Do brown bears have impacts on the rules guiding their own conservation? According to established theories on institutions, they cannot. Conceptually, institutions are reserved for human interaction, as there is broad agreement that institutions are integrated systems of rules that structure social interactions of humans, through the use of language. However, bears and humans effectively inhabit shared spaces, in effect communicating not only directly but in relation to the institutions of conservation governance. This paper explores the multi-scalar conservation governance of the brown bear and illustrates the ways in which individual brown bears indeed can be understood as impacting on the conditions of their own conservation. The paper connects with scholarly and policy approaches that deal with human-predator coexistence and cohabitation as well as non-human animal agency, and explores the different forms of agency and action that bears may be understood to possess and execute. The research question is: How do bears as individuals participate in formulating and defining the practices of conservation of the brown bear as a species? Methodologically the research draws on public data sources, including existing institutional accounts for species conservation, analysis of news pieces, as well as supplementary visual field work material.

The Manifestation of Intersubjectivity in the Cat Café: Collective Efforts among Staff, Customers, Cats and Space

Yixuan Li

University of Edinburgh, United Kingdom

Previous research on human-animal relationships has predominantly focused on pets/companion animals, laboratory animals, and industrial animals, often overlooking how space plays a role in shaping these interactions and relationships. Also, there has been limited attention given to animal-themed restaurants or cafes, where related studies focus primarily on paid companionship and emotional labor. However, these unique spaces often offer a fascinating world to observe how humans and animals co-create and experience intersubjectivity. Hence, through ethnography conducted in a cat cafe, the study aims to explore how cats co-construct intersubjectivity with humans amidst the contrast of transient customers and stable staff and space. By integrating the regulations of the cat cafe, the spatial representation of its furniture and equipment, the cats, customers, and staff—so many heterogeneous actors, this study will use Actor-Network Theory as a sensitive tool to capture intersections among them to form a network of the cat café. This preliminary study concludes that within a confined space, and under the guidance of staff, customers are drawn to and enjoy realizing intersubjectivity with cats. Innovatively, this research introduces the concept of "semi-open space" in sociology, highlighting the indispensable and significant role of space as an actor in the human-animal relational network. It also points out that the relationship between humans and animals is not a simple binary model, but rather the result of the collaborative efforts of a multitude of heterogeneous actors, including often overlooked and taken-for-granted elements like space.

Rights of Nature and Justice. A Sociological Approach to Understanding Environmental Constitutional Changes

Aurea Mota

Universidad Abat Oliba, Spain

This paper analyses processes in which 'nature' is getting rights granted through societal and constitutional. It offers a theoretical approach through which we can understand these processes accompanied by a discussion of a case study that is happening in Europe at this moment: Ireland. This country is about to organise a referendum to change its Constitution and make it possible to include the rights of national biodiversity. The Irish case to be understood in comparison to the other similar ones that happened in other places of the world and in light of the growing of social movements around this issue – such as the Global Alliance for the Rights of Nature (GARN). There have been locally different ways of justifying constitutional changes to include rights of nature. What the different forms of justification have in common is that, at the first step, 'nature' needed to be integrated as a 'being' before a second moment in which the legal justification for these inclusions can be are grounded within the framework of Anthropocene and environmental justice.To raise and answer this kind of questions could help us to look at the problem of social/political change as a process in which many subjects have their role: the ones who have the power of critical and reflexive existence about what they are doing, as well as the ones who act because they are living entities that impact on the world. The paper connects the theoretical approach with empirical analysis as a way of understanding social change, environmental justice, and political action.

RN12 | T09_03: Participatory Governance and Community Engagement in Energy Transitions

Steeling the Power Away? Participatory Politics in European Just Transition Regions

Anaëlle Bueno Patin

Tilburg University, Netherlands, The

The European Green Deal has triggered public debate in regions with a high concentration of carbon intensive industries – such as steel producing regions. As part of the European Green Deal, the Just Transition Fund aims at providing funding to industrial regions in order to alleviate the cost of their transition towards a "carbon-neutral society". However, the participatory processes that are organized to achieve a "Just Transition" have triggered tensions between steel workers, residents and employers.

In this paper, I propose to unpack these participatory practices in the context of the so-called just transition in two steel European regions, namely Hauts-de-France in France and the Dutch region of IJmond. Through more than 40 semi-structured interviews, I provide nuanced insights into the dynamics of participatory governance and its implications for carrying 'just' transitions.

At the heart of the Just Transition strategy lies the principle of "leaving no one behind" as well as the inclusion of marginalized communities through participation. However, participation is enclosed with unequal power dynamics which can contribute to (re)produce new and old inequalities. Scholars have looked at how, by disregarding the role of power structures in producing marginalisation, participatory techniques may further marginalize individuals and groups. Moreover, and in the context of Just Transition, how these participatory practices happened in contexts of important industrial power remains unclear. Strikingly in IJmond , the participatory processes organized linked to the Just Transition didn't seem to mobilize much support for the decarbonization policies. Whereas participatory practices organized by steel workers led to a strike and forcing the owners of the steel factory to take decarbonization seriously. This shows the importance of ownership over the participatory process.

The Role of Trust in Relationships Within the Community to Inhibit the Participation in Energy Refurbishment Project in Italy

Grazia Giacovelli[1,2], Jessica Balest[2], Natalia Magnani[1], Federica Buffa[1]

1University of Trento, Italy; 2Eurac Research Institute for Renewable Energy, Bolzano, Italy

In recent decades, the importance of involving the citizens in the energy transition has grown. In this process, some citizens' aspects have emerged as important actors that can inhibit or facilitate social participation in energy transition. Current approaches to the study of the community dimension of participation in the energy transition tend to emphasise the role of the relationships in facilitating participation. Despite this tendency, little research has been conducted on the role of the type of trust in relationships that facilitate the participation in the energy transition. To try to explore this further, this research explores the role of the social network in energy transition participation through knowledge of the type of trust in the community. The case study concerns the energy refurbishment of a historic building in Valbrenta (IT). The research explores whether the type of trust that features the relationships among the actors and citizens in the community can inhibit or facilitate participation in the transition. Through the administration of 14 questionnaires and 8 semi-structured interviews to stakeholders, the network was explored. Research shows that generalised trust, hence weak bonding ties, can favour participation in the energy refurbishment project, conversely, the dominance of personal trust, hence bonding ties can limit participation.

From Grid To Ground: Understanding Knowledge Dynamics In An Energy Community Project

Giada Filippa Paola Coleandro

University of Bologna, Italy

Energy transitions present a significant challenge to the relationship between energy and society. To change this relationship, it is essential to identify the expectations, knowledge, and ideas embedded in the current energy systems, as well as those required for the desired transitions. However, technical choices behind energy planning can be complex and may obscure decision-making processes, making those choices difficult to follow.

The purpose of this proposal is to present a study on the knowledge dynamics between energy experts and citizens in the development of an Energy Community. The establishment of an Energy Community implies a shift towards decentralised energy systems, where end-users should play a crucial role in the design and management of renewable energy infrastructure. Taking into account the needs and experiences of citizens is crucial for the development of Energy Communities as an alternative socio-technical system. Engaging with the public is not only about involving them in the search for solutions, but also about empowering them to play an active role in the decision-making process so that energy can be reconnected to their daily lives.

This paper presents the results of a qualitative study that followed the development of a pilot project aimed at establishing an energy community in an Italian city. The study collected extensive data through interviews with citizens, representatives of local institutions and project leaders, as well as participant observation during related events. The study shows that although citizen participation is recognised as important in shaping the Energy Community, the pilot project was mostly dominated by a techno-managerial agenda. However, the establishment of a local committee has enabled citizens to reclaim their role by promoting their aspirations and visions.

Citizens' Engagement in Italian Renewable District Heating: a Preliminary Investigation

Aurore Jeanne Stanislava Dudka, Natalia Magnani

Department of Sociology and Social Research, University of Trento, Italy

While a considerable amount of research has been directed toward the active participation of citizens in the energy transition, particularly in the realm of electrical energy, renewable thermal energy, also central in the European's energy transition strategy, has received notably less attention. This gap reflects the

specific characteristics of district heating systems which often demands significant capital investment and a high level of expertise, factors that have been recognized as major impediments to citizen participation. To fill this gap and gain a better understanding of this issue, we focus our study on the Italian context, where we have identified 200 district heating networks that incorporate renewable energy. Utilizing the institutional logics framework alongside empirical research, our objective is to unravel the governance structures of these projects and investigate the role of citizens in terms of ownership and different forms of engagement (from demand side management to renewable energy community). Our findings reveal that the majority of district heating systems are predominantly controlled in a top-down manner. In this landscape, citizens are often relegated to the role of passive users. However, an alternative model has emerged in some rural regions in the North-East of the country, where district heating is managed through cooperative structures. Eventually, our research will outline the characteristics of this model and the socio-technical obstacles in Italian context to the diffusion of community-based approaches to district heating.

RN12 | T09_04: Policy and Discourse on Climate and Environmental Issues

Urgency Invocations In Urban Climate Neutrality Discourses. The Case Of Warsaw

Anna Horolets

University of Warsaw, Poland

Urgency is an indispensable tool for political mobilization in times of actual or imagined emergency, such as climate change. What happens to a policy issue when it is declared 'urgent'? Is it contested, by whom and how? What are the patterns of competing urgencies?

In the proposed paper the aim is to analyze how urgency functions as a discursive and emotional practice. The specific question, which will be tackled with the help of critical discourse studies tool-kit, is how the invocations of urgency in urban climate neutrality policy related discourse are framed and how they compete with other urgencies (e.g. of war migrations, economic crisis or the pandemic).

Cities have a special position in action on climate change, as entities responsible for high proportion of CO2 emissions, in which acknowledging the effects of global warming may take complex institutional and cognitive routes. Analyzing the role and impact of urgency in urban climate neutrality discourse as well as tracing competing urgencies will allow to understand what facilitates the framings of climate change as an emergency and what impedes such framings in cities.

Warsaw is selected as a case study not only due to its track-record of climate policy action and participation in the 'EU Mission 2030: Climate Neutral and Smart Cities', but also due to its situatedness within global economic and political regimes as a semi-peripheral metropolis and a capital of a post-communist state. The paper will trace the processes of movement, translation, friction, contradiction and incommensurability between the various understandings of climate change through the lens of the concept of urgency.

Rewetting of Peatlands between Climate Protection, Loss of Culture and Threat of Livelihood: Insights from an Analysis of the Discourse on a Climate Protection Strategy in Germany based on Newspaper Articles

Jens Jetzkowitz, Charlotte Schroeder

Johann Heinrich von Thünen Institute Federal Research Institute for Rural Areas, Forestry and Fisheries, Germany

Drained organic soils, mostly former peatlands, emit considerable amounts of greenhouse gases, especially CO2. CO2 emissions can be stopped by rewetting the drained organic soils. As in other countries where peat soils have been cultivated for agricultural use, this would contribute to achieving international climate protection targets. However, those who strive to achieve such goals run into conflicts with the owners and users of these soils, primarily farmers who – standing in a long tradition of peatland colonisation – fear for their livelihoods.

In order to understand the land use conflicts that are developing around the climate-motivated rewetting of organic soils in Germany, we analysed how the German public communicates about "peatland rewetting" as part of a discourse analysis. For this purpose, we used a data corpus consisting of 758 newspaper articles, representing both the national discourse strand and regional discourse strands in peatland-rich regions. From the 1970s onwards, the loss of a typical landscape component (including for "the homeland"), which is also protected by international nature conservation conventions, was initially publicly lamented. In 2007, the dynamics of the discourse changed as peatlands were publicly addressed as carbon reservoirs and their drainage as a cause of CO2 emissions. Farmers in particular, who had previously been at least ambivalent about the destruction of peatland soil through peat extraction – which was thematised differently from region to region – find themselves in a new complex field of tension of societal expectations. The results are interpreted with reference to various conceptual frameworks of memory studies to determine how meaningful communication about the re-wetting of organic soils remains possible in this field of tension.

Curiosity And Discontent: Press Coverage Of Energy Transformation Debates in Poland

Piotr Cichocki, Mariusz Baranowski, Piotr Jabkowski

Adam Mickiewicz University, Poland

The challenge of energy transformation remains a contentious issue on both structural-economic and ideological grounds. The drive to transformation away from fossil-fuel

dependence faces concerted opposition raising concerns over the costs to be imposed on businesses and consumers, sometimes also moving in the direction of questioning the feasibility of climate change mitigation policies or an outright climate change skepticism. Poland represents an especially interesting case study for understanding those tensions due to its heavy reliance on coal, which forms a significant part of its energy mix. This reliance poses a challenge in shifting towards more sustainable energy sources without disrupting the economy and employment sectors linked to coal mining and usage. Furthermore, on the political front, Polish right-wing parties, in government in the period 2015-2023, have also developed a transformation-skeptical attitude combining elements of general populist opposition against costly climate driven adjustments with a form of euro-skepticism countering the perceived overreach of European Union institutions trampling over member state sovereignty. Based on algorithmic text mining of a corpus of Polish press articles covering the issue of energy transformation (over 6000 articles published in newspapers and magazines in the period 2016-2023), our study identifies main topics and argumentative patterns present in the Polish discourse on energy transformation. It accounts for the discourse development over time as well as its differentiation on the basis of political orientation, aiming to identify the main agenda pushers and their evolving narratives.

RN13 | T01_01: Intergenerational relations

Intergenerational Relations go Both Ways: Transmission of Gender Attitudes in Two-generation Families

Ana Rita Medeiros

ISCTE, Portugal

Research on intergenerational relations regards transmission of attitudes mainly as a unidirectional process. Some literature, however, emphasizes the existence of a bidirectional relation whereby the young generations shape their parents' beliefs, attitudes, and behaviour, helping them adjust to social change. Taking on a social constructionist view on gender and emphasizing the role of personal agency, the research aimed to analyse the attitudes, beliefs and behaviours of parents and their children and how they changed throughout the life course as a result of their intimate relations, of life transitions and the experience of new roles, as well as of changing social norms relating to gender. To assess these changes in attitudes and behaviours over time 20 biographical semi-structured interviews were conducted with each member of five families composed by a heterosexual couple and two common children. The interviews, fully transcribed, were subjected to a thematic content analysis strategy using MAXQDA software with categories corresponding to the analysis dimensions: time; life domains; agency versus structure; gender attitudes; and the direction of intergenerational relations. Evidence of the bidirectionality of the relations between the two generations translated into changes in both the parent's and the children's beliefs, attitudes, and behaviours regarding gender roles over time was found. Although the younger generation was more prone to gender equality, the older generations' attitudes and behaviours became more progressist overtime. Despite generational differences, women of both generations were found to be not only the most permeable to change overtime, but also those who led it.

Financial Transfers from Parents to Adult Children in the Context of the Invisibility of Public Policy

Paweł Kubicki[1], Marta Olcoń-Kubicka[2], Anna Ruzik-Sierdzińska[1]

1Warsaw School of Economics, Poland; 2Institute of Philosophy and Sociology of the Polish Academy of Sciences, Poland

One of the key moments in the lives of many families is children becoming independent and the process of establishing a new household. Typically, this process is supported by various types of transfers from older generations to younger ones. Supporting newly established households and, more broadly, young adults, is also important from the point of view of public policy. In our paper, we analyze to what extent both parties: the older generation making transfers and the younger generation who are the recipients, notice and acknowledge the role of public policy in the entire process, also understood as the omission of certain actions and solutions. Based on data from the 8th wave of SHARE and in-depth interviews conducted in 2019-2021 with 24 families (people aged 21-40 and their parents) in Poland, we argue that for most households, public policy seems transparent, and it rarely appears in considerations about supporting the younger generation. However, in practice, both the scale and goals of transfers are directly related to policy deficits, starting from housing policy, through educational and social policy and services related to the care of small children. Therefore, state policy, although in the minds of the interlocutors usually does not directly influence the willingness to provide financial transfers, is important in terms of their scale and direction. It may also reflect the perception of the role of the state and public institutions in the everyday life of households.

Intergenerational Patterns In Family Business Practices: Evidence From Cross-national Research

Melanie Sara Palermo, Isabella Crespi, Marta Scocco

University of Macerata, Italy

Family business is denoted by the emotional values of the family and the economic aspects of the working environment. As affirmed in the literature, these different values influence the orientation of individuals towards one element or the other, as well as the intergenerational patterns, that may be characterized by consent, conflict and inconvenience, thus determining everyday practices and the continuity of the company over time.

In light of this, the study aims at analysing the intergenerational patterns in family business practices considering economic and emotional values.

In this comparative research led in Spain and Italy, the qualitative methodology has been adopted: family members of 7 family businesses responding to specific criteria (micro/

small dimensions; male/ female leader) have participated in semi-structured interviews.

The data show that the companies are equally oriented toward the family and the company's values, if on one side this model is desirable as it allows to achieve the success of both the systems, on the other it may lead to an overlap of them, which may cause negative consequences on family business practices (difficulties in disconnecting from work and carrying out pleasure activities with family members, …). Furthermore, the generational patterns are attributable to the area of consent in Spain and to decreasing inconvenience in Italy. Finally, the research underlines how generational legitimation may be the key for avoiding conflicts.

In conclusion, the sociological approach adopted contributes to a better understanding of family business patterns and practices, which are mainly studied under an economic/ managerial perspective.

The Whispering Game of Parenting over Three Generations. Understanding Change, Relationality and Temporality in Intergenerational Relations between Youth and their Parents.

Kristin Beate Vasbø, Kristinn Hegna

University of Oslo, Norway

Based on a three-generation study of parental relations in Norwegian youth, Vasbø & Hegna (2023) found the youth generations of the 1950s, 1980s and the 2010s to differ in the way they talked about their parents with warmth and respect vs distance, disinterest and lack of trust. Here, a focus on generalisations within each generation revealed how the middle generation stood out from both the older and younger generations.

In this study we want to explore youths' reflexive experiences of being parented in the context of three-generation biological chains from the same dataset. The data includes 69 qualitative interviews with Norwegian youths, parents and grandparents from 24 biological families from different parts of Norway. These biographical interviews cover a breadth of topics related to growing up, family relations and transition to adulthood, giving a detailed account of intergenerational relational practices in families (Mason 2004). Our preliminary findings show how the youngest generation often use their own parents as a template for how they see themselves as parents in the future. The older generations however, often juxtaposed and contrasted their experiences as youth with their chosen form of parenting – aiming to do things differently than their parents did. Using our chains of interviews, we can see how, like in a whispering game, their intensions were not received by the younger. By applying theoretic lenses of personal life (Smart 2007, 2009) and relational practices we focus on intergenerational relationship as a multidimensional, temporal and non-linear process to deepen previous findings.

Vasbø, K. B., & Hegna, K. (2023). Feeling close, disclosing feelings–family practices and practices of intimacy in youth-parent relations across three generations in Norway. JYS, 1-19.

RN13 | T01_02: Social reproduction within families

Unequal Family Contexts for Children and Adolescents in Spain

Carlos Ruiz-Ramos, Andrés Felipe Castro Torres

Centre for Demographic Studies, Spain

The environment in which children and adolescents develop plays a crucial role in shaping their future outcomes across various social, educational, economic, psychological, and health domains. Current research on the connection between inequality and family context often relies on predefined statistical categories, like household income, parents' educational attainment, ethnicity, or occupation. However, inequalities are not experienced as isolated

categories but at the intersection of multiple social identities, including gender, place of origin, employment status, and living conditions. We propose a quantitative approach to intersectional theory to understand better how interconnected forms of inequality impact the family, migration, and labor contexts of children and adolescents. We aim to reconstruct the contexts in which children from different social classes are raised by utilizing retrospective information from the 2018 Spanish Fertility Survey, which details parents' family and labor trajectories. This approach allows us to identify which social groups are more likely to experience positively rewarded or socially penalized trajectories. Our findings suggest that socially disadvantaged groups face higher exposure to unstable family trajectories and that it is the interaction between various deprivation categories that contributes to more turbulent childhood and adolescence experiences instead of isolated categories. Our research unveils how migration and labor trajectories influence the (in)stability of children's family situations.

"Parenting And New Paths To Education"

Abigail Rute Varandas Ligeiro, Lídia Patrícia Tomé

Universidade de Évora – CIDEHUS, Portugal

Demography and parenting are two different concepts that interconnect from different perspectives; the populational stricture is an aspect that is influenced by reproductive patterns and well as parenting – that happens when the parents are responsible for a child and their paper is crucial for the cognitive, social and emotional level of their children; their attitude and behaviors towards their kids regarding care and education contributes for their development on different levels: physical, phycological and social.

As this two concepts interconnect, in this paper we explore and structure information about these topics as well as the importance of the parents (or caregivers) as the principal agents for the socialization of their kids.

Different types of parenting are based on the application of activities and practices intertwined to relations of power and hierarchy that are combined to the emotional support and autonomy that the parents give to their children, that being their believes and values that they consider important and relevant to transmit trough educative practices. Parenting is considered a complex task as well as a hard and difficult responsibility to any human being; is a concept and phenomenon that is gaining major significance in a way that is possible to prepare kids to have an independent life.

Now, more than ever, parents have more information that they could ever know about "how to educate" their kids so, in this paper we present the "new" perspectives that the parents have on education, as well as the importance of the family context and other major influential surrounding that shape children character as they grow.

Family Feelings: Tensions around Wealth Reproduction in Superrich Families

Franziska Wiest

Max Planck Institute for the Study of Societies, Germany

Contesting the paradigm of separate spheres in modern social theory, several works have shown how intimate relations are coproduced and sustained through economic and financial transactions (Bessière and Gollac 2023; Hochschild 2003; Illouz 2007; Wimbauer 2003; Zelizer 2005). This paper delves into the dynamics of wealth transmission, emotions, and conflicts within super-rich families as central actors involved in the reproduction of social inequalities (Carney and Nason 2016; Kuusela 2018; Santos 2021). Through the tightly knit connection between family and capital, these families persisted as units of economic production throughout different phases of capitalism, adapting their modes of economic, social, and legal reproduction. Simultaneously, the cultural ideal of the family as a place for love, emotionality and care has tremendously affected how these families structure and manage wealth reproduction. The reproduction of family AND wealth, therefore, poses specific tensions within superrich families and is subject to transformation over generations.

Drawing on in-depth interviews with members of super-rich German families (at least 100 Mio. Euros net wealth) along with personal, legal, and archival data, I investigate how conflicts in superrich families shape family and wealth reproduction intergenerationally. Conflicts are particularly in-sightful to understand the functions of emotions in the strategies and practices of wealth trans-mission. By reconstructing the family wealth trajectories, I discuss questions of belonging and boundary-making, representation and deviance, control and power, destruction and reconcilia-tion. Family conflicts, widely perceived as a significant threat to wealth reproduction, prompt a network of consultants and lawyers to serve as "hidden helpers" (Derix 2016), aiding these families in institutionalizing conflict prevention mechanisms. They construct frameworks for mediating emotions

445

by navigating the interplay between the intersection of family and capital. The paper, therefore, unravels the emotions and actors shaping processes of wealth reproduction within families, demonstrating how the management of family feelings serves as an integral part of wealth reproduction. How the entanglements of family and economy, emotionality and rationality, constitute class-specific emotional forms of relatedness, will be the main contribution of this paper.

Family Roles and Women's Work Preferences in Spain: An Intergenerational Study

Violeta Aragón Martínez

Universidad Nacional de Educación a Distancia, Spain

This research aims to explore the roles of both early socialization, observed through the roles held by mothers within women's childhood households, and the socioeconomic context surrounding their family sphere, in shaping and expressing certain work preferences in adulthood, specifically pre – and post-motherhood stages. This study examines the potential intergenerational influence of maternal roles on women's career preferences.

The initial query of this study is whether a direct relationship exists between mothers' roles observed during childhood and their daughters' work preferences before and after the motherhood stage. The objective is to examine whether maternal roles have an impact on their daughters' work preferences in adulthood, and if this influence changes due to motherhood. Additionally, I aim to explore changes in primary socialization's determining power on current preferences, as well as the possibility that these also change due to family life context. The study also considers the potential impact of educational attainment and number of children as mediating factors in the relationship between mothers' roles and their daughters' work preferences.

By using two subsamples of the Fertility Survey (INE, 2018), one of childless women aged 25-29 and the other of mothers 30-49, it has been attempted to identify possible differences in the impact of maternal roles at different stages of life. The approach entails a thorough assessment of both present and retrospective data, employing structural equation models to untangle the intricate connections between the observation of maternal roles during childhood and current work orientations.

The results of this research seek to contribute both to the understanding of the complex mechanisms at work in women's labour market choices and to the numerous academic debates on this issue.

RN13 | T01_03: Single mothering

Adapting to Lone Parenthood Over Time: A Qualitative Approach to Life Domain Interdependencies and Spillover Effects

Benjamin Moles Kalt, Laura Bernardi

Université de Lausanne, Switzerland

Although lone parenthood is increasingly common in Western societies, it often remains an unexpected, unintended, and critical life course transition for parents and children. A key feature of lone parenthood is its non-normative character and the vulnerability it entails. Family researchers have mainly studied lone parenthood as a static condition at a specific moment in time, focusing on its association with disadvantages in terms of employment, poverty or health outcomes. From a dynamic perspective, however, the transition to lone parenthood triggers new needs and challenges over time, demanding a redefinition of expectations and simultaneous adaptations across life domains. Examining how lone parents carry out these adaptations is thus key to understanding how vulnerability processes take shape over time. Decisions and events occurring in one life domain influence other domains. The limited resources and experiences accumulated over the life course are likely to play a fundamental role in how these adjustments are made. Framed by a life course approach and drawing on the 11-year-long Swiss qualitative panel, "Multiple pathways to lone parenthood" (2012-2022), this study examines the spillover effects between life domains such as employment, health, childcare, housing, partnership or leisure that takes shape in the transition to lone parenthood and subsequent life transitions. We pay particular attention to the temporality of adjustments and the nature of spillover effects in order to identify at which point in the lone parents' trajectories and in which domains critical strains are generated. The findings of this study will provide an empirical basis for designing policy interventions aimed at supporting individuals and families through this transition.

446

Single Mothers' Expectations About Repartnering: Family Project Versus Mother's Affair

Ornella Larenza[1], Laura Bernardi[2]

1University of applied sciences and arts of Southern Switzerland; 2University of Lausanne

Mothers' repartnering is usually understood looking at the demographic and socioeconomic determinants predicting new couples' formation, while subjective expectations about repartnering remain undertheorized. Merging evidence from the literature on predictors with Anderson's

and Green's (2011) theoretical framework on individuals' orientations in repartnering, this article explores variations in expectations around repartnering in a group of 35 single mothers (SM) in the French-speaking part of Switzerland. Using the first two waves of a qualitative panel held in 2012/2013 and 2015, 11 types of expectations are identified through thematic analysis and clustered along a continuum from family-oriented to adult-oriented repartnering. In family-oriented expectations mothers incorporate the expected impacts that new partners could have on their children, while in adult-oriented expectations partners' relationship with the children is not an issue and does not factor in mothers' decisions about repartnering. An intermediate cluster of expectations includes cases in which repartnering in neither a pure SM's family project nor uniquely a SM's affair and efforts are made for the SM's family to accommodate the new partner. Potential predictors of expectations are identified, by contrasting single mothers' biographies in each expectation category along the continuum. Having no prior experiences with couple parenting or having bad experiences with it before single parenthood due to domestic violence is common to mothers in some family-oriented types of expectations, while mothers looking for an intimate relationship (adult-oriented expectation) report higher SES and older age. Custody arrangements, child-rearing preferences, fertility intentions and SMs' social network can also affect their expectations.

Experiences of Solo Mothering, Work and Care in England: Navigating the First Three Years

Victoria Pratt

UCL, United Kingdom

Solo mothers are one of the new family configurations to emerge in Europe as access to assisted reproductive technologies has increased. Although this pathway to motherhood has been seen as a minority elite practice, it is a growing and increasingly diverse phenomenon in England. However, English parental leave and work-care policies remain premised on a traditional, two-parent family model. Current efforts to address related gender imbalances in work and care focus on increasing paternal engagement, which is less meaningful for mothers without a partner. The impact of this context on the possibilities for solo mothering has not yet been explored in the literature. This qualitative study therefore seeks to establish how solo mothers experience work-family reconciliation, with potential implications for all single parent families.

Data collection is ongoing, using semi-structured, online interviews. Participants were recruited through a snowball sampling strategy on Facebook and via the national Donor Conception Network charity. The sample reflects a range of income levels, with several mothers claiming the 'Universal Credit' benefit to support their families. Data is being analysed using Braun and Clarke's (2021) reflexive thematic technique, taking a feminist intersectional approach to better understand inter-group variation. Preliminary findings suggest that, as a new and contested family form, solo mothers may feel distinct tensions in navigating work-care

reconciliation: participants felt that their decision to parent alone limited their freedom to challenge policy inequalities. However, by using parenting culture studies as a framework, the women's accounts may also be interpreted to show how they resist and reframe contemporary parenting norms, for example by constructing non-familial networks of support.

Navigating "Good" (Lone) Motherhood: Lone Mothers' Accounts Through a Social Class Lens

Francielli Dalprá

Institute of Social Sciences, University of Lisbon, Portugal

Despite evolving family structures, societal expectations of "good" motherhood are often shaped by the nuclear family norm and middle-class ideals. Lone mothers, commonly perceived as a homogeneous group and "transgressors" of the nuclear family ideal, actually share a social category. The women who inhabit this category occupy different positions in the social space, influencing their practices and narratives about good (lone) motherhood. Although lone motherhood is a subject of substantial research, less is known about the relationship between social class and lone mothers' experiences.

Hence, we aim to analyse lone mothers' constructions on the meaning of being a "good" mother, exploring the influence of social class on their perspectives. To inform our analyses, we apply an expanded Bourdieusian approach, incorporating Will Atkinson's advancements on Bourdieu's theory and insights from motherhood studies. We combine key concepts such as capitals (economic, cultural, social), trajectory, habitus, and fields, along with Alfred Schutz's concepts of lifeworld and stock of knowledge. Emphasizing their gendered dimensions, our framework elucidates the complex interplay between material and symbolic conditions and individual experiences and agency in shaping lone mothers' practices and narratives.

This study, based in Greater Lisbon, Portugal, interviewed 21 women representing various social classes and living across different locations. For data production, we conducted semi-structured interviews using a biographical approach, supplemented by field notes.

Aligned with our theoretical background, our preliminary results suggest that mothers in dominant positions often associate good motherhood with promoting children's autonomy, while those in dominated positions stress the importance of teaching limits, often linked to controlled consumption.

This research contributes with valuable insights to the limited literature on lone motherhood and social class, offering nuanced perspectives on how women navigate and articulate social norms. It expands our understanding of the definitions of "good" lone motherhood and sheds light on the underlying inequalities that shape both their narratives and practices.

RN13 | T02_01: Parental leave: theoretical and terminological approaches

Formal Rights vs Real Opportunities: Father's Experiences of (Non)Take-up of Parental Leaves in Poland

Anna Kurowska[1], Katarzyna Suwada[2], Kamil Matuszczyk[1]

1University of Warsaw, Poland; 2Nicolaus Copernicus University, Poland

Poland has extended fathers' parental leave rights considerably in the last decade. In 2013, 26 weeks of well-paid shareable parental leave were introduced. In 2023, an additional nine weeks of a non-transferable entitlement to paid parental leave for fathers were added to meet the EU Work-Life Balance Directive requirements. Nevertheless, both in 2013 and in the 2023 reform, some peculiar elements in the Polish parental leave system have been added that promote maternal leave use during the entire first year after the child's birth. The system is embedded in a rather traditional culture, casting mothers as the proper carers and fathers as family breadwinners. All this may seriously hinder fathers' capabilities to use parental leave entitlements.

This paper will present the results of 30 individual, semi-structured interviews with Polish fathers conducted between December 2023 and February 2024 in Poland. Employing these interviews, we aimed to explore Polish fathers' considerations, beliefs and experiences regarding using their formal rights to parental leave. In our study, we will pay particular attention to the role of the newly implemented, non-transferable paid leave for fathers. The aim is to shed light on diverse institutional, cultural and economic barriers fathers in Poland face to take advantage of their formal entitlements. We will also explore conditions in which fathers overcome these barriers and successfully take advantage of their rights.

Parental Leave in Spain 2024: Changes in terminology, regulation, and use

Gerardo Meil, Pedro Romero-Balsas, Jesús Rogero-García

Universidad Autónoma de Madrid, Spain

Spain reformed the regulation on parental leave in 2019, making paternity and maternity leave equal in terms of duration, remuneration, and access conditions, and non-transferable, as part of the gender equality promotion policy. This recent regulation has also change the name of these leave making them gender neutral removing the words "paternity" and "maternity" from its title. This communication aims to discuss the impact of this reform on the practices of using these leaves. The data used in this paper consists of 523,392 records from the Social Security database and QUIDAN Survey 1, 2021, concerning parents of children under 7 years old. The methodology combines descriptive and explanatory analysis. The results show an increase in the usage rates of the leave up to 94% of eligible parents. The percentage of parents who do not use the entire mandatory period is less than 0.1%, but while the proportion of mothers who do not use the full duration of the leave stands at 2%, among fathers, it is 15 times higher. Around half of the fathers split the use of the leave (compared to about 5% of mothers), but only a minority do so once the mother's leave period has ended, severely limiting the transformative potential of the gender relations reform.

What do Parents do on Parental Leave and How Does it Shape Gendered Family Practices?

Katherine Twamley

UCL, United Kingdom

In this paper, I discuss how the kind of parental leave taken by first-time parents shapes their understandings and practices of motherhood and fatherhood. I draw on qualitative longitudinal diary and interview data from 21 mixed-sex couples in England, collected during their parental leave. Half of the sample were sharing leave and the other half were not. In the analysis, I draw on the sociology of everyday life to examine both what participants did and the meanings they attributed to these practices. The accounts demonstrate how women on maternity leave alone become primary carer, through a process of learned expertise and moralised pressures around mothering. Their partners' lives did not radically change and they did not develop similar care expertise. For sharing couples, normative practices could be counteracted by fathers' extended leave alone, but couples taking leave at the same time tended to reinforce gendered normative parenting. I detail why these differences occur, showing how fathers on leave alone were able to foster a sense of themselves as primary carers, even if just for a short time. The study fills a lacuna in research on parental leave practices and the ways in which they contribute to gendered parenting outcomes.

448

The 2021 Baby Boom in Iceland: Exploring the Role of a Parental Leave Reform and the Pandemic

Asdis Arnalds[1], Ari Jónsson[2], Sunna Símonardóttir[3]

1University of Iceland; 2University of Iceland; 3University of Iceland

In 2021, during the height of the COVID-19 pandemic, the total fertility rate in Iceland rose unexpectedly from 1.72 to 1.82. The increased number of births followed an important reform in the Icelandic paid parental leave scheme, which included an expansion of the leave from 10 to 12 months. Analysis of data from Statistics Iceland and focus group interviews with parents who had a child in 2021 were used to explore if and how the parental leave reform and the societal changes related to the pandemic shaped parents' decision to have a child in 2021. As the rise in fertility was short-lived, the results indicate that the baby boom of 2021 can hardly be explained by the parental leave reform. Rather, at least for educated women, who already had children and were in a good financial state, it seems that the pandemic created a favorable atmosphere for having a child. Parents' narratives from the focus group interviews suggest that the pandemic might have been a good time to start or add to the family because of the increased time spent at home and the limited involvement in social activities outside the home.

RN13 | T02_02: Money and family relations

Money Allocations In Families With Biological And Foster Children

Susanne Boethius

Lund University, Sweden

Bringing a child into a foster home affects many family members, both in the biological family and in the foster family. When a child is placed in foster care, there are many challenging emotions, new approaches and practical adjustments that affects not only the child, but also the biological parents, the foster parents, and the foster family's biological children. One of these issues has to do with economy and money. In this paper economic handlings in relation to biological and foster children, are explored from dual perspectives. 20 social service personnel and 35 foster parents in Sweden were interviewed. The paper explores how social service personnel take the foster family's biological children into account when explaining economical decisions, and how foster parents accounts for differences in money allocations between foster children and biological children.

449

The Role of Money in Commitment Processes: A Sociological Study within Family Home Care

Malin Anne Elsa Åkerström

Lund university, Sweden

The American sociologist Viviana Zelizer has dedicated herself to studying the meaning of money. She observes that money is perceived as corrupting what she refers to as 'the intimate sphere': families, relatives, or friendships. The combination of children and monetary compensation is particularly sensitive. An illustration of the potentially polluting influence of money is found in relation to foster homes; monetary motives for taking care of children are looked upon as morally questionable. This is also evident in Social Services' investigations of those who express interest: 'You're not doing it for the money, are you?', and candidate foster parents must present themselves as motivated by interested in care of children and youngsters. Even researchers have attempted to understand the motives of family homes and categorize them, as if it is possible to nails these down in a once and for all definition.

A more sociological perspective involves examining how motives for commitment change over time. Howard Becker's concept of 'side-bets' serves as inspiration in the analysis of foster parents' stories, illustrating how financial compensation can become more prominent over time. What was initially uninteresting, the compensation in the form of fees and overhead allowances, can evolve into something one depends on for their livelihood. This presentation

utilizes interview material with foster families to demonstrate how such a step-by-step development can occur.

Money, Love and (co) Parenting. Post-separation Parents' Negotiations Around Economic and Care Responsibilities

Manuela Naldini, Arianna Santero

University of Turin, Italy

Several studies have focused on the economic consequences of divorce. The interest has been primarily on the potential negative impact that it has on the children. However, after the separation parents may be the actors of divorce conflicts on the meanings of money and decision-making processes around the residential time and child support payment may become complex. Money may become the battleground within which to understand the potential trade-off between financial provision and caring, between 'her' and 'his' idea of 'proper' child time, care and maintenance. Vivian Zelizer (1994) offers an alternative model to look at money to the most used utilitarian framework, which focused on the social and symbolic meanings of money. According to this author, people are constantly "earmarking money", creating new currencies and giving money new meanings. The paper explores how mothers and fathers in Italy construct meanings around child maintenance. It focuses on how parents create, maintain or negotiate legitimacy and sense of deservingness of the child-support payment. This study draws on qualitative interviews with 40 Italian separated mothers and fathers all with a shared child custody arrangement. The results show a wide array of trade-off between financial provision and care, which co-exist with contested, dynamic and interrelated dimensions of negotiation about parental responsibilities which are associated with three main post-separation co-parenting styles: parallel, cooperative and competitive styles. In the Italian context, characterized by the persistence of gender asymmetries, differences clearly emerged between fathers and mothers in giving meanings to 'money for the child'.

Nonresident Fathers' Financial Contributions to Their Children and Fathers' Economic Wellbeing

Anneli Miettinen[1], Miia Saarikallio-Torp[2]

1Social Insurance Institution, Finland; 2Social Insurance Institution, Finland

Parental union dissolutions are common, and many children live a considerable part of their lives in a single-parent family (McLanahan 2004). Besides emotional distress, separation can have striking financial consequences; parents have to make arrangements regarding housing and children's residential arrangements as well as how to share child-related costs. While research on single-mother poverty is abundant (Nieuwenhuis & Maldonado 2018; Nepomnyaschy et al. 2022), economic consequences of the separation to the nonresident parents (mostly fathers) have received only limited attention. Nonresident parents are generally expected to contribute to their children's expenses, usually by paying child support (CS) but they may also make informal contributions which may be considerable in relation to their income. (Dis)satisfaction with arrangements likely increase non-payment but could also affect father-child relationship and increase conflict between parents. Shared residence of children can further complicate financial arrangements between parents.

In this study, we use data from a survey collected among separated parents in Finland in 2019 (fathers n=873) to investigate economic consequences of parental union dissolution from nonresident fathers' perspective. We examine factors related to fathers' financial contributions (both formal and informal) and how these affect their own economic wellbeing. First results show that about half of fathers paid formal CS and about 40% had other arrangements, type of arrangement varying by fathers' socioeconomic status, family situation, and child's residential arrangement. 60% with formal CS reported having economic difficulties, net of SES or other factors, and those with formal CS were less satisfied with the arrangement than others. The results highlight the need to pay attention to fathers' economic situation post-separation.

RN13 | T02_03: Divorce and separation

"Based on the Above, the Fault for the Breakdown of the Marriage Lies Entirely with the Defendant" On the Negotiation of Care Practices of Families in Fault-based Divorces

Viktoria Parisot

Department of Sociology, University of Vienna

Austrian family law is outstanding in Europe because fault-based divorce is still legally valid. These divorces include legal negotiations about the partners fault at the disruption of the marriage. Thus, court files contain first hand insights into the judicial and social normative framework of marriage. A crucial part of the marital obligations is the provision of care work. In the light of the unequal distribution of care work, fault divorces are an important arena in which the negotiation of care practices becomes visible and relevant to legal institutions.

From a praxeological perspective the negotiations about violating or fulfilling marital obligations can be framed as 'troubling families'. In my contribution, I ask how and which care practices are submitted, negotiated and legitimized as marital obligation or marital misconduct. I conducted a qualitative case study by using Situational Analysis and Trans-sequential Analysis on 25 fault divorce files from the period between 2003-2019 of different-gender couples in Austria.

Results show that care practices are negotiated as willingly provided or intentionally denied. The negotiated care practices have different addressees: They are not only addressed 1) to relevant others – such as spouses, children or relatives – but also 2) to the self, which is negotiated as an important addressee for care; e.g. by maintaining one's own health or attractiveness. Furthermore, there are 3) calls to care for more abstract communities, such as the village. Overall, omitted care practices that are interpreted as marital misconduct are often at odds with stereotypical dominant family models.

"Analyzing Post-divorce Dynamics: Work, Work-life Balance and the Family"

Diego Becerril Ruíz, José Jiménez-Cabello, Jesús Jurado Serrano

Department of Sociology, University of Granada, Spain

The number of divorces in Spain is at an average European level, which is relatively significant, especially if we compare it with the Mediterranean region, where it clearly leads these processes. Specifically, in Andalusia, the territory in which this research is located, there were 16,267 divorces (ENSD, INE).

This region accounts for practically one fifth of the total number of divorces in Spain (ENSD, INE), giving an idea of the scale and challenge involved in family break-up processes. Moreover, for more than a decade the percentage of divorces involving minor children has been around 53%-56% (some 9,700 minors). Among this set of challenges and challenges that post-divorce implies, the manifest and latent challenges of two dimensions stand out: work activity and work-life balance. Thus, the general objective of this research is to analyse how both dimensions are affected during this stage and what challenges they present according to cohabitation regimes (i.e. shared and sole custody).

The methodology used is qualitative, through semi-structured interviews with both partners.

The results provide a better understanding of the dynamics and challenges that divorce poses for both parents and minor offspring in terms of the role of work and work-life balance. Thus, in reference to the first dimension, the importance of aspects such as working hours, job prospects and income of each ex-spouse in the post-divorce period is observed. In addition, the relevance of aspects related to work-life balance, such as the distribution of time, the support of family networks or friends, or what happens in the family home, is also highlighted.

Divorcing during the COVID-19 Pandemic: Social and Gender Inequalities in Family Court Practices

451

Gaëlle Aeby[1], Sabrina Roduit[2], Cécile Crevoisier[1], Marina Sucari[2]

1HES-SO Valais-Wallis, Switzerland; 2University of Geneva, Switzerland

The impact of the COVID-19 pandemic has been especially drastic in family law with countless individuals caught up in the middle of a critical family crisis. In particular separating and divorcing individuals with minor children who were already in a situation of instability experienced increased vulnerability both materially and emotionally with detrimental yet differentiated consequences for mothers, fathers and children.

To avoid delays and to deal with emergency cases, the Swiss Federal Council opened the use of remote hearings in civil proceedings as other countries did. While digital justice holds several advantages (e.g. speed, cost reduction), it also raises several practical and ethical concerns (e.g. technology, confidentiality).

This interdisciplinary project entitled "The practice of family law during the Covid-19 pandemic: digital justice and gender inequalities" aims at investigating the practices and challenges associated with the shift to digital justice during the COVID-19 pandemic in family proceedings in Switzerland with a focus on separations and divorces. It consists in a legal text study of the changes in Switzerland with an international comparison (1) coupled with a qualitative study

with a case study of court practices (2) and a quantitative study addressed to family judges and lawyers (3).

This presentation focuses on the case study of court practices to understand the gender and social inequalities related to access to justice during a major crisis. We focus on two issues especially at risk of leading to exacerbated gendered inequalities and conflicts due to a reinforcement of traditional gender roles: child visitation and physical custody arrangements, and maintenance payments.

Class Divides in the Effects of Parental Separation on Time Use

Tomás Cano

UNED, Spain

How parents and children spend their time is crucial for their well-being and children's future outcomes. However, no study has analyzed how parental separation affects parents' and children's time use. This study uses longitudinal time-use data and panel regressions to disentangle how parental separation changes the amount and type of shared parent-child time. Importantly, this study also shows how such effect varies across social classes. Preliminary results show that separation leads parents to spend less total time with children, as well as it leads children to spend more time unstructured activities, and less time in educational activities. These effects are stronger for lower-class families, hence, reproducing the intergenerational transmission of (dis)advantage. Results are robuts across several sensitivity checks.

RN13 | T02_04: Queer families

Reproductive Imaginations in Queer Family-Making: Tensions Between Outcome and Process

Robert Pralat

University of Cambridge, United Kingdom

For people who are unlikely to have children through sex, for parenthood to materialise, it first needs to be imagined. Lesbians and gay men, among others, must consider not only whether they want to become parents, but also—if they do desire to create a family with children—how they would do it. Sociologists of families and intimate lives have attended to how people imagine their intimate futures, focusing on notional children as imagined entities: an outcome of becoming a parent. This paper examines instead the process of becoming a parent, and the various pathways to parenthood that lesbians and gay men may consider as they contemplate if having children is what they want. Drawing on interviews conducted in England and Wales, I find that the complexity of achieving parenthood is as capable of capturing people's imagination as is the appeal of having children. I reflect on what can be gained in our understanding of families and intimate lives when the analytical focus moves from the lived experience to the imagination. I discuss how the unease of envisaging the reproductive process, and the way it contrasts with the comfort of imagining a future family as an outcome, may be more pronounced in some national contexts than others. Finally, I ponder how the ambivalence of queer parenthood resembles the mixed feelings about having children experienced in society at large, as concerns about costs of living, fears of the climate crisis and anxieties around reproductive uncertainties increasingly call parenting intention into question.

Tension, Mis-Trust and Transformation: Revindications of same-sex families rights in Greece

Athina Mara

Roehampton University, United Kingdom

Accepting diversity by accepting LGBTI+ human and civil rights is the main objective of Member States of the European Union. Family life, marriage, and gender equality are protected under the European Convention on Human Rights. Despite EU treaties towards equality, pink families often experience sociolegal discrimination in many EU societies (Hicks, 2006). Amidst the heated public national discussions in Greece of a new law that will introduce same-sex civil marriage for the first time and in regard to same-sex kinship rights in particular, this article conducts a critical policy discourse analysis of law 4356; in 2015, it was the legal framework that first extended civil partnership

452

legislation to include same-sex couples in the country. This law is examined as the first and currently only law that recognises queer family life in specific terms, as it does not provide any legal recognition of parenthood.

The discourse analysis of the paper examines through a sociological lens, how notions of sexuality, family, gender, biological sex, and nation shape laws and public policy pronouncements and contribute to the lack of a corresponding policy framework. By examining the relevant plenary session transcripts of Greek Parliament meetings and public political discourse about the law, I aim to pursue an indepth sociological analysis of what shapes the sociolegal attitudes around same-sex kinship.

The results of the research show that heterosexism, hegemonic ideologies, and norms about gender and sexuality, as well as dominant views about religion, nation, and kinship, are determining (even the queer) family typology within contemporary heteropatriarchal social rules. These factors contribute to the legal and social exclusion of non-heteronormative families, who "deviate" from hegemonic heteropatriarchal societal rules.

(Re)producing 'Mixed-Race Privilege' in Queer Family-Making? Gay Fathers' Navigation of Racial Hierarchy in Selecting Egg Providers

Jung Chen

The University of Cambridge, United Kingdom

In 2019, Taiwan became the first country in Asia to legalise same-sex marriage. However, the reproductive rights of LGBTQ+ people remain on hold. Assisted reproductive technologies (ARTs) are only accessible to non-heterosexual individuals locally. The only feasible way for gay men to become parents to biologically related children is through transnational ARTs and surrogacy. This paper explores gay men's perceptions and strategies for selecting egg providers of particular racial/ethnic backgrounds. The data came from 53 in-depth interviews and 8-month participant observations. While Western gay fathers frequently attempted 'racial matching' by choosing egg providers depending on the race of the non-biogenetic father, Taiwanese gay fathers constructed a different route. There were approximately 150 gay father families in Taiwan, and most of their children are mixed-race, which makes them exceptionally 'visible,' since around 95 percent of Taiwan's population is of Han ethnicity. Westerners account for only 0.1% of the total population. Han-Caucasian-mixed-race children often receive extra attention for their appearances. This research engages with queer theory and the sociology of reproduction approaches to investigate the reinforcement and transitions in the re-making of the racial hierarchy in queer reproduction. Partly, (intended) gay fathers inventively created alternative kinship-making paths. Partly, they sought social recognition by aligning with existing social and cultural norms. Based on the empirical data, the findings reveal a dynamic bargaining process of egg selection situated within the global reproductive industry, in which race/ethnicity gradually becomes commodified and is embedded in the

global-local sociocultural context, where white privilege travels from Western countries to locals such as Taiwan: Han-white-mixed-race people are privileged for their linguistic, cultural, and symbolic capitals. This article argues that the emerging 'mixed-race privilege' became predominant among gay-father families in the context of navigating the dominant racial hierarchy in society, their double-minoritised positions as LGBTQ+ families with mixed-race children. By engaging with racial hierarchy in Taiwan and global reproductive practices, I also propose a transnational perspective to examine the (re)production of new racialised norms among gay-father families.

