering inclusion and equality. The paper ends with a critical outlook on a research program of a sociology of AI, that puts vulnerabilities at its center to analyze risks and precarities that emerge when designing and implementing AI systems in diverse contexts, particularly in domains where groups generally are vulnerabilized, like in long-term-care or healthcare.

1251

JS | RN16_RN24_T02: Digital Landscapes of Health Commuication: Trust, Tensions and Transformations

In an era where digital technologies have reshaped healthcare delivery as well as the way we access and share health information, the concepts of trust, tension, and transformation have taken on new dimensions. This session aims to explore the intricate interplay between health, communication, and emerging technologies while addressing the associated challenges and opportunities. These include but are not restricted to: how technological innovations are transforming patient-provider communication, and public health messaging; the influence of Internet and social media platforms on shaping health-related communication, knowledge sharing and information dissemination, and associated tensions; the role of transparency, trust and truth within online health communities and patients groups; the importance of accurate health information for empowering individuals and the risks of misinformation and fake news, and their impact on public health perceptions and behaviors; ethical and risk-related issues posed by the collection and sharing of personal health data (privacy issues); the communication strategies of healthcare organizations and official authorities in the digital age (e.g. health education programs, disease prevention initiatives, vaccination campaigns, health literacy initiatives); how digital platforms may facilitate social mobilization and activism in the health realm, thus contributing to transformation and social change; the impact of social media and digital technologies on mental and physical health, as well as personal wellbeing (e.g. body image, peer support, etc.). This session welcomes empirical and/or theoretical papers that engage with these issues related to the evolving landscapes of health information and communication in the digital age, and their profound implications for contemporary society.

A Contextual Approach to Understanding the Determinants of Internet Users' Willingness to Share Personal Health Information Online

Jošt Bartol, Vasja Vehovar, Andraž Petrovčič

University of Ljubljana, Faculty of Social Sciences, Centre for Social Informatics, Slovenia

This study explores the intricacies of internet users' decisions to share their personal health information (PHI) online. Acknowledging the significant influence of context and involved actors, a conceptual model was developed to elucidate how users' willingness to share their PHI online varies across three distinct online contexts with different actors: e-commerce (organizations only), social network sites (organizations and peers), and instant messaging (peers only). Drawing on the dual privacy calculus theory, the model incorporates privacy concerns, perceived benefits of information sharing, and perceived privacy control as antecedents of willingness to share PHI online. These factors were examined at both the organizational (e.g., concerns about organizations' privacy practices) and peer level (e.g., concerns about peers' privacy practices). The proposed model was tested on a large, nation-wide sample of 1,666 internet users aged 18+ from Slovenia using structural equation modelling. Carefully translated and tested instruments from previous literature were employed. Perceived monetary (tangible) and social (intangible) benefits were found as the most significant factors influencing willingness to share PHI. Notably, privacy concerns and control related to peers were important only in the case of instant messaging, while privacy concerns and control related to organizations were important in all three contexts. This study has at least three important contributions. First, it empirically demonstrates the complexity and contextuality of decisions to share PHI online. Second, it underscores the importance of perceived benefits regardless of context. Third, it highlights the role of organizational surveillance in shaping online health communication, even in peer-to-peer settings.

Citizen's Willingness To Share Health Data: A Matter Of Trust?

Felix Wilke, Elias Kühnel

Ernst-Abbe University of Applied Sciences Jena, Germany

The use of personal health data for research purposes has become increasingly important in recent years. The digitalisation and availability of large amounts of data open up new opportunities for medical research and the development of treatment approaches. In Germany, the Medical Informatics Initiative (MII) and the electronic patient file offer great potential for combining, sharing and using health data. The EU's current intentions for the European Health Data Space will also have a further impact on the design of data sharing in Germany. However, many people have concerns about data protection and privacy. Especially in Germany, the willingness of the population to share health

1252

data is well below the EU average (Eurobarometer 87.1, 2017). We will present a sociological analysis to explain the willingness to share health data and its influencing factors, based on a new representative survey conducted in Germany. The CATI survey is part of the "AVATAR" project funded by the German Federal Ministry of Education and Research. Our analysis will focus on the role of trust in determining whether and under what conditions citizens are willing to share their health data. Based on this, we will derive appropriate communication structures, e.g. between data donors and data trustees, in order to strengthen transparency and trust in data sharing.

Online Depression Forums: Beyond Medicalization and Psychologization Discourses

Domonkos Sik

University Eötvös Loránd, Hungary

Online depression forums are emerging platforms of e-mental health communities. They provide unique opportunity for analysing the lay discourses surrounding depression, including the interpretations, attributions and suggested solutions of those actors, who are affected by depression either directly or indirectly. Tensions and trust issues related to the hegemonic biomedical discourses and institutional praxes are also discussed in these platforms, which prove to be central if we would like to understand the transforming public perception of depression. As a research group (ELTE - Research Center for Computational Social Science, Discursive framing of depression in online health communities research group), we have been analysing online depression forums in the last five years with both qualitative and various natural language processing methods (e.g. topic modelling, word-embedding). In the presentation, some general conclusions will be drawn from this research. Firstly, the medicalization and psychologization tendencies will be confronted with the discourses on 'social suffering' as an alternative, sociological framing of depression. Secondly, the pre- and post-COVID narrative universes are compared, so that the pandemic's impact could be explored. Thirdly, those socialization processes are briefly described, which occur during the online interactions. Besides focusing on the substantive conclusions, the presentation also aims at demonstrating how natural language processing methods can be used in a meaningful way for addressing key questions of the sociology of (mental) health.

Digital Natives, Yet Unskilled in E-health Navigation: Exploring the Relationship Between E-health Literacy and Perceived Trust of Medical Sources Among Romanian Students

Alina Catalina Duduciuc[1], Maria Corina Barbaros[2], Andreea Răceanu[1]

[1]National University of Political Science and Public Administration, Romania; [2]University "Alexandru Ioan Cuza"

Background: The e-health literacy levels among young people reflect a critical need for targeted educational initiatives to enhance their digital health literacy, ensuring they can navigate and critically assess online health information effectively. Objective and method: Given the absence of formal health and media education in the national elementary and high school curriculum for Romanian students, challenges in navigating health-related information may arise. Throughout a survey (N=500 Romanian students, aged 18-30 years), we investigate the relation between students' e-health literacy (the Romanian version of the DHLI Instrument) and their perceived trust in various sources of medical information, including health authorities, health professionals, NGOs, and the mass media. The survey covers the DHLI, sociodemographics, health status, health literacy, use of the Internet for health information, use of health apps, and the level of trust in health information sources. Additionally, we explore students' e-health literacy in the context of a specific health behavior, such as self-medication for minor headaches. Results: The findings indicate that, overall, Romanian students have low trust in health authorities and health professionals. They also demonstrate a higher level of operational and navigator skills but suboptimal skills in evaluating the relevance of online health information. Among mass media, the Internet (50.6%) emerges as the most trusted source of health-related information, followed by TV (25%), newspapers/magazines (13.7%), and radio (10.7%). Conclusions: There is a significant demand for public policies and strategies addressing communication in medical education and improving e-health literacy levels among the young population with limited skills in evaluating health information.

JS | RN16_RN24_T09: Digital Landscapes of Health Communication: Trust, Tensions and Transformations

In an era where digital technologies have reshaped healthcare delivery as well as the way we access and share health information, the concepts of trust, tension, and transformation have taken on new dimensions. This session aims to explore the intricate interplay between health, communication, and emerging technologies while addressing the associated challenges and opportunities. These include but are not restricted to: how technological innovations are transforming patient-provider communication, and public health messaging; the influence of Internet and social media platforms on shaping health-related communication, knowledge sharing and information dissemination, and associated tensions; the role of transparency, trust and truth within online health communities and patients groups; the importance of accurate health information for empowering individuals and the risks of misinformation and fake news, and their impact on public health perceptions and behaviors; ethical and risk-related issues posed by the collection and sharing of personal health data (privacy issues); the communication strategies of healthcare organizations and official authorities in the digital age (e.g. health education programs, disease prevention initiatives, vaccination campaigns, health literacy initiatives); how digital platforms may facilitate social mobilization and activism in the health realm, thus contributing to transformation and social change; the impact of social media and digital technologies on mental and physical health, as well as personal wellbeing (e.g. body image, peer support, etc.). This session welcomes empirical and/or theoretical papers that engage with these issues related to the evolving landscapes of health information and communication in the digital age, and their profound implications for contemporary society.

The digitalization of 'Individual Plan' – Norway's answer to integrated care

Sigurd Eid Jacobsen

Oslo Metropolitan University, Norway

The article is about the digitalization of 'Individual plan' – Norway's answer to integrated care. 'Individual Plan' is a master-plan intended to increase user-participation and provide better coordination of measures for patients in need of extensive and long-term health-care services. Previously written on paper, different digital platforms have during the last decade been developed to facilitate the management of the plans. In this paper, I examine the use and non-use of individual plans with a particular focus on the transition from paper plans to the use of digital platforms. To this end, I draw upon a longitudinal qualitative dataset of fieldwork and interview data. The sample consists of 12 families with disabled children and 39 municipal services coordinators who are responsible for creating and updating the plan. I find that the use of the plans is declining and point to three reasons: the parents do not see the plan as a useful tool, other professionals do not get involved in the planning work and the technical tool is described as cumbersome. The findings further suggest that the digitalization has transformed the plan from being a coordination tool to also being a communication platform described as too time-consuming by professionals within their current resource situation. On a more general, theoretical level, the article thematizes the active role of technology as well as how the plan is interpreted, used, and rejected as a digital interaction tool using concepts from script analysis and STS.

Fat And The Digital Space: A Study Of Mediated Body Shapes

Rui Liu

Lund University, Sweden

This study looks at imaginaries in the digital space around ideal body shapes. I draw on an empirical case of newly developed weight loss medications and the immense anticipation on the internet surrounding them. While public debates are mostly centred on who should have access to these medications and how to financially reimburse them, one can also ask: what fuels such anticipation and what is the success of these medications really about?

Our perception of body images is both historically associated with class, gender and social status, and is, in contemporary times, closely linked to hopes assigned to advanced biomedicine to transform bodies. While knowledge is rich regarding how fatness is represented and discussed on social media, less known is how mediated discussions affect the way people relate to body shapes and get one's body in shape. This study adds such knowledge. As a pilot study, I will collect two types of empirical material. First, publicly available documents including pharmaceutical marketing material and media reports. Second, observations on chat forums and social media. In combination, the material

will help to answer: How do people evaluate their bodies in relation to possibilities opened up by new weight loss medications?

Imaginaries here are used analytically. They are both affective and material. Studying imaginaries in the digital space provides an analytical entrance to examine the links between individuals' lived experiences with one's body and broader public discourses on body images.

Contested Expertise and YouTube Health: The "Liebscher & Bracht"-Controversy and its Reception

Marius Liedtke

Universität Salzburg, Austria

To explore the often-messy situations in which health expertise and trustworthiness are negotiated in social media contexts, this contribution investigates the public controversy surrounding the admission of German YouTube-channel "Liebscher & Bracht" into the "YouTube Health"-program of the platform as a case study.

According to YouTube, its "Health"-program was launched in an effort to counteract misinformation and provide better access to health-related contents from reliable resources. Channels deemed worthy of admission would gain a visible certification and preferential algorithmic visibility on the platform. "Liebscher & Bracht", popular for its physio-therapeutical advice videos, was one of the first channels admitted when "YouTube Health" was introduced into the German-speaking market in early 2023. However, legacy media outlets soon highlighted that the channel would spread medically unsound advice with exaggerated healing promises, and that it had to delete more than one hundred videos to even be admitted into YouTube Health, raising concerns over the platform's quality standards. The controversy soon spread to YouTube itself, where other content creators have been criticizing "Liebscher & Bracht" for their supposedly unsubstantiated claims for a long time.

By employing an integrated mix of interpretative and digital methods, this contribution analyzes the positions taken towards "Liebscher & Bracht's"-content within this controversy as well as the competing claims for expertise and authority the involved actors engage in. Furthermore, it takes the perspective of the audience into account, as it analyzes and maps the discussions in the comment sections of YouTube videos and news articles, where audiences weigh the presented critique and its claims of scientific evidence against their often very positive personal experiences with the content of a channel they are already trusting.

JS | RN16_RN28_T07: Sport, physical activity, health and medicine

The sociology of health and medicine and the sociology of sport deal with a number of narrowly intertwined topics and social processes. This session aims to bring together scholars from both subdisciplines to discuss these connections. The session convenors welcome contributions focusing on any topics including, but not limited to, fitness culture, sports participation, physical activity and health, sport and doping, sport and injuries, digitalisation of health and sports, physical activity and ageing, sports medicine and health care professionals or medicalisation and pharmaceuticalisation of amateur and professional sport. Studies focusing on the connections between physical activity or sport and health in the context of neoliberal responsibilisation, commodification and globalisation are particularly welcome. Attention will be given to conceptual and empirically-driven contributions drawing on qualitative, quantitative or mixed methods approaches.

The Role of Physical Activity and Other Sources of Workplace Stress and Resources in Wellbeing of University Teachers in Central and Eastern Europe

Klara Kovacs[1], Szilvia Borbély[2], Gabriella Hideg[3]

[1]University of Debrecen, Hungary; [2]University of Nyíregyháza, Hungary; [3]University of Pécs, Hungary

While previously a university education career seemed like a predictable, relatively stress-free, flexible, socially recognized profession, which protected its teachers from all sorts of workplace sources of stress like uncertainty, low work control, this today is no longer the case. Thus, it is important to discover what work-related and personal stress-sources and resources affect academics' well-being. In our study, we would like to answer this niche question by examining Central and Eastern European (Hungarian, Slovakian, Ukrainian, Romanian, and Serbian) university teachers. In order to come up with research questions, the Job demands and resources theory (JD-R theory) was used. The JD-R theory is a theoretical framework that helps to explain and understand the relationship between workplace characteristics and employee performance and well-being. For

our analyses, we used the CEETHE 2023 research database, in the framework of which, with the help of an online survey, we mapped teacher work characteristics of Hungarian, Slovakian, Ukrainian, Romanian, and Serbian higher education institution teachers (N=821). According to our results, emotional exhaustion is the most critical negative predictor, while commitment to work is the most important positive predictor of teachers' well-being. In an indirect way, physical activity contributes to well-being by decreasing certain sources of stress. If the university would like to improve its employees' well-being, then it would be equally important to emphasize institutional management support, which would provide clear-cut expectations and tasks, transparent institutional strategy, goals and plans.

Adapted Physical Activity in Addiction Clinics: Undergoing, Over-investing, and Discovering.

Yannick Le Hénaff[1], Emilie Gaborit[2]

[1]Rouen Normandy University, Dysolab, France; [2]Université de Toulouse, CRESCO, France

Adapted physical activity (APA) is a supportive treatment offered in the context of care provision for chronic illness or ageing. In France, its use is increasing exponentially, including in the addiction clinics which form the focus of this proposal. Taking inspiration from Anselm Strauss's work, we analyse 'illness trajectories' and the different forms of work done in this context by the residents of these clinics.

Our investigation looks at two clinics, where interviews were conducted with 7 health care professionals and 33 residents. Additionally, a series of observation sessions were carried out, over a period of 8 months.

We show that the discrepancy between the residents' behaviour and the professionals' expectations have an impact on care provision in the clinic, but also, in the longer term, on addiction trajectories. Health care practitioners assess patients' ability to show that they are 'committed' to and 'serious' about their care. In this context, APA can be considered a sentinel activity which serves to monitor residents' commitment to their treatment. Furthermore, this health care work in APA must also be analysed from a processual perspective in the broader context of patients' addiction trajectories, their prior experiences with medical and social care, and the feeling of being worn down which can result from being confined to these clinics.

Between Sport And Physical Activity: Ambiguities In EU Policy And Regenerative Actions

Giovannipaolo Ferrari[1], Paolo Diana[2]

[1]Università di Salerno, DISUFF, Italy; CeRIES, Université de Lille, France; [2]Università di Salerno, DISUFF, Italy

Over the years, EU policies have evolved to promote and support citizens' engagement in physical activity and participation in sport. This paper analyses the different dimensions of EU policies related to sport and physical activity. It analyses the initiatives promoted, the programmes implemented and the objectives for the future, even in the face of the "cosmic catastrophe" of COVID-19.

In the first four decades of European integration, EU policy in the field of sport was fragmented and almost completely absent. Since the mid-1990s, governments in many Western countries have developed strategies to encourage their citizens to adopt a more active lifestyle (Waddington 2010). This process has been labelled "the new public health" and has led to a shift in health policy from a focus on "care" to "prevention".

In our analysis, we will first outline the EU policy on sport and physical activity, which initially aims at the psychophysical improvement of European citizens. We will then analyse the ambiguous reception and use of the terms "sport" and "physical activity" by the EU in official documents and guidelines of the European Parliament and the Commission. The focus will shift to new lifestyles shared by more and more people in most EU Member States and to "regenerative actions" taken especially during and after the pandemic. Finally, we will see how, through this - albeit slow - development of jurisprudence, an attempt was ultimately made to promote the mobilisation of territorial institutions and organisations to protect and promote the psychophysical and social well-being of individual European citizens and communities.

Physical Activity and Sport in the Context of Visual Impairment : Issues, Obstacles and Social Functions for Young People with Visual Impairment

Valentine Gourinat[1], Lina Danusevičienė[2], Lisa Gittel[3], Erika Guastafierro[4], Francesca Incagli[4], Martina Lanza[4], Aggée Célestin Lomo Myazhiom[1], David Le Breton[1], Hélène Dollfus[5]

[1]Lab for Interdisciplinary Cultural Studies, University of Strasbourg, France; [2]Lithuanian University of Health Sciences, Lithuania; [3]University Hospital Bonn, Department of Ophthalmology, Germany; [4]SC Neurologia, Salute Pubblica, Disabilità, Fondazione IRCCS Istituto Neurologico Carlo Besta, Italy; [5]University Hospital of Strasbourg, France

Growing up in a social world where sight is an hegemonic sense (Grüsser & Grüsser-Cornehls, 1989) raises many adjustment difficulties for the young person and the social bond as a whole (David Le Breton, 2017). Despite this singularity, children and adolescents with visual impairment are keen to take part in physical activities and sport. While their disability may limit the ways in which they can participate (Greguol, Gobbi & Carraro, 2015), it does not spoil their desire and need to take part in it.

By focusing on people's abilities (in their uniqueness), and moving away from a defectological approach to illness or

disability, the aim is to use motor skills to help people become aware of and/or reappropriate their bodies. While physical and sport activities are intended for recreation and leisure, enabling excluded people to achieve personal accomplishment, socialisation and social participation, the purpose of this paper is to examine the meaning and essence of physical and sport activities (Lomo & Reichhart, 2017) for young people with visual impairment at a time when they are building their identity.

This contribution will be based on field data from the European SeeMylife project (semi-directed interviews with visually impaired young people, their families and carers), in order to highlight the way in which sport is essential, although sometimes still too difficult to access, for this population. Through individual experiences, we will present some more general thoughts on the issues involved in practicing sport in the context of sensory impairment, particularly among young people.

JS | RN17_RN30_T02: Tension and Transformations in Contemporary Labour Market in a Youth and Generational Perspective (I)

Youth, Employment, and Social Protection in Portugal: a Relational Analysis of Young People in the Multidimensional Space of the Labor Market

Rodrigo Vieira Assis, Inês Tavares, Renato Miguel Carmo

Iscte - University Institute of Lisbon, CIES-Iscte, Portugal

Currently, despite Portuguese society benefiting from the most qualified youth workforce ever, a set of vulnerabilities resulting from job precariousness hinders the integration and permanence of young people in the labor market. As a group particularly susceptible to moments of crisis, young people were the most affected by unemployment during the Covid-19 pandemic, representing 70% of workers who lost their jobs between 2019 and 2020 in the country. However, are all young people equally vulnerable to job instability and insecurity? What dimensions structure the social space of the youth labor market in Portugal? To what extent do their perceptions of institutions in the world of work vary depending on their position in this social space? The main objective of this communication is to present a relational analysis of young people in the labor market developed from the examination of responses given by 5076 young people, aged 18-35, surveyed in 2023 in Portugal. Using different methods such as Multiple Correspondence Analysis and Cluster Analysis, the structuring dimensions of the multidimensional space of the youth labor market will be identified, and the privileged associations between diverse indicators highlighting differences and inequalities among young workers in the country will be examined. In addition to being unprecedented in Portugal, this study aims to contribute to the deepening of sociological knowledge about a population particularly affected by changes in the labor market, as observed through current tensions between work and social protection.

Job Insecurity and Life Courses

Sonia Bertolini[1], Valentina Goglio[1], Dirk Hofacker[2]

[1]University of Turin, Italy; [2]University of Duisburg-Essen, Germany

The study focuses on the interplay between subjective perception and objective dimension of workers' job insecurity and how these two dimensions impact on their life course's transitions.

Issues of objective and subjective job insecurity in Europe are framed in the context of the life course, investigating the relationship between a) job insecurity and transition to adulthood, b) its repercussions for mid-career employees and c) its consequences for older workers.

Indeed, the relationship between unstable work careers, family transitions into adult life and mid/end-career transitions can vary according to the welfare state system of the country but, of equal importance, are the subjective perceptions of one's own situation in the labor market and in the society.

Drawing from interviews and survey data across the EU and the UK, this in-depth study explores how worker instability is perceived and experienced, and how this 'perception' in turn affects individuals' economic and social situation. Using intersectional analysis and a unique focus on different life stages, the authors identify groups who are more prone to labor market risks and describe their relative disadvantage.

Focusing on both objective and subjective dimension of job insecurity and its impact on life course transitions, this study also provide evidence to inform policy measures internationally in several social domains related to work, employment and society.

Flexibility Vs. Regularity. Young Workers' Experiences of Precarious Work in Restaurants and Warehouses

Lotta Haikkola

Finnish Youth Research Society, Finland

This presentation examines young workers' work ethos and experiences of work in two sectors in the urban service economy, namely restaurants (hospitality) and warehousing (logistics). Using theories of precarization (Kalleberg & Vallas 2017) and consent (Burawoy 1979), it argues that precarization affects groups of young people differently. In both sectors, work is low-skilled, physically demanding and turnover is high, but employment relations and work organization differ. The restaurant sector uses non-standard contracts and agency work and the trade union is weak. Work is unpredictable, hard to routinize and often understaffed. Warehousing, on the other hand, uses a combination of stable workforce and temp workers and the union is still strong. Work is routinized and standardized. The

different work organization leads to different work practices and work ethos. In the restaurant sector, workers are extremely flexible in the attempt to endure the fast-paced and chaotic work. In warehousing, workers seek to retain control of their work effort, benefiting from the standardized labour process, pay structure and the autonomy of the routinised work. The paper concludes that precarization is not a uniform process, but affects different sectors in a different way, leading to diverse conditions and experiences of work for young people. The presentation is based on ongoing ethnographic research on young people working in hospitality and logistics.

Youth Precarity in Greece

Niki Kosmetatou[1], Dimitris Parsanoglou[1], Aggeliki Yfanti[2]

[1]National and Kapodistrian University of Athens, Greece; [2]Panteion University of Social and Political Sciences, Greece

This presentation is based on ongoing research on youth precarity, conducted by the Centre for Social Theory and Empirical Research of the Department of Sociology at the National and Kapodistrian University of Athens, for the Eteron – Institute for Research and Social Change. The main aim of the research is to map the situation of young people's (aged 19-34) employment in Greece and to identify patterns of precarious labour in different sectors. This research adds on previous work (Parsanoglou et al. 2023) in an effort to contextualise precarity both as a sector and age phenomenon, and to measure precarious labour within the labour market. To do so, we use specific indicators of precarious employment, drawing from the rough data of the Greek Labour Force Survey: part-time (and particularly involuntary part time) employment, temporary employment, lack of medical insurance, need for additional sources of revenue etc.

In this presentation, we will focus on specific sectors where precarious employment is extensive and we will discuss potential divergences occurring between different socio-demographic variables, such as gender, educational level, area of residence etc. By doing so, we hope that we will contribute with additional empirical evidence to the ongoing theoretical and political discussions around the present and future of youth employment.

JS | RN17_RN30_T03: Tension and Transformations in Contemporary Labour Market in a Youth and Generational Perspective (II)

Educational Credentials As Young People's Entrance Ticket To The Labor Market: How Employers' Valuation Of Educational Credentials Determines Job Opportunities

Helena Geisler, Irene Kriesi, Miriam Grønning

Eidgenössische Hochschule für Berufsbildung EHB, Switzerland

Due to structural changes of the labor market and the expansion and diversification of education in most European countries, successful and stable labor market integration has become more challenging for young people. Employers increasingly prefer older, more experienced applicants. Furthermore, competition between school leavers with different types of educational credentials has increased. In the Swiss labor market, several credentials qualify for the same jobs within specific occupational fields. However, there is little research on how employers valuate different credentials in the hiring process. Thus, this contribution explores how employers' valuation of educational credentials is shaped by individual, occupational and firm characteristics.

Following economic theories, credentials signal trainability and productivity. Sociological approaches emphasize perceptions of fit, social closure mechanisms and the legitimation function of comparisons and categorizations. Based on these complementary theories I assume that different recruitment goals (e.g. trainability, immediate productivity, team fit) intersect and shape the valuations of educational credentials. For young people without work experience, employers' valuation of their credentials determines their hiring chances.

We conducted 30 semi-structured interviews with employers in six occupational fields. With a constructivist critical approach using reflexive thematic analysis, we question the reported experiences of recruitment processes. We code the transcripts in a more deductive, latent way and aim to find themes that capture patterns of meaning in the dataset.

Preliminary results suggest that educational credentials of labor market entrants are important for most of the interviewed recruiters. However, they associate different meaning with credentials, and valuation processes depend on the context.

1259

Quality Of Occupational Returns Of Master Graduates In France And Italy: Do Professional Experiences Help To Reduce Inequality?

Sonia Bertolini[1], Sara Romanò[1], Ingrid Tucci[2]

[1]University of Turin, Italy; [2]LEST-CNRS-Aix Marseille Université

This paper compares the labour market situation of master graduates in France and Italy, analysing in particular the quality of occupational returns such as, employment / unemployment, type of contract and mismatch (over and under education gauged with subjective and normative measures) 5 years after graduation. Both countries have undergone a process of flexibilization and segmentation of the labour market, and share a similar degree of fixed-term employment. However, they differ in terms of labour market policy for youth and in some critical points: lower employment rates, women participation in the labour market in Italy for master graduates (OECD 2022).

We expect social class will affect more the quality of job occupation of Italian than French graduates due to the largely Italian 'familialistic' policies. We also want to explore if experiences abroad and internships during the graduation have a similar effect on job quality in the two institutional and policy contexts. In France the share of graduates with experience abroad is higher than Italy, on the contrary Italian graduates tend to engage more in internship experiences.

For France we use the Génération survey (Céreq), a well known panel survey to study the labour market entry of young adults after leaving the school system. For Italy we use AlmaLaurea census data, to which almost all Italian universities participate, providing information on the graduation and employment characteristics of jobs. For both countries we focus on the generation having left university in 2010 with a Master Degree and compare their position five years later.

Expert Or Professional: Negotiating Academic Competence

Minna Paanasalo, Miira Niska

University of Helsinki, Finland

Transformation in contemporary labour market is commonly characterized by increasing flexibility and atypical work relations like part-time work, project and temporary work, and self-employment. As a result of these changes, it is becoming more difficult for young people to make long-term sustainable decisions and choices about working life. Even a university degree doesn't guarantee permanent, full-time employment, and even young university graduates are at risk of unemployment, under-employment, and social exclusion. In addition to the diploma, young graduates are expected to be able to communicate their competence to potential employers. Assistance for the career-decision-making and job search process is often provided in form of career counselling.

In our study, which is part of a research project SPIN (2022–2025), we examine career counselling sessions with a focus on the in situ meaning-making practices: the negotiation concerning the definition and implications of competence and expertise. Our initial data consists of 21 video-recorded counselling sessions, of which two represent the focus of our analysis. With the means of discursive psychology and a micro-analysis of turn-to-turn interaction, we examine cases where the counsellor and the university student negotiate the definitions of competence in relation to expertise and professionalism. In this pattern, the counsellor forms a contrast between their own definition and the definition presented by the student, and ultimately promotes their own definition as a more useful way of adopting an expert identity to succeed in the present work life.

JS | RN17_RN30_T08: Tension and Transformations in Contemporary Labour Market in a Youth and Generational Perspective (III)

Remote Work, Young Adults in Poland and Labor Market Transformations – a Long View

Piotr Binder

Polish Academy of Sciences, Poland

Although remote work is possible only in selected professional contexts, its popularization during the COVID-19 pandemic and subsequent consolidation in new labor laws influenced transformations in the contemporary labor market. However, little research has been devoted to the generational perspective, particularly young adults, who had limited experience working remotely before the outbreak. This study aims to partially fill this gap by investigating the remote work of young Polish employees documented in qualitative longitudinal research.

Theoretically, the analyses are inspired by the boundary theory rooted in reflection on remote work and the life course perspective, which sensitizes to the effect of the stage in biography. They aim to answer whether the young generation rejects long-term remote work or accepts it as compatible with their needs and values. The empirical basis comprises 78 semi-structured interviews with 26 young adults who worked remotely during the research period. Each respondent was interviewed thrice between 2020 and 2022.

Despite the early stage of their careers, the study participants indicated the need for flexibility at work, an individual approach to shaping the boundaries between work and non-work, and to control how and when their work was performed. Both coupled and single respondents regarded remote work as a primarily friendly solution. At the same time, they preferred hybrid variants that allowed them to maintain some direct mentorship and professional contacts. Overall, the findings contribute to a better understanding of work-related generational values in the context of young adults' personal situations, close relationships, and career plans.

Regional Displacement of Low-Qualified Youths: The Role of Regional Competition and Technological Change in Shaping Access to Vocational Training

Helen Hickmann[1], Alexandra Wicht[1,2]

[1]Federal Institute for Vocational Education and Training, Germany; [2]University of Siegen

Numerous cohort studies highlight the growing trend of low-qualified youths facing exclusion from vocational education and training (VET). Yet, the rising significance of labour market characteristics driving this displacement remains largely unexplored. This study investigates the factors influencing the access of low-educated youth to VET in Germany, focusing on unravelling the role of regional competition and the impact of technological change on the labour market.

We used data on school-to-VET transitions from the German National Educational Panel Study, integrating it with district-level regional data on competition, digitalisation and automation. To address time-dependent associations and account for the clustering of observations within training market regions, we employed multilevel mixed-effects complementary log-log regression.

Our findings indicate that a higher regional share of high-qualified apprentices negatively affects the probability of low-educated youth entering VET, suggesting displacement dynamics. However, digitalisation and automation had a small but positive impact on their transition chances. Subgroup analyses by migration background reveal that competition as well as digitalisation, mitigates disparities in VET access between migrants and natives. However, results indicate widening differences in transition probabilities in favour of natives as automation potential increases, indicating selection effects in production-centred local economies. Significant effects are observed primarily during the initial search phase, suggesting signalling effects associated with prolonged search durations.

The study highlights the importance of regional opportunity structures in either fostering or mitigating social inequalities among low-qualified youth. The study also underscores the need to address the migration-related barriers to VET access and to promote the growth of local economies capable of accommodating both high- and low-educated labour.

1261

The Role Of Precariety In Shaping A Career Path. A Qualitative Approach Within The Video Game Industry.

Luis Garrido-Sánchez, Erik Dueñas-Rello

Universidad Complutense de Madrid, Spain

Over the last few decades, Spain has suffered different processes of precarization that have led a significant number of people to fall into what Robert Castel (1997) termed "zones of vulnerability." One of the groups most adversely affected

by this situation is the youth, who encounter numerous challenges in their quest for independence as they try to transition into adulthood (Furlong & Cartmel, 2007). The individualization of young people's transition paths has led to a prolongation of the youth phase, resulting in a desynchronization of transitional markers (Merino & Miranda, 2023).

However, research on this issue has mostly focused on groups already in structural positions of vulnerability. This contribution aims to shed light on how young people from middle-class backgrounds face these waves of precarity. We present the findings of a qualitative study that focuses on the career paths of workers in the video game industry, with an emphasis on the precarity they face during the early stages of their professional journey, which may be considered necessary in order to develop a career that enables them to insert themselves and stabilize within a "passionate work" (McRobbie, 2016).

This research is based on a discursive analysis of 14 semi-structured interviews conducted with video game industry workers aged between 25 and 34, along with insights from 4 key informants from this field (related to the recruitment process). The results of our research illuminate how the precarization experienced by these young people influences the formation of their career paths.

Analyzing New Types Of Work Through Bourdieu's Theories Of Capital: The Case Of The Artisan Courier in Turkey

Caner Özdemir, Serter Oran

Zonguldak Bülent Ecevit University, Turkiye

This study investigates the artisan couriers as a case of transition jobs through a qualitative fieldwork. As the model of platform work spread out recently, especially young people are oriented towards jobs such as driving services, food delivery, etc. These jobs are defined as "self-constrained employment" in which a person is forced to start their own business or work independently. Moreover, they are seen as "transition jobs" for many young people. They often serve as a transition point for the person to develop specific skills, gain experience, or transition into a new industry or career path. Transition jobs can often be temporary or low-paid jobs and are not seen as a long-term career goal. However, they provide a platform for people to gain a new opportunity or experience.

The aim of this study is to investigate the motivations, working conditions and labor market expectations of the young artisan couriers in Turkey. To this end, in-depth interviews will be conducted with couriers who are also university students. Especially students choose to work in delivery jobs during their education and see it as a form of transition job which provide them social and economic capital to be used after graduation. By emphasizing the interconnections between capitals, we aim to gain a deeper understanding of the working conditions, capitals and social positions of artisan couriers; how artisan couriers are shaped as part of an ever-increasing labor market; and how young people are able to survive and thrive in today's changing world of work.

JS | RN17_RN30_T09: Tension and Transformations in Contemporary Labour Market in a Youth and Generational Perspective (IV)

Beyond Crisis: An Analysis of Micro- and Macro-level Determinants of Subjective Job Insecurity Among Europe's Youth

Jovana Zafirovic

Institute of Social Sciences, Serbia

The paper investigates various micro-level and macro-level determinants influencing subjective job insecurity among young Europeans, both before and after the Great Recession, assessing how these influences shift over time. Our research focuses on the change in the relative importance of macro-level factors compared to individual-level concerns in shaping job insecurity perceptions among young individuals in Europe. The scarcity of job opportunities and heightened competition significantly contributed to the pervasive job insecurity experienced by young individuals during and after the economic downturn. Moreover, based on research indicating that the economic and labour market conditions of a country shape individuals' perceptions of job insecurity, and considering the impact of the crisis on these conditions, we argue that macro-level factors have gained increased significance. To address this issue, our paper integrates both macro and micro-level factors into a comprehensive job insecurity model. Utilizing data from the 2nd and 5th waves of the European Social Survey, covering 22 countries, we examine the years 2004 and 2010 to assess the impact of the economic crisis on determinants of job insecurity among young individuals. Our analysis employs multilevel models that account for both individual and contextual factors. The preliminary findings partially support our hypothesis, revealing that while macro-level determinants have indeed grown in importance, micro-level determinants remain the most influential factors in shaping the perceived job insecurity of young people.

1262

Exploring the Expectations and Aspirations of Youth in the Contemporary Labour Market

Amalia Caputo, Ilaria Marotta

University of Naples Federico II, Italy

The focus of contribute is the relationship between young people and work and, in particular, it is intended to outline

the image that young Italians have of their future work and thus of the future society they envision.

The study is framed within the framework of the sociology of the future (Mandich, 2012) and presents the results of a survey that investigated on different dimensions of Italian youth such as mobility, political participation, transitions, entrepreneurialism, migration experiences and education. The reflection follows two different interpretative frames. The first one investigates whether family of origin and socio-economic status still weigh on young people's work choices and, therefore, guide them; thus, we talk about social mobility, investigated from the aspirations and expectations of young people declined according to socioeconomic and cultural background of appearance.

The second interpretive frame, on the other hand, relates occupational and social stratification by assuming that the former is a proxy for the latter (J.H Goldthorpe & K. Hope 1974; A. de Lillo, Schizzerotto 1985; M.L. Bianco & de Lillo, 2007).

Building upon these considerations, one can assumed that to understand the idea that young people have on the future society, it is possible to assess the weight that they attribute to the evaluation criteria in determining the classification – hence the stratification – of employments.

Central to the interpretive scheme, therefore, are gender and generational dimensions with specific reference to sociocultural capital of origin of the young people.

Employment Of Young People With Disabilities In Finland

Pauli Rautiainen, Karoliina Ahonen

University of Eastern Finland, Finland

Section 18 of the Finnish Constitution protects the right to work and obliges public authorities to promote employment without any discrimination. Article 27 of the CRPD provides for the right of persons with disabilities to work on equal basis with others. This is a fundamental dimension of their dignified life.

The presentation discusses on how and why Finnish young people with disabilities face severe difficulties in accessing labour market and are to a great extent excluded from it. Exclusion starts to develop already in the education system.

The presentation is based on interview material which we have collected as part of the research project on "Disability and Dignity" funded by the Academy of Finland. We have interviewed about forty young people with different disabilities. In these interviews, we have asked about their experiences and views on the disability pension system, working life and disability. Based on the interviews, we have built profiles, which we use to structure the different paths of young people with disabilities into and out of working life. In our oral presentation, we will present these profiles.

The presentation will focus on the disability pension system, which is built for securing the livelihood of people with disabilities when they have not been able to work. We will argue that the disability pension system has become arbitrary and inappropriate from the point of view of today's young people with disabilities. The disability pension

system includes numerous discriminatory mechanisms, such as the treatment of blind people and wheelchair users as automatically entitled to a disability pension, regardless of their actual ability to work.

Adult Children's Transition to Adulthood and Old-age Employment of Parents in Taiwan: A Linked Lives Perspective

Yung-Han Chang

National Taichung University of Education, Taiwan

As its population ages rapidly, Taiwan is predicted to become a superaged society in 2025. While the burden of long-term care arrangements makes headlines, recent statistics show increases in labor force participation of the older population and the average retirement age. Meanwhile, studies found a change in pace in the transition to adulthood among Taiwanese young adults. Due to postponement of employment and marriage, today, the younger generation relies on parental support well into adulthood. In contrast to Western societies, in Taiwan, the value of family underpinned by filial piety prescribes adult children to support their parents in their old age. However, the prolonged transition to adulthood sees a rise in the opposite direction of intergenerational exchange. Parents assume the active roles of financial providers for their children. While the public disparages young adults depending on parental support as parasite singles, the interdependence between the younger generation and their parents embodies the principle of linked lives, the interconnectedness of the life courses of family members. The intimate relationship between parents and children is epitomized not only in the exchanges of resources but also in their respective life choices regarding employment or retirement. However, studies that address the employment status of parents or young adults rarely account for the interconnectedness between family members. Drawing on data from the Taiwan Longitudinal Study in Aging and the Panel Study of Family Dynamics, this study aims to fill the gap by incorporating the principle of linked lives to examine the relationship between young adults' transitions to adulthood and parents' employment and retirement decisions.

Changing Inequalities in the Attainment of Material Well-being Among the Youth Minorities, in CCE, 2001-2020

Valér Veres

Babes-Bolyai University, Cluj, Romania

Since the mid-2000s, EU accession has created a new set of relations in the CEE area, especially in most parts of the Carpathian region. As a conceptual framework, we started from Castells' concept of a global networked society, as the

centre-periphery approach had become outdated The data sources for this research are Mozaik2001 and the Hungarian Youth surveys from Hungary, Romania, Slovakia Serbian Voivodina and Ukrainian Transcarpathian regions (2001 and 2020). The analysis is multivariate, based mainly on OLS regression, principal component analysis and index building techniques. The study of youth, the social position of the young generation, is a major methodological challenge. The youth labour market position, as we know, is not permanent and can change rapidly, so the focus of this study is not on occupational position but on the material status of young people, which may be related to their active labour status, but is also influenced by the social position of the parental family.

The specific contribution of the study is that in conditons of inequal socioeconomic situation and life chances, the relative social exclusion experienced by some minority youth groups, how these factors changed in time in last 20 years, especially in conditions of EU accession or exclusion of some countries for CEE area. In each of the countries studied, the odds of achieving good material status are significantly determined by low education, a background with many children and being of Roma origin, and this did not change significantly between 2001 and 2020. There are structural disadvantages in achieving a good financial situation among theminority youth communities, which make it likely that they will be in a state of permanent deprivation or precariat.

1264

JS | RN20_RN21_T05_: Beyond quality and quantity: integrated strategies to analyze media content

Since its inception, social research has relied on texts, videos, and audios as a relevant source of information. To study both social processes of impact (see, for example, migration), and public opinion on such processes, sociologists have collected, organized, and analyzed various types of media content: books, newspapers, diaries, correspondence, movies, tv programs, etc. For some decades, the online world has further enriched the variety of media sources potentially useful and significant for sociological research. Over time, various techniques have been developed and refined (with related software) to analyze media content, both with a quantitative and qualitative approach. With this call we want to encourage presentations that illustrate, also through actual research experiences, the potential, limits, and conditions for application of integrated and innovative research strategies, which aim to combine qualitative and quantitative tools for the analysis of media content.

Integrating Fabulation Index and Visual-Verbal Video Analysis (VVVA) method to study online war narratives

Luigi Giungato[1], Luciana Taddei[2], Olimpia Affuso[1]

[1]Dipartimento di Scienze Politiche e Sociali - Università della Calabria, Italy; [2]CNR - IRPPS - Consiglio Nazionale delle Ricerche - Istituto di Ricerche sulla Popolazione e le Politiche Sociali, Italy

The fabulation index – derived from Jedlowski's (2022) conceptualisation and operationalisation of the concept of "fabulation" – is a tool that seeks to go beyond the mere analysis of the "truthfulness" in online war narratives to evaluate their efficiency, moving to a more phenomenological level. It consists of five dimensions: "polarisation", "actantial structures", "emplotment", "meta-narrative action" and "memetic potential". The index was developed as part of a research project about the social-media dimension of information wars (Giungato et al., 2024 forthcoming). In order to test its validity and reliability, it was applied to a sample of Telegram posts related to the Russian-Ukrainian war, proving to be a useful tool for analysing online war narratives. Although our research to date has mainly focused on written communication (cf. Mezza, 2022; Bennato et al., 2022; Turco, 2022), a deeper reflection on the paradigms of transmediality (Jenkins, 2006), memetic warfare (Giesea, 2015; Iorio, 2022) and post-truth (Floridi, 2014) – together with direct observation of the ongoing phenomenon – leads us to also consider visual forms as a determining element of armed conflict communication – which are increasingly fought in a video-centric environment where users and other actors produce and share audiovisual content with AI assistance. (Cuesta-Valiño et al., 2022; Clack & Johnson, 2021). The Visual-Verbal Video Analysis (VVVA) method adapts Multimodal and Visual Grounded Theory in order to organize and evaluate video material (Fazeli et al., 2023), providing a remarkable tool for our systematic coding and interpretative approach. We'll therefore present the results of the development of the research (Giungato et al., 2024 forthcoming) integrating fabulation index and VVVA.

Investigating Z Generation through Visual Analysis: Uncertainty, Hypersensitivity and Self-Narration

Marina Ciampi, Tito Marci, Matteo Finco

Sapienza - University of Rome, Italy

1265

While Gen Z is often described as a snowflake o strawberry generation – emotionally fragile, anxious and unfit to face difficulties and disappointments – it is also very sensitive about environmental and social issues and often capable to capture the attention of politics, media and public opinion. From a sociological perspective, these tendencies seem to point at a general hypersensitivity, that is, an extremely high aptitude to react to what happen around, foremost formulating affective and also normative expectations and claims, leaving the cognitive approach on the background. In this sense, the world-society's uncertainty and contingency – especially related to the future, increasingly conceived as threatening – generates different forms of psychological and affective-emotional distress (depression, anxiety, self-cutting, and so on), widely spread in the West.

This study analyses, from a qualitative, quantitative and visual perspective, the post-pandemic experience of young students from the Sapienza University of Rome, their personal expectations and claims, through their own self-narratives. The approach is based on the semi-structured interview technique and an experimental visual method which situates interviewees in a comfortable and "safe" environment where they could tell about their experience, biography and life without feeling judged and influenced by the interviewers. The hypothesis is that precisely the affective dimension of individuality could more clearly emerge through this method, highlighting the adaptive reactions to contingency and uncertainty of society.

Text Mining and Network Analysis in a Joint Perspective for the Quali-quantitatve Study of Complex Communication Dynamics: the Case of Echo Chambers.

Luca Delvecchio, Fiorenza Deriu, Raffaella Gallo

Università Sapienza, Italy

The study presented in this abstract aims to define an innovative mixed-methods, quali-quantitative, research design for understanding complex communicative dynamics, such as the so-called echo chambers, that occur among users of Social Network Sites (SNS).

Given that communication exchanges among social media users are typically studied by separately observing interaction dynamics and message content, this work aims to investigate communicative flows by combining text mining techniques to attribute tags to messages (sentiment, theme, and type), and network analysis techniques to identify patterns/models of dissemination and reinforcement of opinions and information among users.

Starting with a sample of 32,180 tweets related to the Russian-Ukrainian war published during the first year of the conflict, first, the network of post authors based on mentions made or received is reconstructed, and within this network are identified: 'source' nodes, which originate the information spreading in the network; 'mediator' nodes, which retransmit messages received from sources; 'target' nodes, which receive content without contributing to its dissemination. Subsequently, three distinct corpora composed of post texts attributed to source, mediator, and target nodes are analyzed. Using text mining techniques, the texts are labeled with respect to the treated topics, then associated with each user. This analysis allows for the investigation of whether specific relational patterns within specific communication flows, identifiable as echo chambers, are defined around specific contents.

Quantified yet Contextual: Integrating Quantitative (CADS, NLP) and Qualitative (CDA) Methods for Media Content Analysis

Marek Troszynski

Collegium Civitas, Poland

The excess content in the hybrid media system (Chadwick, 2013) prompts researchers to adapt and multiply their traditional methods. With an increasing number of texts published daily, researchers should apply more than conventional methods of qualitative text analysis based on the Critical Discourse Analysis (CDA) approach. Despite the advancement of CAQDAS software (e.g., Costa et al., 2023), these tools primarily assist in organizing texts and streamlining coding and analysis processes. However, they do not fully address the inherent limitations of conventional methods in handling the growing volume and complexity of textual data.

This paper uses quantitative methods to organise and reduce extensive text collections at an initial research stage. Achieving this involves Corpus-Assisted Discourse Studies (Baker, 2006; Gillings et al., 2023) and Natural Language Processing (Törnberg & Törnberg, 2016). In the first step, I present the functions of one of the CADS support programs – SketchEngine (Kilgarriff et al., 2014). Then, in step two, I describe using topic modelling, sentiment analysis, and term extraction in studying online content and the utility of tools provided by Clarin ERIC (https://www.clarin.eu/). In the third step, the content that has been organized and structured undergoes in-depth qualitative analysis. This analysis may incorporate concordances, coding, or transferring data to CAQDAS programs like Atlas.ti or QDA Miner. This approach allows mixed methods analysis, enabling classical approaches like CDA. Thanks to this, we attain the unique opportunity to apply a qualitative study to the entire discourse, interpreting texts in relation to their social and cultural contexts.

To illustrate the efficacy of the analysis, each step will be exemplified with case studies from the content analysis of the Polish press and websites.

1266

JS | RN21_RN24_T08:
Using AI tools in sociological research

Artificial Intelligence in Analyzing Internet-Mediated Documents for Social Research

Laura Arosio

University of Milano Bicocca (Italy), Italy

This presentation explores the intersection of social research and artificial intelligence (AI), focusing on the paradigm of documentary analysis in the context of internet-mediated contents. Documentary analysis, as an approach to understanding social reality, harnesses the informational potential embedded in various products created by individuals or groups during their activities. Such contents arise spontaneously for purposes unrelated to social research and encompasses personal documents like diaries and private letters, cultural artifacts such as paintings, books, and songs, as well as institutional documents like laws and regulations and media documents such as news, films and TV series. In the contemporary landscape, these documents are increasingly disseminated through new technologies, collectively referred to as internet-mediated documents. Examples include online diaries or blogs, social media platforms, and digital publications, which uphold continuity with traditional documents while presenting new challenges.

This contribution addresses key questions in the analysis of internet-mediated documents, such as selecting the corpus, contextualizing the content, and navigating ethical challenges. The presentation advocates for the integration of artificial intelligence, specifically exemplifying the use of programs like ChatGPT as tools for analyzing internet-mediated documents. Practical examples will be showcased, illustrating how AI can facilitate both qualitative and quantitative thematic analyses. By delving into the capabilities of ChatGPT, we aim to discuss its potential in addressing methodological dilemmas and ethical considerations associated with the evolving landscape of internet-mediated document analysis. This exploration contributes to the ongoing discourse on the symbiotic relationship between social research and artificial intelligence, offering insights into innovative approaches for navigating the challenges posed by contemporary data sources.

1267

JS | RN20_RN30_T05: Youth and Political meaning 1: methods puzzles and issues

Visual Research Methods as Cultural Practices: The Politics of Visual Culture in Youth Research.

Anastasia Loukianov, Kate Burningham

University of Surrey, United Kingdom

Visual methods are widely used in research with children and young people, notably because they are presented as being more engaging and child-friendly than traditional qualitative methods. They are said to give young people more liberty in choosing what to represent, be best suited to capturing an emic perspective, and support cross-cultural work. As such, they are considered key in promoting young people's political voices and shifting research power dynamics. But the creative outputs of visual research (photographs, films, drawings, etc.) notoriously puzzle researchers with their meaning(s) and interpretation. Thus far visual outputs have primarily been valued as conversation prompts, with a focus on their content rather than aesthetic framing. Yet, wider scholarship in visual research (e.g. Sarah Pink, Gillian Rose) has highlighted the potential role of visual mediums, visual culture, and traditions of image-making in shaping the images produced by participants. Considering visual research methods as cultural practices, we use images of food created by young people aged 12-24 in 7 cities across the world (Christchurch, NZ; Dhaka, BD; Makhanda, ZA; London, UK; New Delhi, IN; São Paulo, BR; Yokohama, JP) in the context of a project on sustainable lifestyles to ask what can be learned by interrogating visual products in their own right. How do visual cultures: a) shape the outputs of visual research and b) guide the processes of meaning-making enacted through visual research? We explore the tensions between the emancipatory goals of visual research methods and their reliance on – often unacknowledged and unquestioned – cultural visual norms.

Longitudinal Qualitative Research into Adolescents' Experiences of Social Change

Kate Pincock, Nicola Jones

Overseas Development Institute, United Kingdom

Time, especially in relation to space, has long been recognised as important in understanding human agency and social transformation. Yet due to the complexity of capturing temporal-spatial interactions and their effects, time is often framed in research as the neutral, linear medium within which events unfold. Longitudinal research can offer a means to address this challenge by generating insights into the social construction of time in different contexts at the micro-level which can be triangulated with data about macro-level dynamics.

A temporal-spatial lens such as this is particularly useful for researching adolescence, which is itself both an empirical reality as an interim, transitional period of time between childhood and adulthood, and a social construction contingent on context. The past two decades have been a period of prolonged social, political and economic upheaval; to properly understand the effects for adolescents and young people in contexts where recent crises have been layered upon existing inequalities and tensions requires attention to different dimensions of time, including sociohistorical dynamics, individual-biographical experiences, and intergenerational shifts.

In this paper, we draw on our experiences of conducting longitudinal qualitative research with adolescents in Jordan, Lebanon and Ethiopia undertaken as part of the Gender and Adolescence: Global Evidence (GAGE) programme to show how considering the relationship between time and space in the ways made possible by a longitudinal approach can help to make sense of the interaction between individual and wider contextual trajectories, and elucidate change and continuities in adolescents' lives at different scales.

Capturing Political Meaning Among Younger Generations: Qualitative Methodological Puzzles and Possibilities

1268

Luís Junqueira, Nuno de Almeida Alves, Rodrigo Roque dos Reis, Margarida Estêvão

Iscte – Instituto Universitário de Lisboa (CIES_Iscte)

The detachment between young people and politics is a common assumption in the political studies community, based on the usual young people's lower electoral turnout and residual affiliation in political parties measured by survey data. When qualitative methodologies are used, the scenario of young people's political participation and meanings attributed to it turns richer and diversified (O'Toole 2003, Pickard 2019).

This difference among young people's political engagement practices was measured and confirmed using a sample of young people in Portugal in 2012-13 (1200 questionnaires/60 interviews), demonstrating a low political engagement when quantitatively measured in contrast with a plural participation when qualitatively observed.

The qualitative data on political participation was subject to a thematical analysis followed by a crisp-set qualitative comparative analysis procedure (Ragin 2017), revealing rich and complex sets of engagements between young people and politics, later enriched and clarified with sociodemographic data and illustrative quotes from the interviews.

This aims to contribute to the discussions on the limitations of survey data among specific subjects and segments of the population, on the conceptual and methodological shortcomings on quantitative measures of political engagement

among young people, and finally on the development of new procedures aimed to enhance classical data analysis.

Balancing Preconceived Methods And Methodological Flexibility In A Large Scale Collaborative Comparative Research On Youth: A Processual Methodology

Gerben Moerman, Evelyne Baillergeau, Christian Bröer

University of Amsterdam, Netherlands, The

In the history of research methodology, a persistent tension has existed between preconceived methods and methodological flexibility, often resulting in the dominance of one over the other. This tension is amplified in four distinct circumstances: firstly, in research projects in which fuinding is based on research proposals, in larger-scale research projects involving extensive qualitative data; secondly, thirdly in comparative or multi-sited research; and fourthly, in collaborative research projects where multiple researchers co-operate.

This article shows our reflections on addressing and pragmatically reconciling this tension within the context of a research that encompasses all four circumstances—the CO-CREATE project.

In this Youth Participatory Action Research (YPAR), 199 adolescents in 5 countries were tasked with formulating policy proposals to prevent adolescent obesity. To assess the PAR process, we created and collected over 1500 pages of field notes, subjecting them to collaborative and comparative qualitative analysis.

To organise and structure the data collection, management and analysis, we adopted a methodological approach conceptualised as a dynamic process, aligning with a pragmatist and perspectivist orientation. Anticipating potential challenges at the project's inception, we prepared for foreshadowed problems, while also confronting unforeseen obstacles along the way. Reflecting on this methodological journey, we offer a nuanced exploration of the implications of methodology as a dynamic process within the context of collaborative qualitative projects employing pragmatist and perspectivist perspectives. To preconceived methods and methodological flexibility we propose two strategies in doing research: Predesigned Methodological Reflexivity and Collaborative Moments of Iterative Validation.

JS | RN20_RN30_T06: Youth and Political meaning 2: creative methods

From Subject To Expert: Narrative Identity Work Of Youth That Made Use Of Youth Care

Eline Verheijen[1], Dorian Schaap[1], Iris Wallenburg[2], Jan-Kees Helderman[1]

[1]Radboud University Nijmegen, Netherlands, The; [2]Erasmus University Rotterdam

An increasing number of youths who made use of youth care services in the past are later engaged in policy making and advocacy organizations as experts by experience. In doing so, they attempt to improve the youth care system and care practices. However, little is known about the way former youth care users who are confronted with stigmatization and coercion in youth care become experts by experience. In particular, how they conduct identity work to make sense of their transition from subject to expert is unknown but critical to understanding the contemporary role of experts by experience in the youth domain. Understanding the narratives of youth helps to unravel these transitions and developments during the life courses of youth. Narratives reflect how youth make sense of impactful events. By narrating, youth learn to deal with, express and make sense of feelings related to traumatic events in their pasts: it is a form of identity work.

In the study, the following research question is answered: How do youth who made use of youth care services apply narrative identity work to give meaning to their transformation from subject to expert in youth care? This research question is answered by analyzing narrative life story interviews which are conducted in The Netherlands. By analyzing these interviews, it is showed how former youth care users regain agency that was lost by becoming a 'youth care subject' as they apply narrative identity work and regain narrative agency.

Re-imagining Feminist Futures: Working with the Archive to Forge Intergenerational Knowledge

Rachel Thomson[1], Sue Scott[2]

[1]University of Sussex, United Kingdom; [2]University of Newcastle, UK

In this paper we draw on learning and resources generated by the ESRC funded 'Reanimating Data: experiments with people, places and archives' project which sought to save, digitise and share a 'classic' data-set of qualitative feminist sociology (the Women, Risk and AIDS project 1988-9). One of the experiments involved in the project was working with

1269

a student theatre society, focusing on three interviews recorded with former drama students in 1988, talking about their loves, relationships and sexual negotiations. In this paper we explore the collaborative work that took place between the original researchers, the three archived interviews and a new generation of young women who worked with this material, taking inspiration from the original study to tell their own stories. Drawing on ideas and methods from queer history and feminist sociology we consider how the creative methods employed in the project forged 'time-binds' that enabled us to bring together past and present in new ways that escape familiar narratives of social change, generating intergenerational insights that could be surprising, disruptive and illuminating. The paper will be illustrated with material from the creative working process and documentation of a final performance.

Young Community Researchers Negotiating the Politics of Migration/Integration and Research Practices

Sofiia Horova, Anastasiia Mykhailova, Anzhela Popyk

University SWPS, Poland

Seeking to refer to the 'methodological pluralism' (Lamont & Swidler, 2014) by contributing to the field of qualitative methodology, we demonstrate how the young (18-25 y.o.) Ukrainian Community Researchers captured the political meaning of forced migration experiences of Ukrainian young adults (18-29 years old) in Poland. The project was held in June 2023-June 2024 in international collaboration with the University of Birmingham in the UK and the University of Viadrina in Germany. It aimed to study the forced migration experiences and visions of post-war reconstruction of Ukraine among the youth in Poland, the UK and Germany. Young Community Researchers were trained and navigated in doing the research at every stage: designing, recruiting/running, data analysis, and disseminating.

This paper seeks to reflect on the CR's experiences in enriching the social qualitative methodologies, as well as to point to their process of negotiating migration policies and politics with the researcher's practices.

The paper demonstrates how young migrants can enrich qualitative methodology, science and practices through running the Community Researchers study.

The study was approved by the Ethics Committee of the University of Birmingham.

JS | RN20_RN30_T08: Youth and Political meaning 3: meaning making and participation

Open an Ethnographic Toolbox for Studying Youth Socialisation and Political Meaning-making,

Claire Balleys

Université de Genève, Switzerland

We propose to open the ethnographic toolbox of an ongoing investigation into the socialisation processes of young people who hang out in urban public spaces and on social media. Our methodological design takes place in 5 successive phases: collaborative observation, urban walking interviews, digital walking interviews, online ethnography and, last but not least, focus groups in a reception setting.

The contribution we propose focuses on how the appropriation of urban spaces meets political meanings. What do young people consider being a legitimate way of occupying urban public space, and how do digital capture and sharing practices intersect with these perceptions? The young people in our corpus (15-25 years old) occupy urban spaces on a long-term basis, sometimes coming into conflict with other actors in public space. They skilfully structure their socialisation in a continuum of face-to-face and mediated interactions.

Our contribution therefore aims to shed light on the political dimensions of urban youth cultures. For example, participation in a feminist demonstration and the resulting digital recording and sharing practices give us access to political meaning-making.

Our preliminary results show a highly sensitive relationship with the social rules of public space occupation. Both on the streets and online, young people collectively negotiate what public behaviour is and isn't socially acceptable. We'll see how gender and class interact with social perceptions of political action in public.

Looking Between the (head)lines of youth civic participation

Maria Bruselius-Jensen

Aalborg University, Denmark

This presentation explores how cutting qualitative analysis in new ways can look behind the obvious and identify underlying social dynamics. The study focus on the dynamics of becoming a young Danish activist, including dealing with questions of equal access to participation. While the vast majority of studies concerned with youth civic participation are concerned with identifying the key public agendas defined through their participation, this study gives the

1270

backseat to the political agendas. Inspired by concepts such as 'everyday makers' and 'lived citizenship' it is argued that everyday micro actions and political agency are interwoven and that in order to study access to youth political participation it is central to also focus on the underlying normative ideals that guides how the young people internally negotiate and practice what it means to be a good activist.

The presentation draws on interviews with 85 young people in their early or mid-twenties who can be defined as 'very engaged' at the time of the interview. They represent in 19 youth organizations selected to represent a variety in aims, forms and sizes. To identify modes of participation and motivations guiding the activist internal practices and negotiations, a cross-cutting abductive analysis of the whole empirical dataset was performed inspired by hermeneutics (Gilje, 2017) and thematic analysis (Schreier, 2012). The presentation will explore and discuss what it means to apply a new cross-cutting analytical lens to a dataset. What insights can it contribute with and what is lost?

The Politization of Everyday Life - Polarization, Emotions, and Young People's Political Engagement

Jonas Lieberkind

Aarhus University, Denmark

In the Nordic countries, research shows that the younger generations meet the democratic expectations of knowledge, political efficacy, and citizenship education.

Nevertheless, polarisation and political division are becoming an increasingly prominent dynamic. A growing number of young individuals perceive society as fragmented and polarized, many young people experience an escalation of the 'us versus them' rhetoric. Various groups of young people—whether in high schools or vocational schools, urban or rural areas, pursuing careers or outside work and education, with different ethnic backgrounds, etc.—are finding it progressively challenging to comprehend and reconcile each other's experiences, attitudes, and values. Against this backdrop, this paper aims to investigate the dispositions that form the basis of Danish young people's political engagement and how this engagement is rooted in affective experiences of everyday life.

The paper is based on a qualitative design: 77 individual interviews with young people in two age cohorts, aged 19-21 and 26-28. The distribution of interviews throughout Denmark ensures representation across very different groups of young people, allowing to identify patterns in their storylines and their corresponding attitudes toward society and fellow citizens. On this basis, the paper aims to explore two research questions: 1) how the political engagement of young people, including the politicization of everyday life (means of transport, consumption, origin, lifestyle, gender, family constellations, etc.), shifts from what is conventionally understood within the 'political domain' into the 'cultural domain'. In this context, Andres Reckwitz's theoretical interest in culturalisation is employed. And 2) how this culturalisation is linked to logic and dynamics about emotions. Arlie Hochschild's methodological focus on the significance of emotions for political engagement is utilized in addressing this question.

JS | RN20_RN32_T07: Quantitative Approaches to Populism

The aim of the joint session is to discuss present theoretical and methodological approaches that enable the analysis of far right-wing populism, paying particular attention as to how less-than-conscious habits, emotions, and gendered performances can be theoretically framed and empiri-cally analyzed. This session is the second part of JS-RN20-RN32.

Between Policy-oriented Criticism and Structural Opposition – Civil Society Advocacy in the Age of Populism

Cecilia Santilli, Roberto Scaramuzzino

Lund University, Sweden

With the wave of right-wing populist parties coming to power and gaining influence in recent years, civil society has been hit by increased ideological resistance from outside. The paper explores how key civil society actors react to policy changes by national governments influenced by right-wing populist parties. The aim is to understand how the rise to power of right-wing populist parties affect the relations between the state and civil society.