Identity and Family Dynamics: Coming Out Experiences of Queer South Asians to Their Parents.

Pooja Marwaha

The University of Edinburgh, United Kingdom

This paper will focus on the intricate dynamics of personal and intimate relationships of queer South Asians as they navigate the process of coming out to their families. Through my research, I look at personal and intimate relationships through the lens of an intersectional feminist framework alongside queer theory. My analysis includes aspects of otherness and kinship, interwoven with themes of honour and care.

This paper will focus on the following question from my thesis – How do relationships with parents evolve in response to queer South Asians questioning or exploring their sexual orientation and coming out to their parents?

Drawing on qualitative data collected via semi-structured interviews conducted online and in person from a subset of 21 participants from the broader thesis, this paper will focus on the accounts provided by 12 participants, 4 male, 6 female, and 2 who identify as non-binary or gender fluid. The analysis will draw out gendered differences in the reaction that South Asian parents have towards their adult child coming out to them.

The findings showcase a range of outcomes, from growing trust and closeness between parents and their children, to a lot of tension and estrangement. By shedding light on these diverse narratives, this paper contributes to a deeper understanding of the complexities involved in the intersection of queer identities and familial relationships within the South Asian context.

RN13 | T03_01: Mental health and family arrangements

A longitudinal View On Maternal Well-Being In Different Post-Separation Care Arrangements In Germany

Christine Entleitner-Phleps, Claudia Recksiedler, Diana Schacht

German Youth Institute, Germany

Changing legal and cultural conditions across Europe led to a higher share of separated parents practicing shared physical care (SPC), in part because this allows for shared parental roles and children's access to both parents. Prior studies documented that, in countries with little institutional support for SPC such as Germany, fewer and a highly selective group practiced it. Regarding maternal well-being, the benefits of SPC are less clear, and prior findings were mixed. Cross-sectional results from Germany revealed that SPC mothers were less strained compared to mothers practicing sole care. However, findings only offer a single snapshot in time and the ripple effects of changes in practiced care arrangements cannot be taken into account. We aim to examine the effects of practiced post-separation care arrangements on maternal well-being longitudinally and consider the impact of changes in practiced care arrangements as well. Data stem from the large-scale, representative Panel Study "Growing up in Germany," which was collected biennially between 2019 and 2023. Our analyses are based on 456 separated mothers of minors and we differentiate between SPC and sole care with frequent, rare, or no contact with the non-resident father. Preliminary descriptive results showed a high degree of stability in all post-separation care arrangements. Fixed-effect regression models revealed that stability in care arrangements was positively associated with maternal well-being, which is in line with the crisis model viewing any family-related transition as a temporary resource drain. Findings will be discussed in light of the institutional context for post-separation families in Germany.

Spillover Effects of Life Events on Mental Health Among Separated Parents

Philipp Dierker[1,2,3]

1Max Planck Institute for Demographic Research, Germany; 2University of Helsinki; 3Max Planck – University of Helsinki Center for Social Inequalities in Population Health

Recent advances in family sociology have increasingly considered dyadic designs and the concept of linked lives within families, emphasizing the long-term interconnectedness of family members' lives. Most research has focused on the assumption that these connections persist over long periods of time, often spanning entire lifetimes. However, there is a gap in understanding the dynamics of these connections in the context of separated parents. This study challenges the common view of post-separation lives as independent by examining the enduring dyadic relationship between parents after separation through the lens of linked lives through their children.

Based on comprehensive Finnish total population register data, our research follows parents of underage children through their separation process. Using panel fixed effects models, we investigate the extent to which significant life events of one parent influence the mental health of their ex-partner, specifically focusing on the probability of anti-depressant prescription as an indicator. The range of life events analyzed includes partnership transitions such as re-partnering or separation, major family events such as deaths of family members, unemployment, and residential moves.

Our research aims to provide a preliminary understanding of the interrelated mental health dynamics among separated parents. This approach challenges existing notions of post-separation independence in parental dyads and aims to make a significant contribution to family sociology and demography. By elucidating the extent to which life events may continue to affect the mental health of ex-partners after separation, this study enables deeper exploration of the enduring links in separated families in future research.

Effects of Parental Unemployment on Children's Mental Health – A Comparison between the United Kingdom and Switzerland

Claire Semaani[1], Christoph Henking[2], Dawid Gondek[3], Laura Bernardi[1]

1University of Lausanne, Switzerland; 2Oxford University, United Kingdom; 3FORS – Swiss Centre of Expertise in the Social Sciences, Switzerland

Family interrelationships in mental health have been understudied and a better understanding of their mechanisms is needed for prevention. This study investigates how parental

454

unemployment affects children's mental health. More precisely, it analyzes how the transition to unemployment of a parent can impact not only their partner, but also their children's mental health through its negative influence on their own mental health. We argue that the loss of financial resources and decrease in mental health engendered by a parent's unemployment can spillover to the whole family. We expect this effect to be emphasized by unemployment duration while attenuated by a higher level of wealth and more generous unemployment benefits.

Family composition plays a role when it comes to interrelationships in mental health, as well as in the context of unemployment. We therefore expect single parent families, especially with lone mothers, to undergo more hardships and have the strongest impact on mental health. By focusing on teenagers, this study enables to measure the impact of a parent's unemployment on a very crucial moment in life – the entry into the professional world or into higher education, where good mental health is key.

Our research uses longitudinal data from the Swiss Household Panel and the United Kingdom Household Longitudinal Study, which possess similar measures of unemployment and mental health. By comparing the situation of these two countries, it will bring new insights to evaluate and adapt family welfare policies which makes it of interest not only to researchers but also policymakers.

The Impact Of Family Complexity On Social-emotional Difficulties In Early Childhood

Judit Monostori, Laura Szabó, Krisztina Kopcsó

Hungarian Demographic Research Institute, Hungary

Numerous studies have examined how family structure influences children's social-emotional outcomes. However, many studies use a simplistic approach to family structure that doesn't take into account the composition of siblings and doesn't consider the complexity of the family from the child's perspective. In our research we tried to capture the complexity of family arrangements. We hypothesised that there would be significant differences in children's outcomes across these categories of family complexity. However, it was also assumed that selection effects and other indicators of parenting could explain the associations. The dependent variable of our study is social-emotional difficulties (measured by the SDQ) at the age of 3. Our data come from wave 1-3 of the longitudinal birth cohort study Cohort'18 Growing Up in Hungary (N=5862). Bivariate analysis shows that a higher proportion of children living in non-intact families have social-emotional difficulties. In addition, among children who lived with both biological parents, the risk of social-emotional difficulties was significantly higher among those who lived with a half/step-sibling than among those who lived in a full-biological family. However, we also found a strong selection effect, which means that the parents with lower SES are over-represented among the non-intact families. This partly explains the association between family complexity and child outcomes. In addition,

the quality of the relationship between the parents, the subjective well-being of the mothers and the income situation of the family also affect children's social-emotional difficulties. After controlling for all these factors, only children in single-parent families are at higher risk.

455

RN13 | T03_02: Division of domestic tasks

Discrepancies Over Domestic Standards: Effects on the Division of Domestic Labor and Coexistence

Jesús Jurado Serrano, Diego Becerril Ruiz, José Jiménez-Cabello

University of Granada, Spain

The division of domestic labor has experienced, in recent decades, an unprecedented transformation towards increasingly egalitarian gender relations. However, despite the changes, women are still primarily responsible for carrying out household chores. To explain the persistence of this gap, gender relations theory has argued that achieving a co-responsible division of domestic labor is conditioned by sociocultural aspects related to the construction and dissemination of egalitarian identities. In this sense, gender identities are one of the key factors to analyze the division of domestic labor. Based on this, this article aims to analyze the way in which heterosexual couples manage their disagreements over domestic standards and the effects that this management has on the distribution of domestic work and coexistence.

The work was done using qualitative methodology using semi-structured interviews with both parts of the couple individually. 22 couples were interviewed, with a total of 44 interviews carried out.

The main results show that couples who have a co-responsible perspective on domestic work learn to manage their disagreements with domestic work and to live with their differences. On the other hand, in couples without a co-responsible perspective, when discrepancies occurred over domestic standards, women ended up doing household chores. In this group of couples, it has also been observed how men use these differences in standards as a way to justify the inequality in the distribution of domestic work.

The main contribution of this work is to point out the influence that gender relations continue to exert on the sexual division of domestic work and the importance that, therefore, has the dissemination of a co-responsible perspective of the couple's relationship.

Dynamics in the Division of Housework in Couples. Longitudinal Dyadic Analyses of Subjective Perceptions

Detlev Lück

Federal Institute for Population Research (BiB), Germany

There is much research on couples' division of housework, on the factors influencing this divi-sion as well as on the effects of this division on relationship satisfaction and other outcomes. We know, for example, that particularly highly educated couples start our with rather equal dis-tributions that tend to shift into "traditional" patterns after the birth of a first child, reducing the relationship satisfaction for the female partner. We also know that the subjective percep-tion and evaluation of the division differs, with each partner perceiving the own share higher than the partner perceives it and with the less engaged partner being more satisfied than the more engaged partner. Nevertheless, a new panel study provides reason to revisit this topic: „FReDA" has been launched in 2021 and will release the data of its second panel wave in May 2024. This data will allow combining many research approaches within one analy-ses, potentially adding puzzle pieces to the picture. FReDA is surveying a large sample of ca. 20,000 adults in Germa-ny, representative for the resident population aged 18 to 49. It comes with partner inter-views, so that about 7,000 couples can be analysed from a dyadic perspective. Both partners independently report their perception of the dis-tribution of several housework chores, their satisfaction with this division, their consideration of the division to be fair and their general relationship satisfaction. This way, not only the distribution as such but also deviating percep-tions can be analysed longitudinally, e.g. depending on birth events between the waves.

The Effect Of Moving Together And Getting Children On The Gendered Division Of Housework: An Event Study Of German Couples

456

Maximilian Schiele

Institute für Arbeitsmarkt und Berufsforschung, Germany

This study contributes to the examination of the gendered division of housework, utilizing an event study framework and drawing on data from the German Socio-Economic Panel spanning two decades. While previous research offers insights into the factors influencing housework distribution within heterosexual relationships, it often overlooks individuals' housework habits before cohabitation or parenthood. By analyzing changes in housework before and after moving in together and having children, this study aims to discern whether the unequal distribution is driven by shared living arrangements or gendered habits predating cohabitation or parenthood.

The findings indicate that women already perform significantly more housework than men before sharing a household. Upon cohabitation, there is no significant change in housework hours for either gender, suggesting that existing gendered housework habits persist. However, when couples become parents, women absorb the additional housework, exacerbating gender inequality in the hours of house work. This implies that the unequal distribution of housework in childless heterosexual households stems from pre-existing gendered housework habits. Yet, when children enter the household, there is a renogotiation of existing housework arrangments among couples, resulting in heightened gener inequality of hours of house work.

These insights highlight the importance of considering pre-cohabitation and pre-parenthood housework habits in understanding the dynamics of housework distribution within heterosexual relationships.

RN13 | T03_03: New methods for family research

Combining Solicited Diaries and In-depth Interviews in Multigenerational Care Research

Ana Jagodic

University of Ljubljana, Faculty of Social Sciences, Slovenia

This paper focuses on combining solicited diaries with in-depth interviews in family and care research. It examines the advantages and disadvantages of combining both qualitative research methods using the example of a study on multigenerational care work in the sandwich generation. The empirical study was conducted between February 2022 and May 2022 in Slovenia on a sample of 30 individuals, providing care work to a younger (children, grandchildren) and older generation (parents, parents of the partner). Data collection with the solicited diary method involved the regular recording of activities by participants in selected time periods and provided the researcher with an insight into everyday routines. It enabled the researcher to map key family and care roles and relationships and raised participants' awareness of taken-for-granted caring practices. Combining solicited diaries with in-depth interviews provided a deeper insight into the understanding and interpretation of the participants' world, as well as additional insight into the experiences and contexts that emerged in the collected diary entries. The combination of both methods contributed to a greater quality and depth of the data collected. The two methods proved to be complementary, with each method compensating for the shortcomings of the other. The combination of both methods also proved to be resource intensive, both in the data collection phase and in the data analysis phase. The main ethical issues relate to the intimate nature of caring practices and family relationships and the potential therapeutic nature of both research methods.

457

Dis/Trust in Families and towards Researchers: Empirical Insights and Methodological Reflections in Researching Wealthy Families

Marliese Weissmann[1], Benjamin Neumann[2], Maya Halatcheva-Trapp[2]

1Sociological Research Institute Göttingen (SOFI), Germany; 2TU Dortmund University, Germany

Wealthy families are a research area that has received relatively little attention in both empirical and methodological studies, especially when viewed through the lenses of family sociology and social inequality, underscoring the necessity for further investigation. In our current project, we address this by examining intergenerational aspects in

the production, preservation, and transmission of wealth in affluent families in Germany. In doing so, we analyse wealth as a dynamic social field which – according to our thesis – is produced and reproduced not only in economic relations but also in family relations. Theoretically, we rely on Pierre Bourdieu and the doing-family approach. Methodically, we draw on family interviews and single interviews with members of different generations. Additionally, we utilize interviews with gatekeeping experts for exploration and sampling.

In our presentation, we aim to introduce empirical insights and methodological reflections of researching affluent families, delving into the importance of trust within wealthy families and towards researchers. We find that trust plays a significant role in familial relationships, but family members may vary in their level of engagement, and mistrust may exist regarding the communication of financial matters. Establishing trust with researchers poses a challenge, especially when entering the field as a new researcher without a background in the milieu or personal connections to wealthy individuals. Conducting family interviews presents an additional challenge, closely tied to the issue of trust within families and towards researchers.

The presentation is based on data from the ongoing collaborative project between TU Dortmund University and the Sociological Research Institute Göttingen (SOFI). The Volkswagen Foundation funds the project, and it is scheduled to run from April 2023 to March 2026.

Enhancing Potentials for Research on Post-Separation Families using the "Growing up in Germany" (AID:A) Panel Study

Diana D. Schacht, Claudia Recksiedler, Simone Schüller, Christina Boll, Christine Entleitner-Phleps, Alexandra Langmeyer-Tornier, Sabine Walper, Claudia Zerle-Elsäßer

German Youth Institute (DJI), Germany

Rates of separation and divorce are persistently high in Western societies, and post-separation families are becoming increasingly diverse and complex, for instance, due to more active fatherhood and increased and faster repartnering. However, post-separation family forms that emerge after parental separation are insufficiently captured in official statistics in Germany because the definition of families is household-based (i.e., no record of non-resident children or parent) and step-parenthood is not accounted for. Many large-scale panel surveys also offer limited information to accurately classify post-separation family forms and care arrangements. This limitation stems as well from their household-based design lacking often crucial information on the nonresident parent, the parent-child, as well as the interparental relationships.

Yet, these indicators have shown to be essential in understanding subsequent child and family-level outcomes, including emotional and economic well-being. The panel study "Growing Up in Germany" (German title: "Aufwachsen

in Deutschland: Alltagswelten; AID:A") launched in 2019 aims to provide comprehensive information on living arrangements, care routines, and relational conflicts of a wide range of family forms. This includes single-parent households, stepfamilies, and information on non-resident biological parents. This paper introduces the survey module specifically targeting post-separation families with a non-resident parent, the so-called "Module on Post-Separation Families", and compares it with other German surveys. Finally, we discuss the research potentials that arise in connection with the broader spectrum of information collected in the survey, encompassing economic deprivation, subjective well-being, health, parental education and employment, as well as attitudes and values.

Research, Teaching and Learning Sociology of the Families and Intimate Lives in Times of AI: Tension, Trust, and Transformation

Rosalina Pisco Costa

Universidade de Évora & CICS.NOVA.UÉvora, Portugal

This paper addresses (new) challenges in research, teaching, and learning the sociology of the families and intimate lives in times of artificial intelligence (AI). Drawing on the author's own experience as a teacher for over 20 years, it explores the current tensions and challenges faced when exploring related topics with chatbots, notably ChatGPT. Generative AI broadly refers to algorithms that can create new content including text, images, audio, video, and code in response to a prompt. There are many services powered by large language models (LLMs), perhaps the best known of which is ChatGPT, on the cover of Time Magazine on Feb. 27, 2023. While ChatGPT has shown the world recent developments in computer science, it was also one of the most visible faces of growing AI concerns. In early 2023, the media began reporting cases of schools blocking ChatGPT, as students were asking the chatbot just released in late 2022 to write papers and answer take-home tests. Moreover, recent research points to Gen Z driving early adoption of generative AI, incorporating it as an important dimension in their (online) lives. Methodologically, the paper follows a conversation between a family sociologist and ChatGPT with a focus on family configurations and intimate interactions. In the end, informed by contemporary sociological theorization, the reflection aims to contribute to a better understanding of the role and challenges of using chatbots as reliable tools to present and critically discuss family and intimate life in research, teaching and learning contexts.

RN13 | T03_04: Family dynamics during the pandemic

"Having Fun As A Teen... That Was Basically Over". Mothers Supporting Adolescents During The Covid-19 Pandemic In Austria

Daniela Schimek, Ulrike Zartler, Vera Dafert

University of Vienna, Austria

Growing up is challenging for adolescents, their parents, and families, even in times without crises. The COVID-19 pandemic has accelerated these challenges, and had multifold detrimental impacts on adolescents. Research has shown that parents, especially mothers, were particularly concerned about the negative impacts on adolescents' educational and psychosocial development, and struggled to support them. This contribution provides a comprehensive sociological analysis of mothers' experiences and challenges in accompanying adolescents through the COVID-19 pandemic.

Theoretically based on family stress theory, and emotional work theory, we empirically rely on an Austrian qualitative longitudinal study with a subsample of 25 mothers of 31 adolescents aged 14 to 19. Respondents were surveyed repeatedly (12 waves of data collection) over a 2-year period (March 2020 to June 2022), using problem-centered telephone interviews and diary entries. Data was analyzed using the Grounded Theory coding scheme.

Results show that mothers' challenges in accompanying adolescents evolved around four main strands: social, physical, psychological, and educational well-being of their children. These multifaceted challenges required mothers to actively engage in emotional and care work, while at the same time struggling with the impact of the COVID-19 pandemic on themselves, and on other family members. We identified four distinct types of maternal support: Coaches, Buddies, Cheerleaders, and Bystanders. To conclude, we argue that the consequences of the pandemic on this sensitive period in the lives of adolescents and their parents have been underestimated, and that the resulting complexities in families deserve more attention in family and youth research.

The Burden of Children During the Pandemic According to Family Configurations

Jacques-Antoine Gauthier, Jean-Marie Le Goff

Lausanne University, Switzerland

Living arrangements depend on many (positional) factors such as gender, age, level of education, occupational status and sector of activity. Living or not with a partner and/or with children also influence individual and collective constraints and opportunities, in particular regarding doing gender practices and the division of labor. Additionally, unexpected, non-normative events, in particular when they have a large collective impact, as it is the case with the COVID-19 pandemic, may trigger significant systemic reorganizations reflecting to some extent the influence of specific social policies. This paper proposes to capture the intersectionality of the structuring factors at play using a configurational perspective inspired by the work of Norbert Elias and by life course studies. This approach aims at emphasizing the relations existing between individuals rather than focusing solely on individual attributes. This allows observing how these (gendered) interdependencies are affected by the measures of confinement and by the conditions in which they were experienced. Using two waves of the Swiss Household Panel (2019 and the special COVID-19 wave realized in May and June 2020), we first built a typology of household configuration in 2019, that is then used to assess the impact of the lockdown on the household members relationships and outcome such as well-being, changes in occupation and income situation, time use, home schooling, family and social life. Eventually, our typology of family configurations is used to analyze the content of qualitative interviews focusing on family life, conducted with both partners of 22 families during the lockdown. We use textual data analysis to compare the narratives of the mothers and the fathers regarding how they perceive the burden of children, especially in relation to home schooling.

Challenges and Experiences in Conducting Qualitative Longitudinal Research in Families during the COVID-19 Pandemic

Vera Dafert, Ulrike Zartler

University of Vienna, Austria

In times of extraordinary crisis, society and research face unpredictable challenges. Families were particularly affected by the impact of the COVID-19 pandemic and the accompanying restrictions on their lives. Qualitative longitudinal studies offer a good opportunity to capture change in families over time in uncertain and dynamic situations, such as a global pandemic. However, conducting qualitative longitudinal research during the pandemic was challenging, as standard research practices and methods reached their limits.

459

Based on the Austrian qualitative longitudinal study "Corona and Family Lives", we discuss practical and ethical questions for family researchers in the context of the COVID-19 pandemic. In this study, 98 parents with kindergarten – or school-aged children were surveyed repeatedly over a period of more than two years (March 2020 – June 2022) using problem-centered telephone interviews (65 respondents) and diary entries (33 respondents). Data collection started in the first week of the first Austrian lockdown (March 16, 2020) with weekly to bi-weekly contacts, and continued at larger intervals until June 2022. Thus, the sample is extraordinarily large, as it comprises 12 waves of data collection (in total, 727 interviews and 372 diary entries).

In this presentation, we outline the key challenges, and show how we addressed them. In particular, we focus on the following issues: (a) limited methodological and technical options for recruitment and data collection due to lockdowns and other restrictions; (b) the ethical responsibility of researchers and the motivation of respondents to participate; (c) management of a large qualitative sample and panel maintenance over time.

Lessons From Affective Relational Injustices Of Family Carer/Care Home Resident Relationships Disrupted by COVID19

Lynn Jamieson

University of Edinburgh, United Kingdom

If access to affective caring relationships is a basic human right, it was a social injustice to deny 'family carers' and residents of care homes meaningful opportunities to continue their long-established intimate relationships during the COVID-19 pandemic. My starting point is the consequences of this denial from the perspective of the 'family carers' (whether daughters, sons, partners or others who had long-term affective caring relationships) who were prevented from visiting an older person in a care home. It is based on joint research conducted in Scotland led by George Palattiyil during the first 'lock down'. Variation in the family carers' understandings and experiences of 'family care' versus 'institutional care' grounds an analysis that adds further nuance to theorising of the associated injustices and inequalities. Analysis of family carers' accounts also extends recent sociological commentary on the routine devaluing of affective-caring relationships and increasing risks of neglect and harm when care is delivered in an increasingly marketized and corporatized or neoliberal welfare regimes. Tracing the trajectories of harm in the accounts of women and men as family carers helps us to understand inequalities by showing how harmful outcomes fall unevenly in ways which are patterned by the varied quality of institutional care tolerated across the marketized care home sector as well as by the varied burdens of guilt, responsibility and incapacity in the delivery of 'family care', across genders and generations. While a sense of injustice was pervasive, consideration is also given to why those with the most reason to fear neglectful 'institutional care' were no more likely to call for radical change in care home sector but rather to defend those giving 'institutional care'.

RN13 | T04_01: Separation and family configurations

Children's Family Relationships Across Households in Postseparation Family Configurations

Ella Sihvonen[1], Anna-Maija Castrén[2]

1The Social Insurance Institution of Finland; 2University of Eastern Finland

In Finland, a significant proportion of children experience parental separation, with one-third of married and half of cohabiting parents' children affected before age 15. About 93 percent of the separated parents agree to have joint custody versus solo custody, with nearly 30 percent of children living in joint physical custody arrangements. According to qualitative studies conducted among children of separated parents, children's understanding of their family often consists of members from the two homes especially in dual-residence arrangements. Indeed, after parental separation, children's family relationships are located in two different households. These relationships often include parents and siblings as well as parents' new spouses and stepsiblings. However, on a more general level we know little about the quality and quantity of children's relationships and the composition of the two households. In this descriptive study, we analyse children's family members in the divorced/separated parents' households and we ask, what kinds of family configurations exist after parental separation from the point of view of the children. We analyse children's family relationships by using the data from a large and unique survey based on a representative sample of divorced/separated parents (n=3449 of which 2320 are mothers and 1104 fathers), whose children were 1-17 years old at the time of the data collection. The aim is to study i diversity of children's family configurations based on parents' information about the residents of their homes. Furthermore, information about duration of the child's residential arrangement enables us to consider the evolution of the residential arrangements over time. We also analyse children's family configurations in relation to other questions in the survey including analysis about the differences between maternal and paternal homes.

Coparenting in Stepfamilies: Interrelational Factors in Parenting Experiences

Bieke Maes, Jan Van Bavel

KU Leuven, Belgium

A growing number of people live in a stepfamily, in which both parents and stepparents play an important role in children's lives. Research has pointed out the importance of positive coparenting between parental figures for children's and caregivers' well-being. But what constitutes positive

coparenting relationships in stepfamilies, and how are they related to parenting perceptions and parenting stress? This study uses Flemish-Belgian survey data from 2021 (n = 3323) to understand how interrelational factors contribute to parenting experiences. By including measures both specifically on the coparenting relationships, for example instrumental and emotional support in parenting related matters, and more general measures of relationship quality and feelings towards the partner and ex-partner, we aim to add to the existing literature and further disentangle parenting dynamics and experiences within stepfamilies. Preliminary findings highlight that although parenting related instrumental and emotional social support are linked to measures of parenting experiences, mainly relationship quality with the partner and ex-partner are related to parenting perceptions and stress. This highlights the importance of understanding coparenting relationships with current and previous partners and their role in parenting experiences beyond the purely parenting related topics.

Stepfamilies and the Law

Susana Atalaia

Instituto de Ciências Sociais da Universidade de Lisboa, Portugal, Portugal

The commitment between conjugal and parental life in stepfamily households, the absence of legal recognition of the stepparent role, and the importance attached to biology in the definition of modern parenting are aspects that prevent stepfamily members, namely stepparents and stepchildren, from maintaining lifelong relationships. Drawing on census data (2001, 2011, and 2021), legal literature, and interviews with experts (law professors, lawyers, and public prosecutors), this paper aims to discuss Portuguese stepfamily members' rights and responsibilities during and after the marital relationship. At a time characterized by increasing family diversity (single-parent families, stepfamilies, same-sex couples, etc.), how does Portuguese family law regulate and protect the social ties established between stepfamily members? What happens to the stepparent-stepchild relationship in the event of death or conjugal break-up? Is the legal recognition of the stepparent-stepchild relationship a child's right, a stepparent's right or both? Results show that, between 2001 and 2021, the number of individuals living in a stepfamily household increased, including the number of children. Despite the growing statistical evidence of stepfamilies in Portugal, the national legal system seems to prevent rather than promote the recognition of stepfamily members' roles and relationships. In 2008, the implicit recognition of stepparents as third parties was a step forward, although the law has a very wide scope and is not limited to stepparents.

Exploring Children's Experiences in Dissolving Stepfamilies: A Qualitative Analysis

Kimberly Jacobs, Sarah Van de Velde, Dimitri Mortelmans

University Antwerp, Belgium

This research delves into the experiences of children navigating the dissolution of stepfamilies, focusing on the impact on their mental health. Existing studies predominantly adopt a retrospective approach or explore long-term consequences, overlooking the critical period of the divorce itself. Acknowledging this gap, the study leverages data from Awel, an organization providing support to children and youth (6-25 years) facing various life challenges.

In 2022 alone, Awel facilitated 22,165 interactions, with a notable portion related to familial struggles. This study employs a qualitative in-depth analysis of chats and emails between Awel and children specifically addressing the challenges arising from the dissolution of stepfamilies.

Initial examination of the data reveals two distinct perspectives on the dissolution of stepfamilies. The first perspective centers on relief, where children express hope for the dissolution. For some, the separation brings relief, because they still harbor dreams of their parents reuniting, facilitated by the absence of parental relationships. These children seek support during their time within the stepfamily.

The second perspective revolves around stress, capturing the experiences of children who successfully integrated into the stepfamily. For these individuals, the disruption of their established family life becomes a significant stressor. Awel receives most contacts from this group during the dissolution phase, as they seek guidance on navigating the aftermath of a second dissolution.

This study aims to provide a nuanced understanding of children's perspectives during the dissolution of stepfamilies, shedding light on both the relieving and stressful aspects of this complex phenomenon.

RN13 | T04_02: Family planning, fertility, and reproductive technologies I

Fertility Intentions In The Age Of Intensive Parenting

Sunna Simonardottir

University of Iceland, Iceland

Fertility rates have significantly declined in advanced, industrialized nations. The factors contributing to these demographic changes are diverse, but it is evident that women are opting for fewer children, delaying childbirth, and a growing number of individuals are choosing not to have children. To explore this trend, examining individuals' and couples' fertility choices within the context of evolving parenting culture proves insightful. Over the past few decades, there has been an increased focus on the notion of intensive parenting and its implications for parenting. This paper explores how intensive parenting ideology influences behaviours and expectations in the parental role. Drawing on two datasets; interviews with 22 Icelandic voluntarily childfree individuals and focus group interviews with 14 young Icelandic women regarding their attitudes toward having children, the study explores how intensive parenting ideologies influence fertility decisions. The Icelandic context provides an interesting research backdrop, given its emphasis on gender equality and policies that support both parents' participation in work and childcare. The findings indicate that women perceive the role of motherhood as mentally and emotionally draining and requiring significant personal sacrifices. Being "ready" to have children is therefore not only linked to notions of self-fulfilment but also to an assessment of when they can expect to possess the skills of a "good" mother. This suggests that narratives of intensive mothering have influenced decisions on fertility in Iceland. While the interviewees acknowledge the unequal responsibilities and duties of mothers and fathers, they do not question the individualism and intensity that characterize modern parenthood.

Beyond the Western Model: Gender (In)equality and Fertility Intentions in Türkiye

Ceylan Engin[1], Ladin Toplu[1], Eralp K. Karduz[2]

1Bogazici University, Turkiye; 2University of Massachusetts – Amherst

We examine the relationship between gender equality and fertility intentions of both men and women in Türkiye, a topic that has been largely uninvestigated. Using the novel data from the 2022 Turkish Covid-19 Values Study (TCVS), we specifically explore how the fertility intention of married couples is influenced by their division of labor in the household and gender ideology.

Focusing on a sample of married men and women (N=388) who are in their childbearing ages (18-49), our findings deviate from the gender revolution theory that explains the positive relationship between gender equality and fertility intention in many European societies. In the Turkish context, the unequal distribution of housework and childcare responsibilities do not emerge as significant predictors of fertility intention, not only for men but also for women. In fact, for men, it is greater patriarchal values which are associated with a greater desire to have more children, while for women it is the economic determinants. As women's economic difficulty increases, their desire to have more children in the future decreases.

The division of labor in Turkish households is still uneven, with women performing the overwhelming majority of domestic and childbearing tasks. The fact that gender equality and fertility intention are not positively related as it is in the Western context indicates, in Hochschild's terms, a continuation of a "stalled revolution," suggesting that "the second half" of the gender revolution has yet to occur in Turkish society.

Socio-Structural Inequalities In Fertility And The Family In Germany

Kerstin Ruckdeschel[1], Anne-Kristin Kuhnt[2], Sabine Diabaté[1]

1Federal Institute for Population Research (BiB), Germany; 2University of Rostock

462

Unequal opportunities to start or expand a family or to live a certain family model ultimately represent risk factors for social cohesion and should be analysed in more detail. Therefore we want to provide an overview of the socio-structural differentiation of fertility and family in Germany, with a particular focus on social inequalities. Our descriptive analyses are based on data from the Family Demographic Panel FReDA (2021) and the Microcensus (2022). With the help of these data sets, we analyse how the diversity of fertility and family living arrangements has developed historically and how it is currently subdivided in terms of social structure in Germany. In doing so, we orientate ourselves on the classic social structure indicators such as age, gender, education, migration status and regional reference (place of residence, size of place of residence). Among the classic socio-structural indicators, special attention is paid to the fertility of men, as they are still neglected in the context of fertility and family. We also look at the phenomenon of fertility postponement in the context of socio-structural dimensions. Furthermore, we extend the range of analyses to include normative factors such as values and attitudes (ideal age for starting a family) and thus go beyond the classic socio-structural dimensions. Our findings show that the classic socio-structural indicators – as well as the newly added ones – actually have a strong influence on fertility and family life. A socio-political sensibilisation to these differences is necessary.

Fertility During Uncertainty: Changing Economic Conditions Under Covid-19 and Fertility Intentions in Türkiye

Meryem Uyaver, Furkan Kazancı, Ceylan Engin

Boğaziçi University, Turkiye

Declining fertility in Türkiye began long before the Covid-19 pandemic. In fact, since the 1960s birth rates in Türkiye have been falling steadily, and in 2017 below replacement fertility was observed for the very first time. However, the total fertility rate dropped to 1760 per 1000 women in 2020, even a sharper reduction than previous years, potentially fueled by the economic risks and uncertainties triggered by Covid-19 pandemic. In our paper, we examine how such worsening economic conditions of individuals influence their fertility decisions, a phenomenon largely uninvestigated in the Turkish context.

Using the novel data from the 2022 Turkish Covid-19 Values Study (TCVS), our sample focuses on married couples (N=259) who are in their childbearing ages (18-49). Our results partially deviate from the risk aversion theory that explains the negative relationship between economic uncertainty and fertility decisions in times of crisis observed in most European societies. In Türkiye, we do not find worsening economic conditions to be a significant predictor of fertility intention for couples who have only one child. Instead, a decline in economic conditions lower fertility intention of couples only when they already reached their ideal family size of two children.

Our findings suggest the prominence of the "ideal family size" of two children in the Turkish context despite the socio-economic risks engendered by Covid-19.

Therefore, our findings persuade us to re-examine the risk aversion theory and investigate beyond economic factors to explain the predictors of fertility intention in times of crisis.

RN13 | T04_03: Informal family care

Social Capital As Resource Of Care Practice In Italy: A Qualitative Study On Caregiving In Italy

Maria Letizia Bosoni, Sara Nanetti, Donatella Bramanti, Giulia Assirelli, Elisabetta Carrà, Lucia Boccacin

Catholic University of Milan, Italy

The term caregiver indicates "someone who provides care", referring to individuals providing care to someone with a low degree of autonomy, who they are connected to by emotional and/or family bonds. During the Covid-19 pandemic, all formal and informal support and care networks were put to the test and had to draw on their reserves of social capital. Within these networks, the level of the caregiver's engagement has dramatically increased, producing negative effects on several aspects of their lives.

In this context, the study aims to understand the trust and cooperative networks available to caregivers, identifying the main mechanisms underlying the caregiver's role and tasks in Italy. This qualitative research is part of a larger national and mixed method project conducted in Italy in 2023-2024. In this presentation we discuss the results from dyadic interviews (with Dyads of caregivers and their reference individuals), involving 10 young caregivers (aged 20-30, at high risk for social exclusion) and 20 senior caregivers (aged 55-65, the so-called sandwich generation). The analysis unit, characterized by the dyad, allows to involve participants in the construction of a joint response, detect interactions and understand how people co-construct and interpret the social reality in which they live and share.

Results reveal a wide spectrum of life experiences in terms of social capital and an ambivalent perception of the caring tasks. Some experiences are marked by difficulty, anxiety and stress, while others are grounded in solidarity and gratitude among family members. Resilience emerged as a crucial protective factor.

"We are in agreement, we don't beat each other" – Tension, Trust and Transformation in Caring Family Figurations

Katharina Pontius

University of Tübingen, Germany

In Germany, as in many European countries, the overwhelming majority of care and support for older persons is still provided by private care arrangements. In most cases, these support arrangements are organized and carried out by people who are considered part of the family.

463

With Norbert Elias, these family arrangements can be understood as (changing) figurations that are characterized by interdependence and mutual dependence as well as affective ties and fluctuating balances of power. In my dissertation project and as a part of the German research training group "Doing Transitions", I investigate the familial care constellations regarding transitions that become visible when new care needs arise. Against this background, I conduct family interviews in which the older and younger family members participate together. The family interviews are supplemented by individual interviews and network maps to also record non-family actors.

The empirical material shows that family figurations are complex structures of biographically evolved relationships, symbolic boundaries, and intertwined vulnerabilities. Thereby, on the one hand, care arrangements can be maintained through trust in the family construct, in family relationships, and in one's position in the family. On the other hand, the so-called 'implicit knowledge' about family and (care) work is changing between the generations as the societal framework alters. This leads to conflicts and tensions, which are suppressed through humor and outsourcing the conflict from the family – or are resolved through learning and negotiation processes.

In a first interpretation, these processes may be interpreted as 'family transitions'.

Differences In Informal Care To Parents Between Women And Men: The Role Of Individual Gender Role Attitudes And Institutional Context

Eszter Zolyomi[1], Cassandra Simmons[2], Ricardo Rodrigues[3]

1European Centre for Social Welfare Policy and Research, Austria; 2European Centre for Social Welfare Policy and Research, Austria; 3Univerisdade de Lisboa, Lisbon School of Economics & Management (SOCIUS – Research Centre in Economic and Organisational Sociology / CSG Research in Social Science and Management)

Introduction: Despite women's increased participation in the labour market and shifting attitudes towards men taking up unpaid work in the domestic sphere, family-based care of older persons remains highly gendered. We investigate how individual gender role attitudes of women and men influence their provision of care to parents and whether this relationship is moderated by the national institutional context, namely public policies and social norms in relation to informal care.

Data and method: We use data from the Generations and Gender Survey and apply multilevel logistic regression including specific country-level variables to analyse the effect of individual values and the overall level of gender equality across different European countries.

Main findings: We find that individual gender egalitarian views correspond with a significant decreased likelihood of providing care for women, and increased probability for men. This association holds when controlling for individual

and family characteristics and after adding the country-level variables. While these conform earlier results on gender egalitarian attitudes contributing to a more equal sharing of domestic labour, our analysis finds limited support for the moderating effect of country contexts on the relationship between gender egalitarian attitudes and the probability of providing care.

Interpretation: Caution should be taken in placing too much hope on changing behaviours through shifts in individual gender role attitudes, however attitudes towards gender roles may still contribute to narrowing the gender gap in informal care by influencing policy change through lagged generational change.

The Impact of Sandwich Care on Employment and Wellbeing in Germany

Christian Deindl[1], Markus King[2]

1TU Dortmund, Germany; 2University of Potsdam, Germany

For the past few decades, the consequences of informal caregiving have become more and more important. One crucial aspect is the provision of care for another adult – usually a parent – while also providing care for a dependent child called "sandwich care". Using data from the 2001-2018 waves from the German Socio Economic Panel (GSOEP), we investigated the association between different modes of care (only childcare, only informal care, sandwich care) and the labour earnings, work-time, self-rated health and life satisfaction of caregivers aged 17-64 using (lagged) fixed-effect models. Our results showed that the provision of sandwich care, as well as an increase in care intensity is associated with a reduction in labour earnings, working hours and satisfaction with life. Additionally, we were able to find that the effects for labour earnings and working hours also persist for at least one wave after the provision of care. Analysing our data stratified by sex revealed that only women show significant decreases in their labour earnings and satisfaction with life if providing sandwich care.

464

RN13 | T04_04: Siblinghood and other personal relations

Theorising Intimacy: Humour, Disability and Siblinghood

Tom Joseph Ryan

University of Sheffield, United Kingdom

Sibling sociology makes clear the unique nature of sibling relationships and the importance they have on how we define our own identities (Davies, 2015). Central concepts to the study of siblings such as love, care, fighting, humour and ambivalence (Davies, 2023) raise interesting and important questions when read from a disability studies perspective (Meltzer and Kramer, 2016). Humour can be seen as a central part of family life (Fiadotava, 2021), being both a source of joy and, at times, a source of frustration. This is particularly the case for siblings, where the backstage nature of sibships creates a space in which boundaries are pushed (Punch, 2008), with sibling's abilities to provoke each other often being down to an intimate understanding of one another. Humour and disability is a potentially controversial topic, with disabled people often being the 'butt' of jokes in society. Alongside this, there are also more radical 'crip' readings of disability humour that argue for an 'insider' disability humour in which these potentially controversial exchanges can take on new more affirmative meanings (Sweden, Ebener and Grist-Gordon, 2012). This paper will use early findings from my thesis to explore how people with learning disabilities and their siblings navigate humour, raising questions around whether the backstage nature of sibling relationships creates a space in which jokes that would not be permissible elsewhere can be enjoyed by siblings. These findings are the result of narrative inquiry, with the addition of the creative methods of timeline mapping and photo elicitation.

On Sisterly Sacrifice: Negotiating (In) Dependence

Katarzyna Dębska

SWPS University, Poland

When the term "sacrifice" is mentioned in the context of family relationships, it is usually associated with motherhood and mothering. In Polish culture, the image of the Mother-Pole, a woman who sacrifices her wishes, her health and even her life for the sake of her children, plays an important role. Although it is both contested in theory, for example in feminist texts, and often rejected in practice, it remains an important point of reference. The experience of sacrifice in family relationships takes place not only in vertical relationships, as in the case of mother and child, but also in a lateral perspective. The motif of sacrifice appears in the narratives of adult sisters who, for various reasons, have been cast in a maternal role in relation to their siblings – mostly younger sisters. In my presentation I will discuss variations of this experience from three perspectives: 1) sisters who have sacrificed for the benefit of their siblings, 2) sisters who are the recipients of this sacrifice, and 3) sisters who remain outside of this relationship, observing the bond between one sister mothering another. The focus of the analysis is on the process of negotiation of identity, power, and (in)dependence within the sisterly relationship across the life span and the consequences of this type of bond for the quality of sisterly relationships for women. The presentation is based on the results of a qualitative study conducted with a group of 65 adult siblings in Poland.

Customary Law concerning the Law on Inheritance in the Culture of the Serbian Community in Kosovo and Metohija – the case of the city of Kosovska Mitrovica

Milica Marjanovic

Faculty of Philosophy in Pristina with temporary headquarters in Kosovska Mitrovica, Serbia

Although numerous social changes took place during socio-historical development that most directly affected family life as a whole, many customs were maintained and developed into socially acceptable rules of behaviour. In light of such considerations, the main research focus of this paper will be centred on the prism of family relations in the probate of male and female heirs, most often siblings. The Law on Inheritance of the Republic of Serbia does not distinguish between male and female heirs, that is, the testator's children who constitute the heirs of the first line of succession; on the other hand, customary law in the tradition of Serbian society dictates that female heirs renounce the inheritance of deceased parents and that the entire property is inherited by the male heir – the brother. The declaration of inheritance of renunciation of the family inheritance is irrevocable. Gender stereotypes are shaped under the strong pressure of social customs and norms, and the main hypothesis of the paper is that tradition and customary law are still stronger than the law, as evidenced by data from the court practice register. The paper will present statistical data from the court on probate proceedings conducted in the territory of the municipality of Kosovska Mitrovica, which explicitly confirms the hypothesis that sisters still give up their part of the inheritance in favour of brothers. At the same time, the reverse situation is much rarer. In addition, a secondary analysis of the content of the papers of researchers who have dealt with this or a similar topic so far will be used.

Forgiving and not Forgiving in Personal Relationships: Forgiveness in Families

Owen Abbott

Cardiff University, United Kingdom

Despite interpersonal forgiveness being an established area of study in psychology and communication studies, sociological research into the role, significance, and practicing of forgiveness in personal relationships is virtually non-existent. This talk will discuss findings from the first qualitative sociological study on forgiveness in personal relationships, drawing on data from 42 in-depth interviews in the UK and from a specially commissioned Mass Observation Project directive. I will firstly discuss why forgiveness should be a significant topic for sociologies of personal life. I will also argue that the perspectives of qualitative sociology facilitate insights into the meaningfulness of forgiveness that the overwhelmingly quantitative approaches of current research into forgiveness from other disciplines cannot provide. Focusing here specifically on forgiveness in family relationships, I will use my data to illustrate how forgiveness is an ordinary and integral feature of enduring close personal relationships. Forgiveness was narrated by participants as not only integral to ensuring that relationships endure and could be repaired, but also as providing key moments through which difficult experiences within familial relationships were made sense of. This data illuminates forgiveness as a relational practice that is deeply entangled in complex circumstances, extended relationships, and personal histories. Instances of forgiveness thus also highlight the entwinement of relationships with our senses of self, providing moments of reflection on responsibilities, how we treat and have been treated by others, what we are willing to accept, and what course our future actions should take.

RN13 | T05_01: Child custody

Joint Physical Custody and Mothers' Life Satisfaction in Belgium, Finland, and Germany

Anja Steinbach[1], Lara Augustijn[2], Elke Claessens[3], Anneli Miettinen[4], Mia Hakovirta[4], Dimitri Mortelmans[3], Quentin H. Riser[5]

1University of Duisburg-Essen, Germany; 2Johannes Gutenberg University Mainz, Germany; 3University of Antwerp, Berlgium; 4University of Turku, Finland; 5University of Wisconsin-Madison, US

Joint physical custody (JPC) is an increasingly common care arrangement in which children live about equally with their parents after separation or divorce. This study examined the association between JPC and mothers' life satisfaction in Belgium, Finland, and Germany. The objective was to determine whether mothers with (asymmetric or symmetric) JPC differed in terms of life satisfaction from mothers with sole physical custody (SPC) and whether there were country-specific differences. Using data from the studies Divorce in Flanders, Survey among Separated Families in Finland, and Family Models in Germany, we estimated OLS regression models for resident mothers in SPC and JPC families with minor children. Results showed significant differences between the countries. Mothers in Belgium did not differ in terms of life satisfaction depending on their child's physical custody arrangement. However, mothers with symmetric JPC had higher life satisfaction than their counterparts with SPC in the Finnish sample, while both asymmetric and symmetric JPC mothers reported higher life satisfaction than SPC mothers in Germany. These differences, however, disappeared after introducing control variables to the regression models. Findings suggest that selection into different physical custody arrangements may explain the positive link between JPC and mothers' life satisfaction; a finding with far-reaching implications.

Parenting In The Context Of Shared Physical Custody: A Typology Of Boundaries Drawn With The Ex-partners' Dwelling

Laura Merla

UCLouvain, Belgium

Shared physical custody is a post-divorce arrangement where children alternatively reside with each of their parents. Based on the testimonies of 21 Belgian teenagers, collected with participatory methodologies, and semi-structured interviews with their parents, this presentation

explores the boundaries that the parents draw between their dwelling and that of their ex-partner, based on their own parental functioning. We first present five parental functioning styles (adapted from Widmer et al, 2004). These styles correspond to different practices and ways of conceiving family relationships within the new household, and in relation with the ex-partner. We then show that each parental functioning corresponds to a specific way of drawing boundaries with the ex-partners' home – thus giving shape to a particular form of island (the fortress island, the cocoon island, the reef island, the open island, and the wild island). The degree of (im)permeability of the boundaries delimiting each parental island depends on three types of spatial-temporal limits, namely boundaries of displacement, which refer to the potential for children to move between their parental residences and see their parents when they are not residing with them; virtual contact boundaries, which refer to whether or not children are encouraged to keep in touch with their parents through communication technologies; and transfer boundaries, which refer to the extent to which children are allowed/expected to take personal belongings to the other parent's residence. Each type is illustrated with quotes from the children's testimonies. Finally, we show that the way in which each parent establishes a particular form of inter-household boundary is influenced by a variety of factors, including material, spatial, familial, and temporal.

Troubling Families and Troubling Parents in Custody Proceedings – "both do not embody the ideal image of an intact family of origin"

Marlies Zuccato-Doutlik

University of Vienna, Austria

Parental separation leads to a family reorganisation. Especially when custody is negotiated in court, 'family troubles' become 'troubling families', applying values and norms to family and parental practices. The headline quote is drawn from a 2001 Austrian custody case, understanding such proceedings as discourse field where various actors compete for definitions of family and parenthood. This contribution deals with the discursive construction of family and gendered parenthood in custody proceedings combining theoretical concepts as Troubling Families and Doing Good Parenthood. The main question is, how familial relations and practices are negotiated and which guiding principles and interpretative patterns are powerful.

Applying a discursive and hermeneutic approach, 30 court files from Austrian custody proceedings from 1961 to 2018 were analysed through GTM, understanding these documents as material manifestation of the social order of knowledge. Findings are that the construction of custody proceedings themselves emerges from parental failure to conform to expectations of providing an 'intact family of origin' with biological, opposite-sex parents. Therefor, mothers and fathers are compelled to legitimize family and parenthood by producing and displaying certain narratives and practices along such demands. Simultaneously parents are

positioned as 'good' or 'bad' through gendered interpretations of these ideas. Displaying new family can be seen as fulfilling the expectation of a 'complete family', while a single father may be interpreted as 'incomplete' family due to an interpretative pattern of the 'womanless household'. This contribution highlights the transformation yet persistence of normative family and gendered parenthood concepts within the discourse of custody proceedings.

Shared Custody and Parental Alienation as key concepts in a "struggle for children" – the Polish case

Malgorzata Sikorska

University of Warsaw, Poland

The primary goal of my presentation is to examine the social actors participating in lobbying for Shared Custody (SC) in Poland, with a particular emphasis on the narratives they present and the narrative techniques they deploy.

Applying the Narrative Policy Framework (NPF) as a theoretical framework and methodological inspiration, I will:

– study WHO (which social actors are actively participating in lobbying efforts for SC, evaluating their connections, motivations, and viewpoints in the debate);

– investigate WHAT is said in these actors' narrations, dissecting the core themes, arguments, and justifications put forth to support their stance on SC;

– investigate HOW the narratives are constructed, aiming to uncover the narrative strategies used by social actors to influence public opinion and policy-making.

Specifically, I use NPF to lead the investigation of key parts of the narratives, such as the portrayal of "Villains", "Victims", and "Heroes", in order to discover recurring patterns and persuasive strategies.

According to my preliminary findings, the Fathers' Movements and the politicians (mostly from the right side, but also from the centre of political arena) are one of the key social actors for the implementation of SC in Poland. In their lobbying, these players have been documented exploiting controversial notions such as Parental Alienation and Parental Alienation Syndrome.

By analyzing the narratives employed by social actors advocating for SC in Poland, this research aims to contribute valuable insights to the ongoing debate over custody arrangements not only in Poland but also in other European and non-European countries. A unique aspect of my presentation will be the exploration of similarities and differences in the arguments used by social actors advocating for SC in different countries.

RN13 | T05_02: Fatherhood

"Who Cares?" Attitudes Towards Parental Roles, Caregiving and Fatherhood in Today's Hungarian Society

Éva Sztáray Kézdy[1], Zsófia Drjenovszky[1], Adrienn Orosz[2]

1Károli Gáspár University of the Reformed Church in Hungary, Hungary; 2Semmelweis University

According to the traditional parental role perception, caring within the family, especially taking care of small children is primarily the role of the mother while the father, as the breadwinner, provides the family with financial stability by working in the labour market separated from the family. In recent decades, however in line with social change a shift is observed from the traditional parental roles towards a more egalitarian concept of family role and a more equal distribution of chores and caring responsibilities. There is also a growing expectation from society for fathers to be more involved in their children's lives, and the inner need of fathers is also increasing to be more actively involved in caring responsibilities.

In our presentation we first summarise the results of recent Hungarian attitude surveys on parenthood and parental role expectation.

We then present the Hungary-relevant results of the European Values Study (EVS) 2017 and those of the International Social Survey Programme (ISSP) Family and Changing Gender Roles 2012 and 2022. We are focusing on the perception and division of childcare responsibilities and parental leave, as well as the values regarding the social perception of fathers' childcare roles.

As we know from previous studies that egalitarian family role conceptions are mainly characteristic in the case of younger families with higher education and living in big cities, in order to explore the attitudes of future parents towards parenting, 8 focus groups were conducted with university students. In our presentation, we also highlight the main findings of our qualitative focus group research about attitudes towards parental roles and caregiving.

Between Distance and Closeness: A Folk Model of Involved Fatherhood from Afar

Danny Kaplan, Liat Sheffer

Bar-Ilan University, Israel

Involved fatherhood is typically associated with face-to-face physical engagement during routine childcare. This study examines whether and how the "therapeutic discourse" serves as a cultural toolkit for upper-middle-class, white-collar, long-distance commuting (LDC) fathers to balance their pursuit of careers abroad and societal expectations of involved fatherhood in the absence of their daily presence at home. Drawing on a qualitative phenomenological analysis of 31 interviews with LDC Israeli fathers, the study delineates a "folk model" of involved fatherhood from afar that makes sense of the father-child relationship by using key therapeutic mechanisms: digital communication with a preference for telephone calls; dialogic conversation characterized by structured routines, authentic content, temporal availability, emotional engagement and quality time; and interpersonal reflection and self-reflection. The folk model reverses the classic paradigm of paternal involvement by substituting face-to-face engagement with remote emotional engagement and physical accessibility with temporal accessibility. The study reveals how a radical rhetoric of therapeutic discourse can be detached from everyday parental care. In a parenting culture that prioritizes intimate relationships over everyday family functions, LDC fathers are able to brand their version of involvement as competent and appropriate, no less than that of fathers who return home every day.

"I feel a lot more on the team, and I can score some points now": Remote-First Work Practices and Paternal Engagement in Childcare and Domestic Tasks

468

Lauren Jennifer Ryan

University of Melbourne, Australia

Fathers' utilisation of flexible work arrangements (FWAs) to manage their work and family responsibilities is often plagued by negative consequences including workplace discrimination and social stigmatisation, resulting in a low uptake of FWAs by fathers for the purposes of care. Existing literature on fathers' experiences with FWAs is largely focused on accommodation strategies, which allow employees to opt-in to certain forms of FWAs offered by their employers. In contrast, remote-first work is a FWA universally applied across the whole organisation and designed to increase employee autonomy, provide location – and time-agnostic work environments, and facilitate the integration of work and family responsibilities. Detailed scholarship on the sociological impacts of this emerging model is currently missing. Using work-family border theory and needs exposure hypothesis, this study provides a critical examination of how fathers employed in remote-first organisations organise their work and family lives, with a particular focus on changes to the gendered division of household labour and care. Using data from in-depth qualitative interviews with 16 fathers working in remote-first organisations across three countries, findings indicate that remote-first work provides fathers with increased opportunity and motivation to engage in caregiving and domestic tasks while maintaining rewarding levels of workforce participation. Fathers report feeling supported to do this care work by their employers and personally value their increased engagement in child – and house-related tasks/activities, with positive implications for self-identity, relationships with

children and partners, and the gendered division of labour and care at home. Findings from this research provide important practical and policy insights into the ongoing development and implementation of the remote-first model and its impacts on fathers' contributions to the division of household labour and care.

Is Paternity Leave Always Linked with Higher Father Engagement? Exploring the Different Ways of Using Paternity Leave and Their Implications for Gender Equality with Mixed Methods

Alix Sponton

Sciences Po Paris, France

This paper relates to "Gender-arrangements and the division of work within couples" and "Work-family balance, work-family conflicts, parental leave".

Research have shown that leave taking lead men to increase their childcare participation. Usually, studies focus on tasks occurring at daytime. Yet, dealing with fragmented sleep represents one of the main challenges faced by caretakers at the beginning of the child life. Women are most often the one taking care of other family members at night (Burgard, 2011), leading Susann Venn and co-authors (2008) to theorize this gendered division of sleep as an additional "shift" for mothers.

This presentation explores the short term and long-term relationship between paternity leave taking and men involvement in childcare at night in France.

This presentations relies on mixed methods. First, I conducted repeated interviews with 32 fathers from various social background, shortly before and two months after childbirth. 21/32 immediately used at least two weeks of paternity leave. Second, I used the French survey Modes de garde (2021), representative of parents of children under 6 (N= 8351) (logistic regressions).

Qualitative results show that, after the birth, fathers were more likely to get up at night while they were on paternity (even more so if the baby was bottle-fed). The impact of leave-taking was very clear, since fathers immediately started to sleep through the night when they returned to paid work. Quantitative results show that, at long term, fathers who took paternity leave after birth contribute a little more to the "night shift" compared to the ones who either postponed or did not take leave at all – and, thus, rarely experienced getting up at night in the first weeks.

Families And Caregivers In Italy: Changes And Cultural Challenges In Care Strategies

Isabella Crespi, Marta Scocco, Melanie Sara Palermo

University of Macerata, Italy

In Italy, there is a preference for maintaining older people in their own living and family environment. However, this has not been matched by equally decisive support from the family and from family members who take charge of the dependent older person. The still dominant model of public assistance at the national level is based on the provision of the accompanying allowance, which effectively offloads the responsibility of organizing assistance onto the family and requires its members to make a significant commitment to care and assistance of the frail older people by caregivers. Given families' pivotal role in caregiving, the paper aims to investigate the adaptations, strategies, and tools for enhancing welfare policies and systems. The focus extends to the family context with informal caregivers.

This paper analyses literature, documentary analysis and open-source secondary data (Share, Eurostat, OECD, and Istat), specifically within the Italian context, to highlight the main demographic and social change related to ageing and family care responsibilities.

Finally, the analysis of the caregiving models within families using literature and previous research examines how caregiving relationships and practices are considered in the Italian context in recent years and which are the main potential aspects to be developed regarding family policies and social interventions.

Navigating The Moral Landscape of Foster Care – Differentiating Types of Suspicion and Blame In Paid Parenthood

Katarina Jacobsson

Lund university, Sweden

Foster care is a way of providing a more family-like upbringing and care for children who, for various reasons, cannot stay with their biological parents. The fact that foster carers are paid a fee to care for a child is not questioned in contemporary child welfare practice, but the level of the fee and what it is spent on (or not spent on) are morally charged issues. Foster parents' motives may be questioned by the media, neighbours or social workers, who may suspect financial gain. Although payments are essential and may be crucial to successful recruitment of foster carers (of

469

whom there is a severe shortage), the issue of foster carer remuneration is fraught with sensitivity, suspicion and blame. This presentation will differentiate between several types of suspicion in money talk that foster carers encounter or reproduce, ranging from subtly educational to explicit blaming comments. Building on economic sociologist Viviana Zelizer's argument that money is often defined as corrupting in family, kinship and friendship relationships, the analysis suggests that foster carers learn how to navigate such suspicions in talk about reimbursement through various encounters with websites, social workers and foster carer communities. The study is part of a three-year research project exploring how money symbolises both the value of good care for those in need and a morally charged or corrupting aspect. The material consists of both texts (official and social media) and interviews with foster carers and social workers.

The FamILens® Model For The Evaluation Of Policies Family Impact: An Application In The Italian Context

Sara Mazzucchelli, Maria Letizia Bosoni, Medina Letizia

CATHOLIC UNIVERSITY OF MILAN, Italy

There is an increasing international debate around the opportunity to assume a family perspective in policy and practice, in particular concerning the impact of policies on family well-being.

In line with this perspective, the Family Impact Lens (FIL) is a model of analysis, design, and implementation of policies and practices that triggers a virtuous and circular dialogue between policymakers, professionals, and researchers, to devise interventions that can positively "impact" on the living conditions and well-being of families, in their different structural forms and socio-economic conditions.

This contribution will present the Family Impact approach, which is based on five evidence-based principles (Bogenschneider et al., 2012; Belletti, Bramanti, & Carrà, 2018) studied firstly in the USA by the Family Impact Institute of Purdue University. This presentation moreover aims to briefly illustrate the path made in recent years by Italian leave policies and changes noticed since April 2014 (Jobs Act), analyzing the impact of policies and interventions on the well-being of families through the FamILens® model (Family Impact Lens).

The Perils of "Reading History Sideways": Is Unmarried Cohabitation Really a Moving Target?

Martin Kreidl, Klára Reimerová

Masaryk university, Czech Republic

Several authors argued that unmarried cohabitating unions are a "moving target" (Seltzer 2000: 1247). It has been proposed that the meaning of unmarried cohabitation changes with its rising diffusion, typically evolving from a "marginal phenomenon" over a "prelude" phase to finally become "indistinguishable" from marriage.

These developmental theories share the emphasis on gradual – and presumably universal – change; i.e. they operate within the so-called "developmental paradigm" of family change and face the peril of "reading history sideways" (Thorton 2001). Interestingly, no study has examined within-country change in the status of unmarried cohabitation so far.

Our aim in this presentation is to see if the position of unmarried cohabitation in the broader landscape of family change evolves over time. We operate with one common typology of unmarried cohabitations (Hiekel et al., 2014) and examine it across two different time points. Did the number of people living in different types of unmarried cohabitations change as predicted by the developmental paradigm? Do we see an increase in the number of cohabitations that are "indistinguishable from marriage"?

Our analysis is based on the GGS (Generations and Gender Survey) data from Czechia. We use two samples, one from 2005 and one from 2021.

While prevalence rose, we find no change in the prevalence of various types of unmarried cohabitations. It appears that in 2021, unmarried cohabitations still primarily served as "prelude" to marriage and the presence of the mode "advanced" types did not change. We challenge the idea that cohabitation is a "moving target" a propose that we should be more careful in operating with the "developmental paradigm" when studying family change.

RN13 | T05_04: Family planning, fertility, and reproductive technologies II

Fears and Barriers to Having Children: Choosing Dog Ownership as an Alternative?

Ivett Szalma[1,2], Lóránt Pélyi[1], Orsolya Udvari[2]

1HUN-REN Centre for Social Sciences, Hungary; 2Corvinus University of Budapest

There is keen interest in reproduction in Hungary: the government has taken several steps in an effort to increase the number of children born since 2010. Despite this, the number of births is not increasing while the number of dogs kept as companion animals is increasing. It is therefore interesting to examine whether choosing dog ownership is an alternative to having children. To answer this question, we conducted 27 semi-structured interviews with childless women or mothers with only one child aged 18 to 45 years living in a large city, who had owned a dog for at least one year.

Our preliminary results show that voluntary childlessness is not closely related to dog ownership. Most childless interviewees also want to have at least one child. However, dogs are seen as a member of the family, and in many cases, they are thought of as a 'quasi' child or sibling of an existing child. Nevertheless, dogs are not thought to be a complete substitute for a human child. We found that there are different reasons why a woman may not want to have (more) children. For example, not having found a suitable partner, or not having the appropriate financial status or housing circumstances. Moreover, many women reported difficulties in reconciling work and family life, which they can manage with a dog, but would not be able to manage if they had a child. They also reported that dogs can play an important role in meeting their needs for care and connections.

Genetic Strangers or Potential Kinship? Egg Donors' Experiences and Expectations in and beyond Anonymity

Yu-Ling Huang

National Cheng Kung University, Taiwan

This paper undertakes an exploration into gamete donation anonymity in Taiwan and how the changing cultural shift towards openness and transparency in the United Kingdom stir the discussions in the island. Enacted in 2007, Taiwan's Assisted Reproduction Act has established anonymous gamete donations as the prevailing model, safeguarding the rights of recipient couples and donors. Curiously, the welfare of offspring has been a marginalized consideration for two decades. Scrutinizing legal texts, media discourse, and drawing insights from in-depth interviews with thirty egg donors, this study delineates the intricate interplay of legal regulations, cultural perceptions of kinship, and organizational dynamics within IVF clinics collectively shape anonymity across legal, medical, and kinship practices. First, the Act, devoid of criteria addressing the offspring's welfare, build secrecy as a guiding principle, steering medical and kinship practices. Second, during clinic consultations and informed consent processes, anonymity is underscored as pivotal for the privacy and familial security of recipients and donors. Third, the public narratives, as portrayed in television shows, depict genetic kinship outside marriage as a threat to familial bonds, thereby reinforcing the anonymity regime. The commercialization of gamete donation among young women intensifies these trends. However, knowledge of some measures ensuring offspring welfare in the UK prompts many donors to reconsider their expectations of anonymity, advocating for a recalibration that balances of the needs of offspring and donor privacy. Proposing a cultural shift towards openness, this study contends that introducing such values into the existing gamete donation regime is imperative.

Oocyte Self-Preservation for Non-Medical Reasons. A New Medical and Social Challenge for Family, Parenthood, Human Reproduction

Lia Lombardi

Université Lumière Lyon 2, France, Università degli studi di Milano, Italy

471

Background

This proposal concerns ongoing research, at the Université Lumière Lyon2, on the topic of the new medico-technological challenge of Oocyte Self-Preservation for Non-Medical Reasons (OPnM) and its impact on human reproduction; on gender relationships, families, and parenthood. It is an interesting field for social sciences, as well as for law, bioethics, biomedicine, and biotechnology.

This research is carried out in three European countries (France, Italy, and Spain), detecting differences in laws, social protection systems, women's rights, and moral and ethical norms on procreation, family, and parenthood.

The main aim is to produce a comparative analysis between these three countries with similar cultural roots but with important differences in the political, legislative, and ethical-moral aspects related to OPnM.

Methodology

To develop this research and to capture the complexity of the OPnM theme, the analysis is conducted through four macro-contexts: 1. institutional; 2. socio-cultural; 3. economic; 4. medical.

It consists of an "integrated" research plan focusing on:

1. Systematic review of the literature, laws, and empirical data on oocyte self-preservation in the three target countries.

2. Field research using qualitative methods, carried out in the target countries and in medical centres and CECOS: 110 semi-structured interviews; 6 focus groups.

Preliminary results

– Analysis of 16 interviews with healthcare professionals and 30 interviews with women in their AOnM pathway, in France and Italy.

– Ongoing social change in relation to parenthood, family, reproduction

– Data from secondary sources on oocyte self-preservation for medical and non-medical reasons in the three target countries.

– Legislative analysis of Medically Assisted Procreation (MAP) and OPnM in the three target countries.

– Medical and sociological approaches to OPnM in the target countries.

The Fertility Timing Gap: The Intended and Real Timing of Childbirth

Jitka Slaba, Jirina Kocourkova, Anna Stastna

Charles University, Faculty of Science, Czech Republic

The fertility gap, which indicates the difference between the planned and actual number of children born, can be explained by the shift in parenthood to older ages and is associated with the non-attainment of one's intended reproductive plans. The paper focuses on the gap in the timing of entry into parenthood, i.e. between the planned and actual age at the birth of the first child. The study is based on data from the "Women 2016" survey which re-interviewed women of fertile age from the second wave of the Czech Generations & Gender Survey conducted in 2008.

Czechia is particularly interesting when analysing the timing of entry into parenthood – in Czechia, the fertility postponement commenced significantly later than in Western European countries and was markedly more dynamic in terms of its development; moreover, recent findings indicate low realisation of the short-term childbearing intention since only one in four childless women realise their original transition to parenthood plans.

Results reveal that at the population level, the fertility timing gap differs across generations. While for Czech women born between 1966 and 1971 the planned age exceeded the actual observed age by one year, the realisation of fertility occurred two years later than planned for the youngest generation (1983-1990) included in the study. At the individual level, the unplanned postponement of fertility (fertility timing gap) was found to be related primarily to partner-related and health factors.

RN13 | T06_01: Family policies and interventions II

Multifaceted FamILens in Italy: Creating Family Impact Checklist to Help Professionals "Think Family"

Matteo Moscatelli, Chiara Ferrari, Elisabetta Carrà

Università Cattolica di Milano, Italy

Families constitute a fundamental cornerstone for individual and community well-being across the entire life course. A large amount of research has consistently demonstrated that family-centered approaches for family services result in more positive outcomes for both individuals and family relationships. This underscores the pivotal role families play in enhancing educational success, fostering social competences, facilitating work-life balance and mitigating the impact of various risk factors. Despite the acknowledged significance of supporting families through policies and practices, exists a lack of instruments and tools for designing policy/services with a "family thinking" approach. This deficiency leaves practitioners inadequately equipped to design programs addressing diverse range of family dynamics. To addresses this gap, this study explores how the Family Impact Lens (Bogenschneider, Little, Ooms, Benning, Cadigan & Corbett, 2012) and its Italian adaptation, the FamILens (Carrà, 2023), can align policies and services with the specific needs of families. The objective of the study was to define and validate four Family Impact Checklist specifically for use in four key areas of intervention: family mediation, elderly home care, human resources management, and social services in child protection. Each study incorporated co-design sessions and a two-round Delphi involving over 15 experts in each domain. The four adapted Checklists encompass a variable number of items across six "think family" principles: family responsibility, family stability, family relationship, family diversity, family engagement, and family networking. After this phase, four large-scale family impact analysis will use surveys through the validated checklists targeting statistically significative samples of professionals. These developed tools can aid professionals in formulating impactful, family-friendly programs that ultimately lead to enhanced individual and community well-being.

Social Workers' and Children's Perspectives on Grief in Family and Close Relationship

Paula Vainikka, Henna Pirskanen

University of Lapland, Finland

Children can experience different griefs in their lives. Grief can be caused by, for example, the death or illness of a

472

close one, ending of a friendship, or many other adversities in life. In this presentation, we explore grief from social workers' and children's perspectives to gain a multi-faceted understanding of the phenomenon, and draw on the concept of relationality.

The presentation is based on two sub-studies conducted in the wider research project Children's and young people's sorrow and grief in family and close relationships (2020-2025) in which data has been collected from children, young people and professionals in Finland and Spain. The first sub-study comprise interviews from social workers (n=18) in Finland. The second sub-study data comprise grief maps, along with interviews, from children (n=21) aged 8-9 years in Finland. We ask 1) what kinds of manifestations of children's grief do social workers interpret and recognize in their work and 2) what family and close relationships children describe as, on one hand, supporting, and on the other hand, as related to the causes of their grief?

Our results imply that social workers perceive children's grief as related to relationships. They only very rarely see it manifested as a "pure" feeling of grief, but often manifested in different ways. Respectively, children's grief map analyses illuminate the various ways in which children's grief is embedded in family and close relationships both as causes of difficult emotions and as sources of help and support. The findings highlight the importance of professionals' ability to recognize and work with children experiencing grief, and the importance of giving children an opportunity to define grief and the relationships attached to it.

Discourses on Work-Family – and School-Family-Relations: Children's Counter Positions

Nicoletta Eunicke, Jana Mikats

Johannes Gutenberg-University Mainz, Germany, Germany

In conservative welfare states, the approach to children in families is ambivalent. On the one hand, families are made responsible for children; on the other hand, public access to and interest in children has increased.

This connection is approached differently in political discourses on work-family and school-family relations. Work-family relations are dominated by an adult-centered view on parents' work-life balance and further a conflicting relation of working parenthood and (good) childhood. In school-family relations, attention is paid to children's future outcomes, which creates tensions of the family as both a site of (missing) education and of (good) childhood. In both cases, family and home seem to be contested site for children with figures such as the overburdened or unskilled family.

Interestingly, these two aspects of working parenthood and family as a place for education are rarely connected in discussions about "how childhood is done" (Spyrou et al. 2019, p. 8).

To unravel these assumptions about family and home in children's lives on theoretical and political levels as well as in everyday life we explore/focus on/research children's positions in home/work and home/school relations. With a situational analysis, we examine children's everyday life with home-based working parents in Austria (n=11 families) and children's (n=43) positions on family-school relations in Germany on base of two qualitative muti-methods studies. We show the heterogenous, overseen, and contradictious discursive positions on home and family and argue that to understand children's lives we need to include the junctions of family and home with work and schools from a generational-relational perspective.

The Impact of COVID Social Policies on Gender Relations in Central and Eastern Europe

Steven Saxonberg[1,2], Tomáš Sirovátka[2], Eduard Csudai[2]

1Södertörn University, Sweden; 2Masaryk University, Czechia

The pandemic created a lot of stress on families, as parents had to take care of sick children and at times stay at home during lockdowns. We conducted a survey of parents living in Czechia, Hungary and Slovakia which included questions both about how COVID influenced their work-life balance and how social policies might have helped them deal with the situation. This includes questions about which parent stayed at home or if both stayed at home, how long they stayed at home during lockdowns, who did most of the childcaring and household tasks when they stayed at home, how different types of social policies helped them cope with the situation, etc. Our paper will investigate both how the pandemic influenced work-life balance and how social policies influenced this. We have chosen 3 neighboring countries to compare the situation to see if any differences emerged. All 3 countries have hybrid welfare systems that have been strongly influenced by Bismarckian pre-communist traditions with genderizing family policies; yet, they also have quite different political developments. Hungary has deviated the most as it is moving in the direction of one-party rule and an "illiberal" state, while Slovak politics has been dominated by a large number of populist parties of various colors, including a party devoted to families (We are Family). Czechia had a coalition of a centrist-populist and social democrats that was replaced by a center-right coalition.

Early Motherhood and Labour Market Outcomes across Europe: the Role of Cultural Age Norms across European Welfare States

Julie Winters, Nadia Sturm, Jan Van Bavel

KU Leuven, Belgium

Due to rising educational attainment and an increased participation in the labour market, balancing family and professional responsibilities has become a persistent challenge for many European women. This is often perceived as one of the main reasons why these women have been delaying significant life events such as childbirth in the past decades. We investigate the impact of early motherhood on labour market outcomes across various European contexts, where countries differ in cultural age norms as well as family and labour market policies. In general, motherhood coming earlier than cultural norms prescribe, is expected to be associated with less favourable labour market outcomes. In countries with an extensive social safety net and higher levels of gender equality, this negative impact of early motherhood may be attenuated. We investigate these issues using the Timing of Life Module from the European Social Survey data from 2018, covering 29 countries. Preliminary results show that there is an association between early motherhood and unemployment in Europe. In Mediterranean countries early motherhood can be linked to more part time labour and in liberal welfare states with unemployment. Against expectations, early motherhood in social-democratic countries is associated with both more unemployment and part time labour. Since we find that the welfare state typology used so far does not work well to make sense of diversity across Europe, we will next move away from this clustering and employ multilevel modeling and fixed effects models to address cultural and institutional differences.

What Did You Say, Where Are we Going on Sunday? – Societal Dimensions of the Mental Work of Employed Mothers

Mirjana Adamović[1], Ksenija Klasnić[2], Anita Dremel[3]

1Institute for Social Research in Zagreb, Croatia; 2University of Zagreb Faculty and Humanities and Social Sciences; 3Faculty of Humanities and Social Sciences, University of Osijek

Physical and emotional labour are frequent topics in research on gender inequality within the private sphere, whereas mental labour, though heavily pervasive, has remained mostly overlooked. Mental labour involves managerial responsibilities such as anticipating needs, identifying options, making decisions, and monitoring their execution for all household members. Primarily performed by women, it often detrimentally influences their overall well-being, especially in case of employed mothers. Our mixed-methods study on domestic mental labour explores the complex dynamics of underexplored elements of traditional gender roles in heterosexual relationships. The analysis first focuses on quantitative data on gender division of mental labour within heterosexual relationships, particularly in societal aspects related to maintaining social support networks and planning and organizing family life and time. The data, collected in 2022 from a representative sample of individuals in heterosexual relationships in Croatia, explores gender differences in the allocation of these responsibilities. The scale encompasses items covering various domestic mental work facets, such as planning time with a partner, arranging gatherings, planning celebrations, coordinating vacations, and reminding of important events and birthdays. Integrated with the survey data, insights from semi-structured interviews with employed mothers conducted in 2023 offer a multifaceted understanding of mental labour division. This research segment explores whether traditional gender roles persist and what impact they exert on quality of life for working mothers. The qualitative depth provided by interviews enriches the quantitative analysis by bringing nuanced perspectives of working mothers concerning the challenges and experiences of allocation of responsibilities and balancing mental labour.

474

Home Office as a Practice in Which the Boundaries Between Work and Home Are Negotiated.

Viera Poláková

Institute for Sociology of SAS, Bratislava, Slovak Republic

The paper deals with the issue of home office, which has become a common type of employment in Slovakia only in the period of the Covid 19 pandemic (2020-2021), due to the risk of spreading the infectious disease. The sudden and strict introduction of the home office has affected the whole of society by leading to various unexpected, unpredictable and unrecognised situations for both employers and employees, as well as for their family members.

This paper will focus on the theme of negotiating the boundaries of actors between work and home in the space of the home. In examining this negotiation, it is particularly concerned with focusing on the gendered aspects of the division of labour, on the aspect of the presence of children requiring care, but also on the time and space in which the actors' negotiation occurs. Relevant theories that address the topic under study include theories of the boundaries between work and family or theories of the dichotomy of public and private space.

The paper is based on the findings of quantitative research conducted on a representative sample of respondents working in home offices in Slovakia. The quantitative research, constructed from several dimensions, provides, by mapping the attitudes and opinions of the respondents,

insights that will help to understand more deeply the processes and interactions taking place in the home environment of which the home office is a part. They can also contribute to better setting processes, conditions and boundaries between private and public. The findings are unique in Slovakia, as previous research has only addressed the issue of home-office from the perspective of the impact of the Covid 19 pandemic.

Couples' Careers Revisited: the Role of Gender Ideologies

Torsten Lietzmann[1], Daniela Grunow[2]

1Insititute for Employment Research, Germany; 2Goethe University Frankfurt

We assess the role of gender ideologies for couples' work trajectories, using data from the German panel study Labour Market and Social Security (PASS). First, we conduct a multichannel sequence analysis to identify work trajectories of heterosexual couples in intensive family formation age (she < age 40). Second, trajectories are predicted based on partners' individual and joint gender ideologies as well as social structural characteristics.

We identify six typical work trajectories, three of which clearly dominate, accounting for more than 80 percent of couples: (1) dual fulltime, (2) marginal secondary and (3) one-and-a-half earner, all featuring a male fulltime earner. The less common patterns are (4) dual limited and unstable employment, (5) dual precarious, and (6) male breadwinning-female homemaking.

Regression models indicate that gender ideologies matter for some but not all joint work trajectories. Most importantly, gender ideologies predict dual fulltime trajectories: couples' joint egalitarianism fosters and believes in separate spheres hinder adopting this trajectory. At the same time, these essentialist believes increase the likelihood of adopting a marginal secondary earner trajectory. His but not her gender ideologies offer explanatory potential beyond social structural characteristics.

RN13 | T06_03: Multiculturality in place and space

Between Guest and Family: Diversified Family Boundaries and Tensions in Host Families for Unaccompanied Refugee Minors

Ines Gottschalk, Franziska Seipelt

Ruhr University Bochum, Germany

This presentation focuses on host families of unaccompanied refugee minors. At present, due to various global conflicts within and outside Europe, issues relating to the care and support of these young people have become increasingly topical and relevant for the sociological research landscape.

Host families are broadly defined as various temporary, family-like constellations that accompany a refugee who has come to Germany without a parent or guardian. The unaccompanied adolescent is integrated into an existing social structure in different ways, so that the relationships within the family are centered around them. Consequently, we ask: How is the understanding of the (nuclear) family collectively renegotiated, and to what extent must all family members undergo identity changes within it?

The microsociological, praxeological study examines host families in an interpretative-qualitative paradigm from an emic perspective. In the data collection phase, five families were interviewed through family talks, along with biographical-narrative individual and couple interviews. A special methodological feature of the study is the triangulation of collective and individual negotiations of (family-)life, as well as the consideration of different points of view from the host family members.

A characteristic of the host family is that the family boundary is (temporarily) extended, and that family members apply different understandings to the family, which can cause tension among members. Especially young refugees occupy a precarious and constantly renegotiated position between being a guest and a family member. The host family and refugee, as an extension of the 'nuclear family', thus exemplifies a life (together) in transition, influencing the formation of relationships and the development of identity for all parties involved.

Mothering in Informal Cubicle Homes: Spatiality, Care Infrastructure, and Intergenerational Relationships

Ruby Lai

Lingnan University, Hong Kong S.A.R. (China)

Despite growing scholarly attention given to housing informality as a consequence of spatial injustice and housing inequality, the contextualized impact of informal housing on family relationships is still under-documented. Home is a place where everyday care work takes place, through which individuals conceive their identities and maintain family lives. It is also the corporeal site in which intersectional inequalities are manifested in everyday settings, particularly central to women's lives because they are usually the primary caregivers. Capitalizing on the literature on space and care infrastructure, this study investigates the reproduction of intersecting marginalization of gender, class, migration status, and housing informality, by focusing on the mothering practices of migrant women and intergenerational interactions in subdivided flats in Hong Kong – tiny units divided from a larger domestic quarter that house the city's low-income families. Data was collected through years of ethnographic observations and in-depth interviews conducted with tenants. Based on the biographical stories of 47 families, the findings illustrate the centrality of space in the construction of motherhood and how female migrants deployed spatial strategies to sustain family lives in impoverished conditions. The narratives of both the mothers and the children demonstrate how the hegemonic discourses of motherhood – which are configured under a neoliberal and traditional familial culture – were replicated and challenged. Resonating with the experiences of many metropolitan cities and urban areas across the globe, this article sheds light on the unacknowledged care labor of migrant mothers and problematizes the stigmatization of migrant motherhood in the context of housing informality.

Tensions and Negotiation Regarding Children Education: Mutual Life and Coping Strategies of Women in Intercultural Jewish-Arab Families in Israel

Shlomit Oryan

Oranim Academic College of education, Israel

The number of mixed couples has increased in recent years in Israel, with several thousands of them being Jewish-Muslim mixed couples. Studies which examined how mixed Muslim-Non-Muslim couples cope with their shared life, found that the non-Muslim women display, both at the interpersonal and in the raising children aspects, full assimilation into the Arab culture, or maintain a mutual acculturation pattern.

Following these findings, the present study examines, through in-depth interviews with 13 Jewish Israeli middle-class women married to Muslim Arab Israeli men, the coping strategies used by the women regarding their daily mutual life and their children's education, such as the language spoken at home, and children's educational institutions.

The findings differ from previous studies, show that the interviewees have a wide range of coping strategies: on the one end, there are families who display full assimilation into Muslim culture. On the other end, there are families in which a complete assimilation of Jewish culture is done by the partners. In between, there are families in which mutual acculturation of both spouses occurs either through daily confrontations or through respectful, democratic negotiations based on acceptance and tolerance towards the other culture.

These findings imply that the existence of these intercultural families, and the ongoing negotiations that occur within them, reveal cracks in the rigid ethno-national-religious boundaries which prevail among the social groups in Israel. In addition, they teach how daily tensions can be resolved through trust and a willingness to mutual transformation on the part of both partners.

Attitudes towards Sexual Liberalization in the Turkish Second Generation in Europe

476

Nadja Milewski

Federal Institute for Population Research (BiB), Germany, Germany

This paper examines attitudes toward premarital sexual relationships among second-generation Turkish migrants and their non-migrant counterparts in six European countries. Attitudes toward virginity at marriage are crucial for understanding demographic variations across countries and within social groups, reflecting the liberalization of family values as a driving force of the Second Demographic Transition. Moreover, attitudes toward virginity serve as a significant marker for gender inequality. Life-course research on the transition to adulthood and union formation reveals persistent differences between immigrant and native groups in Europe, such as leaving the parental home, marriage, and childbearing among immigrants from countries with a Muslim tradition.

Data from the project on The Integration of the European Second Generation (TIES) in Austria, France, Germany, the Netherlands, Sweden, and Switzerland were used. The sample included 4770 respondents (aged 18 to 35 years), with 49.5% being Turkish migrant descendants. Respondents were asked about the acceptability of premarital sexual relations for both men and women. Three research hypotheses were investigated: 1) Building on assimilation theory, second-generation Turks may hold more conservative attitudes than natives. 2) Comparative integration context theory suggests cross-country variations in attitudes toward virginity. 3) Socio-cultural determinants of attitudes

toward premarital sex, including gender, education, and religiosity, were explored.

Results indicate that Turks in countries with more liberal values among the majority groups also hold more liberal values, albeit at a lower level on average. Minimal differences were found between female and male respondents, although virginity at marriage was deemed more important for women than for men.

RN13 | T06_04: Dating and matchmaking

Dating in a Divided Society: Mixed-religion relationships among 16-year-olds in Northern Ireland

Catherine Barbera McNamee, Dirk Schubotz

Queen's University Belfast, United Kingdom

Northern Ireland is a society emerging from significant violent conflict. Although the height of sectarian violence has passed, the legacy of these tensions remains including segregated social spaces such as neighborhoods and schools. As the most intimate type of community-mixing, romantic relationships can provide a useful lens to determine how much progress has been made in removing barriers for inter-group relations across the divide. Mixed-marriages (Catholics and Protestants) have remained relatively low at around 10% despite the lowering of sectarian tensions. Intimate relationships of young people who were born in NI during the peace process can provide insight on mixed-relationship trends as well as identify if barriers remain for cross-community mixing. This study utilizes the 2023 Young Life and Times, a large scale annual representative survey of 16-year-old in NI (n= 2,065) to run multinomial logistic analysis examining what characteristics influence the likelihood of dating someone of a different religion. The results show that religious identity, religiously segregated environments, and where the young person met their partner influenced the likelihood of dating someone from a different religion compared to same religion. The research findings suggest opportunities to meet may be playing a role in barriers to mixed-religion dating in NI among young people alongside preferences and third party resistance. The research addresses gaps in the literature by investigating prevalence of mixed-relationships among young people and examining how opportunities to meet can shape the prevalence of cross-community dating within the NI context. Implications are discussed.

Intimate Tensions: Transformation and Trust in the Negotiation of Gendered and Sexual Relationships on Dating Apps

Brian Heaphy, Jaime Gracia Iglesias, Neta Yododvich

University of Manchester, United Kingdom

This paper draws on data from a UK Economic and Social Research Council funded study of dating app use before, during and after Covid social restrictions, to examine the tensions experienced by heterosexual and lesbian, gay, gay and queer (LGBQ) identified people in negotiating digital intimacies. Drawing on nationwide survey of over 824 people in the UK who used dating apps (with roughly equal

477

numbers of heterosexual and LGBQ participants), and 53 qualitative interviews), it identifies (i) the diverse personal and social factors that lead people to use dating apps, (ii) the intimate tensions that participants experienced, and their implications for trust, and (iii) how such tensions were linked to how dating apps commodify intimacy. Dating apps can appear to provide 'new' and experimental ways of doing intimacy that can be personally and socially transformative, especially at times of personal and social crisis. However, this masks the ways in which, in the pursuit of profit, they also bolster socially entrenched gender practices. We argue that the tensions that dating app users experience emerge from how dating apps commodify intimacy, which undermines intimae trust and sets limits on the transformation of gendered intimacies

Who is Our Better Half? A Study About the Characteristics That Spanish Take into Account when Looking for a Partner

Luis Ayuso Sánchez[1,2], Nadia Khamis Gutiérrez[1,2], Olga Jiménez Rodríguez[1,2]

1Centro de Investigación Social Aplicada; 2Universidad de Málaga, Spain

The way of looking for a partner is conditioned by the social context. In the new digital society, matchmaking processes are mediated by new information and communication technologies, affecting both expectations and behaviours. This study examines the social transformations within the matchmaking market, considering structural and cultural factors. Structurally, some factors are essential: demographic changes, characteristics of the middle class, and increased matchmaking opportunities through ICT. Culturally, the analysis includes trends towards relational individualism, the romantic love's role, the magnitude of emotional elements in the digital society, and the eroticization of daily life.

The research adopts a triple theoretical perspective, economic, social psychology, and sociological. Exchange theory encompassing economic, status, educational, and erotic elements, is employed alongside social psychology to explore the personality aspects contributing to stable relationships. Sociology investigates the interpersonal dynamics when seeking a partner, emphasizing communication, sincerity, agreements, and sexual satisfaction.

The aim is to analyze significant factors that spanish value when initiating romantic relationships, such as money, age, beauty, marriage intentions, religious values, etc. Data is derived from a national opinion survey conducted by the "Centro de Investigaciones Sociológicas (CIS)" in October 2021. Descriptive analysis identifies crucial characteristics, followed by multivariate techniques like cluster analysis to categorize individuals based on common factors. Three typologies—idealistic, traditional, and communicative— are defined, reflecting changing preferences: traditional emphasizing romantic love, idealistic being more materialistic, and communicative emphasizing equality and independence.

Tension, Trust and Transformation: Indian Family in Online Matchmaking

Gunjan Ramraj Yadav

B.D. College, Patliputra University, Patna, India

With the advent of the internet technology and its widespread use, the Internet has come to act as 'social intermediary' in matchmaking across the world. This study explores (whether and) how the internet influences marriage choices and family dynamics during match-fixing in the Indian context. It seeks to un-weave the individual-family-community interaction in the context of changing gender norms. The findings of the study are based on both qualitative and quantitative data gathered through mixed methods (such as profile analysis, personal interviews and participant observation).

Using a combination of theories, debates and concepts (Giddens 'theory of structuration' and Bourdieu's 'theory of practice' along with Feminist notion of selfhood and autonomy), the paper reflects upon the prescriptive, restrictive and supportive role played by the family in the context of online spouse selection. The study, thereby, documents continuity and change in family structure, norms and values by exhibiting the tension and trust between the individual and family and the process of transformation in the realm of matchmaking in India. Findings of the study indicate towards a preference for mutual compatibility and intimacy among individuals nevertheless maintaining the centrality of the family.

Transnational families

Perspectives of Children and on Children in Transnational Custody Conflicts

Johanna Kiermaier, Ulrike Zartler

University of Vienna, Austria

In light of rising global mobilities, more children are growing up in transnational families. When it comes to separation or divorce, questions or conflicts about cross-border custody are becoming increasingly relevant. Parental divorce and separation in transnational families have a massive impact on children's lives and yield complex family situations and transitions. When considering children as active agents within families, however, it becomes clear that their experiences and perspectives are still not considered adequately. Focusing on children in transnational custody conflicts is needed, particularly in the theoretical frame of the Doing Family concept: it is assumed that children do family themselves, and have agency within their families.

In our contribution, we examine the perspectives of children and on children. We ask how children experience transnational custody conflicts in transnational families, and how their situation is negotiated by other kin and network members. To this end, we rely on qualitative multiple-perspective interviews with members of transnational families who experience(d) transnational custody conflicts (currently 13 interviews; ongoing data collection). Data are analyzed according to the Grounded Theory Methodology coding scheme. First findings show that children develop strong opinions when it comes to their role in transnational custody conflicts. They are concerned with their future and are aware of the different levels of conflict, located in their families, wider kin networks, or in a broader societal context. At the same time, they struggle with the lengthy and time-consuming character of legal proceedings. Parents express strong feelings like guilt, fear, or anger, and construct their children as needing protection within the conflict.

Navigating Emotions In Transnational Family Reorganization After Separation Or Divorce: Mothers' Experiences Across Borders

Agnes Dürr, Ulrike Zartler

University of Vienna, Department of Sociology, Austria

With increased global mobility, a growing number of individuals establish transnational family ties. Simultaneously, transnational divorces and separations that unfold within complex social, cultural, and legal contexts become more frequent. Conflicts over parental rights and responsibilities can lead to legal battles over children's custody, or

to cases of international parental child abduction or relocation. Amidst such emotionally intense and conflictual situations, establishing new family structures across national borders yields emotionally charged reorganization processes.

This contribution explores how mothers who experience conflictual transnational divorces or separations navigate and manage their emotions. Theoretically, we draw upon the concepts of emotion work (Hochschild), emotional reflexivity (Holmes), and the ambiguous loss theory (Boss). Empirically, the study relies on an in-depth qualitative analysis of ten narrative interviews with mothers from post-separation transnational families.

Results show that maternal emotion work and emotional reflexivity are essential in the organization of post-separation parenthood, in interactions with various family members, and within the complex legal frameworks of transnational families. Mothers' emotion work is guided by feeling rules, generated by social norms. While social and legal expectations emphasize unemotional and rational decisions, mothers find themselves within a highly emotional climate of fear, uncertainty, powerlessness, and loss of control. They struggle with expectations to manage their own emotions in order to ensure their children's well-being while simultaneously responding to emotions of their children, ex-partners, and extended family. Mothers' experiences are substantially shaped by the resources they have at their disposal.

479

Negotiating Gender in Transnational Conjugality: The Experience of Post-Soviet Women Living in France

Laure Sizaire

Université libre de Bruxelles, France

Drawing on a study conducted among French-post-Soviet couples residing in France, this paper delves into the intricate implications of migratory experiences and transnational conjugality on gender dynamics. When post-Soviet women migrate and establish intimate relationships with partners in the destination country, they experience a shift of gender regime (Connell 1987). For some of them, this shift is intentional, forming part of a deliberate gender project: they use international matchmaking precisely to avoid the gender regime they encountered in post-Soviet countries (unequal relationships, unreliable partners, marginalization on matrimonial market, etc.). For others, shifting gender regime may occur without deliberate intention. In these cases, women share accounts of intimate interactions where, at times, conventional gender expectations are momentarily suspended. When "doing gender" (West & Zimmerman 1987) is impossible, the gender regime's norms and rules are revealed and denaturalized. Beyond these temporary disruptions in interactions (Goffman 1974), the women's comparative assessments witness a relaxation of gender norms, challenging traditional definitions of masculinity and femininity from the women's perspectives. This demonstrates the transformative power of migration on gender relations and sheds light on the opportunities for increased agency and freedom that transnational conjugality

and migratory experiences can offer. Consequently, this paper advocates for a different perspective on the understanding of gender dynamics within the context of migration and conjugality, by taking into serious account the women's comparative assessments, and considering their analyses and reflexivities on gender, which are shaped at the crossroads of their home and destination countries.

RN13 | T07_02: (Un)making intimate ties

From the Formation of the Couple to the Breakup. Practices and Perceptions of Couple Relationships of Young People Today

Olga Jiménez-Rodríguez[1], Nadia Khamis[2], Félix Requena[3]

1Universidad de Málaga, Spain; 2Universidad de Málaga, Spain; 3Universidad de Málaga, Spain

This study aims to analyze the new practices and perceptions of Spanish youth regarding couples. We want to know how the relationship formation process works, its dynamics and management of the breakup. The aim is to identify the factors that intervene and acquire importance in each of the stages of life as a couple, from union to dissolution. We will study what have been the main changes in couple relationships and the management of intimacy in recent decades, since this social phenomenon has experienced important alterations. Among these changes, it is worth highlighting the development and greater prominence acquired by new technologies in daily life. Quantitative and qualitative information has been combined. As for the first, secondary sources of quantitative data have been used to reflect the main characteristics of young couples. Regarding the qualitative methodology, information from the GESTIM Project financed by the BBVA (The management of intimacy in the information and knowledge society) has been used. Three discussion groups of young people between 18 and 29 years old have been held, considering the geographical area, as well as sex, level of education, profession, and romantic situation.

480

Waiting Ever After: A Conceptualisation Of Chronic Readiness

Elise 't Hoen, Elke Claessens, Dimitri Mortelmans

University of Antwerp, Belgium

Previous studies have indicated the importance of commitment readiness (i.e., the feeling of being "ready" to commit to another person) in successfully forming and maintaining romantic relationships. The experience of commitment readiness has been found to support the development of skills that facilitate bonding processes (e.g., being more conscious of one's appearance or being more sociable towards potential dating partners), increasing one's motivation to invest in and maintain a relationship. Consequently, commitment readiness is associated with more stable relationships, leading to greater well-being.

However, when commitment readiness persists for an extended period without resulting in a romantic bond, the prolonged feeling of wanting to commit may lead to what has recently been identified as "chronic readiness". These individuals might be under the impression that certain relationship skills are present, but if they do not succeed in forming a romantic relationship, this could lead to insecurity and diminished confidence, which, in turn, hinders relationship formation.

As of now, knowledge on chronic readiness is quite scarce, as the concept has not yet been fully developed – neither theoretically, nor empirically. For example, it remains unclear whether and when a breaking point can be identified at which commitment readiness becomes "chronic" and potentially problematic regarding relationship formation. Using data from the German Family Panel (Pairfam), this paper investigates the presence of significant changes in behaviour or beliefs related to finding a partner that can be attributed to being chronically ready for a commitment. In doing so, this study forms an important step in making chronic readiness identifiable and operationalisable and in better understanding the duality through which commitment readiness can affect relationship formation.

Intergenerational Perspectives on Instability Within Family Transitions

Paula Pustulka, Zuzanna Kapciak, Jowita Radzińska

SWPS University, Poland

Seen as the last steps in transitions-to-adulthood, entering a stable relationship (partnering) and having a child (parenting) represent the key markers in family transitions. While the changing norms regarding love and relationships, family formation, as well as reproduction, largely offer freedom and agency, such a multiplicity of individual pathways also creates an intergenerationally increasing sense of instability. To that end, young adults today face 'risky freedoms' (Beck and Beck-Gernsheim, 2004) when they consider settling down and/or taking on parental roles. Thus, the paper explores 'instability' in family transitions from an intergenerational perspective, demonstrating the shift towards recognizing more ambivalence and shakiness in family decisions.

The data stems from the ULTRAGEN project (Becoming an adult in times of ultra-uncertainty), specifically its WP2 component implemented as Multi-Perspective Qualitative Longitudinal Research (MPQLR). Over two waves, 121 interviews were completed in 2021 and 2023 with members of 35 family dyads consisting of young adults (aged 18-35) and one parent each.

The analysis focuses on the narratives of family transitions, i.e., framings of partnering and parenting decisions and paths, as well as mutual intergenerational evaluations of attitudes and choices, i.e., comparative understandings of how (and why) one's parent/child thinks about partnering and parenting in certain ways. These are explored through an intergenerational look at 'risky freedoms' within relational and reproductive choices. We demonstrate a profound sense of both personal and structural instability in

the changing attitudes towards family transitions among young adults. 'Shakiness' is also recognized by the parents' generation as a major hurdle for the family transitions they wish for their children.

Family Formation in the Neonatal Intensive Care Environment: Investigating the Impact of Preterm Birth on the Well-being of Mothers and Fathers of Preterm Infants

Alessandra Decataldo, Concetta Russo, Brunella Fiore

University of Milano Bicocca, Italy

The experience of premature birth does not impact solely on the infant and the parents as individuals. Still, it occurs in the context of a critical point in time when they are developing a relationship with one another as a family. Indeed, factors such as parental well-being and family cohesion significantly contribute to the child's developmental outcomes (Elgar et al., 2004). Nevertheless, studies largely focus on the mother-child dyad (DeMier et al., 2000), thus the challenges of preterm fatherhood are so far under-investigated (Mackley et al., 2010).