The relation between right-wing populist parties and civil society is often conflictual. A common feature of populist actors is their attempt to create and promote a direct connection between their representatives and the people, rejecting the idea of all intermediary bodies, included civil society. Moreover, right-wing populism is often based on mobilization in civil society and has allies in specific collective actors that share their (thin) ideology, such as conservatism and ethno-nationalism, while most established CSOs have their origin in social movement that are opposing to right-wing actors and their agenda in favour of solidarity, human rights and minoirty rights.

The paper focuses on the way in which main civil society actors in Italy and Sweden have reacted on the latest budget legislation by their national governments. The analysis focuses on the content of the advocacy and the level of conflict/opposition implied in the advocacy: from non-structural opposition to major structural opposition. The paper compares two different national contexts: Italy and Sweden. Both countries are since the fall of 2022 experiencing new government coalitions that include right-wing populist parties. The aim is to understand how the rise to power of right-wing populist parties affects the relations between the State and civil society.

1271

The Dangerous Effects of the Normalization of the Far-Right in Germany

Mirjam Weiberg-Salzmann, Sabrina Zajak, Fabio Best

German Center for Integration and Migration Research, Germany

Radicalized actors/ideologies and the mainstream are usually considered opposing poles. The mainstream is often portrayed as moderate and centrist in terms of its convictions and policies and placed in opposition to the far-right and far-left. However, with the recent rise of the far-right in many countries and regions worldwide, a rapidly growing body of research is exploring how the electoral successes of the far-right are enabling parties, social movements, agendas, and discourses to move from the fringes to the mainstream. This body of research focuses predominantly on far-right actors and how they strategize, in other words on whether and how far-right parties and movements adapt their narratives, rhetoric and repertoires of action to move closer to mainstream norms in order to appeal to the majority. In this context, the mainstream is predominantly seen through the lens of its interaction with fringe ideologies being adopted or absorbed, which Wodak (2020) has dubbed "shameless normalization". In spite of that, the mainstream is only rarely considered as an agent beyond the conceptual framework of an interaction with the far-right. This presentation draws on novel insights from a quantitative population survey looking into attitudes of different social groups in society vis-à-vis far-right actors and the consequences of their electoral successes in Germany, including perceptions of threats on one's own future and the future of society. It brings together research that pays particular attention to "the mainstream" as a heterogeneous agent accommodating, aligning, and normalizing far-right actors, actions, and attitudes, as well as specifying those continuing to fight against it.

Sexism towards Women in Politics and Radical Right Support: An Experimental Look Through the Spanish Case

Álvaro Calvo Rodríguez

University of A Coruña, Spain

Academic evidence suggests that sexist attitudes are an important factor in contemporary voting for radical right parties (RRP) (Christley, 2021 or Anduiza & Rico, 2022). Furthermore, RRPs embracing strongly anti-feminist stances on gender issues exhibit a more significant gender gap favoring male voters, compared to their more moderate counterparts on gender issues (Campbell and Erzeel , 2018). Nevertheless, there is limited evidence regarding the implications of these attitudes on the descriptive representation of women within these traditionally masculinized parties.

One perspective, exemplified by Catalano Weeks et al. (2022), argues that RRPs strategically increase their female political representation for electoral gains. Conversely, studies such as Chueri & Damerow (2022) posit that the descriptive representation of women within radical right parties doesn't significantly influence female voter preferences for these parties.

This research aims to contribute new insights to this discussion. By employing an experimental survey in the Spanish context, it investigates whether male political overrepresentation has a more pronounced impact on the level of agreement with proposed public policies among VOX voters compared to other political parties.

Far-right Populism and Anti-climate Sentiment: Interaction of Emotions of Inequality, Climate Emotions and Gender Identities (Part of CIDAPE EU Project)

Linda Coufal, Ondrej Cisar

Charles University, Czech Republic

1272

Evidence suggests that personal identities, more specifically gender identities, foster a strong emotional response to climate change narratives. Climate denialism and anti-climate mobilization have been linked to populist views because current narratives of climate change strongly tap into populist anti-elitist sentiment. Furthermore, white cis western conservative masculine identity fosters strong feelings of fear and anxiety, that then translate into far-right populist inclinations, climate denial and even anti-climate mobilization. It has been suggested that both climate change and far-right populism tap into emotions of inequality and climate emotions, which are deeply gendered. Our research dissects the multi-dimensional relationship between these emotions, which we call political emotions since they stem from both individual and collective sources. They involve shared experiences, values, and concepts of morality. We research the intersection of political emotions and gender identity in response to political communication through deliberative techniques. Deliberation is uniquely suited for this research intent because: it allows us to give citizens agency and a feeling of empowerment in their reactions; to observe reactions and further investigate their emotional background; and to observe how reactions are shaped by other members of the public and their emotions. Deliberation in the modernist paradigm has been framed as a rationalized procedure opposing emotions. In line with feminist epistemology, we argue that the emotions elicited through public engagement are crucial for framing and reframing of political discourses and that identities, including gender identities, contribute to the emotional framing of values, endorsed or criticized through these discourses.

JS | RN20_RN32_T09: Populist Discourses and Gender

The aim of the joint session is to discuss present theoretical and methodological approaches that enable the analysis of far right-wing populism, paying particular attention as to how less-than-conscious habits, emotions, and gendered performances can be theoretically framed and empiri-cally analyzed. This session is the third part of JS-RN20-RN32.

Thirty Years Of Gender And Immigration In Italian Far-right Discourses: A Comparative Analysis Of The Lega And Fratelli D'Italia Parties

Francesca Scrinzi[1], Alberta Giorgi[2]

[1]University of Glasgow, United Kingdom; [2]University of Bergamo, Italy

The entanglements of gender and immigration have a prominent role in far-right discourses. Scholars have taken the analysis of their articulation in two directions: on the one hand, far-right actors combine anti-feminist and nativist claims, by depicting those advocating gender+ equality and reproductive rights as colluding with migrants in undermining the traditional family; on the other, the issue of women's rights is co-opted in anti-migrant and Islamophobic narratives targeting the racialized Others as misogynist and sexist.

In this contribution we explore the role of gender and immigration in the discourse of two Italian far-right parties, the Lega (League) and Fratelli d'Italia (Brothers of Italy), by focusing in particular on the issue of migrant demographics, framed as a threat to the traditional family. Migrants are blamed for the Italian declining demographics: while migrant women are targeted for their high fertility, migrant men are portrayed as hypersexual men whose masculinity has not been weakened by the spread of feminism.

Drawing on content and visual analysis of the parties' publications (such as brochures, leaflets, proceedings of public meetings, political manifestos, the leaders' autobiographies), we analyze the parties' discourse on these topics from their origins until the present day, shedding light on discursive critical junctures and showing the role of both internal (e.g. the changes in the organizational structure and leadership, distinctive ideological traditions) and external (e.g. party competition, discursive opportunities) factors in the evolving and interconnected framing of gender and immigration. We argue that a retrospective and historical discourse analysis is key to understanding both current trends and future developments of Italian far-right politics.

Giorgia Meloni Between Discourse And Policy: The Reworking Of Neoliberal Feminism?

Noemi Ciarniello[1], Emiliana De Blasio[1], Donatella Selva[2]

[1]LUISS University, Italy; [2]University of Florence, Italy

For the most part, samples of neoliberal feminism are drawn either from industry or from the star system. Here, instead, we want to study how neoliberal feminism can be interpreted in the political sphere, taking Giorgia Meloni as an example. Meloni's statements are full of references to her ability to recognise the inequalities between men and women, which may be considered the very essence of feminism, being one of the few recognisable elements in all its waves. What is different, in neoliberal feminism, is that the diagnoses and solutions are found in women's individual behaviour, far removed from structural forces.

We take the case of Giorgia Meloni in order to answer two questions: (1) how neoliberal feminism is put into practice in the political arena and (2) how neoliberal feminism consistently combines with conservative positions - not only neofascist - on various political issues. To answer the first question, we examined Meloni's stance on gender issues such as women's leadership, motherhood, work-life balance and violence against women; for the second question, we proceeded more inductively to highlight Meloni's agenda in order to identify problems and solutions to current events. For both questions, we have performed a frame analysis aimed at understanding: diagnosis, prognosis, motivation, rhetoric figures, lexicon. We have retrieved and analysed all statements, public interventions and press interviews given by Meloni covering a time-span of two years, since July 2022, for a total of 36 pieces.

1273

Discomfort And Resentment- On The Affective Politization Of Care

Paula-Irene Villa Braslavsky

LMU Munich, Germany

Contemporary neolliberal societies both generate and process multiple crisis. Among these, one of the most persistant and relevant is surely the 'care-crisis', i.e. the inability of capitalism to (re)generate the very reproduction necessary for production and the increasing impossibilization of care due to the colonization of intimacy and relationships by economic, managerial logics. Sociology - esp. in its critical strands such as feminist, gender, postcolonial perspectives - has long analyzed the multiple dimensions of the intersectional externalization of care and ist intimate entanglement with hegemonic social order.

Rooted in this vast research, and drawing from scattered empirical observations, my paper will focus on the salient politicazion of the "normal family" as core element of authoritarian, "right-wing populism". Taking the German case as main empirical context, I will argue that a) there exists a generalized discomfort produced by contemporary

societies as to the increasing structural erosion of care, and b) this is easily politicized by authoritarian populisms due to a lack of progressive framings of care.

The paper will further argue that sociology needs to adress and serisouly engage with the affective dimension of populist 'promises' and framings, and that progressive politics need to develop positive, radical visions of "caring democracies" (Tronto), already partly envisioned in e.g. (queer) caring communities.

The Alliance of Anti-Genderism and Right-Wing Populism: Global Commonalities and Local Manifestations

Melike Bozdogan

Baskent University, Turkiye

Since the early 2010s, the alliance of right-wing populism and anti-gender movements has been influencing politics in a way that threatens the gains achieved within the scope of gender equality. This study problematizes the relationship between the emergence of anti-gender movements and the rise of right-wing populism. Then, it discusses the global similarities and local manifestations that emerged as a result of this alliance. The study defines anti-gender movements as an opposing social movement organized against gender equality and gender mainstreaming. It examines the common and different movement frames of anti-gender movements through the examples of Türkiye, Hungary, and Poland. In this context, this study first discusses how anti-gender campaigns are organized as a social movement. In this respect, it questions the relationship between anti-genderism and right-wing populism. Then, it evaluates the transnational dimension of anti-genderism through its global commonalities and diversifying localized dynamics. The study uses qualitative research methods and relies on critical discourse analysis. Based on the analysis, the study argues that even though anti-gender campaigns in these three exemplifier countries develop similar discourses in terms of challenging gender equality claims, they gain local dynamics based on the actors involving the anti-gender campaign. The alliance between anti-genderism and right-wing populism has led to the emergence of intersecting backlash areas and the development of new political collaborations.

Sociological Implications of Anti-gender Mobilisations against Comprehensive Sexuality Education in Europe: the Case of Spain

Mar Venegas, Francisco J. Molina, José Luis Paniza

University of Granada, Spain

Far-right politics has spread to democratic societies, including Europe, where anti-gender mobilisations pose a challenge to democracy because of the moral crusade led by the 'global right' to mobilise 'moral panic' against gender and sexuality. Two different arguments have been developed to explain this phenomenon: 1) the economic and social crisis, which reveals the weaknesses of neoliberal economics and democracy; 2) the progress of liberal democracy and human rights, which challenges traditional values and promotes secularisation. This paper develops an explanation that draws on these two rationales to offer a comprehensive explanation of the phenomenon. To this end, the paper presents the results of a project whose general objective is to identify and analyse the discourse of anti-gender movements on the so-called 'gender ideology', as well as their mobilisations against sexual, body and gender equality policies in education in Spain. A mixed methodology was used, based on documentary analysis and in-depth online interviews with a total of 25 participants, 7 anti-gender and 8 feminist organisations. The results suggest that anti-gender mobilisations against 'gender ideology', more specifically Comprehensive Sexuality Education, have a double sociological implication. On the one hand, cultural, since these actions are part of the cultural war instigated by ultra-conservative groups in order to mobilise 'moral panic' in society. On the other hand, political, since this cultural war is a moral crusade against gender politics in the field of sexual and intimate citizenship. These two dimensions are involved in ultra-conservative campaigns to destabilise liberal democracy in Europe.

1274

JS | RN21_RN24_T05: Methodological and theoretical challenges in digital methods

Do Digital Social Sciences Need a Sustainability Assessment?

Kathrin Komp-Leukkunen

LUT University, Finland

The digital social sciences have been rapidly developing over the last years, opening up new horizons for research methods. Big Data provides rich information, and advanced computational methods allow for extracting insight from it. Universities offer an ever-growing number of study programmes in computational social sciences to harness these opportunities. However, recent research documented that computational social sciences are electricity-intensive. The high number of computational processes demands a high amount of energy. This circumstance draws attention in times of energy crisis and growing environmental consciousness. It raises the question whether these methods should also be included in energy saving and environmental protection schemes. This article explores whether it is possible to assess advanced computational methods in the framework of these discussions. It utilizes the United Nations Sustainable Development Goals, which often guide discussions on what to consider in environmental and social sustainability. A content analysis of scientific journal articles on advanced computational methods in the social sciences is carried out. It summarizes the discussions on the environmental and social effects of these methods. The findings are compared to the UN Sustainable Development Goals. The comparison shows that the discussions are dominated by environmental concerns, which tie in with three Goals. However, the discussions pay less attention to the social consequences, which tie in with four more Goals. Thus, advanced computational methods in the digital social sciences do relate to the UN Sustainable Development Goals. University teaching on digital social sciences might consider addressing sustainability in its curricula.

Disrupting Societies. Towards a Social Theory of Algorithmic Inequalities?

Justyna Stypinska

WZB Social Science Research Center Berlin, Germany

The disruptive power of algorithms has become a pressing issue discussed in society, media, business and in the social sciences. Artificial Intelligence (AI) and Machine Learning (ML) systems are perceived as capable of outpacing humans in many cognitive tasks. At the same time, AI entails a number of risks, relating to opaque decision-making, threats to privacy and democracy, structural inequality and social discrimination. There is increasing academic and journalistic evidence that the variety of implicit biases and latent stereotypes encoded in algorithms contribute to the exclusion and marginalization of various disadvantaged groups. This presentation explores the emergence of "algorithmic inequalities", a term coined to describe the novel social disparities resulting from the widespread deployment of AI systems, especially automatic decision-making systems (ADMs). The paper will outline key concepts: algorithmic bias, algorithmic discrimination, and algorithmic inequalities, aiming to clarify their relationships, empirical manifestations, and societal significance. The associations between those concepts pose additional challenges when extended to novel, amorphic groups, such as "dog owners" or "sad teenagers", created as an effect of obscure, algorithmic classifications. The way those groups are formed, based on large amounts of behavioral data, poses a question about the role of classical socio-demographic characteristics, such as gender, race, class, age, income used for our present-day explanations of social structuration processes and social inequalities. The aim of the paper is to initiate a discussion on whether sociology ought to update, innovate, re-visit or construe new theories of social inequalities in the era of big data and algorithms.

Matters of Trust and Knowledge: On Tensions Between BigTech and Social Research

Yves Jeanrenaud

Ludwig-Maximilians-Universität Munich (LMU Munich), Germany

Advanced artificial intelligence (AI) programs may open unprecedented possibilities with the potential to fundamentally change social research methods. Simultaneous, its development is currently dominated by venture-backed 'BigTech' companies and it's once again a winner-take-all race.

A key concern with AI for sociologists is how to evade methodological black boxes and resist the illusion of Emily Bender's stochastic parrots with their potential risks of hidden biases. This might be avoidable by gaining understanding of the AI systems' training models and data. However, our understanding of large language models (LLM) and their training data is often limited by proprietary information and business secrets. In consequence, we can almost only trust companies with what happens to our data.

Therefore, activists on the digital frontier are advocating new laws (e.g. EU AI Act) to make the principles within these machines understandable by obliging transparency. However, grasping (arithmetic) biases can be difficult, despite their well-documented existence. Thus, sociologists could shift to truly open AI, which allows examining source codes and training data alike.

Discussing awareness of (arithmetic) biases questions knowledge and resources. Who can really understand LLM? Where do sociologists find resources and time for such an

1275

endeavour on top of their research? Should sociology trust computer science with this issue to bridge epistemological differences with another discipline?

Hence, this paper focuses on trust within the discussion of AI in societal analysis: Trust in AI service and cloud storage providers, their terms of service and claims; trust in university data centres with much smaller expert teams and arguably different expertise. Additionally, it will explore what a feasible sociological AI application might look like.

Retracing the Narratives of Emerging Technologies through Digital Methods.

Biagio Aragona, Francesco Amato, Mattia De Angelis

University of Naples Federico II, Italy

The black-boxed nature of emerging technologies poses a substantial challenge to understanding how these technologies work and the impacts that may have on individuals and society. Unpacking the assemblage of these technologies is fundamental to anticipate the effects that they deploy and to understand the role of the actors involved in their production and deployment. An important part of their assemblages are the narratives, which drive investments and policy intervention.

The analysis of the narratives may reveal on the one hand the socio-technical imaginaries they rest upon, and on the other hand to understand the potential purposes and domain of application.

Our study employs a quantitative approach, using digital methods to reconstruct and analyse the narratives related to emerging technologies such as Artificial Intelligence, Digital Twins, and High Performance Computing (HPC) in Italy. By focusing on major social media platforms, such as X and YouTube, we explore the performative aspects of these narratives, acknowledging their role in co-creating digital futures.

We traced and analysed the evolving narratives surrounding emerging technologies, considering the actors, the domains, the technologies, and the applications within the public discourse. Research on narratives offers insights into the dynamics and patterns that characterise discussions about these transformative technologies. Our research findings provide a compelling perspective on the intricate interplay between social perceptions and technological innovation.

JS | RN21_RN24_T06: Novel methodological approaches to digital social data

Causal Machine Learning and Sociological Research

Giuseppe Alessandro Veltri

University of Trento, Italy

Like other areas of the social sciences, sociology has faced a crisis concerning the effect sizes of research findings. Various solutions have been proposed to address this issue. This paper will focus on analytical strategies developed in computational social science, specifically causal trees and forests, designed to capitalise on the heterogeneity of effects in both observational and experimental data. These techniques, which combine theoretical and data-driven approaches, are well suited to taking advantage of the wealth of information provided by large studies based on probability samples and are particularly suited for data from randomised controlled trials (RCTs). We will discuss the features of these methods and their theoretical underpinnings and provide an example from empirical work and simulations to demonstrate their utility. Specifically, we will explore the heterogeneity of treatment effects from an empirical study and in two scenarios of RCT-generated data using causal tree and causal forest methods. Additionally, we will examine the use of causal discovery algorithms in the context of Bayesian networks and how they can be beneficial in developing complex causal models from observational data.

1276

Enhanced Representation Learning: A Novel Heuristic for More Stable, Fast, and Precise Political Image Categorisation

Vasileios Maltezos, Matti Nelimarkka, Roman Kyrychenko

University of Helsinki, Finland

In the evolving landscape of social science research, the analysis of visual data, particularly images, has become integral for studying various social phenomena. Traditional methods of manually annotating and labelling these images are not only labour-intensive but also require considerable expertise and resources. In response, our research introduces an innovative approach that significantly enhances zero-shot learning through advanced embeddings for automated image classification. Our novel contribution centres on strong CLIP embeddings with cosine similarity, demonstrating a marked improvement in zero-shot classification. This paper compares various models like image hashing with hamming distance, ResNets, EfficientNets, ViT,

and RegNet and highlights, through this comparison, a new technique to enhance zero-shot learning models. Tested extensively on a diverse dataset of political images from social media, our method shows significant improvements in accuracy, f1-score, and stability, with reduced reliance on extensive manual labelling and resource-intensive neural network training. The key innovation lies in a heuristic that effectively filters the noise from embeddings, enhancing the accuracy and stability of zero-shot classification, particularly in classifying images with socio-political content. While the comparative analysis of different models is a secondary contribution, it underscores the superiority of the CLIP-based approach for this task. Our findings offer valuable insights for social scientists, enabling faster and more efficient analysis of large visual datasets with minimal machine learning expertise, thus offering them a novel lens to understand the transformations in sociopolitical landscapes through advanced image classification. This research highlights the potential of advanced representation learning in transforming visual data analysis in sociological and social science research.

Reflections on using Computational Methods for Sociological Analysis of Textual Data

Stefan Knauff

Bielefeld Univeristy, Germany

Social media platforms have made significant amounts of digital trace data available for computational sociology analyses. Due to the lower publication barrier on social media compared to traditional media outlets, individuals from diverse socio-economic backgrounds can publicly express their opinions, providing a broad perspective. Additionally, online and offline interactions are often interconnected. Offline events can have an impact on online spaces, just as online discussions can affect the analog social world. Analyzing large amounts of unstructured data can provide additional insights into social phenomena and complement or contrast traditional empirical analysis methods.

This talk provides insights into the process of analyzing large amounts of digital trace data for sociological research designs, using the example of measuring stereotyping within Twitter data (rebranded as X). This presentation shares the lessons learned from an ongoing research project that operationalizes regional differences in stereotypes within a dataset of over 2 billion German tweets using embedding models. The study investigates the emergence and usage contexts of stereotypes on Twitter by linking regionalized stereotypes with regional indicators from official statistics or survey data.

Connected Society and digital context: An Agent-Based Modeling of Trust in Information Dissemination

Elvira Celardi, Vincenzo Miracula

Università di Catania, Italy

The increasing interaction and interdependence between the real and the virtual contribute to creating a new social environment for the individual, characterized by belonging to multiple networks of relationships, both physical and non-physical.

In this digital context, social media gained popularity and created a virtual reality where people can express their thoughts and feelings about products, services, brands, individuals, personalities, or any other matter. In that connected society, understanding the dynamics of trust in information is crucial for comprehending the complexities of decision-making and opinion formation. This study employs an agent-based modeling approach to simulate the intricate interplay between individuals, information sources, and trust dynamics within a dynamic social system. Agents, representing individuals with diverse characteristics, beliefs, and information preferences, navigate through a landscape of information sources, assessing trust based on credibility, consistency, and past experiences.

1277

The model explores scenarios such as the spread of misinformation, the efficacy of intervention strategies, the emergence of information hubs, polarization, and responses to crisis situations. Through dynamic interactions, social reinforcement, and evolving trust levels, the simulation captures the nuances of how trust in information shapes individual and collective decision-making. The analysis aims to unravel insights into conditions fostering trust in reliable sources, factors contributing to the persistence of misinformation, and strategies for cultivating a more informed and trustworthy information environment. This agent-based model provides a valuable tool for researchers and policymakers seeking to comprehend and address the complexities of trust in information dissemination within contemporary societies.

JS | RN21_RN24_T08: Using AI tools in sociological research

Comparing the Accuracy of Instant AI Research and Traditional Surveys

Kamila Zahradnickova[1,2], Jan Polisensky[2,3]

[1]Prague University of Economics and Business, Czech Republic; [2]Lakmoos AI s.r.o., Czech Republic; [3]Brno University of Technology, Czech Republic

This study explores the integration of AI in measuring public opinion, focusing on how AI can enhance our understanding of societal trends and behaviors.

While technological advancements and AI integration have revolutionized data collection, making survey responses readily accessible, their accuracy and reliability are debated. Although most research is not focused on LLM (large language models), evaluating other types of AI for reliable societal insights is essential. The study compares the accuracy of AI respondents with real respondents in traditional online surveys, particularly in capturing societal and market trends.

Data were collected from digital respondents (Lakmoos AI, n = 350) and a traditional online panel (Ipsos Instant Research, n = 315) answering seven housing preference questions (e.g. Where would you like to live?). Quantitative answers were compared with t-tests and chi-square tests, one qualitative answer was compared for word count, nonsensical answers, and semantic proximity.

The results indicate no significant difference for AI and traditional respondents in five out of six quantitative questions; in one, AI respondents underestimated "baugruppe" term awareness by 12%. For the open-ended question, AI respondents matched and superseded topic richness, generated longer answers, and had fewer nonsensical or vulgar responses compared to traditional respondents. Overall, AI respondents gave the same answers as their real-world counterparts in six out of seven questions.

Initiating discussions about the possibilities and limitations of instant research using AI is crucial, marking a step to pioneer instant research with accountability and transparency.

The Social Space according to ChatGPT :

Gilles Bastin

Univ. Grenoble Alpes, France

With the launch of the conversational agent ChatGPT, one of the most complex algorithmic infrastructures of today — large language models (LLMs) — was put into the hands of academic researchers and the general public. The chatbot, which is capable of generating well-reasoned answers to user queries, has already been widely deployed for various tasks. It has sparked intense debates on issues such as copyright, integrity in knowledge production, the displacement of skilled human labor and misinformation.

Some recent studies have highlighted possible biases that could raise doubts about the neutrality of the chatbot and question its ability to fairly represent the social world. Nevertheless, the lack of information about its training and validation processes makes it difficult to explain these biases. Furthermore, the idea of bias — a central concept in the computer science literature on LLMs — has limitations such as an exaggerated focus on a very limited number of variables (notably political leaning).

In this presentation, I propose an alternative approach that shifts the focus from describing the biases of ChatGPT to exposing the underlying social world's representation of the chatbot. For that purpose, a multiple correspondence analysis of over 6000 portraits of individuals generated by ChatGPT will be presented. These portraits are distributed according to geographical, social, gender, and ethno-racial criteria based on city names and first names in France. The aim is to unveil the underlying model of society learned by the chatbot in order to gain a better understanding of the potential impact of its future use as a social classification or a social sorting tool, whether in the academia or in other parts of society.

Unraveling Societal Frontiers: AI, ChatGPT, and the Challenges of Interdisciplinary Convergence

Berenika Joanna Dyczek

Uniwersity of Wroclaw, Poland

In this presentation, I will explore the dynamic intersection of sociology and artificial intelligence (AI) with an emphasis on the transformative role of neural networks. Nowadays, terms like Digital Sociology and Computational Digital Sciences are frequently mentioned, highlighting the relationship between AI and sociology. However, there remains some puzzle as to how these fields collaborate (ask Lupton and Selwyn).

As individuals from the technology and hard sciences domains begin to engage with these concepts, it raises a question; should I integrate these disciplines more closely to create something new? This is where ChatGPT takes the stage. It is not merely a tool; instead, it serves as a bridge that connects the realms of sociology and computer science. Nonetheless, using ChatGPT presents challenges along with profound philosophical inquiries. What are the implications for our world when we increasingly interact with AI?

Furthermore, I will delve into real-life instances where AI, through Big Data analysis and machine learning techniques, uncovers previously unseen patterns. And there is more to it. I will closely examine ChatGPT itself. Is it merely a tool? Is it evolving into a player in our social sphere? I will delve into its impact, its autonomy, and what it signifies to have an AI as a part of our exchanges.

Come along as I unravel these captivating intersections between AI and sociology and venture into the horizons they are paving the way for.

1278

Artificial Intelligence in Analyzing Internet-Mediated Documents for Social Research

Laura Arosio

University of Milano Bicocca (Italy), Italy

This presentation explores the intersection of social research and artificial intelligence (AI), focusing on the paradigm of documentary analysis in the context of internet-mediated contents. Documentary analysis, as an approach to understanding social reality, harnesses the informational potential embedded in various products created by individuals or groups during their activities. Such contents arise spontaneously for purposes unrelated to social research and encompasses personal documents like diaries and private letters, cultural artifacts such as paintings, books, and songs, as well as institutional documents like laws and regulations and media documents such as news, films and TV series. In the contemporary landscape, these documents are increasingly disseminated through new technologies, collectively referred to as internet-mediated documents. Examples include online diaries or blogs, social media platforms, and digital publications, which uphold continuity with traditional documents while presenting new challenges.

This contribution addresses key questions in the analysis of internet-mediated documents, such as selecting the corpus, contextualizing the content, and navigating ethical challenges. The presentation advocates for the integration of artificial intelligence, specifically exemplifying the use of programs like ChatGPT as tools for analyzing internet-mediated documents. Practical examples will be showcased, illustrating how AI can facilitate both qualitative and quantitative thematic analyses. By delving into the capabilities of ChatGPT, we aim to discuss its potential in addressing methodological dilemmas and ethical considerations associated with the evolving landscape of internet-mediated document analysis. This exploration contributes to the ongoing discourse on the symbiotic relationship between social research and artificial intelligence, offering insights into innovative approaches for navigating the challenges posed by contemporary data sources.

JS | RN21_RN24_T09: Doing sociological research on digital platforms

Does it Still Make Sense to Use X in Social Research? An Application on the Italian Case of Chatgpt-4

Caterina Ambrosio, Vincenzo Laezza, Ciro Clemente De Falco

University of Naples Federico II, Italy

Twitter, now X, has played a significant role in social research, with numerous studies conducted on this platform. However, recent publications have increasingly highlighted critical aspects, ranging from the lack of geographical information to the closure of APIs. In this context, the present study aims to examine the current effectiveness of X as a source of big data for social research. The case study chosen to address this question focuses on Italian posts on ChatGPT-4 between March 31st and April 28th; during this period, due to a privacy restriction imposed by the regulatory authority, Italians did not have access to ChatGPT-4.

The empirical phase revealed some critical issues related to the use of X. Firstly, following the closure of the APIs – which brought its own set of challenges – data collection was carried out through an algorithm that operates on both the web page structure and the HTML structure. This system can collect a greater number of records compared to the previous methods but with significantly lower informational quality. The lower informational quality is evident in the lack of metadata and an abundance of NAs. The main consequence relates to the limitations of analysis techniques that are confined to being text-based. Another reflective aspect concerns the role of images in X communication: there is a growing need to develop tools capable of analyzing them and incorporating insights from visual sociology.

In conclusion, this work provides a critical perspective on the use of X in social research, exploring challenges, opportunities, and potential solutions.

Sociology by Platforms? The Segmentation of Society in Google's Targeted Advertising System

Adrian Kopps[1,2,3]

[1]Humboldt University of Berlin; [2]Humboldt Institute for Internet and Society; [3]University of Bremen

In recent years, digital platform companies such as Google and Meta have ventured into sociological territory by publishing research on topics such as social cohesion, economic inequality, and patterns of human mobility and migration. Drawing directly on sociological concepts such as social

1279

capital, they are seemingly aiming to position themselves as knowledge producers outside of their direct business interest.

While many social science accounts have focused on the risks that are associated with the increasing corporate digital datafication of the Social and have largely remained at a theoretical level, this study takes a different approach by providing an empirically grounded investigation of the link between the ways in which platforms are datafying their users and the sociological identification of social groups and behaviours.

Using "Google Ads", Google's system for targeted advertising, as a case study, the paper shows how the company draws on traditional sociological categories and reasoning when categorising and segmenting its users for the purpose of targeted advertising. Based on a qualitative analysis of this technical system, the study discusses the potential and limitations of digital datafication for societal analysis and examines how Google's segmentation of its users relates to earlier forms of (corporate) social research.

The paper advances the argument that digital data, such as Google's, enables a more fine-grained mapping of social patterns such as social stratification, geographical segregation, gender roles and the pluralisation of lifestyles than ever before but has not yet produced any categorically new sociological insights and potentially represents a new stage in the privatisation of social research.

Unveiling Gender Disparities in High-Skilled Migration: Insights from LinkedIn Data

Daniela Perrotta, Elizabeth Jacobs, Tom Theile, Emilio Zagheni

Max Planck Insitute for Demographic Research, Germany

International high-skilled migration represents an increasingly important component of migration streams with a significant impact on the global flow of skills and on migration policies. Understanding the factors that explain why highly skilled workers move, and where they go, is of paramount importance in migration research, but generally difficult to measure and model. In this study, we leverage a largely untapped data source, the LinkedIn advertising platform, to retrieve the mobility patterns of professionals across countries in Europe and characterize the gender disparities among professionals migrating within Europe. This research extends our prior work, which also utilized this dataset to characterize the mobility patterns of professionals in Europe and assess the relative attractiveness of European countries for high-educated workers. Here we present preliminary findings that highlight substantial variations in gender composition across countries and age cohorts. Notably, older high-skilled migrants exhibit a pronounced male presence. We also plan to include further analyses by industry categories to deepen our understanding of gender differences in various job areas. This research aims to shed light on the utility and challenges of employing LinkedIn data to offer new insights into the gender differentials in high-skilled migration in Europe.

From Duets to Debates: The Evolving Relevance of TikTok to Social Scientists

Alex Miltsov

Bishop's University, Canada

TikTok has quickly become a popular platform for sharing short videos, with a significant impact on the way millions of people interact online and engage with art, culture, and politics. This paper provides a comprehensive overview of the studies conducted on TikTok, highlighting the growing academic interest in understanding the platform's social effects. Social scientists have employed a wide range of methodological approaches to investigate user experiences on TikTok and the platform's societal implications. This paper summarizes the most common approaches and presents the most effective research strategies that have emerged in TikTok studies. Additionally, it provides a detailed examination of several specific research projects to showcase the various ways social scientists use TikTok for research purposes. Finally, the paper offers recommendations and directions for future research in this rapidly evolving field. By doing so, this work contributes to the larger discussion on the role of social media in contemporary society and its potential for social scientific research.

1280

JS | RN21_RN28_T07: Quantitative research on sports and physical activity

We invite papers opening to an interdisciplinary, multidisciplinary or postdisciplinary sociology-based approach, moving quantitative or mixed methodologies, aimed at understanding the relationships/interactions between sports and physical activities, or focusing on one of these topics.

Variations in the Meaning of Sport in the German Population: Findings from a Survey Experiment

Michael Mutz

Justus-Liebig-University Giessen, Germany

Sociological research on the level and frequency of sporting activity largely relies on large-scale surveys. However, self-reports of sporting activity are sometimes criticized, because of the vagueness of the term 'sport'. Critics doubt that there is a common understanding in society of what 'sport' is, or what physical activities people subsume under this term, when responding to questions. Therefore, researchers need to consider the variations in the meaning of sport in society and how these variations could affect responses.

To assess variations in people's everyday understanding of the concept of 'sport', I use a survey experiment based on 28 vignettes. Each vignette presents a brief description of a physical activity, and respondents were asked to rate them on a Likert scale ranging from 1='definitely not a sport' to 5='definitely a sport'. Respondents were also asked to report their own level of sporting activity. The vignettes and other questions were part of an online survey (N=1.002) representing the German population (+14 years, with internet access). The survey was conducted in October 2021.

Results show that Germans do not have a common understanding of what sport is. A majority has a rather broad, inclusive understanding of sport, but a minority has a narrow, exclusive understanding. Controversy surrounds in particular the classification of light, non-competitive and informally practiced activities such as yoga, darts, dancing, or leisurely cycling that are not consistently understood as either 'sport' or not. Despite these differences, the understanding of sport does not significantly affect the respondents own reported levels of sport activity.

Assessing the Transformative Power of BaskIN through Social Network Analysis

Luciana Taddei, Ilaria Primerano, Anna Milione, Paolo Landri

IRPPS CNR - Istituto di Ricerche sulla Popolazione e le Politiche Sociali del Consiglio Nazionale delle Ricerche, Italy

BaskIN is an inclusive sport inspired by the classic basketball game sharply changing the rules and the playing space. It offers a new philosophical and pedagogical perspective in sports practice (Andriola, Bennici & Bianchi, 2023). It was founded about twenty years ago in Cremona (Italy) and it has had an increasing development in recent years, not only in Italy. Given its peculiarities, it can be configured as an important tool for participatory social innovation (Russo & Della Sala, 2023; Mumford 2002): it redesigns individual participation letting each gamer contribute in his/her way according to his/her possibilities (e.g. dis/abilities, migration, gender, etc.), and has a strong impact on individual and collective well-being (Bianchi, Taddei, 2023; Black e Stevenson 2006).

Our research takes into consideration a BaskIN team recently founded in a little village in the South of Italy, to assess how the introduction of this game has had a positive impact on individuals, families, and community. To assess the transformative potential of BaskIN, we use a mixed method methodology (Taddei, 2022; Amaturo & Punziano, 2016; Tashakkori & Teddlie, 2010; Creswell & Plano Clark, 2007; Johnson, Onwuegbuzie & Turner, 2007), combining deepen interviews with a social network analysis approach for Ego-Nets (Salvini, 2005), able to detect the so-called interpersonal goods (Donati 2011), that enable society to make equitable and sustainable progress (Orsi, 2003).

Content Analysis Of Digital Texts About Sport: The Case Of #IStandWithGary On Twitter

Paolo Diana[1], Giovannipaolo Ferrari[2]

[1]Università di Salerno, DISUFF, Italy; [2]Università di Salerno, DISUFF, Italy; Université de Lille, CeRIES, France

This contribution demonstrates the integration of content analysis (CA) in examining digital texts on sports, utilizing digital methods such as automated extraction of text data from platforms like Twitter. The focus is on organizing this data into structured datasets and leveraging metadata as methodological resources. Using a case study involving the Gary Lineker and BBC controversy, the operations are showcased.

CA employs non-invasive observation techniques to explore socio-cultural meanings in textual data that are not directly observable, allowing for the swift collection of large or small data sets. The USA and the Anglo-Saxon world have a rich tradition of using CA in sports sociology research,

analyzing corpora from various sources, including sports media, official documents, and digital content. This method unveils insights into relationships between sport and various societal issues.

Widely employed in sport studies, CA is pivotal in communication and media studies, shedding light on media discourse about sports. It unravels how the media shapes perceptions of sport, athletes, and teams, reflecting the influence of commercialization and commodification on these portrayals.

In essence, CA facilitates a deeper comprehension of messages, values, and representations associated with sports and the athlete condition. It serves as a tool to understand how these elements shape diverse audience perceptions.

Leisure-time Places in Young People's Everyday Lives: Validity and Reliability of a New Measurement Instrument for Survey Research

Barbara Mataloni

University of Vienna, Austria

The literature highlights that there is a trend away from organised towards informal sport and leisure. Informal relations and engagements are more difficult to capture but they still have their own time and place. They draw attention on places such as urban public places, semi-public places, and private places. The presented new measurement instrument measures the conditions characterising the place in which young people spend most of their leisure time as perceived by themselves. The generated items allow to assess the extent to which leisure-time places (1) allow for 'correspondence', (2) facilitate 'experimentation', and/or (3) require 'adaption'. The measurement instrument was developed in the context of the mixed-methods, longitudinal study 'Pathways to the Future'. This project followed the lives of school leavers from so-called 'New Middle Schools' (grade 8) in Vienna for five years. Theoretical references and qualitative insights were used as point of departure for the development of the measurement instrument. After a thorough pre-test phase, the instrument was inserted in wave 3 (2020) and wave 5 (2022) of the quantitative panel. The aim of this paper is to provide evidence of the validity and reliability of the instrument. The internal structure of the items is analysed with exploratory and confirmatory factor analyses. The reliability of the sub-scales is assessed with Cronbach's alpha coefficient. Overall, the reported evidence suggests that the instrument can be used according to its intended use, i.e., to characterise the qualities of the places in which young people spend most of their leisure time.

JS | RN27_RN37_T01: Tackling the housing crisis: a view on urban homelessness from the south of Europe

Getting access to a house can be considered as one of the more challenging issues in many European cities. Since the economic crisis in 2008 and also during the pandemic and the lockdowns, affordable and social housing are strongly back into the public debate: from 2010 to 2022, average rents increased by 19% and house prices by 47% in the European market (Stare of Housing in Europe 2023 - https://www.stateofhousing.eu). This growth has consistently outpaced the one in incomes and growing evidence of people living in temporary, unsafe, or poor-quality housing can be found in many European cities. How have Southern European cities been affected by this scenario? Are there other processes that can be investigated as, for example, gentrification and changes in the real estate markets connected to tourism? How is it possible to monitor and prevent the risk of homelessness in European cities? And which kind of policies can be considered effective? This Joint Session welcomes presentations focused on these research questions, with attention to the housing crisis and urban homelessness in Southern Europe

To Move and Where to Move? Geographical Mobility Along The Life Course In Italy And Later Housing Circumstances

Giovanna De Santis[1], Tiziana Nazio[2]

[1]Università Politecnica delle Marche; [2]University of Turin, Italy

Residential movement decisions are complex, shaped by life course events and macro circumstances. When movements also involve geographical displacement, educational and/or occupational attainments may follow, but -depending on the distance- they may also undermine situated social support networks like friendship and kin that strongly contribute to later life circumstances in southern European societies. With retrospectively collected data from the first wave of Italian Lives (ITA.LI), a representative household panel survey of the Italian population (16+), we dynamically describe the patterns of residential (im)mobility relative to the municipality of 'origin' at schooling age. Using sequence analysis and clustering techniques, we detect typical patterns of residential mobility through the extent and frequency of moves from and towards the location of residence at age 14, when essential social networks have been grounded in school and early life. We then explore associates of the current housing characteristics with indicators from earlier geographical mobility and salient family circumstances (e.g. social origin, union disruption) to assess differences of various residential mobility trajectories over the life course in relation to housing outcomes.

Taking Care of the Unaccompanied Foreign Minors Starting from the Housing

Giuseppina Tumminelli, Vincenzo D'Amico

University of Palermo, Italy

In Italy the subject of the rights of unaccompanied foreign minors (UAMs) is not an easy one. UAMs are increasingly becoming "victims of collateral damage" due to the risks of urban marginalization (Bauman 2011). Collateral damage is the result, on the one hand, of inequality and, on the other, of an increase in human suffering. Although discomfort and suffering are connected to the individual, they relate to place, and thus individual fragility becomes an expression of urban fragility. The condition of social fragility is, therefore, dictated by a combination of a series of elements that are not related only to housing, but also to the absence of basic resources that might ensure decent material conditions of life (Townsend, 1979). It is of primary importance to trigger considerations and interventions that may promote effective policies aimed at accompanying people at the risk of extreme marginality, starting from individual projects and taking overall charge of the individual. Stability of accommodation is, sure, one of the conditions for guiding people towards self-sufficiency and the response should be geared towards the planning of case management (i.e. taking charge of the person) and the adoption of housing-led and housing-first approaches, based on the principle of swift rehousing, i.e.: housing first, as a basic human right. The paper will focus on analysis of experiences of HF as a possible strategy to reduce the risk of social marginality, e.g. for unaccompanied foreign minors who have become newly legal adults and consequently are leaving the reception system in Italy.

1283

RN27_T01: Transnational families and care arrangements

Transnational Families, Care Strategies and Public Policies in a Post-pandemic (Im)mobility Regime

Laura Oso, Raquel Martínez-Buján, Paloma Moré

Universidade da Coruña

This article analyses the social protection strategies that transnational families have deployed to cope with the new regime of (in)mobilities that emerged after the Covid-19 crisis. It reflects on how the pandemic has restructured the articulation of the family welfare model and the migration regime in Spain. From a theoretical point of view, it combines the analysis of family strategies of "transnational social protection" with the approach of spatial and social (in)mobilities. The article also includes a multilevel analysis (macro, meso, micro) of the connections between care and migration. A mixed methodology was used: 1) the exploitation of secondary sources to show the impact of the Covid-19 crisis on Latin American immigrant families in Spain; and 2) an analysis of ethnographic material consisting of in-depth interviews (n=41) with various members of transnational families (n=13) residing in Spain (n=27) and in their countries of origin (n=14). The results show that after the Covid-19 crisis, an "assemblage of spatial and social (in)mobilities" was generated for the immigrant population. They highlight the social blockages that the immigrant population had to face: legal, residential, occupational and care, and also how informal arrangements to solve these immobilities are led by women. Those families who were further along in the migration cycle or who had social capital (relatives in Spain) were less affected by the impact of the crisis.

Birth, life and death of transnational families: A multi-sited ethnography across Colombia, Spain and France.

POlina Palash[1], Andrea Souto[2], Laura Oso[2], Virginie Baby-Collin[1]

[1]Aix-Marseille Université. Telemme; [2]Universidade da Coruña. Esomi.

This work focuses on transnational care and social protection arrangements in families scattered across their origin context of Colombia and their migration contexts in France and Spain.

It analyses the gendered caring practices among three generations of mostly female family members, in their evolution over large time frames, applying a life course and trajectory perspective. We draw on a multi-sited ethnography conducted in several localities in France, Spain and Colombia, between 2018 and 2023, comprising 37 members from six transnational families originating from Colombia.

The results of the research allow us to discover the transnational family from several points of view. On the one hand, it reveals the process of construction of the "transnational family space" through the different contexts in which the family members considered for this study find themselves - "here", "there" and beyond - using multisite ethnographic methods. Moreover, it shows the different intergenerational perspectives of younger, older and older respondents, as well as the different stages in the evolution of transnational family ties and socio-spatial trajectories over time.

Thus, our work displays how care and social protection arrangements in transnational families evolve over time, reflecting their birth, rise and dissolution, at while disclosing the underlying tensions

Growing Old Between Cuba And Spain: An Approach To The Transnational Reconfiguration Of Care In Cuban-origin Families

Laura Suárez-Grimalt[1], Montserrat Golías[2]

[1]Universidade da Coruña, Spain; [2]Universidade da Coruña, Spain

This paper examines the mobility of the Cuban population, with a focus on care dynamics for older adults in transnational families.

The presence of the Cuban population in Spain has gradually increased since the 1990s, along with the primary destination, the United States. The direction of these migrations has been determined by legislation on nationality, in the case of Spain, or by immigration policy in the case of the United States.

The Cuba-Spain-United States triangle is a clear example of crossed mobilities (Oso, Cortés, and Sáiz, 2017), historically built within these transnational families. However, this proposal suggests analyzing the constant migratory exchange in these three spaces, beyond economic and political interpretations. This is because the health crisis has invited us to focus on the well-being of families and place care at the center (Solís, Martínez-Buján, and Paredes, 2018).

Empirical observation points to a reconfiguration of the flows of Cuban transnational families. In the case of Spain, there has been an increase in the group over 50 years of age (INE data, 2022). The objective of this proposal is, therefore, to analyze the reconfiguration of care in Cuban transnational families. Our contribution intends to analyze the organization of care among the different members of the family, specially considering older adults, and understand them as a space in which to (re)define migration and mobilities.

To achieve this goal, we will analyze secondary sources and conduct two "family life histories" These histories will be constructed from a biographical, multi-methodological, intersectional, gender and longitudinal approach.

1284

Between Cuba and Spain: Patrimonial Care and the Re-organisation of Transnational Families

Alba Vázquez López, Laura Oso Casas

Universidade da Coruña UDC, Spain

In recent years, there has been an intense scientific production that addresses the issue of migration and care. Beyond the perspective of global care chains,which propose, with a uni-directional vision,the transfer of care from the Global South to the Global North, the "circulation of care" approach (Baldassar and Merla,2013)has brought to light the exchanges in which transnational families participate.

In this paper we analyse a dimension of care that has been less addressed in the literature and that has to do with patrimonial goods. By this,we refer to the care of property, homes, pets, as well as the maintenance of burial plots of family members who are no longer present. To this end,we take a gender and intergenerational approach,bringing to light how this type of care re-organises the dynamics of transnational households, as well as families´strategies for mobility and immobility.

The research takes as a case study the migration of women from Cuba to Spain and, specifically, to the region of Ulloa ,in Lugo.This migration is explained by the demand for labour for domestic service,due to the progressive ageing of the population in rural Galicia.This, in turn, is connected to and structured by the demand for care in the host context.

The methodology used is based on multisite fieldwork.The first phase of the study involved conducting biographical interviews with families of Cuban origin located in the town of Monterroso, a village in the province of Lugo, Galicia. Subsequently,visits were made to their relatives in Cuba (areas of Camagüey, Sancti Espiritus and Havana).A total of 25 people were interviewed during the fieldwork.

The Housing Issue And The Gentrification-Touristification-Financialisation Nexus: Lessons From Milan (Italy)

Veronica Conte

KU Leuven, Belgium

This paper aims to understand the housing issue as the result of three phenomena: gentrification, touristification, housing financialisation (Aalbers 2019), a nexus that is central to contemporary urban dynamics especially in southern European cities (Tulumello & Allegretti 2020). To this end, I examine Milan, a city that is in the midst of a severe housing affordability crisis driven by wage stagnation and a steady rise in property prices, that is affecting both the underprivileged and the middle class (Bricocoli & Peverini 2023). The case of Milan is an exception in Italy: although embedded in a southern welfare state, housing regime and labour market, its economy and real estate market have for decades been embedded in the international circuit of capital investment, a factor that brings the gentrification-touristification-financialision nexus to a much more global scale, with serious consequences in terms of socio-spatial and housing inequalities. I argue that this double territorial embeddedness is key to interpreting the housing crisis not only in Milan, but also in other southern European cities with a similar development trajectory. The paper is based on secondary data - collected through policy analysis, press articles and attendance at public events and real estate congresses - and primary data - collected through semi-structured interviews with policymakers, civil servants, housing agencies, real estate consultants and operators, property managers, tenants' unions, civil society groups and experts.

To Move and Where to Move? Geographical Mobility Along The Life Course In Italy And Later Housing Circumstances

Giovanna De Santis[1], Tiziana Nazio[2]

[1]Università Politecnica delle Marche; [2]University of Turin, Italy

Residential movement decisions are complex, shaped by life course events and macro circumstances. When movements also involve geographical displacement, educational and/or occupational attainments may follow, but -depending on the distance- they may also undermine situated social support networks like friendship and kin that strongly contribute to later life circumstances in southern European societies. The paper will focus on analysis of experiences of HF as a possible strategy to reduce the risk of social marginality, e.g. for unaccompanied foreign minors who have become newly legal adults and consequently are leaving the reception system in Italy.

The Responses Of Social Movements And Local Institutions To The Emotional Consequences Of Housing Precarity. Insights From Barcelona And Bologna.

Gabriele D'Adda

Università degli studi di Catania, Italy

This paper aims to address the strategies developed by grassroots organizations and local institutions to deal with the psychological, emotional, and relational impact of housing precarity in southern European cities. An extensive literature has pointed out how long-term processes of commodification, deregulation and financialization of housing have increasingly jeopardize the right to housing. The material consequences of the resulting housing precarity are the expansion of homelessness, a dramatic increase in evictions and foreclosures, the growth of rents and the expulsion of the middle and working classes from inner-city areas (Madden and Marcuse 2016; Carr, Edgeworth, & Hunter 2018; Rolnik 2019; D'Adda 2021; Tosics & Tulumello 2021). While a consolidated literature focuses on the material impact of the precarization of housing rights, both its emotional and health consequences (stress, depression, anxiety, but also a sense of shame and personal failure) as well as the responses to this kind of impact elaborated by social movements and local institutions remain under-researched. Based on the preliminary results of fieldwork research carried out between Barcelona (Spain) and Bologna (Italy) during the last three years, the paper aims to offer some reflections on how urban social movements and local institutions have (re)organized themselves to respond to these issues in the post-pandemic context.

JS | RN27_RN38_T02: Resilient places and communities in times of turbulence: views/perspectives from Southern Europe

Resilient Communities: Adaptation and Resistance to Territorial Stigma in a Rome's Neighbourhood

Francesca Messineo, Maria Grazia Galantino, Matteo Finco

University of Rome La Sapienza, Italy

The concept of territorial stigmatisation highlights how the dissolution of the Fordist-Keynesian capitalism has pushed increasing segments of the urban population towards a condition of 'advanced marginality' and a livelihood into ghetto-neighbourhoods. Despite some valid criticisms, the concept proves to be useful to grasp both the forms of production of stigma and the strategies of adaptation and/or resistance in the case-study of the present paper: the Roman neighbourhood Quarticciolo. Once emblematic of working-class forms of cohesion, it is now characterised by fragmentation and conflicts due to high unemployment, street crime, housing crisis, and lack of services. Yet, in line with the Southern European culture of grassroots local activism, civil-society actors are at work in the neighbourhood countering discursive stigmatisation, providing services, and monitoring the municipal administration's decisions.

1287

The paper presents the results of an exploratory research aimed at mapping the practices of civic activism of Quarticciolo residents by using qualitative and participatory methods (semi-structured interviews, participant observation, participatory workshops). Bottom-up forms of resilience are unpacked, eliciting the coexistence of strategies of infra-stigmatisation, lateral denigration, adaptation, reframing, civic activation, and resistance. Top-down 'circuit of production' of territorial stigma are investigated focusing on the journalistic field, specifically on two news stories that involved Quarticciolo in 2021 and 2023 and made national headlines.

Media content analysis together with field research results allow to unveil the role of different actors, both internal and external to the territory, in promoting or countering stigmatisation. Thus, providing further elements to the analysis of new forms of active citizenship in Southern European countries.

Organizing, Demands And Limits Of The Housing Rights Movement In Spain: A Case Study In A Working Class Neighborhood In the periphery of Madrid

Myriam Aarab

Universidad Complutense de Madrid, Spain

This presentation aims to reflect on the main characteristics, practices and debates that make up the movement for the right to housing in Spain. To this end, the provisional results of a case study of an organization belonging to the movement in a neighborhood in the periphery of Madrid will be presented

The study, part of a broader doctoral research on participation and social exclusion in the city of Madrid, consists of material collected during a year of participant observation and in-depth interviews with activists and affected people. Along with the analysis of the case study, the aim is to describe the moment of strong crisis of access to housing in which it is inserted, especially in the urban contexts of Spain: with skyrocketing rents, difficult access to social housing, and proliferation of evictions, a large part of the population is left precarious and unprotected.

After reconstructing the origins and development of the movement, we will proceed to describe its functioning: based on principles and praxis of mutual support, the participation implies, within horizontal structures, the involvement of the affected people themselves, generating an organization able to build resilience seeking solutions to social emergencies, empowerment for the affected collectives and articulate political demands on the right to housing. It is also intended to reconstruct the main debates within the movement's demands, seeking to reflect on the limits and challenges it faces, in terms of room for maneuver and action, repression, as well as its institutional relations and incidence.

Transformative Rurality: Infrastructure And Connections Of Migrant Agrifood Workers In Rural Southern Italy

Alessandra Corrado

University of Calabria, Italy

Agrifood and migration transformations are changing rural areas. These transformative dynamics deriving from the confrontation between restructuring and regulation processes from one side and subjective and relational responses from the other side can be detected in the composition of local population and workforce, in the reorganisation of rural settlements, agrifood supply chains and production relations.

In Italy, migrant agrifood workers often live in informal settlements, many of which are of a permanent nature. In most cases, these settlements lack essential services, social and health interventions, public transport and inclusion services. However, through these housing solutions, migrants meet their reproduction needs. The areas with the greatest presence of informal, temporary or stable settlements, where migrant workers subject to various forms of exploitation live, are located in Southern Italy. Over the past 15 years, institutions have responded to the housing malaise according to an emergency approach, installing, outside the inhabited centres, container camps and tent camps that generate passivity, isolation, stigmatisation, divisions, socio-environmental degradation, and conflict with the local population, progressively converting into new slums. However, alternative transformations are emerging on the initiative of migrant workers and private actors.

Nature Based Solutions and Community Engagement: Notes from an International Research Project

Claudia Pereira[1], Emilia Araujo[2], Elisabete Teixeira[3]

[1]University of Minho, Portugal; [2]University of Minho, Portugal; [3]University of Minho, Portugal

1288

One of the main challenges for community resilience refers to the way they are involved in the debate and design of the future. This comunication examines the growing consensus around the use of Nature-Based Solutions (NBS) to address societal challenges such as climate change. In fact, NBS incorporates ecosystem restoration, sustainable water management, green infrastructure, and other methods that work together with nature to mitigate issues such as floods, fires, and extreme heat. It is considered that leveraging biodiversity, NBS can enhance the quality of life for communities. However, implementing NBS requires a multidisciplinary framework that involves dialogue between cultural elements, environmental considerations, sociotechnical factors, and political dynamics. This communication presents the outcomes of a study conducted in the context of the NBSINFRA project, which focuses on the community adherence and participation in the co-creation and co-design of NBS solutions in different European cities. The findings suggest that successful NBS implementation depends on the active involvement of local communities and the consideration of cultural, environmental, sociotechnical, and political factors.

JS | RN28_RN33_T01: Sports, Bodies, Gender and Sexualities

Physical Education From Lesbian, Gay, And Bisexual Teachers' Perspective. A Systematic Review Of Qualitative Studies

Johannes Müller[1], Nicola Böhlke[2]

[1]Justus-Liebig-Univerity, Germany; [2]Technische Universität Braunschweig

Prior research has shown that homophobia is widespread in schools, some studies even indicate that the prevalence of harassment towards lesbian, gay, and bisexual (LGB) indi-divi-duals in schools is higher than in other social contexts. Numerous studies have examined physical education (PE) in this respect in the past. However, prior research on sexual diversity in PE focuses primarily on students and rarely on teachers. Against this background, this study takes a look at teachers and explores the question of how LGB teachers experience PE. The study was conceived as a systematic literature review of qualitative studies published between 1990 and 2022. The processual study selection was carried out according to PRISMA. A total of nine studies were identified that met our inclusion criteria. We analyzed and compared the findings of these studies. On an overarching level, our analysis shows that the identified studies predominantly focus on the challenges and problems associated with the sexuality of LGB teachers. Furthermore, our analysis shows that the PE teachers interviewed in the studies perceive and anticipate school as a homophobic context. From the teachers' perspective, PE is a special subject that they experience as particularly risky due to their sexuality. Against the backdrop of these experiences, many PE teachers use protective strategies, which mainly consist of hiding their own sexuality and ignoring the perceived homophobia. Selected findings from the study will be presented in the talk.

Do I Have to be Hungry All My Life to be Happy? A Qualitative Study of Experiences of Obesity

Irena Wolska-Zogata

Uniwersytet Wrocławski, Poland

Background:

Social media usage is at an all-time high among young women, and Instagram is one of the most dominant mediums influencing users' attitudes and behaviours. Even though the World Health Organization recognized obesity as a disease, obesity is still not only socially unacceptable, but is systematically stigmatized across the world. Obesity is considered "repairable" by exercise, nutrition, or medication, and therefore a reflection of willpower. Innumerable internet profiles are purporting to offer the most successful ways to perfect the body, but all correspond to the diet culture. Although Fitspiration intends to promote a healthy lifestyle, research indicates that Fitspiration is similar to Thinspiration as both idealize thinness and exercise for appearance-related reasons, and lead to disordered eating thoughts and behaviors, and inflict punishment through exercise or restriction.

But the evidence suggests that these variables combine in a pernicious cycle. Weight stigma leads to stress. Stress leads to increased eating behaviours and HPA axis dysregulation, which synergistically yield more weight gain and additional stigma. Sadly, many experts still seek to motivate through embarrassment.

Recently, many social media platforms have begun providing the opportunity for users to challenge rigid and unattainable messages regarding beauty, and to promote diverse body sizes and appearances.

Method:

The purpose of this research is to examine the experiences of diet and fit culture through theme analysis of Instagram posts. The 'keyness' of a theme is not necessarily dependent on quantifiable measures, but on whether it captures something important with the overall research question. I have analyzed body-positive content (posts and answers) on Instagram accounts of at least 10,000 followers and that do not sell or promote any products.

Negotiating Normative Boundaries: Iranian Women's Engagement in Sports and Physical Activities

1289

Reza Arjmand, Zahra Termeh Eskandari

Linnaeus University, Sweden

This study explores the nuanced lived experiences of Iranian women in sports spaces, unveiling a complex interplay of societal norms, cultural expectations, and individual agency. The negotiation of bodily practices reflects a dichotomy between tradition and modernity, where women engage in physical activities while adhering or appropriating to broader cultural and political contexts. The tension between Islamic values, symbolized by the compulsory hijab, and the desire for sports participation illustrates the intricate balance these women must maintain. The female body becomes a site of political contestation, shaped by the theocratic state's ideological apparatus. Socio-economic status, cultural capital, and embodied practices intersect, manifesting distinctions between various groups of women, reflecting broader societal structures. The agency of Iranian women in sports emerges as a nuanced interplay between resistance and conformity, with recent events highlighting ongoing transformations. Beyond the sporting realm, this research offers insights into symbolic gestures during sports events, unveiling the multifaceted nature of women's identity within Iranian society. By navigating these complexities, the study contributes to a deeper understanding of the evolving role of Iranian women in public spaces, intricately intertwined with ideological norms and societal expectations.

Between Concealment and Exposure – Menstruation in Professional Sport from a Sociological Perspective

Honorata Jakubowska

Adam Mickiewicz University, Poland

Menstruation in professional sport is rarely the subject of research in social sciences, including sociology, and the current analyses derive mainly from sport science. Meanwhile, it is an exceptionally interesting and important topic of social research related to women and sport taking into account the centrality of the body, its constant display and the privileging of the male body. The aim of this presentation is to discuss the main factors that shape the status of menstruation in professional sport. These factors are (1) the culture of concealment, (2) the nature of sport, including sex segregation, (3) the mediatization of sport and (4) menstrual activism. As a consequence, on the one hand, menstruation is rarely the object of communication, especially addressed to a wider public; on the other hand, menstrual activism contributes to some changes, as well illustrated by the case of the dress code at the Wimbledon tournament. Showing that the (in)visible status of menstruation in sport is shaped by the characteristics of sport, being an athlete, being a woman (both inside and outside sport) and a broader socio-cultural context, the author will point out why it should be the subject of sociological analysis. Adopting a sociological perspective may not only fill the knowledge gap but also have a social impact and contribute to better communication, development of education regarding menstrual issues and better institutional support for female athletes.

1290

JS | RN30_RN35_T01: Decolonizing youth mobility: beyond the normative youth/ mobility nexus (I)

Applying for Citizenship Was Quite Humiliating. Young People on the Move Between Belonging, Transitions and Discrimination.

Ilenya Camozzi[1], Daniela Cherubini[2]

[1]University of Milano-Bicocca, Italy; [2]University of Parma, Italy

In recent years, an increasing contamination between youth studies, migration studies and mobility studies has opened up fruitful areas for reflection on the biographical trajectories of young people, their visions of the future, sense of belonging, as well as their transition paths to adulthood. In particular, youth mobility is suggested by many scholars as a possible new marker of contemporary transition to adult life.

These reflections nevertheless seem to be harnessed within a Western epistemological framework whose implications in ethnocentric terms are its most risky outcome. On the one hand, there is often little problematisation of the very concept of youth and young people on the move to which a normalising view of being young is attached; on the other hand, the debate often uncritically reproduces the dichotomy between mobility and migration. Last but not least, looking at their sense of belonging appears to be essentialising.

Starting from a 5-year longitudinal qualitative research on young people in Italy (ITA.LI Italian Lives, 2018-2022) which collected 3 survey waves with 120 young adults, we analysed the biographies of 11 young people (for a total of 33 narrative interviews) with 'multiple origins' - a descriptive term that aims to broaden the exclusively ethnic meaning of origins.

The analysis shows the complex reflexive configuration of their sense of belonging as well as its processual and changing character especially with reference to the biographical (also in the family sense) experiences of movement. What emerges more, are the everyday politics of belonging and mobility that take shape in their biographies and reveal the scenario of coloniality (Quijano 2000; Mignolo 2007) in which these young people with 'multiple origins' struggle in growing up.

Participatory Research In Jordan In The Shadow Of The War In Gaza: What Are The Implications For Young People's Political Identities?