This paper assesses the stress level of 104 mothers and fathers of preterm babies admitted to intensive and sub-intensive care in two Northern Italy units and its association with clinical (referring to their babies' health conditions) and socio-demographic (referring to families) variables. Indeed, social determinants of health (such as education, occupational social class, job insecurity, employment status, and nationality) have been scrutinized as risk factors for preterm delivery (Dolatian et al., 2012; Weightman et al., 2012) and still rarely investigated in the complexity of the neonatal intensive care environment (Dudek-Shriber, 2004; Ballantyne et al., 2013; Stevenson, 2021).

The study utilized standardized questionnaires with internationally validated scales to evaluate the well-being of parents at the time of discharge and it was conducted on parents of a premature newborn who had survived and were being discharged after a minimum of 10 days of NICU stay. The results suggest that families' unique characteristics and living conditions may impact their response to the hospitalized infant's situation.

RN13 | T07_03: Parenting adult children

Expectations and Experiences of Mothering Adult Children in Later Life: A Comparison between Turkey and the U.S.

Gülçin Con Wright

TED University, Turkiye

Motherhood ideologies are powerful cultural forces which exert tremendous pressure on women of younger children. However, mothering adult children is a topic that has received little attention in both family and gerontology scholarship. The popular notion of the parental role drastically transforming and even disappearing when children transition to adulthood, often idealized as clear-cut independence from one's parents in Western cultures, may explain the relatively scant attention to motherhood in later life. In this paper, I examine the expectations and experiences of older mothers of adult children to understand how they compare to earlier mothering with a cross-cultural comparison between Turkey and the U.S. The data for this study come from semi-structured in-depth interviews conducted with 23 American and 21 Turkish mothers who are above 60 years old and have at least two living adult children of their own. Mothers in both samples identified ways in which their experiences with motherhood for adult children differed significantly from their experiences with younger children but were still important. Yet, how they interpreted their motherly responsibilities to their adult children varied between two countries due to the cultural values of independence at adulthood vs. familism. The most striking differences were in how normative they considered financial support and giving advice. These expectations were also subjected to changing needs and demands of their adult children. This study contributes to the literature by showing how mothering activities and expectations are subject to change in later life and shaped by cultural context.

The Role Of Physical And Digital Proximity In The Quality Of European Intergenerational Relations

Dávid Erát[1], Fruzsina Albert[2], Katalin Füzér[1]

1University of Pécs, Department of Sociology; 2Centre for Social Sciences, Institute for Sociology; Semmelweis University, Institute of Mental Health

Parent-child relationships are amongst the most emotionally intense ties with both positive and negative aspects. In our study, we explore how the quality of these relations is associated with the physical and digital proximity of adult children to their parents. Generally, ties are thought to be stronger when generations live physically closer, as it allows for a higher level of contact, support and more frequent interaction. However, with the recent surge in the usage of digitally mediated communication, the question of how the use of digital platforms affects the quality of intergenerational relations and whether physical distance can be "bridged" by using digital forms of communication arises.

Using data from the European Social Survey (2020-2022), our research provides a wide comparative perspective, as we examine the proposed association in 28 European nations for adult children with alive parent(s) and parents with adult children as well. We measure the quality of intergenerational relations via the reported level of emotional closeness, and our key independent variables are physical distance indicated by travel time and the frequency of digital contact via phones, messaging or digital screens. Preliminary results suggest that physical distance reduces the quality of intergenerational relationship in most countries, while digital forms of contact have a less widespread but (if significant) strong positive effect. Interaction models imply that a combination of digital avenues may have a pronounced effect in certain countries, and that the negative effect of physical distance can be compensated by digital avenues to a limited degree.

Reconfiguring Relations in the Empty Nest – The comparison of Polish and French Empty Nesters.

Magdalena Anna Żadkowska[1], Marta Skowrońska[2], Bogna Dowgiałło[1], Magdalena Anita Gajewska[1], Magdalena Herzberg Kurasz[1], Marianna Kostecka[2], Filip Schmidt[2]

1University of Gdansk, Poland; 2Adam Mickiewicz University, Poznan, Poland

The empty nest phase involves significant reconfigurations of family dynamics, relationships, roles, and emotions. While many psychological studies have investigated empty nest as a period of the family life cycle (Duvall 1971; Feeney et al. 1994; Liberska 2014), sociological studies of this phenomenon are less common and focus on dichotomic questions, such as whether the empty nest brings the risk of marital dissolution or whether it is a chance to renew the relationship between the spouses (Dennerstein et al. 2002; Schmidt et al. 2004; Mitchell and Lovegreen 2009).

Adult children are completing their education, finding a job, and leaving home at a later age on average in many countries (Cherlin 1997, Seiffge-Krenke 2013, Beaupré et al. 2018, cf. Eurostat). In many aspects changes in the dynamics of the transition to adulthood in Poland and France are similar to situations observed elsewhere in Europe and the USA (Arnett 2000; Galland 2003; Benson and Furstenberg 2006; Gillespie 2020; Van de Velde 2008).

Are there cultural differences among parents who face this stage of family life?

The project "Till death do us part... " consisted of 260 in-depth qualitative interviews executed in Poland and France between 2019 and 2022.

482

Our outcomes (Żadkowska et al. 2024) show that the empty nest phase is a transformative period that challenges and reshapes family dynamics, identities, emotions, and relationships. It highlights the interplay between personal experiences and societal expectations. There are many similarities between Polish and French parents in navigating this pivotal stage of life. Still, some differences mirror either the social system or the cultural norms and beliefs that shape social and gender roles.

The Impact Of Parental Divorce On The Leaving Home Process Of Adult Children In Southern EuropO

Guadalupe Quintana, Félix Requena

Universidad de Málaga, Spain

In Spain, as in other southern European countries, the family is a fundamental source of support in life processes such as transitions to adulthood for young people. However, the changes that have taken place in the family sphere, such as the consolidation and extension of divorce (Requena and Ayuso, 2021), make us wonder what impact this may have on intergenerational support networks. This paper presents part of the results of a research project that forms part of a doctoral thesis. The aim is to analyse the family support that children of divorced parents receive from both parents during the process of leaving home in Spain. To this end, in-depth interviews were conducted with both the children and their own parents.

The selection criteria for young people are: being children of divorced parents, being between 25 and 35 years old, and having ever lived away from parent's home. The sampling criteria are established according to sex, social class of origin and level of education. Spain being a family-oriented country where family support strategies during the process of youth emancipation are based on the possibility of prolonging co-residence or returning to the parents' home, we found differences in the discourse of these young people related to the changes that parental divorce introduces in terms of these support strategies.

"Momma Knows Best?": Untangling the Links Between Mothers' and Fathers' Traditional Gender Values and Their Parenting Practices

Elli-Anastasia Lamprianidou[1], Cindy Eira Nunes[1], Ruth Gaunt[2], Gaëlle Venard[1,3], Stijn Van Petegem[1,4]

1Université Libre de Bruxelles, Belgium; 2University of Lincoln, UK; 3Université de Lausanne, Switzerland; 4FNS-FNRS Fonds de la Recherche Scientifique, Belgium

In this study we used gender essentialism as a lens to examine culturally embedded gender inequalities between mothers and fathers. Gender essentialism pertains to the belief that men and women are biologically distinct, and thus better suited for different societal roles and behaviors (Bem, 1993), including parental roles (Hays, 1996). In the specific context of parenting, an essentialist view of gender can explain traditional gender values and expectations, seeing mothers as better suited to caring for children. Previous research has focused on the relationship between parents' traditional gender values and their involvement mostly in terms of quantity, that is hours spent on childcare. By focusing on the quality of parental involvement, this study aimed to fill previous gaps by investigating the relationships between mothers' and fathers' gender essentialist beliefs and their involvement in positive (i.e., parental responsiveness, autonomy support) and negative parenting practices (overprotection, controlling parenting). Our sample consisted of 1,260 Belgian heterosexual parents (Mage = 49.6 years old; 62% of mothers) of adolescents. For both mothers and fathers, the endorsement of gender essentialist beliefs was related to more involvement in negative parenting practices. Additionally, among fathers, gender essentialist beliefs were associated with less involvement in positive practices. These findings highlight the importance of considering parental gender values when studying parenting, as these can play an important role in understanding the quality of parents' involvement in their children's lives.

483

Examining the Interplay Between Fathers' Involvement and Mothers' Gender Essentialist Beliefs about Parenthood

Cindy Eira Nunes[1], Elli-Anastasia Lamprianidou[1], Gaëlle Venard[1,2], Stijn Van Petegem[1]

1Université Libre de Bruxelles, Belgium; 2University of Lausanne, Switzerland

Despite changing societal expectations towards fathers' involvement in family life, important gender disparities persist within most Western countries (Sullivan et al., 2018). Research has increasingly investigated the factors that might hinder fathers' involvement and try to understand contemporary family dynamics. In this study, we address the question of the potential mechanisms that might underlie this persistent gender gap. We longitudinally tested two hypotheses: (1) mothers' endorsement of gender essentialist beliefs, according to which fathers are biologically less suited to parenting (Pinho & Gaunt, 2021), would predict less father involvement across time through mothers' gatekeeping (i.e., maternal behaviors that discourage and control fathers' involvement in childcare); (2) fathers' lower involvement would, in turn, predict mothers' endorsement of gender essentialist beliefs across time. Thereby, we particularly focused on positive types (i.e., responsiveness and autonomy support) and negative types (i.e., overprotective and controlling parenting) of involvement. We used three-wave longitudinal data from 167 heterosexual Belgian couples. Cross-lagged models indicated that mothers' essentialist beliefs did not significantly predict change in any of the fathers' parenting practices. However, each of the four parenting dimensions predicted change in mothers' essentialist beliefs. Nevertheless, when we examined the effect of mothers' essentialist beliefs (at T1) on fathers' parenting (at T3) through maternal gatekeeping (at T2), we found evidence for an indirect effect of mothers' essential beliefs on fathers' responsiveness, autonomy support, and controlling parenting. In conclusion, our findings highlight that mothers' gender essentialist beliefs about parenthood and fathers' parenting may mutually reinforce each other across time.

The Parental Night Shift: Gendered Inequalities in Night-Time Care in the Accounts of Finnish Parents.

Petteri Eerola[1], Armi Mustosmäki[2], Henna Pirskanen[3]

1University of Jyväskylä, Finland; 2University of Eastern Finland, Finland; 3University of Lapland, Finland

This paper examines gendered inequalities in parenting in families with young children from the novel perspective of night-time care and the intimate, 'forgotten hours' between late evenings and early mornings. This 'parental night shift' is studied in the era of intensive parenting, in which the expectations placed on parents – especially mothers – have shifted dramatically over recent decades and parenting has become more emotionally absorbing, labour intensive, and expert-guided. Theoretically the study is based on family studies, gender research and sociology of sleep. We understood the parental night shift as a form of unpaid, gendered hidden care work. Our starting point is that the requirements of paid work and work life become part of intimate practices and negotiations of care at home, and therefore the paper also draws on the existing work-life and care research.

In the paper we analyse gendered inequalities in night-time care through the written narratives (n = 53) and interviews (n = 25) of Finnish parents of different gender, social class and work-life situation and living in various family configurations. The empirical data gathered in 2022 is analysed by applying discursive and narrative methods.

Our preliminary results suggest that night-time care is highly gendered phenomena and a burden often borne by mothers due to their primary carer roles that relate to embodied, cultural and affective, difficult to describe, reasonings. It also seems that parents' experiences on night-time care vary according to families social class, work-life demands and roles and other factors.

RN13 | T08_02: Violence and constraint in family formation

Exploring Marriage Formation Process through Bride Abduction in South Kazakhstan

Laura Makhulbayeva

University of Edinburgh, United Kingdom

No publicised research has been conducted on bride abductions in Southern Kazakhstan since Werner's research in the 1990s who estimated that about 71% of all marriage cases involved abduction. Based on a PhD research, this presentation aims to address two aspects neglected in previous studies. First, it examines the marriage process through the eyes of not only the brides and the consent given by them, but also through the motives and roles of other actors – family members and the broader community – involved in the marriage formation and decision-making processes, and the influence of socio-economic and cultural norms within which these marriages are formed. Second, it examines how pre-marriage couple relationships are developed in this context.

Building on 56 semi-structured interviews with brides, grooms and their family members, the research confirms that different forms of bride abductions are still common practice in the region. Drawing on Werner's typology, it classifies these as 'non-consensual bride abduction' – in which the bride does not give any consent to the marriage prior to the abduction, and 'semi-consensual bride abduction' – in which the bride does not give her consent to the abduction but sees the young man as a potential groom. However, the research subsequently departs from this typology, by viewing bride abduction and the marriage formation as a complex process which involves different stages and the participation of various actors. It highlights that decisions on marriage are made by families collectively, rather than by isolated actors, as well as the power and gender relations within these processes.

How Common Are Forced Marriages In Germany?

Mathis Herpell, Alexandra Orlova, Niklas Harder

German Center for Integration and Migration Research (DeZIM), Germany

Forced marriages are repeatedly discussed in the context of integration and migration, in Germany. This has even led to the passing of legislation aimed at strengthening the persecution of forced marriage. So far, research on this topic has focused on women in women's shelters and relied on the social workers' categorization of marriages. While this approach was able to shed light on forced marriages in some particularly conflictual situations, this selective access to the population of interest has left important questions unanswered. Currently, it is neither known, how many people are in a forced marriage, nor which people are affected by it, in Germany.

In our study, we apply a Bayesian network scale-up approach to estimate the number of people in forced marriage and investigate, how forced marriage is distributed by age, gender and migration background. To do this, we leverage two surveys: In the first, we test our survey items and collect context information on a convenience sample to ensure the validity of our approach. We then ask refined questions to a representative sample. This approach allows us for the first time to produce an estimate of the propensity of forced marriage in Germany.

The Role of The Family in Women's Perceptions And Experiences of Violence

Hediye Sibel Kalaycioglu[1], Oya Kalaycioglu[2], Oznur Usaklilar[3]

1MIDDLE EAST TECHNICAL UNIVERSITY, Turkiye; 2ABANT İZZET BAYSAL UNIVERSITY, BOLU, Turkiye; 3MIDDLE EAST TECHNICAL UNIVERSITY, Turkiye

This paper examines the institution of the family in women's perceptions and experiences of intimate partner violence. The study is based on the results of a project which aims to evaluate policies and practices in combating violence against women through a gap analysis method, which was supported by the Scientific and Technological Research Council of Turkey (TÜBİTAK) between 2020 and 2023. Data is obtained from semi-structured in-depth interviews conducted with 36 women in 12 provinces of NUTS-1 statistical regions of Turkey. Women in their narratives state that their families of origin come to the fore in three stages in their experiences of and reactions to violence they face from their husbands. Firstly, they state that experiences such as poverty, violence, and loss of parents in their families of origin prevented them from standing on their own feet. Not being able to continue their education, their lack of a profession or a vocation, led them into "wrong" marriages. In the second stage, during the period of post-marital violence, women think that the lack of support from their families causes the violence to continue and accelerate. Those who receive family support say that family support is significant for ending the violent relationship. In the third stage, they say that the positive or negative approaches of their families of origin towards violence they face are effective on their decisions to end the marriage and/ or seeking public institutional support. In conclusion, this study reveals that the family, especially the root family, plays an important role in women's experiences of violence, their perceptions and reactions to violence as well as asking for support from public and non-governmental organizations.

Gendered Rural Housing Pathways of Woman Exiting Patriarchal Families. Empowerment Strategies of Working-class Rural Stayers in Poland.

Sylwia Urbańska

University of Warsaw, Poland

To better understand the impact of macro – and meso – changes on family relationships, it is useful to look at rural areas and at the family experiences of rural residents. In particular, the experiences of working class women, whose patterns of empowerment and emancipation from patriarchal family are still little known. The aim of this paper is therefore to discuss two questions. First, what are 'the gendered rural housing pathways' practiced by working-class women who have decided to leave patriarchal family relations (divorce, escape from violence) while still staying in the local social worlds of traditional villages? Second, what are the consequences of these alternative residential trajectories for the social transformation of rural family relations?

The analysis is based on qualitative research conducted in the most traditional eastern region of Poland. The study combines biographical interviews (N=30) and participant ethnography (12 months) conducted between 2018-2022 in the (post)agricultural, Catholic, and far-from-town rural municipality.

By proposing the concept of 'gendered rural housing pathways', I show how the intersection of gender, class and rural locational capitals enables the empowerment of women with the least economic and educational capital (bartering labour for housing, buying own houses). I also analyse the impact of these pioneer biographies on the changes of the moral and families' patterns in the villages studied – in the context of three decades of multidimensional rural transformation (e.g. ageing, depopulation, mobility, deagrarisation and proletarisation) in Poland.

RN13 | T08_03: Parenting challenges

Intensive Parenting Practices in Lithuania: Transgressing the Middle-class Boundaries?

Živilė Oertelė[2], Aušra Maslauskaitė[1,2]

1Vytautas Magnus University, Lithuania; 2Lithuanian Centre for Social Sciences,

Researchers argue that while being a middle-class phenomenon intensive parenting increasingly becomes a normative ideology that transcends class boundaries (Sjödin & Roman 2018). This ideology not only prioritizes achievement, competitiveness and instrumentalism but also perceive children as projects to be moulded into a particular kind of social subjects. At the same time this ideology promotes standards by which women and men are defined and judged. Parents and in particularly mothers grapple with constant pressure to be accountable for all aspects of their children's lives.

Despite the normative reach of intensive parenting across social classes, distinct divisions might persist in everyday parenting practices. Middle-class families, with their elevated overall resources, might find it more manageable to navigate the intricacies of intensive parenting, meeting the normative guidelines with greater ease.

Using the data from the representative Families and Inequalities Survey (N=3000), in this paper, we examine how the intensive parenting practices are linked to the social class in Lithuanian society. Our study focuses on families with young children, examining various empirical aspects of intensive parenting. To measure the parenting practices, we use the Parental Efficacy Scale (Van Ijzendoorn et al. 1999) and Parenting Style Scale (Aunolos, Nurmi 2004; Sebre, Jusiene 2015). The social class position is measured with the objective and subjective indicators. Despite expectations, regression analysis, incorporating additional controls, indicates a weak predictive relationship between social class and parenting style and parental efficacy outcomes. This prompts a hypothesis that the weak association may signify the widespread adoption of intensive parenting practices in society. However, the authors caution that measurement issues should also be taken into account when interpreting the findings.

Family Roles And Identities Change In Ukrainian Families In 2022-2024

Olga Sovenko

University of East Anglia, United Kingdom

The research task of the held project is to reveal how the crucial change in living circumstances have changed the family life, family structure, values, priorities, roles and identities

486

with the connection to social interests, practices and other social institutions inside and outside of Ukraine.

The project results are based on three main parts of a field work:

1. Survey (August 2023, 3 groups of women, 356 participants from Ukraine) – IDP families; wives, whose husbands are serving / served in 2022-2023; women who have traveled abroad and returned to Ukraine as the refugees, with their family members.

2. Series of in-depth-interviews (Febrary-May 2024, 30 women from the hosting European countries).

3. Survey (February 2024, 3 groups of women, 600 participants from Ukraine and the hosting European countries) – mapping of identities which they are having revealed more or less during the 2-years of the full-scale war period.

The findings cover family composition, family life aspects change, analyzing the women's role in the decision-making and family well-being in the changed circumstances, with a special stress to parenting, partners' relationships, roles and identities shifting.

It is crucial to track the families' transformation within the institutional structure of different (native and hosting) societies.

Comparing the attitudes for the previous / current life of Ukrainian women, we find out their coping strategies and values modification. Also the issue of a transformed social capital is discussed.

Cultural Norms Regarding Parental Employment: A European Comparison

Leonie Kleinschrot, Inga Laß, Martin Bujard

Federal Institute for Population Research, Germany

This study compares cultural norms regarding the labour force involvement of parents with young children in different European countries. A country's political and institutional framework structures gender arrangements by determining parents' options for reconciling family and work and by transmitting cultural norms regarding maternal or paternal roles.

Whereas previous research focused on the effects of welfare states on gender role attitudes in general, we use a more concrete measure: attitudes towards the ideal number of weekly working hours for mothers and fathers with two-year-old children. Thus, we examine attitudes towards the extent and division of parental employment. We use data from over 30,000 respondents aged 18-50 from the 2020 Generations & Gender Programme from six different countries that differ significantly in their policies to support working parents (Czech Republic, Denmark, Estonia, Finland, Germany, Norway).

Descriptive analyses show that across countries people consider part-time employment to be ideal for both parents. The ideal working week for fathers ranges from 31.5 hours in Estonia to 35.9 in the Czech Republic. In contrast, the ideal working week for mothers ranges from 9.7 hours in the Czech Republic to 32.2 in Norway. This suggests that

people in defamilialistic welfare states are less likely than those in the familialistic countries to support a traditional division of paid work between parents of young children. In multilevel regression analyses, we will further test whether these differences are policy or compositional effects by including macro – and micro-level factors such as country-specific childcare rates or individual educational level.

487

RN13 | T08_04: Singlehood and childlessness

Unraveling Gendered Trends in Singlehood Across Birth Cohorts and Countries

Laura Robberecht, Gert Thielemans, Dimitri Mortelmans

University of Antwerp, Belgium

Research worldwide has shown an increasing prevalence of the unpartnered and those living alone across all age groups in the last decades. These trends cannot solely be explained by an aging population. Moreover, the trends differ according to gender and show substantial cross-national variation. Singlehood research has been lacking a multidimensional approach, focusing only on a certain type of single, while limited research has pointed towards different trends according to different types of singles. Moreover, there have been different conclusions according to birth cohorts and gender. Therefore, this study aims to bring this together while providing insight into cross-country differences taking different types of singles into account in Europe and the United States, exploring variation according to gender and birth cohort.

For this paper, we map trends in singlehood using multiple longitudinal datasets consisting of retrospective studies (Share, FFS) as well as prospective studies (Pairfam, GSOEP, PSID, Understanding Society). The data includes birth cohorts ranging from 1931-40 to 1971-80 across 42 countries. We use several descriptive methods to map gendered trends, including sequence plots to investigate variation in different types of singlehood among cohorts throughout different life course stages. In line with previous research, we expect a rise in occurrence, but not in the numbers of years spent in singlehood. Furthermore, we expect that the rising prevalence of singlehood is largely due to an increase in singlehood among women in more recent cohorts.

A (Wo)man with a Plan? Understanding Life-course Plans among Single Emerging Adults.

Margot Bracke, Dries Van Gasse, Dimitri Mortelmans

University of Antwerp, Belgium

Even though the number of single (young) adults is rising, singlehood is often seen as a temporary status after which individuals settle with a romantic partner. This paper focuses on developmental tasks that explain periods of singlehood, as some tasks could be prioritised over others. Research among young adults found that being single allowed young adults to pursue individual goals and interests, and therefore, they deliberately delayed romantic involvement.

This paper addresses the fundamental assumption behind this rhetoric, which is the idea that emerging adults plan their relationship status. The 'Developmental Tasks'-argument implies a conscious and planned path that young adults foresee for their (future) relationship status. Using 43 qualitative in-depth interviews with single people between 25 and 35 years; we pose the research question of "how emerging adults plan their relationship status if they plan at all?".

The study contributes to the literature by expanding knowledge on reasons for periods of singlehood among emerging adults. It remains to understand how and why young adults plan their relationship status, prioritising certain developmental tasks over romantic involvement. This will give better insights into young adults' life choices and experiences, especially since earlier studies have shown that there are more developmental tasks than in earlier cohorts and that the sequence of these developmental tasks is less fixed.

Is Precarious Union Formation Making it More Difficult for Women with Low Educational Attainment to Enter Motherhood?

Nadia Sturm, Jan Van Bavel

KU Leuven, Belgium

488

Until recently, highly educated women have been more likely to remain childless than women with lower eductional attainmant but there are signs that this has been changing in a number of European countries. One reason is that is has become increasingly difficult for women with low educational qualifications to secure a stable partnership, which in turn may be related to the rise of the dual earner family model, where women's labour market earnings have become increasingly important for the family's economic wellbeing. Results from single-country studies have shown increasing childlessness and postponement of births among the lower educated indeed, especially in the Nordic countries. Nevertheless, general trends across regions in Europe remain unclear and the focus lies on descriptive results rather than testing causality. The aim of this article, therefore, is analysing how women's likelihood of having a first child is influenced by their educational level and to what extent this relationship can be explained by changing selection into partnerships. We explore these relations using European Social Survey data from 2006 and 2018 from 27 countries. We jointly model union formation and entry into parenthood and their interrelationships using structural equation modeling, and compare the results with what we find for men.

RN13 | T09_01: Gender and family roles II

Attitudes Towards Gender and Family Roles in Czechia: Change Between 2005 and 2020-2022

Dominika Perdoch Sladká, Tereza Fabíková

Masaryk University, Czech Republic

Czechia is one of the countries where the employment of women (and mothers) is relatively high, but the division of family responsibilities remains traditionally gendered. This study explores how attitudes towards gender and family roles developed in Czechia between 2005 and 2020-2022. We analyze data from the Generations and Gender Survey, rounds 1 (2005) and 2 (2020-2022). The sample includes 8,543 respondents aged 18-49 years (M = 33.7, SD = 9.2). As measures of attitudes, we utilize respondents' agreement with statements that concern women's and men's roles and the centrality of children in their lives. Data are analyzed using multinomial logistic regression models. The preliminary results suggest a large shift toward less traditional attitudes. The probability of agreeing that women need children to be fulfilled decreased from 0.69 in 2005 to 0.33 in 2020-2022, and agreement that men need children decreased from 0.5 to 0.25. In both cases, women's attitudes changed significantly more than men's, and female respondents considered parenthood less essential in both women's and especially men's lives than male respondents. Men and women were also less likely to think that a preschool child suffers if their mother works in the later period. The changes were dependent on education, with highly educated people experiencing a steeper decrease in traditional attitudes.

Potentials of Innovative Digital Technologies for Household Management

Ksenija Klasnić, Đurđica Degač, Vedran Halamić, Izvor Rukavina

University of Zagreb Faculty of Humanities and Social Sciences, Croatia

Mental labor is the invisible and understudied cognitive and emotional work related to childcare and household management. Household tasks and responsibilities which are complex and time-consuming often disproportionately burden women, causing excessive mental load. Digital technologies, and artificial intelligence (AI) in particular, have the potential to revolutionize household management by automating tasks, streamlining communication, and providing personalized support. This study examines the potential of AI tools and other innovative digital technologies for household management, with a focus on gendered differences and a particular emphasis on employed mothers' needs.

Findings from a mixed-methods study conducted in Croatia show data from a representative sample of individuals in heterosexual relationships on the gender differences in the use of applications or programs that help to better organize and plan household and family obligations. The interviews with employed mothers provide insights into the specific challenges they face in managing their households and their experiences with different digital tools. The interviews with IT professionals provide insights into the potential of AI to address the challenges faced by employed mothers. Based on the findings of this study, we offer several recommendations for the development of AI tools for household management including personalization, intuitiveness and options for household members collaboration. Development of AI tools that address these recommendations could have a significant impact on the quality of lives of employed mothers. These tools could help to reduce their mental load, improve their work-life balance, and enable a more gender-equal distribution of responsibilities in the private sphere.

Traversing Spatial and Temporal Redefinitions at Home During Long Career-Break: Barriers and Strategies of Return of Women Professionals in the UK

Renu Gupta, Gill Kirton, Suki Sian

Queen Mary University of London, United Kingdom

Amidst the prevalence of research on women returning to work after maternity-break in the UK, this paper focuses on the overlooked experience of women professionals returning from extended career-breaks and asks: how does the experience of extended career-break influence women's perception of barriers, and their strategies of return-to-work?

The paper draws on the structure-agency debate and Anthony Giddens' theory of duality of structure to understand the role of family practices in women's return journey. The theory explains the recursive nature of 'practices' and the constraining and enabling effects of 'structure' within which action takes place. Specifically, the paper employs Giddens' construct of domination (structure) that directs the distribution of resources (modality) and is expressed as power (interaction).

Utilising qualitative data collected through interviews with 42 female participants with career-break between 2 to 10 years and undertaking thematic analysis, the paper illustrates the link between gendered practices at home and individual time-availability, and how it affects family power dynamics and women's re-entry into the workforce. As the couple's relative earnings shape the structure of dominance in unequal distribution of domestic work, power is exercised by the earning male partner through avoidance of housework. The consequent tension and inequity in access to time becomes a barrier to women's return, reinforcing the earnings gap that serves as both a medium and outcome of unequal labour practices within the family.

489

The paper emphasises women's 'agency' in their return-to-work decision but highlights the perceived decrease in women's ambitions, linking it with their cognisance of time constraints and work-family conflicts. The paper establishes that in the resultant strategy of 'finding a fit', women's agency is outweighed by their structural context.

RN13 | T09_02: Family ideologies

Four Decades of Trends change in European Family values: towards a postmodern family?

Mercedes Camarero

Universidad Pablo de Olavide, Spain

The aim is to identify and describe how the ideals regarding marriage or long-term coupling and family caring values in the last decades, between 1980 and 2017, have changed: both about an adult child's duty to care for an ill parent and parents' responsibilities to their children, related to the social meaning of children.

Findings are based on data from the five waves of the European Values Study (1981, 1990, 1999, 2008, 2017) for all 30 European countries participating in the EVS (26 European Union countries plus Iceland, Great Britain, Norway and Switzerland).

To obtain this broad picture describing the ideals regarding marriage, we have developed a typology of marriages based on data from the 2008 and 2017 European Values Study and inspired by Louis Roussel's models. Two criteria have been used to classify evaluative opinions on marriage and construct the ideal types: the nature and function of the bond between partners. The first criterion, the nature of the relationship, differentiates those who favour an Alliance model (43% of Europeans in 2008 and 20% in 2017), a Fusion model (38% and 48%) and an Association model (19% and 32%).

In summary, we describe how the social values guiding couple relationships and relationships between parents and children and adult children and elderly parents have transformed in the last two decades. We apply a principal component analysis to understand the data's logic, followed by a typology of countries.

490

From Renters to Investors?: Residential Property and the Asset Economy in German Couples' Lives

Robin K. Saalfeld

Friedrich-Schiller-University Jena, Germany

Research Question: How do the aspirations of German couples towards residential property reflect broader shifts in Germany's housing market?

Theoretical Approach: This study employs the asset economy (Adkins et al. 2021) as a central theoretical framework, complemented by Karl Mannheim's concept of orientations.

Data: Based on in-depth interviews with 47 German couples, diverse aspirations towards residential property are

captured, considering generational, socio-economic, and regional variations.

Methodology: A qualitative approach categorizes and interprets couples' aspirations using the Documentary Method, discerning patterns and influences shaping property perceptions.

Main Findings: The study identifies a divergent perception of residential property among German couples. While a small segment views residential property primarily as an asset to be optimized, the majority still perceives it as a once-in-a-lifetime family investment, emphasizing stability and long-term security over speculative gains. Additionally, the youngest cohort faces significant barriers accessing the housing market, primarily due to rising house prices in major German cities. This challenge has prompted varied responses: some young couples are turning to less expensive rural areas to achieve homeownership, while others, constrained to renting in urban centers, are increasingly engaging with the asset economy through alternative financial strategies and products.

Interpretation: The emphasis on homeownership among couples, even younger ones facing market barriers, hints at an economic development in Germany where the asset economy's influence is burgeoning, though not yet predominant. The research reveals a complex interplay between economic changes, the evolving role of property, and intimate lives.

Family And State Intervention In Young People's Gaming Behaviours And Its Effect On Family Relationship

Dajun Wang

university of glasgow, United Kingdom

In the digital age, the contradiction between mobile games between parents and children is becoming more common. Parental surveillance on mobile phones allows access to digital conversations and photos, enabling continuous contact with young people. Additionally, the emergence of applications, such as youth protection models and parental controls, legally facilitates parents in monitoring their children's online behaviour (Boyd & Hargittai, 2013). Lachace's (2019) study underscores the adaptability of teenagers to parental monitoring. Furthermore, the Chinese government published one policy about the time and money youth can spend on mobile games in 2021.

This research, based on 1,800 questionnaires and 20 family interviews, addresses the following:

(i) The current state of online gaming among young people, along with parental and state interventions in China.

(ii) Identification of problems and their impact on family relationships.

(iii) Exploration of potential solutions to enhance family relationships and establish an appropriate level of intervention in young people's gaming.

Key findings from the survey and interviews include:

1. Limited understanding of the country's anti-addiction system, leading families to provide personal information for youth to play mobile games; despite this, most parents do not endorse youth gaming.

2. Parents resort to reasons like protecting eyesight or being busy with schoolwork to encourage youth gaming, resulting in conflicts with their children.

3. Parents often use short single-player game durations (10 minutes) to control their children's gaming, displaying a lack of in-depth knowledge about mobile games and insufficient communication with youth.

Narratives of Joy: Exploring Non-Religious Identity Construction across Humanist Family Generations in Western and Eastern Europe

Morena Tartari[1], Hamide Elif Üzümcü[2]

1Babeș-Bolyai University, Romania; 2University of Padua, Italy

From a sociological perspective, the construction of non-religious identities is still largely unexplored, particularly when it concerns atheist families' everyday life and discourses on joy and happiness. This paper aims to fill in this gap by discussing the results of two research studies on secular Humanist movements in Western and Eastern Europe, which explore the everyday life of non-religious families, their activism, and practices.

The research projects RE-Green and WHosGreen, funded by two distinct research grants, involves six countries (United Kingdom, Norway, Italy, Romania, Slovakia, Hungary). This paper is based on the data collected so far in United Kingdom, Norway, Italy, and Romania, as parts of these research projects which are still in progress. In this paper, the data discussed come from in-depth interviews involving Humanist grandparents, parents, and children, which investigate – among other themes – discourses and practices concerning joy in the everyday life of atheists, agnostics, and humanists.

Results allow for a discussion of how non-religious identities are discursively constructed through generations. The themes emerged from the interviews stress the relations between joy, agency and institutional discourses on happiness built from the Humanist non-religious organizations of which the interviewees are members.

This paper also aims to contribute to demonstrating the methodological and theoretical importance of addressing joy in sociological research to understand the experience of minorities and marginalized groups, particularly within the dynamics of family and intergenerational relationships.

RN14 | T01_01: Session 1: Family Constraints

Navigating in the Familistic Sunset: Conjunctions Among Fragmented Life Paths. A field Research

Fatima Farina

Urbino Carlo Bo, Italy

The pluralization of private life choices conflicts with the formulation of public policies based on a rigid and reductive definition of family. In recent decades, economic and syndemic crises have highlighted the social interdependence that often extends beyond blood ties and is instead built on proximity networks or shared living conditions. The gap between practices and policies thus creates a significant challenge not only from a cognitive perspective but also for the development of appropriate policies for individuals involved in forming affective relationships, mutual aid, and care.

The paper explores the constraints of a familistic welfare system rooted in blood ties and female care, drawing from the outcomes of the Conjunctions research conducted in Italy, which encompasses nearly 60 comprehensive interviews. The objective is to achieve a profound comprehension of elective social networks, enduring relationships, and mutual support. The analysis incorporates factors such as the risks of exclusion, the divergence in life and work paths (including territorial mobility), and the escalating demand for aid in response to an aging population and the intensification of existential precarization.

Dual Care: How Did Mothers Working as Teachers Survive the COVID-19 Lockdown?

Réka Geambașu[2,3], Beáta Nagy[1]

1Corvinus University of Budapest, Hungary; 2Babeș-Bolyai University, Romania; 3HUN REN Centre for Economic and Regional Studies, Hungary

An increasing number of studies have focused on how the COVID-19 pandemic affected women's labour market status and how, under the sudden suspension of educational, social, health and leisure services, women could cope with care tasks. Mothers raising small children were particularly affected by the exacerbated care crisis of the pandemic. While schools applied various strategies to adapt their activities to online means of communication, teachers were

a social group heavily faced with the need to adjust their activities to the lockdown.

The paper focuses on how those mothers who were educators dealt with the double expectations of caring for their children and their students. Our research explores the factors behind their strategies to accommodate the needs of their families, their own children, and their pupils. To investigate these questions, in May 2020, we conducted 52 interviews with Hungarian mothers working from their homes, of which 25 interviewees were teachers or educators. In the analysis we identified four main factors shaping the strategies applied: 1) the characteristics of educational activities, the relative importance of the subject taught, their students' age; 2) the interviewees' professional ethics and identity; 3) the family setting with special regards to intensive mothering and spousal hierarchies; and 4) expectations of the school management. We also found that despite the various negative experiences caused by structural shortcomings, interviewees individualized both the difficulties and possible solutions.

Gendered Experiences in Gendered Organizations: How Qualitative Researchers Experienced the Covid-19 Pandemic

Beata Bielska[1], Sylwia Męcfal[2], Adrianna Surmiak[3]

1Nicolaus Copernicus University in Torun, Poland; 2University of Łódź; 3University of Warsaw

There is empirical evidence that Covid-19 affected men and women differently. In academia the feminization of the pandemic was especially visible in a lower rate of submitted publications. There are, however, other aspects of academic work that need reflection.

Going beyond the binary gender, we would like to present how participants representing different types of femininities and masculinities organized their research work during the Covid-19 pandemic: how their methodological and ethical approaches differed.

Our analysis is based on 42 in-depth interviews with a biographical component with men and women, before, with or after PhD, with and without children, who conducted qualitative research during the Covid-19 pandemic. The theoretical frames for the presentation are Joan Acker's theory of gendered organizations and R. W. Connell's masculinities theory.

492

Beyond the Home Office: Understanding the Emotional Landscape of Telecommuting Intensity during the Pandemic

Shan Peng

Tohoku university

Over the past three years, the prevalence of COVID-19 has led to an increasing trend of individuals adopting remote work arrangements. However, there is no consensus in the literature on how telecommuting tensity affects workers' mental health. Using data from the COVID-19 Survey in Five National Longitudinal Cohort Studies: MRC National Survey of Health and Development, 2020-2021, this paper examines how subject negative and positive emotions vary among telecommuting workers between high tensity and low tensity using time and individual fixed-effects models. The research finds that low-intensity telecommuting is associated with more negative emotions compared to high-intensity telecommuting. The effect of telecommuting on workers' well-being also varies by social capital and gender. The frequency of chatting outside of an individual's household reported a lower level of negative emotion. Female and high-intensity telecommuting workers experience the lowest level of negative emotions. Besides, the frequency of meeting people outside of the household mediated the negative effect of telecommuting tensity and negative emotions. This paper provides new evidence on the impact of telecommuting during the pandemic and sheds light for policymakers and employers to re-evaluate the benefits of telecommuting.

RN14 | T01_02: Session 2: Motherhood

Perceptions and Expectations About Motherhood: Two Case Studies on Women in Highly Demanding Professions

Beatriz Mañas Ramírez, Luis Camarero Rioja, María Gómez Escarda

Universidad Nacional de Educación a Distancia (UNED), Spain

This presentation is part of the project "Fertility, motherhood and high professional demands: women in the military and high-level female athletes", funded by BBVA Foundation in its 2021 call for Scientific Research Grants.

In the Spanish demographic context, considered of lowest-low fertility (Wilkins, 2019; Esteve et al., 2021; Baranda, 2019), it is well known that for several decades the achievement of women's educational and professional projects has had an impact on family formation strategies, including delaying the age of motherhood, and a gap between desired and actually observed fertility (González and López, 2021; Baranda, 2019). This situation evidences the difficulties that still exist for many Spanish women to reconcile desires for motherhood with professional careers.

From a research approach that considers groups especially representative of the processes studied as key cases for their understanding, and through a mixed methodology (qualitative and quantitative), this research analyzes the decisions, expectations and perceptions about fertility and motherhood in two specific groups of women whose professions involve a very high level of demand and commitment during the reproductive ages: high-level female athletes and military women.

The results show the different dimensions that shape the expectations, perceptions and obstacles surrounding reproductive decisions in these conditions of special professional demands. Also, we analyze the differences between these two case groups and with respect to women in the general population. The conclusions can help guide policies and measures aimed at reconciling professional projects without renouncing the desires of women who wish to become mothers.

493

Reconciling Work and Motherhood: Unravelling the Effects of Family Policies and Labour Market Regulations on Mothers' Wages

Anna Gerlach

Goethe University Frankfurt, Germany

Despite much progress, gender differences in the labour market persist in modern economies, and motherhood in particular continues to have a negative effect on women's careers. States can implement family policies to promote mothers' employment by making it easier to reconcile work and family life. They can also introduce labour market regulations to increase job security and pay equity. However, these policies can have unintended consequences for mothers' wages, and the effects may vary by mothers 'educational attainment. This paper asks how mothers' wages evolve after the birth of their first child and whether the effects of family policies or labour market regulations differ across educational groups. I analyse panel data for 26 European countries from the EU-SILC and the SOEP and combine it with policy measures from Eurostat and the OECD. Using multilevel models, I show that family policies that facilitate the reconciliation of family and work, such as extensive childcare availability, are associated with higher wages for all mothers, and this effect increases over time. However, long parental leave, which is linked to long career breaks, leads to permanently lower wages, which is most pronounced for higher educated women. Regulations that aim at more marginalized groups in the labour market, such as minimum wages and employment protection for temporary contracts, positively affect wages, while regulations that target the more protected core workforce, such as collective bargaining and protection for permanent positions, have mixed effects. The results suggest that mothers are still often treated as labour market outsiders.

Key Challenges Of Managing Pregnancy And New Parenthood For Mothers And Fathers Who Work In Small And Medium-Sized Enterprises (SMEs) In The UK

Helen Norman[1], Bianca Stumbitz[2], Clarice Santos[2]

1University of Leeds; 2Middlesex University

The transition to parenthood is one of the most impactful processes in working life and the single most important event in the gendering of careers with adverse implications for gender equality. Despite considerable progress towards more 'family-friendly' working by large trailblazing UK companies, evidence suggests that many small and medium-sized enterprises (SMEs) (employing 1-249 staff) lag behind in their recognition of the challenges parents face, and the implementation and promotion of 'family-friendly' work options.

Understanding and addressing the challenges in managing new parenthood within an SME context is important because SMEs account for 99.9% of the UK business population. Previous research focuses on experiences of pregnancy, parenthood, and employment in large organisations and thus excludes the majority of workers. SMEs often do not have a dedicated Human Resources department or formal maternity or paternity policies, which can generate inequalities for those juggling work and care. However, less hierarchical structures may also be associated with closer, family-like relationships that influence the level and nature of support provided to expectant and new parents.

This paper draws on data from 40 in-depth interviews with expectant and new mothers and fathers (which is part of a larger, Economic and Social Research Council (ESRC) funded study on the 'Transition to Parenthood in SMEs'). We conceptualise adaptions to new parenthood as a process of mutual adjustment (employer and employee ad hoc bargaining) in the context of gendered organisations with the key characteristics of SMEs (e.g., more informal staff management and resource scarcity). We find that participants experience SME specific work-life reconciliation challenges, but also identify good practice examples that both SMEs and larger workplaces can learn from.

Internalised and Normalised Bodily Experiences of Mothers in Precarious Work

Blessing Chukwuka

Queens University Belfast, United Kingdom

Extant literature situates the maternal body as valuable in public space yet 'monstrous' (Gatrell, 2011; Riad, 2007; Thanem, 2011) and 'out of place' in the workspace (Gatrell, 2008) which resultantly increased embodiment research in the world of work. This qualitative research delves into the maternal bodily experiences of mothers engaged in precarious work, particularly those facing financial constraints. The study highlights the intricate interplay between the personal and professional lives of mothers in low-income positions. Struggling to balance economic pressures with familial responsibilities, participants navigate a delicate equilibrium marked by societal expectations. The tension is palpable as mothers grapple with the societal demand to embody both the ideal mother and ideal worker, further exacerbated by financial limitations. This internal conflict is reflected in the nuanced bodily experiences of these women, offering insights into the subtle negotiations required to navigate their roles. The study involves in-depth interviews with 20 participants and the findings underscore the impact of precarious work on the psyche and physicality of mothers, shedding light on the embodied challenges they face. As financial constraints intersect with societal expectations, participants reveal a complex web of internalized and normalised norms that shape their bodily experiences. This research contributes to a deeper understanding of the lived experiences of mothers in low-income jobs, unravelling the subtle dynamics between personal and professional realms in the context of precarious employment.

RN14 | T02: Session 3: Work-Life Balance

Part-time Work As Solution For Work-family Reconciliation In Finland?

Johanna Lammi-Taskula[1], Johanna Närvi[1], Anneli Miettinen[2], Miia Saarikallio-Torp[2]

1Finnish Institute for Health and Welfare, Finland; 2Social Insurance Institution, Finland

Tensions between family responsibilities and paid employment are one of the key challenges for parents with young children. Part-time work has been commonly used especially by women to manage these tensions. Whereas it may have a positive impact on work-life balance and overall life satisfaction, it also carries penalties including lower status and income and weaker career opportunities. These penalties reflect a "flexibility stigma": workers who use flexible working arrangements for care purposes are seen as less productive and less committed.

Public policies in Finland aim at promoting work-family reconciliation with relatively generous leave policies combined with affordable public childcare services. Parents of young children who choose to work part-time receive a small benefit, but this option is used by less than one in ten families, mainly by mothers.

In this paper, we discuss the temporary use of part-time option and obstacles related to it among parents of young children, analysing intersections of gender with sociodemographic and labour market aspects. We use data from the Finnish Parental Leave survey collected in spring 2022 among parents with 1-2-year-old children (n= 1524 fathers, 1824 mothers).

Preliminary results show that parents with a better position in the labour market are more likely to temporarily swift to part-time work. For them, obstacles to part-time work are related to work pressure rather than family economy. Among fathers, part-time work is also more common among those who have previously taken full-time child care leave, supporting their spouse's return to work after parental leave.

The results suggest that socio-economic disparities in sharing childcare responsibility and family leave between parents are reflected also in the gendered "flexibility stigma" in the labour market.

Is Work-Family Balance (still) The Province Of Women? Opportunities And Inequalities In Portugal and Spain

Edna Costa

EEG/CICP – Universidade do Minho, Portugal

Work-family balance (WFB) has been in recent decades at the centre of debate as the share of dual-earner families with small children has significantly increased. As a result, traditional strategies for the articulation of work and family have been questioned, claims for more gender balanced options became critical and WFB has been included in the set of "new social risks", alongside other crucial challenges to welfare states.

This paper addresses strategies and opportunities for WFB in Iberia and the gendered variation they entail, and seeks to understand the extent to which real, unconstrained choice is equally available. Despite shared historical and political backgrounds, the Portuguese and Spanish democracies present both distinct patterns of employment and care and distinct challenges in WFB which have gone largely unnoticed.

Theoretically, it draws on Sen's capability-approach, arguing that women's and men's choices are bound up with the real opportunities they have and ultimately that gender inequalities in capabilities may correspond to similar inequalities in the actual division of labour. Most importantly, instead of assuming an ideal division of paid and unpaid work that suits all working parents, it supports the maximization of available options which are, in turn, shaped by multidimensional factors at the institutional and cultural levels. Empirically, this involves the analysis of reconciliation policies (parental leaves, childcare and tax incentives) labour market features (occupational segregatio, gender pay gaps and flexibility of working times) and gender norms. It draws on publicly available data for 2019, since our variables of interest have suffered significant variations during the Covid-19 pandemic context and that is beyond the scope of this study.

The Effect of Organisational Family-friendly Flexible Work Arrangements on Women's Promotion Prospects

Susanne Irene Wanger

Institut für Arbeitsmarkt – und Berufsforschung, Germany

Even though women have been able to increase their participation in management positions to a small extent in recent years, they are still significantly underrepresented in management positions. Organisational measures to promote gender equality and work-life balance are seen as an option to reduce inequalities between men and women. Against this background, I examine whether family-friendly flexible work arrangements (FFWA) in firms can promote the advancement of women into leadership positions (including

495

part-time) and thus contribute to reducing gender inequalities in firms. This is investigated using a German linked-employer-employee dataset (LIAB) from 2012 to 2016 and logistic panel regression models.

First, the analysis shows that FFWA improves the chances of advancement for employees, with women and men benefiting equally. Second, FFWA increases the chances of being promoted to managerial positions with reduced working hours – this effect is slightly stronger in men. For women in highly qualified professions, the conflict between work and family is still significant. Even with FFWAs, female part-time workers still have significantly fewer opportunities for advancement, suggesting that FFWAs alone cannot overcome deep-rooted work culture and societal expectations.

Third, surprisingly, no significant effects of FFWA were found for mothers. FFWAs are generally viewed as mechanisms to help working mothers balance work and family responsibilities. However, the results suggest that even with the FFWA, mothers do not have a better chance of being promoted to a leadership position. This raises the question of whether FFWAs are being implemented in workplaces in a way that truly supports working mothers.

Work and Family Plans of Male and Female Theology Students Based on the Results of a Focus Group Study

Emese Biró, Emőke Török

Károli Gáspár University of the Reformed Church in Hungary, Hungary

The expectations, plans and goals of future pastors are developed and consolidated during theological studies. One of the particularities of the pastoral vocation is that work and private life are closely intertwined and difficult to separate. The personal choices of prospective pastors are thus also crucial in shaping their professional careers, which previous research suggests may be more of a constraint for women.

We conducted six focus group interviews with Protestant theology students preparing for a ministry career. Our aim was to find out what gender differences and similarities can be observed among the theology students' interpretations of goals, vocational success and work-life balance in their career. The plans and expectations of current pastoral students can have a decisive influence on how gender-based differences in opportunities in the churches develop.

The focus group method provides an opportunity both to explore the participating male and female theological students' own experiences that have shaped these goals and perceived or projected opportunities, and to explore the prevailing discourses among students on these issues.

The results suggest that female theology students were more reserved and cautious in their articulation of goals than their male counterparts. On the one hand, they assume that reasons outside and above them may override them and that the conservative church environment may constrain their options. On the other hand, it was repeatedly expressed that, as women, they find it difficult to reconcile pastoral work and family life and take it for granted that they will compromise more in the professional field.

RN14 | T02_02: Session 4: Poverty: Mothers, Children, Families

Contesting "Work First" Outcomes in Local Front-Line Settings in the UK and Sweden: Two Case Studies

Tove Samzelius[1], Sue Cohen[2]

1Malmö University, Sweden; 2Bristol University, UK

Social security reforms in the UK have and Sweden increasingly prioritise placing people in paid work, often using the threat of withholding benefits and thereby pushing people to take low paid insecure jobs without the training and skills support that further progression. Drawing on Nancy Fraser's theorisation on the 'politics of needs interpretation', this paper examines how work-first policies are interpreted and managed by localised interagency meetings where the undermining of women's rights, employment and skills development can be contested. Contextualised against social security reforms that put emphasis on a "work first" approach, the paper suggests that localised inter-agency meetings can become arenas where perceived hegemonic injustices are symbolically elaborated and challenged from below. Although discourses emphasising self-sufficiency and the importance of work tend to act as depoliticising and normalising, the way they are implemented in practice is not necessarily accepted passively by frontline professionals, who can question wider social inequalities, interpretive justifications, as well as harmful consequences for individuals, notably women, young adults and minoritized groups. The sharing of challenges and strategies can also encourage cross fertilization for ways forward in in improving conditions of employment and narrowing pay and training gaps

496

Family Policies and Roma Women in the Anti-liberal Political Regime and Workfare System in Hungary

Zsuzsanna Vidra[1,2], Enikő Virágh[1]

1ELTE, Hungary; 2HUN-REN, Hungary

Family policy in the Hungarian illiberal system is pro-natalist, it aims to improve the demographic situation framed as a national interest. The policy objectives are characterized by an increased role for employment-based income support, explicitly articulating "responsible parenthood". Roma women typically appear implicitly in family policy discourses. Still, the emergence and strategic use of stereotypes about welfare dependency or buzzwords about the neo-liberal inspired "work-based society" (=wokefare) in discourses designates the place of Roma women.

Using critical frame analysis, our study provides an overview of the changes in family policies starting in 2010; shows what discursive tools and narratives politicians, decision-makers, and other government actors use and how Roma men and women appear in them; and analyzes the dynamics between anti-gender discourses, illiberalism, and workfare, as well as the effects of new, employment-based family policies on the Roma in general, and Roma women in particular.

The main findings show that family policy is anti-poor and anti-Roma, with little or no support for the most vulnerable groups, and various negative impacts on Roma women. At the same time, policy discourses differentiate between "deserving" and "undeserving" Roma, those who "live for their children", and those who "live off their children". According to the ideology of "work-based society", work is framed as a route to social integration, recognition, and appreciation of Roma, or in other words, the way to become a "deserving" citizen of the country. This group also deserves to benefit from the family policy measures, and these Roma women can legitimately contribute to the increase in births.

Duress And Agency: Women In Persistent Poverty Document Their Lives

Gal Levy, Dana Kaplan, Avigail Biton, Riki Kohan-Benlulu

The Open University of Israel, Israel

How is life felt by people who experience persistent poverty? Given the systemic denial of self-representational agency from those living in poverty and the neoliberalisation of the welfare state in Israel, this paper turns to those who remained invisible to both the media and the state during the pandemic and later under the Gaza war (2023). In line with current tendencies to prioritise the lived knowledge of people in poverty, we provided our interlocutors with a specifically designed diary tool to share their mundane experiences at their own discretion. Using diaries (N=10) as well as interview data (N=35), this paper unpacks the ways participants deal with and understand their everyday relationships with the absent Israeli state, mostly in regards to welfare and education. Based on a thematic analysis of the diaries and interview data, our findings reveal the Janus-faced abandoning/monitoring state that they routinely confront. We demonstrate how they are constantly chasing the state, struggling to receive the support they lawfully deserve. At the same time, being subjected to state monitoring and surveillance often results not only in mistrust but also in withdrawing almost altogether from the welfare services and social workers, and turning to alternative support networks. We conclude by offering two insights that accentuate, on the one hand, what we and our diarists already know, namely that they count for nothing. Still, on the other hand, the act of self-documentation itself reveals the representational agency of those brave diarists who refuse to forsake their worthiness as citizens.

Abandonment and Adoptions: The Geographical Organization of a Child Welfare Policy

Nanna Dahler

Lund University, Denmark

A new approach to child welfare has seen the light over the last decade in Denmark: Adoption without consent from biological parents is used more often by municipal child protection services. Before reforms to adoption – and child welfare law in 2015, Denmark saw 1-2 yearly cases of child protection adoptions. After the reform, numbers have risen yearly, to 45 adoptions in 2022. But Danish municipalities use adoption without consent to a varying degree; while half of the 98 municipalities have not applied the policy, and a small handful of municipalities conduct half of national adoptions – most of these are poor and rural municipalities.

This paper explores the case of three municipalities that are amongst the ones who conduct most adoptions. Inspired by institutional ethnography (DeVault and McCoy 2006), the study explores the reasons behind rising adoption numbers through interviews with municipal child welfare case workers and their nearest managers. The paper points to a couple of reasons for the more frequent use of adoptions in these municipalities; a larger number of children in foster care placement coupled with a political investment in adoption as a solution. The paper uses the concept of "organized abandonment" (Gilmore 2023) to explore the conditions of austerity that paved the way for adoptions as policy, and argues that adoptions constitute a care fix (Dowling 2017) that reorganises care responsibilities geographically.

RN14 | T03: Session 5: Finances, Provision, Breadwinning

Changing Breadwinning Patterns in Europe: Cohort and Time Period Effects

Núria Sánchez-Mira, Luana Goveia Marx

Université de Neuchâtel, Switzerland

Women's earnings have become over the last decades increasingly important for household economies, with dual-earning gradually becoming the norm and female breadwinner households on the rise in many countries in Europe (O'Reilly & Sánchez-Mira, 2019; Vitali & Arpino, 2016). Younger cohorts of individuals with different labor market orientations and gender attitudes may bring changes in couples' breadwinning arrangements, but these are also the result of economic needs and employment opportunities, which fluctuate during periods of crisis (Chesley, 2017; Sánchez-Mira, 2021). Economic shocks are thus likely to trigger changes in breadwinning patterns, with distinct effects depending on the characteristics of the crisis and their sectoral impacts on gender-segregated labor markets (Karamessini & Rubery, 2014). Moreover, European countries vary a great deal in terms of socio-economic levels and patterns of breadwinning and have experienced to different extents the last waves of crises (financial crisis of 2008, Covid-19 pandemic, cost of living crisis). Against this background, this paper will analyze changing trends in breadwinning patterns over the last two decades in Europe. Using repeated cross-sectional survey data (2003 to 2022) covering 31 European countries from the EU Statistics on Income and Living Conditions (EU-SILC), we employ Age-Period-Cohort-Interaction (APC_I) models to examine how i) age-graded trajectories, (ii) economic fluctuations, and (iii) cohort replacement jointly determine the changing trends in breadwinning patterns among cohabiting couples over time and across countries. Overall, we expect cohort replacement to shift couples towards more dual earning and female breadwinning, a trend that will have been fueled by economic shocks according to their different magnitudes and nature.

Earn More, Care Less?

Simon Helperin[1], Ann-Zofie Duvander[2]

1Uppsala University Sweden; 2Stockholm University, Sweden

This study examines how women's relative earnings affect parental leave distribution in Sweden, focusing on first and second-born children from 2015 to 2019. It utilises Swedish register data and a pre-post comparison model to test if a woman's increased earnings share changes her partner's parental leave share, using a gender-egalitarian context to assess a generalized bargaining model in marital decision-making. This model posits that parental leave division is tied to earnings distribution, predicting that higher female earnings would increase fathers' leave participation. Initial findings go against a generalized bargaining model: increased earnings share for mothers correlates with reduced paternal leave for the father, challenging the bargaining model and questioning its applicability. This discrepancy suggests alternative theories like role theory or doing gender, emphasizing gendered behaviour, might be more relevant, even in gender-egalitarian settings. Despite these findings, the authors warn against definitive causal conclusions, as observed patterns could plausibly be explained by potential group differences, rather than a causal relation between earnings and parental leave division. Overall, this article contributes to understanding gender equality in parental roles, especially in countries with advanced family policies.

Parenthood and Economic Reliance: Mapping the Role of the Family, the Labour Market and the State

Hero Ashman

University of California, Berkeley, United States of America

People depend on multiple sources of income for their economic well being, including wages, earnings of family members, and state benefits. Reliance on these different sources of income is typically studied in a zero-sum framework, obscuring the ways that the family, the labour market and the state interdependently determine people's position in the income hierarchy. This is particularly true for women, whose roles within family reproductive labour often push them to rely simultaneously on their own wages and income from their partners and the state. However, in an era of labour market precarity, economic interdependence may increasingly be the case for men as well. This paper explores the degree to which reliance on direct and indirect relationships to income vary with gender and parental status. Using survey data from the US, I find that for women parenthood is associated with lower reliance on wages and greater reliance on partners' earnings. However, for men parenthood is associated with greater reliance on both wages and partners' earnings. This finding demonstrates the importance of conceptualizing reliance on different sources of income as interdependent, rather than mutually exclusive. I then map out the labour-market, income redistribution, and family-formation conditions under which direct and indirect sources of incomes are complements for one another, as opposed to substitutes. This approach to studying income attainment can be used in cross-country comparisons to better understand how gendered work-family-welfare dynamics produce income inequality.

498

Italian Audiovisual Companies Between Female Leadership, Innovation and Soft Power

Mihaela Gavrila

Sapienza University of Rome, Italy

Starting from the hypothesis that gender is embedded in the global contemporary society's individual, interactional, and institutional dimensions, this research proposes recognising female employment and empowerment in major Italian audio-visual companies. Recent data (Brand Finance, 2023) confirms that companies aiming to better manage their international brands must strategically bid on young people and women leaders (Gavrila, 2023).

Women leaders bring a unique perspective to the table, which can lead to more diverse and inclusive storytelling and content creation, and improve the overall performance and success of audio-visual companies (Andersen and Jensen, 2014; Blass et al., 2022). They can challenge traditional gender roles and stereotypes in the industry, paving the way for more opportunities for women and other underrepresented groups (Liddy and O'Brien, 2021). A progressive increase in the representation of women in creative, productive and managerial positions within Italian television can create a greater understanding of the difficulties of being a working woman and provide the added value of a female presence in Italian audio-visual companies. In addition to official data, this proposal analyses the primary data of 40 in-depth interviews with TV producers, authors and managers of successful Italian television programs. This methodology aims to trace a set of personal and professional career trajectories and their distinctive and innovative contributions to Italian audio-visual industries. The intention is to: highlight which Italian production contexts are currently favourable to the empowerment of women workers in the television industry and outline future trends: using an intersectional lens should be a general key, capable of considering, in addition to gender, the different social identities that systematically contribute to discrimination, hindering the formation of true leadership positions (EENCA, 2020).

How Do Economic Opportunities Shape Boys´ And Girls´ Math Job Aspirations? A Micro-macro Approach

Mingming Li, Wilfred Uunk, Lukas Arnold

Institute for Sociology, University of Innsbruck.

The Gender-Equality Paradox (GEP) is the phenomenon that the gender gap in STEM aspiration is larger in wealthier and more gender-equal countries. A common explanation for GEP is that boys and girls have more opportunities for gendered self-fulfillment in terms of education and job decision when economic conditions are better. We improve prior literatures on GEP by testing this explanation in a more refined manner. We investigate micro-level social origin effects on girls' and boys' preferences for a math-related job under various macro-level economic conditions. These conditions are societal affluence, social welfare provision, female labor market opportunities, and the pay of STEM and non-STEM jobs. Three waves from the Trends in International Mathematics and Science Study (TIMSS) on students' math-related job aspirations are collected, enriched with datasets of the Global Welfare Dataset (GLOW), International Labor Organization (ILO), and World Bank (WB). With Generalized Ordered Logistic Regression, we find that social origin and societal affluence are negatively associated with girls' math-job aspirations, and that for boys these effects are smaller. A second finding is that in countries with a higher STEM to non-STEM wage ratio and with a lower female employment ratio in STEM, boys and girls aspire more for math, and this about the same for every social origin. Third, when longer maternity insurance and unemployment insurance durations are provided, boys' and girls' math aspirations decline, but not for children from higher social origin. Our findings support and extend Charles economic opportunity theory for gendered STEM aspirations and decisions.

RN14 | T05: Session 6: Equal Pay Policies

Formally Engaging, Informally Opposing: Employer Organizations' and Business Advocacy Groups' Discursive Resistance to Equal Pay Policy in Finland

Paula Koskinen Sandberg

Aalto University School of Business, Finland

This paper provides novel insights into the relationship between business advocacy groups' and employer organizations' lobbying tactics and public policy development. The study analyzes the attempts of renewing Finnish gender equality law in several instances, from 2010 to 2024, and social partners' and business advocacy groups' influence on the policy process. The focus is on the kinds of discursive and rhetorical strategies that central actors use in opposition to equal pay legislation, and on power dynamics within this setting.

This study uses a longitudinal qualitative research design and utilizes several datasets from 2010 to 2024 to trace central actors' discursive strategies around the policy processes, both before and during. These datasets include: minutes of meetings of working groups, parliamentary data, press releases, positions, media data, statements, policy documents, reports.

Our findings highlight that while trade unions tend to support equal pay initiatives, employer organizations and business advocacy groups resist any changes to equal pay law, and they do so very clearly and consistently, using a variety of discursive strategies. This in turn has implications for policy development and, ultimately, opportunities to advance gender equality and equal pay.

With EU Directive on pay transparency accepted in 2023, to be implemented within three years via national legislation, this topic is of high relevance across the EU and beyond.

Tension, Trust and Transformation in Equal Pay for Work of Equal Value in the UK 1968-2024

Hazel Conley

University of the West of England, United Kingdom

What women are paid is, in the end, the ultimate barometer of how the value of their work in the public sphere is perceived. In the UK, from the beginning of the industrial revolution to the present day what women are paid (or not paid) for their labour has been wrought with tensions and has sorely challenged working women's trust in the State, their employers and their trade unions. In most developed economies attitudes and, concomitantly, government policy and law in relation to gendered pay discrimination began to change in the 1960s, but how far can we call progress since then transformation when there is still a gender pay gap of 15%? Reporting on the findings of a major AHRC funded project, Gender Equality at Work: An Interdisciplinary History of 50 Years of Workplace Equality Legislation, this paper examines the development of equal pay for work of equal value as a legal, political and industrial relations phenomena in the UK over 7 decades. The research is theoretically framed in Feminist Institutionalism and draws largely on historical documentary data but also on oral history research, examining key legal cases, equal pay disputes and pivotal sociological moments along the way. The research evidences the tenacity of institutionalised pay discrimination in the way that women's work and pay are negotiated and evaluated to the problematic legal remedies that are available for them to access their human right to pay equality.

Can Public Procurement – as a Form of Responsive/reflexive Regulation – Offer Transformative Potential for Equality?

Tessa Wright, Hazel Conley

Queen Mary, United Kingdom

500

Gender segregation persists in the construction sector despite industry calls to increase workforce diversity, particularly in response to labour shortages. One mechanism for urging contractors to take action to increase the numbers of women, ethnic minorities or other under-represented groups is public procurement – when public sector clients build equality requirements into tendering processes for building contracts. This paper revisits our earlier work on the transformative potential of public procurement – as a form of responsive or reflexive regulation – to increase workforce equality (Wright and Conley 2020) by examining recent data collected by the Buying Social Justice through Procurement project on the procurement practices of local authorities, housing associations and universities in Great Britain.

Previously we argued that responsive or reflexive procurement regulation can offer a 'third way' between hard, 'command and control' regulation by the state and voluntarist or deregulatory approaches, neither of which have achieved sufficient gender equality progress. We examine different forms of procurement legislation used in England, Scotland and Wales and assess how far they are responsive or reflexive to gender equality.

Based on expert interviews, a survey of procurement officers and good practice case studies the paper explores the extent to which civil society stakeholders are involved in procurement, from identifying needs, specifying equality requirements and monitoring delivery. By identifying the barriers and opportunities for civil society to engage with public procurement practices that seek to increase social value, we develop our analysis of whether responsive/

reflexive regulation can produce tangible equality advances for disadvantaged groups.

The First Year Gender Pay Gap Reporting in Ireland: A Sociological Analysis of Organisations' Plans to Mitigate Gender Pay Gaps.

Sara O'Sullivan

University College Dublin, Ireland

Two key legacy features of labour markets globally are a sexual division of labour (Connell 2009) and a persistent gender pay gap. One policy solution that has been implemented in the past decade across the OECD is gender wage gap reporting. Making data on pay available publicly potentially increases awareness of the problem, something that proponents see as likely to increase organisations' efforts to close the pay gap (Hijzen 2023).

In 2022 organisations in the Republic of Ireland with 250+ employees were required to report on their hourly gender pay gaps for the first time and also to report the actions planned to mitigate any pay gaps. In total, reports published by 538 organisations were located and analysed.

In this paper I will give a brief overview of the quantitative data identifying where gender wage gaps are largest and smallest. My primary focus will be on the actions planned by organisations to mitigate gender pay gaps. Ryan (2023) identifies four problematic features of the gender equality initiatives proposed by organisations: they focus only on numbers, the actions are about fixing women rather than systems; the organisations are too optimistic about progress to date and intersectionality is ignored. All of these are evident in the Irish GPG reports. In addition there is a lack of concrete plans of action & targets.

Catching Up Or Falling Behind? An Analysis Of Progress Towards Gender Equality In Southern European Countries After The Covid-19 Pandemic

Olga Salido

Complutense University of Madrid, Spain

Both the Great Recession and the COVID-19 crisis have had more intense and long-lasting consequences in Southern European countries, threatening to unravel previous gains in gender equality. In this paper we explore the extent to which the COVID-19 crisis has widened the gap between Southern countries and the European Union, halting earlier convergence trends in gender equality and widening inequalities.

Previous studies have shown the negative gender impacts of austerity policies implemented during the Great Recession at the EU level (Karamessini and Rubery, 2014; Walby 2018). There is also growing evidence that the multifaceted effects of the COVID-19 crisis have been far from gender-blind (Alon et al. 2020a, 2020b; Bluedorn et al. 2020; EIGE 2022; Eurofound 2022). Women have borne the brunt of the increase in care work during the pandemic, leading to difficulties in reconciling work and family life and a deterioration of their position in the labour market (EIGE 2022; Eurofound 2021, 2022, 2023; Hupnau and Petrongolo 2020).

Using data from Eurostat (Labour Force Survey) and Eurofound (COVID e-survey), this paper examines the hypothesis of a potential de-convergence of peripheral Southern European countries with respect to the EU27 through a systematic picture of the effects of the COVID-19 crisis on women's well-being and employment indicators. It also raises the issue of the performance of different social protection models and their capacity to safeguard progress on gender equality, highlighting the need to strengthen EU's compromise with gender equality and social cohesion, particularly during economic crises.

Gender Mainstreaming in Practice. Everywhere and Nowhere?

Runa Brandal Myklebust, Mari Teigen

Institute for Social Research

Gender mainstreaming (GM), as defined by the Council of Europe, means 'the (re)organization, improvement, development and evaluation of policy processes, so that gender

501

equality perspectives are incorporated in all policies at all levels and at all stages, by the actors normally involved in policymaking'. GM aims to eliminate gender bias in existing routines by transforming organizational practices and processes. It builds on the idea that obstacles to equality exist in the structures; they are institutionalized and can therefore only be changed by institutionalizing the perspective of equality.

As this suggests, GM is an ambitious strategy. A growing body of research points to challenges when translating the theory of GM into practice. Studies find that GM functions only to a limited extent as intended and rarely achieves its goal of improving gender equality. The challenges are not solely a matter of institutional and political resistance, but also a lack of conceptual clarity.

In Norway, GM has been a central strategy since the Gender Equality Act of 1978, but the duties of employers and public authorities were strengthened in the Equality and Anti-Discrimination Act of 2017. Public authorities are obliged to promote equality and prevent discrimination in all their activities, and to issue a report on the activities related to the duty. This article questions how the strategy of GM is understood and implemented in practice. Firstly, we investigate this by comparing authorities' reports from before and after the recent strengthening of the duties. Secondly, we conduct interviews with leaders in Norwegian ministries, to assess how they understand and implement the duty in their daily work and their perceptions of the opportunities and challenges of GM strategies.

Exploring The Challenges Of Gender Mainstreaming In Public Administration

Malin Espersson

Lund University, Sweden

This paper investigates the challenges of gender mainstreaming in Swedish municipalities, with a focus on the initial implementation. Since the mid-1990s, gender mainstreaming has been the prevailing strategy within Swedish authorities and public administration to increase gender equality in society. In simple terms, this means that a gender equality perspective must be integrated into all decisions and at all levels in order to ensure an equal provision of welfare to all citizens. Still, many gender equality challenges remain, which may call into question the effectiveness of the strategy. In Sweden, the discourse of gender equality is strong and organizations in both the public sector and the business sector are expected to work actively on gender equality, to maintain organizational legitimacy. However, critical researchers argue that extensive changes have not taken place and that the strategy of gender mainstreaming has contributed to the bureaucratization of gender equality work.

The study is based on 20 semi-structured interviews with officials, managers and politicians involved in gender mainstreaming in a Swedish municipality, document analyses and participant observations. Drawing on the concept of decoupling, from institutional theory in organizational studies,

this paper aims at understanding initial implementing gender mainstreaming. Through the analytical notion of the occurring talk, decisions and actions, this study analyses how actors in different parts of the municipality value and act in relation to gender equality and gender mainstreaming. The paper demonstrates how officials uses different strategies to move forward with gender mainstreaming, despite a lack of interest or priority from other groups.

Women´s Drop to the Top as Governmental and Political Leaders

Ana María López Narbona, Marta Ortega Gaspar

UNIVERSIDAD DE MALAGA, Spain

Women are underrepresented in all levels of government and in the parliament (European Institute for Gender Equality, IEGE, Gender Statistics Database). Additionally, the representation suffers of the "drop to the top" syndrome, i.e., the degree to which female representation drops as seniority level increases. What prevents women from advancing in political leadership? The model proposed in this analysis tries to understand the acceptance of males as the prototypical leaders, from the theory of "culture of gender", which defines the expectations that society has for women and men as leaders, and Inglehart´s postmaterialism theory. Data are obtained from the EVS/WVS (2022). European Values Study and World Values Survey.

RN14 | T06_01: Session 8: Domestic Care

Private Domestic Care Services for the Elderly: Inequalities and New Conditions of Care in a Changing Swedish Welfare State

Terese Anving, Sara Eldén

Lund University, Sweden

The sector for private domestic services in Sweden has grown rapidly since the RUT tax deduction was introduced in 2007. Already in the government proposition (2006/07:94) it was suggested that services provided by the expanding market would come to replace parts of the publicly funded elderly care, thus marking a shift in the organisation of care in the welfare state. Today we begin to see the effects of this, people over the age of 65 are one of the main groups making use of the RUT tax deduction (Swedish NAO 2020: 34) and an increasing number of companies offer services specifically targeting the elderly, their relatives and their different needs. At the same time research has shown that it has become more difficult to get publicly funded home care (Szebehely et al 2017) and during the last decades care for the elderly has been characterised by austerity, decentralisation, privatisation and 'freedom of choice' (Brennan et al 2012; Edebalk 2022). Departing from a qualitative study on paid domestic care for elderly and the changing conditions and understandings of care we will in this paper analyse the characteristics of the market focusing the relation between public and private care as well as underlying understandings of what care work is. We will argue that the expansion of the market reproduces inequalities between different groups of elderly and their relatives as well as between employers and employees, relating specifically to gender, race and class.

Home Care For Profit: Digital Platforms Brokering Migrant Women's Labour in Spai

Raquel Martínez-Buján[1], Paloma Moré[2]

1University of A Coruña, Spain; 2University of A Coruña, Spain

This article explores the recent proliferation of digital platforms that provide senior home care in Spain. Based on qualitative fieldwork consisting of semi-structured interviews (n=20) and participatory workshops (n=3), the aim is twofold: on the one hand it identifies the underlying causes of the proliferation of these companies, such as changes to legislation regulating domestic work and increased collaboration between the welfare regime and private enterprise in the provision of home care, particularly since the 2020 health emergency; and on the other hand, it analyses

how the activity of the platforms has affected the nature of the sector and the migrant women's working conditions. The results indicate that the expansion of digital platforms marks a new phase in the commodification of care in Spain. Our analysis highlights the contradictions between the business model of these actors, which define themselves as organizations able to guarantee the "professionalisation" and "formalisation" of home care work, and the harsh reality of the dire working conditions encountered by workers, mostly migrant women from Latin America.

Home Care Workers' Cooperatives: Building Spaces of Resistance for Sustainable Care Provision

Antía Eijo Mejuto

Universidade da Coruña, Spain

Domestic and care work has been families' main response when it comes to providing long-term care in Spain. A family-based system, together with an insufficient public coverage leave the organisation of care falling on private solutions adopted by families, encouraging a progressive marketisation of care services that shifts the burden of care work mostly to domestic workers. Despite the essential nature of this work, which has been highlighted and acknowledged by public institutions during the pandemic, its execution has been based on precarious conditions and deficient labour law. Although some fundamental rights have been recognized through the recent legislative changes introduced in Spain, such as the access to unemployment subside or limitations in relation to workers dismissal, care and domestic workers have been applying their own strategies to face discrimination and to dignify their profession during the past years. Thus, workers have gathered through cooperatives created with the double goal of promoting decent working conditions while also ensuring the right to quality care. Through a qualitative methodology based on semi-structured interviews, this paper aims to analyse the role of these social economy initiatives in building an alternative care provision model. Moreover, it aims to evaluate the capacity of this community-based and self-organized initiatives to alleviate the structural inequalities care workers must face and to guarantee service users' right to access quality care services.

The Flip Side Of Gender Segregation: Men In Female-Dominated Occupations

Margarita Torre[1], Maik Hamjediers[2]

1University Carlos III of Madrid, Spain; 2Humboldt University of Berlin, Germany

Men's participation in female-dominated occupations remains limited, and this phenomenon perpetuates occupational segregation. To describe why men are reluctant to work in these roles, the literature suggests three types of explanations. First, female-dominated occupations often

503

offer lower wages to male-dominated jobs. While women have strong incentives to enter male-dominated fields, men lack pecuniary reasons to pursue female-dominated occupations. Second, female-dominated occupations are often concentrated in specific fields, whereas male-dominated or gender-neutral occupations offer a broader range of career alternatives. Third, men may fear social stigma when engaging in female occupations and tasks. These theoretical explanations have predominantly been explored in single-case studies, which neglects cross-country variation as well as temporal transformations of labor markets, both potentially affecting men's opportunities and incentives to engage in traditionally female-dominated fields. In this study, we aim to provide a comprehensive overview of male participation in gender-atypical work from a long-term, comparative perspective. Specifically, we analyze Labor Force Survey (LFS) data from 21 countries spanning the years 1990 to 2020. The empirical section is divided into two blocks: First, we conduct a descriptive analysis to explore men's employment in female jobs across countries and within countries over time. Second, we run multilevel analyses to examine individual, occupational, and country-level factors. This includes assessing the intersection between gender and occupational status among workers. Thereby, our study contributes a comprehensive description and assessment of men's lack in female-dominated occupations.

RN14 | T06_02: Session 9: Care Employees and policies

Professional Recognition And Job Quality: The Gendered Cases Of Israeli Art Therapists And Childcare Workers

Orly Benjamin

Bar Ilan University, Israel

Government procurement in social services has been already criticized for encouraging low-quality jobs and deteriorating job quality in contract-based provided services. The impact of these ramifications for women in care and service occupations has been discussed with an emphasis on three issues: failing to apply updated professional knowledge in the area of the provided service; governmental contracting bodies' interest in lowering service costs; and, for limited governmental control over service quality and job quality. When attention has been directed to service providers it was commonly noticed that they were seeking ways to reduce their costs benefiting from the little control over the service they provide. Up until recently, the path of reducing costs through political intervening in professional recognition processes, a process reducing expenses for both service providers and governmental contracting bodies, has not been systematically examined, In order to shed light on the political dimension of cost reduction in the operating of social services, I raise the following research questions: what political actions serve cost reduction of services provided by non-governmental entities? and, how politicians apply gendered consideration in processes of professionalization and occupational recognition for art therapists and childcare workers. To expose the political moves holding back occupational recognition of these two occupations, I have applied feminist discourse analysis on Parliament protocols discussing these occupations and I present my comparison of the gendered considerations raised by an ultra-Orthodox party representing a service provider. I show how for both art therapists and childcare workers, Ultraorthodox politicians prevented occupational recognition leaving both occupations unrecognized for their occupational training, skills and experience. The gendered consideration focused on the assumption that limited training can replace existing demands.

Gender Inequality in the Healthcare Sector: Occupational Segregation by Gender in Medicine and Nursing

Rebecca Graziosi

University of Macerata, Italy

Occupational segregation by gender may negatively affect individual choices about education and occupation, as well

504

as society and the economy (EIGE, 2018). This kind of gender inequality seems to reinforce stereotypes and constitute a ground for discrimination (EIGE, 2018; WHO, 2019). In the healthcare sector, occupational segregation by gender is manifested by the tendency of female workers to be employed in some medical specialties (such as pediatrics or gynecology, among others), nursing and midwifery, or generally in less retributed and prestigious occupations (WHO, 2019). This research analyzes the experiences of nursing students and medical residents to seek to understand how certain individual drivers (decisions, hopes, ambitions, etc.) may foster gender-based occupational segregation. Adopting the Grounded Theory method, 40 semi-structured interviews were conducted (20 with nursing students and 20 with residents from different medical specializations). The respondents were selected from diverse areas of Italy. The main finding demonstrates that cultural and organizational factors may play a role in contributing to occupational segregation jointly with individual factors. In addition, the analysis of the interviews revealed two core categories. One concerns the moment of the choice of specialization or university course and the key people who guided the decision, while the other category involves discrimination episodes. Various key people seem to influence respondents' choices and motivations to different extents. Also, in the background, the dimension of change taking place in the health sector in terms of greater gender equality arose.

Undervalued and Underpaid: the Role of Marketisation in the English Early Childhood Education and Care Workforce Crisis

Xanthe Whittaker, Jennifer Tomlinson, Kate Hardy, Helen Norman

University of Leeds, United Kingdom

Early years education and care (ECEC) is central to public policy objectives for addressing childhood social, economic and education inequalities, and enabling women's labour market participation. Yet, in England, the creation of markets to deliver these objectives has been fraught. Our two major research projects – undertaken at the height of the Covid-19 pandemic and three years on – show the ECEC sector in crisis, characterised by unaffordability for parents, providers in financial distress and chronic labour shortages.

This presentation addresses the 'productivity paradox' in ECEC, whereby labour shortages have not prompted wage rises, detailing how state-coordinated mechanisms of marketisation operate to set wages and place constraints on quality of work, ultimately entrenching the undervaluing this feminized care workforce.

We present findings from two large, multi-method research studies of staff across the ECEC sector (5000 survey responses and over 300 interviews) collected in 2020, 2021 and 2023. Surveys collected key indications about ECEC staff satisfaction and leave intention, and interviews sought rationales for staff attitudes to their work.

We contribute to theories of gender relations in the labour market by examining the relationship between marketisation, working conditions and gendered labour market outcomes. We show how:

i. by stimulating demand-led provision, marketization has exposed the sector to a high level of volatility.

ii. the state, as monopsony buyer, acts as a price-setter.

iii. in adverse market conditions, these factors, combined with demand inelasticity and limited price flexibility, drive providers to erode working conditions and pay.

Collective Care Initiative in Spain: Gendered Dynamics and Transformative Feminist Strategies in Social and Solidarity Economy.

Isabel de Blas-Buruaga[1], Matxalen Legarreta-Iza[1], Sofía Ugena-Sancho[2]

1University of the Basque Country UPV/EHU; 2Universidad de Barcelona

Faced with the care crisis, collective initiatives have been developed in Spain to address the demand for care and articulate new forms of organization. They help move towards more egalitarian relationships and a more democratic organization of care. Most of them operate in a horizontal and assembly-based manner and they are aligned with the principles of Social and Solidarity Economy. As such, the situation of women is perceived in better terms than in the labor market in general. The objective of the contribution is to identify what is transformative about them. For this purpose, by adopting the Classic Theory of Gift, we analyze the way that reciprocal responsibilities and associated moral obligations operate in these projects. We address three cases, all within Spain: 1) a worker cooperative that facilitates co-responsibility among cooperative members and that produces agroecological food and offers catering; 2) a non-profit association that provides care to elderly people; and 3) a group of families associated around an educational model of alternative pedagogy. The field work was carried out between November 2021 and August 2023, through 27 in-deep interviews, 6 workshops, and several participatory observations. A total of 45 people (36 women and 9 men) participated in the research. The results show both gendered dynamics and transformative feminist strategies. In the three initiatives, reciprocity operates as a regulating principle. This said, we also observed that this regulation occurs within a context of dynamic tension in which fatigue and self-exploitation are counterbalanced by individual and collective self-care practices.

505

Exit As Market Response: Analyzing Nurse Turnover in Sweden As A Contradictory Response to Job Dissatisfaction and Care Crisis

Rebecca Elizabeth Selberg

Lund University, Sweden

The global care crisis is now a marked feature of capitalism, and its resulting care deficit represents a pressing social issue. A central aspect of the care crisis is nurse turnover and – retention, which affects countries of all levels of socioeconomic development, including the Scandinavian countries and their expansive public sector healthcare systems. In Sweden, staff shortages among women-dominated healthcare workers have increased in the last years, despite heightened political attention and policy development aimed at increased retention; job hopping is so widespread that it is currently undermining the provision of high quality and timely medical interventions and necessary care efforts – and causing unstable working conditions for remaining nurses.

Based on a survey questionnaire and in-depth interviews with registered nurses in the Swedish healthcare system, and within a theoretical framework drawing on both Hirschman's seminal typology around exit-voice-loyalty and Hochschild's and other feminist scholars' analyses of marketization, this article explores job hopping and exit spirals in the Swedish healthcare sector as a specific feature of the care crisis. The results indicate that nurse exit constitutes a contradictory response grounded in the nursing professions' adjustment to marketization. This article thus contributes to the growing field of empirical studies on the care crisis, as well as to feminist understandings of gendered divisions of labor and important developments in care professions.

RN14 | T07_01: Session 10: Labour market outcomes of gender segregation and education

"Occupational Gender Segregation in the Spanish Labour Market: Diagnosis and Policies"

Empar Aguado-Bloise[1], Josep Vicent Pitxer-Campos[2]

1University of Valencia, Spain; 2University of Valencia, Spain

Women working in occupations where there is a significant majority of men face different challenges from those in occupations with more gender-balanced workforces, and also different from those in feminised occupations and sectors. Identifying this situation, and understanding why occupational segregation in the labour market persists, is a central issue in addressing gender inequality in paid work.

In Spain women assume a greater share of the burden of reproductive work. This, in Spain, is accompanied by an insufficient provision of public services to cover care needs. Both circumstances lead to difficulties in women's access to the labour market, as well as in the trajectories followed by women. However, despite these difficulties, women are increasingly entering the labour market.

506

With the massive entry of women into the labour market we are witnessing an increasingly common and generalised presence of women in the different productive sectors and occupations. However, this is not the case; occupational segregation persists.

Given this situation, it is necessary to enrich employment policies with measures aimed at significantly and progressively reducing the aforementioned gender inequalities in the Spanish labour market, for which it is necessary to identify the existing situation and the underlying causes of these inequalities.

The research presented is structured as follows: firstly, we examine the growing participation of women in the labour market; next, we analyse the occupational gender segregation using information from official statistics, mainly the LFS; in the following section, we present the main explanatory elements of the gender inequalities studied, accompanied by the main lines of intervention.

Women's Occupational Segregation And Mental Health. Exposure To Risks Among Female Professionals In Five Micro Classes

Lorenzo Cattani, Roberto Rizza

University of Bologna, Italy

This study explores the intricate dynamics between gender, occupation, and work-related strains impacting women's mental well-being using the 2020 EU-LFS ad-hoc module data on 38,066 female professionals in Western Europe. The primary aim is to discern how different occupations affect diverse experiences of work-induced strains affecting mental well-being, such as work overload, violence, and challenging client interactions.

Key findings from the study highlight significant variations in risk exposure among women employed in diverse occupational groupings, and critically question the compensating differential theory that assumes female-dominated occupations to have more "women-friendly" working arrangements which in turn compensate for the lower salaries paid. The data show, on the contrary, that interactive service-sector occupations are more exposed to risks to the mental well-being of female workers. Health professionals emerge as a group particularly susceptible to these risks, followed by legal-cultural professionals and teachers. Notably, when considering shift and weekend working, risk exposure increases considerably for these workers.

Emphasizing a "within-gender" perspective, the study uncovers nuanced occupation-based inequalities affecting women. It introduces a novel approach to occupational segregation, examining exposure to work-induced strains, asserting that such strains are unevenly distributed, particularly in professions with more female workers.

The study urges policymakers to reevaluate customer-worker relationships, advocating for gender-specific measures to mitigate heightened psychological well-being risks in professions with increased female representation.

In conclusion, the study comprehensively explains the intersection of gender, occupation, and work-induced strains, highlighting how micro-classes shape women's experiences in the labor market

Are Gender Gaps in Education Leaving Less Educated Men Behind in the Labor Market?

Liza Reisel, Adrian Farner Rogne, Sara Seehuus, Kari Vea Salvanes

Institute for Social Research, Norway

The gender gap in education has reversed globally, with women now outnumbering men in higher education in most advanced economies. This shift has raised concerns about the potential impact on men's economic conditions. This study examines whether men in Norway are falling behind in the labor market due to these reversed educational disparities and changing labor market opportunities. We analyze employment, income, and wage trends for young men and women with varying education levels from 1980 to 2019 using population-wide data from public registers. Our findings suggest that the key divide in Norway is between men with and without completed upper secondary education. This contrasts with findings from the USA, where the critical divide is found between those with and without higher education. Moreover, in Norway, men with completed vocational upper secondary education have comparable incomes and employment levels to men with undergraduate degrees, who in turn have better labor market outcomes than women with the same level of education. Contrary to findings from countries like the USA, real wages have not decreased over time for any groups of men or women in the Norwegian context. However, employment levels for young adults with only primary school education have significantly declined since the early 1990s in the Norwegian labour market. More men than women do not complete upper secondary school, potentially making this trend more detrimental to men. However, men have higher labor force participation rates than women in this subgroup, as well as among those with upper secondary education as their highest degree. Consequently, the proportion of young men and women outside the labor market remains similar.

"I'm Not a Farmer, Just a Helper" – (Self) Marginalization of Female Farmers in Poland

507

Marta Gospodarczyk

University of Warsaw, Poland

Farming is challenging for researchers studying work-related issues. Especially in its more traditional shape, farming is deeply entangled with family, causing the usual lines between workplace and home to blur. This is due to the physical proximity of the home and the farm, the inclusion of virtually all family members in the farmwork, and the familial line of succession. The existing research shows a stark gender divide, with women living and working in farming households more likely to consider themselves "helpers" rather than farmers in their own right, despite performing most of the same tasks as the men in the household; they are also less likely to own and manage their farms. This (self) marginalization of female farmers is the focus of the paper.

The paper is based on the research conducted in Eastern Poland in 2023 and 2024, during which individual interviews with men and women from farming households were conducted. The research confirmed, that women are less likely to identify themselves as farmers; they perform both housework and farmwork; they are also often responsible for the farm's paperwork. The paper will elaborate on the labor division in the investigated farming households, as well as the attitudes of both men and women regarding what constitutes "farmwork", "housework", "work" and "not-work", as well as "men's work" and "female work". Therefore, this paper is devoted to decoding the meanings of gender and work in a specific context, where the line between work and home is oftentimes blurred.

RN14 | T07_02: Session 11: Resisting Care Normativity

Double Burden Of Work Hazards Among Norwegian Female Employees?

Espen Dahl, Åsmund Hermansen, Therese Saltkjel

Oslo Metropolitan University, Norway

Background: Despite the fact that the Nordic welfare states, Norway included, are known for their gender equality, the Norwegian occupational structure is highly gender segregated. However, few have studied the degree to which men and women experience a double burden of hazardous working conditions. Aims: To shed light on differences in how men and women are facing both high physical and high psychosocial exposures, and to explore the role of the occupations that men and women typically hold. Data and Methods: We use Norwegian register data that include all employed men and women in 2021. We further exploit two recently constructed Job Exposure Matrices (JEMs) to characterize the physical and the psychosocial (Job Strain) work environment among working men and women. Occupations are coded in accordance with the Norwegian version of ISCO-88. Both JEMs are grouped into quintiles, cross-tabulated and analyzed separately for men and women. The focus of the analysis is on the combinations where the exposures on both dimensions are low (1st and 2nd quintile) and where the exposures on both dimensions are high (4th and 5th quintile). Results: 1) In the lower quintiles, indicating low levels of physical and psychosocial exposures, 76 per cent are men. In the higher quintiles, indicating high levels of physical and psychosocial exposures, 72 per cent are women. 2) The occupation specific analysis reveals that typical male dominated occupations (managers, professionals) have low scores on both dimensions, whereas female dominated occupations (salespersons, nursing assistants) have high scores on both dimensions. Conclusion: In Norway, the double burden of work hazards among women is clearly present, largely due to the gendered occupational segregation.

Emotional Economy in Care Migration Recruitment Strategies and Its Gender Effects at the European (Semi)Periphery

Majda Hrženjak

Peace Institut, Slovenia

Neoliberal cuts in public spending on long-term care have worsened working conditions in care services for older people in global North, which is reflected in labour turnover and care deficit. Like most Eastern European countries,

Slovenia is in a triple position in this transnational political economy of care: local care workers are leaving as daily commuters for work in neighbouring Austria and Italy; migrant care workers are being recruited from European ''third countries'' of the Western Balkans, for whom Slovenia is often only a transit destination for migration further to Western Europe. Although Slovenia has bilateral agreement on labour migration with Bosnia and Herzegovina, the recruitment of migrant workers mostly bypasses official channels, following two strategies: migrant social networks and family reunification. In this paper, I discuss these two recruiting strategies as a mobilisation of the emotional economy in the management of labour migration, which is functional for keeping labour costs low because it shifts costs of transition, integration and social reproduction onto migrant social networks and families. Particular attention is paid to the gendered effects of these strategies, with a focus on the favouring of migration within the traditional pattern of family reunification and the processes of deskilling legitimised by migration and labour regulations.

The empirical evidence comes from research Transnationalisation of eldercare (ARIS, J5-3104). In 2022/3 we conducted three series of interviews: with 11 national stakeholders; with 16 migrant care workers; with 8 stakeholders in Bosnia and Herzegovina, the country from which most migrant caregivers come to Slovenia.

Caring Masculinities in Banking and Finance: Gender and Change in the Workplace?

Ania Plomien

London School of Economics, United Kingdom

Despite welfare state policy facilitating men's caring in private life becoming increasingly common, industry and workplace equality and diversity initiatives tend to target women. Yet, the masculine (unencumbered and disembodied) worker ideal continues to limit the attainment of gender equality in all its complexity. Drawing on research into gender and career development in the UK Banking and Finance sector conducted in 2010-11 and 2018-20, I examine the gap between policy aspirations and practice, and consider men's engagement with care to attain gender-equal outcomes. Through a critical policy analysis and 68 semi-structured interviews with women and men employed in banking and finance, I demonstrate how the industry has spearheaded policy to advance gender equality by addressing above-average gender pay gaps and improving the underrepresentation of women in leadership positions. However, the sector's legacy of long-working hours and presenteeism, incentivised risk-taking, lack of collective responsibility, and entitlement to high pay undermine these objectives. Interviews reveal the extent to which organisational policy and practice facilitates men's care in the private sphere (e.g. for children, partners, parents) and in their public roles (e.g. for colleagues, direct reports, mentees, and by advancing workplace caring behaviours and culture). I explore how men's caring subjectivities and behaviours are gendered, how they are imbricated with class and seniority, care-obligations, sexuality, age, and migration,

508

and how they are structurally embedded in workplace and welfare state contexts. Extending the concept of Caring Masculinity, I theorise the work that men's private / public care at work does in shifting gender role attitudes and power relations towards workplace transformation.

Digital Communication From Gender And Intersectional Perspective

Rumiana Stoilova[1], Kalyoan Haralampiev[2], Elitsa Dimitrova[3]

1Institute of Philosophy and Sociology at Bulgarian Academy of Sciences; 2Sofia University "St. Kliment Ohridski"; 3Institute of Population and Human Studies, at Bulgarian Academy of Sciences

Objectives: The COVID-19 pandemic was followed by the precipitous digital shift that brought about deep transformations in the sphere of paid work related to an increasing trend in distant employment (telework) and utilization of ICT. We expect, however that the opportunities for distance work depend on individual characteristics – gender, age and ethnicity, on characteristics at mezzo – occupational and at national level. The aim of this paper is to explore the relationships between different occupational groups and their attitudes to the opportunities of the digital communication in the European societies. Applying the intersectional approach we recognize the interplay between the objective position of individuals in the social structure and their socially constructed identities Collins (2015).

Data and methods: We use individual quantitative data from the European Social Survey, conducted in 2020/2021 and apply comparative descriptive analysis and multivariate analysis on the topic of digital communication.

Preliminary results:

Women have lower digital skills than men in the three of the indicators used in the ESS survey and in parallel we observe the negative tendency that is caused by the occupational class and age. In terms of the benefits derived from the digital communication, women are more likely than men to respond positively to the question that mobile communication helps people feel closer. Online communication contributes to women's empowerment. Women who use internet are twice more confident than women who don't use internet in their ability to participate in politics.

RN14 | T08_01: Session 12: Persistent Gender Pay Gaps

What Lies Behind the Unexplained Fraction of the Gender Pay Gap? Findings and Insights on How to Ensure Equal Pay

Sara Facão Casaca

University of Lisbon, Lisbon School of Economics & Management, SOCIUS-CSG, Portugal

This paper addresses gender inequalities in the labour market in Portugal, focusing mainly on the gender pay gap (GPG). Considering the core characteristics of the country's workforce and the main patterns of men and women's participation in the labour market, the limitations of the human capital arguments are highlighted. We estimate both the raw and the adjusted gender pay gap and demonstrate that, when individual differences (age, seniority at the workplace and education levels) between men and women are controlled, the gender pay gap is seen to be even more pronounced. Moreover, the application of a decomposition method sheds light on the magnitude of the unexplained fraction of this gap, thereby supporting the thesis that the 'value' of work is not gender-neutral and the need to tackle both direct and indirect discrimination processes on the grounds of gender. The findings suggest the need for job evaluation methodologies and pay policies that fully ensure both direct and indirect non-discrimination on the grounds of gender at an organisational level, together with a consistent and well-articulated approach towards the deconstruction of gender stereotypes in all fields of public policies. In the final part of the paper, the role of the social partners and social dialogue in the elimination of the GPG is also stressed.

Architectures Of Inequality And The Gender Pay Gap

Rachel Verdin

University Of Sussex, United Kingdom

The UK's gender pay gap stands at 14.3% (White, 2023) and, while it is shrinking, the rate of closure is slow, varied and by no means consistent. The introduction of the Gender Pay Reporting Regulations in 2017, and the furore surrounding the subsequent publication of company reports, prompted a resurgence of interest in gender equality. This mixed methodological study examines the first six years of largely untapped pay reporting data with a case study focus on the finance sector, given the particularly large pay gaps therein. The 'architectures of inequality' model is developed as a new analytical tool to understand the progress and resistance that marks this wicked problem. This visual tool helps to elucidate how the continual momentum of societal shifts and legal and organisational interventions helps to insulate

509

the GPG. The examination helps us to better understand how this decades old problem persists, demonstrating how a broader and embedded lack of transparency, alongside practical realities, such as workplace norms, continue to restrict progress. Two key findings are presented from this examination. First, the application of the architectures model reveals how common blind spots, such as the thorny issues of transparency and accountability, remain central to the persistence of the gender pay gap. Second, an ongoing dynamism demonstrates how the impediments to alleviating the gap are in constant flux, exerting continual pressures on any potential progress. By observing these interactions and paying close attention to the data the barriers and unintended consequences of equality policy can be identified.