Sarah Alheiwidi[1], Nicola Anne Jones[2], Kate Pincock[3]

[1]GAGE, Jordan; [2]ODI, United Kingdom; [3]GAGE and Oxford University, UK

The prolonged occupation of Palestine has had a significant impact on young people in the Middle East, who have grown up witnessing repeated waves of violence, denial both of citizenship or the right to return for refugees, and inaction by the international community. In October 2023, Israeli bombing of Gaza in response to attacks by Hamas led to mass protests in Jordan, where 3 million Palestinians currently live, a fifth of whom lack citizenship. The Jordanian government has reiterated its commitment to keeping its border closed to deter further forced displacements.

In Jordan, the Gender and Adolescence: Global Evidence (GAGE) programme, a major longitudinal mixed-methods study on adolescence in lower- and middle-income countries, has been exploring the experiences of adolescents and their families in Palestinian and Syrian refugee and Jordanian host communities since 2016. The study has generated a rich range of in-depth evidence on a range of issues from young people's mental health to family and community violence, but until war broke out in Gaza in 2023, young people have been reluctant to express their views on politics or their own sense of citizenship and identity due to strong social norms that discourage these conversations.

Drawing on participatory research from before and after the 2023 conflict, we discuss how crisis may offer an inroad into exploring political and civic identities and create space for resistance to social norms that historically result in young people's political self-censorship. Participatory research that forefronts an ethic of care can further supports young people to discuss politics in ways that feel appropriate and safe.

Rethinking Global South-North Student Mobility: The New Wave of Migration from Turkey to Germany

Pınar Gümüs Mantu[1], Demet Lüküslü[2,3]

[1]Justus Liebig University Giessen, Germany; [2]Yeditepe University, Istanbul; [3]2023/24 Mercator Istanbul Policy Center Fellow

In the last decade, high-skilled young people from Turkey have been moving to Germany in increasing numbers. Constituting a considerable part of the "new wave Turkish migration" in Germany, these young individuals are experiencing their (temporary or permanent) move to Germany in a variety of forms and processes, including educational field as masters or doctorate students. The grounds for seeking

1291

mobility chances in Germany are far from just about gaining international educational competencies, but rather triggered by increasing socio-economic and political grievances in Turkey having drastic impact on young people's lives. In that sense, graduate student mobility from Turkey to Germany offers an important case study for rethinking the dynamics of global South-North student mobility.

Reconciling youth studies and critical perspectives in mobility-migration nexus, this paper will scrutinize how moving and being mobile between borders/communities/spaces relate to ways of navigating transition to adulthood. Going beyond normative notions about youth mobility, this paper gives "methodological primacy" to mobility and investigates how mobility "creates and transforms different worlds" (De Genova et al. 2022). Based on ten in-depth interviews and two online focus group discussions conducted with young individuals who have moved from Turkey to Germany with educational purposes since 2014, this paper will discuss: How are everyday practices of young people shaped by experiences of mobility? How do they reflect on the relationship between being young and being mobile/migrant? How do the notions of mobility and movement involve in their future projections/imaginations about adulthood, which is normatively thought to be sedentary?

Young Migrants Transitions to Adulthood and Their Geographical Mobility: Developing a Critical, Decolonial Perspective from Ethnographic Observations.

Tindaro Bellinvia[1], Lidia Lo Schiavo[2]

[1]University of Messina, Italy; [2]University of Messina, Italy

Young migrants can be regarded as global subjects who undertake two interconnected mobility trajectories: their transition to adulthood and their planned migrations. In particular, young and underage migrants from North and Sub-Saharan Africa, who are forced to face further retrenchment in welfare policies due to neoliberal reforms in education and labour, and structurally adverse opportunities for their transition to adulthood, and eager to respond both to family expectations of social mobility and their own aspiration to overcome social marginality, may undertake high risk journeys towards Europe in their attempt to realize their expectations for a better future. A decolonial perspective on youth mobility can help to unveil the intrinsic ambivalence in the intertwining between the ideoscape of a global lifestyle projected towards marginal countries outside Europe, and the real landscape of violent border management and the unfolding of entrenched social discriminations in Europe itself. Since 2021, we have conducted qualitative research work in the field, carrying out thirty in-depth interviews and ethnographic observations of former unaccompanied migrant minors of sub-Saharan origin employed as workers in the horticultural sector in the Barcelona-Milazzo district. The ethnographic investigation is being further enriched by fieldwork carried out in Messina, which also includes young North Africans. In both research contexts, the trajectories to adulthood of unaccompanied

foreign minors and young migrants have been investigated both in the fields of education and work, including some cases of addiction, showing how the reproduction of borders impacts young migrant conditions also within the host societies.

Decolonising Intra-EU Mobility Studies? An Intersectional Analysis of Black and Minority Ethnic Italian Mobilities

Simone Varriale[1], Michela Franceschelli[2]

[1]Loughborough University, United Kingdom; [2]UCL Social Research Institute, United Kingdom

Drawing on 30 narrative interviews conducted between late 2023 and early 2024, this paper discusses the international mobilities of Black and minority ethnic Italians, particularly their experiences of 'emigration' towards the UK and, in some cases, 'return' towards Italy.

The paper presents preliminary findings about three main themes: 1) the role of the Italian 'culture of migration' in shaping participants' decision-making processes; 2) the centrality of structural and everyday racism to participants' narratives of emigration (and sometimes return); 3) how intersecting structures of race, class, gender, age and legal status shape participants' unequal experiences of mobility.

We argue that while intra-EU mobility studies remain centred on 'white' EU citizens (and on hierarchies of Eastern-Western whiteness), mere inclusion of Black and minoritised Europeans is not sufficient to 'decolonise' this field. Without additional theoretical resources, a politics of epistemic 'inclusion' risks to homogenise an otherwise diverse and unequal population. Drawing on intersectionality, this paper seeks to unravel key intersecting inequalities among 'mobile' Black and minoritised Italians, while highlighting the centrality of racism to participants' experiences.

The paper connects literature on intra-EU migration with scholarship on Black and postcolonial Europe. By focusing on a mobile population that remains invisible in both areas of debate, and by drawing on intersectional theory, it provides both an empirical and theoretical contribution to growing debates about 'unequal Europe' and mobility patterns between its cores and peripheries.

Mobility Aspirations amongst Young Chinese, Brazilian and Ukrainian Descendants in Portugal

Olga Cojocaru[1], Renata Rodrigues Carone[2], Sofia Gaspar[3]

[1]ISCTE – Instituto Universitário de Lisboa (ISCTE-IUL), Portugal; [2]ISCTE – Instituto Universitário de Lisboa (ISCTE-IUL), Portugal; [3]ISCTE – Instituto Universitário de Lisboa (ISCTE-IUL), Portugal

Future is the prerogative of youth and a vast field open to imagination and revealing aspirations. Based on in-depth interviews with youth in Portugal aged 18-35 of Chinese, Brazilian and Ukrainian descent, we examine comparatively how young people of migrant origin engage with the future in terms of (im)mobility aspirations. If their parents exercised extraordinary migration agency and a capacity to aspire to a different future, what kind of aspirations do their descendants put forward in terms of mobility or permanence/immobility in Portugal? Once having the capability and resources to move or to stay (de Haas 2021), where do they place their choices? By looking at how they frame aspirations in terms of what, where and with whom, we reflect on the contents, the projected space-time horizon as well as the relational embeddedness of the aspirations that the youth expressed. Based on their testimonies, we have distinguished three possible trajectories: a). permanency in Portugal, b). onward intra-EU mobility/remigration to a third country and c). "return" to parents' origin country. We found out that the "freedom and ability to choose where to live" is significantly impacted by distinct kinship moral regimes and the perceived degree of belonging in Portuguese society.

Examining the aspirations of migrants' descendants gives us insight into their subjective sense of belonging and their perceived capability to succeed in the current structure of opportunities, against their family migration history, social context, education and employment prospects. Not least, given that migrants' descendants in Portugal articulated visions from the present standpoint, we make the case for a time-sensitive approach to aspirations which would reflect how they evolve over time according to changing circumstances and revised life plans.

Youth Immigrant Audiences's Pessimistic Sentiments: From Communication to Social-Based Concerns

Margarida Maneta, Maria José Brites, Teresa Sofia Castro, Mariana Müller

Lusófona University, CICANT, Portugal

The study of young people and news has been dominated by a Westernized research-centred view of the youth's relation with the news and their life contexts. A crucial subject

1293

that demands more research is the context of migrant youth (Clark & Marchi, 2017; Leurs et al., 2018).

Within a financed project conducted in Portugal on young people and news, the initial review of the literature evidenced a need for a decolonisation of the Western universalistic view of media and news contexts (Treré et al., 2020) as it pointed to a distorted map of the world that places the academic literature mostly in the global north context.

For this presentation, we focused on the national and representative survey (n=1300, in 2023) that was applied under the same project and tried to address this identified gap. We relied particularly on a cohort (n=102) that covers the non-western respondents from Angola, Cape Vert, Mozambique, Brazil, Guinea, São Tomé, Bangladesh, Japan, India, Argentina, Venezuela, Colombia, Ecuador and Peru and their answers to two open questions: How do you construct the image you have of the world around you? and How do you imagine the news in the future?

Early results analysis denotes negative feelings towards the speed at which information is produced and circulates, opening the way for the increasing of manipulative, and untrusty information production as a result they claim more trustworthy news while, at the same time, they see a pathway for the news that in their own words has no salvation.

Co-production of knowledge by young Ukrainian immigrants in Finland

1294

Arseniy Svynarenko

Finnish Youth Research Society, Finland

Within the context of a broader discussion on epistemic rights and migration, this paper will examine aspects of epistemic capabilities of young Ukrainian immigrants in Finland through the prism of their communication practices and immigration narratives. These practices reflect on young immigrants' access to information and communication platforms, media culture and information literacy. Recent studies in Ukraine demonstrated that for 18-29-year-old Ukrainians the common sources of news were social media channels (for 87%) and friends/relatives (36%) - these are essentially interactive channels for production of knowledge that also tend to form echo chambers. This paper is based on focus group interviews with young Ukrainian immigrants in Finland. The discourses about trust and understanding/translation were central in the descriptions of consumption and production of information in Finland. In the multilingual environment where young immigrants live, their interaction with service providers was often mediated by translation human or machine translations. Furthermore, many young Ukrainians have recently undergone a linguistic conversion (switching from Russian to Ukrainian language in public domain). In Finland, the broad accessibility of information and translations services in Russian language adds another layer of complexity to realisation of epistemic rights of Ukrainian immigrants. Accessibility of information and ability to exchange/co-produce the knowledge in the native language is one of important factors for building the trust between the involved parties.

RS01 | Institutional Ethnography

RS01 | T05: Turns to Institutional Ethnography

Turning to IE

May-Linda Magnussen

University of Agder, Norway, Norway

I aim to write a text about my journey towards and into institutional ethnography, and about how the 'luggage' I aquired along the way, shapes how I do and write institutional ethnography today. In the mentioned journey, I will explore how ruling relations pushed me towards IE, but also how other forces – such as a desire to understand the complexity of social life – pulled me in this direction. My meeting with sociology at the university, and the role that class and gender probably played in this meeting, is central to my journey. The same goes for Norwegian sociology of family, work life and gender that I was taught and entered into, and which was an essential part of the cross-disciplinary «women research» («kvinneforskning») that grew from the 1970s and onwards. My experience from doing commissioned research and development projects about gender equality in a regional research institute will also be reflected upon, as well as my relation to research that grew out of the «women research» in Norway: Highly theoretical «gender research» on the one hand, and action-oriented «gender equality research» on the other. The text will also include my experience of working my way into institutional ethnography, and of 'sneaking' IE insights and tools into more conventional research. The last part of the text will be about how the mentioned experience shapes how I do and write IE today.

Institutional Ethnography and the recovery of Historical Materialism in sociology.

Senzio Sergio D'Agata

University of Milano-Bicocca, Italy

The theoretical potential of IE is the main reason why I became interested in it. Starting my journey as a PhD student in urban studies, I was looking for a method that allowed me to critically perform my research. Coming theoretically from a Marxist background, I was not satisfied with mainstream methodologies, either qualitative or quantitative, mainly for two reasons: firstly, it seemed to me that mainstream sociology, spanning from "pure" forms like new institutionalism to "hybrid" ones such as political ecology, could not strongly link theoretical assumptions with empirical findings in terms of critic potential; secondly, I was unsatisfied with the extreme segmentation of empirical researches in urban sociology and the inability to conceive

a project suited for going beyond the vacuous multi-level conception.

In other words, what led me to search for an approach like the IE was the following broad question: how is it possible for local processes to happen in international institutional structures? Is it possible to find structural features or processes that make visible the contradictions between the remote order and the proximity order referred to by Lefebvre?

So, I chose to use IE because it was the only approach to conceive an inquiry method coherent with historical materialistic premises present in Marxist literature and I share Smith's urge to re-found sociology. In this journey, I find difficult to communicate IE with other researchers and that is why I feel like an impostor. I strongly believe that efforts to better communicate and confront IE with other "methodologies" are needed in order to expand the european network and gain access to the legitimate realm of marxist urban research.

My Long Journey In Institutional Ethnography – Experiences And Reflections

Marjo Kuronen

University of Jyväskylä, Finland

1295

I consider myself as a feminist, sociologically oriented social work academic. I first became to know IE already 30 years ago, at the beginning of my doctoral studies at the early 1990's, in a seminar where Dorothy Smith had been invited as a speaker. I got interested in it because I was doing ethnographic research on health services for mothers. I learned that ethnography in IE means something more fundamental than just a method. That notion was a turning point in how I saw ethnographic research. Another, more substantial reason was Dorothy Smith's work (together with Allison Griffith) on mothering and schooling. More recently, I have reflected the value of IE in my own discipline, social work, especially when doing research on welfare service experiences and needs of women in vulnerable and marginalized positions in society. As I see it, IE offers a framework to analyse women's experiences and their encounters with professionals connected with a wider institutional context. Also, the way in which Smith underlines the role of texts in how the ruling relations work is important in social work where different texts have a crucial role in defining the life of service users and regulating the work of professionals. Thirdly, I find Smith's materialist and realist commitment to tell 'how things actually work' important to make research a tool to improve the service system for women. Finally, IE fits into emancipatory and empowering aims and ethical values of social work research and practice, especially those of feminist and critical social work. Primarily, IE has provided me a feminist lens and approach to study social work related issues.

AITA – The Researcher's Life Experiences And Following The Breadcrumbs

Joanne Azevedo

York University, Canada

This presentation will delve into my experience of using IE for my PhD research. My PhD research seeks to better understand the institutional mechanisms that work to maintain oppressive practices in child protection social work settings. However, this paper will delve deeper into my experience of using IE as my method of inquiry, with a look at the experience of being an 'insider' transformed into an "outsider" to the system of child protection. A looming sense of being an 'imposter' lived with me throughout my research, as I grappled with the enduring feeling of shame of having been terminated from my employment from the field of child protection. The experience of being expelled from the community I had previously loved, left me feeling discredited and uncertain. Throughout my research project I questioned my location, and I questioned my ability to provide credible research findings. As my research progressed, I found myself mired in an iterative process, cycling back to review what I saw/experienced and the disjunctures I was aware of. This process continues, even as I prepare for this presentation. Taber (2012) argues that it is impossible to separate the researcher from their life experiences, and that it is important to recognize that those life experiences inform the research in a crucial way. Ultimately, I came to accept the autoethnographic data is an important part of my research. It is through the autoethnography that themes of complicity in oppressive social relations emerge. Ultimately, I came to understand that my experiences were indeed valid data, providing insights into social relations that have not been brought forward in this way before.

RS01 | T06: Institutional Ethnography and Resistance Studies

Institutional Resistance to Activism Against Sexual Violence. The Experiences of Students, Researchers, and Professors in Montreal Universities.

Alice Farneti

Bielefeld University, Germany

What are the institutional mechanisms that prevent universities from adequately addressing the problem of sexual violence? Thanks to the efforts of the feminist movement, several organizations, including universities, have adopted policies against sexual harassment and violence. However, complaint systems are not sufficient strategies because they ignore the institutional barriers that prevent students from filing complaints. In recent years, a student-led feminist mobilization in Quebec has exposed the lack of adequate institutional responses to sexual violence in universities. As a result of this mobilization, Quebec passed a law requiring all universities to implement policies against sexual violence and educational programs for all members of the academic community. Although the introduction of the law represents a victory for the feminist movement, there is a risk that universities will reduce policies to marketing strategies by excluding activists' perspectives from the policy-making process.

My PhD research draws on Institutional Ethnography to examine how institutional resistance to addressing sexual violence operates in the organizational context of the university. I examine the experiences of activists – students, researchers and professors – involved in the mobilization against sexual violence at different universities in Montreal. In this presentation, I show that the social organization of the university is implicated in perpetuating sexual violence by delegitimizing the students' perspectives. I argue that institutional power operates through various institutional strategies that silence people who denounce power inequalities. Finally, I discuss how Institutional Ethnography can benefit from the contribution of phenomenological approaches to institutions.

Towards a Feminist Abolitionist Institutional Ethnography?

Órla Meadhbh Murray

Durham University, United Kingdom

This paper will reflect on Institutional Ethnography and feminist abolitionist discussions around policing and prisons, considering how abolitionist strategies and critiques

1296

disrupt reformist and apolitical impulses in some versions of Institutional Ethnography. Drawing on my PhD research and current monograph project – an Institutional Ethnography of UK university audit processes – I consider how academics' reading, writing, and performing of 'boring' bureaucratic processes can both reproduce institutional inequalities and potentially disrupt them, but that there are limits to this sort of reformist responses to institutional demands. Using abolitionist thought, I consider the carceral logics inherent in audit culture, and attempt to find abolitionist responses, alongside highlighting the direct connections between UK universities and carceral systems.

Researching Emerging Movements with Institutional Ethnography

Sarah Murru[1], Majken Jul Sørensen[2,3]

[1]KU Leuven, Belgium; [2]Østfold University College; [3]Karlstad University

We present a new research design that seeks to investigate "emerging movements" in welfare contexts by bringing together insights from Institutional Ethnography (IE) and Resistance Studies (RS). We ask, "how do individual, everyday resistance and more organised forms of collective resistance reinforce and influence each other, and what role can researchers play in this?" Within RS, the links between individual acts of everyday resistance and more collective resistance such as social movements have been identified as an important area where more research is needed. We suggest that IE might offer insights into understanding how movements emerge. In particular, we develop George Smith's specialised version of IE, Political Activist Ethnography (PAE)(Hussey, 2012; Bisaillon, 2012). PAE aims to accompany social movements in their work for social change by investigating how ruling relations work and how this information can be used to make the work of movement activists more effective (Withers, 2021). PAE is thus a sociology for social movements and for activists (Kinsman, 2006). In particular, we will present how PAE's approach of "mapping social relations of struggle" can help us understand resistance work within the context of emerging movements, when practices might differ from the usual ones we encounter in RS, further contributing to a more "fluid" understanding of resistance work as an ongoing process.

A Broaden Understanding of Referrals to the Child Welfare System

Siv Schroder

University of Agder, Norway

For children and their families at risk to get in contact with the child welfare system (CWS) there needs to be sent a referral. I have used Institutional Ethnography to explore referrals to the CWS seen from young people's standpoint. The scope of the paper is to get knowledge about young people's experiences of getting in contact with the CWS, and as a part of this also contribute to a broaden understanding of referrals. My main finding is that the young people had many experiences, both good and bad, before there were sent a report of concern to the CWS. From the young people's standpoint, these experiences were of great importance for their first meeting with the caseworker. In the contrary, the caseworkers I interviewed and the political texts I analyzed, did not emphasize how young people's earlier experiences with help-seeking could impact their meeting with the CWS. This shows a disjuncture between the youth's experiences and the employees of the CWS understandings and handling of referrals, a disjuncture that might function as an obstacle for young people to receive the help they need. These findings can be seen in relation to trust, where young people's experiences of not receiving help may cause distrust in the CWS. It is therefore important to try to develop the service in a way that incorporate young people's experiences.

1297

RS01 | T08: Institutional Ethnography and Education

"They Always Say 'It's This New Thing We Have To Do', When… It's Been There For Years!": An Institutional Ethnography of Equality, Diversity and Inclusion Work in a Norwegian University.

Gabriela Wale Soto

University of Bergen, Norway

Following equal rights and anti-discrimination legislation, higher education institutions around the world have signalled their commitment to equality, diversity, and inclusion (EDI), developing a range of policies and initiatives. In Norway, gender equality and gender balance have been high on the political agenda for decades. Concurrently, diversity and inclusion have increasingly been emphasized in higher education arenas, finding their place in central strategy documents and national programs. While a considerable body of research on EDI work comes from Anglophone-speaking countries in the Global North, little is known about the practice of EDI work in Norwegian higher education.

Drawing from Institutional Ethnography (IE), this paper offers preliminary findings from my ongoing PhD project investigating the everyday doing of EDI in a Norwegian university. Following my fieldwork, including observations of institutional events, document analysis, and semi-structured interviews with staff and students involved in EDI, I demonstrate how central strategy documents circulating in the institution enable the case study university to proclaim its proactiveness and vision of itself as an inclusive and forward-looking institution. Additionally, I reflect on how EDI workers use and learn the language circulating in the institution in order to speak to the institution in an attempt to gain legitimacy and currency.

This paper aims to foster critical discussions on IE as an approach for investigating equity work in the Norwegian context, where EDI is less centralised than other contexts and where the trust in public institutions and the welfare state shape practices and discourses around society and social transformation.

Ruling Relations and Grades as Texts: How IE Illuminates Contested Space of Grades in Higher Education

Sharon Ann Ultsch

Independent Scholar

This study begins to map the role grades (marking in international contexts) play as

regulatory text mediating ruling relations within U.S. higher education institutions.

Taking an IE approach, this study aims to illustrate how grades are "activated" as an

institutional regulatory text that constitutes the context for academic staff actions, decisions, and thinking. IE mapping helps explicate how grades discursively organize academic staff's experience consistent with a neoliberal regime of accountability. The author argues that traditional "grades" (A-F) and by extension Grade Point Average (GPA in U.S. universities), not only erases aspects of the actual labor of academic staff involved in preparing and teaching their modules but also creates a conflict of professional values for staff as they navigate institutional surveillance through assessment policy.

Conceptualized as a "regulatory text" in the IE framework, the preliminary findings in this paper illuminate how this "text" (grades) shapes faculty work tasks in higher education to

1298

shift academic staff's professional knowledge and interests (often unknowingly) to the interests of ruling relations from afar. Employing IE methodology from an academic staff's perspective, this study illuminates how grades, when conceptualized as a text, coordinate staff activities, decisions, and sequential events to accomplish the coordination and control that supports neoliberal higher education institutional interests. This article demonstrates how IE provides a way forward for those interested in "re-visioning" HE to understand how neoliberal social policies shape and infiltrate academic staff's daily experience. To transform HE and in alignment with Dorothy Smith's belief, we first need to explicate social experience if we want to change experience in HE. This study begins that process of explication from an academic staff's perspective.

School Stress And Coping-Work Among Adolescent Girls

Janne Lund

University of Agder, Norway

Performance related stress in school is a well-known and increasing challenge in the Nordic countries (Anniko et al., 2019). Moreover, it is a particular challenge concerning adolescent girls and it is related to mental health problems. Some research has connected the increase of school stress to reforms in the educational systems emphasizing testing and assessments (Högberg et al., 2021). In stress theory, coping and stress is closely related, and research often concentrate on how people cope with different types of stress.

Coping is explained as the ways we deal with different challenges and stressors. In this study I take use of the analytical concept work from Institutional Etnography (Smith, 2005) in order to expand the term coping into coping-work. The term work from IE includes what people do in their everyday life, meaning peoples intended actions or doings, both physical and mental doings. The constructed term, coping-work (Lund et al., 2023), includes the coping itself, but also the intention of the coping, and the context, or the everyday life, where the coping takes place. The study is based on 22 ethnographic interviews with 10 girls aged 14-16 about their everyday life. When using coping-work as an analytical lens, and the understanding of peoples' lives as socially organized (Smith, 2005), it is interesting to explore the issue of school-stress among girls and how the school stress can possibly be understood as a reasonable coping-work when dealing with institutional demands.

Collaborative IE Analysis

Ann Christin E. Nilsen[1], Morena Tartari[2], Órla Meadhbh Murray[3], May-Linda Magnussen[1], Janne Lund[1], Eric Kimathi[1], Senzio Sergio D'Agata[4], Kamilla Petschnig[5], Gabriela Wale Soto[6], Helle Winum[7]

[1]University of Agder, Norway; [2]Babeș-Bolyai University, Romania; [3]Durham University, UK; [4]University of Milan-Bicocca, Italy; [5]Roskilde University, Denmark; [6]University of Bergen, Norway; [7]University of Southern Denmark, Denmark

Analysis is arguably the most difficult part of any research project, including studies that use IE. Smith and others have argued that in an IE study, analysis is an integral part of the research process from the very outset. Deciding which standpoint to start the inquiry within, what problematic to pursue, which traces to follow, which texts to look for etc are all analytical questions. Hence in IE, analysis cannot be reduced to techniques. The role of the IE researcher has been compared to that of a detective: it requires us to turn every stone upside down, looking for traces at unforeseen sites, listening to the people who are involved, and keeping our presumptions at bay for a while. But whereas detectives often work in teams, researchers are often left to do their investigations alone. In this paper, we will share our experiences with collaborative analysis. At a workshop in November 2023, ten researchers with different knowledge of IE – some were PhD students and newcomers to IE and others had many years of experience with IE – met to experiment with collaborative analysis. Each of the PhD students were invited to present one or a few analytical dilemmas, followed by a prepared commentary by a more seasoned IE researcher, before we all engaged in a conversation about the dilemma addressed. The question we address in the paper is how collaborative analysis can strengthen and challenge both our projects and ourselves as researchers.

RS01 | T09: Institutional Ethnography, Front-Line Workers, and Services

Institutional Ethnography and Feminist Studies of Technoscience: the Politics of Observing Nordic Care

Riikka Homanen

Tampere University, Finland

My presentation is about doing politics in theory. Specifically, it is about how and what institutional ethnography (IE) and feminist studies of technoscience (FT) allow us to observe. I ask how one might conduct studies that explore normativity, not only in the researcher-author-subject relationship but also in the subject matter. What kinds of (observed) realities might be viewed as politically acceptable? I tackle these questions by combining IE with FT in an effort to discuss how the support provided by public Nordic maternity healthcare can be viewed as both controlling and enabling motherhood. I show that combining IE with certain insights from FT offers a better grasp on why the subject of care, in the context of Nordic care services, cannot and ought not to be reduced to a disciplined product of idealised governmentality. The politics inherent in IE and FT are widely applied by researchers studying institutions, science, technology and/or medicine. Drawing on ethnographic material from maternity healthcare clinics in Finland, this paper demonstrates how IE and FT can be combined in a hybrid text in which the theoretical repertoires coexist, although not (always) simultaneously. I conceptualise IE and FT as two modes of ordering in the form of theoretical repertoires that relate to each other but cannot, and need not, be synthesised or conflated if one wishes to apply them both. In my analyses there are simultaneous narratives from both orderings that are ultimately coordinated: they hang together, but not as one. As I show, irreducible differences in ontological commitments boil down to the (in)coherence of institutional agency and power: the political orders observed, and the alternatives arrived at, are different in nature.

The Social Organisation Of Integration In Norwegian ECEC Centres – Refugee Parents' Perspectives

Eric Kimathi, Ann Christin Eklund Nilsen

University of Agder, Norway

This conference paper reports on the findings of an institutional ethnographic study on the social organisation of integration work in Norwegian ECEC centers conducted between October 2019 and October 2021. By taking the standpoint of 15 refugee parents, we explore how different refugees relate to welfare state civic requirements for integration in ECEC centers. We explicate why it is easier for some refugees to conform to the civic integration ideals as they search for a 'smoother' integration process, while other refugees struggle to find a balance between the integration ideals/requirements and their cultural ideals. Informed by institutional ethnography, the analysis is focused on mapping the accounts of parents to trace how their experiences are hooked into trans-local and ruling relations, and how these relations influence the experiences of the refugee parents. The focus will be on the link between the local experiences and the connection with the institutional complex that shape those experiences, thus, revealing how the integration experiences of refugee parents are socially organised.

Institutional Ethnography, an Opportunity for Activist Social Work

Ann-Torill Tørrisplass, Guro Wisth Øydgard, Janne Iren Paulsen Breimo

Nord Univeristy, Norway

Social work is both a profession and an academic discipline. In this tension between social work as a profession and social work as an academic discipline, there is an ongoing debate regarding what is considered social works strength, but also how social work should move forward as a research discipline, as some critics claim that social work does not have its own theoretical foundation (Brottveit, 2008). Research on social work are used in social work education, and it is vital that it is grounded in peoples everyday experiences. It is also important that the core of social work, not only focus on social work as a profession, aiding marginalized people in their everyday struggles, but strengthen its ambition to also entail political activist endeavors. It is our claim that these endeavors are entangled, and that a promotion of social works activism, through the methodology of IE, can be a fruitful answer to both the debate on what is considered the strength of social work as well as its theoretical basis.

The social is the very core of institutional ethnography (Smith, 2005) and forms both the starting point for the study as well as the topic. Often, institutional ethnographies will provide descriptive, thorough descriptions of how fault lines and problematics arise, and these descriptions in turn form the basis for empirical claims that can be used as a basis for promoting change. This is the promise and the ambition that comes with using IE in our research, and in this paper we discuss how this can represent an opportunity for promoting activist social work research.

RS02 | T01: Celebration in Changing Social Context

"My best friend is 23!": A Study of Birthday Celebration on WeChat as a Ritual Performance among Middle-Class Chinese Youth

Kunchi Wu

London School of Economics and Political Science, United Kingdom

With the growing importance of social media in our daily lives, almost all aspects of our lives are digitalized. However, an important but underrated type of activity has not been given enough attention: the social rituals in our everyday lives. It is not new to study ritual in the context of digitalization. However, birthday celebration, as a notable ritual in people's social interaction and marking point of life course, has not been studied thoroughly in a digital context while digital birthday celebrations are increasingly viewed by internet users, as an essential aspect of social interactions, and in some cases, even more influential than offline rituals. Therefore, this study aims to explore how social media platforms, as mediums of ritualistic performance, shape the fundamental meaning of birthday rituals and how this transformation influences people's attitudes towards birthdays as a ritual.

This research applies Victor Turner's theory of rituals, examining birthday celebrations on social media among middle-class Chinese youth as performative acts loaded with meaning and societal impact. It explores how these digital rituals mirror participants' mindsets and respond to social conflicts in a digitalized society. Drawing from Turner's concepts of social drama and communitas, the study investigates how these online birthday rituals foster community and equality, addressing societal tensions. Additionally, incorporating Bourdieu's theory, the study probes the role of cultural capital in these interactions, analyzing how youths use social media to display and accrue cultural capital, impacting their social standing.

Collecting data by conducting interviews and participant observation, this study takes critical discourse analysis (CDA) as the primary analytical perspective, dissecting the understanding of the underlying meaning systems behind the expressed content behind digital birthday celebrations.

Resilience and Ritualization: A qualitative exploration of the celebration of Romanian Orthodox Easter during the first Covid-19 Lockdown.

Ozana Cucu-Oancea

Institute of Sociology – Romanian Academy, Romania

As a researcher dedicated to the sociology of celebration, the Covid-19 pandemic provided me with a valuable opportunity to observe how people experience celebration in times of crisis. Simultaneously, it offered me the chance to assess the power of ritualization in everyday life. Hence, in April 2020 I conducted a study that aimed to explore how Romanians perceived and engaged in the celebration of Easter during the first Covid-19 lockdown.

The data analysis considered the premises of Knottnerus' Structural Ritualization Theory (SRT) regarding deritualization and reritualization associated with disruptive social and personal life events. According to SRT, the disruption of ritualized symbolic practices (RSP) due to natural disasters, such as the Covid-19 pandemic, is believed to have negative repercussions on individuals' social and affective lives. This impact is implicitly reflected in Easter mood and Easter satisfaction, which are central indicators in this study. On the other hand, the recreation of ritual practices is seen as a resilience factor, alleviating psychological and social stress and contributing to the restoration of socio-emotional stability. Therefore, it plays a crucial role in the recovery of individuals subjected to disruptive events. This study confirms the SRT thesis that (re-)ritualization is an important resilience factor in times of crisis triggered by events that lead to disruption of the daily lives of individuals/communities.

Data were collected using the solicited diary method, involving a purposive sample of 73 participants aged 16-80 years, from various areas of Romania.

The Impact Of The Pandemic On The Celebration Culture Of Students At The University Of Turku

Marianne Silvan-Lempinen

University of Turku, Finland

To learn about the effects of the pandemic on the social relations of young adults we studied the celebration culture of Turku University students and how it changed during and after the pandemic. By a survey, we wanted to find out how the student life differed from the expectations for the freshmen and in what direction the celebration culture might change. Did old traditions return, did new models emerge?

The survey data was collected from March 2022 to the third episode of the corona epidemic. A stratified sample of altogether 2000 students representing all faculties was emailed

1301

the request to participate the research. The response rate was around 30 per cent.

The survey answers showed clearly that the pandemic affected the creation and maintenance of social networks for all students. The freshmen could not integrate with the older students. Meetings and events moved online or in small groups. Large student events were prohibited. This affected everyone's quality of life and celebration. However, celebration culture continued despite the pandemic.

Alcohol use and its purpose changed shape during the pandemic only partially returning to its former state, after the lifting of the imposed restrictions. Traditional ways of celebrating were joined by new, more diverse ways of spending time together. The events have partly moved to outdoor events. Alcohol-free game nights have also become more frequent. Some of the changes seem to have been temporary, while others may have become more permanent.

Transforming Beauty: Relevance, Role Models, and Representation in the Rose of Tralee Pageant

Rebecca Finkel

Queen Margaret University, United Kingdom

There is insight to be gained by examining the way a society celebrates (Finkel et al., 2018; Dashper & Finkel, 2020; Barriere & Finkel, 2020). Celebrations of all types show off the values of a community and what and whom is considered important as well as marginal. Drawing on the work of Goffman (1967) with regard to social rituals and Bourdieu (1986) with regard to status and social capital, this research focuses on an understudied type of special event, beauty pageants, and more specifically on the case study of the Rose of Tralee Pageant in Ireland. This pageant has been selected for investigation because it has been on a journey to reflect and respond more relevantly to contemporary societal norms. Tensions surrounding beauty pageants are not new; these events have faced criticism for decades for being sexist, oppressive, and reinforcing heteronormative performative femininity (King-O'Riain, 2007). However, perhaps due to representations in movies such as Miss Congeniality and shows such as Dumplin', beauty pageants have more recently been reframed in a more positive, empowering light with a focus on community service and personal accomplishments (Magee, 2021). The Rose of Tralee Pageant seeks to be the latter type of event, with an emphasis on pageant participants as role models and national ambassadors. Qualitative methods include visual ethnography, in-depth interviews, and observation of live and televised pageants. The location of the festival in Ireland, which has seen many social transformations in the past decade, provides a compelling landscape for considering what these events can tell us about collectively accepted attitudes of how women are viewed and valued.

RS02 | T08: Institutional and Societal Perspectives on Celebration

Who Is Interested in the Etatisation of the Latvian Song and Dance Festival?

Jānis Daugavietis

Institute of Literature, Folklore and Art – University of Latvia, Latvia

The study "Etatisation of the Latvian Song Festival" (Daugavietis 2024 [accepted manuscript]) preliminarily points out that these festivals are most etatised right now, under the democratic regime and mixed-market economy in Latvia. This is in line with Szymon Chodak's theory of the etatised state, in which he argues that in contemporary Western post-capitalist countries, citizens increasingly delegate duties and responsibilities to the state until society becomes a social structure highly controlled and regulated by the state (1989). The Latvian Song Festival is a good illustration of this etatisation. Etatisation has not stopped with the collapse of the totalitarian state, the USSR. In fact, by abandoning only the 'principle of forced voluntary participation' in the festival process, and in amateur art in general, and ideologically revising the content, new spheres of state intervention are found. Chodak writes that etatisation is supported by certain interest groups, such as the new elites and the salariat. There is a certain consensus in the Song Festival scholarship about its sustainability – the Latvian cultural elite of various scales has never lost interest in it (Klotiņš 2003, Kruks 2018). By analysing press materials (interviews, opinion columns, news stories), public documents of organisations involved in the Song Festival process and other sources, I will try to understand who these particular interest groups are, where their interests lie and how they get their way.

At the Crossroad of Sacred and Public Spaces. Emile Durkheim and Hannah Arendt on Appearing and Disappearing During Illegal Raves

Mart Willekens

Ghent University, Belgium

On Friday, April 28, 2023, a number of young people entered a warehouse in the military domain of Brustem (Flanders). In a short time span, they transformed the location into a massive rave party, attracting a crowd ranging from 5,000 to 10,000 participants. To comprehend the theoretical significance of this event, insights from Hannah Arendt's political theory on public spaces and Emile Durkheim's social theory on sacred rituals can be used to develop a more comprehensive understanding of what occurs during these

events. Claiming a local space to form a temporary community has a foundational element that Arendt deems crucial for the formation of a public space where people can appear and speak as free political actors. However, most people who go to illegal raves show little interest in making a public appearance or speak as political actors. Instead, they tend to emphasize the act of 'disappearing' while listening and dancing to the music. In other words, they seem to form an interaction ritual in the Durkheimian sense, rather than a political community as envisioned by Arendt. Nevertheless, there is an element of civil disobedience that introduces a political dimension and the foundational aspect may be easily overlooked when these events are strictly interpreted as interaction rituals. This paper explores how the concepts of appearing and disappearing can serve as a bridge between two very different authors. This exploration offers a promising avenue for studying the nature of both legal and illegal celebrations.

Recent Past, Memory Building and Social Transformation in Post-Socialist Rural Romania: Caşin Commune Celebrations (Bacău County)

Angelica Helena Marinescu

Institute of Sociology, Romanian Academy, Romania

The research investigates the new local festivities in the commune of Caşin, Bacău county, Romania, in the post-socialist period, aiming to illuminate hidden, forgotten narratives of a recent traumatic past, in order to envisage perspectives for social transformation and sustainable society, relevant in the context of contemporary social dynamics (internal and external migration, etc.). In a constructivist perspective, memory is built up by the cultural practices of the individuals, a legitimation of the personal memories (souvenirs) and the implication on the community identity construction, having a performative dimension, as rituals and ceremonies (Jasinski, 2001, Inglis, 2005). In the aftermath of the 1990's, as in other local communities of the Romanian rural areas, the Caşin commune residents, with the support of the authorities, revived a local fair (Târgul de Sântămăria) and put in place a festival, the "Caşin Commune Celebrations", taking place yearly on the 15th of August, a major religious celebration in rural Romania. The celebrations stage the memory of the recent past (a horse-driven tilt carts parade, "traditional" way of making a living, turned clandestine during the communist regime), as well as local ethno-mythological strata, built upon the symbolical past of the village. The methodology consists of participative observation, interviews with authorities regarding the history of the village and the new festive ceremonies, as well as with residents (nine interviews), and visual documentation. Beyond "invented tradition" (Hobsbawm, 1983), the festivities are rather a way of negotiating the past (Vultur, 2011), social and cultural memory revival (Halbwachs, 1950, Nora, 1986, P. Ehrenhaus, 2008), contributing at building community's identity, intergenerational dialogue, cultural empathy, local pride and self-esteem, and future social change.

State of the Art of the Sociological Study of Celebration. From Elementary Forms to Formative Elements and Back?

Ismo Juhani Kantola

University of Turku, Finland

In his masterwork on elementary forms of religious life Emil Durkheim argued that religion, and rituality in general, are society's expression of itself. The recent twenty years of sociological study of celebration has kind of changed the focus from elementary forms to formative elements. How do new forms of having a good time together emerge, can we single out their vital elements?

The project has distanced itself from the functionalist as well as class conflict explanations of culture. Although celebration is conditioned by material assets and physical forces at the same time it is reducible neither to them nor their laws.

The presentation re-elaborates the question about the interrelations of society and celebration. In the light of the research presented and discussed in previous meetings of the Research Stream, would it make sense to crystallize celebration simply as an ideal of society?

We have focused on the crucial elements of a good party, feast, and festival. We have learned that gratification in celebration is not only the outcome of a successful obedience of emerging constellations but of timely investments and hard work as well. Can we now take the next step and maintain that everyday toil, drudgery and hard work – accomplished by individuals as well as organized collectivities – is there only to ensure celebration – consciously or unconsciously?

The paper will elaborate these questions by making use of theoretical advancements in the field of cultural studies (Raymond Williams; Antoine Hennion etc.) as well as the research presented in the Stream.

RS03 | Interpretative Interactionism: sociology of Interactions and Meaning

RS03 | T02: Interpretive Interactionism 1: Introduction and Theoretical Contributions

The Obstructive Activity of Experience. A Phenomenological Approach to Aspiring in Contexts of Adversity

Evelyne Baillergeau

University of Amsterdam, Netherlands, The

This presentation questions aspiring, hence the process though which people frame the desirable representations of the future that inspire the things they do. While aspiring for change is key for populations living in adversity, aspiring for change is far from self-evident, as suggested by the idea of adaptive preferences (Elster, 1983; Sen, 2002): individuals tend to adjust their 'wants' to adverse circumstances, leading them not to project themselves in favourable living conditions. However, some people living in adversity do aspire for change. So why is that? Building on a discussion of the works of Alfred Schutz (1951 & 1953) on projecting and those of Pierre Bourdieu (1977) on habitus, I posit aspiring as an essential but distinctive attitude towards the unknown to come that is affected by social and cultural processes and I propose lines along which to appreciate lived experiences as the locus where power-suffused social relationships (operating at different levels) concur to condition aspiring work in various ways. Therefore I use illustrations from the case of how Dutch vocational school students project themselves as prospective citizens.

Time, Potentiality, and Interaction Ritual Theory

Iddo Tavory, Nicholas Hoynes

New York University, United States of America

The notion of "Interaction Ritual" is one of the most cited, but least developed, contributions of micro-sociological theory. This paper first clarifies what interaction rituals are. As we argue, while Goffman's interaction ritual theory was incredibly fertile in outlining a sacred dimension of self and interaction, it has been boxed into an overly delimited situational context. We thus outline three approaches that transcend such a delimited situation: (a) Collins' Interaction Ritual Chains framework, which substitutes Goffman's approach to the sacred with a focus on micro-macro mechanisms; (b) a literature that pushes interaction ritual theory in time by focusing on their unexpected intersituational consequences, and; (c) the intersituational aspect of interaction ritual, which focuses on the way actors evoke potentiality. Last, we argue that clarifying these approaches provides sociologists with both a more precise way to understand interaction, as well as a way to approach the social distribution of interaction rituals.

The Communicative Forms of Violence

Rene Tuma

TU Berlin, Germany

The theoretical and methodological approach of communicative genre analysis and the social theoretical framework of communicative constructivism offer a sociological-interpretive understanding of concrete interaction sequences. This approach is therefore particularly relevant to the analysis of situational violence. My paper discusses the extent to which this perspective makes it possible to address problems of situational centrism in current microsociological research on violence without losing touch with concrete forms of interaction. The analysis of communicative genres and forms makes it possible to consider both the institutionalisation and the situational openness of violent sequences. It helps to understand how actors themselves produce, negotiate and institutionalise violence communicatively, and what resources they use in the process. Two aspects are relevant: first, the specific knowledge of what constitutes an adequate and therefore legitimate form of violence in a specific context, and related to this, the ambiguities and meta-conflicts about where the boundaries of violence lie, are a central point of reference for the analysis. The article begins with a discussion of the concept of violence, then presents examples of the levels of analysis of street fights, before concluding with a discussion of the potential of such a communicative, genre-analytical research programme for the study of violence.

1304

RS03 | T04: Interpretive Interactionism 2: Inequalities

The Making and Un-Making of (Global) Racial Identities: The Case People of African descent

Nicole Sommer

Bielefeld University, Germany

This paper explores the complex process of constructing categorical belonging of individuals, specifically examining the interactional dynamics that contribute to the formation of the category "People of African Descent" (PAD). The term, which originated at the UN's Third World Conference Against Racism in 2001, encompasses individuals in the African diaspora, primarily descendants of victims of the transatlantic slave trade. The study challenges the notion of pre-existing collective identities, arguing that the categorization of People of African Descent is the result of multiple knowledge processes.

From an interactionist perspective, I propose that the creation of categorical belonging is not an objectively given entity, but rather emerges through multiple practices of knowledge, including ongoing social interactions. A key focus is on categorical belonging to racial identities, and thus to the category of people of African descent, which is continually shaped through face-to-face interactions. Importantly, I argue that even in global contexts such as UN conferences, physical co-presence remains a significant factor in the delineation of categorical boundaries.

This paper draws on ethnographic observations conducted at UN conferences in Geneva and New York that provide insights into the interactional mechanisms that contribute to the construction of categorical belonging. By highlighting the role of face-to-face interactions in shaping People of African descent identity, this paper aims to advance our understanding of the socio-political implications surrounding the categorization and inclusion of People of African Descent in international forums.

Marriages of Convenience and the Temporal Politics of Migration Control – An Interpretative Interactionist Approach

Steph Marie Hanlon

University College Dublin and Carlow College, Ireland

Despite the criminalising and punitive discourses associated with unwanted marriage migration, and the use of crime control strategies to prevent such marriages from occurring, 'marriages of convenience' are not a criminal offense in Ireland. While An Garda Síochána (the Irish Police) are unable to prosecute people over marriages alone, this has

been navigated by granting extensive discretionary power to civil registrars and immigration authorities to identify and report 'suspicious' couples. This paper addresses the sites of contestation and resistance from the perspective of civil registrars at the street level of migration governance. This is achieved by taking a multi actor asessment to how anticipatory logics are created, interpreted and acted upon, and conceptualises interpretation in terms of the spaces and times where intersections of anticipatory actions, discretionary implementations and ambiguous policy become manifest.

The paper proposes a tentative analytical framework that combines anticipation (Anderson, 2010), goal ambiguity (Bastien, 2009) and pre-crime (McCulloch and Wilson, 2016). The paper presents a mixed-methods qualitative research design. It traces the theoretical and empirical debates in the literature, making the case for an interpretive research approach. Lastly, it illustrates the value of examining pre-emptive criminalisation from an interpretive interactionist perspective and highlights how the interpretive process can inform research on the temporal politics of migration governance and the (re)making of citizenship.

Social Class In The Psychotherapeutic Treatment Of Work-related Suffering

Alexander Herold

University of Education, Freiburg, Germany

I will present the first conclusions from my PhD Project, in which I study the role and salience of social class in psychotherapy from the professional's perspective. In social epidemiology literature, class is repeatedly identified as a central factor in the distribution of mental illnesses and diagnoses – but is often overlooked in research on psychotherapy itself. However, Joanna Ryan (2018), for example, describes class as "silent but omnipresent" in therapy, because it plays a decisive role in structuring working relationships. Additionally, as works by Eva Illouz (2020) and others show, the therapeutic culture itself produces new forms of social inequality.

In this work, I reconstruct how practitioners use class-related frames to interpret the stories of their patients. In doing so, the analysis faces the challenge of reconstructing the meaning of class as a mostly implicit social phenomenon in the interactions and micropolitical negotiations.

I address this question using ethnographic research in several psychosomatic clinics and with the help of individual and group interviews with doctors, therapists, nurses, social workers, and complementary therapists. On the one hand, I reconstruct the significance of different orientations towards work and career in the course of treatment and, on the other hand, how emotionally and socially competent patients are distinguished from incompetent patients. The research was conducted as part of the project "Psychotherapeutic Treatment of Work-Related Suffering in Germany" at the University of Education Freiburg and the Institute for Social Research Frankfurt am Main.

Ryan, Joanna (2018), Class and Psychoanalysis: Landscapes of Inequality, New York, NY: Routledge.

Illouz, Eva (2008), Saving the Modern Soul: Therapy, Emotions, and the Culture of Self-help, Berkeley: University of California Press.

Navigating Power Dynamics in Healthcare: Informal Exchanges as a Counterbalance to Medical Authoritarianism in Post-Socialist Romania

Andreea Cristine Palaga

Babeş-Bolyai University, Romania

In post-socialist Romania, the healthcare system is characterized by a deeply entrenched medical authoritarianism and structural violence. This paper, through an interpretative interactionist lens, explores how informal exchanges within this system act as a strategic response to and a counterbalance against medical dominance, while providing an anthropological analysis of the nuanced interplay between healthcare professionals and patients.

The present study focuses on the function of informal exchanges as more than mere economic transactions; medical informality emerges as a vital interactional tool, enabling patients to navigate the rigid hierarchy of medical practice and all the system's neuralgic points. Gift-based informal practices facilitate a form of agency for patients, allowing them to negotiate care and personalize the clinical encounter. The research adopts a qualitative methodology, utilizing in-depth interviews and observational techniques to uncover the rich, complex motivations driving these informal interactions.

Significantly, this paper uncovers how these exchanges are not random acts of corruption or desperation but are deeply rooted in the cultural and historical fabric of Romanian society. They represent a form of resistance and adaptation to the structural violence inherent to the medical system, showcasing the patients' resilience and ingenuity in the face of institutional power imbalances.

In conclusion, the study offers a critical perspective on the socio-anthropology of interactions and meaning in healthcare settings. It highlights how informal exchanges function as a grassroots strategy to humanize and democratize medical encounters, challenging the traditional authoritarian medical model. This research not only contributes to our understanding of medical informality but also illuminates the broader socio-cultural dynamics at play in post-socialist healthcare environments.

RS03 | T07: Interpretive Interactionism 3: Body and Experience

Disembodied Expertise and Embodied Practice – the Boundaries of AI-enhanced Expertise in Rock climbing

Ilkka Arminen, Otto Segersven

University of Helsinki, Finland

We are interested in exploring the limits of the incorporation of artificial intelligence into human practices. Two professional climbers have set to test AI in climbing and asked AI to set crack Boulder suitable for elite level climber in a youtube video Will Ai Destroy Rock Climbing? In the video, the professional climber prompts AI to advice how to construct an elite level crack boulder challenge with 10 movements. The climber's reactions, both verbal and gestural, to AI suggestions are then available in the video. Finally, the climber does the climbing of the challenge with the help of AI coaching the movements. Rock climbing is an extreme case of an embodied task, and in that way our example demonstrates the challenge of embodiment to the disembodied artificial intelligence. Notably, human-LLM interaction is embedded into human interactional competencies with the help of which 'intelligence' is ascribed to a machine. In embodied practice, the disembodied advice from AI is enriched with human embodied vision. We will apply ethnomethodologically inspired video analysis to specify and detail the sense-making practices in the video, in which the human-AI interaction is presented to the overhearing and seeing audience. For a discussion, we will aim at disclosing the emerging sensibilities that appear in the world where human practices are augmented with disembodied expertise, whose scope of knowledge is almost infinite, but which lacks embodied sensibility.

1306

Overcoming the Overwhelming. Three Accounts of the Bodily-emotional Experiences of Street Violence.

Floris Mosselman, Don Weenink

Universiteit van Amsterdam, The Netherlands

Prevailing social-scientific and phenomenological explanations of street violence tend to see it as an outpouring of overwhelming and uncontrollable emotions. In stark contrast, criminology's influential notion of the "code of the street" posits that young men intentionally and strategically perform aggressive responsiveness. Grounded in ethnographic research among youths in the Netherlands, we

report on three different accounts of the bodily-emotional experiences of interpersonal conflict and violence. In the first account, intense emotions narrow sensory perception, cloud mental acuity, and lead to a loss of control. However, youths also claimed they can hide and change their fear into a readiness to fight through body work and mental preparation; they also reported being able to read their opponents' bodies to infer their emotional states. Finally, youths who had the most experience with interpersonal conflict and violence emphasized their situational awareness to assess the risks and seize the opportunities that emerge in the dynamic constellation of a fight. Our findings bridge apparently contradictory ideas about the role emotions play in violence and alert us to useful insights on body/emotion work from the sociology of emotions to study interpersonal conflict and violence.

Tango Your Age Away. How Interaction in Tango Aesthetics is Associated with Experiences of Agelessness

Andreas Henriksson, Satu Heikkinen

Karlstad University, Sweden

People practice tango as an everyday aesthetic pursuit and some tango practitioners talk of tango aesthetics as transcending age. Tango aesthetics refer to all aesthetical qualities in tango culture, including body movements, music, clothing, milieus, and language. Transcendence is a quality ascribed to (and sometimes understood to define) aesthetic experience by individuals and groups. Everyday aesthetics is a research field about beauty embedded in everyday life. In this presentation we seek to show how transcendent qualities are bound up with interaction in and around the dance. We interview 10 tango practitioners in Sweden that are at least 65 years old, to examine how dis/connected beauty from and to age in various ways. We argue that while structural factors, such as middle-class habitus and classed notions of transcendent aesthetic, are important, local interaction, both around and within the dancing pair, is central to when and how age is experienced in tango aesthetics. These findings link interactionist research to the thorny issue of aesthetics as a transcendent experience.

Making Meaning Through The Body: Understanding The Yoga Experience Through Embodiment, Interaction And Culture

Sophia Martina Pallaro

Dublin City University, Ireland

The experience of yoga practitioners is often described with reference to their body and emotions. Through a sustained engagement with yoga, practitioners develop an enhanced embodied awareness and, over time, this can lead to a spontaneous and sustained openness to one's embodied, emotional and relational dispositions: an embodied self-reflexivity. However, this process is assisted by a dialogical form of self-reflexivity which takes place through an internal dialogue, and whereby the experience is interpreted not only in relation to embodiment and the yoga setting, but also in the context of social interactions in a variety of social networks, and through cultural understandings available in the wider cultural landscape.

This paper analyses the experience of yoga practitioners in contemporary Ireland. It adopts a phenomenological-symbolic interactionist theoretical approach. Phenomenology, and in particular Merleau-Ponty's concept of being a body brings focus on the embodied dimension of yoga practitioners' experience. Symbolic interactionism, and especially Mead and Goffman's theories, locate the experience within networks of social interaction and of cultural frameworks. Through a narrative methodology, this paper explores the accounts elaborated by yoga practitioners and analyses the meaning-making process they engage in.

In this paper I will show how, in the act of interpreting one's embodied experience, the intimacy of such a personal dimension meets the public realm of cultural frameworks and social interactions. Yoga practitioners' interpretation of their experience is elaborated in and emerges from their embodiment, the yoga setting, their networks of social interactions, and the diverse cultural knowledges and understandings available to them.

RS03 | T08: Interpretive Interactionism 4: Professional and Institutional Interaction

Interaction on digital platform – Case higher education

Saila Maria Piippola

Luleå University of Technology, Sweden

In this article, the impact of digitization on interaction during the pandemic is analyzed when teaching in higher education has switched to the digital online platform zoom. Changes in society that during the covid-19 pandemic create breakthrough times and good opportunities to study fundamental change processes in society. One such change became prominent when we moved to zoom. We are sometimes expected to be able to control and control our emotions, so even in our work environment, teachers, and students. These reflections and learnings are based on teachers' observations from several different university courses during 2020-2022. These findings have also been discussed after the pandemic at seminars about visible and un visible borders how we create our everyday life. The analysis is interpreted based on the sociologist Erving Goffman's dramaturgical approach with particular focus on the anterior and posterior regions. Zoom constitutes the social context in which the social interaction is expected to take place. The article makes visible how the digital tool zoom can be understood as the front and back region in contrast to traditional classroom teaching. The interaction between people in higher education constitutes everyone at the same time both audience and actor in that we direct our own performance to maintain a certain self-image, which also presupposes honesty in one's own performance. Neither society nor the school has any objective structure, but it is an interaction between actors who meet in different social situations. In higher education, digitization creates great opportunities but also challenges.

Exploring A Binational Negotiated Culture Through The Lens Of Alfred Schütz: The Case Of A French-Italian Organisation

Zenia Simonella, Simone Pulcher, Lia Tirabeni

University of Milano-Bicocca, Italy

Through the lens of the social phenomenology of Alfred Schütz, and in particular in light of The Stranger (1944), this contribution investigates the cognitive process through which knowledge is questioned, adjusted and reworked in a French-Italian company responsible for the construction of the Lyon-Turin railway line. Data were collected through fifty semi-structured interviews with top and middle managers and by means of ethnographic notes accumulated in the course of six meetings. Adopting an interpretivist perspective, the analysis shows that, at the individual level, employees found the binational context challenging and potentially conflictual during interactions. Two postures were identified, and they were labelled 'reflexive' and 'resistant' according to how employees were willing to make sense, learn and adjust their implicit knowledge deriving from their national culture. At the organisational level, after analysing the construction of four binational artefacts (a glossary, a geographical information system, a call for tender, a planning document), two types of such artefacts were identified and labelled as 'shared' or 'contested', being interpreted as the outcome respectively of a cooperative experience and a conflictual one. Even if their nature was different, all the artefacts were embedded in what we have called, following Schütz, the 'organisational stock of knowledge', this being considered the material assets of the 'negotiated binational culture' of the studied company. We propose a framework which highlights our theoretical contribution connecting individual and organisational levels, finally discussing similarities and differences with respect to Schütz's analysis.

"'Does That Work For You?' A Post-Recruitment Practice

Esther González-Martínez

University of Fribourg, Switzerland

This paper is based on conversation analysis of a corpus of audio-recorded telephone calls between members of hospital personnel in the French-speaking part of Switzerland. The calls focus on recruiting a colleague: the caller secures the involvement – assistance, cooperation, or contribution – of the called person in the realization of a course of action. The paper examines a form of post-expansion of the base sequence achieving recruitment. Following their acceptance of the initial recruiting move, the recruitee checks the suitability of their response. They open the sequence with a minimal utterance such as "okay?," "all right?," or "does it work for you?" to which the recipient responds affirmatively with utterances such as "okay," "all right,", or "yes that works." The initial utterance voices the recruitee's concern over the recruiter's agreement with their response to the recruiting move. The sequence balances agency between speakers. The recruitee, who has been mobilized by a colleague to do something, displays that they are themselves setting the terms for the future action as well as showing their awareness that this action is nevertheless contingent on the recruiter's own agreement. At the same time, the initial utterance has a strong preference design towards a yes response and functions as a first step towards closing the call. The analysis examines ordinary practices through which interlocutors move coordination work forward and show concern over their partners' support of their moves. It contributes to the study of post-recruitment practices, a subject that has not yet been explored in conversation analytic research.

1308

Role Performances in Mediated Encounters: Social Workers' and Vulnerable Clients' Welfare Encounters Via Phone

Alexandrina Schmidt

Copenhagen Business School, Denmark

Welfare encounters are increasingly conducted using communicative devices comprising mediated encounters. This article contributes to research investigating the integration of mediated encounters into social work practice. The study takes a symbolic interactionist perspective and is based on interviews with 24 social workers and 17 vulnerable clients. It examines the role of phone mediation in social workers' and clients' role performances in mediated welfare encounters that lack non-verbal communication. Using Goffman's concept of retrospective fatefulness, the study discusses the stakes of welfare encounters for social workers and clients: While a professional work role and organisational goal attainment are at stake for social workers, vulnerable clients' livelihood depends on the welfare encounter and the social and economic support such encounters provide. The study argues that phone mediation visualises these unequal stakes, often taken for granted in routine face-to-face welfare encounters, and alerts the participants to the uncertainty welfare encounters hold. The study also finds that mediated encounters may provide a confidential distance, which can be used to support hard-to-reach clients and social work practice. However, mediated encounters can also risk being insignificant for clients' trajectories and restricting social workers' and clients' roles. Overall, the study highlights everyday technologies, such as a phone, that hold importance for welfare delivery, service, and clients' welfare trajectories. It argues for including everyday technologies in future research agendas that examine the digitalisation of social work and further investigating the importance of (the absence of) non-verbal communication in mediated interactions.

Making Sense of Organizational Failure: Interactional Work on Delineating Prosecutor´s Accountability and Responsibility

Jana Strussova, Jana Lindbloom

Institute for Sociology, Slovak Academy of Sciences, Slovak Republic

In a period of intense institutional crisis, for example, when a serious organizational failure occurs, not only the public but also the involved participants try to make sense of what actually happened. In 2020, in Slovakia, the first public inquiries of the candidates for the highest position of prosecution were held. This new procedure, incorporated into the election process, resulted from corruption scandals of high-ranking officials at the Prosecutor's Office. These inquiries have served as interactional settings in which both the institutionalized logic and the lived organizational practice were publicly contested and scrutinized. The pressure to conceive of the hearings as arenas for accountability produced complex and situationally tailored accounts of bounded responsibility for purported organizational failure. This paper draws on the official recordings and offers an analysis of the public inquiries as phenomena in which organization-related experiences, accounts and explanations emerge as a product of situated sensemaking and interactional practices. Both aspects of this empirical material, that is organization-related data and interview-performance aspects, have been examined from the interpretative, sensemaking, processual, and ethnomethodological perspective. The paper focuses on the ways the participants themselves handle and manage public accountability, interrogation, and responsibility attributions. The aim is to highlight the strategies which the candidates apply in order to both signal and document their professional conduct as well as to steer the imposition of new criteria by which the committee members aim to evaluate prosecutors´ careers.

Observing the Inter-body Dynamics of Interaction. The Contributions of Pragmatism and Ethnomethodology

Fabienne Malbois, Benjamin Tremblay, Alexandre Lambelet

Haute école de travail social et de la santé Lausanne (HETSL, HES-SO), Switzerland

In long-term facilities that care for older people suffering from dementia, the ethnographer's bodily and emotional engagement is a sine qua non for any hope of interpreting what goes on in care practices. Dementia affects the ability to act and communicate: memory problems are accompanied by changes in language (aphasia), recognition (agnosia) and gestures (apraxia). Hence, the « order of interaction » (Goffman, 1983) between residents and professionals has little to do with the world of everyday life and resembles an « open-ended and unpredictable adventure » (Kitwood, 1993). More precisely, with regard to illness-related disorders, the professionals'ethnomethods that enable contact with residents are marked by the prevalence of inter-body relations and the performativity of the senses. So the ethnographer can only observe them in the first person, as a « sensing subject » (Straus, 2000). But how can we move on from the regime of lived experience to the register of objective reporting to others (including in writing), which implies a disengaged third-person position? In other words, how is it possible give an account in discourse, in a position that privileges the third person, of the observation of the sensuous and emotional dimensions of such interactions, that are « experienced, expressed and fundamentally given in the first person » (Genard, 2020b)? Drawing on the contributions of pragmatism and ethnomethodology, our paper will look at the operations that make it possible to carry out a rigorous ethnography of what happens when the study of interactions requires a first-person position.

Creating 'Windows Of Opportunity': How Police Officers Sense And Generate Momentum For Gaining Control In Police-Civilian Interactions

Laura Danique Keesman

Vrije Universiteit Amsterdam, Netherlands, The

This article examines how police officers generate momentum and create opportunities for gaining control in – what they perceive as – potentially violent interactions. Theoretically, the article aims to add to interactionist sociology by illuminating the mechanisms through which participants anticipate and create shared meanings of future possibilities for an encounter to take, building upon insights into the function of social interaction for future configuration proposed by interactionist scholars since the 1960s. The empirical contribution is to challenge explanations of officers' attempts to gain control as mere cognitivist decision-making, ignoring the embodied dimension of anticipating. Drawing on 94 elicitation interviews with Dutch officers on violent events and field work observations of police-civilian interactions, findings show that officers argue they sense opportunities through an awareness of civilian distraction. To create opportunities for actions that enable gaining control, they refocus civilians' attention. Officers do this by acting in ways a civilian does not readily anticipate through bodily-spatial positioning and by using material objects, what I refer to as 'positional play'. By detailing how officers act upon momentum, I illustrate that embodied sense-making and attunement towards serendipitous circumstances is key for police action. The article enriches interactionist scholarship by showing the mise en scène of how the police realize control on an embodied level.

Facework In Career Counselling

Emma Nortio

University of Helsinki, Finland

In this study, I explore the ways in which participants of institutional interaction engage in facework. Career counselling is a form of institutional interaction in which counsellor and counsellee work together to support counsellee's work transitions and career. A central feature of career counselling is respectful and confidential interaction between the counsellor and counsellee and an integral part of respectful interaction, for one, is facework coined by Erving Goffman (1955). Facework refers to acts that enable interaction partners to protect each others' face, i.e. positive social value. Previous research on facework in institutional interaction has focused on the ways in which counsellors protect their clients' face and to a lesser extent on facework done by the client. However, clients' facework is an important part of respectful institutional interaction. It can also be seen as a negotiation or "discursive struggle" of power (cf. Donaghue, 2021). The present analysis examines career counselling sessions from the perspective of facework done by the client to see how they participate in constructing respectful interaction. The aim of this study is to discuss the findings in relation to the wider context of young adults' employability and career transitions. The data of this research consists of 22 videoed career counselling sessions that are analysed by employing conversation analysis and discursive approaches with a focus on multimodal interaction. The paper will contribute to recent discussions of face and facework as relational, interactional and situated phenomena (e.g. Arundale, 2006; Donaghue, 2021).

RS04 | T02: The concept of social sustainability

Take It Or Leave It: Why Researchers (Do Not) Include Social Sustainability in Their Research

Jarkko Levänen, Kathrin Komp-Leukkunen

LUT University, Finland

The broad nature of sustainability is widely acknowledged, but still most research in this area focuses either on environmental or economic dimensions. Much less attention is being paid to 'third pillar' of sustainable development, i.e. social sustainability, meaning features of societies that enhance justness and the quality of life for both current and future generations. We explored reasons for this circumstance by observing two focus groups with researchers from different disciplines. The groups discussed reasons for (a) including, and (b) not including social sustainability in scientific studies. Transcribed discussions were subjected to qualitative content analyses.

Our findings show that the reasons for including and excluding social sustainability are interwoven and result from multifaceted and underdetermined nature of the concept. Social sustainability can be moulded to fit into very different scientific contexts, making it a quasi-universal add on. Underdetermined nature of social sustainability can also lead to misunderstandings and inconsistencies in scientific argumentation. For example, mentioning social sustainability in grant applications was considered advantageous by researchers because it can increase the relevance of the application and thus improve its review scores. However, this same strategy was considered counter-productive for article submissions because of rather narrow scope of many journals.

The concept of social sustainability has distinct features that can simultaneously create advantages and challenges for scientific studies. Therefore, it is important for researchers to consider different aspects when dealing with social sustainability.

"Without Trust You Cannot Resist". Trust as a Complexity Reduction Tool for Social Sustainability

Francesca Colella[1], Laura Falci[2]

[1]University of L'Aquila, Italy; [2]Sapienza, University of Rome, Italy

The concept of trust holds a major place in the history of sociological thought. Trust has been attributed multiple meanings resulting from the growing awareness of its importance within contemporary society, characterised by extreme complexity and uncertainty, in which the actor has bounded rationality. It has a positive meaning that arises and develops in an environment that is anything but positive.

This proposal will attempt to show the interconnections between trust and social sustainability, intended as a set of actions to ensure high levels of wellbeing for all citizens (including future generations) by fostering social equity, co-operation, valorisation of diversity, social justice, and safe-guard of rights. We submit an extensive empirical sociological study carried out at the Department of Human Sciences of the University of L'Aquila between December 2022 and January 2024. It reports a qualitative research study covering the entire Italian national territory, with more than 100 focused interviews with significant respondents. It investigates the topic of trust on four main areas: trust in oneself, interpersonal trust, systemic trust (institutions and organisations) and trust in the future, both personal and of Italian and global society in the next 10 years.

The study investigates, in several areas, the meaning of self-confidence and trust in others, empathy, cooperation, resorting to general thematization and specific biographical episodes.

It is evident that trust is central not only to social interaction, but especially to 'tighten' the social fabric: society would disintegrate if trust was not stronger than logical and ocular verification.

Unveiling Social Sustainability. A Comprehensive Sociological Exploration

Stella Volturo, Alessandro Martelli

University of Bologna, Italy

In an era marked by rapid global changes, the pursuit of social sustainability has become a crucial focus within the discourse of the social sciences. Social sustainability is defined as the capacity of social systems or societies to foster social integration, encompassing processes that generate trust, socio-emotional bonds, and social capital (Pieper et al., 2019; Eizenberg and Jabareen, 2017). This paper delves into the multifaceted landscape of social sustainability, examining its implications for contemporary societies. The study focuses on the intricate interplay between social structures, community dynamics, and the pursuit of equitable development.

We explore the challenges and opportunities inherent in fostering social sustainability, recognizing the diverse perspectives and experiences that shape the fabric of our societies. Drawing on theoretical analysis, we investigate the conceptual links related to the principal dimensions of social sustainability, including social participation, community

cohesion, diversity, and equity (Woodcraft, 2015). Furthermore, our research emphasizes the need for interdisciplinary collaborations, as social sustainability intersects with environmental and economic considerations. We argue that a holistic understanding of sustainability requires a comprehensive examination of the social dimensions that underpin resilient societies.

In conclusion, this study contributes to the ongoing sociological dialogue by providing insights into the complex web of factors influencing social sustainability. By illuminating the challenges and proposing actionable strategies, we aim to enrich the current debate on social sustainability and its implications for social policies.

'Social Sustainability' Or What Else? Normative And Cognitive Representations In The Sustainable Finance Framework.

Tiziana Nupieri, Giulia Salaris

Sapienza University of Rome, Italy

The paper explores the relationship between social sustainability and sustainable finance, focusing on the European regulatory process. The research aims to understand how social sustainability is conveyed in this context, while also looking at the historical developments that have led the financial sector to embrace socio-environmental issues. Which normative and cognitive representations of social sustainability do the European Commission's advisory groups put forward? And how do these representations shape the conceptualization of social sustainability? The study starts with a literature review that lays out the lack of an unambiguous definition of social sustainability, then shifts focus to the historical evolution of the financial world's approach to sustainability, focusing on Agenda 2030, the Action Plan on Financing Sustainable Growth, and European regulatory initiatives like the Social Taxonomy. The core section introduces an empirical analysis of two artifacts produced by the Sustainable Finance Platform: the Social Taxonomy Report and the Final Report on Minimum Safeguards. Following the référentiel approach (Jobert & Muller 1987), the analysis highlights the main cognitive and normative representations (Surel 2000) that influence the experts' worldview (Muller 2003) in the regulatory process. The findings suggest a worldview that promotes social sustainability as a tool for economic growth rather than overall well-being. The latter interpretation, considering the ambiguity of different definitions of social sustainability and the increasing relevance of sustainable finance to the SDGs, could become the naturalized definition of social sustainability, potentially influencing future sustainability policies and practices.

Perceptions of Energy Transformation in Polish Society: From the Sociology of Coal to Renewables

Mariusz Baranowski, Przemysław Pluciński

Adam Mickiewicz University, Poznan, Poland

Background of the study

The ongoing energy transformation, characterized by reduced reliance on fossil fuels and increased energy efficiency, poses significant global challenges and opportunities for societies. Our study explores the perceptions of the Polish population regarding the justness of the energy transition process. This is an extremely important issue because the EU's Green Transition policy aims for climate neutrality by 2050.

Conceptual approach, methods and data

In the study, we rely on the sustainability transitions approach. Our research is based on an original survey conducted on a representative sample of Poles in April 2023. The distribution of opinions on critical aspects of the energy transformation and the potential for sustainability, such as equal benefits, shared cost burdens, citizen participation in decision-making, and the concept of prosumption, is examined.

Expected outcomes

This sociological inquiry delves into the dynamics of public opinion shaping policy decisions concerning transforming fossil fuels into sustainable energy sources. The context of Poland's predominantly coal-based energy mix, comprising approximately 79% of total energy production, adds complexity to societal perceptions and significantly influences climate and energy policies. Understanding public sentiments becomes crucial against Russia's aggression against Ukraine and the sharp increase in electricity prices during the winter of 2022/2023. Our presentation contributes valuable insights into the multifaceted perceptions of Polish society towards the ongoing energy transformation, offering implications for policymakers and researchers engaged in the intersection of energy, climate, and sociology.

Dutch Agriculture and Society: Identifying Factors with Which the Social Sustainability of Agriculture Can Be Assessed

J.M. Nooij[1], J.A.B. Duncan[2], C.J.E. Schulp[1]

[1]Vrije Universiteit Amsterdam, Amsterdam, the Netherlands; [2]Wageningen University and Research, Wageningen, the Netherlands

The Dutch agricultural landscape and Dutch place-based identity are inseparable; approximately half of the Dutch land is zoned for agriculture, and the Dutch identity and continues to be strongly linked to the agricultural sector and the goods it produces. At the same time, the role farmers have played in Dutch society has changed over past century.

The consolidation of farms in the Netherlands has had important social impacts. Some have associated it with the deterioration of rural areas and the production of so-called rural islands. Concurrently, agro-ecology, food forests and organic agriculture are increasing. The result is a fragmented rural landscape demonstrated by recent farmer protests that made international headlines. This highlights the diverse expectations placed on the agricultural sector, and the conflicting perspectives on how socially sustainable agriculture is envisioned in the Netherlands.

The aim of this paper is to establish factors with which the social sustainability of farms can be identified. A sequential mixed methods design was used. First, an online survey identified perspectives regarding the social roles of the agricultural sector. Subsequently, interviews with a visual mapping element were conducted with representatives of key stakeholder groups to identify how these factors related. This analysis uncovered 8 social factors that influence how the social sustainability of the Dutch agricultural sector is assessed. The paper shows that there are diverse perspectives regarding the social sustainability of farms between stakeholder groups. A recurring theme was the role of farmers as primarily entrepreneurs, as well as a notion that farms have become more disconnected from general society.

Sustainable Food Production and Social Economy: A driver for social wellbeing and integration in rural areas

Bernadett Csurgó, Márta Kiss

HUNREN Centre for Social Sciences, Hungary

Nowadays, the social economy is becoming more and more valued at the European and global levels. The reason for its popularity and political support is that the actors of the social economy are playing a growing role in the management of social and environmental problems. This paper looks at the nexus between sustainable food production and the social economy and examines its impact on the sustainable consumption habits of marginalised communities through the lens of social well-being.

Over the past decade (Kiss 2014, Kiss 2016, Kiss-Rácz 2019, 2022, Molnár et al. 2018, Pálné 2019, 2021, Váradi 2015, 2016), local economic development in rural areas has been characterised by a continuous expansion of the role of local governments as farmers and a focus on economic coordination and market organisation tasks. In Hungary, a new model of the social economy has emerged, which is closely intertwined with organic farming and sustainable food production.

This paper aims to analyse the influence of social economy based organic farms and local food workshops on stakeholders' knowledge, attitudes, and actions towards sustainability, especially for people belonging to underprivileged social groups. The analysis is based on qualitative case studies of social economy farms from various regions of Hungary. By exploring how sustainable agriculture models within the social economy contribute to the social integration of marginalised communities, the research sheds light on the broader implications of these initiatives for the promotion of sustainable development and well-being in rural areas.

Back to Sustainable Production? Traditional Professions for Future Sustainability.

Wojciech Połeć

Warsaw University of Life Sciences – SGGW, Poland

1313

This study is based on a qualitative study conducted with twenty people continuing and recreating traditional forms of production related to the processing and use of objects and devices made of wood in Poland. The interviews were conducted using visual sociology methods in the form of documentary films. An important context of the study were changes in technology and economic conditions in which a given activity takes place.

In the past, many everyday items were made of wood, especially in rural communities, within the household. In such cases, they did not enter into trade, apart from sporadic cases. Traditional products made of wood and distributed on local markets did not cause problems related to the production of waste that was difficult to remove and did not generate transportation costs. Over time, a process of changes took place from independent production (natural consumption) to consumption mediated by the market.

Although wooden products have gone out of common use, replaced by plastics and metal, they are coming back as products with symbolic and decorative meaning and as products with today's desired features such as eco-friendliness, traditionality, reference to the past, but also exclusivity. Changing the ways of using and perceiving wooden products is an opportunity to maintain the transmission of traditional skills, which in themselves are beginning to be perceived as a value, as part of the intangible cultural heritage.

The aim of the study is to show what opportunities lie in returning to traditional forms of production, but I also show what barriers and difficulties appear in the activities of people who try to continue traditional forms of production in changed social and market conditions.

RS04 | T06: Social sustainability in society

Childcare and Wellbeing in Times of Crisis: Towards Sustainable Care Solutions

Ingela Naumann

University of Fribourg, Switzerland / University of Edinburgh, UK

When the Covid-pandemic hit in 2020, social distancing rules led to the temporary closure of childcare facilities and schools in many countries. While important public health measures, "lockdowns" also gave gloomy evidence to the negative effects the absence of childcare and education services can have on family and community wellbeing, on child outcomes, and on gender equality (Naumann et al. 2022). However, the Covid-pandemic not only highlighted the importance of childcare and education infrastructure for social wellbeing and social sustainability, but also shed light on already existing gaps in care and education provision which were exacerbated during the Covid health crisis.

We live in turbulent times with the risk of health or other crises hitting also in the future. The question how core social services such as childcare and education can be made more sustainable to weather such crises is paramount to ensuring social wellbeing and prosperity of societies today.

This paper discusses findings from the UK-based ESRC-project on "Childcare and wellbeing in times of Covid-19: developing crisis-resilient care solutions" that explored the effects of childcare and school closures on family wellbeing via survey data analysis and 60 interviews with parents, and in a second step, conducted two co-production case studies in areas with persistent childcare and early education services gaps, one in a remote rural community, one in a socially disadvantaged urban area, with the aim to provide insights on how childcare infrastructure could be made more sustainable within the UK system, particularly with respect to areas with persistent services gaps.

Foundational Economy, State-controlled Companies, and Social Sustainability: Lessons from the Rivatized Oundational Economy in Italy

Angelo Salento, Marco Marrone

University of Salento, Italy

The waves of privatization happened in the last decades within foundational economic sectors have crucially impacted on social sustainability. As the Foundational Collective (2018) has highlighted, this is a term referring to all those activities that are key in influencing social inequalities and the liveability of territories, such as healthcare, education, public transports, post services. Despite the interest of critical scholar on neoliberal privatization, very little research has been devoted to the crucial role of former State-owned and State-controlled corporations in these sectors. The goal of this presentation is to fill this gap, stressing the need to study the role former State-owned/controlled corporations in terms of social sustainability.

This will be done presenting three case study from Italy. Firstly, that of Poste Italiane, where privatization started in 1998, that nowadays appear more focused on providing financial services than on their traditional services. Secondly, it is the case of Trenitalia, where the presence of market logics are evident in the remuneration of managements, conditioning their investment and producing a lack of infrastructure in the southern part of the country. Finally, we will look at Autostrade, privatized during 80s and that nowadays, following the incident of Ponte Morandi in 2018 in the city of Genoa, is facing a unique project of re-publication imposed by the Italian government. Empirical data will come from shareholders kalepine, company strategic plans and interviews with management and trade union representatives.

Enhancing Eco-Social Sustainability through Diversity and Inclusion in the Labour Market

Joana S. Marques[1], Ana Luísa Martinho[2]

[1]Iscte – Instituto Universitário de Lisboa, CIES-Iscte; [2]CEOS. PPorto/ISCAP – Politécnico do Porto

1314

The social and ecological questions have become increasingly intertwined in face of environmental crisis. Whereas a key sustainable development goal is to achieve full and productive employment and decent work for all, not only we are far from the notion of "decent" in face of work precarisation trends worldwide, but also various vulnerable and disadvantaged groups continue to be marginalized in this ambition. Drawing on fieldwork conducted with social economy organisations dedicated to the social and labour integration of these groups in Portugal, this exploratory study shows contradictory results. On the one hand, these organizations struggle to aligning themselves with the green transition, in face of limited resources. On the other hand, they are at the forefront of eco-social innovation. By embracing the complexity and diversity of profiles that enrich both professional and societal contexts and reframing groups commonly labelled as vulnerable in terms of their unique potentialities and resources, they contribute to a new paradigm of sustainable development – one that respects a pace more aligned with planetary boundaries, while simultaneously reducing inequalities and democratising societies. The main findings of this exploratory research underscore that more diverse and inclusive labour markets play a pivotal role in achieving eco-social sustainability.

Transformative Learning Processes in Community Repair – Lessons Learned from Living Labs

Magdalena Meißner, Melanie Jaeger-Erben

BTU Cottbus-Senftenberg, Germany

The connection between collaborative repair, care work and responsibility for sustainable development has only received little attention in research so far. Connecting the different perspectives, however, opens up new spaces for thought and action that can potentially support the achievement of various sustainability goals, such as promoting sustainable consumption, reducing (global) inequalities and combating climate change. In communities of repair, individual and collective processes of change take place that can be described as forms of transformative learning (Singer-Brodowski 2016). Transformative learning concepts describe how learning processes enable adults to transform their previous meanings and know-how and thus to engage in critical thinking and autonomous judgement. Our assumption is that transformative learning as a concept could bridge the current gap between social and individual insights into the necessity of socio-ecological change and the ability of taking care of the (global) future through solidarity-based action. The paper will look at transformative learning processes taking place in the context of community repair and identifies challenges and conditions for learning. It will provide first answers to the following questions: What kind of learning processes happen in people engaging in community repair for the first time? How is solidarity-based action learned in this context? Do the experiences and learning processes also influence other areas of life and encourage sustainable consumption and solidarity-based action beyond the repair of objects? To answer the questions living labs were conducted in which the participants visited different Repair Cafés over a ten-month period of time and documented those visits.While learning processes foster openness to further repair and experimentation, there's limited evidence that communal repairing sparks thought-provoking impulses beyond repair, inspiring additional solidarity-based actions.

RS05 | Active labour market policies: implementation, challenges and innovation
RS05 | T01: Active Labour Market Policy Design and Discourses

Being able to do a 'real' job – institutional narratives within and about Local Labour Market Programs

Sara Nyhlén[1], Maja Östling[2], Katarina Giritli Nygren[3]

[1]Mid Sweden University; [2]Mid Sweden University; [3]Mid Sweden University

Local Labour Market Programs (LLMPs) at the municipal level in Sweden is a part of Active Labour Market Policies (ALMP). The LLMPs are aimed at enhancing people considered to be distant from the labour market, with particular complex problematics, opportunities to be self-sufficient and assume a place in the labour market. People with functional variations, immigrants and young people have difficulty entering the labour market, a problem exacerbated by the pandemic crisis. In this article we explore how ableist discourses operates in institutional narratives about work, the worker and abilities in relation to participants in LLMPs. The article is based on interview with managers and local politicians in charge of the LLMP units in eight Swedish municipalities. In the interviews we explore the mechanisms of the LLMPs and analyses them in relation to ableist norms. The managers and politicians' narratives conceptualize skills and measures of productivity intrinsically excluding people who are not seen as being able to undertake productive work in line with the imposed requirement. The study shows that the LLMPs reproduce disability inequality but at times also create spaces of inclusion by questioning the idea of a 'real job'.

Policy Idea in Flux: The Case of Youth-Oriented Active Labor Market Policies in Finland

Essi Ahlroth, Mikko Niemelä

INVEST Research Flagship Center, University Of Turku, Finland

Unemployment and social or economic exclusion of youth has been one of the most pressing issues for welfare societies in recent decades inflicting both economic and wellbeing costs. Active Labor Market Policies (ALMPs) that target

youth, such as the EU's youth guarantee and national versions in member states, have established a position as a go to solution to address the issue of youth unemployment and exclusion. We examine the adaptation of the idea by studying the case of youth oriented ALMPs in the context of Nordic welfare state. The data consists of legislative initiatives made by Finnish government between years 1992 and 2021(2022). We use qualitative content analysis to investigate how, and trough what kind of policies the idea of Youth-oriented ALMP embedded to Finnish labor market policy. Secondly, we study the evolution of the idea by following different policy objectives and alternatives emerging and changing through the analysis period. The aim is to clarify the picture of youth as a target group for labor market policy and shed light to the process of global policy ideas merging in to the national policy forming.

Strengthening Responsiveness through Innovation and Co-creation of Knowledge between Employment Services and Research

Dorte Caswell, Tanja Dall

Aalborg University, Denmark

Developing employment services that are responsive to the needs of vulnerable unemployed poses a continual challenge for street level bureaucrats and management (van Berkel et al. 2017). The role of knowledge, derived from both research and practical experience, plays a pivotal role in addressing this challenge. However, there is still limited research on understanding the processes of knowledge mobilization (Davies et al. 2015). This paper explores a collaborative and innovative partnership spanning over more than four years, where social science researchers closely collaborated with six municipalities to enhance responsive employment services through processes of knowledge mobilization.

This approach represents a novel perspective on innovation within the context of street level bureaucracy. Utilizing extensive ethnographic and qualitative data researchers engaged in repeated visits to the municipalities. They also established platforms for knowledge exchange in an explorative and innovative process.

The paper aspires to address the implementation challenges associated with developing more responsive services in Active Labour Market Policy (ALMP) organisations in Denmark and beyond. The analysis delves into how knowledge is co-created in dialogues between frontline workers and researchers, how conceptual knowledge challenges and transforms practical understandings, and how dilemmas and problems in practice find their way into research.

The findings suggest that co-creating knowledge has the potential to support the development of more responsive welfare services. It empowers frontline workers to cultivate collective, reflective practices and propel research towards deeper insights into the dilemmas of practice within the field of ALMP.

Active Labour Market Policies And Undeclared Work. Reflections On An Understudied Relationship

Anna Rio, Diego Coletto

University of Milano Bicocca

The contribution aims to provide insights into how employment services and, more specifically, active labour market policies (ALMPs) deal with the phenomenon of undeclared and informal work, something which has received limited attention in the literature. We are interested in analysing the relationship between the concept of employability – which is at the core of ALMPs – and undeclared work, which is often represented in the public debate as bad and low-paid. After unpacking ALMPs into their fundamental components (activation, conditionality, personalization), we aim to examine how they intersect with and confront undeclared and informal work. Activation relates to it according to a socio-educational normative framework – assisting individuals entrapped in irregular working conditions to find better solutions. Conditionality mechanisms target and punish people exploiting public benefits while earning undeclared incomes. Meanwhile, personalization, grounded in evaluating an individual's history and needs, should recognize skills acquired through any job and personal experience.

Using these analytical outlines, we seek to explore recent developments related to both active labour market policies and undeclared work, implemented under the Italian Recovery and Resilience Plan. We present some preliminary findings from exploratory research based on documentary analysis and fieldwork involving operators who implement the ALMPs in three Italian regions. Specifically, we highlight actual links, regulatory gaps, and normative contradictions on one side; on the implementation side, we delve into how and to what extent undeclared work is considered in daily employment services activities. We conclude by proposing a comparative research agenda.

1316

RS05 | T02: Access and Bias in Implementation of Active Labour Market Policies

The Hidden Irony Of Activation Policies. Findings From Further Education in Germany

Sigrid Betzelt[2], Sarina Parschick[1]

[1]University of Kassel, Germany; [2]Berlin School of Economics and Law, Germany

The provision of further occupational training and active inclusion programs for jobless people are gaining importance as an essential infrastructure for ALMP, given current economic and societal transformations. Nonetheless, this sector is largely below the radar of academic (labour market) research. As part of a broader trend of activation policies over the past few decades, the sector has been identified as a key source of human capital building, while at the same time undergoing a process of ‚marketization' and NPM governance. The latter is based on formalised output control and short-term measures which involve precarious employment conditions at provider organisations. Hence, the mandate of service providers has become highly ambiguous – between meeting the (social and skill) needs of users, and business goals of enhancing cost-efficiency and (quasi-)market success. Drawing on own qualitative research in Germany and other field studies, the paper discusses implications of this constellation for service-providing organisations and their mandate. Illuminating in particular the role of emotional dynamics, the findings reveal that the institutional framework conditions entail strong tensions for educators and management, leading to permanent pressures to square the circle of inconsistent demands. Those involved must cope with frustration, anxiety or anger, which undermines motivation and fuels staff turnover. All this is detrimental to the clientele, with creaming practices neglecting vulnerable groups with special needs. This suggests a hidden irony of current activation policies in Germany and beyond: disempowering providers expected to empower people. Finally, it will be discussed which public policy innovations could overcome this imbroglio.

Activation policies in Marseille and Turin : international differences and 'Matthew effects'

Anouck Manez

Ecole des hautes études en sciences sociales (EHESS), France

This paper will review the results of my recently defended thesis, in which I propose to take seriously the activities of the unemployed and their schedules, and to examine the differentiated symbolic and material valorisation of 'work' outside paid employment by institutions, the individuals themselves and their acquaintances

The study is based on biographical interviews with around sixty unemployed people living in Marseille and Turin, and offers a localised comparison, supported by secondary statistical analyses of the Labour Force Survey.

One of the main differences between France and Italy lies in the implementation of activation policies towards the unemployed. In Turin, although they enshrined in national legislation, they remain symbolic. Informal work and family solidarity, in a context of poorly developed social policies and a labour market that has been brutally liberalised over the last twenty years, play a predominant role in the experiences of unemployment recounted, and work is associated above all with paid work and employment that is lacking.

In France, activation schemes play a central role in the experiences of people, particularly those occupying the least privileged positions. The model of the 'nomadic executive' and the 'skills' logic (where all activities, paid or unpaid, are likely to be valued and rewarded on the labour market) promoted by activation policies is in fact only accessible to certain profiles, in particular well-to-do managers. Conversely, the many out-of-work activities of the less privileged escape any form of symbolic and material recognition.

Is The Access To Activation Programs Still Gendered? Welfare Recipients' Participation In Programs From 2008 To 2021

Veronika J. Knize

Institute for Employment Research, Germany

1317

Across welfare states, welfare recipients can participate in "activation" programs to improve their chances of finding employment. While a few studies have found that women's participation was far lower than men's during the 2000s, we do not know whether program participation has changed over the last years amid normative changes in gender roles and the rise of individualistic policies. I attempt to fill this research gap investigating whether, how, and why program participation in Germany changed from 2008 to 2021. Preliminary findings show that the gender gap in program participation has been declining. Since women's reduced participation translates into lower chances of (re)training and employment for them, a real decline in the gap would be an advancement toward gender equity. I shed light on whether the change is due to quantitative changes (e.g., women's participation would increase if relatively fewer mothers collected benefits) or qualitative changes. Are today's parents of young children more gender egalitarian, meaning that being available for job search is no longer as gendered? Are public employment services more gender neutral in what they promote? I consider the dimensions of policies, public employment services, and family and individual in the analysis. Empirically, I draw an inflow sample from administrative data every year from 2008 to 2019 and apply regression methods on each year to explore program participation within the two following years. A key

distinction is made between parents and non-parents of younger children. Ultimately, this paper studies whether gender is becoming less definitive in the welfare state.

The Implementation Of A "Social Labour Market" – Subsidized Employment For Hard-To-Place Unemployed Persons

Dr. Claudia Globisch, Dr. Peter Kupka

Institute for Employment Research (IAB), Germany

For a long time, subsidized employment schemes have been an important – though often contested – part of active labour market politics. While its supporters claim that it is better to pay for employment than for unemployment, critiques refer to high costs, lock-in effects and possibly better suited forms of ALMP like further training.

After the German labour market reforms were passed in the early 2000s, all ALMP schemes were strongly judged by their effectiveness in the way of transition into regular employment. Only one type of scheme – the so-called social labour market – did not follow that logic because its target group were persons with no realistic chance to find unsubsidized employment. This active labour market measure addresses the criticism that benefit recipients with better opportunities receive preferential treatment by being reserved for people who are considered to have no chances on the labour market without support.

We will present findings from our implementation study of the Participation Opportunities Act (POA) which has been in force since 2019. The scheme offers subsidized employment in order to provide social participation but also integration into regular jobs. Results show that even within this scheme for persons very remote from the labour market, some creaming takes place due to its implementation as either more labour market or more social policy oriented. We show the use of discretion of frontline workers, depending on the job centres emphasis either on the social or labour market aspect and on the financial resources of the job centre.

RS05 | T08: Impact and Implications of Active Labour Market Policy

Subsidised Employment Programmes: (Temporary) Social Inclusion for the Long-Term Unemployed?

Miriam Raab

Institute for Employment Research (IAB), Germany

Some active labour market programmes aim at (re)introducing the long-term unemployed to the labour market by offering wage subsidies to employers and coaching to programme participants. An additional goal has become to improve the participants' social inclusion. However, positive effects might only be short-lived due to the fixed duration of these programmes. This makes the (premature) end of the subsidised employment relationship a critical point and the successful transition into unsubsidised work the crucial marker for the programmes' long-term effects. By using the example of Germany's "Social Inclusion Act" ("Teilhabechancengesetz"), an ALMP introduced in 2019, this paper aims at presenting the key drivers for both a sustainable labour market integration and social inclusion of formerly long-term unemployed programme participants. Based on biographical-narrative interviews (first and follow-up) with 33 programme participants, I analyse the participants' experiences with their subsidised jobs considering their (employment) biographies and work attitudes as well the impact their employers and coaches have. This paper contributes to the research on the implementation of ALMPs and the debate on the (un)sustainability of their effects with a qualitative longitudinal perspective and provides policy recommendations.

Evaluating the Long-Term Impact of Skill Investment Policies: Insights from a Competencies Development Programme in Poland

Magdalena Jelonek[1,2], Barbara Worek[2], Marcin Kocór[2]

[1]Cracow University of Economics; [2]Jagiellonian University, Poland

The objective of Active Labour Market Policies (ALMPs) is to enhance the alignment between available positions and job seekers. Nonetheless, the efficacy and impact of these policies are the subject of extensive debate and skepticism. Investigations into various initiatives for skill development frequently indicate minimal to no substantial influence on employment or income rates. This phenomenon can be

ascribed to the efficient functioning of labor markets, which exhibit fewer market failures than previously assumed (The World Bank Research Observer, 2017; Jelonek 2022). Typically, the impact of such interventions is evaluated at a specific point in time. It is worth looking at such policies in the long term by answering the question of what effect investments in competencies have in the long run.

This study aims to present the outcomes of an evaluation of a public program initiated in Poland in 2014. This program, focused on the enhancement of student competencies, intends to align them with employer requirements, thereby augmenting their career prospects.

Employing data from a survey of intervention participants (n=400, panel data), administrative records on the employment outcomes of graduates (ELA – Graduate Tracking System) and qualitative information (IDI, FGI), this paper explores the short-term and long-term effects (one year and several years post-graduation) of this intervention. Specifically, it examines not only the impact on employability but also on the career progression of the beneficiaries.

Data Collection and Use in Italian Employment Services: Organizational Determinants and Impact on Internal Processes

Anna Di Palma[1], Gregorio Buzzelli[1,2], Costanza Gagliesi[1]

[1]Polytechnic University of Turin, Italy; [2]University of Milan, Italy

In the last decade, digital public transformation has become a salient topic both in academia and public institutions. The adoption and successful use of digital means within public organizations leads to a double examination of both determinants and impacts on internal processes. In this context, the role of data is a peculiar one, as its availability can both account for a determinant – as their use may lead to a transformation of internal processes – and a result – its collection requires infrastructure, administrative capacities and skills. While data management is an understudied topic in labour policy, employment centres have been progressively asked to collect and use data for e-guidance, profiling and job matching aims.

Given the framework, this working paper examines organizational determinants and impacts on internal processes of data collection and use in Italian employment centres. Italy is a peculiar case, as it constitutionally recognizes a high degree of autonomy for regions in labour policy – which leads to a high degree of regional variation. The initial phase of the research will consider two neighbouring northern regions, i.e. Lombardy and Emilia Romagna, to seek for organizational drivers of success and empirical changes, if any, in processes related to e-guidance, profiling and job matching. Their comparison appears relevant as they are both economically developed, and are high performing based on preliminary results from the regional DESI (Politecnico di Milano, 2022). The design of the research foresees the use of qualitative interviews with managers and operators from employment centres belonging to the two Italian regions.

Counselling That Overlooks The Client? Unemployed Researchers Under The Influence Of The Employment Office

Susanne Wollin-Giering, Markus Hoffmann

TU Berlin, Germany

The international debate on the usefulness of employment agencies has recently produced ambivalent results, including results that suggest that they have no effect at all.

In this presentation, we aim to demonstrate how unemployed researchers who attempt to continue the research from their previous employment by incorporating benefits from employment agencies as resources and continue to work specifically on their research careers during periods of unemployment, negotiate demands and benefits from employment agencies with officers of these organisations. This process is largely determined by the officers' interpretive frames, which do not sufficiently differentiate between the work of specific professions.

Our argument is based on interviews with 20 researchers from various disciplines (including ethnology, sociology, plant biology, biomedicine) with experience of unemployment and with 13 employees of employment agencies in various locations in Germany. We show that

(1) phases of unemployment are actively and partly strategically utilised for the continuation of the research career;

(2) the influence of the employment agencies on the strategic use of unemployment phases depends on their organisational structures; and

(3) that this influence also depends on the officers' understanding of differences between 'normal work' and research work.

Employment office offerings rarely match the specific needs of unemployed researchers. The same applies to counselling, which that depends on the individually varying interpretative frames of the officers.

As a consequence, successful integration is only marginally attributable to the employment agencies. In most cases, it is achieved by researchers themselves who have to resist the agencies' placement activities.

RS06 | European intimate lives and reproductive choices in the face of planetary crises
RS06 | T01: Reproductive choices and family futures

"The World is Getting Worse": Networks of Significant Others and Desirable Family Life in a World under Crises

Anna-Maija Castren, Aino Luotonen

University of Eastern Finland, Finland

This paper presents preliminary results of an ongoing international study focusing on young adults' networks of significant others and on their reflections on desirable family and intimate relationships in a world under global crises. European societies have shown concern about changes in people's reproductive behaviour causing a decrease in fertility. Young adults postpone parenthood and fewer children are born. NETREP, an international research project carried out in Finland, Portugal, and Scotland, interviews young and youngish adults in three countries about the intimate relationships and family life they consider desirable, on their social networks, and more generally on their concerns about the future of the planet. This presentation draws on the data collected in Edinburgh and Helsinki and focuses on the interviewees' networks from a configurational perspective. We investigate the composition of the networks embedded in which research participants live and make decisions regarding their intimate life. Analysed data consists of interviews and networks mapped with name generator questions in qualitative research interviews of 40 young / youngish adults aged 25 to 40 years. We ask who are the significant others our research participants rely on in everyday life and in major life decisions? For example, to what extent do young adults follow traditional family life course of previous generations drawing on heteronormativity and the couple-norm, despite uncertainties related to crises like global warming and despite the many alternatives to heterosexual family form available, like single parenthood, non-monogamy, and inter-species families etc.?

A Cross-national Perspective on Young Adults' Attitudes Towards Family and Gender in Portugal, Finland, and the UK

Rita Gouveia

Institute of Social Sciences – University of Lisbon, Portugal

In turbulent times marked by global macro events and ongoing trends, such as the pandemic crisis, economic inflation, climate change, and housing market collapse that have been affecting the transitions to adulthood in Europe, it is crucial to understand young people's perspectives on family and gender. Also, the continuing trends of de-standardization of the lifecourse and the pluralization of family, intimate, and parenthood relationships and practices – with the increase of reconstituted families, lone parenthood, friendship co-parenting, polyamorous arrangements, medically assisted procreation, and gender fluidity – call for the study of the dynamics of continuity and change in young peoples' normative expectations. Therefore, this paper aims to provide a comprehensive cross-national perspective on the attitudes towards family life and gender relations among young people living in three distinct national contexts with different welfare arrangements and socio-historical backgrounds: Portugal, Finland, and the United Kingdom. We will draw on representative quantitative data from cross-national surveys, such as the European Social Survey (ESS) and the European Values Study (EVS), by focusing on individuals aged between 18 and 40 residing in the 3 geographical areas. Findings show that there are both variations and commonalities in the attitudes to family and gender across the three countries, as well as a complexity of attitudinal profiles combining egalitarian and non-egalitarian attitudes to the segregation of gender roles, division of paid and unpaid work, LGBT+ rights, and parenthood models. Finally, these divergences and convergences in the attitudinal profiles across countries are shaped by cultural, structural, and biographical factors.

Climate Change Concerns and Fertility Desires: A Comparative Vignette Study among University Students in Belgium and Italy

Sara Bisi, Nadia Sturm, Jan Van Bavel

Centre for Sociological Research, Ku Leuven, Belgium

This research investigates the potential impact of climate change concerns on fertility desires through an online vignette study conducted among university students in Belgium and Italy. Respondents who were not in the control group were exposed to either a pessimistic or a more optimistic climate change scenario. Following the exposure to climate change scenarios, participants were questioned about their fertility desires. Additionally, respondents were asked about their attitudes towards climate change, including their level of concern, awareness, government satisfaction, and sense of responsibility. In line with previous studies, we found that Italians on average perceived lower personal responsibility in tackling climate change compared to Belgians, and they also expressed higher dissatisfaction with their national government's actions on climate change compared to their Belgian counterparts. Multinomial logistic regression was used for hypothesis testing. From the vignettes, we found that, when exposed to a pessimistic scenario regarding climate change, Belgian

and Italian respondents have a higher probability of reporting low fertility desire compared to their control groups. Following the optimistic scenario, only Belgians have a higher probability of reporting high desire, while Italians experience effects similar to those exposed to the pessimistic scenario. These differences are mediated by feelings of personal responsibility and trust in government. While the results should be approached with caution due to the non-probabilistic nature of the sample and the limitation of online data collection, they emphasise the importance of taking climate change concerns into account when analysing fertility desires.

RS06 | T03: Parenting in times of complex planetary crises

Good Parenting: a New Risk to Reproductive Decisions?

Vanessa Cunha

University of Lisbon, Portugal

From 1970s, Portugal has been facing fertility decline, based on childbearing postponement and small offspring. This reproductive pattern reflects major changes in society, especially since the Revolution: in family life and gender relations; in the universal and increasingly extended education and feminisation of the labour market; in reproductive, maternal and infant health.

During the Great Recession, Portuguese births and fertility severely dropped to historic lows, highlighting the impact of economic deterioration and insecurity in reproductive decisions. Recently, Covid-19 Pandemics has also hit births and fertility, albeit over a shorter period and to a lesser extent. What these two crises shown was that times characterised by high uncertainty trigger an aversion to risk in terms of reproductive decisions, and that fertility recovery is not always as swift in demographic terms, or even possible in individual terms.

In addition, new perspectives on parenting, defined by childhood experts and European directives translated into national policy-making, may be reinforcing the low fertility pattern. By requiring a wide-range of requisites and competencies to fulfil the well-being of children and their integral and individualised development, "good" parenting is becoming highly demanding and harder to achieve, and ultimately configuring a new risk when reproductive decisions are at stake.

This presentation brings findings from a research on parenting and reproductive decisions concluded in 2022. Drawing on interviews with parents of school-aged children, it focuses on their sense of demand, how they cope with difficulties and uncertainties that "good" parenting encompasses, and how it reflects in their present reproductive decisions. As fieldwork took place during Pandemics, the presentation also seeks to understand how this crisis challenged parenting as much as reproductive decisions.

Framings of Reproduction and Family Building in Finnish Population Politics Publications in the Era of Declining Birthrates

Jenna Siivonen

University of Eastern Finland, Finland

The trend of rapidly declining birth rates in Europe has led to a rise of population political discourse in reproduction and family politics. This shift is particularly evident in welfare states, such as the Nordics, in which institutional support for family and parenthood has previously been largely motivated by values of equality and justice. In this paper I discuss the contemporary population political framing of reproduction and family building motivated by the declining birthrate, drawing on my analysis of the 2020 Finnish population policy programme and 2021 prime minister's office's population policy report. The focus of the presentation is on the problematization of people having less children and addressing the presented causes for this shift and the suggested policies for affecting the number of children being born. I reflect on the limitations, silences, and tensions of the population political framing of reproduction in relation to the culturally shared hopes, uncertainties and complex meaning making surrounding childbearing and family building choices. I analyse how population political discourses reflect norms regarding reproduction and family building and, furthermore, how these discourses contribute to the institutional and legislative conditions for organising intimate relationships. This paper is a part of an ongoing doctoral research studying contemporary Finnish reproduction regime(s) on the levels of population policy and young adult's accounts on reproduction, family, and intimate relationships.

Reproductive Journeys in Unsettled Times

Marjaana Jones

Tampere University, Finland

Fertility rates have been declining in several countries, which has led to discussions about a demographic transition and even a 'fertility crisis'. In Finland, the 2022 fertility rate was at the lowest point since records began. Various factors are contributing to childbearing intentions with people choosing to live child-free or postpone having children. Other factors include economic concerns and precarious employment. It has also been argued that modern parenting requires more energy and time. Additionally, recent studies have indicated that eco-concerns are playing a growing role in reproductive decision-making. Indeed, some people are choosing to have less or no children partly due to anxieties over the future of the planet.

Behind every country's fertility rate, lies a myriad of fertility decisions taken by individuals. Through dyadic interviews, I will explore the journeys of new and expectant parents and the choices they face as they decide to have children in these unsettled times, against a backdrop of falling fertility rates. The issues explored with these parents will include matters such as reproductive timing, eco-reproductive and economic concerns, as well as their wishes and needs regarding the support and care they receive during pregnancy. This research is part of a wider ongoing research project that looks at both the reproductive choices of today's parents; explores the fragmentation and marketisation of the Finnish maternity care system; and investigates how parents navigate the expanding pregnancy care market. In my presentation, I will present some of the preliminary findings based on parental interviews.

RS06 | T08: Visioning future families

A New Family Member or the Latest Sign of the Family Decline? A Research on the Family Life of Italians and Their Pets

Gaia Peruzzi[1], Angelica Spampinato[2]

[1]Sapienza Università di Roma, Italy; [2]Sapienza Università di Roma, Italy

Women and men always lived together with animals, but in recent years some important changes can be noticed in western societies: the number of pets in our houses is increasing, just like the expenses dedicated to them; moreover, many people began to bring their nonhuman companions outside the home, in supermarkets, restaurants, public transports and holidays. Vegans and groups for animal rights are becoming most popular.

Some people think that this new kind of relationships with animals is an advancement of societies in social justice and morality; others consider these new habits as a symptom of the excessive individualism and hypocrite capitalism, linked to search for uncommitted relationships and to the declining of birth rates.

Our paper proposes the outcome of a research investigating humans and animals relationships in intimate live. Our goal is to come to light the new practices concerning pets that are spreading in everyday lives, and the meanings that women and men give to these relationships : How people consider animals with which they live? How much the choices concerning pets affect the family plans? Are there significant differences between women and men, or depending on social class and age? We have collected and analyzed more than 130 in-depth interviews to Italian women and men of different ages and background, and a similar number of pictures of their animals. The impressive consistency of the stories confirm that a deep change is happening in family cultures and intimate lives. Due to the lack of empirical research on this topic, we imagine that our evidence may offer suggestions to other analysis and international literature.

Reproductive Imaginaries of Italian Youth. Aspirations, Desires and Fears for the Future in a Time of Global Crisis

Caterina Satta

University of Cagliari, Italy

Based on qualitative future-oriented research with childless Italians (aged 24 to 35) with mobility capital and experiences, the paper investigates their reproductive imaginaries, ideas of companionship and parenthood in the face of planetary crises. Younger generations are recently emerged into the public arena through movements such as Fridays for future claiming, even in the terms of intergenerational injustice, a future for them and the planet. At the same time, they are held responsible (whether not blamed) for our future in relation to their reproductive choices and, especially for Italy, the declining birth rates. Structural and socio-economic conditions are not irrelevant in shaping their choices, as reported in literature, but in order to grasp the ongoing transformation in younger generations' intimate life we need, not only to reconceptualize the meaning of these socio-economic determinants (i.e. in this unstable context, which is the current significance of work in their lives? How does it shape their intimate relationships?), but also imagine new research methods, concepts, and perspectives. Given that procreation has to deal with "the not yet" and with an "affective" dimension likewise the future – which is strictly connected with people's plans but also feelings of hope, fear and desire and so on – intimate lives and reproductive choices are deeply imbued with imaginaries and feelings of the future at micro and global level. I'll discuss the findings, underpinned by speculative and inventive methodologies, focusing on youth modes of engagement with their future intimate life and reproductive imaginaries in the context of complex planetary future.

Building (also Queer) Intimate Futures: Finnish Young Adults' Perceptions of Couple Relationship

1323

Aino Maria Luotonen, Anna-Maija Castrén

University of Eastern Finland, Finland

In recent years, several crises have shaped the context in which young adults make their plans and decisions about partnership, intimacies, and family building. While multiple ways of living in intimate relationships are becoming more recognized, the prevailing ideal of adult intimate lives reflects the couple-norm that highlights exclusivity, commitment, and cohabitation, and is connected to expectations regarding reproduction (Roseneil, Crowhurst, Hellesund, Santos & Stoilova 2020). In our presentation we ask: how do young adults who have a partner navigate expectations regarding family-building, and imagine their intimate futures? How are future plans and imaginaries connected to gender and sexual orientation? How is the awareness of planetary crisis connected to ways of imagining intimate lives in the future? The presentation is based on an ongoing qualitative study that investigates how adults aged 25–40, living in Helsinki metropolitan area, Finland, plan and imagine their future intimate relationships. They are in either a different-sex or same-sex couple relationship, and some are in a polyamorous relationship. Based on an analysis of individual research interviews, accounts of couple relationships are scrutinized in the context of individuals' networks of close relationships. The analysis shows a variety of ways in which young adults build and imagine their intimate lives, sometimes by following more conventional paths to family-building, and sometimes by imagining alternative queer futures (cf. Holmes, Jamieson & Natalier 2021).

Negotiating Having Children in the Uncertain Futures of Climate Change

Charlotte Herbertz

University of Kassel

Discourse on climate change is confronting European youth with perspectives of catastrophic global development and substantial uncertainty, impeding their ability to project themselves into closed and non-malleable futures. Previous research on future-making has mostly focused on technologies or institutions while little is known about the ways imaginations of climate futures are shaping intimate lives. This paper presents findings from a qualitative study that has explored the question of generativity in its most proto-typical setting: The communicative processes of confronting the question of whether one can still bring a child into this world. Drawing on empirical data from narrative interviews with German young adults (25-35) struggling with this question, I will outline patterns of describing the problem of future-production in their temporal structures before presenting communicative practices of re-opening the future. These include 1) focusing on one's practical agency, 2) finding ethical loopholes and 3) relativising mankind's capacity to make such a decision. The results suggest rethinking approaches that propose ethics of care as a solution to the problem of assuming responsibility for future generations. The paper contributes to advancing an understanding of the restrictions of life planning in the temporalities of climate crisis and sheds light on the contradictions of decision-making processes.

RS07 | Politics of engagement and new social pragmatism

RS07 | T02: Institutional engagements: politics and tests

Struggling with Participation: Moving in and out of Institutionalized Tests in Wind Turbine Controversies

Daniel Nordstrand Frantzen

DTU – Technical University of Denmark

Public participation has long been heralded as an important factor in increasing the social acceptance of renewable energy technologies, and hence as a means to advance the green transition (Gross, 2007; Wüstenhagen et al., 2007). This paper questions this enthusiasm for participation by pointing to the difficulties of coordination that both planners and local residents encounter when hearing processes for wind farms are conducted.

Applying a pragmatic lens, these hearings are understood as 'formatting' participation in specific ways (cf. Meilvang et al., 2018) by outlining legitimate ways of putting the projects under hearing to the test. This perspective is advanced through Boltanski's (2011) work on institutions that allows for an analytical distinction between institutionalized tests and alternative tests which are not accepted by the 'planning institution'.

By analyzing qualitative data from six case studies of Danish wind farm projects, this paper explores how civic participation moves in and out of the institutionalized tests of the public hearing format. The paper outlines that apart from adhering to the institutionally accepted forms of participation, locals build critiques of wind farms through two alternative types of tests. First, 'potentiality tests', where locals are trying to establish that other solutions than the project under hearing are both possible and more desirable. Second, 'de-legitimation tests', where locals try to repurpose the institutionalized tests as instruments for cancelling the project under hearing e.g. by finding and communicating grave faults in the project's environmental impact assessment. The paper suggests that examining these alternative tests can both help in clarifying the present state of the planning institution and imagining how it could be altered to become more inclusive.

Pragmatic Sociology And The Moral Worth Of Animals. From Common Humanity To Sentient Commonality?

Tomi Henrik Lehtimäki

University of Helsinki, Finland

This presentation focuses on the issue of how to build commonality between humans and nonhuman animals. I examine how pragmatic sociology can contribute to the study of animal politics, but also how the issue of human-animal commonality challenges pragmatic sociological approaches. Animals are commonly accounted through the premise that they are unable to speak, and cannot therefore 'voice their concerns' in issues related to their wellbeing. This perspective therefore explores ways that we could understand how the 'voice' of animals gets heard, or how it could be heard. How to account for animals in new ways is a central issue for current changes in contemporary societies, whether one considers topics such as the environmental crisis or emerging pandemics. But aside from these at times rather human-centric problems, the question of how to build commonality with animals also deals with the status of animals as intrinsically valuable beings. In terms of pragmatic sociology, how can animals be part of the common good, not only as objects but as experiencing subjects. The perspective examined here focuses then on the issue of animal sentience, and how sentience could possibly operate as a form of commonality. In addition to the focus on human-animal relations, this question also examines the place of affects or emotions in pragmatic sociology. Empirically, the presentation builds on a project focused on animal (welfare) law, and how the law operate as a 'tool' for the classification and evaluation of animals, which is significant for their treatment and overall status in society.

Predator Politics And The Moral Entanglements Of Interactions: Reindeer Husbandry In Finland Under Pressure For Change

Tapio Nykänen

University of Lapland, Finland

Reindeer husbandry is a vital livelihood from the cultural, social, and political perspective of the indigenous Sámi people. In Finland, it is not only practiced by the Sámi but also by ethnic Finns, who constitute the majority of reindeer herders. I am investigating the evolving pressures on valuations in reindeer husbandry across various reindeer herding cultures in the Finnish region, starting from the late 20th century, due to the increasing populations of large predators. Specifically, I am examining how the rise in damage caused by predators to reindeer and the compensation paid for such damages alter moral valuations associated with work practices, other reindeer herders, and animals.

In my research, I primarily draw from the theory of moral valuations formulated by Stefan Bargheer in his book "Moral Entanglements: Conserving Birds in Britain and Germany" (2018). Bargheer's theory originates from the Chicago school of pragmatic sociology, particularly the work of John Dewey. Following Bargheer, I complement Dewey's theoretical toolkit with a theory on institutions and their impact on moral valuations.

I view contemporary predator politics as an institutional change that is likely to shift the internal logic of reindeer herding toward what Bargheer defines as work-like action. In play-like, "uninterrupted" action, valuations are associated simultaneously with means and ends. In contrast, in work-like action, values are emphatically associated with ends. In many reindeer herding cultures, values associated with means and ends (in-view) have traditionally been strongly entangled. Hence, predator politics represents a potentially significant cultural change.

Tensions in Norwegian Education: A Pragmatic Exploration of Inclusive Pedagogy and Neoliberal Critique

Eli Smeplass, Jan Frode Haugseth

Norwegian University of Science and Technology, Norway

This paper navigates the tension between inclusive pedagogy and neoliberal reforms in Norwegian education through a pragmatic lens. It traces the historical lineage of education in Norway, underscoring its nation-building role (Helsvig 2014). Post-millennium policy shifts, influenced by OECD recommendations, introduced results-oriented practices, generating tensions with traditional pedagogical norms (Norwegian Official Report 2000:19; Thuen 2010). Utilizing Thévenot's framework, the authors analyze curriculum designs across different periods, hypothesizing a shift towards instrumental and justice-oriented paradigms (Thévenot 2007, 2014). Employing qualitative text and content-analysis, the study examines policy documents alongside subject-specific descriptions from the reforms R87, R97, and LK06, and extracts from textbooks in Norwegian language and Social science across these periods. This inquiry unveils evolving logics and values shaping educational practices and policies, illuminating the nuanced interplay between inclusive pedagogy and neoliberalism within the Norwegian educational scenario, accentuating the implications of quantification tools introduced in the early 2000s (Nilsen & Skarpenes 2022).

RS07 | T03: Engagements in diversity from insitutions to interaction

Connecting Local Activism to Global Hierarchies: a Trust Reading of Synodality and Community-led Local Development

Katalin Fuzer

University of Pecs, Department of Sociology, Hungary

The paper offers a trust reading of participative practices in two very different settings which share a commitment to creating mutual understanding and building common ground locally. 1. The Catholic Church has recently set out to walk a synodal path calling all baptised to (re)discover their vocations by interacting in small local groups, bringing new impetus to their own religious practices as well as to traditional church hierarchies entangled in clericalism and shaken by abuse scandals. 2. The participative turn in the World Bank's Community and Local Development programs in poverty-ridden low-income countries and disaster areas, or the European Union's Community Led Local Development programs call on local actors to interact in co-planning, co-creating, implementing and sustaining complex local development interventions in rural and urban areas in sharp contrast to the co-dependency that evolved in infrastructure-only investment interventions planned and implemented chiefly by international/global development agencies.

Based on the author's prior work on trust, social capital and local development, this paper suggests that we need a more thorough understanding of how interpersonal and institutional trust mechanisms intertwine in a commitment to realize organisational objectives via the emphatically "lay" collaboration of "locals." What kind of trust in "locals" is at the base of these participative processes? Does interpersonal trust evolve among "lay" actors or do participative processes thrive solely on pre-existing interpersonal trust dynamics? How is trust in abstract systems, expertise, professionalism reconfigured in the course of participative processes in these two settings? How can "project class" actors enable or inhibit participation by lay locals in local development and synodal processes? Debating these issues in RS07 would promote the sociology of trust.

"A Holy Discourse Of Secular Orders Of Worth"

Øystein Egeland

University of Stavanger, Norway

The paper presents an analyzis of the Norwegian Church` strategies and rhetorical tools when aiming to change and challenge the migration control policy in to a more liberal direction. The church has been providing church asylum to rejected asylum applicants, offered support to Christian converts, advocated for amnesties, legal rights to work and healthcare services for irregulars. The data draws on in-depth interviews with church officials and volunteers. Combining theorethical frameworks of norm theory and Boltanski and Thevenot`s perspectives on justification and regimes of engagement, the paper aims to analyze central issues of conflict in a broader migration debate.The research field is opting to change institutionalized and entrenched norms on the asylum field when acting as norm entrepreneurs, and in the manners they re-present their antagonists and norm antipreneurs – the migration apparatus and law makers. I discuss how the actors strive to change well-established norms by re-presenting the overall asylum policy and individual cases in certain manners, justified by Boltanski and Thevenot`s different orders of worth. Existing norms and legislation are perceived problematic, which justifies the norms to be undermined. The research field grounds its criticism from within the migration bureaucracy system, highlighting flaws and deficiencies in the asylum procedures. The church navigates between different orders of worth; "inspiration" (religious), civic (rights) and industrial (bureaucratic). The paper illustrates how religiously founded ethics and morals play a less dominant role compared to arguments based on a critical representation of errors within the migration system.

Non-White Meta-Categories in the US and UK: Unpacking the Language of Diversity and Racial Justice

Mari Jose Sanchez

Harvard University, United States of America

My research offers a comparative-relational study of what I call "non-white meta-categories" – umbrella categories that encapsulate or refer collectively to populations considered not white – in the US and UK. In the US, non-white meta-categories include "people of color" (POC) and "minority"; in the UK, these include "Politically Black" and variations of "minority ethnic" such as "Black and Minority Ethnic" (BME) or "Black, Asian, Minority Ethnic" (BAME). While racial justice and State actors have used non-white meta-categories in both countries since the 1960s, the categories have increasingly become unsettled by progressive and conservative actors leading up to 2020. I examine these changes by focusing on the production and reception of the categories. For the production side, I interview 40 civil society actors in each country, including activists, intellectuals, social media influencers, and other public figures, who are actively creating, transforming, and debating meanings about the categories. For the reception side, I look at the government bodies that have responded to changing meanings of non-white meta-categories by proposing new guidelines around their usage. Specifically, in the US, I examine updates announced in 2022 to the Office of Management & Budget's Statistical Directive 15, including guidelines to avoid use of the term "minority"; in the UK, I examine the Cabinet Office's Race Disparity Unit 2022

standards for government departments on how to communicate ethnicity data, which includes the recommendation to eliminate BAME. I argue that non-white meta-categories shape assumptions about the commonalities and differences of marginalized communities, illuminate certain racial inequalities while obscuring others, and inform pathways to achieve racial justice.

To Whom The Racialised Turn: Telling Minority Vs Majority People About Incidents of Ethnoracial Stigmatisation

Anders Vassenden[1], Julia Orupabo[2], Ayan Handulle[1]

[1]University of Stavanger, Norway; [2]Institute for Social Research, Norway

The last decade has seen a surge in studies on how ethnoracial minorities respond to stigmatisation through different strategies, spanning from confrontations to withdrawing (e.g. Lamont 2016). Yet, surprisingly few studies have examined how people rework these experiences in the aftermath, like through seeking support and consolation from significant others. In a study of minorities' negotiation of ambiguous ethnoracial stigmatisation (N=20), we explore the reworkings of stigmatisation in backstage contexts. A key finding is that interviewees typically refrain from discussing them with ethnic majority individuals, whether these are friends, colleagues, or others. Rather, they share their experiences with minority peers. The reasons that our interviewees give for their ethnic/racial separation of audiences and distinguishing between interlocutors, include suspicions that majority individuals may trivialise or not understand their experiences. Even if one expects majority persons to be genuinely sympathetic, the interactional labour of explaining ethnoracial dynamics to someone without similar experiences, may require too much effort, especially when what one seeks, is immediate support. From other minority individuals, in contrast, participants report to experience and expect emotional support and self-confirmation. We propose a theoretical interpretation of these dynamics that centres interaction ritual, formulated differently by Goffman ([1967] 1982) and Collins (2004). Whereas a "nervousness" in prospective minority-majority storytelling resembles Goffman's interaction ritual, the minority-minority situation is closer to Collins' version, which highlights shared focus and emotional mood, and subsequent formation of solidarity.

RS07 | T04: Engagements and affordances of activism

The New Power of the Masses – Internet Communication as an Ordinary User's Tool of Influence

Agnieszka Kampka

Warsaw University of Life Sciences, Poland

The paper addresses whether social media can be seen as a new power tool for ordinary people, similar to the people's voice in democratic elections or crowd pressure in protests and revolutions. Moreover, if so, how can ordinary users use these tools to deal with the experiences of recent times, crises, and global challenges? A single individual can influence the opinions, attitudes and actions of others on social media when they 1) witness important or shocking events, 2) become an influencer, and 3) are part of a large, interacting online community. The latter case will be the subject of this paper.

Using the fandom of the Korean band BTS as an example, the author describes new opportunities for communicative influence by ordinary social media users. Based on a literature review and an analysis of the fandom's activities, the author discusses the specific challenges of media competence in social media. Then, the author refers to selected contemporary concepts on the masses, showing how they can explain the communicative cooperation phenomenon of online collectives. The author argues that these new online forms of social interaction and influence, based on trust and a commonality of emotions and experiences, can be considered a transformative force in the public sphere.

A Pic is More Than a Proof: Unpacking the Polysemy of Climate Images on Instagram through Plural Forms of Valuation

Juulia Katariina Heikkinen

University of Helsinki, Finland

In the era of public space dominated by visual content, understanding how images politicize societal issues has become crucial. Yet, images are still mostly evaluated through their documentative value, ignoring the many different ways in which they can make grievances recognizable, valid and actionable. By unpacking the polysemy of climate change images on Instagram, this paper contributes to the recognition and identification of the plurality of visual politicization, asking: how is the climate emergency politicized through social media images in Europe? Using a novel, ethnography-trained machine learning scheme to recognize and categorize political action (Maltezos, Luhtakallio & Meriluoto, in review), this paper takes the results of a computational categorization of over 20,000 climate-hashtagged

Instagram images from four European countries (Finland, France, Germany, and Portugal) as a starting point for qualitative analysis. With the toolkit of French pragmatist sociology (Boltanski/Thévenot 2006; Thévenot 2001; 2007; 2014; 2015; Eranti 2018)., analysis with empirical examples reveals how different ways to engage with climate emergency cohabit the public sphere, some reaching towards the legitimation through common good and others relying on more personalized and intimate valuations. In practice, three grammars of communality (Thévenot 2001; 2007; 2014; 2015) public justification, individual interest, and familiarity, are operationalized to break down the plurality in visual politicization in online climate activism. This way, the paper moves beyond the indexical relation of images and "truth" towards an understanding of politicization through other forms of valuation.

War's Effect: A Case Study of Environmental Activism in Russia Before and After the Full-scale Invasion of Ukraine

Svetlana Erpyleva

University of Bremen, Germany; Public Sociology Laboratory, Russia

Russia's full-scale invasion of Ukraine not only led to thousands of victims in Ukraine but also significantly impacted the political climate within Russia. Anti-democratic laws, severe censorship, and growing repression were implemented to suppress public dissent. These measures affected civil society and grassroots politics in Russia at large; any form of contentious activism, not just anti-war sentiments, began to be perceived as increasingly risky by activists and the wider public. This paper examines a specific case of grassroots activism in Russia—the Russian branch of the international climate movement "Fridays for Future"—to observe how the war changed it. The paper relies on a holistic study of the movement conducted in both 2021, a year before the full-scale invasion, and in 2024, two years after the invasion. In both cases, in-depth biographical interviews with activists were collected. How did the war impact the organizational structure of the movement and the meanings activists attribute to their activities? How did it alter the biographical trajectories of the activists? This holistic case study of a single movement aims to identify mechanisms that reveal how large-scale military conflicts affect grassroots politics in an already depoliticized authoritarian context.

Being The Change You Want To See. Prefigurative Democracy In Radical Social Movements

Georg Mikael Boldt, Heini Salminen

Univeristy of Helsinki, Finland

Many of the contemporary practices for citizen participation in public governance can be traced to the procedures and conventions developed for deliberation and decision-making in social movements from the 1960s onward. Despite political and bureaucratic acclaim for participatory democracy in public governance, participants and researchers have often been critical about these processes. Nevertheless, far from abandoning the hallmark of popular inclusion, new methods for building common ground are continuously being developed and practiced within social movements.

In this paper, we describe the utopian ways in which democratic practices are prefigured in contemporary social movements. Based on interviews and ethnographic fieldwork in radical social movements in Finland, these findings are situated in a particular cultural context. However, as the paper demonstrates, the various tools, such as the establishment of guidelines for safer spaces in queer activism and the incorporation of deliberative decision-making practices in environmental movements, are globally diffused through activist networks and publications. These practices are a response to perceived repression, inequality, and the capitalist logic of competition, and their application is imaginative and contextually dependent.