Explaining Earnings Differences in and Within Female-Dominated sectors: Evidence for the Care Sector in Portugal

Viktoria Szenkurök[2], Ricardo Jorge Rodrigues[1]

1Lisbon School of Economics and Management (ISEG), University of Lisbon, Portugal; 2Vienna University of Economics and Business

The aim of this study is to analyze earnings differentials in the long-term care (LTC) sector and to assess how these compare to other female-dominated and 'caring' sectors (child care, health care and social work) in Portugal. This analysis is framed by the intersection of two main theories. The first is the 'devaluation theory', which posits that female work is less valued, leading female-dominated sectors or occupations to face an earnings penalty. The second theory is the 'compensating wage differentials' associated with emotional labour, which see the latter as a job demand that is compensated by the market.

We use a unique matched employer-employee data from Quadros de Pessoal in 2021 for Portugal – an administrative dataset including all employees and firms in the private sector (profit and non-profit) in Portugal – employing a multilevel framework to identify earnings gaps and potential contributing factors for women and men within the LTC and caring sectors.

Our findings reveal that female-dominated sectors face an earnings penalty that is particularly evident in the caring sectors and occupations associated with high emotional labour. Within the caring sectors, the earnings penalty is statistically significantly higher in the LTC sector, even after accounting for various individual – and firm-level factors. Analyzing gender differences further in the caring sectors, male workers in LTC performing high emotional labour occupations experience an additional earnings penalty compared to women.

These findings hold substantial relevance to understand the composition of the gender wage gap, the valuation and the attractiveness of the caring sectors in general and the LTC sector in particular for women and men and the gender balance of the care workforce.

Is Gendered Employment Related to Job-holders' Occupational Prestige Evaluations?

Sabine Krüger

Federal Institute for Vocational Education and Training, Germany

The need for social status has long been recognized by sociologists as an essential aspect of social life. It has long been suggested that the occupational structure is a key factor of status inequality and that social prestige is attached to jobs in a manner that is remarkably consistent across national boundaries. However, not much is known about how individuals estimate the prestige of their occupation. This study explores the various factors that influence how people evaluate their own occupational prestige, with a focus on gender differences. Specifically, it addresses the following research questions:

I. Do the prestige ratings differ between job holders and people outside of an occupation?

II. If so, does this apply to specific professions, or is it more independent of the profession and related to characteristics of the job holders?

III. Do male and female job holders differ in their estimations of their occupational prestige?

IV. Are the differences greater for men and women working in gender-(a)typical occupations? What explains the variations?

The study uses data from a follow-up study on prestige to the 2018 BIBB/BAuA Employment Survey prestige, the sample contains data on 6342 individuals employed in 347 occupations. Preliminary results suggest that differences in job holders' prestige evaluations are related to individual differences rather than occupational attributes and that women tend to "underestimate" their occupation's prestige. People working in male-dominated occupations tend to "underestimate" their occupation's prestige as well, but there is no gender-specific effect of working in an (a)typical profession.

RN14 | T08_02: Session 13: Networking in the academic world and beyond

Breaking Into the Boys' Club: Unequal Network Composition and Returns as Explanations for Gender Differences in Career Success

Roza Meuleman

Radboud University, the Netherlands

To this day, one of the most prominent dimensions of labour market inequality is the significant and persistent gender gap in career success. Women earn less and are less likely to occupy management positions than men for instance. These inequalities are detrimental to the financial independence of women and, in turn, contribute to broader labour market inequalities. In recent decades, empirical research has increasingly focused on social networks as an explanation (Collischon & Eberl, 2021; Lutter, 2015). Yet, more detailed answers to fundamental questions of whether, how, and why networks contribute to gender-related [labour market] inequality are needed (Woehler et al., 2021). Building on gender role socialization and social network theories, we therefore address three questions. First, to what extent do men's and women's social network resources differ, and can these differences (partially) explain gender differences in career success? Second, to what extent do social network resources relate differently to men's and women's career success? Third, are these possible gender differences specific for certain types of network resources? To address these questions, we use nationally representative data from the Netherlands: the Longitudinal Internet Studies for the Social sciences panel. In this dataset, we collected unique information concerning individuals' access to various network resources among the general working population. Linear regression analyses and Structural Equation Models are used to examine the direct and indirect relationships between gender, network resources, and career success. Preliminary results show that women have less network resources than men, which partly explains the gender gap.

Reproducing Gender Inequalities in the Academic Labour Market: Discretionary Practices in the Quest for 'Excellence'

Maddalena Cannito[1], Monia Anzivino[2]

1University of Turin, Italy; 2University of Trento, Italy

Excellence has become the benchmark for evaluating, recruiting, and promoting academics. It is conceived, within the normative framework of meritocracy, as the result of individual performance and effort, independent from individuals' ascribed characteristics and measurable through formalized parameters considered neutral and objective. However, scientific literature has drawn attention to the distortions that the 'faith' in meritocracy produces in academia, especially in terms of gender inequalities.

Drawing on 176 semi-structured interviews with early and advanced-career academics in STEM and SSH Departments, members of competition selection boards, Departments' Directors and their deputies in four Italian Universities, the paper investigates how excellence is constructed in selection and evaluation procedures and explores the implications in terms of (re)production of gender inequalities.

The results show that, despite the insistence on the importance of standardized criteria in the recruitment and promotion procedures, the margins of discretion are still wide. Discretionary practices, indeed, are interpreted as: correctives to merely quantitative evaluations, since they have 'measurable' elements that set them apart from arbitrariness; a form of gatekeeping aimed at selecting those who truly deserve to be admitted into the scientific community; the result of the pursuit of excellence in a context characterized by the so-called 'credential inflation'.

Discretion then leave room for biased evaluations and decisions guided by cooptative practices – where academic recruitment and promotion are decided at a local level through mechanisms rewarding loyalty to a research group – that are now obscured by the centrality of meritocratic rhetoric and that perpetuate institutionalised patterns that privilege men.

511

The Tension Between Gender Equality Policies And Gender Inequalities In Universities: A Case Analysis Of The Faculty Of Political Science And Sociology (University of Granada, Spain)

Patricia S. Sánchez-Muros Lozano, María Luisa Jiménez Rodrigo, José María García de Diego, Ana Burgués de Feitas

University of Granada, Spain

Despite the increase in the number of women in higher education and their representation as academic staff, several indicators show that behind these 'big numbers', inequalities persist. In addition to the structural and symbolic inequalities that still persist, the limitations of equality policies in promoting effective change have been identified as an important factor. The present research, which is still in progress, focuses on the case analysis of the Faculty of Political Science and Sociology of the University of Granada (Spain). It aims to provide data on the dynamics of gender inequality operating in academic life, as well as the perceptions and effects of gender equality policies, in order to develop an effective gender equality plan. To this end, a multilevel (university, faculty and department) and multi-method approach (analysis of indicators, documentary

analysis, surveys and semi-structured interviews with key informants) is used. The advanced results confirm that policies are often limited to positive attitudes and informal agreements, without achieving practical effectiveness and damaging confidence in public policies. Surveys of teachers show statistically significant differences between men and women on issues such as work-life balance, visibility and recognition of performance. These and other issues have a major impact on academic careers, limiting access to leadership positions, specialised training, mobility, job stability and promotion to higher ranks. Interviews with women experts corroborate these data and indicate that progress has been insufficient. It was emphasised that these findings need to have a social impact, raising awareness and promoting substantial changes in the academic sphere.

Towards Equality in Research and Innovation: Quantitative Analysis of Gender Equality Plans in Polish Universities and Polish Research Institutes

Karolina Sikora

Jagiellonian University, Poland

In 2021 the European Commission set the introduction of Gender Equality Plan (GEP) as an eligibility criterion for Research & Innovation (R&I) institutions seeking funding within the Horizon Europe programme, to further promote gender equality as a value of the EU and highlight the positive effects of gender equality on research and innovation. Prior to this event, the gender equality policy instruments in R&I institutions in Poland had been dispersed or mainly implemented within the HR Excellence in Research programme. The establishment of the GEP eligibility criterion led to an increase in development and introduction of GEPs in Polish universities and research institutes.

The aim of this presentation is to discuss the results of quantitative content analysis of 83 GEPs introduced in Polish universities and research institutes. The research performed was multi-layered, addressing the following research questions: 1) are the GEPs compliant with EU guidelines in terms of their scope?; 2) do GEPs detail budget allocations and specify the entities tasked with their implementation?; 3) do GEPs employ inclusive language and incorporate an intersectionality perspective?

Research findings reveal that the scope of the GEPs is similar across institutions, and generally aligns with EU guidelines. GEP implementation details are frequently vague, indicating dispersed responsibility. Moreover, budget details in GEPs are unclear, suggesting potential resource access issues. Finally, the use of inclusive language is most often inconsequential, and the intersectionality perspective is rarely considered.

RN14 | T09_01: Session 14: Alternative Organizations

Cooperative Organisations and Women's Employment in Italy: All That Glitters Is Not Gold

Rebecca Paraciani, Alessandro Martelli, Ilaria Pitti

University of Bologna, Italy

The purpose of this paper is to delve into the phenomenon of women's employment in cooperative organisations. Women have historically represented a significant part of the social and employment base in this kind of enterprises. Indeed, in principle, cooperative organisations seem to offer more opportunities of employment and empowerment of women than capitalist enterprises.

Focusing on Italy – a country distinguished by a rich, well-developed and diversified ecosystem of cooperative organisations – this paper problematises these assumptions by looking closer at the kind of employment that women get in cooperative enterprises.

Through the secondary analysis of national statistical data and the analysis of semi-structured interviews with experts, the paper analyses horizontal and vertical segregation labour segregation and gender pay gap in the cooperative world. With women representing almost half of the employees, cooperatives seems to be fertile ground for female employment.

However, data show a gendered horizontal segregation of labour with women working mainly in social cooperatives, in agriculture and in the service productive sector. Moreover, women are able to break through the glass ceiling and to reach positions of leadership and power only in social cooperatives, highlighting a vertical segregation of labour in the others field. This type of segregation, combined with the fact that women work less due to the massive spread of part-time contracts, contributes to a relevant gender pay gap despite the impressive levels of female employment distinguishing the coperative world.

Tensions and Ambivalences in Women Entrepreneurs' Governance of Time in Spain: Between Agency and Subjection

Carlota Carretero García

Jaume I University, Spain

This presentation focuses on the governance of time in the narratives of young women entrepreneurs in Spain. The study of this topic aims to delve into how the reorganisation of time currently taking place through the political promotion of a new labour achetypical subject (the

512

entrepreneur) impacts on women's daily routines. Also, it allows to analyse the (dis)continuities and ambivalences in the meaning given to the promise of agency and capacity for self-organisation that contains the hegemonic entrepreneurial discourse. For this research, 30 semi-structured interviews were carried out with young women entrepreneurs who participated in public training programmes on entrepreneurial competences for women. The analytical approach is rooted in critical discourse analysis and connected to governmentality studies and feminist theory. This approach allows to address the power relationships and inequalities, but also the meanings given to individual experiences and vulnerabilities, that emerge through women's narratives focused on the self-governance of time.

Sisterhood and Solidarity in Times of Crisis: Early Days of Shelter Work in a Canadian Prairie City.

Elizabeth Quinlan

University of Saskatchewan, Canada

In June 1988, the all-female workforce at a shelter for women fleeing from domestic violence voted in favour of striking. The shelter's Board of Directors retaliated by locking out the workers. Tense labour relations ensued for months. While walking the picket line, the shelter workers continued to fulfill their care responsibilities for the female residents. In turn, the residents supported the workers' line. How did that solidarity emerge?

Having been guided by the feminist politics of the Anti-Violence Movement to challenge the injustices of patriarchy in the decade before, the shelter workers turned their attention to confronting the power relations embedded in their employment in the late 1980s. The paper reports on a study that examines how the solidarity between the shelter workers and residents emerged at a time when neoliberalism was in its ascendency pitting workers against citizens. The study endows a sensitivity to discourses that shape and are shaped by coalition building between workers and citizens. The study's data of archival documents and oral history interviews with surviving shelter workers offers fresh insights on how workers can combine the struggle for labour rights with the feminist principle of 'caring for the other'.

Female Entrepreneurs In Rural Areas In Japan: Networks And Collaborations To Rebuild And Redesign Shrinking Cities

Kuniko Ishiguro

Tokyo International Universiry, Japan

This research investigates the characteristics, motivations, and management styles of female entrepreneurs in rural areas in Japan, as well as challenges facing them. The country has long been struggling to promote gender equality in economy and employment. Meanwhile, problems of shrinking population, aging society, depopulation in rural areas, and weakening competitiveness in the global economy have increased. This research addresses two major issues: women's advancement in the economy and how to tackle the country's economic problems, and tries to assess how one important group of people can promote both women's advancement in the economy and regional revitalization. The research has been conducted in rural areas in Eastern Japan to examine women's contribution to these local economies, as well as to analyze sources of their power to set up and sustain their businesses. It has found out that the women researched have been driven by their simple questions regarding the current problems in the economy and society which central and local governments have been unable to solve and have tried to find solutions for themselves by organizing their own networks and involvement and collaboration with local governments. Unlike big businesses based in Tokyo or big cities, whose sole focus may be economic success, those female entrepreneurs have started to become very important actors for the revitalization of the country, and for furthering female advancement in the country's economy and the society.

513

RN14 | T09_02: Session 15: Masculine Occupations

Women's Work in the Judiciary. Notes from Spain

Eva Bermúdez-Figueroa

Universidad de Cádiz, Spain

This paper explores women's representation in the justice administration from a labor perspective. The analysis is based on two premises. Firstly, it recognizes the growing presence of women in legal studies in democratic nations, suggesting this should be mirrored in the professional realm with women over-represented in the legal professions. Secondly, existing research on law and gender often focuses on bias in judicial decisions, overlooking women's positions as legal system employees. This study aims to fill this gap by descriptively analyzing gender in the Spanish judicial system, identifying women's roles, categories, and professions. Reseach questions include: Where are women in the justice system? Are they represented in all judiciary areas? What are their main occupations and positions? We delve into quantitative analysis on Spanish judiciary employment using statistics from sources like the General Council of the Judiciary, the Public Employment Bulletin, and the National Statistics on Public Employment. We concentrate on three legal professions: judicial, prosecutorial, and lawyer careers. The data highlights the significance of official statistics in making women visible, revealing challenges to gender equality policies. The available data will demonstrate the importance of official statistics in making women visible, becoming a sample of the resistances and counter-resistances to the implementation of gender equality policies in public administration. It reveals how the lack of reconciliation of work and family life linked to the lack of co-responsability, persists as one of the main obstacles to the equal participation of women in the judicial system, thereby widening the gender gap and reinforcing gendered roles in the labor market.

Male Dominated Workplaces and Part-Time Work as Mechanisms of Informal Occupational Closure That Exclude Women from the Pilot Trainer Role

Stella Margaret Warren[1], Sue Durbin[1], Vanda Papafilippou[1], Marnie Munns[2]

1University of the West of England, Bristol, United Kingdom; 2Boeing

Aviation is a traditionally male working environment (Durbin et al., 2022b; Bridges, 2014; McCarthy et al., 2015) where women's suitability and abilities are questioned (Yanıkoğlu et al., 2020) a persistent masculine and misogynistic culture persists and women struggle to be accepted by both colleagues and passengers (Durbin et al., 2022a, 2022b; McCarthy et al., 2015).

To understand the extent of the underrepresentation of women in the sector, this article focuses upon the pilot trainer role, which is a senior progression route for pilots, but with very low numbers of women who make up just 0.9% of all UK registered trainers/examiners (CAA, 2022).

We examine the processes, professional/organisational cultures and informal workplace practices (Tomlinson, 2006) that result in less transparency in the career progression of women to the pilot trainer role. To understand how this specific profession 'closes' towards women, we turn to the theory of occupational closure (Weeden, 2002; Witz, 1990). Traditionally, analysis of occupational closure has been mostly associated with the conscious efforts of professions to regulate access, but informal processes and interactions, which are difficult to trace and are often persistent in professions, act also as a mechanism of informal occupational closure (Evetts, 1998; Roscigno et al., 2007; Tomlinson, 2006). Adopting the theoretical lens of informal occupational closure, we can understand structural inequalities, such as blocking women to progress to a pilot trainer role when they work part-time, but also the interplay between organisations and professions, and individual level processes (Acker, 1990).

Aetiology Of Gender Inequalities In Italian Public Administrations

514

Roberta Zonno

Università degli Studi di Bari, Italy

The purpose of this contribution is to understand if and how the merit system adopted by Italian Public Administrations in the past twenty years has been contributing to foster gender inequalities.

In fact, in this system, based on what is called "performances cycle", which sets goals, tasks and rewards of both offices and individuals, evaluations are generally conducted by managers with a gender-neutral approach, aiming to make such evaluations as effective and objective as possible. This means that managers do not consider specific gender-based factors, like unpaid care workload of children, disabled and elder relatives due to gender stereotypes, nor sex-based factors, such as pregnancy and birth. It is very important to underline that in Italy, maternal paid leave covers five months to be spent before or after birth, and is an inalienable right. Therefore, women must be absent from work for at least five months, which on a twelve-month-evalutation makes a difference indeed.

The main theoretical framework of this research can be summarized into three main areas: theories of late second-wave/early third-wave feminism (i.e. Bacchi, 1990); theories of public value from both economic and political science prospective (i.e. Deidda Gagliardo, 2022); theories of management and organization (i.e. Conley et Koskinen Sandberg, 2023).

The conduction of the research involves three Italian city councils and has been divided in three sections: in the first one, a self-assessment tool will be used to understand

which gender equality criteria the administration has set and which ones need implementation; secondly, employees will be asked to answer questionnaires to understand their perception of gender inequalities in performance evaluations and managers will be interviewed to assess their awareness of how gender-neutral evaluations may impact on careers and economic rewards. Eventually, there will be focus groups to share the results and to offer a testing of gender-sensitive indicators and tools in performance cycle management.

The contribution is cutting-edge because aims to reinvent the methodology of performance management and evaluation, improving careers opportunities for women civil servants.

On the Road to Gender Equality? Truck Driving Women in Sweden

Lisa Maria Ringblom

Malmö University, Sweden

In recent decades, the proportion of women has increased significantly in several previously male-dominated professions in Sweden, such as physicians and lawyers. Common to these is that they are well-paid, high-status professions that require higher education. However, the number of women is now also increasing in several male-dominated working-class professions but why?

Today, we have significant knowledge of the mechanisms that create and maintain gender inequality in working-life. However, changes towards increased gender equality are not as well researched. Therefore, more knowledge is needed about how gender-integrating processes function and how gender norms and gender patterns in working life can be changed and challenged.

In Sweden today, the male-dominated profession of truck drivers consists of eight percent women. However, there are good reasons to believe that this figure will increase significantly in the coming years. Increased interest in the profession by women can e.g. be observed in the upper secondary school's Vehicle and Transport program, where 24 percent of those admitted in the autumn of 2020 were women.

The overall aim of the study is to investigate how gender-integrating processes in male-dominated blue-collar professions can be understood and explained, and thereby how gender equality can be improved. The empirical data consist of 30 interviews with truck driving women and transport industry experts.

RN15 | Global, Transnational and Cosmopolitan Sociology
RN15 | T01: Global Sociologies

In search of Global Sociology: A critical overview of competing research agendas

Victor Roudometof

University of Cyprus, Cyprus

This paper critically examines the idea of global sociology. While academic Sociology initially emerged out of the critical self-reflection of Western societies, in the post-1945 era the field extended its reach to the rest of the world. The notion of global sociology emerged in the 1960s and has been on the agenda of the International Sociological Association since at least 1990. Delving deeper than the mere notion of a sociology that is applied to the entire world, global sociology requires the re-examination of the role of core sociological concepts and narratives, especially regarding the extent to which these reflect Eurocentric preoccupations. Global Studies and Postcolonial Sociology, two of the most widely known research fields claiming global intent, are examined as to whether they provide convincing narratives for global sociology. While both offer promising insights, they also suffer from important drawbacks. Instead of attempting to unearth new grand narratives that would displace the narrative of Western modernity, though, it might be possible to envision a plurality of such narratives coming from different regions of the globe. Sociology can thus be conceived not as exclusively global but also as local and glocal.

Sociology and Anthropology: Is there still a Difference in a Globalized World?

Marco Caselli[1], John Eade[2]

1Università Cattolica del Sacro Cuore, Italy; 2University of Roehampton, London

This contribution questions the persistence, today, of solid boundaries and a real difference between sociology and anthropology. The distinction between them is, in fact, not in the object, given that both study people and their relationships within society and different cultural contexts. The distinction is not even in the scale of their analyses: if, in fact, anthropology favours a micro perspective, large sectors of sociology adopt this same perspective. The distinction is not even in the research techniques adopted: if in fact anthropology favours qualitative techniques based on direct observation, these techniques are also widely used in sociology. The distinction then probably lies in the origins

and different starting objectives of the two disciplines. On the one hand, anthropology was born out of curiosity to know and study the "other" societies with which the West came into contact in its expansion while, on the other hand, sociology was born to try to understand and hopefully direct a society that was transforming with unprecedented depth and speed. In a nutshell: anthropology was born to study others, while sociology was born to study ourselves. The question is then the following: is this distinction still justifiable in a world, such as the current one, in which the processes of globalization make the distinction between "us" and "them" increasingly less clear and relevant, in whatever way we want to define these terms, and in which, moreover, the field of sociology is fortunately populated by an ever-increasing number of non-Western scholars?

Internationalization of Sociology in Lithuania: Challenges and Opportunities

Diana Janušauskienė

Institute of Sociology of the Lithuanian Centre for Social Sciences, Lithuania

Internationalization of sociology has been a crucial issue in sociological literature for several decades. It is agreed that global scientific knowledge circulation makes a valuable impact for the development of sociology. However, a critical analysis of global power relations between the centre and the periphery of sociology coupled with an investigation of the impact of internationalization for national sociologies reveals the existence of numerous challenges. These challenges encompass intellectual dependency, Eurocentrism, social inequalities, and the dominance of the English language, among others.

This paper attempts to contribute to the ongoing debate on internationalisation of science by analysing challenges and opportunities inherent in this phenomenon, with a specific focus on small countries. The empirical foundation for this analysis derives from a case study of Lithuania. Methodologically, the present paper draws upon a synthesis of previous research on internationalization, documentary analysis, and a secondary analysis of sociological data.

Prosociality to Cope with Global Challenges: A Research and Policy Agenda

Giacomo Bazzani

University of Florence, Italy

In response to contemporary global challenges, the concept of solidarity undergoes a transformative reevaluation, demanding a departure from conventional interpretations. This article contributes three pivotal insights to navigate this evolving landscape. Firstly, it discerns the emergence of unprecedented interdependencies arising from global challenges and introduces the concept of altruistic solidarity.

516

This new paradigm transcends traditional distinctions between mechanical and organic solidarity, reflecting a profound shift in societal interconnections.

Secondly, the article advocates for a precise definition, demarcating solidarity from other social processes and grounding the conceptual framework in the empirical criterion of prosociality. This distinction ensures a focused examination of solidarity, using prosociality as the litmus test for understanding its dynamics across diverse contexts.

Lastly, the article introduces the Five Strategies prosocial model, a comprehensive interdisciplinary guide designed to provide practical insights for researchers and policymakers. This model elucidates strategies for studying and promoting prosociality effectively, underscoring its pivotal role in addressing global challenges. By navigating the intricate interplay between societal structures and prosocial behaviors, the model equips stakeholders with a versatile tool for informed decision-making and policy formulation. This holistic approach positions altruistic solidarity and the Five Strategies prosocial model as crucial elements in fostering cooperative responses to the multifaceted challenges of our interconnected world.

Intergovernmental Organizations As Carriers Of World Cultural Norms and Principles: Analysis Of Discursive Change In Formal Reporting Of Four Organizations

Marjaana Rautalin[1], Eetu Vento[2], Jukka Syväterä[3]

1University of Helsinki, Finland; 2University of Helsinki, Finland; 3University of Helsinki, Finland

Social scientists have been increasingly interested in examining global social change. Literature often ascribes the change to IOs and the norms and principles they promote to nation-states. However, research is scarce on how these norms and principles enter IOs' agendas. Existing research focuses on individual norms and on who or which entity has accelerated the adoption of the norm in question in the organization at any given time. In this study, we supplement the existing research on IOs as consumers and carriers of global norms and principles by investigating four prominent IGOs – the IAEA, the ILO, the IMF, the OECD – and the rhetoric used in their annual reporting. Our initial findings indicate that despite their distinct tasks and profiles, all four organizations start to take a stand on the increasingly diverse norms and principles shared in world society in the mid-90s and especially in the 2000s. Yet, there are differences in what kind of norms or principles are perceived as most pertinent in the sense that they are first incorporated into IGOs' annual reporting. There are also differences between organizations in how these norms and principles are used as part of communication directed at member countries. We argue that the abstraction of the language evident in IGOs' formal reporting is part of a wider discursive shift in world society that started after the end of the Cold War, and which accelerated as the 21st century entered. The change in IGOs' formal rhetoric is largely a result of organizations' aspiration to construct themselves as influential by addressing an increasingly large number of their member countries.

517

Private Affiliations in International Public Policy: The Case of UN Space Governance

Florian Rabitz, Inga Popovaite, Vidas Vilcinskas

Kaunas University of Technology, Lithuania

Diplomats that represent governments in international negotiations have normative commitments to serving the public interests both of their home countries and of

international society at large. But diplomats also frequently have parallel commitments arising from their private affiliations to organizations other than their respective governments. Examples of such private affiliations include memberships in think tanks, consulting roles for civil society organizations, or collaborations with industry organizations. While private affiliations are not problematic as such, they can raise challenges regarding conflicts of interest in international public policy. In this paper, we use social network analysis to gauge patterns of private affiliations in the rapidly evolving field of outer space governance. We focus on the United Nations Committee on the Peaceful Uses of Outer Space (COPUOS), the primary international forum dealing with diverse political and legal aspects of outer space at a historical moment which sees an unprecedented increase in the number of private space organizations. We collect publicly available information from social media about private affiliations held by current diplomatic representatives in COPUOS, using 2-mode networks to associate individuals with organizations. Preliminary results suggest that the diplomatic representatives of spacefaring nations tend to hold strong corporate ties that exist in parallel to their public interest commitments, raising questions regarding regulatory capture that have similarly been raised in other international forums such as the International Maritime Organization or the International Civil Aviation Organization. We conclude by discussing the need for improved transparency measures and conflict-of-interest policies in order to ensure inclusive, accountable and democratic governance of outer space. IRB approval has been obtained for collection and processing of personal data.

The Global Circulation and Performance of Extreme Narratives

Gwenaellë Bauvois

University of Helsinki, Finland

Extremist narratives are frequently perceived as mere 'stories' recounting specific events or situations within a particular national, political, historical, or cultural context, particularly in discussions related to nationalism and immigration. However, in this paper we argue that the exploration of extremism, along with its narrative content, should transcend narrow national confines and be regarded also as a global phenomenon.

Extreme narratives, for instance conspiracies reinforcing the mistrust in politicians and in the media, are not static, impermeable and strictly restricted to one geopolitical setting, particularly amid global crises. These narratives circulate, more and more quickly in the hybrid media system, and gain reinforcement through processes such as reiteration, repetition, and citation— through 'performativity' —manifesting differently across diverse contexts. Furthermore, these extreme narratives are 'being performed' by diverse 'populist' actors, notably politicians and identity entrepreneurs, enhancing their emotional stickiness by tapping into sentiments of fear, shame, or pride. While being localised on some level, these narratives also frequently exhibit striking similarities across different contexts, more notably when societal tensions take a supranational dimension.

This paper provides theoretical insights into the global and transnational nature of the circulation and performance of extreme narratives, drawing on preliminary reflections and findings from the ongoing Horizon project ARENAS (Analysis of and Responses to Extremist Narratives).

Testing the Role of Kin and Nonkin in Personal Networks at the Intersection of Familism and Individualization

Shira Offer

Bar Ilan University, Israel

Normative, social, and demographic shifts associated with late modernity have led to major transformations in the realm of intimacy and care. Scholars have argued that in contemporary society, nonkin relationships assume a larger role in people's lives and increasingly fulfill functions traditionally associated with the family. Using egocentric network data collected with a representative sample in 2021, this study examines the roles of kin and nonkin in the support networks of Jewish and Palestinian Israelis (N = 899 respondents who named 6,648 alters). Israeli society provides an excellent case study for testing this issue because it is characterized by conflicting trends of high familialism and strengthening individualization. Results show that in general, among Jewish and Palestinian respondents alike, both immediate kin and nonkin (a category that mainly included friends) were an important source of support. The share of extended kin in the support network was small, especially among Jewish respondents. However, multilevel analyses revealed that after controlling for sociodemographic characteristics, immediate kin were more likely than nonkin to provide support among Jewish respondents only. Among Palestinian respondents, the opposite trend was observed. These findings were not affected by perceptions of familism, which were generally high, but perceptions of family strain considerably weakened the likelihood of immediate kin providing support. No significant difference was found between extended kin and nonkin in the likelihood of support. These findings are discussed as part of the defamilialization debate and recent economic and social developments.

RN15 | T03: Actors and Agency in a Global Context

"Migrants as Agents of Change: from the Welfarist Approach to Mutual Learning in Some Co-development Practices"

Silvia Malacarne, Anna Facchetti, Gloria Mussetto

Università Cattolica del Sacro Cuore, Italy

In the latest decades, international development cooperation and migration have had to contend with a progressive paradigm shift, rooted in the enhancement of human capital and the creation of reciprocal relationships between the North and the global South, in contrast to the traditional welfarist approach. In this scenario, this contribution aims to focus attention on the mutual learning concept which, thanks to the results of previous research, can be defined as an exchange of heterogeneous resources within a context of asymmetrical relationships where all involved actors can teach and, simultaneously, learn from each other. In the present research, mutual learning is investigated within the field of co-development, a cooperation strategy that highlights the agency of migrants and seeks to overcome the paternalistic logic characterizing the "donor-beneficiary" relationship for decades. The research question is whether it is possible to trace the mutual learning construct in successful practices of co-development that testify to the aforementioned paradigm shift. From a methodological perspective, a qualitative approach has been adopted; through the implementation of semi-structured interviews and participant observation, collected from different research projects about migrants and co-development process, the following results were emerged: an enrichment of theoretical reflection on the relations forms between the parties involved in co-development actions; the identification of cases where migrants have played an active role both towards their own communities of origin and in host societies, revealing themselves as agents of change. The added values of this contribution are, firstly, exploring mutual learning construct in the co-development context, and, secondly, the identification of empirical evidence that underscores the urgency of bridging the gap between theoretical reflection and empirical research in cooperation and migrations study.

Shaping The Human Self. Global Issues For A Professional Imagination In Social Work Training.

Sylvain Beck

Paris CI Migrations, France

This paper argues that the professional training of social workers is a laboratory for studying the shape of the human self by the preparation to the practices of crafts (Beck, 2023 ; 2024 forthcoming). Based on a methodology of participant observer in schools of social work in France (2015-2023) this paper, I argue that the professional practices are firstly shaped during the training and by the encounters, mixing emotions and sensitivity (Pappell, 1972), identification, and the taste of the otherness embodied in an institutional context and a social policy making as a trial experience that shapes a human self with an ability to a global social change as an intermediary level. This argument lies on to the interconnection between local and global scale by national political action as a shifting level. Following the few studies interested in global or transnational social work (O'Leary, 2019), rethinking professional identities (Nuttman-Shwartz, 2017) and practices (Panagiotaros, Boddy, Gray and Ife, 2022), or education in social work (Gabel, Gatenio, Healy, 2012) also considers social work at the heart of global issues. Interestingly, we can understand universal social problems divided in structural and conjunctural that social workers have to face of. Social and individual problems like access to human rights and social protection, child protection, disabilities, homelessness, sexual abuses and conjugal violences, drug abuses, mental health, racism and discriminations, immigration and asylum seeking are situations that we find around the world. But the social policies are structured at a regional, national and local level. They articulate professional practices and bureaucratic responses which a social diplomacy requires a professional imagination in the Anthropocene era.

Rethinking Cosmopolitan Sociological Method: Cross-boundary Ethnography

Run Li

Ecole Normale Supérieur de Lyon, France

As boundaries become increasingly blurred and complex, researchers in complex and culturally diverse field settings face uncertainties in interaction mechanisms, difficulties in establishing trust, and distances from local contexts. Addressing this issue, this study introduces cross-boundary ethnography, which has evolved through the study of interactions among groups within a bus station in Shenzhen. It combines sensory ethnography, ethnography of recognition, and digital ethnography. These approaches assist researchers in deeply observing and experiencing "place," establishing long-term trust relationships, and exploring new spatio-temporal dimensions, thereby revealing the researcher's presence, the complementarity between

research methods, and the process of interpreting local culture. Secondly, this article will clarify the relationship between cross-boundary ethnography and cosmopolitan methodological approaches, with the former being built upon the latter. Finally, the significance of cross-boundary ethnography lies in establishing a methodology that transcends both universalism and particularism. It requires researchers to self-position in plural and multi-sited spaces, reshape their roles, and dynamically respond to local situations.

Being Cosmopolitanism In The Margin: Making The Bubble Tea On The Imagination

Xinwei Zhang

University of Helsinki, Finland

During the summer of 2022, at a sandy beach located in the greater Helsinki, a bubble tea stall made a recurring appearance every sunny weekday afternoon and on weekends. This simplistic stall, in contrast to the more elaborate bubble tea shops, followed a streamlined process involving three steps: pouring tea from a thermos into a plastic cup, adding three pumps of fruity syrup based on preference, and incorporating a spoonful of colorful popping balls, omitting the conventional shaking process. Surprisingly, this modest set-up captured the attention of every child at the beach with an interest in bubble tea during that summer. This engagement led the children to encourage their parents to purchase the drink, share images of themselves with the drink on social media, and employ the hashtag #bubbletea in their posts. No one seemed to care if it was an authentic bubble tea, everyone was happy they were involved in a fashion process of bubble tea. "It tastes weird. I don't like it, but I will post it in my ins stories." One of the customers told to me, and it is her first time to try bubble tea.

How did this happen? Bubble tea is today a world-wide phenomenon. Bubble tea is not only associated with East Asian migration and diasporas; it is also deeply connected with young people and youth culture. As bubble tea has migrated, the practices and meanings associated with it change, but one constant is its connections to youthfulness, and fashion (Sigley 2015).

What are these consumers who don't know what bubble tea is consuming when they are consuming bubble tea? Is bubble tea drinking part of broader trends towards more cosmopolitan forms of cultural consumption, especially among other non-East Asian consumers? This paper will explore how bubble tea turn to be a symbol of cosmopolitanism through interview and participant observation data and how people imagine cosmopolitanism via drink bubble tea.

Theorising Mobile Subjectivity: The Case of Digital Nomads

Mari Hannele Toivanen

University of Helsinki, Finland

Digital nomadism is a rapidly growing phenomenon, particularly in the post-pandemic world. This presentation focuses on various aspects of digital nomad lifestyle, as narrated by digital nomads themselves. It also briefly touches upon the structural aspects (nation-state, neoliberal

520

capitalist system) of this form of lifestyle mobility, and its impact to the formation of mobile subjectivity. The empirical focus is on work, social relations, mobility as lifestyle and identity. In this presentation, I offer a conceptualisation of post-pandemic mobile, nomadic subjectivity drawing from an ethnographic study on digital nomadism. I ask: How do mobile subjectivities emerge? How is such subjectivity performed by digital nomads and sustained through mobility/immobility? How is the mobile, nomadic subjectivity entangled in embodiment, practice and context? As classical migration paradigms are falling behind in capturing the lived reality of modern-day nomadic mobilities, this presentation offers conceptual insight on the supranational dimension of digital nomads' social reality. The presentation draws from large ethnographic material, qualitative interviews with sixty-five digital nomads and stakeholders and observation data, collected by the author between 2019-2024, in Thailand, Spain, Portugal, Mauritius and Bulgaria. More broadly, the presentation sheds light on the profound societal and global changes we are currently witnessing concerning work, (lifestyle) mobilities, digitalisation and their impact on social and professional lives.

Locality and Cosmopolitanism in Action: Research of the Independent (Indie) Music Scene

Dalit Simchai[1], Uri Dorchin[2]

1Tel Hai College; 2Netanya Academic College

This paper offers an exploration of Israel's independent (indie) music scene as a prism to theorize locality and cosmopolitanism in action. It is based on research in Israel's indie music scene, focusing on its two prominent festivals. Through this research, we lay the groundwork for a nuanced discussion of localization and cosmopolitanism. While aligning themselves with national ethos and spaces, organizers of these festivals also constitute a part of a social and professional network that transcends Israel's borders. Moreover, unlike festivals dedicated to national or international values, practitioners in the local indie scene feature a nonchalant approach to both, effortlessly intertwining spatial, cultural, and stylistic categories as a matter of course. This reality creates a holistic sense of place that challenges binary distinctions and defies the analytical logic of "glocalization". To illustrate the continuous movement through spatial and cultural realms we use the model of a Mobius strip, a physical shape that allows for a recurring motion from the outer to the inner surface by moving along a singular plane and without transgressing any borderlines. The festivals, thus, embody a unique and fluid form of cosmopolitan expression, challenging traditional paradigms of cultural interaction.

Multiple Expressions of the Sense of Belonging and Transnational Practices of Solidarity in the Light of Translocality: a Case Study of Senegalese in Tuscany

Ivana Acocella, Costanza Gasparo, Chiara Carbone

Università degli Studi di Firenze, Italy

Senegalese migration to Italy is characterized by strong ties with the motherland, as evidenced by the extent of remittances and the propensity for associationism to be "actors of development" in the contexts of origin. The paper analyzes how the sense of belonging marked by the continuous tension between the "myth of return" and "dual presence" defines both the migratory culture and solidarity practices of the Senegalese migrant, within which translocality (the places where mobile subjects are locally rooted; see Smith 2001; Sinatti 2017) may offer new analytical perspectives on the transnational characteristics of everyday life. The first part of the paper will explore the characteristics of Senegalese transnational migration culture and its continuous redefinition based on trade-offs between definitive return and the benefits offered by staying in migration. The second part presents four forms of solidarity (religious, village, secular-multiethnic, and cooperative) promoted by Senegalese organizations toward their country, for which the different ways of experiencing translocality highlight multiple expressions of the moral economy of belonging and of migrants' transnational practices as agents of development, interpreted from the binomial "moral obligation/sacrifice" versus "responsibility/opportunity". The aim is to identify how translocality makes possible access to different forms of social and material capital, as well as the shift from a more traditional aid culture based on membership in specific groups toward more secularized and professionalizing engagement strategies ascribable to the mainstream of development cooperation. The analyses are based on ethnographic research conducted in Tuscany.

RN15 | T05: Cosmopolitan Sociologies (2)

Cosmopolitan Democracy The Test Of The 21st Century

Daniele Archibugi

Irpps – Italian National Research Council, Italy

The never dormant cosmopolitan aspiration had ignited with new hopes at the end of the cold war. After the roaring 1990s, it almost seemed that it was possible to live without enemies and that the democratic regimes of the West would also extend to the East and South of the world.

Unfortunately, two wars of aggression, the one in Afghanistan and Iraq, have had the deleterious effect of losing the leading role that Western countries could have claimed. Global challenges are increasingly pressing (in just over five years, the world had to deal with financial crises, environmental emergencies and pandemics) while the attempt to respond to them with shared global governance has given disappointing results.

Is it still possible to affirm a democratic global governance to move out of the current impasse?

If the traditional idea that the players of international politics should be a restricted circle of state governments is rejected, what are the social and institutional forces which could carry out a positive role in a fresh democratic global governance?

The paper explores the cases of a few new actors which, although sporadically, have managed to provide enhanced vigour to the hope of a cosmopolitan democracy. Three cases are scrutinized: i) local government activism in Riace (Italy) to host refugees, ii) international NGOs providing micro-credit to women in Indian rural areas, and iii) transnational networks of social participation. On the ground of these experiences, their potentials and limits for genuine cosmopolitan citizenship will be explored.

"Trans-local Connections and the Staging of Cosmopolitanism: Dramaturgy of Town Twinning"

Barbara Kremser, Andrea Glauser

University of Music and Performing Arts Vienna, Austria

This contribution focuses on a practice of trans-local and transnational interconnection that has experienced a strong boost, especially after the Second World War: town twinning. Various forms of such associations existed and continue to do so, and they seem important in the context of the idea of "living in one world." From a historical perspective, town twinning has often been associated with values such as international understanding, the promotion of peace and open-mindedness, and has been linked with the idea of bringing citizens from different contexts, that is, countries and regions, into direct, personal exchange.

What meaning is attributed to town twinning arrangements today – in the context of multiple global crises and strong social polarization and contradictions? Our study explores this question using the example of Vienna and its diverse international district partnerships. The main interest lies in the staging of these connections and specifically the way in which they are lived and dramaturgically set. Through an ethnographic research perspective and drawing on theoretical considerations of discursive institutionalism, symbolic interactionism, and the dramaturgy of existence (theater studies), we investigate rituals and socialities characteristic to these connections, which are sometimes called "friendships from below." The analysis focuses in particular on gifts and artifacts and their placement in public space, and the narratives that encompass these connections. In this context, failed connections and pretended declarations or expressions of (political) friendship are also of interest. The aim is to illuminate and better understand forms of enactment of (trans-)locality and cosmopolitanism in and through town twinning.

The Cosmopolitan Brands Of Elite Universities: Reproducing Local Inequalities On The Global Stage

Martin Myers[1], Kalwant Bhopal[2]

522

1University Of Nottingham, United Kingdom; 2University of Birmingham, United Kingdom

Abstract

This paper draws upon Pierre Bourdieu's analysis of the competition for economic, social and cultural capitals within educational fields to analyse the work of elite university brands. Despite their immediate recognisability, exclusive brands such as Nike or Chanel, Harvard or Oxford, possess a nebulous quality that is difficult to define or value. Brands often act as a medium through which relational values are generated and in which consumers invest in a brand experience. The relational nature between brands and brand consumers can readily be understood within a Bourdiesian frame as the completion for cultural, economic and social capitals. Whilst elite university brands perform similar functions of generating value, they also exhibit other characteristics that are more unusual. This includes elite universities being uniquely positioned to 'self-certify' their brand's value without the need to generate greater brand consumption. Unlike many universities they do not have to compete for students for example, and if anything their exclusivity, including along lines of class and race, adds value to the brand. Elite universities also reproduce institutional positions in which they are the final arbiters of knowledge production. Drawing upon qualitative research conducted at four elite universities in the US and UK this paper will explore how this brand exclusivity functions as a local phenomenon with the ability to generate value and power nationally and transnationally. We conclude elite university brands are 'Cosmopolitan Brands' immersed in local and highly exclusive practices which reinforce wider inequalities of class and race on the global stage.

Mediating Cosmopolitan Consumption: A Comparison of Global Consumer-facing Brands, Ethical Brand Strategies, and Cosmopolitan Configurations

Sonia Karen Bookman, Tiffany Hall

University of Manitoba, Canada

Part of a broader trend toward the "moralization of markets" (Stehr, 2008), global consumer-facing brands from Starbucks to H&M have adapted the mantra of corporate social responsibility (CSR) and now act as "moral entrepreneurs" in their respective fields (Otto et al., 2021:5). Such brands comprise popular sites where consumers daily encounter images of global cultural diversity, principles of social and environmental responsibility, and opportunities to engage in, what can be captured by the term, cosmopolitan consumption. As market mechanisms with wide-reaching influence, we are concerned with the ways in which such brands shape cosmopolitan ideals, practices, and visions, in other words, what it means to be cosmopolitan in contemporary consumer culture?

Although there is a growing scholarship on cosmopolitan consumption, little sustained attention has been paid to investigating how it is articulated and underpinned by market cultural forms such as brands. In this paper we consider how global companies and their brands support and mediate particular kinds of cosmopolitanism and cosmopolitan consumption via their involvement with, and implementation of corporate social responsibility (CSR). Focusing on three global consumer-facing brands, Amazon, H&M, and IKEA, in a Canadian context, the paper draws on material from recent case study research (2020-2023), including documentary study, detailed textual and visual analysis of brand communications, and visual observation of brand environments. A critical, comparative analysis will reveal how the brands articulate different visions of cosmopolitanism and assemble particular cosmopolitan affordances, developing distinctive strategies for engaging consumers in cosmopolitan consumption and the co-performance of a responsible brand image. We conclude by exploring some of the broader social and cultural implications of such cosmopolitan configurations, in terms of their potential effects on public discourse.

Epistemic Leaps In Political Mind Reading: Portraying Senator McCain's Mind On Russian State Television

Oona Ala-Koivula, Hanna Rautajoki

Tampere University, Finland

Attributing thoughts, desires, motives, emotions, and other inner experiences to other people is a highly routinized feature of our everyday sensemaking. However, even though people can imagine and believe to know what is going on in other peoples' minds, there is no direct access to others' consciousness, leaving room for multiple interpretations all based on an epistemic leap from the interior of one mind to another. In our paper we argue that the routinized folk-psychological way of making sense of the reality around us and the lack of actual access to others' minds opens a site for political persuasion. To grasp this process, we introduce the idea of political mind reading as a means of persuasion in political rhetoric in which political actors make sense of political events by suggesting folk-psychological descriptions of how things are and why, and so doing the mind reading routine for their audiences. Furthermore, we suggest that the portrayal of others' minds works as a form of epistemic governance, that is, as a means to influence people's conceptions of reality and actors in it. In the empirical analysis this phenomenon is investigated through the case of a Russian political talk show, 'Bolshaya igra', analyzing extracts of political mind reading in the opening episode of the program (broadcast in September 2018) centered on the legacy of U.S. senator John McCain.

523

Does International Mobility Pay Off? Comparing Labour Market Success of German Remigrants and the German Non-mobile Population

Antonia Clara Görtz

University Duisburg-Essen, Germany

Although remigration account for a large part of migration events and professionals and academics are increasingly required to have international experience for a successful career, little is known about the impact of remigration on individual labour market success. Whereas some authors stress that remigration is associated with failure of emigration, other researchers underline that remigrants' career could benefit due to their international experiences in terms of rising human capital. In this case, there could be benefits in job positions and wages. Therefore, the presentation addresses two questions: First, does international experience pay off in terms of labour market success? And second, which occupational groups does this apply to?

To answer these questions, remigrants and the non-mobile population are compared. Analyses are based on data from the German Emigration and Remigration Panel Study (GERPS) and the German Socio-Economic Panel (GSOEP). Entropy balancing and mean value comparison is applied for the comparison of the German remigrants and the mobile population. Appropriate regressions are used to investigate differences between remigrants and the non-mobile population in terms of different labour market outcomes (wages, occupational status, unemployment risk). It can be assumed that international mobility affects remigrants' labour market success. However, some differences in terms of gender, skills and migration background could be assumed. The analyses contribute to a better understanding of possible social inequalities with regard to individual returns to international mobility.

Resilience through Relationships: Social Networking Strategies of Ukrainian Refugees in Poland and Australia

Lukasz Krzyzowski[1], Maria Nawojczyk[2], Oleksandra Missa[2], Anastasija Plakhotnyk[3], Janusz Mucha[4]

1Edith Cowan University, Australia; 2AGH University of Krakow, Poland; 3Jagiellonian University, Poland; 4University of Bialystok, Poland

This paper presents a comprehensive comparative analysis focusing on the experiences of Ukrainian refugees in distinct social, cultural, economic, and environments. It underscores the role of digital platforms in connecting refugees with their homeland and forming supportive networks in their host countries, highlighting how these modern technologies bridge geographical distances and foster community building.

Utilising three waves of interviews incorporating ego-centric social network analysis, the study provides unique insights into how refugees build and depend on these networks for support and wellbeing. The analysis showcases how these social networks are instrumental in facilitating not just practical aspects of resettlement but also in maintaining local and transnational support connections.

The comparative analysis with Australian data enriches our understanding of how different contexts shape refugee experiences and social networks. A significant focus is placed on the role of digital platforms in enhancing connectivity, bridging distances with their homeland, and forming supportive communities in host countries.

The study also examines the balance between local support networks within host communities and transnational connections, analysing their impact on refugee experiences. Findings demonstrate how these networks facilitate integration, providing resources, practical and emotional support, and advice.

The paper concludes with significant policy implications. It advocates for policies that recognise and strengthen these social networks as they are integral to the social integration and overall well-being of refugees. It suggests that government and non-governmental organisations should focus on facilitating and enhancing these networks, providing resources and platforms that can assist in the creation and maintenance of these vital connections.