We use this case to argue that these methods showcase a desire to create horizontal decision-making structures, reflexivity on the use of power, and expansion of the political community through recognition and avoidance of exclusionary closure. The findings bridge the gap between what is and what could be by showing how movement actors solve the problems they identify in democratic processes by developing new ways of finding commonality. This both highlights shortcomings in common democratic procedures and offers potential solutions for solving conflicts also outside of radical social movement deliberation.

Dancing In The Cells: From The Prison To The Stage...Without Leaving The Cell

José Maria Carvalho, Maria Rosália Guerra, José Manuel Resende

Évora University, Portugal

The CORPOEMCADEIA project was implemented between 2019 and 2022 at Linhó Prison, organizing contemporary dance sessions with a group of inmates with the aim of empowering them for social integration. From the ethnographic research that accompanied these sessions, we realized that dance invites participation in the common, anchored in body listening, energetic-affective attunement and kinetic-rhythmic contagion. Here we focus on the first part of the public presentation of the choreography (and its rehearsals), focusing on the objects summoned to establish sensory-perceptive commonalities. Each inmate goes on stage dressed in their prison clothes, but carrying a bag with their artistic clothes and a chalk. After changing clothes, they draw their cell on the floor, exploring it through the dance language and expressing their emotional relationship with that space. We argue, based on empirical data, that the inclusion in the dance of concrete objects (the bag, the clothes, the chalk), but also imagined ones (the cell and what makes it up), unfolds, through the bodily involvement they arouse, the meanings, hidden between the walls, of the commonplaces summoned represented in the show, thus opening up a public denunciation of the living conditions in prison. This criticism, however, rather than through argument and justification, communicates through the sensitivity of the danced gestures in which the bodies explore and express themselves poetically, thus affirming their common humanity.

Citizenship As Battlefield And As Common Work

Giovanni Moro

Sapienza University, Rome, Italy, Italy

To address the complex dynamics of contemporary societies without regarding common citizens just as victims or beneficiaries either of the State or the market, employing citizenship as a standpoint could be of the utmost worth. The scientific community's renewed focus on citizenship since the 1990s has not led to a shared thematization, as shown by the proliferation of "hyphenated citizenships" that characterizes Citizenship Studies. However, the massive amount of material produced in theoretical research can be used to conceptualize citizenship as a phenomenon. In this way, citizenship can be defined as a device of inclusion, cohesion and development, composed of belonging as status (legal and social) and identity, rights with related duties, and participation. This device is defined and transformed not only in the norms of constitutional rank and in the "repository" of secondary norms, procedures, public policies, judgments, civil regulations, but also in citizenship practices. With the aid of this conceptual architecture, it is possible to research the material configurations and changes of citizenship, reflecting its dynamic, contextual and conflictual nature. Examples coming from research on citizenship in Italy – regarding migration, forms of political participation, establishment of new citizenship duties, management of Covid-19 pandemic – show how citizenship configuration is both a battlefield and the place of a continuous, common work of definition of the political community.

Democracy Without Political? Constructing Hegemonic Consensus on Finland's NATO Membership

Janne Petteri Lehtonen

University of Helsinki, Finland

Following Mouffean understanding of plural democracy, continuous conflict is a core feature of democratic systems. Any established order is a hegemonic articulation, and thus essentially contestable. Attempts to constitute a hegemonic order can be understood as pursuits to depoliticize an issue, yet normatively, room for political (re)contestations would seem a necessary condition for true plural democracy. In cases of security policies and articulations of an outside crisis, however, democratic systems can be particularly susceptible to diminish the space for the plurality of contesting views.

To understand construction of hegemonic order in times of crises, I examine the case of public discussions in Finland during its process of joining NATO after the Russian full-scale invasion to Ukraine in 2022. The public opinion in Finland turned quite literally over one night from opposing NATO membership into supporting it, and consecutively, political leaders started to advance Finland joining NATO. I ask, how mainstream newspapers as public actors interpreted and constructed the novel conversation climate concerning Finland's security and NATO membership, and how space for political conflict and democratic values were represented.

Conducting post-structuralist discourse analysis of Finnish newspaper editorials, I detect an intriguing image of democracy without political. Democratic deliberation over NATO membership was highly valued in the editorials, yet simultaneously, they depict a pre-determined outcome of this deliberation: a wide commitment and unified, non-political support for Finland joining NATO. Interestingly, here democratic deliberation becomes a process of committing everyone behind a hegemonic consensus, and thus rather legitimating the decision than forming it.

Towards a Pragmatist Theory of Politics

Taina Meriluoto, Veikko Eranti

University of Helsinki, Finland

This paper builds the sociology of engagements frameworks towards a theory of political action. It argues that in order to meaningfully employ the framework for political analysis, we need to develop its conceptual tools to account for tools of creating conflict alongside tools of creating commonality. To do so, we need to focus on how political subjects, and conflict situations are created, in addition to focusing on how arguments are built and justified.

Boltanski and Thévenot (1999) use the example of a car crash when illustrating how conflicts emerge. In their imagination, conflicts are situations that happen on their own, and whose relevant actors are obvious. However, conflicts in democratic politics are actively created, and their subjects are deliberately constructed, and only then can be solved through coordination of common action.

This paper builds on our recent work (Eranti & Meriluoto 2023, Meriluoto 2023), joining sociology of engagements with post-foundational political theory. We deploy the latter's concept of hegemony to understand to understand how and why conflicts need to be purposefully created. The concept of hegemony also has a complicated relationship with the core pragmatist concept of critical capacity.

By joining the the two traditions, we build a pragmatist theoretical scaffolding for political analysis – a framework that recognizes that the potential for both creation and resolution of conflicts need to constructed.

RS07 | T06: Engagements in deliberation and community

Different Criticisms Towards Established Associations in Finland

Maija Elina Jokela

University of Helsinki, Finland

Registered associations have traditionally been thought of as the primary form of action that, in pragmatic terminology, can be considered as civic in Finland. This paper is based on ethnographic data about two civic groups in Helsinki, Finland: an urban neighborhood movement called Kallio movement and the Finnish supporters of Right to Live, an asylum seekers' protest. Both are examples of loose and unofficial groups, organized in social media, that differ from the Finnish tradition of registered associations. Both groups also posed criticism towards established civic organizations and rooted for "free civic action" in stead, but for different reasons. In the presentation, I will explore these reasonings with the help of pragmatic sociology.

Kallio movement members criticized the very idea of registered associations because of the associations' hierarchical power relations and the lack of freedom and creativity of individuals whereas "free civic action" was seen as a more dynamic and equal form of action. This kind of critique is a combination of civic order of worth and liberal grammar. The supporters of Right to Live criticized the traditional volunteer organizations working with regugees with a vocabulary stemming from the familiar regime. The supporters perceived that organizations such as the Red Cross intentionally prevent personal relationships between asylum seekers and the volunteers, therefore dehumanizing the asylum seekers. In contrast, the supporters of Right to Live highlighted the friendships that had formed between the asylum seekers and the supporters by calling the protest "Right to Live family".

I ask, do these critiques change the valuation of registered associations as the vehicles of civic order of worth and how?

Lay Engagement with Interconnected Environmental and Social Crises: Complexity, Voice and Deliberation in Comparative Perspective

Sarah Irwin[1], Anna Baillie[2], Tim Reddel[3], Miriam Yates[3]

[1]University of Leeds, United Kingdom; [2]University of Glasgow; [3]University of Queensland

It is widely recognized that the interconnected crises of climate change, ecological collapse and extreme inequality cannot be addressed without inclusive, creative and democratically informed interventions to transition away

from high carbon energy and social arrangements towards sustainable ways of living. However, in current policy framings and political narratives there is limited scope for citizen engagement in forging such interventions, particularly amongst disadvantaged communities. Relatedly, 'the public' are often positioned as naïve or misinformed and there is insufficient recognition of nuance within lay understandings. This shortfall in democratic engagement gives oxygen to populist claims about what "the people" really think and stalls political and policy action on climate change and related inequalities.

We examine new research evidence on complexity in citizens' engagement with the climate and ecological crises, bringing into comparison examples from England, Scotland and Australia. These focus on minoritized groups' perceptions of climate policy and the cost of living crisis in England, local deliberative engagements in energy transitions in Scotland and indigenous sustainability practices and land stewardship in Australia. Across these varied cases we interrogate parallels both in research participants' recognition of, and engagement with context and complexity and in how their perspectives are marginalized in mainstream political and policy discourses and practices. We draw from these cases to explore ways in which community voices and practices might inform more democratic, relational and collaborative forms of policy making which, in turn, could accelerate transitions to a low carbon and more equitable future.

Expert Engagements with the Imaginary of 'Community Energy': the Case of Portugal

Ross Wallace

Instituto Universitário de Lisboa (ISCTE-IUL), Portugal

This study investigates the formation and interpretation of new laws for "Renewable Energy Communities" in Portugal by experts from legal, scientific, political, and economic fields. Utilizing pragmatic sociology and discourse analysis, it scrutinizes legal documents, policy frameworks, and expert interviews to understand how these new constructs are construed as viable solutions for energy transition and climate change. The research probes into the institutionalization process of these laws, examining how future-oriented engagements influence them. It inquires into how various institutional practices, types of expertise, and social representations have shaped these laws, exploring different orientations towards the future (such as possible, probable, hoped-for, or feared outcomes) and their relationship with distinct regimes of engagement.

In particular, we treat new energy laws as the site of struggle between a plurality of competing social representations of the common good, which are constituted by, among other things, imagined publics and expectations of the future. In the case analysed here, social representations of "active" versus "passive" citizens, and of "communities of place" versus "communities of interest" are playing a pivotal role in the transposition of Renewable Energy Communities in Portugal, as are representations of security, liberty and fairness. We highlight how technical experts navigate these

discursive tensions, reinterpreting key attributes of energy communities,

This analysis reveals that despite critical tensions, a stable and conventional approach to energy transition is discursively sustained. This conventional path involves scaling up community energy, anchoring it in dominant institutional logics and neoliberal ideologies. The study thus sheds light on the complexities of institutionalizing Renewable Energy Communities in Portugal, demonstrating the interplay between forms of engagement, orders of worth and social representations in shaping energy policies.

How Confident and Extreme Opinions Can Challenge Deliberation Processes: a Case Study of a German Mini Public on New Genomic Techniques

Nora Heinzelmann[1], Leonie Dendler[2]

[1]Friedrich Alexander University, Germany; [2]German Federal Institut for Risk Assessment, Germany

This presentation will discuss current deliberative trends in finding ways for society to "build commonality". In particular, it will shed light on the potentially problematic role of participants advancing extreme opinions in public deliberation processes. Drawing on literature from philosophy and social science together with empirical data from a German consensus conference on new genomic techniques, we discuss how deliberation events tend to attract individuals with more extreme and confident opinions. We also provide evidence that participants, in our case, became significantly more confident in their opinions, that confidence and extremity of opinions correlated, and that participants changed more extreme opinions less during deliberation. This, we argue, may in turn have problematic implications: it may promote group polarisation, impede consensus, and prevent policy impact. We will close with an outline of potential strategies to address these issues and areas for further research for deliberative participation and societal consensus finding overall.

RS07 | T07: New Social Pragmatism

Pragmatist-inspired Sociologies and Disaster Studies. Understanding the Moral and Political Complexity of Repairing

Laura Centemeri

CNRS, Centre d'Etude des Mouvements Sociaux/EHESS, Paris

In this paper I argue for the relevance of pragmatist-inspired sociologies in the field of (critical) disaster studies. In particular, I show the interest of sociological tools that are sensitive to the diversity of modes of engagements with the environment in exploring the tensions surrounding the definition of damages and their repairing. Such a sociological perspective reveals the diversity of forms in which "reparation" can be defined and can occur in disaster situations. In particular, I highlight three different logics of repairing that become visible in the aftermath of disaster. Repairing as a demand for justice; repairing as fixing infrastructures so that they are functional again; repairing as the practice of taking care of damaged (social and material) ecologies. This approach is based on the assumption that every disaster situation is, first and foremost, a problematic situation marked by uncertainty and the need for inquiry on the "whatness" of what is going on. The nature of the event as a disaster and the damages it caused are defined through a series of valuation processes and claims for recognition. Struggles to assert certain interpretations of the situation determine the realm of possible futures. In this sense, ways of repairing are intertwined with different ways of preparing (for) the future. The emphasis on the technical dimension of recovery and the urgent need to get infrastructures up and running again – recovery as « building back better » – turns recovery into a moment of decision about the future which, without taking the time to deliberate collectively on desirable futures, irreversibly erases certain futures from the horizon of possibilities, what Tony Fry calls defuturing.

Places of Engagement and Engagement in Places: How Similar Rural Communities Construct Dissimilar School Communities

Ove Skarpenes, Kirsten Horrigmo

University of Agder, Norway

This paper aims to clarify the huge variety in school assessment results in two similar rural municipalities in Norway. We conducted a statistical analysis that included 420 of the country's 429 municipalities. The statistical analysis adjusted for the three most important variables and a regression model showed deviations from actual and expected results in the national tests. Against this composite backdrop, two places were chosen for comparison. In Sunplace the pupils scored much higher than expected, and in Woodland, the pupils scored much lower than expected. The reproduction thesis did not fit well with the cases discussed in this paper since the "reproduction variables" are adjusted for. Thus, we searched for other cultural differences. In these two cases interviews with eight key persons (three in Sunplace and five in Woodland) who together represented a certain breadth of local knowledge both from civil and public affairs were conducted. In addition, we did six focus group interviews with teachers and pupils (three in each municipality). Theoretically informed by Laurent Thévenot's work our contribution sketches some differences in how people participate with different forms of engagement and construct different forms of commonalities in the two rural school communities. Our findings show that the differences in sense of pride and community are communicated into the school cultures. The consequence is varying degrees of discipline and inclusion at the schools.

New Social Pragmatism

Eeva Luhtakallio[1], Veikko Eranti[1], Anders Blok[2]

[1]University of Helsinki, Finland; [2]University of Copenhagen

1332

This presentation introduces a new theoretical approach to political action, the New Social Pragmatism. This approach combines conceptual tools from the French pragmatist tradition (in particular Boltanski & Thévenot), and American cultural sociology (in particular Swidler, Eliasoph and Lichterman). We suggest that such combination is beneficial for considering how people strive to create commonality in today's complex societies, offering a widened perspective to analysing how the political emerges through an array of activities. Furthermore, the approach positions conflict at the centre of inquiry to make sense of the different ways people engage in society.

NSP provides tools for understanding simultaneously the structures of social life, and the conditions in which social life changes. In the presentation, we exemplify how this approach helps address social life flowing smoothly, resulting from people's constant action of engaging in ways that aim at ensuring the flow, and crises interrupting the flow and people's contextual tools to solve the crises, either returning to smoothness or laying out new landscapes: in sum, efforts and activities building the common from essentially pluralist starting points.

To present New Social Pragmatism, we revisit the concept of participation in social scientific debate. We argue that the concept needs both clarification free of normative weight and widening of scope to grasp types of societal action currently often passing under its radar. These aspects are joined in connecting the concept of participation, the actions taken to create commonality, and a broad understanding of the political under the idea of 'doing society', referring to the constant engaging, imagining and acting taking place on a scale from everyday situations to larger social transformations.

RS07 | T08: Engagements with altered agency

Being In Dementia: At The Limits Of Existence, Are There Still Commonplaces?

Maria Rosália Guerra, José Maria Carvalho, José Manuel Resende

Universidade de Évora, Portugal

When individuals affected by dementia seclude themselves and resist leaving the places where they freely circulate, in a relaxed manner, within the disoriented comfort they create with objects that affect them, such behaviors raise perplexities among social support professionals who accompany them daily. Their observations in the face of scenarios of this nature lead us to confront multiple dilemmas, as they indicate resistance from these actors in implementing the normative guidelines referenced in public policies aimed at caring for and protecting individuals at the limit of their existence.

In this communication, we present reflections that we have been conducting in research that has been physically accompanying individuals incapacitated by dementia. Faced with these incapacitations, it is from their corporeality that we take note of how these actors react when activities requiring leaving the environments they inhabit as living beings are proposed to them. Based on data collected through prolonged ethnographic observations in various environments they navigate, we gather information where the connections of their personality in those contexts are made through the mediation of intermediary objects that make possible the production of commonplaces affecting their existence.

The sensitive aspects of the proximity between these individuals and elective objects have led us to overlay the analysis on their dependencies as living beings, and through them, the tensions they exhibit and that resonate in expressions through their bodily gestures, clearly deviating from one side of the grammars that support intentional action and, on the other side, from the aspirations of languages that underlie empowering purposes in the pursuit of autonomy.

Putting Situationnal Citizenship To Music

Simon Lemaire

Unamur, Belgium / Dune

Based on a doctoral research, my contribution rely on an ethnography of politics and participation (Cefaï, D., Carrel, M., Talpin, J., Eliasoph, N., & Lichterman, P., 2012; Berger, 2018) about groups of people living with young onset dementia. The canonical analysis of participation risks being reduced to the classic observation of democratic deficit (Zask, 2011) in those dementia activist groups. A Goffmanian perspective however invites us to go beyond this observation to dwell on the interactional efforts developed in these spaces where political and care wills are mixed. Through an interactional work aiming to allow people living with dementia to share the cognitive relationship embedded in each situation, the moral and political identity of the people affected is restated. I linken this interactionnal attention that I qualify as "setting to music" with a form of citizenship that I define as "situationnal", and I question the coupling of this goffmanian citizenship with forms of agency of the individual on his private or public environnement, using a Deweyan pragmatist approach. The sociological analysis I suggest paves the way between the political philosophy of democracy and concrete situations of participation in the specific case of a vulnerable public, and it therefore adresses in a very pragmatic way the question of "How to create and maintain mutual understanding and build common ground without excluding or taming down differing voices?"

Politics, Elections, Disabled People: Disabled People in Turkey in the Context of Local and General Elections

Esra Ince

Ankara University, Turkiye

The fact that people with disabilities often lack equal access to education, health care and rehabilitation services and employment causes them to be excluded and marginalised from socio-economic,cultural and political life(Groce,2018:724).However, problems such as the low visibility of the issue of disability, which is complex and has a very wide factual plane, and the fact that they are not included in the target audience by politicians are quite common. Political parties have the functions of socialisation and social mobility, focusing on a specific issue and bringing together micro-scale problems. This ground first of all enables disabled individuals to provide socialisation and social mobility by using political parties as a tool in social integration. In the context of the "human rights model" that we use to make sense of the social place of the disabled, the fact that the parties are in a political structure that "represents" the disabled is seen as important in their social integration and in expressing their problems. In the context of disability and political parties, this study focuses on the place and representation of the disabled in the electoral policies of the General Elections of the Republic of Turkey(2023) and the local elections of the Republic of Turkey(2024). Within the scope of the study, the posts about the disabled and disability policies in party texts and social media accounts will be analysed by critical discourse analysis and content analysis method. In addition, equal access of disabled people, whether they are socially excluded or not, and in which context they are included in the texts are other points examined in this study.

RS07 | T09: Urban & spatial engagments

Contesting The Compact City: Hyperdensity As A New Meta-critique

Luca Piddiu[1], Luca Pattaroni[2]

[1]University of Geneva; [2]École Polytechnique Fédérale de Lausanne

Inheriting from the social urban struggles of the sixties and seventies, new urban contentious forms are being analyzed in western cities, going from protest camp to public renaming, combined to more traditional forms of protests. Among these, disputes about the "compact city" and its high density are fairly less talked about. Regarding our case-study of Geneva, contested urban "hyperdensity" is becoming the hegemonic topic in the public sphere, problematizing "saturation" effects (Pattaroni, Drevon & Piraud, 2019).

Investigating recent mobilizations against densification project, we will attempt to account for the contemporary renewal of urban struggles in a double context of a financialized and guaranteed urban development. Indeed, the mobilization against hyperdensity opposes urban projects that have often a large political support as they reflect the compact city compromises – those of the "sustainable neighborhoods" forged in the beginning of the 2000, between market, civic and green principles. In anchored situation of urban resistance to densification projects, conservative small private owner associations are joined by radical ecological activists forging new alliances around the preservation of biodiversity and a partly renewed criticism of metropolis (Faburel, 2020).

This politicization of urban development, reinstate the issue of the City as a political project of commoning and reneighboring between human beings and living entities. The renewal of urban struggles will allow us to question the place not only of new assemblages (Blok, 2013) in renewed urban commonalities but also the way broader meta-critiques of contemporary capitalist development find their way in new situated critical engagements along alternative ways of testing – and accounting for – what could constitute a viable future.

Domestic Space and Emergent Markets Rival Each Other – Towards Renewed Rules for the Division of Welfare

Jutta Elisabet Juvenius

University of Helsinki, Finland

This presentation is based on large interview material that is collected both from the urban dwellers from Helsinki as well as from housing specialists working in the biggest cities of Finland. In the presentation I look how changes in the housing system – that has been one of the key sites for the Nordic Welfare State – have shaped the conditions for division of welfare. I show how home has remained its status as special place and source of ontological security, challenging recent neoliberalist comments framing apartments as tradable consumer goods. Same time cities – being key actors drafting housing policies – aim to adapt to changing operational environment. Based on data, all cities participating into study still recognize social mixing and social housing as key welfare interventions, though the number of latter has shrunk drastically. Nevertheless, even cities declaring anti-market policies pass recent notes on market-oriented housing policies' tendency to weaken urban dwellers' ontological security and create new societal hierarchies. This requires new coping strategies with which residents aim to secure continuity of their dwelling conditions. Finnish social policies have historically based on universalism, so public good is targeted for everyone regardless their social status. However, these developments create a situation in which urban dwellers are either expected to secure their own welfare or be in weak enough socioeconomic position to enter circle of social housing. Altogether this means that there is a need for discussions on the values steering societal development and how these values are implemented in urban dwelling.

The Devil Is In The Details: Solidarities In Shared Spaces

1334

Akofa laetitia Boglo

Universiteit voor Humanistiek, Netherlands, The

Solidarity needs people to exist between, and sometimes objects or events to organise around. But what about a space to organise or emerge in? This paper looks at particular spaces in which people share – physically – common ground, and asks how they can be spaces within which solidarities emerge, converge, and sometimes compete.

Drawing on participant observation and interviews in community centres in two Dutch neighbourhoods, this paper asks what happens if we approach community centres as more than containers within which people can participate in low-threshold activities or find social support, but as spaces with significant potential to act upon and shape the interactions that take place within them.

In a further step, the organisation and in some sense curation of these spaces by volunteers and professionals is considered. The way these spaces are filled in, and the process according to which this happens, is argued to reflect particular cultural repertoires which set up norms and create boundaries around proper and 'improper' use which can then become imbued with symbolic meaning.

This pattern appears through an examination of (small) details ranging from opening hours and programming, to types of beverages available, and furniture and toys in common areas. It often appears that these spaces take shape through a haphazard process of repair and replacement over time, and programming and accessibility are subject to financial and organisational constrains. However, an

argument is made that these details and the meanings attributed to them, though they may appear of little consequence, can influence how people come together and affect the types of solidarities which emerge within these shared spaces.

RS08 | T01: Performative Citizenship and Beyond

Horizontal Citizenship and Solidarity. How Urban Movements Create Alternative Ways of Being Political

Helge Schwiertz

Universität Hamburg, Germany

In the face of the polycrisis, citizens in Europe are experiencing the restrictions, failures or absence of state institutions. These institutions hardly provide adequate responses to the crises, and their post-democratic constitution leaves little room for the articulation of dem-ocratic alternatives. In this context, progressive movements tend to relate less to the 'imag-ined community' of the nation-state and a bounded community of citizens than to cities, neighborhoods and communities. And they do not limit themselves to participation, protest and demands vis-à-vis the state, but engage in prefigurative practices of solidarity, care and commoning. However, what significance does citizenship still hold in these contexts and how can we reconceptualize citizenship to consider these changes? To examine the remain-ing emancipatory potential of citizenship approaches with regard to social movements lo-cated at urban scales, I propose the concept of 'horizontal citizenship'. Detaching citizen-ship from a narrow focus on the state, I explore the enactment of citizenship through rela-tionships of solidarity in civil society and social movements. I emphasize how, against ne-oliberal individualization and isolation, collective political subjects emerge that often con-stitute themselves transversally by crossing national boundaries or the public-private-split. On a theoretical level, I critically review sociological and political concepts of citizenship in relation to contentious politics. I discuss approaches of insurgent, performative, and urban citizenship. Challenging the persistent focus on legalistic notions and state institu-tions in citizenship studies, I re-articulate the concept of citizenship with concepts that are currently resonating in both academic debates and social movements: solidarity, care, and commoning. Theoretical considerations are combined with empirical analyses based on the recent history of social movements in Europe and selected case studies of the ECSEuro project.

Inhabiting the City. Solidarity Practices in Urban Mobilizations in Italy

Angela Adami, Joana Hofstetter

1335

Scuola Normale Superiore, Italy

Activists increasingly frame their engagement in contestations at the urban level around notions of "inhabiting" rather than "housing", thereby also creating new collective identities and political subjectivities as "inhabitants", dwellers and citizens at the same time. It is around this definition that coalitional practices develop around an idea of embedded solidarity. This contribution explores such practices of "inhabiting" as they emerge through mobilisations "from below" in a variety of urban initiatives, spanning across issues of housing, migration and care. Using in-depth and site-specific ethnographic data collected in Florence and Palermo, we show that initially, practices of mutual aid create forms of solidarity which are localised and tailored to the necessities of specific neighbourhoods and constituencies. With time, however, these practices tend to expand beyond the boundaries of their geographical origin and link otherwise disconnected urban areas. Theoretically, we draw on the concepts of mutual aid (e.g. Katz, 1981; Kropotkin, 1902; Spade, 202; Travlou, 2021), the commons (e.g. della Porta, 2024), and intersectional solidarity (e.g. Ciccia, della Porta, & Pavan, 2021; Ciccia & Roggeband; 2021) to address both the microlevel dynamics, the production of alternative economies, as well as the question of the broader transformative potential of these entangled practices. Empirically, we aim at singling out in a cross-city perspective the specific adaptation of solidarity practices to the different political and discursive opportunities in the two different contexts, seeing them as embedded in specific territorial political subcultures which also affected the social movement development.

Love Against Borders – Articulations of sexual citizenship in cross-border and transnational protests

Jennifer Ramme

Viadrina Institut für Europa-Studien (IFES), European University Viadrina, Germany

Many countries are experiencing war or growing authoritarianism based on heteronormative nationalisms, forcing LBTQIA* populations to migrate. For example, Russia's anti-LGBTQ* policies, manifested in increasing repression and bans on so-called "homo-propaganda", as well as similar policies in some former state-socialist countries in Europe, are one of the reasons for the increasing migration of queer people. At the same time, local resistance emerged in countries such as Poland, articulated in protests that deploy alternative imaginaries, while local protests in migration hotspots such as Warsaw or Berlin are transforming through the involvement of new activists. The activist landscapes are changing and we can observe new articulations of dissent, such as the cross-border protests between Słubice and Frankfurt Oder on the Polish-German border. They are an example of activism that challenges both national and European scales and identity bordering. Drawing on empirical research, including participant observation, media analysis and interviews, this study examines the negotiation of sexual citizenship in the discourses and actions of the Słubfurt Pride or through transnational demonstrations in the urban centers of Warsaw and Berlin. It explores how these gatherings transcend national, gendered and sexual boundaries.

(Re)articulating Acts of Citizenship in Times of Multiple Crisis – The Field of Housing and Activist Tenant Citizenship

Franz Bernhardt

Aalborg University, Denmark

The concept of "acts of citizenship" (Isin 2008) accounts for the interventions of those who are not considered political subjects because of their precarious legal status or social position, but who constitute themselves as citizens by becoming public and making rights-claims. We argue to extend the debate on acts of citizenship 1) theoretically, by re-articulating activist citizenship approaches with concepts of care and solidarity, and 2) empirically, by analyzing cases of activist citizenship in the field of housing. First, we discuss how the definition of acts of citizenship is fundamentally linked to a specific understanding of politics that is based on becoming public and claiming rights as well as negation/rupture, which Isin (2009) conceptualized by distinguishing 'active' and 'activist' citizenship. Even though this understanding of politics is crucial, we are also stressing the importance of close social ties, mutual help, and solidarity for the emergence of collective political subjectivities. Second, we substantiate and advance this theorization through our empirical research in the field of housing. We examine politically organized tenants' assemblies and struggles by focusing on the movement Almen Modstand, which emerged in 2018 in reaction to the commodification, privatization, and territorial stigmatization of non-profit housing in Denmark through the Danish government's 'Ghetto Law'. This empirical intersection of housing, care, migration, and anti-racist activism makes this struggle a unique new case to advance the concept of citizenship acts by examining its emergence in a social and political space (non-profit housing) where it is commonly not discussed in these terms.

RS08 | T02: Migrant Solidarities and Transversal Alliances

Precarious Migrant Solidarities and Spaces of Witnessing in the Aegean Carceral Archipelago

Ludek Stavinoha

University of East Anglia, United Kingdom

Since 2020, the Aegean archipelago has witnessed the growing criminalisation of citizens who assist illegalised migrants and the construction of a new highly securitised, EU-funded carceral facilities – 'Closed Controlled Access Centres' – for containing 'undesirable' migrant populations. Drawing on long-term ethnographic research on citizen-led migrant solidarity initiatives on the Greek islands of Lesvos, Samos, Chios, and Kos, this paper documents how citizen-volunteers navigate this changing terrain.

Located at the intersection of debates on 'citizen humanitarianism', migrant solidarity, and 'acts of citizenship', the paper first identifies three tactics deployed by the state – (1) physical erasure of autonomous spaces of solidarity; (2) silencing of political speech; (3) and racialised segregation – and their ambivalent effects on the ability of grassroots volunteers to enact solidarity and engage in practices of witnessing to violence against incarcerated migrants. It details how this has blurred the boundaries between solidarity initiatives and the state-sanctioned humanitarian/bordering apparatus on one hand, while also generating subversive, if highly precarious, forms of clandestine solidarity on the other. The paper argues that attempts to eviscerate solidarity are not just assaults on the ability of grassroots actors to provide humanitarian aid. Rather, they constitute attempts to foreclose the possibilities of camps in the Aegean from being transformed, once again, into spaces of witnessing; symptoms of a bordering apparatus that seeks to stifle and choke transgressive solidarities between citizens and non-citizens. With the Aegean islands a long-standing site of infrastructural experimentation for disciplining unruly mobility, the implications of this extend far beyond Greece.

Doing Solidarity in Urban Borderlands: Grassroots Initiatives and Migrant Support in Athens and Thessaloniki – Exploring Care Practices, Community Spaces and Networking

Chiara Martini

University of Milan, Italy

In recent years, solidarity grassroots movements and autonomous organizations have become pivotal in responding to the exclusionary EU migration policy, both at Europe's borders and within its member states. The present study focuses on the Greek context, a crucial entry point in the EU and an important nexus of the Balkan Routes, where a dynamic network of individuals and organizations from below has undertaken diverse forms of support for those attempting to reach Europe. Drawing on an ethnographic research conducted in the cities of Athens and Thessaloniki while participating in various pro-migrant initiatives, the paper delves into the practices of local and international grassroots organizations that have engaged in mutual aid, care, and "direct social actions" (Zamponi, 2017) in these contexts, offering alternative, non-hierarchical approaches to assist people on the move. Focusing on urban spaces as significant arenas (Bauder, 2020), the study examines the "de-bordering" practices (Ambrosini, 2022) of these actors which, although not always explicitly contentious, have proven crucial in challenging border regimes and constructing alternative alliances that contest prevailing migration policies. Therefore, the study underscores the role of urban spaces in the proliferation and reinforcement of borders, as well as in their contestation, fostering forms of solidarity and resistance. Secondly, it unravels the dynamics and outcomes of these practices, assessing their role in forging alliances and networks that actively challenge the current migration and border regime. Additionally, it explores how these initiatives contribute to creating new "safe" spaces conducive to encounters and exchanges, promoting a perspective that seeks to address and alleviate oppressive and exclusionary policies.

Solidarity Networks and Places of Hope: Addressing Housing Issue of Persons under International Protection in Ljubljana

Anteja Tomašič

The Peace Institute, Slovenia

The main focus of the paper is to address the challenges of finding housing in Ljubljana by persons under international protection, and to discuss the emergence of alternative forms of participation and practices of solidarity within the local community. In addition to being affected by the high

1337

demand for accommodation and rising rent and real-estate prices on the free housing market, refugees face discrimination based on their background. Their everyday lives are severely affected by the inconsistencies of the Slovenian integration and housing policy. Immediately after obtaining the refugee status, they must leave the asylum home and look for accommodation in the free housing market. Due to deficiencies in the mentioned areas, they seek solutions beyond state politics. Through ethnographic research, we mainly observe two strategies that help to address their housing issues. The first is the use of a few private apartments the knowledge of which is spreading by word of mouth. These apartments are places of hope, yet a reminder that the authorities should address housing accessibility for refugees on a systemic level. The second strategy is mutual assistance in finding accommodation and sharing information about empty housing capacities, which takes place in the private environment and on the premises of NGOs. Both strategies show innovative ways of networking between refugees and the local community to find temporary solutions to deficient integration and housing policy. With an ethnographic approach, we discuss the experiences of refugees and homeowners, and show how solidarity networking strategies create new places of hope.

The Affects Of Solidarity

Niki Kubaczek

transversal texts, Austria

2024 looks like another year where ultra right wing political parties gain even more momentum and consensus than the years before. The years of (the mostly Spanish) municpalism and the different struggles for a solidarity city seems to be moving further and further into the distance. The paper will discuss to what extent the notions of municipalism and the city as site of solidarity (Mokre / Kubaczek 2021) could be of use against the looming authoritarian, racist and fascist tipping points of the present: What are the possibilities of undermining the narrative of migration as threat, that works so well over the last years and decades? What could struggles for a solidarity city contribute to the question of social movements and insitutions? What is the difference between charity , solidarity and care? And how could struggles for a solidarity city contribute to a movement, in which intersectional analysis transform into a transversal solidarity? With solidarity city movements as an example, the paper will focus first and foremost on the question what affects lie in the heart when solidarity takes place, when we enact solidarity. Therefore the paper will connect the notions of affirmation that Ferdinand Tönnies developed in Gemeinschaft und Gesellschaft. Abhandlung des Communismus und des Socialismus als empirischer Culturformen an connect it to recent notions of an affirmative politics as proposed for example by the feminist philosopher Rosi Braidotti in various recent writings.

RS08 | T03: Care as a cross-cutting concept: practices, communities and struggles of care at urban scales I

Solidarity Neighborhoods In Berlin and Hamburg: Building Relations Of Care, Communities, And Commons In Local Struggles Around Housing And Migrant Rights

Mouna Maaroufi

Hamburg University, Germany

Based on ethnographic fieldwork conducted in the neighborhoods of Kreuzberg in Berlin and Wilhelmsburg in Hamburg, this paper examines solidarity initiatives and the relations of care, community, and commons that are being formed in ongoing struggles around housing and migration. In these neighborhoods shaped by gentrification, displacement, privatization, and precarization, it analyzes the approaches of several initiatives in addressing and transforming the prevailing crisis-ridden conditions 'from below' and asks to what extent the local context of the neighborhood helps to forge long-term relations of care and solidarity, thus facilitating the intersection of different struggles. In Hamburg-Wilhelmsburg, we focus on two initiatives which are mainly active locally and maintain close relations among each other – despite different political and community backgrounds. In Berlin-Kreuzberg, the research centers on a collective non-commercial kitchen and space of encounter and organizing for heterogeneous people. The cases show how communities and commons are built in neighborhoods around shared spatial and social contexts in which relations of "autonomous solidarity", "mutual aid", and collective care practices arise in the everyday life (Agustín & Jørgensen 2019, Spade 2020). The initiatives are involved in a continuous process of commoning of "infrastructures of solidarity", in which responsibilities and resources are as best as possible distributed collectively and democratically (Schilliger 2020, Caffentzis & Federici 2014). In this way, the initiatives enact lived alternatives to privatized and commodified ways of social provisioning and to the disciplining and differential inclusion of (municipal) institutions. Establishing such alternatives on a local scale entails working against the prevalent individualization and isolation, overcoming the constructed distance and divisions in contemporary crisis-ridden city life and in doing so, building solidarity communities, neighborhoods or even cities.

1338

Abolitionist Community Care Against the State

Melanie Susan Brazzell

Harvard University, United States of America

The concept of 'community' is frustratingly vague, rarely defined yet often invoked by sociologists and political actors as a local counterweight to state models of governance. This presentation tackles the slipperiness of the term through an ethnography of movements for abolitionist care and transformative justice in London and Berlin. I examine their concept and practice of 'community' as a non – or anti-state alternative to the criminal legal system for safety and justice, particularly for gender-based violence.

While transnational bodies like the EU evacuate some elements of national sovereignty, others are reconfigured by neoliberal governance: through austerity in the caring social sector and expansion of the carceral state. Reproductive care work is outsourced to private sector, precaritized migrant workers (who are then disciplined by a "crimmigration" (Stumpf 2006) regime) or to third sector "shadow state" (Wolch 1990) non-profits, where an unwaged community replaces the state as service provider through "community capitalism" (Van Dyk 2018).

Yet 'community' is also deployed by a range of political actors as a figure of opposition to the state and capital. Among them are transformative justice practitioners in London and Berlin who draw on Black, indigenous, queer and crip feminisms to provide mutual aid to community members experiencing violence. This abolitionist care (Medel 2017, Boodman 2020, Thompson 2021) drags 'kitchen table' support out of the feminized private sphere, not into the public (the state) but into the "third space" (Federici 2019) of the commons. I ague that these movements reimagine community through a framework of care as interdependent relationality and shared denizenship, and mobilize community to contest the carceral state, whose sovereignty and citizenship is framed as disintegrative of social bonds.

Embodied Solidarity : Feminist Care and Vulnerability in Parisian Squats

A. Tancrede Pages

Ghent University, Belgium

This article examines the practice of everyday solidarity within a squat in the Parisian banlieue (suburb). It focuses on the tensions involved in everyday life within a heterogeneous collective that embodies a wide range of differing precarities and identities from illegalized migrants to transpersons and from persons with substance abuse disorder to neuroatypical persons. Based on months of ethnographic fieldwork in two Parisian squats – one which was self-described as being an LGBT+ space – I explore the concept of embodied solidarity as relying upon a shared common space in which interpersonal relations of care may occur. In particular, I break down how squats can serve as sites of (de-)re-constructing the meanings of deservingness, belonging, and precarity of a multitude of socio-political struggles into an amorphous collective identity rooted in everyday interpersonal interaction. The article concludes by emphasizing the way in which embodied solidarity opens up the possibility for a prefigurative politics, namely presentist democracy, which allows for claims to a right to the city be made by heterogeneous socio-political actors.

RS08 | T04: Care as a cross-cutting concept: practices, communities and struggles of care at urban scales II

Claiming and Commoning Care in the City. Solidarity Practices in/through the Feminist Strike Movement in Zurich and Bern

Sarah Berit Schilliger

University of Bern, Switzerland

Particularly since the pandemic, it has become evident that nation-states and markets have failed to create care infrastructures that guarantee good care and offer decent working conditions. This structural carelessness, manifested above all at local level, has been increasingly addressed by feminist strike movements in recent years. In Switzerland, around 300'000 women took to the streets on 14 June 2023. However, the feminist strike movement is by no means limited to this event but can rather be understood as an ongoing process (Gago 2018) with different forms, scales and sites of politicization of care.

Based on activist ethnographic fieldwork within the feminist strike movement in Bern and Zurich, I explore how childcare workers, networks of mothers and neighborhood collectives challenge the ongoing crisis of social reproduction by both claiming the expansion of public childcare infrastructures and by creating self-organized, collective structures and spaces of childcare within the city. Solidarity between paid and un(der)paid care workers for the expansion of public care infrastructures and self-organized care commoning in the neighborhood are both elements of a multiplied process of feminist striking. At the micropolitical level, these initiatives can be seen as practical interventions answering to immediate needs in the context of an ongoing care crisis, but also as experimentations with collectively and self-organized forms of care, based in affirmations of interdependency (Tronto 2013) and intensified proximity (Roth/Russell/Thompson 2023). On a broader societal level, these solidarity initiatives not only question the hegemonic division between the public and the private spheres, but also the neoliberal "care fix" strategy which attempts to bridge the care crisis by "offloading the cost of care" to less privileged sectors of society (Dowling 2021).

Domestic workers and the Covid-19 pandemic: Who cares?

Christina Mittmasser[1], Milena Chimienti[1], Emma Gauttier[2], Myrian Carbajal[2]

[1]University of applied Sciences and Arts western Switzerland, School of Social Work Genevad; [2]University of applied Sciences and Arts western Switzerland, School of Social Work Fribourg

Women working in the domestic sector have been particularly affected by the Covid-19 pandemic due to their precarious working conditions in private households and the unstable legal status many of them hold. While the value of other forms of care work was at least symbolically recognized, domestic workers experienced a further invisibilization and vulnerabilization. In an ongoing research project we study the effects of the pandemic on these women's lives in Switzerland. Not only do we inquire the different ways they have coped with this exceptional situation, we are also interested in the support infrastructure that was available for this group during the Covid-19 crisis. Our contribution is based on 58 semi-structured interviews with representatives of political authorities, as well as civil society actors providing alimentary, financial and administrative support in four cities (Zurich, Bern, Fribourg and Geneva). These are complemented by a first set of narrative interviews with domestic workers. Preliminary results show that they could rarely access support measures by the state during the pandemic, and the responsibility to care for them was passed on to the city level and smaller civil society actors. Thereby, the management of the pandemic reveals the low value the state attributes to domestic work, but also new forms of solidarity by non-state actors on the local scale. In this context, we aim to discuss the potentials and risks of rescaling responsibilities in times of crisis and show how local initiatives challenge and reproduce nation-state logics at the same time.

1340

Cooking, Caring, Communing from Below: Grassroots Community Kitchen Initiatives in Five European Cities

Sandi Abram[1], Joana Lilli Hofstetter[2], Mouna Maaroufi[3], Franz Bernhardt[4], Natascha Flückiger[5]

[1]University of Ljubljana, Slovenia; [2]Faculty of Political and Social Sciences, Scuola Normale Superiore, Italy; [3]University of Hamburg, Germany; [4]Aalborg University, Denmark; [5]University of Bern, Switzerland

In this paper, we examine collective cooking initiatives in five European cities, highlighting the importance of fostering mutual care and commoning spaces in the realm of social reproduction within contemporary urban social movements. We argue that the communal act of cooking and eating serves as a powerful counter to the precarious

conditions of urban life, creating a sense of commonality, care and working against divisive and hierarchical power relations.

Our analysis positions grassroots community kitchen initiatives as forms of resistance to the neoliberal city, characterized by a commodity-oriented aestheticization that often leads to gentrified urban atmospheres, including the gastrofication of public spaces and various tastes of gentrification (Stock 2013; Alkon, Kato and Sbicca 2020).

In response, we explore the politicization of eating practices as a means of commoning reproductive activities (see Federici 2019; Zechner 2021) in unconventional, non-commodified ways.

Using a multi-sited ethnographic approach, our study includes:

1) The Kiezkantine initiative in Berlin, which promotes weekly community meals in a non-commercial neighbourhood store.

2) The Medina Community Centre in Bern, adjacent to the Reitschule cultural centre, which facilitates encounters between people through cooking and eating together.

3) Sister's Cuisine and Trampolinhuset in Copenhagen, known for preparing meals in refugee justice community centres.

4) Popular canteens in Florence, established by (trans)feminist activists from the Non una di meno movement, providing food for street-based trans sex workers.

5) A repurposed former workers' canteen in Ljubljana, redefining eating practices as a political act by reviving a space once dedicated to the working class.

RS08 | T06: Urban re-articulations of state and civil society: cases of new municipalism I

Urban cosmopolitanism.: Towards Multiscalar Networks of Solidarity and Hospitality Cities

Óscar García Agustín, Martin Bak Jorgensen

Aalborg University, Denmark

This presentation seeks to conceptualize a dialectical and critical understanding of cosmopolitanism from below from the potential of the cities to forge an inclusive cosmopolitanism. It does not mean that the cities guarantee per se the existence of diversity and inclusiveness. In our conceptualisation of urban cosmopolitanism, the city becomes the site to foster translocal solidarities, connecting dialectically particularism and universalism, and expanding the political community. Moreover, this framework allows us to analyse new forms of global networking of Solidarity/Sanctuary cities. We argue that such networks may have a transformative potential based on local solidarities, and the ability to both develop new imaginaries and materialise these through practices. We use two cases to illustrate this point, namely the Fearless Cities movement and the World Social Forum on Migration.

1341

Scaling Across: A Microsociological Perspective on the Political Outcomes of Neighborhood Activism

Anna Zhelnina

Utrecht University, Netherlands, The

Social movements attain a variety of incremental gains as they strive to achieve their primary goals. Even if a movement does not achieve its primary goals, the accumulated gains can pull people further into new arenas of collective action, transforming the configuration of larger political fields.

The literature on movement "spillover" and intermovement interactions has laid the groundwork to further our understanding of how movements influence each other and the situation in which they operate (through overlapping activist communities, tactical diffusion, and discursive change). While plenty of evidence exists that movements generate new social networks, identities, and worldviews, a fundamental question remains: Why do such gains sometimes "travel" across movement causes and arenas and sometimes not?

This paper describes the microlevel mechanisms enabling or blocking the transfer of gains across political arenas:

individual players simultaneously negotiate and assess potential gains and losses at multiple levels (in their private lives, relevant small groups, and city and national politics). Individuals' choices reveal how the personal and structural dimensions are connected and how personal and collective outcomes are interrelated.

The empirical material includes data collected during an urban renewal controversy in Moscow and its spillover into electoral arenas in 2017–2019 (interviews, observations, and digital ethnographies of online communities created to organize supporters and opponents of the renewal proposal). I identify the microlevel mechanisms facilitating and blocking the transfer. I also demonstrate that individual players simultaneously assess potential gains and losses at multiple levels: in their private lives, civic communities, and national politics.

Enacting Local Solidarity for the Displaced People and the Emergence of New Municipalism in Authoritarian Political Environment. The Hungarian Case with special reference to Budapest

Margit Feischmidt[1], Violetta Zentai[2], Ildiko Zakarias[1], Csilla Zsigmond[1], Eszter Neumann[1]

[1]Research Centre for Social Sciences, Budapest, Hungary; [2]Central European University, Vienna and Budapest

Recent migration studies reveal that citizens, civil society, and subnational governments, often backed by transnational networks fill the gaps in refugee protection left by national authorities (Agustin and Jorgensen, 2019; Vandevoordt 2019). The pandemic crisis in 2020 also drew attention to that social solidarity and mutual assistance between people on everyday matters had significantly increased, local governments and solidarity activists became increasingly valuable allies for each other. Inquiries dwelling on authoritarian political environments have also found that, even in a shrinking space for civil society, solidarity actors may generate new political alternatives (Della Porta and Steinhilper 2022, Jacobsson and Korolczuk 2017).

By unveiling how solidarity for people displaced by Russian invasion of Ukraine is organized in Hungary and the helping rationales are framed by local and municipal actors, our analysis centers on the way how solidarity becomes localised. Through examining the scales of locality, we consider discourses, institutions and alliances that play a central role in the construction and maintenance of local solidarity constellations. Our paper explores how in these constellations new municipalism as a political alternative is emerging and sustained. Our research team has been scrutinizing the patterns of Hungarian solidarity mobilisation in crisis situations since 2015. Most recently, we have conducted 30 interviews and ethnographic observations in Budapest and four rural regions of Hungary to explore bottom-up solidarity mobilisations with displaced people from Ukraine.

For this presentation, we will work explicitly with data from Budapest.

Practicing Solidarity with Artists at Risk: Conditions and Contours of City-based Initiatives

Andrea Ilse Glauser

mdw –University of Music and Performing Arts Vienna, Austria

This paper focuses on city-based and trans-locally connected initiatives aimed at protecting artists (writers, musicians, visual artists etc.) who are facing persecution. In many countries and regions of the world, artistic freedom is severely restricted; in authoritarian or totalitarian regimes, artists are often among those actors who are particularly exposed and at risk due to the (public) nature of their work. In response, a complex and heterogeneous network of initiatives has been developed, mainly sustained by municipal and civil society organizations and interest groups, and specifically geared toward creating an infrastructure of exile for persecuted artists. Through a long-term empirical study based on ethnographic observation, interviews with involved parties and document analyses, this contribution analyzes the conditions and contours of such initiatives with a focus on Polish, Austrian, and Swiss cities. This paper will pay attention to how the actors involved deal with the tightening of border controls and mobility regimes of the respective nation states and the European Union. Furthermore, this paper explores how these forms of practicing solidarity relate more generally to the state level—in terms of conflict and/or cooperation—and how the city-based activities are intertwined with trans-local networks. The empirical findings are brought into conversation with theoretical debates concerning new municipalism and the "city as a site of solidarity" (Kubaczek/Mokre 2021).

1342

RS08 | T08: Urban re-articulations of state and civil society: cases of new municipalism II

Bridging the Gap: Local Initiatives and Health Care Activism for Undocumented Migrants in Germany

Ilker Ataç

Hochschule Fulda University of Applied Sciences, Germany

Undocumented migrants in Germany face substantial barriers in accessing regular health services, despite international agreements guaranteeing for their healthcare rights. Control policies, social law exclusion, and economic considerations impede the realization of emergency care rights. Consequently, civil society actors and welfare organizations play a pivotal role in delivering healthcare to undocumented migrants, operating parallel to the mainstream healthcare system. These entities serve as frontline advocates, building trust and facilitating access to essential services. Throughout various German cities, dedicated volunteers and activists contribute by providing free and confidential healthcare services to counteract exclusion, giving rise to novel forms of solidarity.

In this presentation, I will explore the innovative strategies employed by activists in framing health services for undocumented migrants as essential citizenship rights, rather than mere humanitarian endeavors. The focus will be on local initiatives, their organization, outreach strategies, and collaborations with other local stakeholders. A critical examination of how activist organizations navigate the delicate balance between offering health services for migrants and advocating for these services as inherent citizenship rights will be undertaken. This discussion will delve into the practical implementation of political ideals, the social and institutional relationships utilized at the local and regional levels, and the ways in which activists challenge humanitarian parallel services. Drawing from interviews and participatory research, this presentation aims to shed light on the evolving landscape of health activism in Germany and its transformative impact on redefining citizenship rights within the local context.

Getting Appropriate Public Services: Empirical Evidence on Indigenous' Relations and Practices in Canadian Multilevel Governance

Julia Dahlvik

University of Applies Sciences Vienna, Austria

My multilocal case study focuses on the challenges of providing and accessing public services and the rights associated with these services (housing, health, education etc.). Preliminary findings from the Northwest Territories in Canada provide insights into civil society-state-relations, their transformation, and their multi-scalar entanglements. The particularities of this case – over 50% of the population being Indigenous, a combination of different orders of government in place (municipal, regional, territorial, federal, band and self-governments), a vast territory and a nonpartisan consensus government – importantly contribute to how the social relations between actors and authorities are shaped.

My research is based on qualitative interviews with citizens and Indigenous community members, government representatives (of the different orders), other experts as well as document analysis.

After centuries of colonization and domination, the relations between the Indigenous peoples and different orders of government are slowly developing into a more empowered position for the Indigenous peoples. Enacting this way forward 'from below' is an important part of it. "We know who we are and what we need," an Indigenous' quote illustrates the core principle: instead of paternalistic decision-making, involve those who are concerned and let them decide. Regional and Community Corporations, governed by Indigenous peoples, are an institutional way of arranging their relations to other orders of government. With federal and territorial funding, they provide the – culturally appropriate – services to their community members, with whom they consult regularly; these include housing, health, education, and other services. Tensions, trust and transformation are key elements in this context.

Findings from this research also allow for learnings for European contexts.

Possible session: "Enacting solidarity and citizenship 'from below': transversal and translocal relations"

Possibilities and Limitations of Introducing a City ID Card for Berlin

Stefanie Kron

Evangelische Hochschule Berlin, Germany

The Berlin Senate has committed itself to having an expert study on the possibility of introducing a municipal ID card (Berlin City ID Card) that is independent of residence status. The aim is to enable the estimated 50,000-100,000 people living in Berlin without a residence permit (undocumented migrants) to participate more fully in the life of the city. Several other cities in Europe, including Berne, Zurich,

1343

Barcelona, and Paris, are currently considering the introduction of a city ID card or have already introduced one.

The author of this abstract was commissioned to prepare the Berlin report. Some preliminary results will be presented and discussed. The methodology includes the concept of "urban citizenship" since the municipal ID is considered as the most far-reaching instrument to implement "urban citizenship" (not only) for undocumented migrants. Empirically, the report is based on qualitative interviews with counseling centers, migrant self-organizations, senate administrations, and academics. Health, education, housing, and work are the main areas examined regarding the existing restrictions and offers, as well as the potential of a Berlin City ID for undocumented migrants. The focus is on the following questions:

– To what extent can a Berlin City ID overcome the specifically German legal restrictions on access to social rights for undocumented people and actually enable more urban participation or even "urban citizenship"?

– What is the role of Berlin's civil society and its translocal networks in providing and negotiating support for undocumented migrants with state institutions?

– What are the differences and similarities between the models of the City ID in different European cities?

Maintaining Communicative and Political Infrastructure in a Depoliticised Community – Lessons From a Deindustrialised Slovenian Town

Marko Ribać

Peace Institute, Slovenia

Paper attempts to evaluate how specific organizational modes, activities and practices of a small activist initiative Iniciativa mestni zbor (short: IMZ; eng.: City-Wide Assemblies initiative) contribute to sustenance of communicative and political life in a small deindustrialised Slovenian town of Maribor. Paper combines literature and research on phenomena like commons, care and solidarity infrastructure (see Tronto, Simone, Gutierrez Sanchez) with theorising on the "right to the city" (Lefebvre, D. Harvey) to evaluate initiative's abilities to facilitate deliberative, democratic and horizontal participation in the city. Author also draws conclusions from his ethnographic research to propose how initiative attempted – historically – to combat widespread political and communicative dispossession of the city's residents. Ethnographical field notes show how activists laboriously try to re-create and maintain contemporary places of »isonomia« (Arendt) in the town: by maintaining a communicative and political network of spaces devoted to deliberative and participatory practices of citizens "from below" (weekly plenums, community garden(s), city-wide participatory budget etc.). In this sense initiative sustains and reproduces communicative and political infrastructure that continuously facilitates "immaterial commons" in the dispossessed community: communicative and political life in the city devoid of channels and avenues for meaningful municipal and urban participation. Paper in the end outlines some dangers on the political horizon: it problematizes the routine nature of maintaining the communicative infrastructure where author recognises immense labour devoted to the role of this informal public stewardship "from below" but acknowledges the dangers of depoliticization when the political spaces are gradually becoming devoid of people.

RS10 Producing, Contesting, and Reconfiguring Urban Sustainability

RS10 | T03: Producing, contesting and reconfiguring urban sustainability: session 1

The goal of this Research Stream is to set up an international forum for theoretical and empirical research providing new perspectives and insights on the production, contestation and reconfiguration of urban sustainability.

Reframing Urban Sustainability: Politics and Contestation through DIY Infrastructuring in Global Cities

Manisha Anantharaman

Centre de Sociologie des Organisations, Sciences Po, France

Sustainability is quickly emerging as a dominant ideology and framework for material action in global cities. As cities around the world invest in green urban infrastructures as both a climate and urban competitiveness strategy, research has shown that these sustainability actions can displace and dispossess working class and racialized communities. Further, the technocratic and managerial precepts of sustainability mean that it can function as an anti-politics machine, some scholars argue. In this paper, I complicate this narrative by showing how the very amorphous quality of sustainability discourse and practice makes it a potent vehicle for politics, despite its apolitical and technocratic framing. Combining theories of social reproduction, urban political ecology and intersectionality, this paper examines how urban sustainability infrastructuring, i.e. the creation of infrastructures to solve environmental problems, functions as a "terrain" or "contact zone" bringing together the state, business, middle class environmentalists, and sections of the urban poor. Drawing on a long-term, ethnographic study of "zero-waste" transitions in Bengaluru, India, I show that infrastructures become the site of political contestation where diverse actors adopt, contest, and modify neoliberal sustainability's emphasis on market-based solutions, behavior change, and the aesthetic conflation of "clean" with "green". Emergent forms of "communal sustainability" and "DIY infrastructuring" challenge dominant narratives of eco-modernization that posit teleological accounts of change, instead illustrating the transformative potential of collective action projects that cross lines of class, caste, race, and geography. The paper ends by proposing a novel theoretical framework to study participation and collective action in urban sustainability through an interdisciplinary situated, relational, and intersectional approach.

Addressing Urban Inequalities Through Sustainability Planning: A Focus on Bologna and Its Neighborhoods

Tommaso Rimondi, Alessandra Landi, Marco Castrignanò

Department of Sociology and Business Law, University of Bologna, Italy

Climate change and other environmental challenges compel cities to reassess their urban spaces and the daily lives of their residents. An important step towards a "carbon zero" city can be achieved through the reduction of carbon emissions from cars, creating "people-friendly" neighborhoods where essential needs can be met within a walkable distance. The distribution of public services within neighborhoods plays a pivotal role, not only enhancing the quality of life but also reducing reliance on polluting means of transportation.

By addressing public services distribution and accessibility, urban planning towards sustainability can contribute to fighting pre-existing spatial inequalities that make a difference in residents' lives, fostering social inclusion and stronger community ties on the micro-urban scale, reaffirming density as a fundamental urban feature.

Using GIS tools, we focus on the case study of Bologna (Italy) and its spatial inequalities (regarding urban services), crucial for the challenges Bologna is facing and the policies adopted (such as the EU Mission "100 climate-neutral and smart cities by 2030"). Using information on urban service provision and census tracts data, we analyze the spatial distribution of public services across neighborhoods, to measure service provision and accessibility within walking distances of 5, 10 or 15 minutes. Results show that while Bologna offers a good provision of services within a 15-minute walk, there are significant differences at the neighborhood and intra-neighborhood scales. Furthermore, we analyze the geography of socio-economic fragility within the city, to understand "who" can benefit from service proximity.

Finally, we emphasize how effective urban sustainability projects must address urban inequalities, mitigating the risk of assuming inequalities as a given and unalterable structural condition, thus ending up reproducing them.

'Good' Public Spaces And What They Look Like In The Context Of Contemporary Urban Challenges: An Urban User Perspective.

Mollie Isabel Wilson, Anastasia Loukianov, Zoe Harris

University of Surrey, United Kingdom

1345

Efforts to determine the impacts of privatisation on public space quality have produced variable outcomes, exacerbated by the difficulty of generating consensus on what 'good' public space actually looks like. Focusing on urban public spaces, we contextualise public space quality in the broader needs of the urban community through exploring what 'good' public space delivery looks like in consideration of contemporary urban challenges. We ask: firstly, what does the urban community perceive these challenges to be?; secondly, what are the preferred qualities of urban public spaces according to urban users?. A social constructivist approach is taken in recognition that qualities and overall quality of public space are socially constructed and may vary between communities and individuals. This paper presents the findings from focus groups and individual follow-up interviews in three English cities with diverse members of the urban public. Focus group data includes transcripts and outputs for three activities: group selection and ranking of perceived urban challenges; group selection and ranking of most desirable attributes for an envisioned public space development; and an individual choice matrix using public space cases with different described attributes. These activities are expected to highlight desirable public space attributes and reveal any patterns between preferred attributes and perceived needs. Furthermore, the results are expected to give insight on how responsiveness to urban challenges can be comprehensively integrated into design and governance of the city's shared spaces from the perspective of urban dwellers for a more sustainable and community-oriented approach to urban public space delivery.

Urban Environmental Governance and Citizens Participation: To Win The Climate Challenge, An Entire City Is Needed

Monica Bernardi

Milano-Bicocca University, Italy

The upcoming Intergovernmental Panel for Climate Change (IPCC) report on cities underscores their pivotal role in addressing the climate challenge. With 57% of the global population residing in urban areas, contributing to 70% of carbon emissions and 80% of wealth production, cities are at the forefront of climate action. Their increasing relevance is highlighted by the intensification of recent extreme weather events, by the pressing need to understand how major demographic, social, and economic centers will respond to rising levels of extreme shocks, and by the interconnection of risks and vulnerabilities (Bai, 2023). The IPCC cities study will explore biophysical aspects, impacts and risks, development modes of mitigation and adaptation projects, energy and emissions, policy and governance, and civil society's contribution to the climate challenge.

This work focuses on the latter two aspects, examining governance strategies and citizen engagement in the context of the European Mission on 100 cities aiming for carbon neutrality by 2030. The case in point is Florence, one of the 9 selected Italian cities, with a rooted commitment to climate action. Specifically, the study delves into the "Firenze per il Clima" strategy, which aims to raise awareness among citizens about climate actions and encourages active participation from organizations and individuals. The city environmental governance framework is analyzed within the theoretical framework of urban and multilevel climate governance (Bulkeley, 2013; Bulkeley & Betsill, 2003); and the citizens' involvement processes are deepened by analyzing the process of democratic innovation implemented in its first start-up phase, including the establishment of an advisory body of citizens for climate-related decision-making, the Climate City Assembly.

The goal of this Research Stream is to set up an international forum for theoretical and empirical research providing new perspectives and insights on the production, contestation and reconfiguration of urban sustainability.

Exploring Multiple Challenges in Sustainable Urban Mobility Governance: Insights from Padua, Italy

Maria Dodaro

University of Padua, Italy

Urban mobility systems are essential for the economy and society, yielding noteworthy implications for the environment, urban sustainability, citizen health and well-being, as well as the productive and commercial fabric of territories. In recent years, the exacerbation of the climate crisis has amplified attention toward urban mobility issues, particularly in the pursuit of innovative solutions, including within smart city projects. However, this attention has predominantly focused on the technical infrastructures supporting mobility systems, frequently overlooking their social, cultural, and even economic components.

Moreover, responses to tensions among diverse stakeholders, including businesses, city users, workers, tourists, professionals, and environmental movements, have not consistently succeeded in fostering negotiation logics between divergent interests while simultaneously endorsing sustainable and socially inclusive mobility models.

Drawing on an ongoing study in Padua, Italy, this contribution highlights the political-economic and socio-cultural factors hindering the progress of sustainable urban mobility projects. In particular, it examines participatory practices in this domain, the perspectives of retailers and other relevant stakeholders, and scrutinizes the influence of politics and expertise on outcomes.

The study integrates sociological and political economy research on urban mobility and car dependency with studies on urban governance and participation. Employing a mixed survey methodology, it includes qualitative interviews with key stakeholders, an analysis of documents from a 2019 Agenda 21 participatory process related to a project of urban renovation and mobility, a newspapers content analysis, and a questionnaire directed at Padua's shopkeepers aimed to explore their mobility habits and perspectives on sustainable urban mobility.

Controversies on Sustainable Urban Mobility: Contestation, Polarization and Climatization

Emiliano Scanu

Université Laval, Canada

Sustainable urban mobility projects and infrastructure are today very widespread as means to improve local transportation and at the same time mitigate climate change and foster economic growth. Despite good intentions, these policies do not always produce the expected results and may face resistance from actors who see them as a "war on cars". Recent research has well highlighted this "contestation of sustainable urban mobility", and more widely trends towards a discursive polarization between supporters of active and public transportation and promoters of automobility. By combining insights from environmental discourse analysis and urban theory, this paper presents an empirical study of a sustainable mobility policy in Quebec City, Canada, which has given rise to a controversy opposing two divergent perspectives on urban transportation as well as on climate change. The first is an ecological modernization discourse advocating for the decarbonization of the urban transportation system through the improvement of public transit infrastructure. The second is a promethean counter-discourse which opposes public spending in transportation and supports the unconditional growth of urban sprawl and the use of the car, be that gas-powered or electric. In addition to showing that urban transportation policies can face resistance even when these are cast from a neoliberal perspective axed on sustainability and urban growth, the results highlight that polarization in transportation is increasingly climatized, that is to say structured around claims, storylines, technologies, and knowledge specific to the field of climate action, whether to advocate change (e.g.: energy transition) or status quo (e.g.: denial and skepticism). These phenomena of polarization and climatization can be considered as two important recent trends in the making and unmaking of urban sustainability.

The Customers Perspective: Attaining Sustainable Last Mile Delivery with Parcel Lockers In An Urban Environment

David Strauß, Andreas Breinbauer

University of Applied Sciences BFI Vienna, Austria

Urbanization intensifies spatial density, impacting not solely the inhabitants and their multifaceted activities but also exerting influence on the logistical dynamics responsible for supplying urban domains. As parcel volumes rise originating in the increasing e-commercialization, simultaneous challenges in social, environmental, and economic realms emerge, particularly in the context of deliveries to private households. Sustainable city planning necessitates a focus on sustainable logistics, especially addressing the

1347

inefficiencies inherent in the last mile (LM) delivery to end consumers. Parcel lockers (PL) are one innovative way to improve the sustainability of the LM. Prioritizing the customer perspective as the focal point is imperative for realizing sustainable market implementation, as the acceptance of a lot of innovative solution for urban sustainability hinges on their endorsement. Customer attitudes play a crucial role but are not yet emphasized in the research field. Therefore, a dataset of n = 530 was collected via questionnaire from Vienna residents of the 23rd district and analyzed using logistical regression analysis to predict which customer attitudes influence the probability of using a PL. The six key attitudes "reliability", "anonymity", "flexibility in daily routines", "consumer safety", "minutes to PL" and "minutes to post office" and the control variable "parcels per month" were. Notably "environmental benefits" and the control variable "age" had no effect on the probability. To conclude: urban sustainability efficacy necessitates embracing and comprehending the perspectives of the people. Thus, sustainability can organically evolve from grassroots levels, integrating into practical enhancements in everyday life.

Urban nature in Paris. Individualisation, representation and global competition

Carolina Mudan Marelli

University of Bologna, Italy

Urban nature is a crucial element in the definition of citizens' 'quality of life'. Although this object of research is not new to sociological studies of the territory, with the rise of the new global climate challenges, it has also taken on a renewed centrality in the debates on urban space, a centrality that is still little investigated.

Starting from a multi-sited ethnographic analysis of urban greenery processes that have appeared in recent years in Paris, carried out between 2015 and 2019 with the Laboratoire Architecture Anthropologie, the contribution will focus on some recent socio-political trends affecting the city through the enhancement of nature, here understood with particular reference to vegetation. The case of Paris is particularly interesting in this respect, as it is one of the few cities where urban vegetation has been part of the urban development agenda since the 18th century.

This contribution will show the main trends emerging from the analysis of recent urban vegetalisation processes: individualisation, representation and global competition. These trends have strong, albeit not always obvious, links. On the one hand, there is individualisation, conceived as a new scale within which we attempt to frame contemporary processes of citizen participation in the care of urban vegetation; on the other hand, representation, as a means through which to capitalise on and valorise the fragmented and individualised actions of urban vegetation; and finally, global competition, in which urban nature, from a simple sphere of local public action, becomes an international political arena, an arena in which some cities seek to assume leadership.

The goal of this Research Stream is to set up an international forum for theoretical and empirical research providing new perspectives and insights on the production, contestation and reconfiguration of urban sustainability.

Smart City and the Four Spheres of Neoliberalism

Ozge Dilaver, Nikolaos Goumagias

Northumbria University, United Kingdom

Smart city is a controversial subject. Despite not being clearly defined, it impacts upon policymaking across the world by promising cost-efficient solutions to urban and environmental problems. An interdisciplinary literature in social sciences, however, regards smart city not as a profoundly new concept, but as a technologically framed extension of neoliberal urbanism. In this paper, we contribute to this debate by examining the process through which city-smartening develops and attracts power. By studying and building upon the literature critical of smart cities, we identify four spheres of city-smartening – discursive, market-building, governance and distributional spheres – and analyse interdependent actions of corporate and political actors in these spheres. We argue that when considered together, the workings of city-smartening in these spheres form what we call fuzzy mechanics, reinforcing each other and enabling mobilisation of resources for smart city projects. We also suggest, through examples, that two forms of action in particular; establishing primacy of means over ends as desirable outcomes of urban governance and initiating constant-sum competition at different levels of agency, provide movement and momentum within these workings.

Navigating Sociotechnical Transitions: Adapting to Low-Carbon Future Technologies in Mănăștur's Socialist Legacy, Cluj-Napoca, Romania

Vlad Bejinariu, Norbert Petrovici, Andreea-Cristine Palaga

Faculty of Sociology and Social Work, Babeș-Bolyai University, Romania

This research explores the concept of "sociotechnical transition" (Geels and Schot, 2007), aiming to understand local efforts to reduce carbon emissions via the implementation of low-carbon technologies (LCTs). It examines the interplay between technological innovation, institutional frameworks, and societal shifts at various levels, and how these factors collectively influence LCT adoption (Geels, et al., 2018).

Acknowledging the recent "sociotechnical agendas" on place-specific analysis (Sovacool, et al. 2020), we conduct a case study in Mănăștur, a socialist-era neighborhood in Cluj-Napoca, Romania. To inquire about the LCT adoption, we employ semi-structured interviews with different stakeholders such as the neighborhood inhabitants, engineers, architects, owners' associations, business actors and the local council. Additionally, we review plans for restructuring the neighborhood's infrastructure.

Our key findings are linked to the conflicting perceptions surrounding LCT adoption. A central path dependent issue of the sociotechnical transition consists in the socialist legacy of central district heating and the subsequent shift towards deregulated household energy consumption through privatization, which positioned the individual homeowner as the primary decision-maker. Our research reveals that the adoption of various LCTs is contingent on specific policies, demonstrating variations among different stakeholders and technologies. Homeowners show a strong preference for solar photovoltaic rooftops, while this presents challenges for local governments as an institutional gatekeeper due to increased energy production in the national grid. Furthermore, smaller retrofits are more readily accepted, as they have minimal impact on homeowners' lifestyles, albeit offering limited carbon emissions reduction. Consequently, home refurbishment may not prioritize the most effective technologies.

Towards a Sustainable Urban Future. Assessing the Impact of Citizen Science in Socio-Ecological Transitions

Teresa Carlone[1], Selene Tondini[2]

[1]University of Bologna, Italy; [2]University of Bologna, Italy

Nowadays, climate change has irreversible implications on human well-being, territorial health, and resource accessibility. Achieving an equitable Socio-Ecological Transition and fostering a sustainable perspective in urban spaces requires collaboration among stakeholders identified in the Quintuple Helix of Innovation. Civil society, as a crucial force in innovation projects, seeks to democratize knowledge and research in the environmental domain. The H2020 I-CHANGE project focuses on demonstrating the potential for collective behavioral change by engaging civil society in citizen science initiatives, employing the Living Labs methodology. This contribution proposes an empirical evaluation framework for measuring sustainable behaviors and climate awareness resulting from citizen science participation. The framework follows a two-phase process. The initial phase involves a pilot survey inspired by the COM-B model, exploring key elements within capabilities, opportunities, and motivation relevant to local communities engaged in Living Lab activities. Case studies in Bologna and Hasselt reveal the interplay of technical, cultural, and socioeconomic factors influencing behavioral changes related to air quality and mobility practices. Preliminary findings underscore the significance of individual experience, education, cultural norms, and economic incentives, with gender differences highlighting the need for gender-sensitive communication interventions. The iterative second phase assesses behavioral changes resulting from increased climate awareness due to citizen science engagement. The evaluation tool gauges impact on participant groups, with a control group providing a baseline for estimating the effectiveness of citizen science activities. While the adoption of the COM-B model poses risks and potential limitations, this evaluation framework represents a significant challenge for projects addressing behavioral change towards more sustainable lifestyles, offering practical applications to standardize procedures and tools in different social, political, and economic contexts within the Living Lab approach.

RS11 | Sociology of Spatial Mobilities

RS11 | T02_01: Residential Location Decisions

Contextualizing Residential Preferences And Spatial Mobility Decisions: Insights From A Geocoded Discrete Choice Experiment

Christoph Zangger[1,2], Amélie Bank[1,3], Maret Korell[1]

[1]University of Bern, Switzerland; [2]LMU Munich, Germany; [3]University of Basel, Switzerland

When confronted with a decision to move, people can rarely realize their preferences to the full extent. The set of available housing options, individual means and discriminatory behavior of landlords narrow their opportunity set to what is available and affordable. Nevertheless, even in this case, there is often room to pursue one's preferences, which comprise aspects of the housing unit as well as its surrounding neighborhood.

Using data from a discrete choice experiment, implemented in a large, representative survey in Switzerland with about 3'600 respondents, we examine how people balance – among other things – different contextual characteristics of housing alternatives (e.g., social and ethnic composition of the neighborhood, local social network, distance to school and work). What is more, the survey is geocoded, and its sampling allows for the identification of door-to-door neighbors as well as a linkage to register data at various geographic scales. Consequently, we are further able to examine the extent to which people's preferences are spatially and socially interdependent, and how they are linked to presently experienced neighborhood relations and conditions.

The results from conditional and mixed logit models suggests that people consider contextual characteristics of the surrounding neighborhood, namely its composition and the presence of friends therein, and balance the spatial distance to work and school when looking for a new place to live. Moreover, the tastes for different types of neighborhoods are heterogenous and can be related to the small-scale neighborhood conditions and networks that people currently experience, reinforcing existing inequalities in housing preferences.

Explaining Migration Dynamics: Even Big Data Fails When Looking Through the Wrong Lens

Konstantin Hoffie

BA Leipzig University Of Cooperative Education, Germany

We examine internal migration patterns in Germany from 2000 to 2017 and model migrant flows between districts. We stratify migrants into five age groups. Our approach distinguishes between modeling of variation across periods and variation across space. For both, we consider all age groups. Confirming Beyer et al.(2022), we observe that gravity models fail to explain changes across periods. However, this deficiency we do not attribute to the model. Rather, when the number of origin-destination pairs is high, there is almost no variation within these pairs. There is nothing to explain. In contrast, modeling variation across space is typically considered very successful. We consider several hundred predictors for modeling of spatial variation. We use LASSO for feature selection. Compared to the simple gravity model, additional predictors improve model fit only slightly. This we attribute to something that might be considered a statistical artifact: The very high explained deviance of the simple gravity model. The explained deviance of 0.8 of the simple model we ascribe primarily to huge differences between region pairs. When stratifying region pairs along population sizes and distance to account for these, explained deviances of the simple model vary from 0.03 to 0.9 between strata. Stratifying region pairs essentially means choosing different comparisons. We argue that depending on the research question, sometimes looking at all the data means looking through the wrong lens. Since migration data are often of similar structure, we think our findings generalize to international migration as well.

Residential Mobility of the German Baby-Boomer-Cohort

Andreas Hartung, Annette Spellerberg

University of Kaiserslautern-Landau, Germany

Our presentation focuses on the residential mobility of baby boomers in Germany. These exceptionally large birth cohorts, born between the mid-1950s and mid-to-late 1960s, will begin to retire in the next few years. This poses major social challenges, but also offers opportunities in a number of ways. Given the severe housing shortage in Germany, the baby boomers are of particular interest, as many of them have completed their family phase and are living in large apartments or houses. Their greater willingness to move would mean that these numerous dwellings could be mobilised for the housing market.

We combine data from the representative German Socio-Economic Panel with a survey conducted as part of the "Ageing Smart" project, which focuses on the needs of baby boomers in seven pilot municipalities in Germany. Both datasets are used to outline (1) the residential mobility patterns of baby boomers in the years just before retirement, as well as (2) their subjective expectations and demands

regarding their future living situation and (3) their willingness to be mobile. On this basis, we try to predict (4) the mobility behaviour of baby boomers in the following years.

To address the current debate on housing supply, we design different relocation scenarios that empirically address issues such as the willingness to reduce living space and to sell the long-occupied property. In terms of spatial mobility, one scenario addresses the willingness to move from an urban, suburban, or rural area to another type of location.

Our current findings suggest an overall low propensity for residential mobility among baby boomers, particularly among homeowners, rural areas, and poorer households. How does the debate need to change?

"The Classical German Dream" – Investigating The Relevance Of Normative Beliefs In Residential (Im) mobility Decisions

Cornelia Tippel[1], Aura Moldovan[2], Frank Osterhage[1], Annett Steinführer[2]

[1]ILS – Research Institute for Regional and Urban Development, Germany; [2]Thünen Institute of Rural Studies, Germany

In residential mobility and migration research, the motives for internal migrations have been extensively analysed, but somehow reduced to pragmatic considerations including life course events. Only scarce research has hitherto pointed to the relevance of normative beliefs such as mobility imperatives (e.g. Cook/Cuervo 2020) or the perception of a 'normative housing ladder' (Lux et al. 2018).

Thus, our contribution aims to enhance the knowledge about normative beliefs in residential (im)mobility decisions. The empirical material is part of a larger research project, which analyses residential location decisions both in urban and rural areas in Germany. Based on 30 in-depth interviews complemented by a large population survey (n=3,600), both on residential (im)mobility decisions, we analyse these decisions more comprehensively as recurring, revisable or at least adaptable decisions directed towards the future, but made in the context of biographical experiences, including housing and mobility experiences, economic and cultural resources, social embeddedness, situational and emotional aspects as well as normative beliefs (Peter et al., 2022).

Our empirical material allows an in-depth analysis of the underlying normative beliefs within residential (im)mobility decisions and emphasises that residential (im)mobility decisions are strongly influenced by normative beliefs such as the idea of a housing career over the life course. These social norms about mobility and housing are interlinked with other normative beliefs, e.g. of good parenthood, and perceived expectations of relevant others. Methodologically, we reflect how normative beliefs can be identified in qualitative interviews and how and when people position themselves to social norms within residential (im)mobility decisions.

RS11 | T02_02: Life Course, Transitions and Vulnerability

Exploring the Impacts of Virtual Access on the Mobility and Livelihoods of Marginalized Groups: A Comparative Study in Dortmund, Sao Paulo, and Cape Town

Dorcas Nthoki Nyamai[1], Sophie Schramm[1], Bradley Rink[2]

[1]Technical University of Dortmund, Germany; [2]University of the Western Cape

Mobility serves as a pivotal determinant of the livelihoods of individuals in cities by shaping their access to social, healthcare, and economic services and opportunities. The outbreak of the pandemic underscored the major reliance on mobility as a conduit for accessing essential services, yet it also unveiled the potential for enhanced resilience in the form of virtual access. While conventional notions of accessibility encompass four interconnected dimensions, namely individual characteristics (individual choices, preferences, activities, and socio-economic circumstances), spatial attributes (spatial layout/land use), modes of mobility, and temporal dynamics of mode availability and activity, the pandemic ushered in a fifth dimension: virtual access. Our contribution is based on international interdisciplinary research that compares three diverse urban settings: Dortmund (Germany), São Paulo (Brazil) and Cape Town (South Africa). This research sheds light on the intricate ways in which the pandemic impacted the lives of marginalized groups in each city. This impact manifested through direct restrictions on physical mobility and indirect consequences stemming from reduced mobility, which affected the functioning of other infrastructures, services, and access to income-generating activities. Most importantly, we examine how marginalized groups navigated these challenges through virtual access, the livelihood opportunities they found and the difficulties or barriers they faced when shifting parts of their everyday activities into virtual spaces. Through a mixed-methods approach that involves household surveys and interviews with key experts in the mobility, social, health and employment sectors, the research explores the changing roles of physical and virtual access for urban marginalized groups and their livelihoods. Drawing from these analyses, the research intends to recommend measures that support and improve the resilience of marginalized groups through equitable physical and virtual accessibility.

1351

Beyond Linked Lives: The Dynamic and Multidimensional Nature of Polish Migrant Women's Mobility Experiences in Leipzig, Germany

Katarzyna D. Kajdanek

University of Wrocław, Poland

The paper examines empirical manifestations of the concept of 'unlinked lives' (Settersten et al. 2024, Nico et al. 2021), a recent development of the concepts of 'linked lives' (Coulter et al., 2016; Elder et al., 2003; Settersten, 2015) and 'social convoys' (Webster et al., 2022) as pillars of the life course approach in mobility studies.

The research problem is set in the context of international (from Poland to Germany) and residential (within Germany) mobility and focuses on why and how 'un-linking' is experienced by Polish female migrants currently living in Leipzig and how it is connected to different life domains and different levels of social reality (Bernardi et al., 2019, 2020).

The analysis is based on eighteen episodic narrative interviews (Flick, 2000) conducted between September and December 2023, transcribed, and analysed using thematic analysis (Gibbs, 2018).

Preliminary results suggest a dynamic and multi-dimensional character of unlinking.

Its dynamics can be observed in "un-linking" as a factor in the past (breaking of relationships becomes a condition for mobility); present (influencing relations during mobility events); future (anticipated unlinking as a result of timing and current experiences). Its multidimensional character is illustrated by the variety of life domains in which unlinking is experienced (family life, friendships, neighbourhoods, nation) and by the levels of social reality in which informants located key explanatory factors for disengagement (from the intra-individual to the macro-structural level).

The academic contribution of the paper lies in the empirical illustration of the concept of unlinked lives, and in providing data-based arguments in the current discussion on the application of principles of the life course perspective in internal and residential mobility studies.

Having a Child But Not a Car: Mobility Biographies and Social Practices of Couples Who Do Not Increase Their Car Use After Childbirth

Marta Skowrońska[1], Filip Schmidt[1], Michał Czepkiewicz[1,2], Marianna Kostecka[1], Dawid Krysiński[1,3]

[1]Adam Mickiewicz University Poznan, Poland; [2]University of Iceland, Iceland; [3]University of Wroclaw, Poland

Childbirth is regarded as one of the key events which transform mobility in the life course (Lanzendorf, 2003; Müggenburg et al., 2015). Although it tends to increase households' car use (McCarthy et al., 2017; Oakil et al., 2014; Prillwitz et al., 2006), it is not a universal pattern (Lanzendorf, 2010; McCarthy et al., 2021). People who don't increase their car use, and especially those who reduce it after childbirth, remain understudied, despite being a very policy-relevant category.

To fill this gap, we describe the dynamics, drivers and challenges of this pathway of mobility transitions into parenthood. Answering the calls to make up for more general shortcomings of the mobility biographies approach we analyse these pathways:

(1) In the perspective of the whole life course to account for the socialisation effects (Rau & Scheiner, 2020) and the intersection of individual mobility biographies with changing social and infrastructural context (Greene & Rau, 2018);

(2) As a product of competing meanings, skills and materialities, as well as social practices which are or are not linked to automobility (Kent, 2022; Sattlegger & Rau, 2016).

The presentation is based on a mixed-methods research conducted in two Polish metropolitan areas (Poznań and Tricity) in 2023-24, including a geo-questionnaire and individual in-depth interviews with both parents of kids aged 0-6.

1352

A Matter of Time and Place? Changes in the Willingness for Spatial Mobility of NEET Youth Seeking VET in the Context of Regional Disparities in Germany

Linda Hoffmann[1], Alexandra Wicht[1,2]

[1]Federal Institute for Vocational Education and Training (BIBB), Germany; [2]University of Siegen, Germany

Many young adults encounter difficulties making the school-to-VET transition and often end up in NEET status (Not in Education, Employment, or Training), with detrimental consequences for their life course. Spatial mobility is an important means of overcoming NEET and facilitating

successful transitions to VET, especially for youth from disadvantaged regions. However, the development of mobility willingness over time and influencing factors remain unclear.

Following the Agency-Structure Debate and Subjected Expected Utility Theory, school-to-VET transitions and concurrent occupational and mobility decisions are understood as adaptive processes depending on time, individual agentic preferences and structural opportunities. Next to individuals' occupational aspirations, their (mis)match with available regional opportunities and the overall attractiveness of the region are decisive for job-related mobility decisions.

We use data from the National Educational Panel Study, applying multilevel growth curve models to analyze changes in the mobility radius (distance to applied-for training positions) of youth seeking VET for up to three years. We linked administrative geospatial data (NUTS-3) to map individuals' regional opportunity structure (person-environment mismatch, general unattractiveness).

Our findings reveal a significant increase in the mobility radius among VET applicants over time. Regional context plays a significant role, with youth from regions with higher person-environment mismatch and higher unattractiveness maintaining an expanded mobility radius over time. Subgroup analyses underscore a robust positive correlation between status aspirations and mobility radius, particularly in highly unattractive regions. Moreover, within these regions, especially youths with high-status aspirations expand their mobility radius during their search, highlighting pronounced agency in pursuit of their goals.

RS11 | T03_01: Refugees and Spatial (Im)mobilities

Locus of Control, Social Networks and Secondary Migration of Refugees in Germany

Philipp Jaschke

Institute for Employment Research (IAB), Germany

This paper seeks to improve the understanding of refugees' secondary (within destination country) mobility after arrival. So far, there is no empirical evidence on the role of personality traits and how they interact with regional factors. In this context, the paper examines the interplay between local refugee networks and refugees' Locus of Control in shaping secondary migration. LoC denotes the degree to which a person believes that events in his or her life are determined by own actions (internal LoC) or by external circumstances (external LoC).

To rule out endogeneity concerns due to regional sorting, I exploit the plausibly exogenous initial assignment of refugees over districts by authorities. I show that – once mobility restrictions have been lifted – refugees with internal LoC more often out-select from districts with large pre-existing refugee networks than externals. This result is robust to inclusion of a whole set of individual demographic pre – and post-arrival variables as well as further personality traits that have been found to affect mobility and labor market prospects.

Further evidence suggests that out-selection of internals is the result of intentional job search outside of refugee networks: First, refugees with internal LoC, inter alia, search for or have found jobs with support of German friends more often than externals. Second, this translates into higher job quality; internals who have moved earn higher wages in the medium and long-run. Contrary, mean wage trajectories of refugee stayers do not differ depending on LoC, suggesting that unobserved factors are not driving my results.

Longer Term Impacts of the School Ethnic Composition : Assessing the Nest-leaving Behaviour of Refugees and their Descendants

Rosa Weber

Institut National d'Etudes Démographiques, France

A considerable literature has addressed the effects of school segregation and school composition on individual level outcomes such as educational achievement, delinquency or employment. Studies have also addressed how school choice relates to residential segregation during childhood. However, we continue to know less about longer term impacts of the school ethnic composition on neighbourhood

1353

attainment during young adulthood (first independent residence), as well as how this differs by migration and ethnic background. Using longitudinal Swedish register data, we follow individuals born in 1987-1992 from age 16-28, distinguishing between three distinct generations–G1.5, G2 and G2.5–of refugees and the mainstream Swedish population. We address the research questions: To which extent does the proportion of foreign-background schoolmates at age 16 (during the last year of secondary school) impact individuals' residential outcomes during their late twenties? And, how does this interact with the neighbourhood context during adolescence? Our findings indicate that refugees tend to leave the parental home later than the Swedish mainstream population. Among girls, we also observe sizeable differences across generations in the timing of nest-leaving. G2.5 refugee girls tend to leave the parental home about one year later than G1.5 refugee girls. In contrast, generational differences remain minor for boys. We also find that a high share of immigrants in the school is negatively related to nest-leaving. This relationship is particularly strong in neighbourhoods with high shares of immigrants. Analyses distinguishing by neighbourhood attainment indicate that the school composition, more so than the neighbourhood composition, impacts the likelihood of moving to a neighbourhood with a high socioeconomic status. These patterns are similar for males and females and robust to controls for parental socioeconomic status.

Residency Restrictions and their Consequences for the Health of Refugees in Germany

Laura Goßner

Institute for Employment Research (IAB), Germany

Individuals seeking protection in Germany are geographically distributed by authorities after their arrival. In the assigned region they are obliged to live in reception centers and shared accommodations until the asylum procedure has been completed. Originally, residential restrictions were lifted once a protection status was granted. However, since the so-called Integration Act came into force on the 6th of August 2016, freedom of movement is restricted further and refugees can be subject to a residency restriction for up to three years after they were granted protection. Depending on the federal state they live in, this restriction can be as narrowly as on the district or municipality level. This paper investigates how residency restrictions affect the health of refugees. It is hypothesized that for example through feelings of exclusion or disenfranchisement or regional differences in the availability of health services, residency restriction can have an impact on health outcomes.

The paper relies on the IAB-BAMF-SOEP Survey of Refugees and methodologically employs an instrumental variable approach where the timing of protection status (pre or post the reform) is used as an instrument. Additionally, the paper leverages the exogenous distribution of refugees across Germany upon arrival and state-level variations in implementing the restrictions.

With the paper, a more precise understanding of the extensive effects of limiting the spatial mobility of individuals is enabled. Since health is a basic prerequisite for labor market participation, ways of how the holistic integration of refugees into the labor market and society can be improved will become apparent.

Drivers of Agency: Im-/mobility Aspirations of Rejected Asylum Seekers – Insights from a Mixed-Methods Respondent Driven Sampling

Randy Stache, Lisa Johnson

BAMF Research Centre, Germany

The number of rejected asylum seekers has been continuously high across Europe over the past decade. Rejected asylum seekers are legally obliged to leave the country, yet many are tolerated to stay for reasons of non-deportability. This frequently results in a state of limbo between regularity and irregularity, often for lengthy periods of time. After several years of im-/mobility, people are caught between integration and deportation, while at the same time not being able to return to their countries of origin. How migrants deal with this process, what aspirations and capabilities they have is scarcely known, as they are hard-to-reach and hard-so-survey at the same time.

1354

At the BAMF Research Centre, we conducted an app-based Respondent Driven Sampling (RDS) with rejected asylum seekers from anglophone West Africa from June to December 2023. The app contained all elements necessary for running an RDS, including a factorial survey, and did not require any personal data from the participants. The survey was preceded by an extensive 10-month formative assessment, which included ethnographic fieldwork and qualitative interviews with "seeds" who later spread the RDS as initial respondents into the target group. In addition, randomly selected people from the target group were drawn from the Central Register of Foreigners and invited to take part in the app survey.

In this contribution, we bring together the results of the qualitative interviews and the factorial survey, which asked respondents to recommend hypothetical people in hypothetical situations whether they should stay, return or migrate onwards. This innovative mixed-methods analysis allows new insights into the negotiation of im-/mobility processes among rejected asylum seekers and potentially contributes to a more informed policy making.

RS11 | T03_02: Cross-border Mobility, Migration and Immobility

Rethinking "Spatial" Mobilities In The Light Of The Mutations Of Carcerality

Christophe Mincke

National Institute for Criminalistics and Criminology (NICC), Belgium

Our presentation aims to interrogate the concept of "spatial mobilities" by delving into a contemplation of the nature of space. Consequently, our reflections will be grounded in an examination of the parliamentary documents pertaining to the Belgian penitentiary law. This 1200-page corpus constitutes a cohesive effort to reevaluate the prison system in light of contemporary discussions on incarceration. It encapsulates prevailing notions of carcerality and endeavors to formulate a legitimate prison model in accordance with 21st-century standards.

The analysis of this corpus has been facilitated through the use of NVIVO. Central to these documents are themes of space, time, and mobilities, which will serve as a foundation for proposing a novel perspective on these concepts and, more broadly, their significance in both physical and non-physical realms.

We aim to illustrate how the prison, with its considerations of (im)mobility, porosity, openness, social inclusion, as well as the circulation of goods, services, and culture, enables us to contemplate the interconnection of spaces, whether physical or otherwise. Through this tangible example of a spatial and mobility dispositif, we intend to advocate for a reevaluation of our understanding of these categories.

Everyday Life and Alienation at the Border: The Case of Artvin Çoruh University Students

Esin Hamdi Dinçer[1], Gülşen Çakıl-Dinçer[2]

[1]Artvin Çoruh University, Turkiye; [2]Adıyaman University, Turkiye

Sarp Border Gate, Turkey's gateway to the Caucasus and Central Asia, is 15 km from Hopa, which has a population of 28000. Although Hopa is a small-scale settlement in terms of surface area and population, it is a district with constant movement since it is a border city. In addition, since there are two faculties and a vocational school affiliated with Artvin Çoruh University, it is seen that the young population is also included in this movement. The subject of this study covers the everyday life experiences of university students who study in a border city. While discussing students' everyday life, the theory that Thomas Nail calls kinopolitics, which offers a different perspective on migration philosophy, will be based. Accordingly, the expulsion mechanisms that students, whom we will consider as immigrant figures, are exposed to will be determined. Nail claims that immigrant figures reveal the pedetic power as resistance in response to the kinopower, which consists of the expulsion mechanisms implemented by the government. In his theory, Nail assumes that every kinopower will give rise to a pedetic power and excludes the possibility of experiencing the alienation conditions of everyday life. We can re-evaluate this possibility with Henri Lefebvre's critique of everyday life. This study aims to identify the transformations occurring in the everyday life of university students, who are figures, and to reveal their relationship with alienation, taking into account the recent crises experienced in Turkey with the pandemic, earthquake, and increase in inflation. For this purpose, we will use the data obtained from in-depth interviews with 30 senior students studying at Hopa Faculty of Economics and Administrative Sciences and Faculty of Theology.

RS11 | T04: Remote Working and Spatial Mobility

Remote Work and Internal Return Migration to the South of Italy: Insight from Ongoing Empirical Research

Anne-Iris Romens, Federica Cavazzoni, Noemi Novello, Roberta Rosa Valtorta, Raùl Zecca Castel, Maurizio Totaro

University of Milan – Bicocca, Italy

With the recent spread of remote work, an increasing number of workers are being able to perform their jobs from areas that are distant from their companies' headquarters. This is especially the case in Italy where remote work only spread recently with the Covid-19 pandemic (INAPP 2022). The use of remote work and hybrid working modalities (Countouris et al. 2023) permits those who practice it to move and recontextualise their work closer to relatives, returning to places that were left behind because of the lack of employment opportunities, such as in the South of Italy (South working 2020). In this regard, Italy has been characterized by a significant territorial divide between the South and the North part of the country, with several migrating from the South to the North to look for employment opportunities and leaving (part of) their families behind (Biagi et al. 2011; King 2015).

Our research aims to analyze the extent to which remote work is fostering internal return migration to the South of Italy. How do workers relate to the place where their employer is based and to the area where they perform distant remote work? What impact does this multilocal practice have on their well-being, and their social and professional relations? How does this mobility relate to care responsibilities?

The project investigates the phenomenon using a mixed methodology, which combines interviews, secondary data analysis, and participatory video making. Our contribution will focus on the preliminary findings emerging from 25 interviews with remote workers and relevant stakeholders.

Working From Home During the Pandemic in Germany – Prevalence, Associations, and Methodological Issues

Thomas Skora

GESIS – Leibniz Institute for the Social Sciences, Germany

In response to the COVID-19 pandemic, non-pharmaceutical interventions such as contact restrictions and stay-at-home orders were introduced in many European countries, leading to a significant increase in virtual mobility as many workers started to work from home (WFH). The high interest generated by this shift among scientists and policymakers led to numerous surveys being launched to gain insights into the prevalence of and social differences in WFH. These surveys were often based on non-probabilistic online samples with self-selection of participants. However, self-selection raises concerns regarding the possibility of biased results, as it can adversely affect both the estimation of the prevalence of social phenomena and the estimation of associations. So far, however, studies that systematically investigate to what extent and in what direction the results are influenced by the study design are lacking. The present paper aims to address this gap. It relies on a pooled data set of around 30 individual-level surveys that were conducted in Germany between March and December 2020. Based on theoretical considerations on the expected biases, I) the prevalence, II) the relationship with selected, often considered covariates (e.g., education, gender, age) and III) the influence of different survey design aspects on these estimates (sampling procedure, interview mode and measurement instruments) are established using techniques of multilevel modelling. The findings of this study can help to better assess the accuracy of existing empirical findings on WFH, considering the applied survey design, and to avoid shortcomings when planning new surveys.

Telework, Flextime and Daily Mobility Behavior Before and During the COVID-19 Pandemic in Switzerland

1356

Fabienne Wöhner

University of Bern, Switzerland

Switzerland's transport infrastructure is increasingly reaching its capacity limits. Additionally, transport is one of the main sources of greenhouse gas emissions in Switzerland. Therefore, reducing traffic is necessary to address the Paris Climate Agreement and to mitigate congestion. This study brings together three social phenomena: Firstly, traffic congestion and climate goals as a starting point. Secondly, the digitalization of the labor market as a possible solution. Thirdly, the COVID-19 pandemic as an unforeseen event that has strongly influenced the previous two aspects.

Commuters are particularly affected by congestion and traffic jams but are also partly responsible for the problem. But the digitalization of the labor market increasingly allows workers more spatial and temporal flexibility in the form of telework and flextime. It is hypothesized that working flexibly could reduce traffic by avoiding commuting or rush hours. However, pre-pandemic analyses show that telework does not reduce traffic, because saved commutes are offset by trips for other purposes in Switzerland. During the pandemic, the usage of telework spread rapidly and the virus drastically affected daily mobility patterns. This raises the question of how the coronavirus has influenced travel behavior (e.g. distances travelled, mode choice) and whether pre-pandemic findings on the rebound effect of telework are still valid. These questions are answered using the latest

Swiss Mobility and Transport Microcensus (MTMC) from 2021. One key finding is that there was no longer a rebound effect in non-work travel, which can be attributed to a lack of opportunities to leave home other than for work.

The Impact of Working from Home on Households' Residential Location Decisions

Verena Gerwinat

TU Dortmund University, Germany

Since the covid-19 pandemic, the proportion of remote workers in Europe has risen sharply. Recent studies have shown that working from home (WFH) has an impact on residential mobility (e.g. Moser et al. 2022; Dolls/Lay 2023). Even if there is no talk of an 'urban exodus' in Europe as there is in the USA, studies show that suburbanization processes are intensifying. Still, there is a lack of qualitative approaches to understand what influence WFH has on the decision of whether and where a household moves. This paper aims to make a contribution to filling this gap.

Based on guideline-based interviews with various households before and after a relocation, which took place between 2020 and 2023 as part of the recently completed 'STAWAL' research project, the paper explores the role that WFH plays in the formulation of housing preferences and the subsequent location choice. The spatial focus is on the three German metropolitan regions of Berlin, Munich and the Ruhr area, where the tight housing markets severely restrict the available housing choices.

The findings show that WFH is only one of many influencing factors of relocation decisions. Despite or even because of the possibility of WFH, individual lifestyles and life stages are decisive for the choice of residential location. WFH has become an opportunity for suburban oriented households to move to the suburbs, and for urban oriented households to live in inner city neighborhoods regardless of their workplace location. These results confirm the strong influence of lifestyle and life course on residential location choice and invite further discussions about the implications for residential segregation.

RS11 | T05: Commuting and Transportation Options

The Effect of Long Commutes on Civic Engagement: An Analysis With German Panel Data

Heiko Rüger[1,4], Nico Stawarz[1], Thomas Skora[2], Lena Greinke[3]

[1]Federal Institute for Population Research (BiB), Wiesbaden, Germany; [2]GESIS Leibniz Institute for the Social Sciences, Mannheim, Germany; [3]Gottfried Wilhelm Leibniz University, Hannover, Germany; [4]Johannes Gutenberg University, Mainz, Germany

Forms of regional mobility such as long-distance commuting and multi-local living, i.e. second homes, have increased in Germany and other countries. These forms of commuting between regions are seen as alternatives to internal migration. On the one hand, regional mobility is important for the functioning of labour markets and is positively related to individual wealth. On the other hand, increased spatial mobilisation could lead to uprooting and isolation as individuals become detached from local social relations. This paper examines the effects of regional mobility on civic engagement using the example of long daily commutes, with civic engagement being an important dimension of social capital and cohesion. Based on theoretical considerations, including the Civic Voluntarism Model, we expect a negative relationship between commuting distance and the extent of volunteer work. We apply fixed effects (FE) panel regression to longitudinal data for 1997-2019 from the German Socio-Economic Panel (SOEP) (N=102,171 observations, 23,517 individuals). First results show that medium-distance commuting (25-49 km) and especially long-distance commuting (≥50 km) are associated with a reduction in volunteering compared to short distances. The negative effects of both medium and long-distance commuting tended to be more pronounced in sparsely populated regions. This is particularly relevant as it is in rural areas that important public services are often provided by volunteers. Overall, the findings suggest that while regional mobility is important from an economic perspective, it could have a negative impact on social capital and cohesion by reducing civic engagement.

Commuting and Residency Choices – Investigating the Transition to Higher Education in Germany

Dennis Oliver Kubitza

Federal Institute for Vocational Education and Training (BIBB), Germany

The transition from school to university involves critical decisions—choosing a major, selecting a university, and

1357

deciding whether to move or commute. The inclination to commute and relocate varies based on socio-economic backgrounds, financial situations, and regional contexts, complicating efforts to estimate policy effects. Questions arise about the effectiveness of current public transport subsidies and whether housing subsidies serve as viable alternatives for commuting, and for whom.

To address these issues, we examine differences in travel times among German university students by exploring binary movement decisions based on their anticipated commuting times. Our analysis employs logistic regression models using individual data from the MESARAS survey (Weisser, 2016) (N=2589). To assess various influences, we integrate personal information with regional contexts and utilize the availability and range of public transport subscriptions for students as of the year of enrollment. Combined with the geo-referenced mobility episodes (provided by MESARAS), we can incorporate commuting times by different transportation modes (Google Distances API) for our key dependent variable and estimate the effect of the availability of student tickets on the decision between movement and commuting.

Literature

Weisser, R. (2016). Mesaras 2013: Mobility, expectations, self-assessment, and risk attitude of students.

Differences in Accessibility and Motility For Car and Non-car Users and Their Social Consequences in Two Metropolitan Areas in Poland

Filip Schmidt[1], Michał Czepkiewicz[1,2], Dawid Krysiński[1,3]

[1]Adam Mickiewicz University, Poland; [2]University of Iceland, Iceland; [3]University of Wroclaw, Poland

Accessibility is one of the key concepts in transport and mobility studies studies (Jones & Lucas, 2012), which has a significant impact on people's well-being and life chances (Martens et al., 2019). However, accessibility studies often focus on time and distance between home and specific destinations, yet there are many other dimensions of accessibility (Halden et al., 2000; van Wee, 2022). The concept of motility (Kaufmann et al., 2004; Kaufmann & Audikana, 2020) allows us to capture the potential to be mobile in a broader sense.

We propose measurements for different dimensions of motility, such as the ability to be mobile (based on residential characteristics, economic resources and mobility-related skills), the ability to choose the mode of transport and the ability to substitute mobility by satisfying needs online or with the help of others. Responding to the call (Kaufmann et al. 2004: 752-3) to focus on how motility is moderated by conditions and structural constraints, we analyse differences between motility and mobility-mediated need satisfaction between people who have free access to car use and those who do not. We show that while for the former most components of motility do not translate into increased need satisfaction, for the latter other aspects of

motility (skills, available mobility options, opportunities to substitute mobility) are highly correlated with their mobility-mediated well-being.

The presentation is based on a survey and GIS analyses conducted in a mixed-methods research project in two Polish metropolitan areas (Poznań and Tricity) in 2023-24.

Long-distance Commuting Mothers in Europe and Their Affective Experiences

Gil Viry[1], Heiko Rüger[2]

[1]University of Edinburgh, UK; [2]German Federal Institute for Population Research

Long-distance commuting (LDC), as any other forms of employment-related mobility, is highly gendered. Consistent with prevailing gender norms, research shows that women are less likely to combine LDC and parenthood than men, because long commutes interfere with household responsibilities. In a mobilities approach that not only focuses on norms and preferences but also on power and constraint, this study examines the important but understudied question of how the selective group of LDC mothers affectively experience their long commutes, what individual meanings they give to LDC and the degree of choice they have in their mobility. It analyses how this experience varies according to their travel, work and household situation, their career-family and gender-role attitudes. We used data from the Job Mobilities and Family Lives in Europe survey including a pooled sample of 251 mothers from six European countries (Belgium, France, Germany, Poland, Spain and Switzerland) spending one hour or more everyday commuting to their workplace and living with partner and minor children. Results show that mothers' affective experience of commuting strongly depends on the child age, work schedules and attitudes toward work and gender but is only weakly associated with socio-economic status and support for childcare and housework. Career-oriented mothers having flexible working hours and egalitarian gender-role attitudes tend to perceive their commute positively and as an opportunity. Conversely, low-income mothers with traditional gender-role attitudes perceive being forced to commute. Mothers of small children and those living in Spain tend to experience their commute negatively and as a need.

RS11 | T06: Spatial Mobility, Contextual and Neighbourhood Effects

How Do Involuntary Relocations Affect The Labor Market Integration Of The Unemployed In Germany?

Sebastian Bähr, Katja Wolf

Institute for Employment Research (IAB), Germany

In Germany, the government pays the housing costs of individuals receiving basic income support ("Bürgergeld", formerly "Arbeitslosengeld 2"), who are often unemployed, up to a locally determined limit. If the actual costs exceed this limit, recipients must find cheaper housing or fund the difference from their often tight budget. Given the tense housing market in Germany, relocations to cheaper housing might push individuals to deprived neighborhoods, which may negatively affect their chances of finding employment and end benefit receipt.

We use new administrative data of all individuals relocating within the German basic income support scheme from 2015 to 2020 and self-collected data on the historical local payment limits. This data allows us, for the first time, to identify households with housing costs above the threshold and to study their mobility behavior and subsequent labor market outcomes. We consider moves of this group as involuntary relocations, which might be less selective than general mobility. Since we have geo-coded information on the street address, we can identify every move by address change. By combining this individual-level data with 500m grid-level data of the socio-economic structure of the neighborhood, we can incorporate the characteristics of origin and destination grid cells to assess and compare the quality of the neighborhoods. Finally, we analyze how these neighborhood quality changes affect the probability of finding employment and exiting benefit receipt. Our results help to inform the current discussion about inner-city gentrification, the displacement of poor residents, and the prolonged payment of housing costs for benefit recipients.

Deprivation and the Development of Bridging Social Capital for Young Adults in Switzerland

Paul Schuler[1], Gil Viry[1], Mark McCann[2]

[1]University of Edinburgh, United Kingdom; [2]University of Glasgow, United Kingdom

Social capital theory emphasises the benefits of forming relationships and social networks. In particular, access to different places and social circles enables the development of so-called bridging social capital that is crucial for the educational and professional attainment of young adults. However, opportunities to meet other people and form relationships are unequally distributed and depend on residential characteristics and available resources. Despite the recognised significance of place for social relationships, limited research explicitly examines how residential and individual deprivation hinders the attainment of bridging social capital for young adults. In this study, we analyse how different forms of deprivation are associated with the network characteristics of young adults in Switzerland, in terms of geographical and social dispersion as indicators of spatial mobility and bridging social capital. We use personal network analysis and multilevel models to analyse the 2020-2021 subsample (n = 15,770) of a cross-sectional survey of young adults (aged 18-20) in Switzerland, including the full cohort of young males, conducted as part of the Swiss Federal Survey of Young Adults (CHX-YASS).

We find higher residential deprivation to be associated with smaller personal networks, fewer bridging ties, and more locally clustered networks but also that residential population composition and the distribution of infrastructure are linked to network characteristics in a more nuanced way. This study highlights the imperative of studying social networks and place together to better understand their interdependence and the intricacies of social life.

Analysing Segregation with Agent-based Models Based on Surveyed Neighbourhhood Preferences

Sören Petermann, Daniel Schubert

Ruhr-University Bochum, Germany

Social inequality continues to increase in cities. The issue of segregation is currently being discussed and focussed on considering the shortage of residential space in cities. Inner-city ethnic segregation processes depend on residential choices that are based on neighbourhood preferences. The question to be answered in the presentation is whether these residential choices lead to a segregated city.

Most studies refer to the segregation model developed by Schelling (2006). This model assumes that actors perceive their neighbourhoods from their own point of view and leave them if their preferences are not fulfilled. The assumption is that the actors are not aware of the consequences of their individual decisions. The fact that the characteristics of the individual actors influence each other can lead to a connected process of spatial segregation.

The General Social Survey in Germany (ALLBUS) is a representative trend study of the German population. In 2016, a vignette study was used as an in-depth topic to survey neighbourhood preferences regarding the composition of the neighbourhood. To this end, the 13 vignettes with different proportions of social groups were presented to the respondents, who were asked if they wanted to live in this neighbourhood.

However, these preferences do not explain the spatial distribution. To examine these distributions, a segregation model was created in Netlogo. Using agent-based modelling, we

1359

can implement these results from the ALLBUS data in models and analyse the results. In a first step, we can investigate which patterns result from the use of individual preferences for the spatial distribution in the model. This allows us to explore whether individual preferences alone are sufficient to explain segregation.

Mobility Intentions of International Graduates in Germany. Individual, Institutional, and Regional Conditions

Knut Petzold, Jonatan Möller

Zittau/Goerlitz University of Applied Sciences, Germany

Demographic change and the resulting shortage of skilled workers challenges the economy and social welfare system in Germany. International students can help tackling those challenges, once they stay after graduation. It is especially important whether graduates are willing to stay in the region of their university or plan to move forward. Conceptualized as a decision on continued internal migration, staying in Germany can be seen as an investment based on specific cost-benefit considerations. We explore the conditions of students' mobility intentions, both at an individual and structural level. To investigate these conditions, we use recent data of a large-scale survey with international students in Germany, enhanced by spatial indicators on socio-economic conditions. Multi-level modeling is used to account for differences at the country level and to examine possible cross level interactions with individual characteristics. The importance of contextual conditions can also be compared between the country of origin and the host country. As expected, perceived career prospects have a strong and stable effect on the mobility intentions. This effect is moderated by the specific ratio of spatial indicators, such as the gross domestic project. Students whose profile meets the professional demand of the German labour market are more likely to stay. Further individual drivers on the mobility intentions are the subjective satisfaction and the social support during studies. While the analysis confirms the overall importance of economic preferences and structural opportunities, it particularly points to the direction that the special constellations between regional conditions of the countries should be examined more deeply.

RS11 | T07: Spatial Mobility and Subjective Well-being

The Effect of Spatial Mobility on Subjective Well-being: a Longitudinal Couple-level Analysis

Elias Hofmann[1], Nico Stawarz[1], Heiko Rüger[1], Nicolai Netz[2]

[1]Federal Institute for Population Research (BiB), Germany; [2]German Centre for Higher Education Research and Science Studies (DZHW), Germany

There is a large body of literature focusing on the economic effects of spatial mobility in the context of partnerships, highlighting the potential for conflicting (re-)location preferences and the complex decision-making processes that shape couples' relocation behaviour. In this context, it has often been suggested that partnered men have greater economic benefits from work-related moves than their female partners. There are, however, also other aspects driving the migration decision – besides economic benefits. In this con-text, studies using subjective well-being (SWB) as a more comprehensive measure of migration outcomes show positive migration returns for men and women. We argue that considering SWB gains as outcomes of mobility allow to test economic theories of family migration (such as the new home economics and bargaining theories) more precisely, since individuals ultimately strive to improve their utility (captured through SWB). This allows us to get important insights into the within-couple dynamics underlying and the specific outcomes following spatial mobility.

In this paper, we use data from the German Socio-economic Panel Study (SOEP) and deploy fixed effects panel regression models. By exploiting the household structure of the dataset, we add to the existing litera-ture (which mainly focusses on individual-level SWB effects) by explicitly considering the evolution of within-couple differences in SWB and the sum of SWB within the household. Moreover, we also consider which partner benefits more from migration in terms of SWB. Distributed fixed-effects models allow us to estimate how persistent the SWB patterns are.

Effects of Internal Migration on the Life Satisfaction of Apprentices

Rafael Warkotsch[1], Nicolai Netz[1], Stawarz Nico[2], Alexandra Wicht[3,4]

[1]German Centre for Higher Education Research and Science Studies (DZHW), Germany; [2]Federal Institute for Population Research (BiB), Germany; [3]Federal Institute for Vocational Education and Training (BIBB), Germany; [4]University of Siegen, Germany

Spatial mobility can have far-reaching implications for individuals' life satisfaction trajectories. To date, previous

1360

research has mostly examined how spatial mobility influences life satisfaction in reference to middle-aged adults. Moreover, it has sometimes disregarded the influence of other important life events preceding, accompanying, or following spatial mobility. Consequently, its conclusions are not readily transferable to individuals in other life stages and their age-specific life events. To narrow this research gap, we examine how migrating within Germany during the transition to vocational education and training (VET) influences the life satisfaction trajectories of apprentices. Using data from the German National Educational Panel Study (NEPS), we estimate fixed-effects panel regressions to deal with selection into VET-related migration. We find positive long-term effects of VET-related migration on apprentices' life satisfaction; these are, however, moderate compared to the large positive baseline effect of transitioning from school to VET. The effects of VET-related migration hardly vary contingent on apprentices' pre-migration VET opportunity structures. Moreover, these effects are only slightly more beneficial for apprentices migrating towards high-status (versus low-status) VET positions and to urban (versus rural) areas. These results suggest that lifestyle-related rather than strictly VET-related factors explain the life satisfaction gains of internal migration during the VET life stage. Overall, our study illustrates the need to consider the specificity of life stages and coupled life events when analysing effects of spatial mobility on life satisfaction.

The Return of the Failed? A Panel Study on Subjective Well-being of German Return Migrants

Nico Stawarz[1], Andreas Genoni[1,2], Martijn Hendriks[3]

[1]Federal Institute for Population Research (BiB), Germany; [2]National Center of Competence in Research for migration and mobility studies, University of Neuchâtel, Switzerland; [3]Erasmus University Rotterdam, Rotterdam, The Netherlands

In many economically highly-developed countries, a relevant proportion of the population emigrates annually. This group is often assumed to experience increases in subjective well-being (SWB) because of the benefits accompanied with migration. A signifcant share of emigrants, however, return back home at some point. Little is known about returnees' potential costs and benefits, and SWB. From a neoclassical economic persepctive, returneesare conceived as 'failed emigrants' who return due to unmet emigration expectations. This would suggest that returnees experience decreases in SWB during their time abroad, and possible increases after they returned back home, e.g. due to occupational improvements and better social embeddedness. In contrast, new economics of labor migration (NELM) see returnees as successful migrants who return because they achieved their goals abroad. From this perspective, returnees' SWB should increase abroad and remain stable with the return because of improved individual utility levels.

We tap into the research gap by investigating shifts in SWB of internationally mobile German citizens in the course of (i.e. before and after) their return to Germany. We apply fixed effects (FE) panel regression models and impact functions to probality-based data of the German Emigration and Remigration Panel Study (GERPS), which is representative with respect to the studied group. Results reveal that returnees' SWB decreases slightly abroad but remains stable overall during the course of return (B = − 0.05, SE = 0.072, p = 0.463). However, the outlined contrasting theoretical assumptions and preliminary evidence suggest that return motives cause substantial heterogeneity in how returning affects SWB.

Social Inequalities in the Effects of Spatial Mobility on Life Satisfaction

Fabian Kratz[1], Nico Stawarz[2], Nicolai Netz[3]

[1]Ludwig-Maximilians-Universität München (LMU), Germany; [2]Federal Institute for Population Research (BiB), Germany; [3]German Centre for Higher Education Research and Science Studies (DZHW), Germany

We systematically assess the interplay of social origin and educational attainment in shaping returns to internal migration. We draw on cumulative inequality theory and argue that parental and own resources increase returns to migration. To assess the subjectively scaled overall returns to migration, we examine subjective well-being operationalized through life satisfaction. To test how social origin and education affect life satisfaction returns to migration, we closely follow the estimands approach: (1) We define the theoretical estimands, i.e., the total effects of social origin and education on life satisfaction returns to migration, and the controlled direct effects of social origin if we emulate interventions to fix educational attainment at different levels. (2) We discuss the assumptions needed to identify these effects. (3) We outline how different versions of stratified fixed effects panel regressions with dummy impact functions can deliver empirical quantities that speak to the theoretical estimands. Drawing on a sample of adults aged 18–65 years from the German Socio-Economic Panel (SOEP), we confirm prior findings that migration leads to long-term gains in life satisfaction. We expand on these findings by showing that individuals from high social origins and with high levels of education benefit more and over a longer time from migration. Preliminary findings suggest that the lion's share of the total effect of social origin on returns to migration arises because of origin-specific differences in educational attainment. Overall, our study makes important theoretical and methodological contributions to the literature on mechanisms of cumulative (dis-)advantage in life course processes.

RS11 | T07_02: Everyday and Urban Mobilities

Sustainable (im)Mobility and Accessibility in Italian Peri-urban environments. First results from a 4 case studies research

Matteo Colleoni, Simone Caiello, Francesca Lacqua

University of Milano-Bicocca, Italy

Nowadays urbanisation process is characterised by a significant increase in built-up areas and the territorial dispersion of residential, productive and commercial settlements between urban centers and their rural hinterlands. Reasons behind are several and can be summarized in the transformations of the production, reproduction and distribution system of contemporary societies, that increase complexity of urban/metropolitan areas. Within these, new forms of territorial organisation go beyond the centre-periphery model to become more polycentric, mobility patterns are more intense, multidirectional and multi-use, and access to services and local opportunities is more problematic. The causes refer, first of all, to the choice of younger families to settle in municipalities outside the main cities in search of larger, affordable, comfortable and safe environments, and to the opportunities linked to mobility systems structures and new commercial and work-related arrangements tendencies ongoing in fringe areas.

Within the broader functional urban areas, peri-urban contexts in particular benefit from their proximity to cities but suffer as well from the effects of uncontrolled expansion of the built environment: transport congestion, decline in landscape quality, forced mobility, high reliance on private transport. All these aspects often end in a potential higher social exclusion, result of the immobility of the more deprived people.

This work aims to explore mobility and accessibility of peri – urban environments with the related (im)mobility challenge, focusing on the first results of a national project on mobility and accessibility to services and territorial opportunities in four Italian peri-urban areas analysing spatial data through GIS techniques.

Navigating Disruption: Unraveling the Cascading Effects of COVID-19's Impact on Marginalized Communities through Public Transport in South Africa, Brazil and Germany

Tanja Schnittfinke

TU Dortmund University, Germany

Recent global crises, such as the COVID-19 pandemic, have brought to light the intricate connections between spatial mobility, societal structures, and crises-induced disruptions. This research delves into the multifaceted impacts of COVID-19 disruptions on marginalized groups in the public transport sectors of Ruhr, Germany, Sao Paulo, Brazil, and Cape Town, South Africa. What happens if public transport can no longer be used, not allowing people to reach essential services? The overarching research question explores the indirect effects of critical infrastructure and service disruptions on the livelihoods of marginalized households before, during, and after the pandemic.

By focusing on critical sectors, including healthcare, food and nutrition, social work, education, and childcare, this study employs a criticality assessment approach by analyzing cascading chains to anticipate the ripple effects of disruptions in each field. These chains were validated through expert workshops in the respective countries, considering impacts on staff, service users, patients, students, and their families. Furthermore, the research investigates the potential of virtual mobility and online services as substitutes for in-person services during disruptions.

The presentation focuses on spatial (im)mobilities and their implications for sociological issues contributing to understanding the unequal distribution of access to spatial (digital) mobility, particularly across gender, ethnic, and class lines, magnified during crises. In the context of the global theme, the findings shed light on mobilities and inequalities during the COVID-19 pandemic, emphasizing the interconnectedness of spatial mobility, societal structures, and crisis-induced vulnerabilities.

Urban Mobility Dynamics in Cluj-Napoca, Romania: Activity Spaces, POI Accessibility, and Socio-Economic Integration

Vlad – Ionut Alexe[1], Norbert Petrovici[1], Camelia – Florina Andor[2], Titus Man[3]

[1]The Faculty of Sociology and Social Work, Babeș-Bolyai University, Romania; [2]Faculty of Mathematics and Computer Science, Babeș-Bolyai University, Romania; [3]Geography Faculty, Babeș-Bolyai University, Romania

The patterns and practices of urban mobility are an important aspect of creating liveable and equitable environments. They significantly influence the quality of life, sustainability, and the broader socio-economic organization of cities. This study uses the concept of "activity space" (Cagney, Cornwell, Goldman, Cai, 2020) as a framework to combine an analysis of Points of Interest (POI), city structure, and land use, providing a holistic perspective on patterns of urban movement.

We research Cluj-Napoca metropolitan area and leverage Call Detail Record data (Phithakkitnukoon, et al. 2010) to calculate mobility flows. We use GIS and mobility analytics to map areas based on their proximity and accessibility to POIs, including employment centers, recreational venues, and educational facilities while considering how "activity spaces" factor into mobility patterns.

Key findings indicate minimal segregation and high mobility within Cluj-Napoca, pointing to an integrated activity space across socio-economic groups. This is consistent with the hypothesis of "exploded urbanism" (Petrovici, Poenaru, 2023) of demographically decreasing core and increasing peri-urban areas. However, a concentration of POIs, especially employment in the new globalized outsourced economy of secondary business processes, increases the mobility flows toward these locations, which in turn, contributes to congestion and mobility challenges. These findings resonate with a broader urban trend where the disjunction between employment and housing geography impacts mobility patterns. The study's implications for understanding the city-region geography where low investment in housing and high need for work availability of an emerging globalized economy plays a key role in urban growth.

RS11 | T08: Spatial Mobility and Social Mobility

The Impact of Social Origin on the Spatial Distance Covered at the Transition from School to Vocational or Higher Education, with Consideration of the Type of Programme

Tom Behringer

RPTU Kaiserslautern-Landau, Germany

In the contribution, I examine for the first time whether there is an effect of social origin on the spatial distance covered by young adults at the transition from school to vocational education. Previous studies have already found an effect of social origin on the spatial distance covered at the transition from school to higher education but have used inadequate methods for their estimation. Hence, I also revise this estimation. Furthermore, the studies have not differentiated the effect of social origin by the type of higher education. Therefore, I distinguish in my analyses of the effect of social origin on the spatial distance between three post-school educational programmes: vocational education, higher education at a university of applied sciences ("Fachhochschule"), and higher education at a university. For addressing the three mentioned research desiderata, I use longitudinal data from starting cohorts 3 and 4 of the German National Educational Panel Study (NEPS) and compute multiple linear regression models. The central finding is that in all three types of transitions (vocational education, higher education at a university of applied sciences, higher education at a university) young adults on average cover a greater distance if they have an academic background compared to having a non-academic background. Depending on the type of programme, the effect of social origin is between 17 km (vocational education) and 25 km (university) and does not differ significantly between the three types of transitions.

Of Fathers and Sons: The Intergenerational Transfer of Return Premium in Children of Returnees

Jose David Lopez Blanco

University Carlos III, Spain

In the rapidly evolving dynamics of global migration, the phenomena of return and temporary migration have emerged as pivotal subjects. While the economic sociology of return migration—particularly the concept of a "return premium" and how return migrants may capitalize on their experiences post-return—is gaining traction, the potential for intergenerational transfer remains significantly under-researched. Our study delves into this relatively

1363

uncharted area, focusing on the social mobility of children who were either born abroad and returned with their families during their childhood, or those who migrated and later returned with their parents. We explore two primary mechanisms that could contribute to this mobility: the acquisition of diverse human capital during their education abroad, and the increased mobility rates that these children may have 'learned' or acquired from their past migration experiences. Employing data from the Survey of Health, Ageing and Retirement in Europe (SHARE), our analysis encompasses the varied life paths of these individuals, mapping the complete migration histories—including commuting, long-distance internal migration, and international migration—of return migrants' children from seven European countries historically involved in guestworker programs (Spain, Italy, Greece, Portugal, Slovenia, Croatia, and Finland). This research aims to illuminate the complex effects of return migration, highlighting its ramifications for migrants and their progeny alike.

Spatial Mobility and its Significance for Scientific Careers. Results of a Mixed-Methods Study in Germany

Nicole Burzan, Benjamin Neumann

Technische Universität Dortmund, Germany

The current state of research shows that spatial mobility plays a major role in scientific careers. Career-related relocations or regular commuting play an important role for academics just as conference trips or longer research stays abroad. This raises the question of which mobility behaviour people have in different career phases (also from a development perspective) and under which conditions they rate it as an opportunity or a burden.

This contribution presents results from our completed research project "Academics 'in motion'", a mixed-methods study conducted between 2020 and 2023 at TU Dortmund University and Niederrhein University of Applied Sciences and Arts, funded by the German Research Foundation (DFG). The project combined quantitative data collected in an online-survey and qualitative interviews, which traced scientific career paths in a retrospective manner. We differentiated spatial mobility patterns among other aspects according to career phase and discipline.

The results show quantitatively that the career phase in particular plays an important role for spatial mobility. The majority of postdocs are constantly or even increasingly mobile. At the same time they rate mobility as a requirement, while doctoral students and professors tend to rate it more as an opportunity. Furthermore, some selection effects suggest that spatial mobility supports careers. Qualitatively, we distinguished three types with different mobility behaviour and attitudes. In addition to the degree of orientation towards science, the anticipated duration of (long-distance) mobility in connection with support in the couple relationship was significant. Seeing mobility as positive in the long term was highly conditional; science therefore does not necessarily socialize people to perceive spatial mobility as normal. Qualitatively and qualitatively, a dynamic time perspective thus proved to be relevant.

Changing Class, Changing Space: The Geographical And Symbolical Significance Of Distance.

Clara Gutleben

University of Tübingen, Germany

In A Man's Place, Annie Ernaux depicts the train journey as a metaphor for social trajectory, and characterises the passenger (who represents the "class defector") as an immigrant from the inside (the inside of a country and the inside of oneself). The notion of distance, applied to social mobility, thus takes on a double dimension, between geographical distance and cultural as well as mental displacement.

This proposed contribution forms part of the studies carried out by the 'Doing Transitions' group, which is interested in the constitution of transitions over the life course. It will be based on narrative biographical interviews (part of which consists of a food biography) conducted in France with ten "transclasses" (Jaquet; 2014). We will examine the role played by space in the discourse of transclasses as regards their positioning in social space. To do so, we will look at the effects of distancing between a sense of here and a far-off elsewhere, and of assimilation for example through the designation of a place as 'home'. We will also consider the adaptation of cultural (in particular food) practices according to the type of space in which they take place (Bourdieu; 1979), as a manifestation of spatio-normativity. Finally, we will study the contrast drawn by transclasses between the (national, international, professional, leisure, daily) mobility they value and the stagnation they associate with their social class of origin.

The study will draw on the sociology of culture, the Bourdieusian theory of distinction and Chantal Jacquet's concept of the ethos of distance.

1364

RS11 | T09: Crises, Residential Preferences and Spatial Mobilities

Residential Mobility and Geographical Polarization of Party Supporters: Is There Evidence for Self-Selection into Politically Compatible Regions in Germany?