Vaccination Against Covid-19 – The Transnational Issues

Irina Zamfirache, Raisa Zamfirescu

University of Bucharest, Romania

The COVID-19 pandemic changed the way individuals trust and relate to their healthcare systems. Our research focuses on the challenges that the European countries have faced regarding the vaccination anti Covid-19. We propose a general typology regarding vaccination hesitation, acceptance and refusal against COVID-19 for the EU27. The analysis has two dimensions: a quantitative one based on the information collected at the beginning of most of the national vaccination campaigns in Europe, including Eurobarometer 94.3 and country case studies based on social documents, mass media coverage and laws regarding vaccination. Based on the knowledges, attitudes and perceptions stated by the respondents of the European states (EU27), we constructed with the help of the cluster k-means (SPSS) statistical analysis a typology with four categories on the subject of vaccination against COVID-19. Our study proposes a matrix with five items / scenarios on a scale from total agreement to total disagreement. We chose a typology with four attitudinal types (clusters). The information collected for the case studies provide additional details and explanations for the issues that the healthcare systems faced regarding vaccination and also explain the tensions associated with the vaccination against COVID-19.

Transnational Feminist Studies of Telemedical Abortion: The Need for Collaborative Research

Paula Wallmeyer

University of Luxembourg, Germany

This presentation explores the efforts of NGOs that provide telemedical medical abortion (TMA) at the European level, making abortion more accessible by reducing financial and logistical barriers. Positioning my research in line with the transnational feminist paradigm, I draw on research strategies that seek to foster social change while simultaneously working to counter the privileging of institutionalised knowledge production. Attempts to regulate women's reproductive choices are closely related to heteronormative notions of the family, regressive notions of gender, and racist notions of the nation. As a topic at the heart of this discourse, abortion is subject to political regulation like almost no other medical service, leading to an international patchwork of abortion legislation. Consequently, access to abortion is highly unequal at the international, national, and regional levels. The spatiality of the issues ultimately makes it a question of mobility. Transnational NGOs are addressing the reality of limited and unequal access to abortion by dispatching abortion drugs worldwide. The presentation focusses on these organisations in a European context and discusses collaborative research processes that aim to align the interests of researchers and the community. I draw on expert interviews with NGO staff and representatives, which aimed to find shared points of interest and working together to refine the interview guide for the following interviews with women seeking TMA. The outcome is a collaboratively constructed research tool. This strategy aims to expand my research community beyond academia, fostering research that aligns with the interests of practitioners in the field.

Puerto Ricans Online Gaming Communities on Discord: A Virtual Ethnography from a Transnational Perspective

Luis Eduardo Andrade Silva

University of Salamanca, Spain

As digital landscapes evolve, so too do the modalities of community and identity construction, particularly within online gaming spheres. This study examines how Puerto Rican migrants engage in transnational identity formation through the microcosm of Discord's gaming communities. The central research question is: How do online gaming environments act as cultural nexuses for transnational identity among migrants? Rooted in theories of media evolution and migration integration, this virtual ethnography challenges traditional assimilation paradigms, highlighting the salience of gaming platforms in sustaining diasporic ties. It scrutinizes the dynamics of community engagement, symbolic interaction, and identity performance within these digital arenas, emphasizing the intersection of play and cultural expression.

Utilizing digital ethnography as its methodology, the study employs immersive participant observation within Puerto Rican gaming groups on Discord. This approach enables an in-depth understanding of the sociocultural practices that underpin community cohesion and the complex layering of migrant identities in online spaces. Preliminary results reveal that gaming communities on Discord serve as more than mere virtual playgrounds; they are crucial in perpetuating cultural traditions, fostering social learning, and facilitating transnational connections. These interactive environments offer migrants a platform for cultural negotiation and community building, often resulting in the reinforcement of national identity while simultaneously encouraging integration into the global gaming culture.

This investigation contributes a detailed examination of gaming communities as significant social ecosystems that extend beyond entertainment, impacting real-world integration and identity formation. It highlights the intricate ways in which gaming practices and digital communication converge to create a unique transnational space for migrants, where the rituals and narratives of gaming become intertwined with the lived experiences of diaspora. This research adds to the growing field of digital social sciences by

525

elucidating the role of gaming in migrant transnationalism, offering insights into the mechanisms through which digital play spaces can mirror, challenge, and transform cultural and social realities. The significance of this work is highlighted by its focus on a demographic that has not been extensively explored within gaming studies, thereby contributing a fresh perspective to the virtual ethnographic study of Latin American migrants' online gaming communities.

Homemaking as a multilocal process. The case of Bangladeshi migration across Rome and London

Simone Cerulli

University of Milan Bicocca, Italy

Drawing on ethnographic fieldwork on Bangladeshi migrant communities in Rome and London, this research aims at deepening the study of diasporic and transnational networks in their attempts to carve a niche in the context of arrival, by exploring the intersection of spatial politics, religious practices, and homemaking processes. In a context of global interconnectedness and exponentially increasing sources of imagination, new forms of belonging, identity and adaptation to space emerge. This gives rise to new challenges for both young generations, in their being "twice-migrants", and local and national policies in their responses to an ever-increasing complexity. This contribution therefore investigates what it means for an entire generation of people born on Italian soil to grow up and adapt to a hostile context that does not recognise their autochthony, and thus opt for emigration in search of a sense of belonging. This gives rise to a paradox that generates further and often painful friction between the multiple contextual identities to be cyclically deployed, between the different dimensions of being Bangladeshi, Italian Bangladeshi and British Bangladeshi.

RN15 | T08: Global Orders

Institutional Orders in COVID-19 Responses: Negotiating State Legitimacy and Global-local Asymmetries in Uganda and Tanzania

Tiina Kontinen[1], Karembe Ahimbisibwe[1,2], Judith Kahamba[1,3], Kellen Aganyira[2]

1University of Jyväskylä, Finland; 2Makerere University, Uganda; 3Sokoine University, Tanzania

The paper explores institutional orders manifested in Uganda and Tanzania during the Covid-19 response. We draw and build on organizational institutionalism to interrogate power dynamics in building state legitimacy first, embedded in state-citizens relations and second, in regard to global policies and guidelines led by the World Health Organization (WHO). We argue that within existing socio-political regimes in these two East African countries, the global Covid-19 measures were adopted, adapted, or resisted in ways that drew on different sources of legitimacy when portraying state tutelage, neglect, and coercion over citizenry. Based on an analysis of newspaper articles reporting on Presidents' addresses as well as announcements and orders from governmental bodies such as Health Ministries during 2020-2022, the paper scrutinizes the use of diverse institutional orders not only to legitimate state (in)action but also to acquiesce to and dismiss the global policies emanating from the powerful global North. We show how the two neighboring countries adopted strikingly different but hybrid responses that were legitimated through the logics of science, economy, religion, tradition, and authoritarian populist politics. Uganda's long-reigning President Museveni took a robust science-led and militaristic enforced strategy while Tanzania's President Magufuli initially embraced and then abandoned the WHO science-led approach and announced the country Covid-free; to be changed again after President Hassan assumed power in 2021. We discuss how the different legitimation strategies resonated with the two countries' post-colonial history of shifting global relations and the reproduction of their particular authoritarian states.

Discourses of Suspicion in Actor Designations: Articulation of Legal Subjects in Foreign Agent Law

Ivan Serbin

Tampere University, Finland

This article explores how the discussion and the subsequent reporting of the law in the state media rationalised the Foreign Agent Law in Russia between 2012 and 2022 to various audiences. By referring to the Membership

526

Categorisation Analysis and Bakhtin's consideration for the dialogism of discourse, I look at how identification and homogenisation of respective actors are used to communicate the legitimate view of the ontology of social reality. The preliminary argument rests on the observation that by employing a repertoire of membership identifications and narrative structures, the advocates of the law constructed an ontological view dominated by the hermeneutic of suspicion in international relations and models of appropriate citizenship.

Adopted upon Vladimir Putin's return to power in 2012, Russian Foreign Agent Law subjected the multitude of actors in civil society to rigorous regulation under the pretext of combatting foreign influence on domestic affairs. Unfolding in the past decade the law drew on strategies of external legitimisation through cross-national policy comparison. By referring to the example of similar policies elsewhere, such as the Foreign Agent Registration Act in the USA, the politicians in charge communicated the legitimacy of the newly invented policy. At the same time, the expansion of the law which gradually subjected the entirety of civil society was marked by the amplification of polarising political rhetorics. In this sense, the arguments in favour of the policy constructed the ontological view of international politics as a recurring attempt to subvert the indigenous processes by covert influence.

I argue, that presenting the policy as an import rather than an indigenous measure rationalised the securitisation of civil society and established a precedent for further expansion of the trend to gradually delegitimise organisations deemed dangerous. In this fashion, the discursive strategy of the proponents of the law builds on the popular imageries of modernisation in line with the universal trends, thus refuting the critique from the actors of civil society affected by this measure and international commentators alike. However, by referring to the binary semiotics of 'Us and Them' the expansion of the policy was rationalised to the national audiences.

(Re)mapping Global Power Relations? Logistics, Labor and Humanitarian Aid

Patricia Sarah Ward

University of Bielefeld, Germany

This paper considers how humanitarian logistics organizes labor relations in the contemporary economy. Over the past few decades, research has been prolific on the economic, social and cultural effects of the global (re)organization of supply chains on work and workers, highlighting continuities as well as transformations in terms of labor processes, workers' mobilities and solidarities, the role of the state, and the reproduction of the colonial division of labor. Yet, the majority of this work focuses on the private sector. What is missing from these analyses is the inclusion of transnational humanitarianism: a major global industry that embeds logics from both profit and non-profit sectors in its operations, and organizes labor in and beyond 'crisis' contexts. Drawing upon critical interdisciplinary scholarship on logistics and sociological analyses of the labor process, this paper considers the organization of work and workers in major humanitarian logistic hubs located in Italy and Dubai, spaces where multiple state and non-state stakeholders strive to satisfy a variety of 'clients' and 'mandates' on 'humanitarian emergency' premises. I find that the labor relations that manifest and are produced from these spaces urge more elaborate explanations about first, how market, but also other logics organize labor and workers. Second, the vehicles of power stakeholders mobilize to construct and delineate skill and social value. I argue that thinking with and through humanitarianism as logistics expands explanations about the processes that construct the international division of labor and thus mappings of global power broadly construed.

RN15 | T09: Global Networks

Do External Threats Decrease Political Polarization? Climate Change and Immigration Discussions on Finnish Twitter After the Russian Invasion of Ukraine

Tuomas Ylä-Anttila, Antti Gronow, Arttu Malkamäki, Yan Xia, Mikko Kivelä

University of Helsinki, Finland

Increasing polarization poses serious challenges to democracy. Research has suggested that the rise of an external threat can decrease polarization and increase social cohesion, but the evidence for this claim is mixed. To better understand this phenomenon, we investigate whether the external threat posed by the Russian invasion of Ukraine in February 2022 depolarized discussion on divisive topics – immigration and climate change – on Finnish Twitter. Analyzing retweet networks before and after the invasion, we find that polarization does decrease, but only selectively. The depolarizing effect is confined to specific subtopics of divisive discussions and is limited by motivated reasoning – the tendency of participants to interpret new information in a way that fits their pre-existing, polarized frames. These results suggest that the depolarizing effect of external threats is limited, at least in the context of polarized bubbles on social media.

Global Science Cooperation at Cross-Roads? – Sino-German Research Collaborations amid "De-Risking" and "Research Security"

Lynn Sibert

Technical University Berlin, Germany

A distinct global science system that manifests itself through transnational knowledge production and transfer, is usually discussed as a paradigmatic expression of global cooperation. Amid intensified geo-political conflicts and an increased focus on national security, new challenges for open scientific cooperation arise, especially in the fields of emerging technologies. At the same time, the balance of power in global science has shifted: While asymmetries between Global South/North persist, China has developed into a leading center for scientific research output and cutting-edge innovation. While trends towards securitisation of collaborative science with "critical third countries" are becoming apparent in European science systems (following earlier science policy shifts in the US, i.e. "China initiative") and concepts of risk-aware collaborations being established, there is currently still little research on this topic. However, these changes of collaborative science offer major insights for adjusting and developing empirically-informed theoretical concepts of global cooperation. There is an urgent need to broaden the predominant bibliometric study of global scientific cooperation through qualitative-interpretative approaches. As part of an ongoing research project on Sino-German scientific cooperation, both document analysis (current guidelines, policy recommendations/measures from universities, research institutions and funding organisations) and ethnographic data are being collected to investigate researchers' and science administrators' perspectives and experiences. First results from field research conducted in internal workshops organised by German research institutions in response to new science policy requirements, in which conditions and measures for the future design of cooperation with Chinese partners are discussed, will be presented. Key conflict lines will be outlined looking at the extent to which established concepts of global cooperation are being challenged.

(Re)Bordering Europe: The Impacts of Brexit in the Dover-Calais Borderland

Cedric Jürgensen[1,2]

1Leipzig University, Germany; 2Centre Marc Bloch, Germany

528

For multiple decades, the European Union has not only grown together politically and

economically but also culturally and socially. Brexit, however, has shown that this kind of transnationalization can be reversed. While the political and economic consequences of this

have been the subject of a vivid public and scholarly discussion, its social and societal impacts have been largely absent from these debates.

The aim of my research project is to fill this gap by analyzing the social consequences of Brexit. Borderlands have been shown to be particularly suitable areas to investigate processes of (de)transnationalization. This is particularly true for the Dover-Calais crossing. The crossing is the most important transportation link between the UK and continental Europe, playing a pivotal role for the flow of both goods and passengers.

In a first step, I present my theoretical framework and conceptualize how the UK's exit from the EU could influence the border and, in turn, the lives of borderland residents. I argue that Brexit changes the legal and political configuration of the border as well as border discourses. This, then, has an effect on the lives and experience of people in the borderland, which consequently influence identities, perceptions, and discourses.

Following this, I present the initial findings of my fieldwork. Brexit has turned the border into a legal and psychological barrier for transnational mobility and cooperation. This is particularly visible in areas such as fishery, local and regional administration, and NGOs in the migration context. Actors in these domains face increased difficulties for cross-border activities. Potentially, these observations

could be indicative for larger processes of a restructuration of transnational mobility and interactions that results from Brexit.

EUropean Borders and Urban (In)Security

Nina Perkowski

University of Hamburg, Germany

Over the last thirty years, borders have become increasingly diversified: border controls no longer take place only at state borders, but also within state territories. This paper critically examines this shift, with a particular focus on how urban areas are becoming new frontiers of border control and security. Through a comparative analysis, this paper examines how border logics are transposed into urban contexts, reshaping social relations and notions of (in)security and belonging. Hamburg and Milan serve as contrasting case studies, offering insights into the spatialization and governance of danger and (in)security within urban settings. The paper examines public debates and urban security practices in each city, revealing distinct narratives and challenges. In Hamburg, the discourse on urban security is dominated by issues of racial profiling and the police's expanded authority in designated "dangerous spaces". Conversely, urban security debates in Milan are marked by controversies related to the military operation "Safe Streets" and the ensuing power dynamics between national, regional and urban authorities. Examining both cases, the paper argues that an economy of fear, often underpinned by white ignorance, informs urban bordering practices in various ways. As such, the paper underscores the need for a critical engagement with the types of (non-)knowledge that influence perceptions of migration and (in)security across different scales, shaping policies and practices both at the EU's external borders and within EUropean cities.

RN16 | Sociology of Health and Medicine

RN16 | T01_01: Trust and health

Classical and contemporary scholars maintain – with robust argument – the centrality of trust in doing society. In a way, trust can be considered the concrete of social relationships. Defined as a positive expectation emerging in a condition of uncertainty and vulnerability (Guido Möllering), trust appears to be a pivotal notion in healthcare. Besides the commonplace about trust that patients must grant to healthcare professionals responsible for curing their vulnerable bodies, it is crucial to consider the trust that healthcare professionals must accord to patients, particularly when their vulnerability emerges. Two examples can offer a plastic view of the issue: childhood vaccination and psychotic crisis management. In the first situation, parents must trust healthcare professionals proposing inoculating medication in a loved, precious, healthy body. In the second vignette, we can imagine a psychiatrist made vulnerable by the behaviour of the disturbed patient, deciding if to carry on or suspend – for instance, by binding him/her to a bed – the therapeutic alliance. For this session, scholars are invited to discuss either theoretical or empirical studies, focussing on the cure and care relationships where the need for trust emerges in a frame of particular vulnerability of patients and/or healthcare professionals.

Trust In Government In A Time of Crisis: Does It Matter?

Samantha Meyer[1], Hoda Herati[1], Helena Nascimento[1], Michael Calnan[2], Patrick Brown[3], Paul Ward[4], Eve Dube[5]

1University of Waterloo, Canada; 2University of Kent, UK; 3University of Amsterdam, NL; 4Torrens University, AUS; 5Université Laval

The ability of governments and nations to handle crises and protect the lives of citizens is heavily dependent on the public's trust in their governments and related social institutions. The aim of the present research was to understand public trust in government during a time of crisis, drawing on interview data (N = 56) collected during the COVID-19 pandemic in Canada (2021). In addition to the general public (n = 11), participants were sampled to obtain diversity as it relates to identifying as First Nations, Métis, and Inuit (n = 7), LGBT2SQ+ (n = 5), low-income (n = 8), Black Canadians (n = 7), young adult (n = 8), and newcomers to Canada (n = 10). Data were coded in consideration of social theories of trust, and specifically the nature of trust between individuals and institutions working with government in pandemic management. Canadians' trust in government was shaped by perceptions of pandemic communication, as well as decision-making and implementation of countermeasures. Data suggest that although participants did not trust government, they were accepting of measures and messages as presented through government channels, pointing to the importance of (re)building trust in government. Perhaps more importantly however, data indicate that resources should be invested in monitoring and evaluating public perception of individuals and institutions generating the evidence-base used to guide government communication and decision-making to ensure trust is maintained. Theoretically, our work adds to our understanding of the nature of trust as it relates to the association between interpersonal and institutional trust, and also the nature of trust across institutions.

Medical (Dis)Trust and Post-Mortem Organ Donation Behaviours

Sinja Coz

University of Ljubljana, Slovenia

530

Organ transplantation is a lifesaving medical treatment. For its functioning social trust is crucial, as organ procurement for transplantation relies solely on the voluntarism of individuals through a decision for organ donation. This is especially important with post-mortem organ donation that requires of people to accept reality of death, which exposes our powerlessness and our dependence on medical institutions and other social structures.

Many factors, from personal to institutional or systemic, contribute to individual decision about post-mortem organ donation. This presentation will be focused on the role of medical (dis)trust, including the fear of medical neglect of potential donors, distrust in brain death diagnosis and expectation of a miracle, and trust in healthcare institutions.

Presented study is part of a larger study exploring the interplay between socio-cultural aspects of death and post-mortem organ donation behaviours. We conducted a qualitative study in Slovenia in 2021 using semi-structured in-depth interviews with people who are not registered as organ donors. With reflexive thematic analysis we identified how attitudes towards death interplay with post-mortem organ donation behaviours and how are they framed by wider socio-cultural aspects of death.

The findings show that medical (dis)trust is one of the major potential inhibitors of decision to donate organs, i.e. if present among personal beliefs one is less likely to consent to post-mortem organ donation for oneself or others. The study also suggests that the level of trust in healthcare institutions might be reflected in the decision for or against post-mortem organ donation as an expression of support or resistance to the established system.

RN16 | T01_02: The tensions surrounding medicine: declining trust and legitimacy towards expertise, epistemic challenges and transformative processes

The crisis of medical expertise, exacerbated by the COVID-19 Pandemic, is a significant concern for scientists and regulatory agencies whose role and authority are being questioned. Besides the conflict between the scientific community and the social groups that opposed controversial positions, we witness epistemic tensions even within the medical field. While Evidence-Based Medicine is still the gold standard, the universal applicability of the hierarchy of evidence has been challenged, and a more pluralistic approach has been advocated. The pandemic has questioned the feasibility of controlled trials in times of crisis, and the careful analysis of real-world settings and real-life clinical practices has been proposed as a new standard during emergencies. We invite contributions that critically reflect on the epistemic tensions in medicine during the pandemic and beyond. A (non-conclusive) list of topics includes: – the evolution of EBM, even in the light of AI, and the real-world evidence perspective; – the trust towards scientific and medical experts and regulatory agencies after the pandemic; – the tensions between protocols/guidelines and decision-making in everyday clinical practice; – bottom-up knowledge production by epistemic communities and communities of practice; – the role of sociology in sustaining the transformation towards a more pluralist approach in medical research.

"Anti-Scientific Americans:" The Prevalence, Origins, and Health Policy Consequences of Anti-Intellectualism in the U.S.

Matt Motta

Boston University School of Public Health, United States of America

Anti-intellectualism is a pervasive and pernicious force in contemporary American political life. Often conceptualized the dislike and distrust of experts – i.e., individuals who can make credible claims of superior knowledge in scientific and academic fields – anti-intellectualism has been thought to motivate opposition of evidence-based health policies.

In this manuscript, I summarize insights from a book project in which I offer a new theoretical framework (and empirical tests of that framework) for understanding the prevalence, origins, and health policy consequences of anti-intellectual attitude endorsement in the U.S. Bringing together micro-level survey data from dozens of cross-sectional and longitudinal surveys (spanning six decades), and macro-level data from hundreds of aggregated opinion polls dating back to the 1940s, I find that anti-intellectualism is both a pervasive and pernicious presence in American public life. I demonstrate that about one third of Americans can be thought about as holding anti-intellectual attitudes at any given time, which have become increasingly politicized following the rise of the Tea Party in the early 2010s. Reviving often-overlooked insights from Richard Hofstadter's pioneering work, I also show that anti-intellectualism both shapes and is shaped by Americans' resentment of the role that experts play in the policymaking process. Anti-intellectualism further motivates opposition to expert-backed health policies, including resistance to the advice of public health experts in the face of the COVID-19 pandemic. Finally, I show that – – in periods where public anti-intellectual attitude endorsement is comparatively greater – – elected officials tend to respond by curtailing experts' influence in the policymaking process. I conclude on an optimistic note, by discussing how what we might learn from this research can help restore trust in experts.

Doubt in Medical Science As An Important Consequence Of The Covid-19 Pandemic: The Case Of Serbia

Uroš V. Šuvaković

University of Belgrade – Faculty of Education, Serbia

One of the greatest achievements of medical science and science in general is the vaccine invention – by Edward Jenner who created the smallpox vaccine. In honor of this invention, Pasteur suggested that all vaccines should be given that name, and the vaccine discovered by Jenner was named after him. Moreover, thanks to the efforts of the

531

World Health Organization (WHO), smallpox was declared eradicated in 1980, which was the first eradication case ever of a human disease. Owing to vaccines, millions of human lives have been saved, particularly when it comes to infectious diseases such as smallpox.

On the example of Serbia, we show the continued action of antivaxxers in the past ten years. Public figures, mostly with no medical education, led a mass-media campaign against the MMR vaccine, which resulted in local epidemics, primarily measles, and was followed by the COVID-19 pandemic, when the announcement of the vaccine created against this disease immediately sparked stories about its harm to human health. In Serbia, the already existing prerequisites through years-long action of the anti-vaccine lobby were combined with the new cause – anti-COVID-19 vaccination, where this lobby's activities were transferred on to social media. The anti-vaccination process was strongly politicized and supported by foreign news pointing to vaccine nationalism, affairs regarding vaccine acquisition, corporations fighting for profit and many other weaknesses, which further deepened the Serbian citizens' mistrust. By the end of the pandemic, approximately 60% of adult citizens were vaccinated against COVID-19, which does not necessarily mean doubt was removed.

Tensions Around Expertise in Medicine? Laypeople and the Popularisation of Health-Related Self-Measuring Devices

Ann Kristin Augst

TU Dortmund, Germany

Technical devices that can be used to measure various body data are becoming increasingly popular, as sales figures show. In times of increasing data processing and sharing, the usage of these devices can be seen as a potential challenge to medical expertise. Although these devices (e.g. the Apple Watch or the Fitbit) do not necessarily comply with medical technology standards, the data and figures generated by them and their automatic evaluation might compete with, or even undermine, the expertise of medical professionals, and result in mis-(self-)diagnosis and/or – treatment. Based on interviews conducted with both patients and doctors in Germany as part of the research project "Digital Body Knowledge. Conflict Lines of Problematic Popularity in Health Care" (funded by the German Research Foundation), this presentation aims to answer the following questions: What role does data collected from patients play in medical practice? Does it really challenge medical expertise? And do healthcare professionals interact with the increasingly popular devices and their output? This presentation will demonstrate which tensions and (needs for) transformations are evident in the field and who (does not) trust whom – or what. Central to this is the infrastructure of the German healthcare system, in particular the state of its digitalisation, but also a deep-rooted scepticism towards technical innovations among the population and a primarily cautious approach to data protection create a

unique framework for the (non-)negotiation of knowledge between laypeople and experts in the healthcare sector.

Rethinking Healthcare Assessment: Bridging the Gap Between Subjective Experiences and Objective Criteria

Sandra Jaworeck

TU Chemnitz, Germany

This submission presents a new approach to evaluating healthcare systems in the context of evolving social transformations and the pivotal role of trust in healthcare. A novel health care index is introduced, seamlessly blending individual assessments with objective macro criteria, overcoming the limitations of traditional comparisons. The index, crafted through a data-driven procedure, uniquely incorporates subjective elements by weighting macro indicators based on individual self-rated health, adding a nuanced dimension to the evaluation process. In a multi-level model, this innovative index proves not only effective in minimizing country differences but also in explaining variability in self-rated health without impacting other estimates.

Moreover, the paper extends the discourse on health system comparisons by introducing a subjective level to traditional objective factors. The analysis delves into correlations between this subjective index and existing health system indices, highlighting the importance of considering not just objective health determinants but also subjective aspects like access to the health system. Intriguingly, correlations weaken when health expenditures are imposed rather than chosen voluntarily, underscoring the significance of subjective experiences in evaluating healthcare systems. This research contributes to the session's exploration of trust in healthcare, emphasizing a holistic approach that seamlessly integrates objective and subjective dimensions for a more captivating and comprehensive understanding of health system performance.

532

RN16 | T01_03: Trusting health information online in the era of transforming social communication

New communication technologies are influencing all aspects of people's lives. By making access to information more democratic, easier and immediately available (Muhammed, Mathew 2022), web-based platforms and applications encourage patients to deal with their informational and emotional needs in a new way. During the COVID-19 pandemic, the limited access to professional medical care has increased people's will to turn to various online channels (e.g. websites, online health communities) for healthcare purposes (Pöyry, Reinikainen & Luoma-Aho 2022; Kothari, Walker & Burns 2022). Therefore, it seems important to explore sense-making and decision-making processes employed in such situations, especially in the case of risk and uncertainty (e.g. life-threatening diseases). The use of online sources does not happen in a vacuum, but it is integrated into a texture of social practices (Gherardi, 2004) in which trust plays a crucial role. Trust, a highly complex and multidimensional phenomenon, has cognitive, emotional and behavioral dimensions, which merge into a unitary social experience (Lewis and Weigert 1985). In this sense, it is relevant to unveil how patients negotiate the risks associated with their choice to use online channels for healthcare purposes (e.g. Chauhan and Campbell, 2021).

In Such A Dark Period, The Only Light: Patients' Motivations And Strategies To Seek Care From #TERAPIADOMICILIARECOVID19

Alberto Ardissone

University of Macerata, Italy

This contribution presents the findings of a qualitative study conducted in Italy about a peculiar online health community named #TERAPIADOMICILIARECOVID19 (#TDC19), which, since April 2020, has assisted people with COVID-19 with early-at-home therapy delivered by volunteer doctors, free of charge for patients. The aim of the study was to analyse patients' motivations and strategies when negotiating risk in the context of this choice. Findings showed that patients' choices were the outcome of a process that forms an entangled ecology of care involving several dimensions, crossing micro, meso and macro levels: a) the process of knowledge-building by assessing mass-media, ascertaining the best protocol and recalling previous experiences with similar diseases; b) the experience of feeling abandoned by general practitioners (GPs) and healthcare institutions; c) the positive encounter with #TDC19's posts of gratitude written by people who were cured by #TDC19 doctors. In the end, patients' choice was not a leap of faith; they negotiated and balanced out the perceived risks associated with COVID-19 and with the possible available choices (GPs, do-it-yourself, #TDC19-doctors) based on a strategy that encompassed a blend of rational and in-between logics.

Health Misinformation And Social Divides During The COVID-19 Pandemic

Javier Alvarez-Galvez[1], Victor Suarez-Lledo[2], Maribel Serrano-Macias[3], Jesus Carretero-Bravo[4], Esther Ortega-Martin[5]

1Computational Social Science DataLab, INDESS, University of Cadiz, Spain; 2Department of Sociology, University of Granada, Spain; 3Department of History, Geography and Philosophy, Humanities, University Pablo de Olavide, Spain; 4Computational Social Science DataLab, INDESS, University of Cadiz, Spain; 5Computational Social Science DataLab, INDESS, University of Cadiz, Spain

533

The COVID-19 pandemic has been followed by a massive infodemic, defined as an overabundance of information (whether accurate or not) that makes it hard for people to find trustworthy sources and reliable guidance when needed. The propagation of health misinformation through social media has become a major public health concern today. Although there is broad agreement among health professionals, researchers, and policymakers on the need to control health misinformation, there is still little evidence about the effects that the dissemination of false or misleading health messages through social media could have on public health in the near future. The present study aims to characterize the COVID-19 infodemic and its impact on social and health decision-making processes using a combination of social media mining techniques, surveys, experimental, and simulation data. In general, we observed that health misinformation was highest on Twitter and on topics related to tobacco products and drugs. During the pandemic, high politicization of health issues was noted. Misinformation on other health-related topics, such as vaccines or chronic diseases, was also highly prevalent. Furthermore, bots were identified as a source of disinformation that favors the dissemination of false or misleading content while contributing to increased social polarization and negative sentiments among population. Significant differences were detected in the structures of the diverse communities in relation to specific topics of conversation. Our findings show that the processes of social polarization can vary considerably depending on the misinformation sources, the network topology and the subjects on which the debates are articulated.

What Did Healthcare Organizations Learn from Covid-19? A Pragmatist Approach

Kirstine Zinck Pedersen

Copenhagen Business School, Denmark

Healthcare organizations experienced radical changes in their organization and management, everyday practices, and core tasks during the covid-19 crisis. This paper examines whether and how the experiences from the pandemic have resulted in lasting organizational learning. Based on a longitudinal interview-study with Danish healthcare professionals in the onset of the Covid-19 pandemic and 2.5 years later, it is shown that while only few codified and formalized learning outcomes appeared as lasting, certain more tangible and invisible new habits and organizational routines have developed from the Covid-experience. The study adds to discussions of organisational learning in healthcare by emphasising the habitual aspect of learning processes, even in times of crisis or uncertainty. This discussion is based on John Dewey's understanding of learning as the experience-based refinement of predispositions to act in certain ways.

Trust In Official Health Information Sources: The Perception Of Public Sector Communication On Covid-19 By Italian Citizens And General Practitioners.

Gea Ducci, Mario Corsi, Camilla Folena

University of Urbino Carlo Bo, Italy

In the digital and platform society (van Dijck et al. 2018), health discourses are generated from multiple online sources in a hybrid and convergent media ecosystem (Jenkins et al. 2013; Bentivegna-Boccia Artieri 2019). Public health institutions try to inhabit digital environments by being aware of the e-patient phenomenon (DuPré 2014; Ferguson 2007).

During COVID-19 (Lupton 2022), public health institutions accelerated the use of digital media to deal with the infodemic and information disorder (PAHO 2020; Lewis et al. 2021), with advantages and disadvantages (including the risk of increasing inequalities) (Coombs 2020; Lovari et al. 2021). According to the literature on crisis and emergency communication, institutions' communication on the various aspects of the pandemic has to be integrated, multi-channel, and inter-institutional.

In this regard, a study has been conducted aiming to detect which information sources were used by Italians during the pandemic, the strategic role of public health institutions' communication, and the population's trust in them (Ducci et al. 2022), detecting the citizens' perception and the general practitioners' point of view.

The study was based on a quantitative method.

In May-July 2021, telephone interviews with a structured questionnaire were subjected to a stratified sample of Italian citizens (1.001 units), and a structured questionnaire was administered to a sample of general practitioners in a pre-selected region.

The results highlighted:

– differences between Italian citizens in relation to their attitudes towards information sources and health institutions communication;

– the need for greater inter-institutional and integrated communication between general practitioners, institutions, and healthcare facilities in order to satisfy citizens' needs.

534

RN16 | T01_04: Gender perspectives in sociology of health and medicine research

"Don't Say That The Doctor Gave You 'Only' Five Years – Say He Gives You 'No Fewer Than' Five!". Relation Between Prostate Cancer Support Group and Biomedicine.

Katarzyna Barbara Slaby

Collegium Medicum Jagiellonian University, Cracow, Poland

In the presentation, I am portraying a prostate cancer support group ("Gladiator" association) in the context of its relationship with biomedical surroundings. Based on the fieldwork carried out between 2019 and 2022 in a mid-size city in Poland and having insight into narrated personal cancer experiences and public performances I would like to highlight the specific underpinnings of support group and its narrative of prostate cancer itself. In the interviews, men recall their experiences without withholding personal and intimate details. Still, on the group level, they reaching out for a language rather rooted in objectivity and solution-oriented discourse on prostate cancer, close to what Arthur Frank (1995) called the 'restitution narrative', empowered mostly by an extended version of 'patient and physician male dyad' (see Oliffe, Thorne 2007). This results in peculiar overtrust (to refer to the conference theme) and uncritical partnership with the local clinical settings, leading to a kind of biomedicalisation of association as a whole.

However, it is worth emphasizing that the context of the association's activity is the peculiar under-recognition of that type of support group (at least, in Poland) as well as the lower public awareness of prostate cancer itself, compared, for example, to breast cancer. There is also no denying that an illness such as prostate cancer can compromise a sense of masculinity and agency. Nevertheless, since the association's agenda is strongly oriented mostly toward providing information on preventive care and health promotion, it significantly impacts who (or what) the organization supports, and which voices are heard and which are being silenced.

Applying Multilevel Intersectional Analysis on the COVID-19 Incidence from a Gender Perspective

Claudia Malpica-Lander[1,2], Lidia Arroyo-Prieto[1]

1Universitat Oberta de Catalunya, Spain; 2Universitat de Barcelona

As shown by previous research, both structural gender inequalities and gender normativity that conforms men and women's social practices and subjectivies, affect the risk of exposure with regard to health issues (Hare-Mustin & Marecek, 1994; Pujal & Amigot, 2010; Artazcoz, 2004; Velasco, 2009; Kingle, 2008; Regitz-Zagrosek & Seeland, 2012; Schiebinger, 2018). In particular, in the case of infectious diseases transmitted through social interaction such as COVID-19 the gender perspective is especially relevant in terms of identifying how gendered practices and structures are affecting the disease (Nkangu, Olatunde, Sanni, 2017; Smith, 2019; Smith, Avdiu & Nayyar, 2020; Wang, et al., 2020). This pandemic has shown the relevance of care work to sustain the current socio-economic system as frontline jobs, and, at the same time, it makes visible some requirements of care sector linked with the quality of care services.

The project, funded by the Agency for Healthcare Quality and Assessment of Catalonia (AQuAS), aims to identify how gender and intersectionality with other socio-economic axes of inequality (income level, educational level, origin) affect the incidence of COVID-19 through a multilevel intersectional model based on the Public Data Analysis Programme for Health Research and Innovation (PADRIS). The analysis will look into gender inequalities with an intersectional approach (Evans et al., 2017; Merlo, 2018); taking into account the age, origin and income.

"'Stop Telling Us it's Not a Real Pain!' The Socio-Historical Analysis of Discourses Behind the Painful Experiences of Women Living with Endometriosis in Ireland"

Barbara Gornicka

University College Dublin, Ireland

Endometriosis is one of the most complex, debilitating and enigmatic conditions, which affects at least 10% of women's world population (Jackson, 2019; Horne et al, 2017; Huntington & Gilmour, 2005). This chronic gynaecological disease is a 'heterogeneous disorder of unknown aetiology defined by the presence of endometrial-like tissue (lesions) outside the uterus' (Horne et al, 2017: 2191). It includes severe pelvic pain, during and outside menstruation times, pain during intercourse, heavy periods, problematic levels of fertility, or leading to complete infertility (Vigano et al, 2004). Currently, it takes on average nine years to receive a correct diagnosis in Ireland, which makes it one of the most

misdiagnosed or slow to diagnose conditions (EAI, 2020). Women's menstrual pain has been normalised among medical circles and women are reluctant to disclose any abnormalities around menstrual pain and other irregularities, due to stigmatising or discrediting factors Seear (2009; 2014). The origins of stigmatisation, tabooisation and fear attached to women's reproductive anatomy and its functions has a long history (see Shorter, 1982; Laqueur, 1990; Lindquist, 2016). Despite the switch to the 'two-sex model' paradigm, the hierarchical sentiment between men and women continues to linger (Bueter,2017). While this history is well developed in an international context, there is less clarity as to the context in Ireland. This paper discusses how the social and historical discourses reveal gendered differences in the standards of care, diagnosis and treatment among the suffering Irish women. It investigates the historical gendered narratives within medical knowledge and practices, which surrounded women's reproductive health in Ireland and specifically endometriosis.

RN16 | T02_01: Trust and health (2)

Classical and contemporary scholars maintain – with robust argument – the centrality of trust in doing society. In a way, trust can be considered the concrete of social relationships. Defined as a positive expectation emerging in a condition of uncertainty and vulnerability (Guido Möllering), trust appears to be a pivotal notion in healthcare. Besides the commonplace about trust that patients must grant to healthcare professionals responsible for curing their vulnerable bodies, it is crucial to consider the trust that healthcare professionals must accord to patients, particularly when their vulnerability emerges. Two examples can offer a plastic view of the issue: childhood vaccination and psychotic crisis management. In the first situation, parents must trust healthcare professionals proposing inoculating medication in a loved, precious, healthy body. In the second vignette, we can imagine a psychiatrist made vulnerable by the behaviour of the disturbed patient, deciding if to carry on or suspend – for instance, by binding him/her to a bed – the therapeutic alliance. For this session, scholars are invited to discuss either theoretical or empirical studies, focussing on the cure and care relationships where the need for trust emerges in a frame of particular vulnerability of patients and/or healthcare professionals.

536

Institutional Mistrust. The Doctor-Patient Relationship in Prison Healthcare

Luca Sterchele

Università degli Studi di Padova, Italy

Prison is a social environment in which suspicion permeates all relations between groups (and, often, individuals), both horizontally and vertically (Ronco, 2016). This element of distrust, characterising the more traditional opposition between prisoners and prison staff (Sykes, 1958), also affects the doctor-patient relationship. Despite various legislative interventions that have followed over the years and culminated with the Prison Healthcare Reform of 2008 – which transferred healthcare competences to the Ministry of Health, and therefore to territorial services – the frame of suspicion that characterises infra-walls relations between doctors and patients has not been eradicated.

This contribution, moving from ethnographic research carried out in three Italian prisons between 2017 and 2019,

aims at providing some considerations regarding the twists that the element of "trust" assumes in the therapeutic relationship within prison walls. Where "trust" turns out to be the pivotal element in such relationship outside, in prison there is a reversal that sees "suspicion" as the core category through which to filter the healthcare relationship. The frame of suspicion comes to be configured as the primary interpretative filter for healthcare workers in prison, so much as to be transmitted and "taught" to new operators. This leads to the production of categories such as those of "simulators", "crackpots", "hypochondriacs", through which some prison patients are labelled. Those simplifying categories are oriented to reduce a perceived constant threat of "being fooled" (and thus the menace to the institutional imperative of "working tranquility"), ending up posing serious challenges to an effective relation of care.

Trust and Chronic Illness Management at School: Reflections from a Research with Children

Francesca Zaltron[1], Anna Rosa Favretto[2], Stefania Fucci[3]

1University of Eastern Piedmont, Italy; 2University of Turin, Italy; 3University of Parma, Italy

The contribution intends to present a reflection on a topic that is little dealt with in the sociological literature in the field of children's illnesses, namely the management of chronic illness at school. In particular, attention will be focused on the analysis of some factors that can facilitate or hinder the management of chronic illness at school, considering that this management implies a complex collaboration between services (school and healthcare) and different actors (families, children, school and health personnel).

The proposed reflection moves from the results of a qualitative research carried out in a North-West Region of Italy, which investigated the point of view of children (8-9 years old and 11-12 years old) suffering from asthma and type 1 diabetes and that of adults (parents, teachers, health personnel) involved in the illness management process. The aim was to grasp the subjective meaning attributed to asthma management behavior and practices at school and the constraints and resources that contribute to structuring children's agency and participation in this specific context. In particular, it will be highlighted how the issue of trust is central to the analysis of the illness management dynamics at school, in the division of social labor between the actors and the institutions present in the school environment, especially in the attribution of responsibilities. The research has highlighted how trust acts on at least three levels: in relations between institutions, i.e. between the healthcare service, the school service and the families; between adults and students/patients and in peer relations.

Aggressive Repertoires During the COVID-19 Crisis in Romania

Cosmin Toth

University of Bucharest, Romania

This analysis examines the discursive construction of decision-makers during a significant public health crisis—the peak of the COVID-19 crisis in Romania. To accomplish this objective, comments posted as reactions to news about vaccination on one of Romania's most accessed news sites were analyzed, along with a sample of comments posted on YouTube channels of three TV news stations in Romania.

The primary methodological approach employed was content analysis, complemented by techniques specific to discourse analysis. This combination aimed to provide a comprehensive understanding of how decision-making authorities were socially constructed and the legitimacy of their actions and decisions. Comment analysis often revealed an aggressive or anxious tone. However, the discursive constructions and their targets varied. The comments were categorized based on the level of aggression, structural and discursive mechanisms used, types of reproach (moral or epistemic), and the target of aggression. Subsequently, repertoires of aggression were identified to unveil the criteria by which decision-makers are evaluated, as well as the legitimacy of their actions and decisions during crises.

As a conceptual reference point, we drew upon the definition of repertoires provided by Wetherell and Potter (1988, 172): "building blocks that speakers use to construct versions of actions, cognitive processes, and other phenomena.". Interpretive repertoires, as linguistic resources, serve as ideological statements representing "systems of terms used recurrently to characterize and evaluate actions, events, and other phenomena" (Potter and Wetherell, 1987, 149). Through these repertoires, we aim to unveil the normative structure and value expectations used to define and evaluate decisions and actions of relevant actors in times of crisis.

537

The Role of Trust in Health-Related Conspiracy Beliefs during the Covid-19 Pandemic

Sümeyye Sena Akkoç

Bogazici University, Turkiye

Conspiracy theories pose a significant threat to public health during crises by eroding trust in public institutions and scientific knowledge. While prior research has explained believing conspiracy theories through informational deficiency, psychological traits, or poor cognitive skills, these explanations fall short in accounting for sociocultural influences of alternative truth discourses, eroding trust in knowledge, and increasing uncertainties. This study aims for an expanded understanding of conspiratorial beliefs by incorporating sociological dimensions such as trust and ideological beliefs in a global health crisis context.

The research investigates how trust in political institutions, healthcare services and scientists, religiosity, political view, and sociodemographic factors are connected to belief in health-related conspiracy theories during the Covid-19 pandemic. Research data is obtained from Türkiye Covid-19 Values Study Survey, conducted face-to-face with 1500 samples in April-May 2022. The descriptive results show that 44.8% of the respondents endorse at least one conspiracy theory. The preliminary regression analysis indicates a negative relationship between conspiracy theory belief, and trust in political institutions and scientists. Although there is negative association between health system trust, the relationship is not significant. Also, increased religiosity is significantly related to higher conspiracy theory belief. No significant relationship is found for age, gender, class, and education.

The findings indicate the significance of considering the role of building trust, especially in political institutions and scientists, during the communication of health-related information to counteract belief in conspiracy theories in times of informational uncertainty and public health crises.

RN16 | T02_02: The tensions surrounding medicine: declining trust and legitimacy towards expertise, epistemic challenges and transformative processes (2)

The crisis of medical expertise, exacerbated by the COVID-19 Pandemic, is a significant concern for scientists and regulatory agencies whose role and authority are being questioned. Besides the conflict between the scientific community and the social groups that opposed controversial positions, we witness epistemic tensions even within the medical field. While Evidence-Based Medicine is still the gold standard, the universal applicability of the hierarchy of evidence has been challenged, and a more pluralistic approach has been advocated. The pandemic has questioned the feasibility of controlled trials in times of crisis, and the careful analysis of real-world settings and real-life clinical practices has been proposed as a new standard during emergencies. We invite contributions that critically reflect on the epistemic tensions in medicine during the pandemic and beyond. A (non-conclusive) list of topics includes: – the evolution of EBM, even in the light of AI, and the real-world evidence perspective; – the trust towards scientific and medical experts and regulatory agencies after the pandemic; – the tensions between protocols/guidelines and decision-making in everyday clinical practice; – bottom-up knowledge production by epistemic communities and communities of practice; – the role of sociology in sustaining the transformation towards a more pluralist approach in medical research.

538

Risks And Errors In Healthcare: The Construction Of Personal Health And Well-Being

Loredana Maria Anna Tallarita

University of Enna "Kore", Italy

Safety in healthcare is linked to the issue of error prevention, clinical risk control, and guideline implementation. Errors in the medical-hospital setting are the result of actions implemented in structured role contexts that result

in uncontrollable and unexpected effects, generating un-intended consequences. However, error is fruitful because it generates additional knowledge. In the medical-hospital setting, it can be predicted or controlled with increased health safety standards and widespread risk-management activities. At a time in history, when continuous global emergencies highlight the critical nature of a health care system that is not always up to the task of resolving the issues posed, preventing or reducing errors means: maintaining a high level of medical-hospital safety; protecting the health and well-being of the patient; and controlling that the patient is not the victim of adverse events or harm during the period of hospitalization and, in the most extreme cases, death (Kohn, IOM 1999).

The cognitive questions, using error and risk as keys, attempt to identify an interpretive model (Yin 2014, Schütz 1982, Glaser & Strauss 1967) of the relationship that has been established between physicians and patients through the analysis of actions and outcomes during the pandemic phase, which prompted the implementation of guidelines and the treatment of risk, increasing levels of health safety.

Navigating Uncertainties: Tension and Trust in Indian Public Healthcare around Chronic Illness Management

Avilasha Ghosh

Indian Institute of Technology Delhi, India

The public healthcare system forms the the backbone of India's health provisions and national welfare, aimed at providing universal healthcare to individuals across socio-economic groups. Recent studies of Indian public hospitals, however, show evidence of underfunding, declining quality of care, and steady patterns of underutilisation of public health facilities by patients (Baru 2003; Mahal 2022). The declining quality of care in Indian public hospitals along with experiences of prolonged waiting, speedy consultations, low inventory of medicines, and understaffed management severely impact patients' sense of wellbeing and trust in public care services. In such a context, how do patients who use Indian public hospitals for chronic disease treatments perceive the quality of care and infrastructure in state-provisioned healthcare? Since most patients who access public healthcare in India are from economically marginal groups, what are their daily challenges in accessing timely, quality care? Drawing on my fieldwork in two large public hospitals in the metropolitan cities of Delhi and Kolkata, and a sociological analysis of my interactions with public healthcare professionals and patients in the out-patient waiting rooms, I build an ethnographic account of care and conflict between patients and staff in Indian public hospitals. The paper highlights the everyday struggles of poor patients seeking primary care services in public hospitals, and aims to provide a critical overview of the Indian public health infrastructure with a focus on patient experiences of illness, care, trust, and conflict in the out-patient wards of government sponsored hospitals.

Medical Activism in Changing Society: Contradictions of the Expert's Position

Victoria Dudina

St.Petersburg University, Russian Federation

Medical knowledge is influenced by many social factors. In conditions of social uncertainty, the question of the expert's social position becomes especially relevant. To what extent can experts go beyond their direct technical competence by using symbolic power to solve public health problems? We studied the phenomenon of "medical activism" as an example of the conversion of professional power into social power. The research question was whether physicians focus only on the technical aspects of their profession or believe that they should also pay attention to broader social issues and determinants that influence both the health status of individuals and constitute the institutional context of medicine.

Views on medical activism were analyzed using data from interviews (N=26) with healthcare professionals. A thematic analysis was conducted. Different positions have been identified. The most common view of medical activism involves expanding the role of the health professional from that of a narrow expert to that of an active participant using their knowledge to solve health problems. A narrow type of medical activism involves doctors attempting to achieve progressive goals when attempting to balance the unequal social relationship between doctor and patient. Broad type of medical activism goes beyond the medical context and seeks to use symbolic power to achieve broader goals—improving access to quality health care for disadvantaged people. Some informants put medical activism in question and treat public health problems as rooted in conditions beyond the control of health professionals. The research was supported by RSF (project No 22-18-00261).