Stephan Schütze

Bielefeld University, Germany

There is a broad controversy regarding people's preference to live among politically like-minded others, causing a polarized political geography driven by selective residential mobility and the spatial concentration of political beliefs. However, current research on this issue has predominantly focused on democracies or referendums with majority voting systems and has come to contradictory conclusions. This study aims to close this gap for multi-party systems by investigating the extent to which party supporters in Germany sort themselves into politically more compatible regions when changing their place of residence. Using individual survey data from the German Socio-Economic Panel (SOEP) and official regional statistics provided by the Federal Institute for Research on Building, Urban Affairs, and Spatial Development (BBSR), logistic multilevel analyses are conducted for German NUTS-3 regions. An expected outcome is that party supporters move to regions where their preferred party enjoys electoral success and their ideological worldview is no longer in conflict with the region. Furthermore, it is expected that distance and differences in urbanization between origin and destination regions are central to residential choices, with a positive relationship in favor of politically congruent regions. This analysis not only sheds light on the impact of political circumstances as pull factors in residential decisions but also explores the transferability of theoretical considerations on geographic sorting to proportional representation systems. The findings bear implications for democratic coexistence, suggesting that its core values, such as consensus and cooperation, are compromised when geographic polarization and tensions between politically homogeneous regions contribute to societal divisions.

Crisis of Middle-Class Housing? Experiences of the Residents of Warsaw and Gdańsk, Poland

Bielecka Katarzyna, Justyna Anna Orchowska

University of Warsaw, Poland

This presentation addresses one of the most important contemporary challenges: growing housing disparities and their relationship with socio-spatial inequalities. Over the past decade, housing costs have outpaced income growth in cities across different contexts, leading some scholars to declare a "global crisis of urban housing affordability" (Wetzstein, 2017: 2). As a result, an increasing number of urban residents have been confronted with heightened financial pressures related to housing. This applies not only to low-income households but also to the middle class. This phenomenon is particularly visible in large cities, where real estate prices reach their peak.

This presentation aims to explore the experiences of housing insecurity among the urban middle class in Poland. Previous research has shown that housing for these classes plays a special role – it is a significant element of their identity and the main component of their wealth (Bacqué et al. 2015; Benson, Jackson, 2017). Drawing on Bourdieu's theory, this presentation seeks to answer the questions: What are the middle classes' strategies to cope with changing housing conditions? How does housing insecurity influence their perceptions of urban space?

1365

The speech will be based on empirical research conducted in Gdansk and Warsaw (2023), which involved 20 biographical interviews with individuals aged 30-40, including private renters and mortgage holders. Findings indicate that the middle class employ diverse forms of capital to secure housing, willingly making significant sacrifices to reside in habitus-aligned neighbourhoods. These insights extend beyond the Polish context, offering broader insights into the relationship between urban space, housing status, and social inequalities.

Embedding Cross-border Labor Mobility into Socio-Ecological Transformation: Exploring Mobility Infrastructurization At The German-Polish Border

Kyoko Shinozaki, Iepke Rijcken

University of Salzburg, Austria

When the issue of sustainability is debated, we tend to think about climate change, the energy transition or recycling, of which mainly natural sciences and engineering science have been forefront. So, what has got Sociology to do with it? While Sociology may be argued to be a late comer in these debates, considering the anthropogenic nature of climate change, the relevance of Sociology to the theme is more than evident. Sociology has here a lot to

offer to critically assess and theorize the capitalistic ways of living and consumption as well as collective action. The UN's SDGs encompass a wide range of issues pertaining to the socio-ecological transformations from a holistic perspective for the sustenance of our earth. Amidst the sugrge of rightwing populism, European societies are experience challenges related to ageing population and labour shortages, for which mobile workers and migrants are often seen as part of the solution. There is an urgent need to improve job quality as an enabler of increased labour market participation, fair working conditions and equality – contributing to sustainable work over the life course.

The aim of this paper is to rethink cross-border labour mobility at the German-Polish border in the context of socio-ecological transformation. Drawing on ethnographic fieldwork with a convivial approach, we analyze the process in which the complex interplay of technologies, institutions, and actors facilitates the practices of cross-border commuting from west Poland into the automotive production sector and distribution centres in Brandenburg.

RS12 | Linking Ages - Towards a Sociological Theorizing of Age Constructions Across the Life Course

RS12 | T01: Linking Ages – Towards a Sociological Theorizing of Age Constructions Across the Life Course

The Conceptualisations of Ageism, Childism and Adultism in Research on Intergenerational Encounters: A Scoping Review

Satu Maarit Heikkinen[1], Monika Allgurin[2]

[1]Karlstad university, Sweden; [2]Jönköping university, Sweden

1366

This article is based on a scoping review of how ageism, childism and adultism have been conceptualized in research on intergenerational encounters. A central premise of many studies on intergenerational encounters is that regular interactions between older and younger people should counteract ageism. However, with its origins in social gerontology, the concept of ageism has been traditionally focused on older people. Thus, for example, in childhood studies, ageism is less common and is used alongside concepts, such as childism and adultism. Studies on intergenerational encounters that cover a wide age range and relate to both gerontology and childhood studies offer a lot of potential for exploring how the concept of ageism is used alongside the concepts of childism and adultism. Focusing on reviewing the empirical studies of intergenerational encounters, in this article, we investigate definitions and mechanisms of ageism, childism and adultism alongside considerations of groups that are targeted by these forms of discrimination. Our preliminary findings show not only the dominance of the concept of ageism used in studies on intergenerational encounters, but also that ageism is usually understood as targeting older people. While some studies highlight both children's and older people's perspectives, ageism is still mostly defined as affecting older people. We discuss these findings in relation to the recent developments in discussions of ageism, childism and adultism. We propose that ageism as an overarching concept capturing age inequalities can be strengthened and developed using important insights from conceptualizations of childism and adultism.

Age As a Subject of Disputes and Performances

Pascale Garnier

Université Sorbonne Paris Nord, France

This presentation would like to underline the importance of linking sociology of childhood and children and sociology of age and to discuss how to think their links. As it has been demonstrated a long time ago (Sacks, 1974; Atkinson, 1980; Widmer, 1983), age categories, such as childhood, cannot be thought of separately. They form a system that is deeply embedded in social and cultural "chrono-normativity" (Freeman, 2010). Our approach intends to show that this system is also a moral and political order (Garnier, 1995; 2014). And, for studying what we call "classements d'âge" (age rankings), we analyze empirical "disputes" about what is "good" (or not) for children and what they are "able to do" (or not), in many historical or nowadays practices. Explicitly or implicitly what is at stake in these "disputes" are the "economies of worth" (Boltanski & Thévenot, 2006) between ages and the equivalences between them as human beings.

Closed to this approach, Passuth (1987) sheds light on "age hierarchies" among children. Age is often a matter of "disputes" among them, for example distinguishing throughout material culture what is for them or for "babies" and what they want for becoming "big ones" (Garnier, 2021). This approach leads also to consider age as "performance" (Butler, 1993): age is not just an externally prescribed category but a greatness that must be realized. Even young children have to perform their age, fulfill the expectations linked to their age (Garnier & al., 2016). Doing his or her age is also a process where the futur is accomplished in the ongoing present.

Age is More Than a Number: Developing an Integrative Conceptual Framework on Age

José Manuel De São José

Universidade do Algarve, Portugal; Centro Interdisciplinar de Ciências Sociais (CICS.NOVA)

Age is omnipresent in our lives and a fundamental element in the organization of human societies. Age relations, like other power relations (e.g.: gender relations) generate social inequality. However, sociological theorization/conceptualization on age is still scarce and dispersed, compromising empirical research on this relevant topic. This article systematizes the theoretical/conceptual work on age carried out so far in the field of social sciences and, based on this systematization and other relevant literature (with emphasis on general sociological theory), proposes a conceptual framework that integrates and expands this work. This integrative conceptual framework on age is expected to promote empirical and theoretical work on this topic, bringing us closer to the volume and quality of work that has already been done on gender, race/ethnicity, and social class.

Is 20.4 the New 19.3? Transformations of Perceived Age Boundaries in Early and Late Adulthood

Anna Wanka[1], Moritz Hess[2]

[1]Goethe University Frankfurt, Germany; [2]Hochschule Niederrhein, Germany

Age plays a major role in the differentiation of people. But how do we know – that is, having acquired an implicit, internalized understanding of – whether a person is to be categorized as 'young' or 'old'? This paper is concerned with assessments of age boundaries from youth to adulthood on the one and from adulthood to old age on the other margin of life. We argue that, despite developments of de-standardization of the life course, most societies still maintain a strong system of chronormativity. Such chrononorms, age boundaries and ageisms are the result of historically, socially and culturally contingent and dynamic social processes and practices. In this paper, we thus pose the question how assessments of age boundaries change over time and differ between cultural contexts and social groups. We thereby contrast age boundaries in early and late adulthood from a 'Linking Ages' perspective to see if such changes and differences are 'linked' across the life course. We draw on data from the European Social Survey (ESS) wave 3 (2006/7) and wave 9 (2018) for multivariate data analysis. Results show that women are assessed to age 'faster' then men, but there in an increase of age boundaries between the two waves that narrows this gender gap. Moreover, differences in social position (e.g. education, income) and country of residence shape age assessments. We discuss these findings at the backdrop of theories of chrononormativity, the institutionalized life course, and the double standard of ageing.

1367

The Effect of Past and Current Financial Vulnerability on Older Adults' Financial Planning Horizon

Aviad Tur-Sinai[1], Marina Motsenok[2]

[1]University of Haifa, Israel; [2]Ben-Gurion University of the Negev

Among the economic decisions that people expect to make in their lives, some relate to the need to establish priorities for their activities and when to undertake them. To satisfy the ongoing need to assure the older population an optimum standard of living, a deeper understanding of the determinants and considerations that may assure individuals and their households an appropriate economic horizon and quality of life is needed. The study focuses on mapping and understanding the set of characteristics that determine older adults' financial planning horizons.

The study yields a deep and broad picture of the determinants of the financial planning horizon of people aged 50+, using data from four waves of SHARE that elicit information

on older adults' present and childhood (n=35,719 at baseline, 52.69% female, age 50+).

The study shows that individuals' financial hardship and/or exposure to hunger in childhood lower the probability of preferring a lengthy planning horizon for their future saving and spending; people at a high cognitive ability tend to plan their saving and spending to the long term; and individuals' and households' economic decisions hinge on their households' economic capacity. Among those of working age, a perfect substitution is found between individuals' characteristics in childhood and their economic characteristics and cognitive ability in the present.

Given the steady upturn in life expectancy and the ongoing need to assure the older population an optimal standard of living, the study provides insights and a better understanding of the full set of determinants and characteristics that may assure individuals and their households an adequate economic horizon and quality of life.

RS12 | T02: Linking Ages – Empirical Insights into Age Constructions Across the Life Course

Age, Body, Transitions: Exploring the Relation of Age and Embodied Transformations Through the Method of Age Blinding.

Frederika Schulte, Kritika Gosain, Clara Gutleben, Katharina Pontius

University of Tuebingen, Germany

Throughout the life course, our bodies change and undergo transformations. Drawing on the theoretical notions of embodiment and social practices, two arguments can be put forward: first, the meanings we create around (ageing) bodies are socially constructed and thoroughly interwoven with multi-layered discourses, institutional norms, and social values. Second, these bodies themselves are constituted in social practices of "attribution, addressing and staging" (Nägler/Wanka). Regarding this interplay, we are interested in the question of the entanglement of bodies and age(ing) throughout transitions, asking "How does the social category of age shape our everyday and scientific constructions of the body?".

The proposed contribution is based on a joint reflection of four PhD projects pursued in the German research training group "Doing Transitions" that focus on diverse phenomena – class mobility, abortion, hysterectomy, family care – and age groups. Applying the methodological approach of "age blindness" and "interpretation under different premises" (Freutel-Funke et al.) to the empirical material of these four projects, we will investigate the relationship between age and body phenomena, for example in the social negotiation of pain in different age groups, asking "Who is allowed to express pain and to what extent? Whose pain is accepted? And whose pain is also associated with learning experiences?"

We conclude that this methodological approach unveils the significant role played by the construction of age and bodies in the life course trajectories of individuals, and, beyond, adds to reflexivity in the interpretation process. Finally, we propose to apply a 'Linking Ages' agenda to other categories of social difference, such as class or gender.

1368

Linking Moves –Relocations To Assisted Living Arrangements Of Young And Older Adults

Karla Frederike Wazinski

Goethe University Frankfurt, Germany

How "age" as a powerful category of difference structures society is particularly evident in age-segregated places. Such places, like kindergartens, youth clubs, or care homes, are designed exclusively for certain age groups, while typically being supervised by (pedagogical) staff of a different age.

The project presented here focuses on relocations to (pedagogically) supervised, age-segregated living arrangements for young adults (case 1) and older adults (case 2) and uses an ethnographic approach to "follow" the relocation process at both ages, while continuously relating them to each other.

First findings show how age differentiations come to matter in the interplay of relocation, housing and pedagogical practices on the basis of realms such as privacy, independence, care and hygiene. For example, independence is framed as a competence that needs to be acquired in young adulthood and maintained in older adulthood. In different ways, both show an orientation towards the ideal of an autonomous, independent adult.

On the basis of the project and the preliminary findings, it will be discussed what a "linking ages" perspective offers for research on the constitution of age and age differentiation: What other things do we learn about 'age' and the emergence of this category of difference? What blind spots are there, what might eventually get lost?

Sex, Drugs, and Rock-n-roll? Aging Hippies Reconstructing Old Age

Galit Nimrod

Ben-Gurion University of the Negev, Israel

Based on 40 in-depth interviews with lifelong, returning, and past residents of an intentional community founded by a group of hippies in 1971, this study explored continuity and change between youth and old age among aging hippies. Of the hippie sex, drugs, and rock-n-roll triad, the latter seemed significantly less influenced by time and aging processes. In contrast, some people testified that as they got older, they experienced some liberation from the centrality of sex in their lives, and many reported decreased use of psychedelics and a transformation in the purpose of cannabis use from 'spiritual' to 'instrumental.' Interviewees' involvement in other activities was diverse. Still, social and physical activities seemed to be the most dominant activity types, and two specific activities—taking long walks and gardening—were common to most participants. In addition, several people reported involvement in various forms of 'serious' leisure. The continuity of the ethics of play, in general, and activities that maintained study participants' identity, in particular, are consistent with previous research demonstrating a tendency for continuity in later life. Still, the present study emphasizes the importance of combining continuity and change. Allowing for modifications in both intensity and meaning may result in an activity repertoire that better fits the older individual's interests and circumstances. This combination, along with the dominance of physical and social activities and the many 'serious' leisure activities, suggests that aging hippies present a new model for reconstructing old age and making the most of later life.

Reinterpretation of Age-Systems in the Migratory Context

Mónica Ibánez-Angulo

University of Burgos, Spain

In this paper, I aim to present an alternative approach to studying age within the context of transnational migration. This approach explores how migrants reinterpret, accommodate, and challenge age systems learned and practiced in their 'anthropological home' in the new migratory context.

While existing academic publications on migration and age treat age as an absolute chronological socio-demographic variable or analyze how specific age groups, especially youngsters, integrate into the migratory context, my approach suggests that age constitutes a meaningful social system that shapes power relations among members of different generations and that, consequently, the accommodation process to different age systems also involves challenging sociocultural constructions of age in both the origin and migratory contexts.

Specifically, my paper will focus on three main issues:

1. How migrants reinterpret age systems in the migratory context in terms of behaviours, achievements, expectations, self-identifications?

2. How inter/intra-generational solidarity and reciprocity are manifested in the migratory context?

3. How age intersects with other social constructions such as gender, social class, status, and ethnic and racial constructions?

In addition to reviewing sociological and anthropological literature on sociocultural constructions of age, this paper incorporates informal interviews with West African, Bulgarian, Moroccan, and Ecuadorian women living in Burgos (Spain) and known to the researcher through their participation in other research projects.

1369

Twilight Love: Examining The Demands For Intimacy And Choice In Re-partnering In Later Life Among Chinese Elderly From a Life Course Perspective

Wenxin Jiang

The London School of Economics and Political Science, United Kingdom

As life expectancy rises, seniors enter an "additional stage of life" after retirement. This phase brings significant changes in family dynamics and social networks, with spouses becoming the primary source of support. Urbanization and the pandemic have intensified loneliness among single seniors, leading to a greater desire for intimacy. However, limited sociological research focuses on such demand, particularly in China, where familial responsibilities take precedence and the intimate needs of the elderly are marginalized. To challenge age discourse and open possibilities for elderly intimacy, this study aims to explore the intertwined trajectories and pathways that lead to the choice in re-partnering among elderly individuals while also investigating the various factors considered in partner selection and tensions within the kinship system. Since the choice in re-partnering in later life is influenced by both enduring traditional norms and the transformative nature of modern intimacy, a life course perspective that incorporates individual, generational, and historical temporal dimensions is meaningful. Qualitative methods, including in-depth interviews, photo elicitation, and narrative analysis, are used. Preliminary findings suggest that the potential partners' quality of life is a key consideration in mate selection, with physical and mental health playing a significant role. Individuals who possess a greater understanding of health preservation knowledge exhibit higher levels of attractiveness within the dating pool. Meanwhile, health can be viewed as a form of life course capital that confers cumulative advantages for later-life intimacy. Individuals with higher socioeconomic status, who are not required to sacrifice health for work, or who have employed health care actions in response to suboptimal health in early adulthood, are more likely to find compatible partners and experience higher well-being in later life.

Precariousness And Ontological Insecurity: An Analysis Of Self-reflexivity of Precarious Workers In Portugal

Renato Miguel Carmo[1], Rodrigo Vieira Assis[1], Isabel Roque[2], Jorge Caleiras[1,3]

[1]Iscte – University Institute of Lisbon; CIES-Iscte; [2]CES – UC; [3]CoLABOR

1370

The impact of the COVID-19 pandemic exposed the consequences of the flexibilization of labor relations which had been growing mainly since the 2008 financial crisis, highlighting that precariousness affected the world of work and other dimensions of life, such as family, housing, support networks, health, and well-being. Several authors, such as Anthony Giddens, Margaret Archer, and Bernard Lahire, have analyzed the way in which individuals reflect on themselves with reference to the contexts in which they are inserted. According to this approach, self-reflexivity is activated to deal with contingencies that affect the routinize nature of everyday life, threatening their established ontological security. Therefore, how do precarious workers, behave in the face of high levels of permanent instability and insecurity in the labor market? How do they perceive precariousness? The objective of this paper is to present the results of an analysis focused on the individual agency of 53 workers from different sectors of activity, interviewed between 2019 and 2020 in Portugal. The analysis addresses the ways in which these individuals activate reflexive skills to manage themselves in the face of alife condition characterized by a state of "ontological insecurity". This presentation will discuss how vulnerable workers reflect on themselves and attribute meaning to their lives with reference to the level of precarious working conditions and the persistence of insecurity and uncertainty. The results led to the development of a three-level typology of self-reflexivity among precarious workers: reflexivity dominated by precariousness, reflexivity rooted in precariousness, and reflexivity uprooted from precariousness.

A New Algorithmic Subjectivity? Notes on Power and Resistance in Platform Labour

Federico Chicchi[1], Marco Marrone[2]

[1]Università di Bologna, Italy; [2]Università del Salento, Italy

The last decade has been marked by the pervasive spread of digital technologies. The rise of digital platforms and algorithmic management is transforming both the sphere of production and of social reproduction, as well as their previous interdependencies. Algorithms not only exercise an augmented despotic power with consequences in terms of labor intensification and constant surveillance. It functions, above all, as a positive power that operates by defining new subjective features and providing platforms the necessary social ground for their functioning. In this perspective, algorithms combine discipline and governmentality establishing platforms not only as a new business model, but as a social infrastructure that insists on the formation of new "forms of life." However, the borders of algorithmic expansion are surrounded by labor and social conflicts that are showing an unexpected ability to challenge platforms' power. This highlights how the processes of digitization are not flat or linear. On the contrary, a fundamental ambivalence persists on algorithmic subjectivity, marking a difference from previous phases of post-Fordist precarisation where unionization and labor conflicts appeared limited. The aim of this presentation will be to investigate genealogy of the operations that characterize this ambivalence intrinsic to emerging algorithmic subjectivity. Our analysis will be based on combining theoretical understanding of the new subjectivity at work with empirical data: interviews with platform workers and data taken from the participatory observation within Riders Union Bologna, one of the numerous informal unions that have developed in recent years in the food delivery sector.

Labour In-Between Gift And Commodity – Reproducing And Resisting Precarity In The Digital Games Industry

Mikael Bergmasth, Erika Andersson Cederholm, Malin Espersson

Lund university, Sweden

The paper investigates the phenomenon of double exploitation in 'passionate work', where workers are exploiting themselves in their dedication to work and colleagues, simultaneously as being exposed to exploitation by employers and the industry at large. The study is based on an analysis of semi-structured interviews with game developers employed in the Swedish digital games industry. The digital games industry has been highlighted internationally as an industry that obscures precarious working conditions behind the passion for creating games. Drawing on the relational work perspective in economic sociology, the analysis

identifies the expectations and subtle norms in different socio-economic exchange systems, as well as the ambiguities and mismatches when the norms of gift exchange and market exchange intersect. Through the analytical notion of 'labour as gift versus labour as commodity', the study highlights the interactive social processes through which self-exploitation are sustained as well as questioned and resisted. It is argued that although work performed within the framework of an employment is to be considered a commodity in a structural meaning, it is not solely a commodity. Friendship reciprocity and favour exchanges are regarded as beyond-work-relationships as well as being integral to the formal labour relationships. The paper discusses the interactive dynamics of friendship and collegial exchanges, accounts of non-reciprocated gifts, as well as self-blaming and guilting practices. It is demonstrated how the mismatches between different forms of socio-economic exchange evoke reflections on the value of work, which paves the way to voice and potential exit from the industry.

Legitimising Frames for Adverse Working Conditions of Seasonal Workers in Croatia

Katarina Jaklin[1,2], Jelena Ostojić[3]

[1]Institute for Social Research in Zagreb, Croatia; [2]University of Ljubljana, Faculty of Social Sciences; [3]University of Zagreb, Faculty of Humanities and Social Sciences

This paper examines the legitimizing frames for adverse working conditions experienced by seasonal workers in Croatia, a European semi-peripheral country with seaside tourism monoculture that emerged in the aftermath of the post-socialist dismantling of other industries.

Working conditions within the tourism sector are characterised by long working hours without appropriate daily and weekly rest periods, presentism, substandard accommodation and food provision, and low remuneration, contributing to the broader context of precariousness. The precariousness experienced by seasonal workers is not only confined to their employment status but also extends to other dimensions of life, particularly in disrupting the normal life flow and lacking social protection, including regulatory measures and welfare provisions. Despite this, there is a notable absence of labor unrest within this sector.

Focusing on workers' subjectivity, this paper aims to explore how workers interpret and legitimize those working conditions and the repercussions of those legitimizing frames on collective forms of agency. The paper draws on insights from 23 semi-structured interviews conducted in 2021, encompassing a diverse sample of seasonal workers in Croatia. By concentrating on a specific country case, this paper seeks to enhance the understanding of embeddedness of those legitimizing frameworks and workers' subjectivities in this social context. It also explores their diversification based on different life and work trajectories of seasonal workers, attempting to comprehend the impact on the potential for collective action within the tourism sector.

RS14 | T04: Between Precarious and Entrepreneurial Subjectivities

Entrepreneurship and Precarious Work: Experiences and Meanings Among Young People from the Urban Outskirts

Maria Carla Corrochano

Federal University of São Carlos, Brazil

In a context of high unemployment, more flexible labor relations and loss of rights, the implementation of a neoliberal agenda has the spread of entrepreneurship as an important resource for social legitimization, especially among young people. A wide and diverse range of workers have been labeled as "entrepreneurs", covering up precarious work situations. This article presents the results of a quantitative and qualitative survey, supported by FAPESP and CNPq, carried out between 2021 and 2023, comprising 208 young people from the urban outskirts of São Paulo and working as "entrepreneurs" in different areas: culture, communication, food, aesthetics, clothes production, among others. It is based on literature focused on the construction of neoliberal subjectivity in Latin America, which has contributed to the development of conceptual and methodological tools as an analytical resource focused on the relationship between structural conditions and individual forms of agency, as highlighted in the works of Danilo Martuccelli and Kathia Araújo. The results show how young people understand and experience their work as "entrepreneurs", marked by reflexivity and the creation of new strategies and practices, including collective ones, as opposed to the dissemination of individualizing solutions in the world of work.

Precarisation Of The Self: The Role Of The Social State

Saro Gibilisco

University of Fribourg (CH), Switzerland

This paper aims to broaden the understanding of precariousness in the Global North by moving beyond its association with employment conditions, and by framing it as socio-political regulation. Contrary to the prevalent discourse suggesting a crisis in the social state, the paper argue that the social state functions as an agent to the production of both precariousness and agency, with an increasing individual responsibility and precarisation of the self. This is discussed for the Swiss case by analysing legal documents on unemployment from 1890 to 2010, outlining changes in the management of precariousness.

The paper posits that the social state is undergoing an ambivalent reorganization of social security so that precariousness becomes internalized within individual agency. On one hand, the social state no longer seeks to stabilize capitalist processes through centralized and collective risk management; rather risk management is shifted onto individuals, therewith intensifying subjective assessment of precariousness in the population. On the other hand, the social state emphasizes a shift from compensatory to preventive logic; it aims at preparing individuals to minimize the risk by requiring them to work on their skills, emotions, motivations, and perspectives.

Instead of viewing precariousness as an obstacle to agency, this paper suggests it is nurtured through the capacity to act, think, and feel. This raises questions about how precariousness today can become a form of solidarity and collective agency within the rationality of the social state, where precariousness is mandated to be internalized, shifting the collective struggle into a personal one.

Creating an Illusion of Control in Gig-work: Analysis of Bolt Food Communication to Food Delivery Couriers in Riga

Maija Spurina, Iveta Kesane

Latvian Academy of Culture, Latvia

1372

With the platform economy on the rise, an increasing number of people across the globe choose platform work as their primary or supplementary source of income. Platforms attract workers, promising unprecedented autonomy and flexibility, and present them as self-employed entrepreneurs. Yet, the use of algorithmic management and asymmetric distribution of information between a platform and its workers leave the latter with very little control and creates rather precarious working conditions.

In this paper, we shed light on the everyday realities of food delivery gig-workers by critically examining the communication of a food delivery platform, Bolt Food, to its courier partners in Riga. Through quantitative and qualitative cultural sociological analysis of 4135 Telegram messages Bolt Food has sent to its food delivery couriers in Riga from 2021 to 2023, we analyze the intensity and content of communication, use of persuasive means of expression, and asymmetrical provision of information, and thereby provide an insight into how platforms create an "illusion of control" (Woodcock 2020).

The present analysis is part of an ongoing research project, "Meaning and Practice of Autonomy in Gig-Work: Socio-cultural Inquiry in Experience of Wolt and Bolt Delivery Workers in Riga," conducted at the Latvian Academy of Culture and funded by the Latvian Council of Sciences (Nr. lzp-2021/1-0521).

RS14 | T05: Non-standard work and job quality

Algorithmic Work and Job Quality

Yuliya Vanzhulova Tavares

Queen Mary University London, United Kingdom

This research is centred on job quality in algorithmic work. Algorithmic work is platform-based employment that uses algorithmic control to mediate the commissioning, supervising, delivering and compensating workers on a contingent, piece-work basis. There is increasing attention to the work performed through (and for) digital labour platforms, broadly categorized into gig work, executed locally in person, and cloud work, executed remotely online (e.g., De Stefano, 2016; Graham et al., 2017). Scholars point to extremely precarious working conditions (e.g., Berg, 2015), eroded terms of employment (Howcroft et al., 2019), and few opportunities for development (e.g., Duggan et al., 2021) associated with platform-mediated working arrangements. In parallel, autonomy, flexibility, task variety and complexity are found beneficial to workers' job quality outcomes, although to various degrees (e.g., D'Cruz & Noronha, 2016; Wood et al., 2019). This research aims to contribute to an existing gap in the literature in three ways. First, adopting a multidimensional construct of job quality to explore gig and cloud work (economics, sociology of work and psychology), drawn on the Good Work Index, which is the most comprehensive method in measuring 'good' work to date (Williams et al., 2020). Second, brings larger quantitative samples which enable us to extrapolate and look at different larger labour markets drawing on the comprehensive 'Understanding Society' of the UK household and members of the household national-level study, which integrated the 'Gig Economy' module in 2019. Third, investigating differences between gig and cloud work. Gig work has attracted wider scholarly attention compared to cloud work (e.g., Berger et al., 2019; Wu et al., 2019). The potential impact of the research extends to both academia and policymakers.

Precarious Work In China 2010-2021: Types, Distribution and Causes

Xi Ni

The Chinese University of Hong Kong, Hong Kong S.A.R. (China)

Existing studies have shown a global trend toward rising levels of labor insecurity, trapping a growing number of populations in precarious works in both the Global North and the Global South. The debate on precarious work reflects a universal concern on the future of work despite differences in cultures, political regimes or economic systems. However, few studies have been done in discussing the precarious work in China. Precarious work is relatively rare in China before the 1980s, as the informal economy has been mostly wiped out in 1950s, the majority of the labor were employed in state or collective enterprises, guaranteed with a life-long full-time job. During the transition from central planned economy to market economy, despite China's great success in economic development, the past decades also saw rising social inequalities and growing tensions in labor relations. Which is also reflected by the growing prevalence of precarious work across all sectors of the economy. To comprehend the overall state of precarious work in China, this study first proposes a multi-dimensional measurement on job quality to identify the precarious work in the Chinese labor market based on an intuitive and tangible taxonomy on working population. Based on which, we further analyze the prevalence of precarious employment in China since 2010, as well as populations who are vulnerable to the precarious jobs. Moreover, beyond the individual scope, a macro-level analysis is further performed to reveal the institutional and structural forces underlying the prevalence of precarious works in China during the past decade.

How Workers' Employment Trajectories Are Affected By Insecure Employment At The Early Career Stage

Rebecca Tamara Florisson

Queen Mary University of London, United Kingdom

1373

This research explores how engagement with insecure work — particularly multiple forms of insecurity — during the early career affects UK workers' longer-term employment trajectories and outcomes. This work uses a holistic measure of labour market insecurity across three dimensions derived from the literature:

• contractual insecurity, where people are not guaranteed future hours or future work

• financial insecurity, where people experience low pay or unpredictable pay

• and (lack of) access to rights and protections.

As a new contribution, these three dimensions of insecurity are represented by six indicators for insecurity selected from the British Household Panel Survey and Understanding Society (1991 to present). The work tracks the labour market entry of 8,500 young workers aged 16-24 and classifying the different levels of intensity and duration of insecurity at every point of observation. It then tracks individual outcomes over time using descriptive analyses and regressions.

The analysis demonstrates that cumulative levels of insecurity in the UK have been relatively stable over the past 30 years. Most concerningly, it finds that while three quarters of young workers who enter into insecure work obtain secure positions within three years, a sizeable minority of workers remain in insecure work for protracted periods of time, suggesting clear employment penalties for young workers who engage in insecure work that persist for some time.

In-Work Poverty in the North East of England: What are the key drivers and lived experiences?

Jo McBride[1], Cat Spellman[1], Marti Lopez Andreu[2]

[1]Durham University Business School, United Kingdom;
[2]Newcastle University, United Kingdom

The North East is one of the UK's weakest and most deprived regional economies. Around two thirds of the region's towns have household deprivation higher than the mean average. The Trades Union Congress (TUC 2023) note that the region has had an increase in working adults in insecure work – the third highest rate in the country and a factor in the high levels of in-work poverty (IWP).

Regional voluntary organisations are raising serious concerns relating to the rise of IWP in the region, with people in full time work now afflicted. We have built a coalition of NE organisational representatives with a cross sector consensus on the urgency of tackling poverty in the region with our specific focus on IWP and its drivers.

We have collated secondary data from existing data sets to help understand the extent of the problem additional to an overview of institutional responses that have been introduced to tackle the problem and why they have not been successful. This data provides valuable information on the structural social and economic factors affecting the region, however there is an urgent need to better understand how in-work poverty emerges between working and social conditions and the personal and household context within which workers are embedded. Although at an early stage at the time of writing, preliminary findings will derive qualitative data from people's lived experiences of IWP as well as inputs from local authorities, trade unions, and community organisations in order to more broadly inform the rise of IWP in the region.

RS14 | T06: Migrant precarious labour

Employment Precarization And Skilled Labour Migration In Western EU Countries

Kamile Botyriute

Lithuanian Centre for Social Sciences, Lithuania

The purpose of this study is to examine the relationship between employment precariousness and high-skilled migration. There exists a large number of studies investigating the effects of precarious employment on various issues, ranging from unemployment to job insecurity, however, studies on the effects of precariousness on migration are scarce. In addition, in scholarly literature, high-skilled migration in developed economies is presented as a specific migration with patterns differing from those from low-income countries or among those with lower educational attainment. For these reasons, data from a relatively homogeneous sample of EU-15 or Western European countries, which represent the highly developed European sub-region, was selected. In the analysis, fixed-effects linear regression was applied. The model included part-time, involuntary part-time, temporary, involuntary temporary, short-term employment, unemployment, and earnings as independent variables and the emigration of people with tertiary education as a dependent variable. The analysis showed that involuntary part-time and short-term employment are significant positive predictors of high-skilled emigration. Meanwhile, unemployment and earnings did not predict high-skilled labour mobility in the sample of EU-15 countries. The results support the implication that labour precariousness may be related to increased emigration of those with higher education in developed economies.

1374

Migrant Precarious Work, Platform Capitalism, and the Strategies for Social Reproduction in Urban Spaces: Insights from Madrid and Barcelona

Ana Santamarina Guerrero, Francisco Jose Fernández-Trujillo Moares

Universidad Nacional de Educación a Distancia, Spain

This paper explores the realities and discourses of migrant precarious work under platform capitalism, tracing the intertwining between the gig economy, migrant struggles, and the city. Platforms are strongholds for migrant workers, who have become an indispensable labour force for a wide range of digital applications, in sectors ranging from transport to care work (Altenried, 2021; Gebrial, 2022). The structural vulnerability and barriers to accessing other

forms of employment have made platform work a means of subsistence for many migrants in contemporary urban areas (Van Doorn & Vijay, 2021). Migrants are at the lowest rung of a sector characterized by a reconfiguration of labour relations towards increasingly flexible models and atypical forms of work that undermine job security and workers' rights (Fernández-Trujillo, 2020). Drawing on field-work conducted in Madrid and Barcelona with migrant workers in three different types of platforms – delivery, free tours, and care work – the paper explores: (i) the precarious conditions that are specific to migrant workers in the various platforms, critically addressing the racialized, gendered and classed dimensions of digital labor; and (ii) migrants' strategies and practices, both within and outside the platforms, for sustaining their livelihoods. These include not only the (formal and informal) struggles for workers' rights, but also the everyday support networks and strategies of social reproduction in the city, drawing attention to some of the ways in which platform work becomes a means of maintaining local and global chains of care.

Race, Class, and Immigrant Entrepreneurship in the Finnish Competition State

Anuhya Bobba

University of Turku, Finland

A primary characteristic of neoliberal capitalism is depoliticization, whereby inequalities inherent to capital-state relations are either accepted or left uncontested, because economic practices are seen as more impartial than and separate from the political realm as well as public deliberation. Accordingly, scholarship concerning ethnic, immigrant, and migrant entrepreneurship in Finland is foreclosed by neoliberal capitalism as well as the imperative of competition that it entails, in the sense that entrepreneurship is considered a positive and necessary economic venture despite the precarity it produces. The selected studies (n=35) highlight discrepancies and limitations of entrepreneurship, often to suggest targeted policy measures that would make the profession more profitable for ethnic minorities, immigrants, and migrants. The more critical of studies attempt to highlight the exploitation required by entrepreneurship, but ultimately believe that the profession can be reconciled with state intervention. This article argues that with a clearer conceptualization of race and class in relation to Finland's recent development into a neoliberal, competition state, entrepreneurship can be politically contested as the preferred subjectivity of neoliberal capitalism that disciplines labor, makes different forms of work precarious, but also as a precarious form of work ipso facto. It becomes difficult then, as de Moura Ferraz and de Silva Ferraz (2022) suggest, to justify or reconcile entrepreneurship in the context of increasing global and national wealth inequality.

Precariousness In The Context of Contractual Flexibility: Distinct Trade Union Strategies For Distinct Types Of Precarious Workers?

Marta Kahancova, Adam Šumichrast

Comenius University, Slovak Republic

The rise of non-standard forms of work across European countries has trigged increasing research attention. While some authors refer to contractual flexibility, others frame the emerging non-standard forms of work via the lens of precariousness. Both concepts refer to employment status, contract length and working hours, yet the dimensions of precariousness include also lacking access to social security, training and career progression, as well as lacking interest representation (Trif et al. 2023). Using the example of two types of non-standard work, namely, temporary agency work and gig work, the paper comparatively identifies the sources of precariousness among agency workers and gig workers and asks if trade unions develop distinct strategies to mitigate precariousness in these distinct worker types. The conceptualization is embedded in different industrial relations settings, covering six European countries (Denmark, Sweden, Slovakia, Poland, Ireland and the UK). The paper is part of the ongoing Horizon Project TransEuroWorks. Trade union strategies vis-à-vis precarious workers are part of a broader analysis covering also employer preferences for particular types of flexible workforce, and access of these workers to social protection.

"The Algorithm Is Like A Mercurial God" – Exploring Content Creators' Perception Of Algorithmic Agency On YouTube

Roland Verwiebe[1], Aaron Philip[1], Claudia Buder[2], Chiara Osorio Krauter[1], Sarah Weißmann[1]

[1]University of Potsdam, Germany; [2]University Paris 1 Panthéon-Sorbonne; France

Algorithmic systems wield substantial influence in contemporary society, particularly in the context of digital platforms (Bunz, 2012; Burrell & Fourcade, 2021; Zuboff, 2023). Since it is mostly unknown how algorithms specifically work, content creators (CCs) on YouTube who rely on their functionality for economic reasons, are in a constant state of sensemaking regarding the characteristics and perceived preferences of the algorithm (Duffy, 2020; Bishop 2019a; DeVito, 2021).

While studies suggest that users in general and CCs in specific perceive certain algorithmic structures as agentic (Shin, 2022; Singler, 2020; Wu, Pedersen, & Salehi, 2019), we still know very little about the variations within these assessments and in which ways different social characteristics and industry factors play a role in that regard.

We examine this by conducting a thematic analysis (Braun & Clarke, 2012) of 30 interviews with German-speaking CCs on YouTube. We find, similar to previous studies that CCs do perceive agentic qualities of the YouTube algorithm but that their assessment depends on their experience and exposure to it. Four key themes were identified: The algorithm is seen as an entity that is non-transparent and largely unpredictable; as dynamic, intentional, and capable of learning; it exerts a great deal of power, which influences platform users and it is constantly creating hierarchies and reinforcing inequalities. Thus, our study contributes to a more in-depth understanding of this occupation's challenges and shines a new light on human-machine interactions from a social inequality perspective.

Subjective Well-being At The Boundaries Of Independent And Dependent Work Relations in Europe.

Rossella Bozzon

University of Catania, Italy

In the debate on the transformation of employment relations, the growth of non-standard jobs and, specifically, dependent self-employment challenges the "binary divide" rooted in the employment vs. self-employment dichotomy and generally entails a narrowing of the borders between work and private spheres with potential negative consequences on the general levels of well-being.

This paper aims to investigate the subjective well-being of emerging working statuses at the boundaries of independent and dependent employment – i.e. dependent self-employment – in Europe.

Firstly, it analyses how subjective well-being is connected to job demands (time pressures, space constraints, job insecurity) and job resources (levels of autonomy, control, and social support) in the organisation of daily work for different types of self-employed workers – dependent vs genuine – and standard and non-standard employees. Secondly, it investigates whether and how differences in the levels of subjective well-being across standard and non-standard (self-)employment statuses are mediated by household-specific factors related to life stages, place of residence, and care duties.

The analyses are based on the European Working Condition Telephone Survey 2021 (Eurofound 2023), which includes different measures of subjective well-being (intended as low job engagement, burnout, and risk of depression), status in employment, quality of working conditions, life stages and household arrangements.

Preliminary analyses show that subjective well-being varies consistently across different types of employment. While entrepreneurs and genuine solo self-employed workers show the highest levels of well-being, dependent self-employed workers show higher risks of experiencing low job engagement, burnout and depression, with mean values close to those of non-standard employees and informal workers.

Reclaiming Agency: Managing Problematic Menstruation in Precarious Research and Innovation Workplaces

Chiara Cocco, Cat Morgan, Jos Collins, Nima Ali, Kate Sang

Heriot-Watt University, United Kingdom

This study examines the multifaceted nature of precariousness, emphasizing the interplay between employment, gender-specific health issues, and broader social conditions. It

1376

critically assesses how fieldwork-based jobs, often linked to short-term funded projects and early career positions, affect job security and workers' agency. We discuss how these factors particularly impact the participation of women and other marginalised groups in the research and innovation workforce, further increasing inequalities in the knowledge production space.

A significant contribution of this research is its focus on the overlooked and stigmatised aspects of women's health, especially problematic menstruation and the implications in the context of precarious employment. Further, this intersectional study explores how managing menstrual health at work intersects with other factors, including ethnicity, disability, neurodiversity, age and sexuality. By integrating these factors, the research provides a comprehensive view of precariousness as a spectrum of social conditions experienced differently in research and innovation workspaces.

Our research, based on extensive interviews with over 40 workers in unconventional job settings, including extreme fieldwork locations, reveals how flexible working patterns encourage workers' agency by, for example, allowing people who menstruate to manage their workload around their menstrual cycle. Further, we explain how delegating tasks is often not possible in precarious jobs, thus worsening the working conditions of those who experience problematic menstruation.

The aim of this study is to co-design workplace interventions with stakeholders by shaping individual and collective strategies to navigate and resist precarious conditions. Our research empowers marginalised workers to reclaim agency in their work environment by offering an inclusive and nuanced understanding of precariousness, foregrounding the importance of considering gender and health in employment.

Precarity, Youth Transitions and Emotional Wellbeing: Insights from the Post-pandemic Era in Catalonia

Mireia Bolibar[1], Eva Padrosa[2], Oriol Barranco[1], Alejandro González-Heras[1]

[1]Universitat Autònoma de Barcelona, Spain; [2]ESIMar (Mar Nursing School), IMIM (Hospital del Mar Medical Research Institute), Universitat Pompeu Fabra, Spain

There is a concern for the mental and emotional wellbeing of the young in Europe, especially since the COVID-19 pandemic crises. From the perspective of social production of health, it is crucial to understand this phenomenon in connection with the fact that youth transitions to employment, economic independence, and family formation have become increasingly protracted and precarious.

Previous research highlighted the relevance of precarious employment and the unfolding of experiences of exclusion, fragmentation, and interruptions over labor career paths on young people's mental health. Our research aims to delve into both the labor and economic aspects underlying the youth mental health crisis, capturing the complex, overarching, and dynamic nature of precarity among the young. Specifically, we study how precarious career paths relate to

economic insecurity and difficulties developing transitions into adulthood, and analyse how these processes and their interaction hinder young people's emotional wellbeing.

Our research is based on the analysis of the Catalan Youth Survey 2022, a CAWI survey of 3,000 individuals aged 15-34 years old in Catalonia (Spain). The survey includes retrospective data on labor career paths, residential, and family transitions, which allows us to identify the economic and labor-related adverse events experienced during and after the COVID-19 pandemic. It also gathers information on the respondent's emotional wellbeing through the WHO-5 wellbeing index.

Preliminary results of our study describe the diverse precarity landscapes that young people endure, and their relationship with emotional wellbeing. They also highlight remarkable gender inequalities in these processes

1377

RS14 | T08: Comparing precarious labour across countries and sectors

'Labour Agency' among waste workers in India & its impact on wellbeing: Structures & Drivers

Partho Mukherjee[1], Dr. Rachel Tolhurst[2], Dr. Lana Whittaker[2], Dr. Surekha Garimella[1]

[1]The George Institute for Global Health, India; [2]Liverpool School of Tropical Medicine

Agency is defined as 'intention and the practice of taking action for one's own self-interest or the interests of others' (Castree et al in Rogaly, 2009). However, ability to act goes beyond individual causality of intention to action, and is shaped by socio-cultural, historical and economic conditions in which individuals are situated (Walls et al, 2015). In India, work of waste entails informal and precarious working arrangements (Gidwani, 2015). Further, multiple identity markers embodied by waste workers – their caste, gender, migrant status and religion – shape not only community relations but also the nature of state's interaction, with respect to civic rights and accountability for instance. Therefore, it is important to understand how the enmeshing of these identity markers, working relations and positions in larger networks of capitalist production condition the agency of waste workers, because ability to 'take action' in self or community interest has implications on health and wellbeing. Following the call of Coe & Jordhus-Lier (2010) to (re)politicise and (re)institutionalize labour agency within formations of Capital, state, community and labour markets within which workers are embedded, we seek to understand the conditions that structure 'Labour Agency' among waste workers working within informal recycling industry in India. Using qualitative methods of participant observation and thematic analysis of field notes, interviews and focus group discussions, we 're-embed' labour agency within the framework of global production networks, state and community politics as suggested by Coe & Jordhus-Lier. We find that constraints that shape agency among waste workers are the consequences of racialised workings of organized abandonment by the state(Gilmore, 2007), under conditions of capitalist production that deems sections of workers as Surplus (Adler-Bolton & Vierkant, 2022).

Informality Within the Formal: Informalizing Processes and Exploitation Within Highly Regulated and Protected Nordic Labor Markets

Olivia Maury[1], Rasmus Ahlstrand[2], Ann Cathrin Corrales-Øverlid[3], Elisabeth Wide[1]

[1]University of Helsinki, Finland; [2]Lund University, Sweden; [3]The University of Bergen, Norway

Nordic labour markets are renowned for their strong protection of workers through collective bargaining, highly regulated and secure employment, and comprehensive welfare states. However, a growing body of research indicates processes of precarisation, most tangible among migrant workers in labour-intensive and low-wage segments of the labour market, pointing to factors such as the flexibilisation and de-regulation of labour relations, globalization and migration. As part of the research project 'Tackling Precarious and Informal Work in the Nordic countries' (PrecaNord), the paper provides a cross-border and cross-sectoral analysis of precarious working lives in the Nordics. It critically scrutinizes precarious and low-wage work in three sectors–construction, cleaning, and food-delivery—in the Finnish, Norwegian, and Swedish labour markets. Drawing on ethnographic and interview data with migrant workers, we identify what we call 'informalising practices within formal labour relations', and show how these are driven by the intertwinement of changing labour-, migration-, and welfare regimes. We demonstrate how employers navigate the so-called Nordic model by elaborating a variety of 'techniques of achieving partial informalisation', while also highlighting workers' agency to ameliorate their situation in line with or against such techniques. Building on previous theorization of informal work relations, particularly developed in the Global South, we highlight how complex interrelations between formal and informal work arrangements materialize in specific ways in the Nordics. Hence, we question previous assumptions of the formal character of Nordic labour markets, and by pinpointing contemporary forms of exploitation in a Nordic context, we contribute to the existing body of research that moves beyond a strict formal/informal economic divide.

1378

(De)regulation and Segmentation of the Healthcare Labour Market in Portugal: An Ongoing Research

Ana Paula Marques

University of Minho, Portugal

The study of the interpenetration between professional logics and the labour market, which result from the expansion of the phenomenon of "atypicality" of labour ties, is central to the construction of a future dignified workforce in health in Europe. The neoliberal agenda of commodification of the value of work and the health management reforms have expanded the phenomena of "atypicality" of labour ties.

Furthermore, new institutional actors are coming into the field, such as temporary agencies of recruitment and platforms, which disrupt normal employment relation-ships, challenging the boundaries between self-employment and dependent work. In this paper, we intend to explore news directions of the labour market in the health sector in Portugal, by capturing not only transformations in objective conditions of protected professional, but also shedding light on so-called hybrid markets throughout outsourced and temporaries' contracts and its subjective life consequences. The paper is supported on secondary and qualitative research focused on semi-structured interviews with health professionals, which attest to the phenomenon of increasing individualisation and labour sub-contracting in the heath sector in Portugal. It is crucial to understand to what extent theses news directions impact on comprehensive agenda for creating an integrated people-centred health workforce in diverse healthcare systems and sectors.

Precarity in Lithuanian academia

Liudvika Leišytė

TU Dortmund University, Germany

Precarious contracts in European academia have significantly increased in the past decades due to various policy reforms related to academic capitalism, such as increasing the number of doctoral holders, reducing permanent positions, worsening working conditions for academics as well as saving schemes of university managers. This paper focuses on the Lithuanian higher education context, where academic tenure is an illusive and changing concept. We pose the questions on how do academics compare across disciplines, seniority and gender regarding their employment contract? How does the voice regarding promotion being heard compare across gender, type of contract and seniority? The paper draws on the survey, carried out among academic staff at a major university in Lithuania, N=360, with the response rate of 19.1%.

This contribution points that the perception of fairness of recruitment and promotion is perceived slightly differently depending on gender and career level. The same holds for perceived voice regarding career advancement in the faculty. This is in line with the academic and social capital theory, with those with higher capital, that is, senior academics, are also the ones with more power and say in the faculty, and thus, have more voice regarding promotion. The difference by discipline can be explained related to the research funding mechanisms, whereby, hard sciences have increasingly been relying on postdoctoral labour in the laboratories funded by research council or foundations, bring more precarious contracts into the system. At the same time, a rather high percentage of precarious positions at both junior and senior levels points to the high level of precarity in the Lithuanian higher education system overall, which questions the tenure rules in the country.

RS14 | T09: Platform work

Internalizing precariousness – experiences of Georgian platform workers

Ana Diakonidze

Tbilisi State University, Georgia

While platform work has become increasingly prevalent in low-to-middle-income countries over the past decade, scholarly discussion of its implications for workers in such countries is scarce. One strand of literature highlights the benefits of platform work in less advanced economies, such as providing alternative and better earning opportunities than what is otherwise available on the local market (D'Cruz and Norohna, 2016; Wood et al., 2019). Another strand, however, points to the highly precarious nature of such employment (Hunt and Machingura, 2016; Malik et al., 2018). Most of these studies implicitly assume that high levels of unemployment and a largely informal economy push workers in these countries to join the platform workforce. There is however little research on how local workforces view their working conditions and which factors make them accept the precariousness of such work.

This article addresses this gap, examining the reasons why workers engage in platform work and the perceived advantages/disadvantages of such work vis-à-vis the local context. The study is based on 40 semi-structured interviews with driver-partners in Tbilisi, the capital of the Republic of Georgia. The main argument put forward in the article is that it is not the lack of employment opportunities, but rather the poor quality of available jobs and the lack of social protection which explain workers' readiness to accept platform working conditions. These factors lead to an 'internalization of precariousness' – a condition where workers perceive precariousness in employment relations as the norm. The precarity of platform work is thus equally considered normal.

Between the 'individual' and the 'collective' in platform work: Cases from Greece

Maria Kyriakidou

American College of Thessaloniki, Greece

The present paper sheds light to aspects of platform work in Greece as an interface between the individual and the collective experience. It, first, reviews existing theoretical work on the concept of 'liminality' and the ways in which it can be employed in relation to platform work and the precarious nature of employment challenges that relate to it. The transitional nature of such work can be seen as an intermediate state within the broader employment landscape. Individuals in such type of work may experience a sense of being in-between, with uncertain career trajectories and limited job security. Platform work can lead to social and

1379

economic dislocation, thus contributing to a sense of disarray in individuals' lives as they navigate the challenges associated with unstable employment. However, the formation of trade unions along with platform workers' activism and collective demands can mitigate such feelings and provide grounds that can empower platform workers. The presentation will, then, develop with the application of theory to practice and especially to case studies from Greece where platform workers have been unionized and pursued collective action. An approach assessing the existing literature on the borderline features of such work is necessary to further evaluate the need for societal awareness and policy measures to address the challenges associated with platform work and eventually promote more stable and secure employment opportunities.

Beyond the App: Decoding Snapp!'s Rise and Labor Struggle in Iran's Largest Startup

Ida Nikou

SUNY Stony Brook Univeristy, United States of America

Snapp! is the largest rideshare platform and prominent startup in Iran mirroring the Uber model.

Exploiting chronic unemployment and soaring inflation rates, Snapp! offers a meager income to a large cohort of job-seekers, thereby driving wages downward and intensifying the precariousness of employment. Further amplifying this exploitation, Snapp! systematically transfers the entirety of business-related risks and responsibilities onto its drivers, encompassing financial burdens associated with insurance, fuel, and vehicular maintenance.

Crucially, Snapp! classifies its drivers as independent contractors characterized by flexible work arrangements. This classification effectively exempts workers from the limited safeguards enshrined in Iranian labor regulations, notably encompassing minimum wage, insurance coverage, and workplace safety standards.

Since 2018, Snapp! drivers have staged multiple strikes against the discriminatory practices. However, despite their success in mobilizing sporadic protests and strikes, establishing a representative body of drivers has proven elusive. This challenge is partially tied to the structural characteristics of the platform-based gig economy, the isolation inherent in the work milieu of drivers, the transitory nature of employment emblematic of neoliberalism, and the intricate web of cultural dynamics shaping the interactions between workers and the company.

This paper explores the precarious labor conditions within Snapp!, offering insights into the ethnic composition of its workforce and how the company has strategically harnessed this diversity to divide and control. Furthermore, this paper provides an overview of the collective mobilization endeavors and bargaining undertakings initiated by Snapp!'s labor force over the preceding years, with a focus on elucidating the encountered challenges.

Migrant Domestic Platform Workers In Milan: Insights From An Everyday Life Perspective

Alina Dambrosio Clementelli, Annalisa Murgia

University of Milan, Italy

Digital labour platforms (DLPs) are progressively facilitating migrant mobility, mainly by providing access to low-wage labour markets that are integral to migration infrastructures (van Doorn et al., 2022). Critical studies have demonstrated how DLPs exploit gender, race, and immigration status inequalities to access a precarious labour force, producing new mechanisms of invisibility and exploitation, particularly among women migrant workers (Rodríguez-Modroño et al., 2022; van Doorn, 2017). This paper contributes to the growing debate on domestic platform work (Sedacca, 2022; Dattani, 2021), which is conceptualised as a capital-driven force in the larger process of commodification and exploitation of migrant reproductive labour (Graham et al., 2017; Yin, 2023). While studies conducted to date have mainly focused on precarious working conditions, our perspective pays attention to the dimension of everyday life. In particular, we adopt intersectionality as an analytical lens (Holvino, 2008; Rodriguez et al., 2016) to examine the production of inequalities and the tactics employed by migrant domestic platform workers in their everyday lives. Our analysis is based on a qualitative case study that began in Milan, Italy in September 2023 and is ongoing. A set of semi-structured interviews was conducted with key informants, such as trade unionists, platform recruiters, and migrant associations, and in-depth interviews with migrant domestic platform workers have begun and will continue in the coming months. The aim is to understand how the pervasiveness of DLPs can affect the everyday lives of workers, as well as the exercise of individual and collective forms of agency.

RS15 | T02: Military engagement in peace(buiding)

Borders of War and Peace: Experience and Prospects of Demobilization of Participants of Military Conflicts in the USSR and Russia

Sergey Vyacheslavovich Startsev

Higher School of Economics, Russian Federation

The spheres of war and peaceful life – including in the research literature – are often divided into different corners. This makes us consider veterans as those who, while undergoing the initiation ceremony, leave behind military experience and start a peaceful life anew. The same point of view presents military actions as the ultimate social experience in which the same ultimate phenomena occur: heroism, shame, physical and psychological trauma that are absent in peaceful life. However, the empirical alternative is the close penetration of military experience into the peaceful life of a participant in an armed conflict.

As a result of the conducted research, 27 in-depth interviews with participants in the armed conflicts in Afghanistan and Ukraine were collected. The interview materials demonstrate the problematization associated with the process of demilitarization and return to peaceful life. These problematizations come from the skills acquired during participation in combat operations, elements of identification and classification systems. The inclusion in the sample of informants who have recently returned from the fighting in Ukraine also made it possible to analyze the conflict, which produces veterans in the open phase.

The conducted research demonstrates that veteran identification is formed on the basis of the gap between peaceful and military life and manifests itself as an inability to adapt military experience to the functioning of civilian everyday life. Veterans themselves are often not silent heroes who are honored by society, but demonstrate antisocial behavior and aggression. All this is the result of the fact that the war does not end immediately upon the return of the combatant from the battlefield, but reminds of itself as an inconvenient category of "veteran".

Beyond the Frontlines: Unveiling the Pivotal Roles of Women for Conflict Resolution

Delphine Resteigne

Royal Military Academy, Belgium

This paper examines the critical roles played by women in peace and conflict resolution, with a specific focus on their contributions in the ongoing conflict in Ukraine. By adopting a sociological perspective, this study seeks to unravel the complex dynamics and transformative potential inherent in the intersection of women's agency and civil society engagement in fostering peace. Women's involvement in peace and conflict resolution is explored as a multifaceted social phenomenon, challenging traditional power structures and offering alternative narratives that prioritize inclusivity, empathy, and collaboration. Civil society, as a collective force, will be analyzed through a sociological lens to understand its impact on shaping public opinion, influencing policy decisions, and fostering grassroots initiatives for peace. This includes examining how diverse actors within civil society, including women, contribute to shaping the discourse surrounding peacebuilding efforts and to foster community resilience. By focusing on the specific case of Ukraine, the study strives to provide insights into the localized sociological dynamics that shape the roles of women and civil society in the pursuit of lasting peace.

RS15 | T04: Ukraine under attack

Attitudes Of The Ukrainian Population Towards The War With Russia

Alberto Veira-Ramos[1], Tetiana Liubyva[2]

[1]Carlos III University of Madrid, Spain; [2]Institute of Sociology of the National Academy of Sciences of Ukraine

Since the unprovoked full-scale Russian invasion of Ukraine in February 2022, two surveys have been conducted by the Institute of Sociology of the National Academy of Sciences of Ukraine in December 2022 and June 2023. Because of the special conditions, information was obtained by mobile phone calls (random digit dialing). In both cases more than 2.000 valid interviews were completed. The surveys included usual questions but also new questions about the war were formulated. Data reveals a high trust of the Ukrainian population on their Armed Forces, particularly when compared with other State Institutions, already before the war began (2021). After the war began and the initial Russian offensive was repelled, over 75% of respondents replied to be very sure about the victory of Ukraine (dec 2022) and close to 70% reported to be willing to accept sacrifices for as long as it takes to obtain a final victory (dec 2022). Close to 85% of respondents consider that victory can be declared only when the internationally recognised borders of Ukraine as established in 1991 are restored (june 2023). Only a small minority consider that victory can be declared while giving away the control over the Donbas region or Crimea. We found that there are indeed very small differences between Ukrainians on their attitudes towards the war and on how it might end when controlling their age, gender, income education or region of residence. We interpret the results as evidence of a strong internal cohesion, strenghtened even further after the beginning of the war. This imposes high expectations on the government of Zelensky to deliver the desired victory.

Support for Ukraine and attitudes towards sanctions against Russia in Europe

Dávid Kollár[1,2,3,4], Lili Zenovitz[1], Lilla Békési[1]

[1]Századvég Foundation, Hungary; [2]Pázmany Péter Catholic University; [3]Metropolitan University Budapest; [4]University of Pecs

The Russian invasion of Ukraine has revealed Europe's deep divisions over appropriate responses. Some countries have strongly supported Ukraine, provided military aid and advocated sanctions against Russia. However, other countries have been more hesitant to assist Ukraine militarily or punish Russia economically. This presentation analyzes the influences shaping European countries' attitudes towards the Ukraine war using multilevel modeling of military aid statistics and public opinion data from 30 European countries. The analysis reveals significant differences between countries in military aid to Ukraine and public support for sanctions against Russia. These differences reflect varying geostrategic interests, economic calculations, security perceptions and values. Structural factors such as proximity to Russia, dependence on Russian gas imports and involvement in US arms trade networks have a significant influence on state policy on military aid. The results show, however, that public attitudes are the most influential factor, with greater public support for sanctions predicting higher military spending on Ukraine. These public attitudes towards sanctions are also influenced by a variety of individual and structural factors. Those who hold liberal values, live close to Russia and have their country involved in US arms trade networks are more likely to support Ukraine and sanction Russia, while dependence on Russian gas reduces public support for sanctions. Ultimately, material and ideational factors interact in nuanced ways to shape public attitudes towards the invasion, which in turn strongly influence state responses. The analysis thus confirms that economic interests, security considerations, values and geopolitical orientations all play an integral role in shaping public opinion and guiding responses to Russia's aggression in Ukraine.

Beyond Betrayal: The Narratives of Ukrainian Collaborationists

1382

Eva Ievgeniia Babenko

Åbo Akademi University, Finland

Russian hybrid war against Ukraine in the East escalated into a full-scale invasion in 2022 catalysing the awakening of Ukrainian self-consciousness. However, strong national resistance radicalized pro-Russian citizens, influenced by concepts like "eternal brotherhood", "one nation", and a "unified Soviet past" propagated by Russia, making them look for contributions to the Russian offence.

Ukrainian journalist Volodymyr Zolkin collected semi-structured video interviews with collaborationists in a detention camp. The unedited footage, with the consent of the interviewees (N=40), was published on YouTube, documenting crucial testimonies of wartime collaboration on non-occupied territories. Regardless of the significance of this material, it remains unanalysed. Using the qualitative approach, I am to explore the narratives of Ukrainian collaborationists who voluntarily assisted Russia in the war of aggression against Ukraine.

The research will address the following topics:

– Motivation and justification: revealing the primary reasons driving the collaboration and investigating how interviewees rationalise their actions.

– Construction of truth: highlighting the rejection of the common truth narrative by collaborationists, who formulate alternative interpretations of facts.

– Construction of identity: investigating how the collaborationists define their identities and loyalties to Ukraine and Russia.

– Coping mechanisms: understanding how interviewees deal with the consequences of their collaboration, examining how they frame and interpret their experiences.

– Regional factor: investigating whether there is a link between individuals' regional background and the likelihood of being engaged in collaboration with Russia.

This research aims to comprehend the complex phenomenon of collaboration and propaganda in the ongoing Russo-Ukrainian war, rooted in the historical confrontation between competing national development trajectories of Ukraine. Insights gained from the interviews will be critical for addressing challenges in shaping reconciliation and peacebuilding strategies in post-war Ukraine.

Boundaries of Brotherhood: Evaluating Chinese Public Opinion on Russia's Military Actions in Ukraine

Xin-You Chen

Academia Sinica, Taiwan

This research examines the alignment of Chinese public opinion with the government's portrayal of Sino-Russian relations as a 'friendship without limits,' especially in the context of Russia's invasion of Ukraine. The official Chinese narrative attributes Russia's invasion to NATO's eastward expansion, presenting it as a threat to Russian security. Notably, the Chinese government has not openly criticized Russia for its military actions in Ukraine. However, it remains unclear whether the government's stance is supported and reflected in the views of the Chinese populace. Our study analyzed data from an online survey conducted in November 2023 across China, with 3,541 respondents. The findings reveal that 49% of the Chinese public support Russia's military intervention, with a higher proportion of men than women endorsing this view. Significantly, this support is more prevalent among individuals who also favor using military force in Taiwan should Taiwan resist reunification. Additionally, those who support Russia's invasion tend to view China's current economic condition positively. In conclusion, this research highlights a significant alignment between the Chinese government and its populace, particularly among male citizens. The endorsement of military action in Taiwan by those who support Russia's intervention in Ukraine suggests a broader acceptance of military solutions in international conflicts among the Chinese population. These findings carry profound implications for understanding the Chinese public's stance on contentious global issues and could significantly influence the Chinese government's future diplomatic strategies and policy decisions.

RS15 | T07: Territorial pacification, surveillance, protection

Matrix Control: Unveiling the Dual Structure of the Israeli Policing Army as a Case Study

Yagil Levy

The Open University of Israel, Israel

Since the early 2000s, the Israeli Defense Forces (IDF) have undergone a fundamental structural evolution, resulting in the coexistence of two distinct entities within its framework: the 'official' military force and a unique 'policing' army. This study delves into the latter, a quasi-militia force operating predominantly in the West Bank. Though formally subordinate to the political echelons, this policing army functions under a 'matrix control' system, diverging from the conventional hierarchical military organization. This policing force is characterized by a complex web of control mechanisms. It is deeply embedded within the civilian communities of Jewish settlers, leading to a distinctive form of control exercised through various channels. These include internal oversight by religious and settler soldiers, political influence exerted by civilian rabbis, informal structural control by settler communities, operational direction by Civilian Security Coordinators within the settlements, and additional oversight from human rights organizations. Such a multifaceted control structure results in only partial governance by the IDF's official command hierarchy, particularly in law and order operations. This paper aims to unravel the intricate interplay of armed forces within complex political and operational landscapes, exemplified by the Israeli policing army. It highlights how multifarious relationships translate into a nuanced and informal structure of control, thereby offering insights into the dynamics of military organizations in politically and socially complex environments.

1383

The Brazilian Army's Vision of the Amazon: Genesis, Configurations, and Political Uses

Celso Castro

FGV CPDOC, Brazil

The theme of the presentation is the historical persistence of a vision of the Brazilian Army regarding the Amazon region, which places them as its leading guardians, facing both what they see as the result of "international greed" ("international greed") and the action of (bad) Brazilians. How can we understand the configuration this region, imagined by the military, assumes in its institutional cosmology? How did the "military invention of the Amazon" emerge? The growing military participation in politics and the public scene in general, from the mid-2010s onwards,

highlighted the importance of the "Amazon issue" for the Brazilian Army. In this presentation, the emphasis is on understanding its genesis, its configurations, and the political use made by the military from an institutional perspective.

The Genocidal Perspective of the Rohingya Influx into Bangladesh: An Empirical Study in the Cox's Bazar Refugee Camp

Mohammad Mohiuddin

UNIVERSITY OF FERRARA, Italy

The Paper Aims to Address the Genocide Committed Against the Rohingya Minority by the Myanmar Military in 2017. About More Than One Million Rohingyas Were Forced to Migrate to Bangladesh from Rakhine. They Were Expelled From Their Country in a Manner That Numerous International Organizations and Communities Recognized as Ethnic Cleansing. The UN Human Rights Council (UNHRC) Described the Myanmar Army's Action as "a Textbook Example of Ethnic Cleansing and Possibly Genocide," While the US Described it as "Genocide and Crimes Against Humanity Against the Rohingya." In Addition, Amnesty International and Human Rights Watch Have Described Myanmar's Military Operations as a "Widespread and Systematic Attack Amounting to Crimes Against Humanity" and "Decades of Discrimination, Repression, and Renocide Against Rohingyas". The Empirical Data The Author Gathered from Rohingya Refugee Camps in Bangladesh Revealed That Rohingyas in Myanmar Were the Victims of Mass Genocide, Gang Rape, and Arson. Moreover, During the Mass Devastation of Rohingyas in 2017, No One Was Permitted to Enter the Rakhine State, Despite Efforts by the United Nations, International Organizations, and Journalists to Investigate the Crisis Further. In Spite of Restrictions, The Data They Gathered Revealed Harrowing Accounts of Deaths by Fire, Shootings, Stabbings, Burnings, Beatings, Killings of Children, Kidnappings, and All Forms of Sexual Violence.

Perspectives on the 'responsibility to Protect' and Effectiveness of Military Intervention

Lindy Heinecken

Stellenbosch University, South Africa

The Responsibility to Protect (R2P) has emerged as a pivotal global principle aimed at averting and addressing egregious human suffering. While the use of force in safeguarding civilian populations is considered a measure of last resort, the deployment of military forces in protection roles is contentious. Deployments yielded limited success and have been marred by widespread violations of human rights, challenging the integrity of the R2P doctrine. The effective implementation of R2P hinges on various factors, including the gravity of atrocities necessitating intervention, states' willingness to deploy troops for civilian protection, the

adequacy of their training, and the capabilities to respond swiftly. Research indicates that the military's shortcomings in protection duties often stem from inadequate preparedness and insufficient support for the complexities of such tasks. Against this backdrop, we assess the readiness and training of military personnel for protection roles, exploring whether they are equipped with the requisite skills. Additionally, we examine the accountability mechanisms in place to ensure that armed forces do not become perpetrators of human rights violations. The significance of this study is underscored by the escalating global insecurity and the expanding involvement of the military in R2P responsibilities, making it imperative to scrutinize and enhance the efficacy of such interventions.

RS15 | T09: Warfare: i/ legality, legitimacy and societal engagement

Exercises for Developing Civil-Military Collaboration Capability

Erik Hedlund

Swedish Defence University, Sweden

In 2015, the Swedish government decided to rebuild Sweden's total defense, encompassing both military and civil defense. The primary goal was to enhance readiness and crisis management capabilities during wartime through collaboration between civilian organizations and the armed forces. Civil-military exercises became crucial for developing effective civil-military cooperation, with several such exercises conducted annually. This study aims to assess the pedagogical design of civil-military exercises to determine their effectiveness in enhancing civil-military collaboration capabilities. The research employs a theoretical framework based on constructive alignment and uses participatory observations as the research method.

The results show that the exercises do not lead to any increased ability to cooperate.

RS16 | T01: Social and political effects of knowledge production

Global and Local Knowledge, Societal Processes and Conflicts of Materiality: Lithium Extraction in Argentina

Frederike Julia Brandt

Technische Universität Berlin, Germany

1385

This contribution focuses on the conflicts arising from lithium extraction in the so-called lithium triangle, particularly in Argentina – a region with the largest lithium deposits in the world. With a surge in demand driven by electric mobility and renewable energy storage, unconventional lithium mining methods, such as extraction from saline waters, have become prevalent. However, this has triggered widespread protests in Jujuy and Catamarca, where local and indigenous populations resist land expropriation and anticipate severe water scarcity in the arid environment.

The tensions escalate with repressive measures from local and national authorities, prompting a constitutional reform in Jujuy to criminalize social protests and streamline lithium extraction by transnational corporations. A cross-sector resistance movement emerges, uniting indigenous communities, public service employees, miners, and bank staff against the encroachment on their land and resources.

It is a complex arrangement of diverse actors who refer to different knowledge, which is exacerbated by the rapidly changing conditions of the lithium market and the local politics of an unstable country

This research examines the different actors and scales of these conflicts, addressing the negotiation and local implementation of 'universal' norms such as human right.

In conclusion, this research delves into the heart of the conflicts surrounding lithium extraction in Argentina, shedding light on the global and local tensions, the impact on human rights, and the challenges posed by the materiality of the research object and the global market which it is linked to from a sociology of knowledge perspective.

Therefore, it is an empirical exemplary case of tensions and inequalities in the knowledge regimes of different actors on different scales intersecting with global and local tensions.

Pain and Meaning: A Cultural-Interpretative Approach to the Consequences of Political Violence

Ben Bornstein[1,2]

[1]Tel Aviv University, Israel; [2]the Van Leer Institute in Jerusalem

Questions about the social and political consequences of political violence persist globally. These questions are widely addressed by scholars in various disciplines, yet the literature shows conflicting theoretical insights. Many studies tend to ignore the historical and cultural contexts leading to the violent acts. This paper introduces a cultural-interpretive approach to understanding how victims of political violence make sense of their injury, public role, and renewed identity—often linked to distinct political actions. Viewing violent events as interactions that necessitate a symbolic interpretation by the victim, the paper avoids automatic adoption of public and structural categorizations (such as terrorism, war, and ethnic violence). Instead, it explores how victims themselves understand and frame the violence, and focuses on the nexus between the interpretive frameworks and the impact of violence. This epistemological shift reveals the victim's sense-making process, involving a sensory, emotional, and cognitive experience intersecting with cultural meanings, cosmologies, and collective narratives. The paper argues that examining the interpretational encounter between these elements is crucial for outlining the path through which social change unfolds after political violence. Drawing on comprehensive mixed-methods empirical work, including in-depth interviews, a survey, and archival research, the paper offers a multidimensional portrayal of Jewish-Israeli victimhood. Against the backdrop of deep cultural diversity, the findings provide a nuanced exploration of the political and social consequences of political violence. In doing so, the paper explains phenomena such as national solidarity, group hatred or reconciliation initiatives, as stemming from the interplay between cultural logics and, sometimes violent, social interactions.

Forensic Architectures Visual Knowledge Production: From A Fragmented Landscape Of Precarious Images to Evidence

Mina Godarzani-Bakhtiari, René Tuma

Technical Universität Berlin, Germany

This presentation analyses the transformations of knowledge in the field of investigative work, surveillance and the critique of state and police violence. With the dominance and presence of visual technologies, objectivity, evidence and truth are based on changing notions of knowledge and are established in new visual forms. The counter-forensic investigative agency 'Forensic Architecture' provides case studies and attracts public attention, becoming a prime example of a new culture of evidence. Their work addresses the issue that visual documents of violent events are often contested, and that there is no single representation of the entire event, but rather a fragmented landscape of precarious images. Amidst the flood of images, the identification of visual artefacts increasingly requires additional legitimation. We show how forensic architecture works with different types of data and performs complex data analysis. These practices overcome the limitations of data by contextualising it in breadth and analysing it in depth, rearranging, highlighting, sorting and synthesising information into a digital spatial model. The resulting visual meta-artefacts attempt to make the analytical practices reflexively visible. We analyse the new communicative form of evidence production in the field of contested images of violence and link the debate to the wider field of visual and spatial knowledge.

From Communicative Planning to Collaborative Modeling? Investigating the Transformation of Planning Knowledge in Digital Planning Cultures

Ajit Jacob Singh, Marie Marleen Heppner

Bielefeld University, Germany

My contribution investigates "digital planning cultures" from the perspective of communicative constructivism. For some time now, it can be observed that digital planning projects in building construction and transport infrastructure planning increasingly rely on the use of software-based collaborative planning infrastructures to structure "communicative actions" in planning processes and make them transparent for the stakeholders involved. Based on empirical findings, I will outline an approach that examines the transformation of communicative planning as socio-technical entanglements between collaborative actions, digital objects, and technical planning infrastructures. A paradigm shift can be diagnosed by the replacement of graphic representation of 2D plans and the use of CAD systems by modeling complex, three-dimensional construction models. The digital planning method "Building Information Modeling" is a prototypical case for this development. Planning objects (buildings, railway networks) are digitally designed in virtual space at the early start of the planning process. In the further course of the subsequent planning phases, the model is enriched with information, checked for errors and collisions, and simulated regarding suitability and accuracy of fit (e.g., for the creation of a structure gauge) even before it reaches the construction site. The whole digital planning process is interwoven with a multitude of communicative activities that take place both in presence (synchronous meetings, workshops, events, etc.) and mediatized (and asynchronous) via software infrastructures. The digitized 3D model, which is conceived as a "synthetic object" and knowledge-based collaboration medium, is of great importance for the emergence of digital planning cultures: in collaborative planning projects and in organizations, the synthetic object fosters the construction, shaping and change of knowledge, on which the concrete, trans/local practices of digital planning is based.

1386

RS16 | T07: Spaces and Borders of knowledge production

Knowledge About the Past in Border Regions. Disruptive Transformations of Europian Memory Cultures

Vivien Sommer

Leibniz Institute for Society and Space Erkner, Germany

This talk would explore processes of differentiation, and inequalities within various knowledge regimes amidst global and local tensions, focusing on the dynamics of memory cultures in the context of European borders. Despite the erasure of internal borders through the Schengen Agreement, disruptive events such as the coronavirus pandemic or the so-called refugee crisis have prompted temporary closures, revealing the persistence of national borders. Memories of "wounded borders" continue to shape socio-spatial transformations, posing questions about how borders are remembered and their impact on the idea of a borderless Europe.

Drawing on the sociology of knowledge and the sociology of space I will discuss elements of a border memory referring to conflictual memory frames circulation in the Polish-German border region and the region at the German-Swiss border. Memory frames understood as meaning-generating schemes, are dynamic and negotiated in discourses, influencing what knowledge about the past is considered relevant. Borders are seen not only as physical entities but also as symbolic ones, shaping narratives and knowledge frames.

In my talk I will focus on these two border regions, comparing urban and rural communities to understand the intensities of remembering and forgetting, considering discrepancies between national and local memory cultures. I will discuss tensions among memory communities, stemming from differences in temporalities and scales of memory frames. Through empirical examples I will illustrate the transformation of memory frames across these two borders in twin cities and twin villages, shedding light on the conflicting entanglements of local, national and global knowledge regimes about the past.

Spatial Cultures Of The Internet – Between Network And Territory?

Sezgin Sönmez[1], Nadine Schabét[2], René Tuma[1]

[1]Technische Universität Berlin, Germany; [2]FAU Erlangen-Nürnberg, Germany

Over the past few years, discourses have emerged within the field of internet governance, which are increasingly problematizing the various lines of conflict between nation states, global internet corporations and civil societies using spatial terms and concepts. Examples of this include discourses on the centralization or fragmentation of the internet, digital sovereignty, internet shutdowns or the (re)territorialization of the internet. These global conflicts over the Internet can be understood not only as geopolitical disputes between liberal and authoritarian ideas of infrastructural control in a multipolar world order, but also as a conflict between different spatial logics or spatial cultures of the Internet that are negotiated and legitimized within a public arena and are continually inscribed in infrastructure and protocols through various practices of classification and standardization. While the field of Internet governance and its multi-stakeholder approach has always been part of a Western-influenced knowledge regime that seemed to link the openness of the Internet with the openness of markets and societies, in recent years there have been increasing tendencies to bring Internet governance more under the territorial control of nation states.

This contribution draws on empirical research data from Internet governance conferences and interpretations through a sociology of knowledge approach to discourse to illustrate how different spatial logics of the Internet not only realize themselves as opposing knowledge regimes and interpretation patterns, but also overlap, in the sense of a spatial refiguration, in standards and protocols of the contemporary Internet infrastructure.

Social Knowledge Production at the Margins? Global Policy Rankings and the Question of Scientificity

1387

Can David Tobias, Elisabeth Strietzel

Bielefeld University, Germany

In this presentation, we take a closer empirical look at the production of social knowledge in the hybrid space between science and policy-oriented advocacy: namely, in two non-governmental organizations that produce nation-state rankings. These rankings – one in the area of climate politics and the other in the area of financial transparency – seek to influence policymaking by leveraging expert knowledge as well as by creating public pressure through the transformation of data into a quantified comparisons of countries' performances in their respective areas. As a consequence of their hybrid position, their producers are constantly navigating connections to both the scientific as well as to political realms. Against this backdrop, we focus on the former connection and ask how ranking-producing organizations achieve epistemic credibility in their respective ecologies: how do notions associated with scientificity, such as evidence, objectivity, or neutrality, play out in these cases? How do members refer to and act upon them? How are they balanced and put into relation with the explicit goal of influencing political decision-making and advocating particular political agendas? And finally, how do these organizations react to challenges to their expertise? Based on ethnographic research in two ranking-producing civil society organizations, we aim to address these questions and provide an empirical account of the processes and practices of knowledge production they engage in. Ultimately, the

goal of this presentation is twofold: First, to reconstruct and articulate practices of knowledge production at the intersection of science, policy, and the media, and second, to demonstrate how the achievement of truth effects within a transnational civil society context relies on the mobilization of an extended network of actors, rather than a single organization.

Due to Eurocentric Modernity?: A Systems Perspective on the (failure) of interaction between the IPCC and UNFCCC

Niklas Wagner[1], Anna-Katharina Hornidge[2]

[1]University of Bonn, Germany; [2]German Institute of Development and Sustainability (IDOS)

This paper delves into the intricate dynamics of the Intergovernmental Panel on Climate Change (IPCC) and the United Nations Framework Convention on Climate Change (UNFCCC), examining how their interaction (or the failure thereof) is shaped by a systems logic. Embedding this Luhmannian systems theory perspective into theories of modernity, we analyse the embedded systemic structures within these institutions, highlighting the efforts and inherent difficulties of going beyond the logic of scientific and political systems shaped by a Eurocentric conception of modernity.

Our study, informed by interviews with IPCC scientists and UNFCCC negotiators and complemented by observations at the World Climate Conferences, uncovers the systemic challenges in reconciling the linear, Eurocentric logic that dominates these systems. We find that while there is a growing intention within these bodies to diversify knowledge inputs and overcome historical biases, the entrenched systems-logic of both scientific and political frameworks within the IPCC and UNFCCC presents significant barriers. These barriers not only hinder the integration of diverse knowledge systems but also impede meaningful co-production between knowledge holders including scientists, and policymakers.

Our paper contributes to the critical discourse on environmental governance, illustrating the complexities of deconstructing Eurocentric modernity within global sustainability institutions. We argue for a transformative approach that challenges the existing systems-logic of the IPCC and UNFCCC, advocating for a more inclusive framework that genuinely values and incorporates diverse ways of knowing and being. This approach is vital for creating just and equitable sustainability practices that truly reflect the multiplicity of global perspectives and experiences in addressing environmental challenges.

RS16 | T09: Scientific Knowledge within and outside academia

From Calculative Idealism to Calculative Pragmatism – the Role of Quantified Knowledge in Constructing the EU Anti-poverty Policy.

Marianna Zielenska

University of Warsaw, Poland

This paper aims to show how quantified knowledge, exemplified by metrics such as indicators and indices, contributes to the construction of EU anti-poverty policy. I argue that due to the limited legal instruments at the EU's disposal, metrics have become a key governance tool in this area, serving both to influence Member States (MS) policies and to reach compromises between EU actors representing different knowledge regimes and interests. Drawing on in-depth interviews with EC and MS representatives, social and non-governmental partners and experts, I will illustrate how metrics are used to negotiate boundaries in this policy area, and to strengthen its supranational dimension. This is well reflected in the process of agreeing on key metrics, in which a compromise is forged between the EC, MS and other actors on what will be measured and what will be left out of the picture. Such 'commonly agreed' indicators and indices are then institutionalised as key elements of EU anti-poverty policy, legitimising this policy area as a sphere of common European concern, despite the fact that most legal prerogatives remain in the hands of MS. At the same time, those involved in negotiating metrics are aware of their shortcomings and political nature, which indicates a shift from calculative idealism – often presented in the literature as a source of legitimacy that numbers provide to politics – to calculative pragmatism, i.e. from a belief that numbers are purely technical and apolitical, to a recognition that they are imperfect and the result of trade-offs.

Navigating Tensions in Textual Performance of Qualitative Research: Challenges, Internationalization and Power Dynamics in Global Publications

Ana Mijic[1], Vivien Sommer[2], Cornelia Schadler[1]

[1]University of Vienna, Austria; [2]Technical University Berlin

With a focus on qualitative research, our talk addresses tensions within textual performance in local and global publishing processes. Our aim is to highlight the need for an innovative framework that can encompass various aspects.

The presentation scrutinizes the internationalization of methods, addressing the complexities of expressing research in different linguistic contexts and the duality of explicating methodologies situated in national or language based research traditions while crafting empirical papers for international journals. Central to our discussion is the struggle faced by researchers navigating the global landscape of publication.

This encompasses the adoption of formalized processes for publishing in English, different audiences' openness for innovative approaches, and the dichotomy of working and publishing on dual fronts locally and globally. We interrogate the impact this internationalization has on knowledge, asking whether knowledge is lost or new knowledge emerges in the process.

The power dynamics inherent in the games of publication are also explored, both in terms of empirical experiences and publication practices. We delve into ethical considerations surrounding the complex intersection of funding and publication projects. Furthermore, the paper addresses the nuanced issue of positionality in textual performance, examining how researchers position themselves within the text and the varying cultural and disciplinary perspectives on this matter.

Drawing from empirical examples, this presentation aims to provide a platform for discussions on these tensions and challenges, offering insights into the evolving landscape of qualitative research methodology and the imperative need for reflexivity, ethical considerations, and an understanding across diverse scientific traditions.

Two rival prophets of sociology – Functions and audiences of Talcott Parsons' and Pitirim A. Sorokin's sociological future imaginaries

Tim Fenkner

Humboldt-Universität zu Berlin, Germany

Predictions of the future are a controversial genre in sociology. This contribution argues, however, that if we consider the reception side of sociological prophecies, we gain crucial insights into their function for the transformation of academic careers and the discipline as a whole. Harvard University in the 1930s will serve as the setting for a story of rivalry between Pitirim A. Sorokin, this prestigious university's first ever sociologist and Talcott Parsons whose predictions would shape the discipline for decades to come. In his famous debut "The Structure of Social Action" (1937) the young Parsons argued that the various social sciences would converge into a single future paradigm which he called the "Voluntaristic Action Theory". In the very same year, Sorokin's "Social & Cultural Dynamics" (1937) offered a future vision of society as a whole on the verge of transforming from a rational scientific epoch into what he calls an "integralist culture". This diagnosis gained huge popularity with American non-scientific audiences but would also prove to be the beginning of Sorokin's fall into oblivion. Parsons, on the other hand, managed to convince enough of his scientific audience of his sociological prophecy to pave the way for the dismantling of Sorokin's "Department of Sociology" and give birth to the "Department of Social Relations" with Parsons and his paradigm leading the way.

Unveiling Transparency: Presentation of Qualitative Research Methods in Academic Journals

Falk Eckert, Laura Behrmann

DFG Netzwerk Textuelle Performanz in der QSF, Germany

1389

Empirical social research differs from everyday observations in the use of methods and procedures. Traceability for the confirmation or continuation of research results is a central component of scientific research. A prerequisite for this is the transparency of the research procedure and at the same time a central quality criterion. This makes it possible to classify the significance of the findings, follow them up, uncover procedural errors, and even carry out replications to confirm the results. This poses particular challenges for the use of non-standardized qualitative methods, as decisions made during the research process need to be translated into textual presentation as well as being convincing in practical research terms.

In an analysis of high-ranking sociological journal articles from 1995 to 2020, we compared the discursive practices and strategies of presenting qualitative research published in English and German language journals.

Our comparison revealed similarities and differences between the English and German language areas with regard to the presentation of qualitative research and sociological knowledge production. In German language journal publications, in particular, the presentation of methods is uniform, concise, and sometimes intransparent.

In addition, our analyses reveal how forms of publication are shaped by basic epistemic orientations and different knowledge cultures: We thus make a first, overdue contribution to reflecting on the representation of the methodological approach and would like to put up for discussion the connectivity for other disciplines and methodological traditions. An understanding of the current constitution and dynamics of the research field provides a basis for action, both for internal scientific discussions and for inter – and intra-disciplinary as well as research policy transfers.

RS17 | Sociological Research in Portugal - Research Stream in Portuguese (abstracts and presentations to be done in Portuguese)

RS17 | T01: Transformações e recomposições sociais

Mobilidade Urbana e Turismo: Transformação Digital e Utilização de Big Data

Maria João Vaz[2], Márcia Silva[1]

[1]University of Beira Interior, Portugal; [2]University of Minho, Portugal

A presente comunicação tem como objetivo refletir sobre as tensões relacionadas com mobilidade urbana e transformação digital de destinos turísticos. As narrativas de um futuro tecnológico iminente e irrevogável, envolto na eficiência dos dados utilizados em destinos (mais) inteligentes, obscurece uma visão mais holística de desigualdades relacionadas com: o acesso a serviços digitais; com o perfil do utilizador (e.g., idade, género, escolaridade); com o aumento das desigualdades entre espaços urbanos e rurais; e com a privacidade, segurança e o uso (in)apropriado de dados.

Nesse sentido, e partindo da informação proveniente de investigações em curso, entrelaçam-se narrativas de: (i) residentes que revelam tensões sobre a (i)mobilidade urbana, reforçada pela (in)capacidade da carga turística das cidades; (ii) de grupos de interesse (e.g., académicos, profissionais e empresas ligados diretamente e indiretamente à atividade turística ou entidades públicas) que narram, de modo entusiasta a eficiência da utilização de dados (em tempo real) para a resolução de inúmeros problemas, relacionados com (i)mobilidade nos destinos turísticos e a capacidade de colmatar as necessidades dos residentes e dos turistas; e (iii) de turistas que revelam os seus receios quanto à utilização dos seus dados. Com a interligação de distintas metodologias, entre as quais entrevistas semiestruturadas e inquéritos, encontram-se convergências em torno da atual transformação digital e que acentuam a importância de refletir sobre um futuro cada vez mais digital e emancipador de (mais) desigualdades.

O Cooperativismo à Luz da Teoria da Reprodução Social: Etnografia de uma Cooperativa de Mulheres no Alentejo, Portugal.

Daniela Miranda Prado

University of Coimbra, Portugal

A Fraternidade Cooperativa de Tapetes de Arraiolos foi fundada em 1974 por um grupo de mulheres de Arraiolos, no Alentejo, que ficaram desempregadas após os ajustamentos do salário mínimo na sequência da revolução de abril. Na década de 1980, a cooperativa passou a reunir a quase 200 mulheres. O presente estudo é uma etnografia realizada em 2023 com as suas últimas 12 sócias e utiliza a lente analítica da Teoria da Reprodução Social (TSR). A Economia Política Feminista tem vindo a promover a TSR como uma lente adequada para analisar os processos de produção e reprodução nas empresas tradicionais, mas tem prestado menos atenção às entidades da Economia Social e Solidária.

O objetivo deste estudo foi analisar o potencial emancipatório do cooperativismo entre mulheres, explorando as tensões sócio-reprodutivas e as possibilidades de ação que emergiram para elas depois de formar a cooperativa. Os resultados sugerem que, embora a criação da cooperativa não tenha sido necessariamente motivada pela busca de formas de produção mais solidárias, a possibilidade de conciliar tarefas produtivas e reprodutivas foi, de facto, um dos incentivos para a adesão das mulheres. Os elementos de solidariedade, por outro lado, encontram-se em agentes externos, como os sindicatos têxteis, que no surto revolucionário de abril promoveram este tipo de iniciativas como solução para a perda de postos de trabalho. Cinquenta anos depois da revolução de abril, esta etnografia fornece elementos que nos permitem refletir sobre a situação das mulheres trabalhadoras numa zona rural de Portugal e sobre a forma como o processo revolucionário estruturou as oportunidades de emprego na vila de Arraiolos.

Recent Developments In The Labour Market In Portugal: Volumes, Recompositions And Mismatches

Jorge Caleiras, Ana Ferreira Teixeira, Diogo Silva Cunha, Dora Fonseca

CoLABOR, Portugal

This paper aims to analyze the main developments and trends that mark the recent evolution of the labor market in Portugal. Emphasis is placed on the identification of the main changes and continuities in the employment profile from a diachronic perspective and compared with other realities in the EU. What do these trends tell us about the specialisation profile of the Portuguese economy? The profile of employment in Portugal is changing because Portuguese society is in a process of socio-demographic transformation. But it is also changing due to economic recompositions, in particular those relating to specialisation profiles. After a theoretical-methodological framework, the volumes and rates of activity, employment and unemployment are analysed; the main recompositions in the recovery of employment are identified and discussed; and labour market mismatches are examined, both in quantitative terms (labour shortages or surpluses in relation to available jobs) and in qualitative terms (between the skills

1390

and competences offered by workers and employers' demand for certain skills and qualifications). It concludes with a synthesis of the main results achieved, which calls for a broader final reflection.

RS18 | Exploring and Consolidating New Research Strategies in the Post-COVID-19 Era

RS18 | T03: Exploring and Consolidating New Research Strategies in the Post-COVID-19 Era. Part I

Methods and Practices of Peer Review Between Schools with Inquiry-Based Activities in Both Physical and Virtual Settings

Donatella Poliandri, Letizia Giampietro

INVALSI – Italian National Institute for Educational Evaluation, Italy

1391

As part of a project aimed at developing a school inclusion index, we introduce a model of peer review between schools. Peer review is an evaluative process involving schools, departments, or networks of schools, focusing on a specific area of interest. It entails providing feedback and/or a report for internal use summarizing the results and suggesting directions for development for the receiving school (Godfrey, 2020). In this context, peer review can be considered both an extension of the self-evaluation process, exploring specific aspects between schools, and a professional development strategy for the involved staff (Giampietro et al., 2023).

The adopted peer review model incorporates both in-person survey activities, such as classroom observation to gain insights into the inclusion climate among students, and remote activities. This includes virtual visits between schools to explore innovative inclusion processes promoted by schools, as well as online focus groups (Poliandri et al., 2023) involving key stakeholders (teachers, support teachers, parents, representatives of school inclusion groups, municipal representatives) to comprehend the concept of inclusion comprehensively.

In light of the restrictive measures imposed by COVID-19, certain online research strategies should be perceived "not just as an adaptive compromise but as an opportunity for innovative methodological approaches" (Keen et al., 2022: 2). This consideration takes into account both the benefits (cost reduction, time savings, increased participation, etc.) and the limitations associated with dematerialized participation (absence or reduction of non-verbal or paralinguistic communicative elements, distractions, technological skills, etc.).

The Challenges and Opportunities of Conducting Participatory Theatre Online: Reflections from a Pandemic-Study on Campus Sexual Violence Activism

Curtis Fogel[1], Elizabeth Quinlan[2], Andrea Quinlan[3]

[1]Brock University, Canada; [2]University of Saskatchewan; [3]University of Waterloo

While online research methods have garnered much attention over recent decades, the required move to online research amidst the COVID-19 pandemic generated unique impacts worthy of interrogation. This is particularly true for Participatory Action Research (PAR) methods that rely on embodied action, collective emotional energy, and social interaction. This paper reflects on a study on sexual violence activism on Canadian university campuses that employed Participatory Theatre (PT) online during the pandemic. PT is a PAR methodology that utilizes embodied theatre techniques to critically examine social problems, while working in tandem with participants to take strategic action to evoke progressive social transformation. Given the embodied nature of PT and the 'emotional energy' of participants that it relies upon, it has most commonly been used in in-person settings. Departing from this trend, this study involved virtual PT interactions with university students and instructors across Canada to examine activists' strategies for building allyship to confront and challenge campus sexual violence. Through the lens of this research project, this paper reflects on the challenges and opportunities of moving the interactive and embodied qualitative methodology of Participatory Theatre online.

The Use of Mobile Phone Data to Study Immigrant Community in New York City

Yuanfei Li[1], Zai Liang[2]

[1]Shanghai University, China, People's Republic of; [2]University at Albany, SUNY, USA

As the one-time epicenter of the COVID-19 pandemic in the U.S., New York City (NYC) suffered the biggest economic damage in the country. NYC's Asian immigrants are no exceptions. However, it is often a challenge to precisely measure the economic impact of disaster and global pandemic because not all low skilled immigrants are in the formal data collection system. In this paper, using Manhattan's Chinatown as an example, we explore how de-identified mobile phone data can be used to study the economic impact of COVID on Chinatown and immigrant workers in this labor market. First, we measure the economic impact of COVID on Chinatown by measuring the changes in the foot traffic between control group (period during March-May 2019) and experiment group (period during March-May 2020, during COVID). By comparing the economic activities during COVID with economic activities during normal time period, this measure informs us how much Chinatown's economic activities have suffered due to COVID-19. The second approach is to use cell phone data to measure unemployment for Chinatown workers. We define workers as individuals who have spent more than 4 hours a day in Chinatown (this would exclude tourists or short time visitors). Thus the unemployment rate of workers can be informed by comparing total number of individuals who spent more than 4 hours a day during COVID (March-May 2020) with total number of individuals who spent more than 4 hours in Chinatown before COVID (November 2019-January 2020). We argue that this method can be applied more broadly to study economic activities of a service-based community that involves in person transactions such as restaurants.

World in Crises: Towards Qualitative Interviewing through Existential Questions

Sona Balasanyan[1], Hasmik Gevorgyan[2]

[1]University of Vienna, Austria; [2]Yerevan State University, Armenia

This methodological paper examines the role of qualitative interviews within the context of existential philosophy and its application in understanding interviewing experiences in times of crises. Drawing on various methodological approaches towards qualitative interviewing, including oral history, biographical, feminist, phenomenological, and cross – cultural, this study explores how interviewing has evolved into a multi-modal practice. In recent years, society and social scientists have faced numerous challenges, including ecological and economic crises, conflicts and wars, and the COVID-19 pandemic. This paper argues that existential philosophy can offer valuable insights into conducting qualitative interviews during such multidimensional disasters. By integrating existential questioning (presented as an interviewing technique in the paper) into the interview process, interviewers can engage with interviewees making sense of critical life situations. The paper examines how existential questioning contributes to a deeper understanding of interviewees' worldviews, focusing on sensitive boundaries between critical life contexts and personal reflections. It also highlights the interactionist nature of interviews; signifying moments where existential questions can enhance the symbolic interaction between an interviewer and an interviewee. Ultimately, this study demonstrates how specific existential questions (either standalone, or as probes and prompts) can lead to the emergence of new meanings during interviews, enabling research participants and the researchers to make sense of crises. By embracing existential questioning, qualitative interviewing gains added value in understanding and responding to the interviewees facing crises and critical life situations.

1392

Participatory action research in the Neonatal Intensive Care Units: A Case Study from Northern Italy

Concetta Russo, Alessandra Decataldo, Brunella Fiore

Università degli Studi di Milano-Bicocca, Italy

Participatory action research involves engaging social actors in all phases of the inquiry, leading to new ethical dilemmas and responsibilities for sociologists. These issues become even more complex when researchers work in settings like hospital wards, where decisions about life and death are a regular part of the healthcare staff's daily routine. In such contexts, managing patients' sensitive data presents additional challenges.

In the ParWelB project, we applied codes of ethics and methodological reflexivity to address the ethical demands that arise from parents' experiences of premature birth and their relationships with healthcare staff of intensive and sub-intensive care in two Northern Italy units. Scholars suggest involving parents in decision-making for their newborn can reduce negative feelings. To this end, we used narrative interviews and video-making to help parents make sense of their experiences and connect with healthcare staff.

Participatory research methods require researchers to consciously relinquish some of their power to represent and interpret reality. To foster ethical practice for the future, we promote two levels of dialogue: between researchers and healthcare staff (e.g., psychologists, neonatologists, and nurses) to share different disciplinary perspectives, and between researchers and parents as active participants in the research process.

RS18 | T04: Exploring and Consolidating New Research Strategies in the Post-COVID-19 Era. Part 2

Beyond the Virus: Socio-cultural Factors Shaping Government Responses to COVID-19.

Frédéric Vandermoere, Robbe Geerts

University of Antwerp, Belgium

In the early stages of the pandemic, significant differences emerged between countries in both the virological situation and government interventions. Moreover, the association between these two facets exhibited considerable variability across nations. This presentation aims to address the central question: what socio-cultural factors account for the diversity in the stringency of government measures amid the initial phase, just before the World Health Organization declared the virus a pandemic? This sociological research departs from a conventional stimulus-response model based on a linear "science-policy" paradigm, and argues that explanations for variability in government actions go beyond the virus itself. Specifically, based on statistical data from a diverse set of countries (n=90), this research demonstrates that cultural factors, such as the extent to which societies are resistant to change or emphasize quality of life, provide an underexplored explanation for the variation in COVID-19 risk regulation. Partial correlations and stepwise regressions reveal that this remains significant even after controlling for other factors like the virological situation and economic context of a country. In conclusion, the presentation highlights the potential of sociological insights to enhance the legitimacy of political decision making.

1393

Didactic Innovation and Life Skills. A Focus on the Educational Offer of Sapienza University of Rome

Maria Paola Faggiano[1], Antonio Fasanella[1], Sergio Mauceri[1], Barbara Mazza[1], Veronica Lo Presti[1], Maria Dentale[2], Lorenzo Barbanera[1], Viviana Capozza[1], Alfonsina Mastrolia[1], Desiree Tabegna[1], Ernesto Dario Calò[1], Alessandro Vetrano[1]

[1]Department of Communication and Social Research, Faculty of Political Sciences, Sociology, Communication, Sapienza University of Rome, Italy; [2]IRPPS-CNR, Rome, Italy

In the university context, European educational policies are increasingly investing in the development of innovative teaching strategies focused on active-learning (Sursock and

Smidt, 2010). Therefore, in response to the technological transformation accelerated by the COVID-19 pandemic (Rof et al., 2022), universities have implemented teaching changes geared towards imparting essential life skills to students, useful for their professional growth and their cultural and social development (Bean et al., 2018). The goal of the research project – which adopts a mixed methods, multistakeholder and multilevel approach (Mauceri, 2012 e 2019), aimed at integrating individual and contextual data, digital and traditional methods, qualitative and quantitative analysis (Content Analysis, Secondary Data Analysis, Web Survey and In-depth Interviews – analysis units: educational offer, students, course convenors, academics) is to identify best practices at La Sapienza University of Rome by exploring the innovative aspects of teaching and its effectiveness in facilitating the acquisition of life skills. To this end, the study includes a comprehensive analysis of the impact of innovative training experience across all its Master's Degree Courses (141). Here the first step of a broader investigation is enhanced: a desk review of institutional communications regarding the constitutive teachings of Postgraduate Programs found in the University's Course Catalog (analysis of webpages of current courses and academics' profiles). This contribute and, more generally, the research programme launched, aims to assess whether the post-pandemic changes have enabled the University to develop teaching approaches that meet students' expectations while promoting the develop of cognitive, emotional, and social competencies.

Entrepreneuring New Teaching Strategies in the Post-Pandemic Digital Classroom

Katia Moles[1], Laura Robinson[1], Jeremy Schulz[2]

[1]Santa Clara University, United States of America; [2]UC Berkeley, United States of America

Sociology is being transformed by innovative pedagogical strategies for online learning initiated by the pandemic (Zizzari and Fiore 2024; Decataldo, Fiore, Zizzari, 2021). Our work examines how digital communication tools can facilitate teaching sociology to university students. Inspired by the Socratic method, we argue that instructors can facilitate ongoing dialogic engagement among students that includes asking students to test their own ideas, constructively critique one another, and consider varied conclusions using discussion boards. We analyze our primary data set (n=1500) of quantitative and qualitative student self-evaluations of remote learning using discussion boards, as well as robust content analysis of archived digital interactions between instructors and students. With this multi-method research design, we compare students' evaluation of different pedagogical strategies in discussion boards employed to meet the challenges posed by the pandemic shift to online learning. The findings reveal that discussion boards can be effective vehicles for learning under the following conditions for both instructors and students: Digital inclusion in terms of access to broadband and devices, as well as digital skills to use these resources effectively. Once these challenges are met, instructors can teach sociology effectively using digital communication tools and platforms for dialogue-based interactions. Findings suggest that 1) the type of instructor moderation matters, 2) encouraging a growth mindset empowers students to become resilient learners, and 3) employing text-based digital dialogue can build classroom communities that lessen student stress. Implications offer a potential roadmap for successful use of digital pedagogies for our field.

Transition to Activity Based Workplaces (ABWs) in the Post Covid-19 Era

Pär Löfstrand, Erika Wall, John Selander, Mikael Nordenmark, Josefine Hansson, Stig Vinberg

Mid Sweden University, Sweden

This abstract explores the expectations and concerns associated with ABWs during a transition to ABW in a Swedish municipality (620 employees).

Modern work life is changing rapidly, not at least because of the covid – 19 pandemic. In the Post Covid – 19 Era many workplaces have changed towards more flexible work arrangements. This has increased the implementation of so called ABWs, not at least among public sector workplaces.

Previous research has revealed that expectations surrounding ABWs relate to increased collaboration and employee well-being. By providing a variety of work settings, ABWs enable employees to choose spaces that align with their tasks, fostering communication and idea sharing. Furthermore, ABWs are anticipated to enhance employee satisfaction and productivity through increased autonomy and flexibility.

Concerns exist regarding noise distractions, lack of privacy, and effective leadership. Additionally, the absence of enclosed private areas may raise concerns about confidentiality. Leadership are crucial in ABWs to create a culture of trust and collaboration.

In this study we explored qualitative data from around 600 municipality employees who were in the middle of transition from cell-offices to ABW. The employees were handed a questionnaire with questions of how they perceived their work environment from a social, organizational, and psychological perspective. The survey also included three open-ended questions: What expectations do you have for your new workplace? what risks do you see in your new workplace? and, what opportunities do you see with your new workplace?

This paper aims to account for employees' perceptions of moving to an ABW. Overall, understanding and addressing these expectations and concerns are essential for successful implementation of ABWs and to maximize their potential benefits while mitigating potential challenges.

1394

RS19 | Rethinking Dependence: Trust and Social Hierarchies in an Era of Uncertainty

RS19 | T08: Rethinking Dependence: Trust and Social Hierarchies

Global crises have increased over the past decade, highlighting the significance of trust in interpersonal relationships and interactions with institutions. In an era of prolonged crises, individuals increasingly rely on dependent relations to secure their livelihoods. However, concerns or 'moral panic' about the implications of such dependencies, known as 'states of dependence' (Martin-Yanagisako 2020, Piliavsky 2020), have become widespread. This session aims to reevaluate dependent relations beyond prevailing economic thinking during times of uncertainty. Drawing on the bottom-up approach of new economic anthropological thinking (Narotzky 2016), it investigates how individuals navigate decisions within diverse value systems. The RS asks how dependent relations are constituted, perceived, and negotiated between individuals with conflicting socio-economic interests. What factors sustain and perpetuate these dependencies? What are the consequences of dependent relations for different communities' social reproduction? Additionally, the session explores the intertwining of racial hierarchy and dependent relations. Dependence challenges ideals of freedom and autonomy, yet it remains a crucial topic for research. Many communities we study exhibit hierarchical social structures, which may be seen as desirable if they contribute to pursuing a good life (Ferguson 2015, Piliavsky 2020). Hence, this panel explores how dependent relationships, including clientelism, are perceived, negotiated, or contested within such social contexts. We expect a multidisciplinary meeting of research papers to address the complexity of trust, dependency, and social hierarchies amid global tensions and prolonged uncertainties. Our proposed special topic is at the intersection of development studies, economic sociology, and small scale economic anthropological research.

Therefore, we hope that this session will be of interest to scholars in these different but intersecting fields of study.

1395

Social Inequality and Trust in Europe Between 2002 and 2020

Stefan B. Andrade, Aksel Klint Bastegaard

VIVE – The Danish Center for Social Science Research, Denmark

This paper analyzes the development of trust in Europe. While research indicates that the level of trust among citizens in European countries has been declining since the mid-2000s, the individual, social, and country specific factors behind this decline have not yet been fully addressed. Utilizing structural equation modeling (multilevel factor analysis) on data from the European Social Survey, covering 36 countries and ten time-points between 2002 and 2022, we contribute to the literature with three key findings. First, we map the development of citizens' trust in three types: interpersonal trust, trust in national political institutions, and trust in international political institutions. Second, we determine the extent to which individual, social, and country specific factors explain variance in the three types of trust while considering control variables based on previous research. Tentative findings reveal that the trends in the three types of trust are far from homogeneous across the European countries. While citizens' interpersonal trust and trust in international political institutions have been relatively stable across European countries, young men between ages 25 and 34 in Northern and Southern Europe have become significantly less trustful towards national political institutions. Third, in accordance with previous studies, we expect to find negative effects of growing inequality and unemployment on citizens' trust to the national political institutions. As our findings highlight lower levels of trust for younger citizens with limited attachments to the labor market, we conclude that European societies should consider doing more to secure the social safety net for these groups if Europe is to continue being characterized as a continent with one of the world's highest levels of trust.

Democracy And Trust Among Lithuanian Municipal Councillors In The Times Of Uncertainty

Ieva Dryzaite, Jurga Bucaite Vilke, Viktorija Baranauskiene, Aiste Lazauskiene

Vytautas Magnus University, Lithuania

Recent societal shifts, including the pandemic, migration, wars, energy crises, financial instability, and rapid AI development, have induced varying levels of uncertainty across personal, informational, economic, technological, and social domains. The political sphere is not an exception and is also affected by these uncertainties and undergoes their influence. In such contexts, the examination of Lithuanian councillors' nuanced perceptions of democracy and trust is pivotal as it reveals the intricate challenges they face in upholding democratic ideals in the time of uncertainty.

This presentation aims to analyse the complex interplay between democracy and trust among Lithuanian municipal councillors, exploring the diverse notions of democracy encompassing deliberative, participatory, and representative models. Moreover, it examines the varying levels of trust held by councillors concerning different political outcomes, ranging from policy direction to community engagement strategies. The study seeks to find out how these differing perceptions of democracy and varying levels of trust impact political decision-making and governance strategies during uncertain periods.

This study draws upon empirical data from the European Comparative Survey of Municipalities' Council Members. Their nuanced perspectives illuminate the challenges and dynamics within local governance structures. Theoretical knowledge, insights and empirical data on Lithuanian councillors attitudes towards democracy and trust derive from an ongoing research project "Changing role of local councillor in self-government: leadership, institutions and communities" (No. P-MIP-23-267, Lithuanian Research Council).

Illiquid Dependencies: Legal Techniques and Dependent Relations Among Wage-Garnished Households in Northern Hungary

Balazs Gosztonyi

Max Planck Institute for Social Anthropology/Martin Luther University Halle-Wittenberg

1396

Household over-indebtedness and judicial debt collection in Hungary affect around 700,000 people through wage garnishment – a forced 33% or 50% deduction of wages exceeding the living minimum amount (currently 160 euros per month). This phenomenon disproportionately impacts the populations of villages in Northern Hungary, entangling inhabitants in debt traps, resulting in exclusion from formal wage labor and diminished incomes. A few non-governmental organizations offer debt advice in Hungary in the region.

The central inquiry of this research explores how households navigate and sustain their livelihoods amidst such an illiquid economic environment. Furthermore, the research investigates the advice and strategies debt advisors extend to debtors who cannot meet present and future payment obligations. Through a comprehensive 12-month ethnographic fieldwork, the research relies on interviews with debtors, social workers, and participant observation with debt advisors in Northern Hungary. Across approximately 130 meetings with 3 debt advisors, engaging around 170 debtors in 22 villages, the study sheds light on debt advisors' multifaceted approaches.

The findings underscore that debt advisors essentially offer legal guidance to contest debt collectors, aiming to reduce debts and suspend wage garnishment. When such legal guidance fails to improve financial situations, debtors are further informed about additional ways to avoid wage garnishment, particularly through legal techniques related to establishing dependent financial relationships with family, friends, neighbors, employers, and even the local state. These strategies aim to mitigate the adverse effects of

judicial debt collection while also reshaping social relations and upending hierarchies.

Moralities of Dependent Relations in times of polycrisis in North Hungary and Romania. A Comparative Ethnography

Judit Durst[1], Gergely Pulay[2]

[1]Centre for Social Sciences, HUN-REN, United Kingdom;
[2]Centre for Social Sciences, Hungary

We are witnessing a proliferation of global crises for more than a decade now. Social navigation between and across crisis-ridden fields requires movement across different regimes of value. Instances of crises and various forms of moral deliberation are intertwined and mutually provoke one another both in analytic and everyday terms, for us as scholars and for our interlocutors. Post socialist settings, such as our ethnographic fields both in Romania and in Hungary, generally invite a perspective that considers the routinization and the everyday management of crises opposed to a view that aims to comprehend crises as rupture, a space of the extraordinary or as an event. In an era of prolonged crises, individuals increasingly rely on dependent relations to secure their livelihoods.

An ethnographic theorization of morality, crisis and dependence must be based on the real-life decisions, contexts and pursuits of ordinary people. Our goal in this paper is to engage with the moral deliberation of dependent relations amid multiple crises that pertain to livelihoods of our protagonists: scrap-metal traders at the margins of urban Romania and (informal) labour recruiters from the rural North of Hungary. We seek to work towards a comparative account on dependent relations and the everyday moral evaluations they incite between the exchange of personal favours and the impersonal forms of service provision. Beyond this, we explore a particular dependent (informal) work relation that seems to lead to the re-proletarization of our protagonists in both countries.

RS20 | Maritime Sociology
RS20 | T02: Coastal Social Dynamics: Governance and Practices in Martitime Landscapes.

Landscape in the Governance of the Coastal Region: an Evolutionary Assessment from Portugal

Carla Gonçalves, Paulo Pinho

CITTA – Research Centre for Territory, Transports and Environment / Faculty of Engineering of the University of Porto, Portugal

European coastal regions are confronted with complex governance challenges due to climate change and extensive landscape transformation, particularly in densely populated and heavily infrastructured areas. Despite longstanding calls for the protection and enhancement of coastal regions, their allure for human activities continues to grow, exacerbating the existing pressures in these areas. Recognising the urgency for governance reform, scholars emphasise the necessity of acknowledging the boundaries and dynamics of the coastal socio-ecological system. The integration of a landscape governance approach, reconnecting the politics of scale with natural conditions, is considered advantageous.

However, empirical research on landscape governance has predominantly focused on forest restoration in the Global South, leaving limited discussion on coastal landscapes. To bridge this gap, a multiple case study in Portugal investigated how the landscape concept have been incorporated into coastal governance, specifically in three municipalities (Vila do Conde, Póvoa de Varzim and Esposende) in which a pioneering landscape study was conducted in the late 1970s. The results indicated varying degrees of landscape integration influenced by the current European policy agenda. In addition, the establishment of protected areas and mandatory landscape instruments has played a crucial role in safeguarding the coastal socio-ecological system from urban development. While recognising the limitations of generalisation from a case study research such as this, the findings emphasise the potential game-changing impact of prioritising landscape thinking in coastal governance. The conclusions suggest that a transformative paradigm shift toward coastal landscape governance, anchored in the Council of Europe Landscape Convention, is essential to promote sustainability in coastal regions.

Frame Performance of the Port City

Robert Bartłomiejski

University of Szczecin, Poland

This paper explores the theoretical concept of 'frame performance' in the context of port cities to search for new possible empirical implications for analyzing how cultural and ideological landscapes shape urban experiences. The interpretive framework of the port city refers to two aspects. First, the port city frame is a culturally formed cognitive schema in which an individual event or experience is shuffled as the definition of a situation. Second, the interpretive frame of the port city is the frame of action; that is, the socially regarded mode of proceeding with a certain definition of the situation. I believe that to understand the port city, performers and agents are needed to expose the port city's character in performative action. These, in turn, need to draw experiences from the cultural and ideological resources of the landscape, the meaning of which is revealed in the performances and interpreted by the audience. The cultural stock of frames and social rules and strategies for using "port city frameworks" in the course of interaction and performance will be presented in the case study of Szczecin (Poland).

Socio-ecological Tensions of Local Seafood Value Chains in Croatia

Branko Ančić[1], Dražen Cepić[2]

[1]Institute for Social research in Zagreb, Croatia;
[2]Department of Sociology University of Zadar

Each locality undergoes a cycle of natural capital appreciation and depreciation, influenced by its geographic and economic embeddedness. Globalization amplifies this process by exposing local natural resources to global markets, leading to the deterioration of small-scale, locally oriented production and the rapid depletion of natural capital. Small-scale food systems, like small-scale fishery, are important for food security, since it enables livelihood for millions of people around the world – and as such are deeply embedded in the networks of social and trade relationships. Tension, trust and transformation represent interconnected themes woven into the fabric of fishery value chains. In this research stream, we would like to present research on fishery value chains in Croatia and to delve into various critical themes shaping the industry's dynamics. Our analysis is focused on understanding socio-ecological tensions within the global capitalist sea-food system. Theoretical approach is based on the theory of social embeddedness which suggests that understanding social networks is essential in order to understand economic exchange since it is deeply rooted in social relationships. Topics of corporative logic vs. cooperative logic, power issues in vertical ties of value-chains and conflicts among different actors will be presented with an aim of scrutinizing tensions arising from divergent interests, the role of trust in fostering collaboration, and the transformative potential of sustainable practices. By unraveling the complexities of fishery value chains, our research in Croatia seeks to shed light on the interconnected dynamics of local natural capital cycles and the globalized forces accelerating their depletion.

Anglers Along the Bosphorus and Their Catch's Integral Role in Istanbul's Food System

İlhan Zeynep Karakılıç[2], Selahattin Ünsal Karhan[1]

[1]Independent Researcher, Turkiye; [2]Bahçeşehir University, İstanbul, Türkiye

Along the Bosphorus in İstanbul, Turkey which hosts a rich variety of fish throughout the year, many people from different backgrounds fish from the shore with fishing rods and become a part of Istanbul's fishing culture. One may observe that while many anglers fish for themselves, some fish for selling their catch informally. In this presentation, I want to share the preliminary findings of a research project[1] which derives inspiration from this observation. The project's field research which will include participant observation, in-depth interviews and surveys with experts and anglers will be conducted in the first months of 2024. The project has two main goals. The first one is to understand the socio-economic background of the anglers which is not investigated by social scientists in the context of İstanbul. The second one is to reveal how the catches of these anglers are consumed and taken part in İstanbul diverse food system. When food systems are diversified and globalized, they become more vulnerable to crises. Local resources and solutions gain importance in these situations. In this respect, this presentation will focus on the roles of anglers and their catches' place and role in the food system of İstanbul which contains formal and informal networks spread through a city under constant urban and environmental transformation.

The Implementation Of The ISM Code: An Overview And Assessment Of Current Approaches

Birgit Pauksztat[1], Michelle Grech[2], Margareta Holtensdotter Lützhöft[3]

[1]Nordland Research Institute, Norway; [2]Australian Maritime Safety Authority, Australia; [3]Western Norway University of Applied Sciences, Norway

The International Management Code for the Safe Operation of Ships and for Pollution Prevention (ISM Code) was adopted in 1993 and came into force in 1998 as chapter IX of the Safety of Life at Sea (SOLAS) Convention. Its purpose is to "provide an international standard for the safe management and operation of ships and for pollution prevention". It applies to all passenger vessels, cargo vessels of 500 Gross Registered Tonnage or more, and mobile offshore drilling units. The ISM Code requires companies that operate the above vessels to establish a safety management system that encompasses procedures and measures for improving safety both at the company level and on board of its vessels.

The purpose of this project is to give an overview of approaches and practices used in the implementation of the ISM Code, assess the effectiveness of implementation, and identify difficulties, gaps, flaws and failures as well as strengths of current management systems. To address these questions, we conduct a literature review and analyze data from surveys and interviews with maritime administrations (flag States), port state control authorities, shipping companies and seafarers. This is complemented by a detailed analysis of maritime accident investigation reports.

The presentation provides an overview of the project and presents key findings and insights.

Occupational Disease as a Social Phenomenon. Case of 'mackerel' Disease in the 1950s

Urszula Kozłowska, Karolina Izdebska

University of Szczecin, Poland

A disease, including an occupational disease, can be seen as a subjective experience of discomfort or suffering. It is not only the result of the biological condition of the patient but also of social, cultural factors, stress, personality traits or beliefs of the individual related to the disease. The aim of this presentation is to describe an occupational disease in fishermen and fish processing workers professionally involved in mackerel processing. Cases of the dermatosis – "mackerel disease" could be diagnosed among them. In the literature it is known as redfeed. This condition was exacerbated seasonally from June to September when the fish fed on reddish-orange crustaceans. This red food parched the hands of those handling the mackerel causing painful lesions on the skin.

The research concerns the materials, found in the State Archives in Szczecin, on the disease in the employees of "Odra" Deep Sea Fishing and Fishery Services Company and the Fish Centre.

No whistling in the Bridge – Seafarers' Superstitions in the Past and Today

Arkadiusz Kołodziej, Agnieszka Kołodziej-Durnaś

University of Szczecin, Poland

Superstions have played a signifiacnt role in the work at sea. They were especially important among fishermen where the volume of catch depended on the random factors (strike of luck). Superstitions influenced their labour's organization as well as the interpersonal relations. Today the funkction of superstitions among the representatives of maritime prosessions has decreased significanly. This change stems from the transformations of labour's organization, ship's organizational structure, development of technology and social consciousness of seafarers and fishers.

In the presentation we show on the basis of our qualitative research among seafarers how the role of maritime superstitions has changed and how their social functions evolved.

Motion Sickness Among Offshore Wind Farm Workers – A Mixed-Method Study Of Prevalence, Health, And Behavioural Experiences.

Andrew Fenn

University of Southern Denmark, Denmark

The offshore wind energy sector is growing and needed for future energy security, transforming how energy is generated, and meaning that an increasing number of offshore workers will be required in future.

As wind farms move further offshore into deeper waters, worker exposure to vessel motion and wind turbine motion is likely to increase, especially with new floating offshore wind farms coming online.

Motion sickness is subjective, in some people exposure to vessel motion may have no effect, while others are incapacitated; the condition has multiple symptoms, and it cannot be concluded that the person who vomits is suffering any more than their colleague who has not been sick. It is

foreseeable that motion sickness could lead to bullying or have other consequences beside the immediate symptoms.

For wind farm workers, motion sickness may lead to reductions in performance, increased safety risks, and a range of physical, and psychosocial health challenges in an already challenging work environment.

Research specifically concerning the prevalence and effects of motion sickness in the sector has not been carried out to date, and while it is possible to speculate about the effects and prevalence of motion sickness, supporting data is currently unavailable.

In this mixed-method study we seek to close the identified research gap; identifying the symptoms of motion sickness experienced, exploring the attitudes of workers and employers, and examining the psychosocial impacts of motion sickness. Additionally, we aim to understand barriers and enablers influencing the reporting behaviour, recognising that trust may play a pivotal role as a result of the subjective nature of the condition.

The Bottom Rung Of The Ladder. Using Agency To Explore The Reproduction Of The Gender Gap In The Fishing Sector In Galicia (NW-Spain).

Helena Martínez-Cabrera, Gonzalo Rodríguez-Rodríguez

University of Santiago de Compostela, Spain

In the last 20 years, women were incorporated as full members of the fishing sector but confined to relatively worse positions compared to men's. In this paper, we first describe what the evolution of the socio-economic conditions of the female workforce has been between the publication of the 1999 and 2019 editions of the Regional Input-Output Tables for the Fishing and Canning Sector in Galicia, one of Europe's leading producers of fish. Second, in light of 33 in-depth interviews conducted with women in the fishing sector, we analyze their current agency levels based on the outcomes of a series of backcasting future scenario generation questions. Results underline that their absolute gains in agency did not allow women to increase their capacity to influence the organization of production and reproduction. Gender inequality spans asset distribution, formal rules, cultural norms, and personal preferences and has exposed women to drawbacks.

A Partner At "high-risk" Or A Risky Partner? How Seafarers' Partners Navigate Uncertainties Related To Their Spouses' Work

Colette Szczepaniak[1], Barbara Fersch[2], Hanna Barbara Rasmussen[2]

[1]University of Szczezin, Poland; [2]University of Southern Denmark, Denmark

Although marine occupations have become much safer than in previous times, being a seafarer is still characterized by certain risks and uncertainties, such as the fact that if accidents happen, they might have dire consequences, uncertain schedules concerning when the seafarer might come home again and challenges with being in contact with partner and family at home when at sea. There are also uncertainties concerning retirement because Polish seafarers do not earn pension rights 's when working on foreign ships. In this paper we are focusing on the ways in which seafarers partners deal with those situations, while having also other social roles (mothers, caregivers for older parents, employees) as they are affected by their partners' uncertain work.

We will discuss the different types of navigation strategies, both concerning practical every-day "management" and emotional coping aspects. The analysis is based on 25 qualitative interviews with partners of seafarers in the Polish high-seas transport fleet.

Sailing Through Generations: A Sociological Inquiry Into Seafaring Profession

Ioannis Katsounis[1], Dimitris Gavalas[1], Thanasis Kizos[2]

[1]National and Kapodistrian University of Athens, Greece; [2]University of the Aegean, Greece

The main objective of this study is to record the motivations for choosing the seafaring profession. In this context, emphasis is placed on the island of Chios (Greece), which is recognized for its rich maritime tradition and significant contribution to global shipping. The questions raised are whether seafarers' expectations have been confirmed or denied. It also explores whether seafarers' expectations align with their experiences and examines the intergenerational continuity of seafaring in a traditional seafaring place. In this way, the present study seeks to reveal complex sociological dynamics. A mixed methods approach is utilized to investigate sociological aspects. Beyond merely quantifying data, the study aimed at advancing sociological understanding. For this purpose, an explanatory sequential mixed methods design is employed, comprising two distinct phases. Initially, quantitative data were gathered and analyzed through questionnaires completed by active and retired seafarers from Chios Island. Subsequently, qualitative data were obtained through in-depth interviews with a specific number of seafarers. The sequencing of the qualitative phase was purposefully aligned with the outcomes of the initial quantitative phase. The results contribute to a deeper understanding of the motivations and disincentives for choosing a seafaring career, considering the relevant debate on finding suitable human resources in the maritime industry.

"Experience is very, very important…" Fishers´ Knowledge Practices in the Light of Adaptive Capacity to Structural Change

Fanny Barz[1], Martin Döring[2], Kira Gee[3], Andreas Kannen[3], Tobias Lasner[4], Jürgen Schaper[3]

[1]Thünen Institute of Baltic Sea Fisheries, Rostock, Germany; [2]University of Hamburg, Institute of Geography, Germany; [3]Helmholtz-Zentrum hereon, Geeesthacht, Germany; [4]Thünen Institute of Sea Fisheries, Bremerhaven, Germany

German fishers currently face many challenges such as climate change, degrading fish stocks, fishing bans in marine protected areas, an overaged fleet, a lack of successors, and increasing spatial competition. While research often focuses on technical and economical dimensions, little is known about the social dimensions of fishing and their influence on the adaptive capacity of small-scale fisheries. Based on a sample of 66 semi-structured interviews conducted between 2017 and 2022 on the German coasts, we used an open analytical approach based on Grounded Theory to reconstruct the perspectives of fishers on their current fishing practice(s). This presentation focuses on fishers' knowledge as an important dimension of adaptive capacity. Our results indicate that certain types of knowledge and acquisition pathways are more relevant within the fishers' community. Practical experiences and cross-generational, orally communicated traditions are valued more highly than other types of knowledge such as formal, written communication. More importantly, fishers´ knowledge is local and experience-based, which runs counter to the model-driven, law-based international and written communication in fisheries management. We connect our results on fishers´ knowledge to the concept of different forms of capitals, discussing their influence on the adaptive capacity of fisheries in times of profound structural change. We conclude that the scientific and political support for transforming fisheries in the North and Baltic Sea needs to include much broader understanding of the social dimensions of fishing, including the influence of knowledge production, to enhance the adaptive capacity and resilience of fishing communities in the face of multiple challenges.