Aesthetic Plastic Surgery as De-/stigmatizing Body Work – Tensions Between Everyday and Expert Knowledge About a Medical Discipline

Julia Wustmann

Technical University Dortmund, Germany

Aesthetic plastic surgery has been recording increasing numbers of procedures for years, but the growing number of procedures does not simply translate into social acceptance or popularity. Aesthetic plastic surgery is discussed in relation to its possibilities and limitations as well as its intentions and effects as an ambivalent, tension-filled phenomenon between the poles of empowerment and self-subjugation.

I have addressed the circumstance that the legitimacy of aesthetic plastic surgery as a medical discipline is not given

per se, but is constantly under negotiation, in the context of my research and asked about current patterns of legitimization or delegitimization of aesthetic plastic surgery in Germany. For this purpose, I brought together social perspectives with medical professional self-conceptions by conducting group discussions with everyday actors and expert interviews with aesthetic plastic surgeons.

By analyzing the empirical material and drawing on Goffman's concept of stigma, I will show that the body modified by aesthetic plastic surgery becomes the central object of social demarcation. While aesthetic plastic surgery liberates the body from a stigma from a professional perspective, from an everyday perspective the body is stigmatized by aesthetic plastic surgery in the first place. In conclusion, the presentation shows that behind these different assumptions are completely different understandings of medicine (curative vs. wish-fulfilling), its mode of action (pathogenetic vs. salutogenetic) and, subsequently, different understandings of health and illness.

RN16 | T02_03: Trusting health information online in the era of transforming social communication (2)

New communication technologies are influencing all aspects of people's lives. By making access to information more democratic, easier and immediately available (Muhammed, Mathew 2022), web-based platforms and applications encourage patients to deal with their informational and emotional needs in a new way. During the COVID-19 pandemic, the limited access to professional medical care has increased people's will to turn to various online channels (e.g. websites, online health communities) for healthcare purposes (Pöyry, Reinikainen & Luoma-Aho 2022; Kothari, Walker & Burns 2022). Therefore, it seems important to explore sense-making and decision-making processes employed in such situations, especially in the case of risk and uncertainty (e.g. life-threatening diseases). The use of online sources does not happen in a vacuum, but it is integrated into a texture of social practices (Gherardi, 2004) in which trust plays a crucial role. Trust, a highly complex and multidimensional phenomenon, has cognitive, emotional and behavioral dimensions, which merge into a unitary social experience (Lewis and Weigert 1985). In this sense, it is relevant to unveil how patients negotiate the risks associated with their choice to use online channels for healthcare purposes (e.g. Chauhan and Campbell, 2021).

540

"It's kind of my job to post perfect stuff, but kind of not" – How Influencers with Borderline Personality Organisation become Activists for a Salutogenetic Personal Recovery in the Instagram Stories

Julia Beckmann

University of Vienna (Austria), University of Siegen (Germany)

How do people with Borderline Personality Organisation (BPO) communicate their lives with this severe mental illness in their Instagram stories and how does Instagram co-constitute this discourse? By using the

hermeneutic-knowledge-sociological video analysis, I could divide this audio-visual material into its formal and content-wise dimensions to make assumptions about how the inside-outside dialectics of people with BPO is developing, which is per definition disturbed for them due to trauma in their childhood. This leads to the typical black and white thinking and immense emotional tension for people with BPO. Their process of recovery could be analysed by integrating the analyses across cases with the Constructivist Grounded Theory. Thus, two levels of communication could be identified. First, there is the symptom level, where the peoples' aspiration of posting is the act of posting itself because building a trustful relationship with their followers makes them feel less lonely. They can communicate their symptoms and how they deal with them productively instead of self-harmingly. On this level, much more contradictions of the formally used Instagram functions and the content-wise oral speech are presented than on the second, the reflexion level. Here, they do not problematise themselves anymore but, in an activist way, societal pathologies Instagram itself is seen as symbolizing. Thus, our general cultural structure, to put it in Eva Illouz' words, is criticised and makes necessary transformed ways of participating on Instagram. This leads to them often withdrawing from it to return later with a new idea of how they can participate without being exploited, as Instagram for example censors postings which have the word Borderline in it. Also, they fight for a destigmatisation of mental illness and the false belief that no recovery is possible which they are often antagonised by in hateful messages they receive via Instagram. In theoretical terms, subjectivation can be viewed as solving affective conflicts which enriches affect studies with methodological approaches to their theoretical claims which affect studies are often criticised for having omitted so far. In general, my work is a call for a salutogenetic perspective on health and medicine to help destigmatising (mental) illness.

Pharmaceutical Marketing Influences the Perception and Trust of Medical Doctors and the Pharmaceutical Industry Among Polish Patients.

Marta Makowska

Kozminski University Department of Economic Psychology, Poland

In Poland, a majority of medical doctors (MDs) meet with pharmaceutical sales representatives (PSRs) who visit their offices to promote medications and distribute promotional items, drug samples, and conference invitations. Although this form of pharmaceutical marketing is not directly aimed at patients, it remains perceptible to them. In May 2023, a survey with 1057 Polish respondents sought their perspectives on MD-targeted marketing experiences and trust levels in MDs and pharmaceutical companies. Survey results revealed that instructions from MDs on notes with drug logos were encountered by 70% of respondents, while 44.3% noticed pharmaceutical company logos in MD offices. PSRs in medical facilities were seen by 38.1%, and 33.2% reported longer waits for MD appointments due to PSR visits. Educational materials sponsored by pharmaceutical companies were received by 25.4% of respondents, and 23.0% received drug samples.

The mean trust in MDs was 6.28 (SD = 2.1), while the average trust in pharmaceutical companies was lower (M=5.03, SD=2.3). The study indicated that statistically significantly less trust is placed in MDs and pharmaceutical companies by individuals who noticed the logo in the doctor's office, encountered a PSR in a medical facility, and waited longer for an appointment due to the PSR's visit, compared to those who did not experience these situations. Individuals who received a drug sample from the MD statistically significantly trust MDs more than those who did not receive one. Interestingly, receiving a drug sample had no impact on trust in pharmaceutical companies. MDs and pharmaceutical companies must be aware that their marketing relationships are not invisible and indifferent to patients, and they should consider the consequences of this collaboration on trust.

Reliability of Health Information in Polish Diabetes Online Health Communities: Insights from Administrators and Moderators

Iwona Leonowicz-Bukala, Monika Struck-Peregonczyk

University of Information Technology and Management in Rzeszow, Poland

The importance of new technologies in the process of health information seeking has undoubtedly increased in recent years. Over half of Europe's population searches online health sources and even more in the US. Among these sources are Online Health Communities (OHCs) – web-based platforms bringing together individuals with similar health conditions. Nevertheless, the potential dissemination of misinformation/disinformation within these groups raises concerns among healthcare providers.

Given the global significance of diabetes as one of the most problematic health conditions, we focused on Facebook groups for individuals with type 1 diabetes and their families in Poland. The objective was to investigate the reliability of information shared within these groups in the context of chronic diseases. Drawing on empirical data gathered from in-depth interviews with administrators and moderators of Polish diabetes OHCs, we explore two issues: the kind of misleading content shared by the members of such communities and the strategies (or lack thereof) employed by the administrators/moderators in managing content to ensure the accuracy of health information disseminated within these communities.

In our presentation, we will try to answer the following research questions: 1) What kind of misinformation appears in the groups surveyed, and who is responsible for disseminating it? 2) Do the content administrators/moderators of the Facebook support groups ensure the accuracy of the

541

health-related information published in them, and if so, how? 3) Is this a well-thought-out strategy or rather ad hoc interventions in challenging situations? 4) On what basis do group managers decide whether information is reliable?

Smoking Is An Important Part Of Life. Smoking and Change in Smoking Habits in a Population from Finnmark County, Norway

Jorid Anderssen[1], Trude Gjernes[2]

1UiT The arctic university of Norway, Norway; 2Nord University, Norway

The population in Finnmark, the northernmost county in Norway, have been listed at the top when it comes to prevalence of smoking. Today they are approaching the national average. This paper is based on biographical interviews with 33 current and former smokers aged 25-70 years recruited from three different municipalities in Finnmark. This includes fishermen and reindeer herders. The paper discusses smoking as a practice. How do smoking affect people's everyday life, and what do former smokers miss from when they were smokers?

People trust public information of the harmful effects of smoking, and both former smokers and current smokers see smoking as a temporary practice. Smokers know they must quit, but the question is when. Smoking is an everyday activity, which structures people's everyday routines. It is a social activity and a good friend which provides comfort, well-being, and joy both at home, among friends and outdoors in nature. People spend much of their free time in the wilderness. Smoking enhances the pleasure of sitting together by a campfire, or on a fishing trip, it is a reward for a long skiing trip or a long walk, and it makes reindeer herders and fishermen endure long working days. For this population there is a strong contradiction between the benefits and the health damages by smoking. Especially this is revealed in the relationship between outdoor life and smoking.

RN16 | T02_04: Citizenship and the politics of healthcare

This session will focus on the varieties of citizenship involvement in the context of health and medicine. In the last three decades, we witnessed an increasing role of different citizenship initiatives, including the emergence of health movements, patient self-help groups as well as more institutionalised forms of patients and public involvement, accompanied with the emergence of patient organisations and patient councils. The aim of this session will be to reflect on the varieties of bottom-up and top-down citizenship involvement in national and transnational contexts and on their impact on the transformation of healthcare, medicine and biomedical research. We therefore welcome contributions dealing with, but not limited to, the following questions: What mechanisms and processes enable and undermine the impact of citizenship on the healthcare systems, health, medicine and biomedical research? How are the citizenship initiatives pperceived by professional communities? What is the involvement of professional communities in citizenship initiatives? How is the healthcare citizenship impacted by digital technologies? How do the expressions of citizenship relate to consumption? Are there any difference between bottom-up and top-down citizenship initiatives? Both conceptually-oriented and empirically-driven studies are welcome.

542

Work (Re)Integration Following a Chronic Illness Diagnosis in Romania: Can Nonprofit Organisations Play a Relevant Role in the Process

Adela Elena Popa, Anca Bejenaru, Oana Lup, Felicia Morandau, Livia Pogan

Lucian Blaga University of Sibiu, Romania

Chronic illnesses are increasingly prevalent in the workforce and produce considerable impairment in work participation. However, a considerable proportion of the workers with chronic conditions continue work during treatment or return to work. The Romanian context regarding work integration or return to work after a diagnosis of chronic illness is yet to be studied and understood, as only in the last years studies have emerged on this topic. Nonprofit organisations (NPOs) can potentially influence the work (re)integration

process alongside other categories of stakeholders, yet their role has not been studied in the Romanian context.

Building on a theoretical framework informed by the Person-Environment Fit theory, we employed a qualitative design and collected data through semi-structured interviews with 11 officials of Romanian nonprofit organisations active in fields relevant to this topic. Thematic analysis using NVivo was employed to emphasise the main topics in their discourse. The poster will present results on how representatives of Romanian NPOs view their actual and potential role in work integration and return to work following chronic illness, the barriers and facilitators, and their collaboration with other stakeholders.

The results show a poor and relatively informal involvement of NPOs in the work (re)integration of workers with chronic illnesses. Nevertheless, their expectations and intentions are to be more involved in formal collaborations with other stakeholders (government institutions, employers, health professionals, or labour force agencies) in the future. Based on the data collected, several recommendations are advanced to increase the role and contribution of these organisations in return to work facilitation.

Public Health Activism in Russia: NGO's Politics and Strategies

Olga Borodkina

St Petersburg University, Russian Federation

In modern society, issues related to health are not only at the forefront of the medical community's attention but also of public opinion. NGOs as the key actors in public health activism play a significant role in the transformation of public health. The focus of this research is on changing NGO policies and strategies that face new risks. The research methods included the analysis of statistics and epidemiological data as well as expert interviews with NGO leaders (N=15). The research results indicate that the key activities of NGOs are focused on ensuring access to treatment, including for socially vulnerable groups, fostering constructive relationships between patient and medical organizations, and changing inefficient practices in healthcare delivery. The main factors influencing the activities of health-related NGOs include government support, sources of funding (including international, state, private sources), and interactions with governmental organizations, primarily medical and social service entities, and a public attitudes. NGOs have been making a significant contribution to overcoming discrimination against individuals with various illnesses, including mental disorders. However, in recent years, most health-focused NGOs have faced considerable challenges. The reasons for this situation are largely associated with the luck of international funding, strong competition for grants from Russian foundations and state founding, low level of public trust to NGOs. In conclusion, it is emphasized that digital health activism is developing. In addition, it is necessary to develop an effective cooperation between NGOs and government organizations.

Birth Activism in China: Mappings of the Birth Organizations

Huiyi Huang

University of Coimbra, Portugal

This project maps the current landscape of birth organizations that emerged around 2010, committing to improving women's birth conditions and reducing unnecessary C-section rates and routine episiotomies. The project draws on recent ethnographic research on childbirth medicalization in China (Santos 2020, 2021, Santos and Zhang 2024) to show how the emergence of women-centered birth organizations in different parts of the country was a societal response to the moral dilemmas posed by excessive medicalization and increasing confrontation with obstetric violence. Theoretically, the project connects critical studies of childbirth medicalization (Davis-Floyd, 2004) with a growing body of research on social movement and the "anthropology of the good" (Ortner, 2016), highlighting the importance of ethical and moral tensions in researching childbirth under the technocratic governance. This project explores new possibilities of how the birth organization improves women's childbirth experiences and influences the process of childbirth medicalization.

543

Returning Under the Pandemic: COVID-19, Home Quarantine, and Affective Citizenship

Fan-Tzu Tseng

Academia Sinica, Taiwan

Often hailed as a 'success story' in the fight against Covid-19, by the end of 2021, Taiwan had recorded the lowest total case count and the second-lowest death rate per 100,000 people among OECD countries with comparable demographics. One of the reasons for this achievement was a strict quarantine policy coupled with a high compliance rate, which mandated a 14-day stay in a designated location for all new entrants, regardless of vaccination status, with exits permitted only under exceptional circumstances. Although extensive research has been conducted on the efficacy of quarantine and its adverse effects on those quarantined, the motivations for individuals' adherence to such liberty-constraining measures—particularly when quarantine was home-based and monitored solely through mobile phone signal tracking—remain insufficiently examined. This study, based on interviews with 49 Taiwanese citizens quarantined during the pandemic, reveals that effective epidemic control depends not only on government-imposed measures but also on the willingness of citizens to cooperate. While not legally barring the return of Taiwanese nationals from overseas, they were frequently perceived as a threat to epidemic management and faced emotional ostracism by the island's population. To regain their moral

standing within this small country, returnees rigorously followed quarantine protocols to minimize risks, often voluntarily adopting stricter constraints than those mandated. Their willingness to comply was driven more by a commitment to demonstrate affective citizenship than by mere rational risk assessment, underscoring their reassertion of a responsible role and a sense of belonging within the community, frequently foregoing their personal freedoms.

RN16 | T02_05: Exploring the intersections of health inequalities and social policy in diverse societies

The contemporary landscape of European societies is characterized by increasing diversity, driven by factors such as aging populations, immigration, ethno-racial identity, and shifting dynamics in social class and gender. Within this context, there is an imperative for a comprehensive examination of the interrelationship between health policy and the different healthcare needs of diverse populations to effectively understand and address health inequalities. This session welcomes multidisciplinary contributions that critically examine the political economy of healthcare and the political framing health needs. The contributions should foster a deeper understanding of the implications that current social policies have on shaping the access and utilization of healthcare by diverse population groups, as well as the challenges posed by evolving demographic realities for healthcare systems in meeting the needs of their populations. This session invites scholars with theoretical and empirical contributions that offer insights into the intersection of policy and health from the structural, practice, and service user perspectives.

544

Gendered Health Impact of Longer Compulsory Primary Education? A Register-Based Study of the 1997 Educational Reform in Norway

Kristian Heggebø, Jørn Ljunggren

NOVA, Oslo Metropolitan University, Norway

Starting in the school year 1997-1998, a national reform extended primary schooling from 9 to 10 years in Norway. As a result, 6-year-olds were for the first time enrolled in the school system. Longer education is associated with better health outcomes, in part because educational credentials can be converted into higher-paying jobs with fewer occupational hazards and better working conditions. Furthermore, people with longer education tend to process and understand complex health information more easily. Thus, reforms leading to longer compulsory education may improve health outcomes. However, there could be a non-negligible gender component in the health impact of such educational reforms. Girls outperform boys in all

subjects except physical education in Norwegian primary school, which indicates that there are gender differences in school readiness. "Forcing" everyone to stay in school longer may therefore amplify gender differences in educational attainment, with potential spillover effects on health and longevity. This paper examines whether the compulsory extension of educational careers in Norway was followed by fewer in – and outpatient hospitalizations and lower all-cause and cause-specific mortality, comparing cohorts exposed to differing educational systems (9 vs. 10-year primary education). Administrative register data, covering all registered inhabitants in Norway, are analyzed with various regression techniques. First, the 1991 (post-reform) and 1990 (pre-reform) cohorts are contrasted. Second, the cohort pairs of 1991/1992 and 1989/1990 are examined, to take potential lagged effects into account. Finally, pupils born close to the January 1, 1991 "cut-off" (i.e., those born during January-March 1991 and October-December 1990) are investigated, to adjust for unobserved heterogeneity.

// the FRAGMEN project will receive data in March 2024 //

Health Outcomes of Risk of Automation at Work: Evidence from Germany

Mariia Vasiakina[1], Christian Dudel[1,2,3]

1Max Planck Institute for Demographic Research (MPIDR), Germany; 2Max Planck – University of Helsinki Center for Social Inequalities in Population Health (MaxHel); 3Federal Institute for Population Research (BiB)

This study investigates the impact of risk of automation at work – proxied by the percentage of routine tasks in the occupation – on subjective and objective health outcomes of German employees. We merge the German Socio-Economic Panel (GSOEP) (2013-2018) with occupational information from the expert database BERUFENET of the Federal Employment Agency. We define occupations with less than 30 percent of routine tasks as having a low risk of automation, occupations with 30-69 percent of routine tasks have a medium risk of automation, and occupations with at least 70 percent of routine tasks are considered to have a high risk (Dengler and Matthes, 2015). We estimate fixed effects models in order to reveal gender-specific differences in health outcomes of workers employed in occupations with the medium and high risk of automation and those employed in occupations with the low risk. Our findings suggest that both men and women employed in occupations with the high risk of automation tend to be worse off in terms of self-reported health and anxiety in comparison with their counterparts in non-risky occupations. No effect is found on healthcare use in both gender groups. We also conduct several robustness checks (e.g., different model specifications, stratified analyses) with results remaining mostly consistent with our main findings, while uncovering some heterogeneity in effects among the analyzed groups. Overall, the results of this study highlight potential threats of automation to health and the need for policy measures which might prevent its negative spill-over effects.

The Impact of Race and Class on Distributive Justice and Trust in the Norwegian Welfare System

Lydia Mehrara

Westerm Norway University of Applied Sciences, Norway

Distributive justice and trust are at the core of Norwegian universalism, whereas race and class speak to specific forms of diversity. The intersections of race and class with the distributive justice system in Norway present challenges, impacting the generalized trust in its public service institutions. Diversity introduces complexity to the standardized universal approach in distributive justice because it questions the inclusivity of normative policies in redistributing resources and conceptualizing need. An equality-oriented approach, though seemingly fair, requires recipients to actively mobilize equal rights into opportunities to fairly benefit from social services, particularly in using healthcare.

While addressing health equity is essential in promoting health equality, it is not sufficient. Health equity and trust are intertwined. The utilization of health services and adherence to health recommendations depends greatly on the users' trust in the healthcare system. Despite the high levels of trust citizens in Norway have in its social institutions, individuals from societies with distinct institutional differences or those who have been historically discriminated against will not readily accept this trust.

An intersectional perspective becomes key in both understanding the challenges of diversity for Norway's universal ethos of equality and equity, and in uncovering various barriers to health equity. This paper critically reviews the implications of race and class as sources of diversity on redistributive justice and the trust of immigrants in Norwegian health institutions. It contributes to the discourse on retheorizing universal welfare policies, emphasizing the need to address intersectional drivers of inequality in policy.

RN16 | T03_01: Trust and health (3)

Classical and contemporary scholars maintain – with robust argument – the centrality of trust in doing society. In a way, trust can be considered the concrete of social relationships. Defined as a positive expectation emerging in a condition of uncertainty and vulnerability (Guido Möllering), trust appears to be a pivotal notion in healthcare. Besides the commonplace about trust that patients must grant to healthcare professionals responsible for curing their vulnerable bodies, it is crucial to consider the trust that healthcare professionals must accord to patients, particularly when their vulnerability emerges. Two examples can offer a plastic view of the issue: childhood vaccination and psychotic crisis management. In the first situation, parents must trust healthcare professionals proposing inoculating medication in a loved, precious, healthy body. In the second vignette, we can imagine a psychiatrist made vulnerable by the behaviour of the disturbed patient, deciding if to carry on or suspend – for instance, by binding him/her to a bed – the therapeutic alliance. For this session, scholars are invited to discuss either theoretical or empirical studies, focussing on the cure and care relationships where the need for trust emerges in a frame of particular vulnerability of patients and/or healthcare professionals.

Understanding Experiences of HIV Stigma in Dentistry: Working with Dentists and Patients in Creating a Shared Protocol for Infectious Diseases, Including HIV in the Republic of Ireland

Paul Ryan

Maynooth University, Ireland

This paper is based on a research project undertaken in conjunction with HIV Ireland and the Irish Dental Association and funded by Gilead Sciences. The research takes place against the backdrop where equal access to dental care remains a significant issue in Ireland for PLWHIV. For example, over the last 10 years, HIV Ireland has supported 34 people making discrimination related complaints. Research carried out on public attitudes and stigma in relation to HIV in Ireland, found that 34% of PLWHIV had experienced discrimination by a dentist. (Public Communications Centre, Stamp Out Stigma Campaign, HIV Related Stigma and Discrimination in Ireland today, 2007).

The paper presents findings from Focus Groups undertaken with both dental patients and dentists to understand both the experiences of PLWHIV accessing dental care (documenting stigma and discrimination, good practice, complaints) and the dental profession (registration protocol for new patients with HIV, information required, knowledge of medical advances in HIV treatment)

The paper utilises concepts of anticipated and experienced stigma amongst patients to produce a nuanced picture where intersectional identities impact upon disclosure of their HIV status and their willingness to contest their treatment. Dentists similar revealed a diverse understanding and knowledge of HIV treatment which reflected on behaviours they understood as best practice. Work is ongoing in devising a shared protocol endorsed by the Irish Dental Association based on the findings.

What Do We Think About Physicians? Socio-structural Determinants of Attitudes Towards Physicians in 18 European Countries

Marko Marelić[1], Stjepka Popović[2], Branko Ančić[3]

1Andrija Štampar School of Public Health, School of Medicine, University of Zagreb, Croatia; 2Faculty of Law, University of Zagreb, Croatia; 3Institute for Social Research in Zagreb, Croatia

546

The evaluation of a healthcare system's quality spans diverse dimensions, encompassing accessibility, medical efficacy, the provision of adequate care, and societal functions. A pivotal aspect of healthcare quality stems from social expectations and evaluations, particularly those directed at physicians. Social expectations act as determinants of social satisfaction, potentially exposing gaps between the envisioned ideal behaviour of physicians and the public's perception of their actual conduct. This study aims to scrutinize socio-structural determinants influencing social evaluations and expectations toward physicians across 18 European countries. Our investigation utilizes data from the International Social Survey Programme's Health module (2021), emphasizing public perspectives on health system views, priorities, resources, access, and quality. Employing indicators such as trust, communication of treatment options, medical skills, material orientation vs. care towards patients, and ethical behaviour, we analyse social evaluations and expectations towards physicians. To understand the socio-structural determinants in these 18 European countries, our analysis tests the aforementioned indicators against wealth, equality, and dominant social paradigm markers (GDP, Human Development Index, Inequality-adjusted HDI, Neoliberal versus public health value orientation). Anticipating a robust association between satisfaction with physicians and the overall prosperity of the selected countries, our research aims to contribute nuanced insights into the intricate interplay of socio-economic factors shaping public perceptions of healthcare, within the specified European context.

RN16 | T03_02: The tensions surrounding medicine: declining trust and legitimacy towards expertise, epistemic challenges and transformative processes (3)

The crisis of medical expertise, exacerbated by the COVID-19 Pandemic, is a significant concern for scientists and regulatory agencies whose role and authority are being questioned. Besides the conflict between the scientific community and the social groups that opposed controversial positions, we witness epistemic tensions even within the medical field. While Evidence-Based Medicine is still the gold standard, the universal applicability of the hierarchy of evidence has been challenged, and a more pluralistic approach has been advocated. The pandemic has questioned the feasibility of controlled trials in times of crisis, and the careful analysis of real-world settings and real-life clinical practices has been proposed as a new standard during emergencies. We invite contributions that critically reflect on the epistemic tensions in medicine during the pandemic and beyond. A (non-conclusive) list of topics includes: – the evolution of EBM, even in the light of AI, and the real-world evidence perspective; – the trust towards scientific and medical experts and regulatory agencies after the pandemic; – the tensions between protocols/ guidelines and decision-making in everyday clinical practice; – bottom-up knowledge production by epistemic communities and communities of practice; – the role of sociology in sustaining the transformation towards a more pluralist approach in medical research.

Power and Trust: Narratives of Aesthetic Surgery Through Aesthetic Surgeons

Michaela Honelova

Charles university, Czech Republic

Theoretical framework In Western societies, women's youth and physical beauty are highly valued. It is gendered, socially constructed ideas about the female body that influence how women experience their aging and how they talk about their 'aging body.' The growing presence, visibility, and acceptability of cosmetic surgery have significantly affected society and its perception of aging and beauty. Therefore, it is necessary to research how this medical specialty works, how aesthetic surgeons use their medical knowledge (power), the negotiating process, and how trust is built through the journey leading to the aesthetic surgery procedures.

Methodology The research was based on fifteen in-depth interviews with aesthetic surgeons. Ten interviews with men and five interviews with women were conducted.

Preliminary findings On the one hand, they are medical professionals. On the other hand, however, they act as gatekeepers to the world of an entirely optional medical specialty. Therefore, aesthetic surgeons use specific communication practices, language, trust-building, and gender-specificities. The interactions between female clients/ patients and surgeons occur within a broader context of power and negotiating power positions. Each choice and negotiation is situated concerning power. Power provides the conditions for negotiation between enabling and constraining.

Despite the expanding mass availability of selected anti-aging products, their specialized purchase is subject to ostentatious consumption, as clinic visits are costly. Because aesthetic surgery procedures are still expensive, only some women can afford them. This fact causes increasing social inequalities between people. It leads to double pressure for women from society and a lack of finances, which can have negative consequences. Aging women may subsequently experience more significant inferiority, deprivation, and marginalization.

Medical Discourse And Menstruating Bodies

Petra Poncarová

Faculty of Arts, Charles University, Czech Republic

In current sociology, menstruation is slowly becoming a forefront topic. However, there is still only a little focus on the analysis of medical discourse in conjunction with menstruating bodies. The way we talk about menstruation in Western societies today is heavily influenced and constructed by medical professionals. The Western medical knowledge is heavily based on the assumption that the male physiology is normative, therefore women's bodies and experiences are susceptible to the process of medicalization. Thus, medical discourse is a key factor in constructing the image of woman existing around her reproductive organs. In my own research, I focus on analysing professional medical discourse around menstruation and menstruating bodies in selected Czech medical journal articles and other sources that mediate professional medical communication between experts and lay people. With the use of critical discourse analysis, I will present not only the historical shift in professional knowledge dealing with the issue of women's reproductive health and how professionals communicate this knowledge, but also how the menstrual discourse is operated in the Czech environment within the framework of medical communication and expert ideology.

547

Diagnostic Change and Medicalization of Sociality

Niklas Westberg

University of Halmstad, Sweden

My presentation will include two parts. In the first, I will present results from a study concerning Asperger syndrome (AS) and Autism spectrum disorder (ASD) and in the second part of my presentation I will discuss the concept of "medicalization of sociality" – and how to understand this process from a sociological perspective.

In year 2013 the diagnosis AS was eliminated from the leading diagnostic classification of mental illnesses (DSM-5) and was incorporated in the category of ASD. For people with AS this alteration in diagnostic classification had a strong impact on their everyday life; as subjectivities, solidarities within the aspie-community and relations to various agencies and collectives were now subject for renegotiating and conflict.

Grounded in an on-going study, involving interviews with 15 people with AS and analysis of an online community, the paper will focus on two questions related to this process: How does AS as a cultural category, embedded in psychiatric discourse, structure the feelings and explanations of mental suffering and what happens with this interpretative practice when the diagnosis is incorporated in ASD? In what ways does diagnostic changes transform the conditions for AS as a resource for subjectivity, collectivisation of suffering, and management of feelings of social deviance?

My second part of the presentation will concern "medicalization of sociality". By this phrase, I mean that psychiatry to an increasingly large extent targets impairment in social interaction as signs of mental illness and disorder – as illustrated in diagnosis such as AST, social phobia, selective mutism, avoidant personality disorder. From a sociological point of view this means that new areas of human living become medicalized and subject for medical social control.

Social Pharmacology, Implications In Pharmaceutical Practice

Sorina Nicoleta Aurică[1]

University Bucharest, Faculty of Sociology, Romania

1 Faculty of Sociology University , Bucharest

Corresponding author: Sorina – Nicoleta Aurică, sorina.aurica@gmail.com

Introduction

Social pharmacology focuses on the social, cultural, and behavioral aspects of medication use, aiming to understand and address the complex interplay between medications and society. As pharmacists play a vital role in ensuring safe and effective drug therapy, it is crucial for them to grasp the concepts and principles of social pharmacology.

Objective:This article aims to provide pharmacists with an overview of social pharmacology, its significance, and the potential implications for pharmacy practice.

Methods: The study was carried out through a review of the literature

Results: Social pharmacology is an interdisciplinary field that integrates concepts from sociology, anthropology, psychology, and pharmacology. It recognizes that medication use is influenced by a multitude of factors beyond the physiological aspects of the disease and drug action. These factors include social determinants of health, cultural beliefs, socioeconomic status, health literacy, patient-provider communication, and adherence to therapy. By examining these contextual factors, social pharmacology aims to enhance medication-related outcomes and patient well-being.

Conclusions:Social pharmacology provides a framework for pharmacists to actively engage in public health initiatives. By analyzing medication utilization patterns, identifying high-risk populations, and collaborating with other healthcare professionals, pharmacists can contribute to the development and implementation of effective public health strategies.

RN16 | T03_03: Obstetric Violence between Transformations and Trust

Obstetric violence refers to the mistreatment and abuse that women may suffer during childbirth, usually from health care workers. It is still largely unrecognized and underreported in many countries. Trust and transformation are two key concepts for counteracting obstetric violence. Trust is the basis of the patient-provider relationship and, more in general, of the relationship between care giver and care receiver. Health care systems transformation, on the other hand, involves addressing structural issues, such as promoting accountability, improving working conditions and ensuring that health care workers receive adequate training and support. In summary, addressing obstetric violence requires building trust between health care workers and women, as well as transforming health care systems to prioritize respectful, woman-centred care. By emphasizing trust and transformation, societies can work to reduce obstetric violence and promote positive birth experiences for all women. We believe that sociological research in this field represents an inescapable tool to combine the detection of the problem, the critique of the devices that foster it and, at the same time, to find, together with the different stakeholders involved, including institutional and medical area stakeholders, effective solutions in the field of medical practice, health management and practitioner training.

Abortion, Conscientious Objection and Health Practitioners: What About Midwives?

Camille Maes[1], Elena Spina[2]

1Université de Liège, Belgium; 2Università Politecnica delle Marche, Italy

The paper, based on the most recent data and documentary material, focuses on the use of conscientious objection in the field of voluntary termination of pregnancy by health professionals involved in this procedure.

Italy stands out on the European landscape for having the highest percentage of objectors, being second only to Portugal (63% gynaecologists; 40% anaesthetists and 33% non-medical staff) with significant variability between regions (Ministry of Health 2023). Since conscientious

objection may become a limit to the effective enforceability of the right to terminate a woman's pregnancy, it appears essential to explore the reasons behind this choice in order to remove the obstacles.

In relation to gynaecologists, such reasons have been investigated and are multiples (De Zordo 2015 ; Lalli and Montegiove 2022 ; Ghigi and Quaglia 2023). For non-medical professionals, especially midwives, the issue still appears underestimated. Not only does the question not appear on the agendas of professional and representative bodies, but there is not even any research in this regard, demonstrating the fragility and lack of legitimacy enjoyed by the profession. Therefore, an in-depth study seems necessary to assess the ability of the professional category to address and appropriate this issue by claiming its own jurisdiction. Such investigation is particularly relevant, especially in light of the recent demands coming from the health public sector and from midwives themselves to gain autonomy in abortion care, at the international level.

Towards Temporal and Affective Theorisations of Pain and Contraceptive Care

Kristina Saunders

University of Glasgow, United Kingdom

The intrauterine device (IUD) is a long-acting reversible contraceptive that is inserted through the cervix and placed in the uterus by a healthcare worker. Pain and discomfort are documented side-effects of IUD use, but are regularly dismissed by healthcare workers who may refuse to remove IUDs due to pain (see e.g. Higgins et al, 2016; Mann et al, 2022). While much is known about the tensions arising from this dismissal of pain during IUD use, less is known about longer temporal frames of pain and their relation to caring dynamics.

Drawing on qualitative interviews exploring histories and imagined futures of contraceptive care with 18 IUD users in Scotland, this paper will discuss how participants imagined pain before, and experienced pain during, IUD insertion. Participants received insufficient information about pain or pain relief from healthcare workers, and their accounts demonstrate how this lack of transparency and limited discussions about pain can subvert and undermine consent, often resulting in feelings of violation that embed mistrust prior to and at the point of insertion. This caused some participants to reject the IUD in their imagined futures of contraceptive care, even if satisfied with this method during use, therefore minimising autonomy and heightening mistrust over extended and imagined temporalities. Engaging with past, present, and future orientations, this paper furthers temporal understandings of pain and the tensions shaping contraceptive care, which are necessary to grapple with to ensure that the needs of contraceptive users, and ethical principles of care, are met affectively and temporally.

Exploring Care Practices of Women From The Global South In Long-Term Care Facilities In Germany

Ana Lucía Fernández Fernández

UNED Costa Rica, Germany

The aim of this paper is to introduce care practices advocated by women from the Global South, who work in long-term care institutions in Germany. I seek to analyze the labor market in the care sector within the German context because, according to Tronto's conceptions of care (1990, 2013), this is a space with significant implications for institutionalized hierarchies of class, race, ethnicity, and gender as forms of cultural and social production.

The hypothesis suggests that many female migrants from the Global South join the care sector in Germany, typically occupying the lowest positions within the institutional hierarchy in long-stay care facilities for the elderly. These positions are often assigned to racialized female bodies because of the historical linkage of racialization and feminization of this work, associated with the tasks related to cleaning the 'dirt of others,' hard fiscal work, and providing direct or indirect care for those unable to do it for themselves.

It is relevant to determine whether these institutions perpetuate intertwined hierarchies of racialization and feminization without considering the special care abilities of racialized women from the Global South can provide.

I am interested in identifying the practices that these women try to carry out in their daily work to investigate whether there is room for fostering direct care practices aligned with the socio-cultural context from which they originate and whether these practices tend to benefit the recipients of care.

Furthermore, I aim to explore whether it is possible for these alternative care practices to be promoted or institutionalized within long-term care facilities or whether women workers face discrimination, racism, and censorship in implementing these care practices originating from the Global South.

The Experience of High Blood Pressure. A Qualitative Study on Women's Understandings and Enactments of Hypertension in the Context of Pregnancy and Beyond.

Gunvor Aasbo

University of Oslo, Norway

Hypertension (high blood pressure) is a diagnosis often characterized as asymptomatic and measures of blood pressure (BP) are abstract and basic medical parameters. In medicine, hypertension is regarded as a basic representation of health-risk and linked to lifestyle, i.e. weight, nutrition, alcohol and tobacco. Furthermore, BP is closely followed up during prenatal care, since pregnancies are often regarded as a stress-test on the body. Several women develop hypertension during their pregnancies, and some also develop more serious conditions such as pre-eclampsia (PE) or gestational diabetes mellitus (GDM) which give them higher risk of cardiovascular diseases throughout their life course. Therefore, monitoring women's BP beyond pregnancy is receiving increased attention and women diagnosed with PE or GDM are recommended to follow up their BP in consultations with their GP annually throughout their life course. However, only a marginal share of women diagnosed with PE or GDM follow up these conditions after pregnancy. Hence, there are innovative steps taken to develop an eHealth app which may assist women to self-measure their BP, as well as nudge them to see their GP for in-clinic measurements of BP. To generate knowledge on the experiential side of living with and monitoring hypertension, we are currently interviewing women in Norway diagnosed with PE and GDM. In this paper we aim to develop understandings regarding how women interpret, experience and handle their hypertension as a temporal and possible chronic condition, and how these perspectives reflect complex and multiple understandings of disease ontology and health risks.

RN16 | T03_04: Citizenship and the politics of healthcare (2)

This session will focus on the varieties of citizenship involvement in the context of health and medicine. In the last three decades, we witnessed an increasing role of different citizenship initiatives, including the emergence of health movements, patient self-help groups as well as more institutionalised forms of patients and public involvement, accompanied with the emergence of patient organisations and patient councils. The aim of this session will be to reflect on the varieties of bottom-up and top-down citizenship involvement in national and transnational contexts and on their impact on the transformation of healthcare, medicine and biomedical research. We therefore welcome contributions dealing with, but not limited to, the following questions: What mechanisms and processes enable and undermine the impact of citizenship on the healthcare systems, health, medicine and biomedical research? How are the citizenship initiatives pperceived by professional communities? What is the involvement of professional communities in citizenship initiatives? How is the healthcare citizenship impacted by digital technologies? How do the expressions of citizenship relate to consumption? Are there any difference between bottom-up and top-down citizenship initiatives? Both conceptually-oriented and empirically-driven studies are welcome.

The Politics of Post-infection Disease Diagnoses: the Case of Post-COVID-19

Janneke Maria Louise Kuiper[1], Luca Marelli[2], Ine Van Hoyweghen[1]

1KU Leuven, Belgium; 2University of Milan, Italy

COVID-19 has brought an unprecedented amount of attention to post-infection disease or post-acute sequelae (ongoing, relapsing, or new symptoms present long after infection). Where many of these diseases have long struggled for attention and recognition, the widespread experiences of post-, or long, COVID-19 have relatively quickly led to a significant level of acceptance. Whilst many patients still feel unseen, unheard, and stigmatised, an increasing number of resources are being directed towards a better understanding of post-COVID-19. With a visible patient advocacy movement and different hypotheses on the pathogenesis and core symptoms, the diagnosis is currently being constructed. Building on an analysis of the different experiences, paradigms, and advocacy movements around post-COVID-19, in this paper we map the post-COVID-19 route to disease acceptance. Combining a document analysis with preliminary empirical findings, we focus on the emerging forms of knowledge-making and changing configurations between the different medical stakeholders, lay or patient experiences and advocacy, and (online) media in the co-production of this new illness concept. The current construction of the post-COVID-19 diagnosis, and its appeal to other patient groups that are seeking validation, provides valuable insight into the politics of diagnosis(-making). The strategic (re)positioning of post-COVID-19 and adjacent illnesses (e.g., other contested and post-infection diseases such as myalgic encephalomyelitis/chronic fatigue syndrome) deserves scrutiny to understand how diagnoses are shaped when much is still unknown and uncertain. Considering post-COVID-19's high prevalence, how the diagnostic boundaries will be drawn will significantly impact the distribution of resources and our understanding of illness, cure, and care.

Trans*forming Healthcare – How Affects And Responsibilities Oscillate Between Trans Patients And Their Healthcare Providers

Felix Lene Ihrig

University of Vienna, Austria

In recent years trans, inter, nonbinary and other genderqueer (TINQA*) people have not only become more visible in academia, they are also receiving more attention in public and medical discourse. While Medicine plays a major role in TINQA* people's lives, healthcare professionals are only partly familiar with their needs (Appenroth & Castro Varela, 2019); a deficiency Tronto (1998) would describe as both a moral problem and one of expertise. Especially when a person's marginalisation is as explicitly tied to their body, medical contexts can become sites where their social positioning is negotiated (Appenroth & Castro Varela, 2019). Hence this current project step of my doctoral thesis focusses on how healthcare providers talk about healthcare for TINQA* patients in Austria. I analyse the data gathered at lectures on this topic using Constructing Grounded Theory (Charmaz, 2006) and Institutional Ethnography (Smith, 2006). All research steps and questions are also discussed with "Community Teams" representing various TINQA* voices. Therefore, I can put the discourse amongst healthcare providers in context with TINQA* people's expectations towards them. First insights show that most general practitioners are aware of their knowledge gaps. The current situation, which requires three assessments prior to receiving gender affirming healthcare, is viewed as problematic by many gynaecologists. However, they fear that renegotiating the national guidelines might lead to worsening care due to a conservative political climate. TINQA* people trace these and other experiences of discrimination back to the affective positionalities of healthcare providers.

551

This role reversal facilitates an empathic reaction from TIN-QA* patients towards their healthcare providers. I aim to reconnect these perspectives back to the bigger picture of institutionalized healthcare.

Symbolic Violence, Public Health and the Tactics Used to Challenge the Stigmatisation of Homelessness: Findings from an Ethnographic Case Study in South London, UK

River Ujhadbor, Simone Helleren, Andy Guise

King's College London, United Kingdom

Stigma and discrimination in health and social care systems are widely recognised as leading to poor health and welfare. Stigma can stop people accessing health and social support, and lead to unfair treatment from professionals. Despite that recognition, there is little in-depth knowledge of how stigma is experienced and navigated by people facing homelessness and where, and how it is embedded in social processes. Without that knowledge we cannot challenge the stigma people experience at a system and social level. This particular knowledge gap comes in the context of long-standing calls for social theory on stigma to engage with power, structure and symbolic violence.

This paper presents findings from an ongoing ethnographic research taking place in London UK. We draw on interview data with 42 people who are currently homeless, and then additional interviews with those working in and managing services, and observation in hostel and day centre settings. The paper explores how stigma is experienced and examines the tactics used by those experiencing homelessness to manage, resist or subvert stigma through everyday practices and discourses.

The presentation will explore the implications of these findings for public health policy and practice, and offers a critical re-examination of Pierre's Bourdieu's concepts of misrecognition and symbolic violence, and specifically looks at how recognition and misrecognition of stigma co-exist and interact in dynamic ways. We will then reflect on our research methodology informed by a participatory ethos that moves away from deficit driven models to centre the strength, ingenuity and resistance of marginalised communities.

"Strategies for Coping with Risk and Uncertainty among People with Disabilities in the Context of Online Health Information""

Dorota Żuchowska-Skiba

AGH University of Krakow, Poland

The aim of my presentation is to reconstruct the strategies employed by individuals with disabilities in coping with risk and uncertainty concerning health information. Understanding these strategies is crucial as they influence how individuals with disabilities utilize such information and make decisions regarding therapies or medical procedures. In line with Jens O. Zinn's (2008) concept of uncertainty and risk, emphasizing the social aspects of coping with uncertainty, this analysis seeks not only to explore individual strategies but also to present the social context shaping the community of individuals with disabilities in the online space, impacting their coping with risk and uncertainty and fostering trust in health-related content.

For my research, I will apply the method of netnography. The analysis will encompass the content of publications, comments, and reactions to posts related to health topics posted in Facebook groups. This will enable an understanding of dominant narratives, identification of issues and behavioral patterns, and reconstruction of strategies related to the use of health information by individuals with disabilities.

Within the study, I will focus on participant observation to better grasp dynamic interactions and strategies in the online community of individuals with disabilities. Such an approach will allow inferences about the strategies employed in these online communities in the process of sharing knowledge and experience regarding health. Additionally, sentiment analysis will provide a better understanding of how individuals with disabilities perceive health information in social media. The application of sentiment analysis is particularly important in the context of studying the influence of online strategies on trust in this information.

552

RN16 | T04_01: The tensions surrounding medicine: declining trust and legitimacy towards expertise, epistemic challenges and transformative processes (4)

The crisis of medical expertise, exacerbated by the COVID-19 Pandemic, is a significant concern for scientists and regulatory agencies whose role and authority are being questioned. Besides the conflict between the scientific community and the social groups that opposed controversial positions, we witness epistemic tensions even within the medical field. While Evidence-Based Medicine is still the gold standard, the universal applicability of the hierarchy of evidence has been challenged, and a more pluralistic approach has been advocated. The pandemic has questioned the feasibility of controlled trials in times of crisis, and the careful analysis of real-world settings and real-life clinical practices has been proposed as a new standard during emergencies. We invite contributions that critically reflect on the epistemic tensions in medicine during the pandemic and beyond. A (non-conclusive) list of topics includes: – the evolution of EBM, even in the light of AI, and the real-world evidence perspective; – the trust towards scientific and medical experts and regulatory agencies after the pandemic; – the tensions between protocols/guidelines and decision-making in everyday clinical practice; – bottom-up knowledge production by epistemic communities and communities of practice; – the role of sociology in sustaining the transformation towards a more pluralist approach in medical research.

Reimagining Community Based Compulsory Treatment Through an Ethics of Care Framework

Aisha Macgregor

University of Stirling, United Kingdom

Community based Compulsory Treatment Orders (CTOs) were introduced in Scotland through a rights-based agenda. They aim to reduce repeated readmission to psychiatric hospitals, and ostensibly improve people's outcomes. CTOs contain both caring and controlling dimensions and the coexistence of these antithetical components creates significant ethical tensions in practice. Medicalised cultures and associated hierarchies of power can result in a loss of control, creating mistrust and conflict between individuals on CTOs and mental health professionals. This paper aims to provide a reimagining of compulsory treatment by proposing how an ethics of care can be used to interrogate the ethical complexities surrounding compulsory treatment and human rights entitlements. This framework was developed as part of doctoral research based on semi-structured interviews with 35 people on CTOs, families, and mental health advocates. The data was thematically analysed using NVivo, with second order analysis involving interpretation through ethics of care principles. This paper will discuss the potential to foster trust through attentiveness and responsiveness, its grounding in a situated ethics, and the underpinning relational ontology which focuses on the negotiation of power in relationships. I propose that this framework opens new territories through which rights can be analysed, providing a valuable tool to examine and transform practice relating to compulsory treatment.

Timing and health

Christian Bröer, Zana Chadud Cosac, Anne van Wieringen, Mirthe Visser

UvA/FMG/Sociology, Netherlands, The

In this contribution we present the first results of research into people's everyday attempts to organize time and they way this might be related to health. We approach time as practical activity – hence timing – and focus our preliminary analysis on three aspects everyday life in households with young children: pregnancy, breastfeeding and stress. The analysis builds on longitudinal ethnographic work in the Sarphati Panel in Amsterdam.

We approach pregnancy, birth and breastfeeding and more broadly the "first 1000" days of life as the period in which the life of another human has to become part of the wider world. Our approach loosely follows Zerubavel and Goudsblom in the sense that a time is seen as a social attempt at coordinating and managing a range of natural and social processes. Our attempt is more specific in the sense that we focus on microsociological timing practices and their relation to (unruly) bodies. Practices are then defined as consisting of meaning, materialities and know-how (following Blue and Shove). These practices respond to both pragmatic contexts (bodily development, micro-situational constraints and opportunities and power struggles in everyday life) and institutional rhythms (loosely in the sense of Lefevbre). We assume that stress is not only a consequence of time scarcity but rather related to experiences of unsuccessful timing practices. Particularly the overload of prevention, risk and health concerns and thus of future time, we think, accounts for stress among young parents. We exemplify this through a detailed analysis of interviews and observations in 40 households which we followed from the birth of the first child until the child turned 5.

Making Ambiguity: How Clinicians Manage Diagnosis Categories to Shape Parent Responsibility

Dan Liu

The University of Hong Kong, Hong Kong S.A.R. (China)

Recent decades have witnessed a dramatic increasing rate in the prevalence of invisible developmental disorders which include developmental delays and autism spectrum disorder. Early identification of development disorders has long been considered as a medicalised regime across nations by involving the development and application of numerous assessment scales in the fields of psychiatry and psychology as evidence for diagnosis. Accurate, abstractive and timely diagnosis, therefore, provides both medical practitioners and parents with guidelines for actions in hospitals and home. However, under what conditions do clinicians hesitate and even refuse to provide an accurate diagnosis? Following sociology of diagnosis that addresses diagnosis as a process, this study examines clinician-patient interactions in two departments that offer early identification and interventions services in Southwestern China. Participant observation and in-depth interviews reveal that clinicians deploy ambiguity of diagnosis as an interactive strategy that groom parents to take responsibility, namely, perform high-quality of compliance with treatment norms. Three types of the strategies are identified, prioritising risk over symptoms to facilitate parental engagement, personalising differences over criteria to preserve hope, and specifying function while avoiding diagnosis to maintain parental engagement. These strategies are efficient to convince parents to accept treatment plans and facilitate parental involvement in the early stage. However, these strategies inadvertently contribute to increased blame and stigma towards parents as their children progress through treatment. This study contributes to the understanding of complexities and consequence of diagnosis by pointing out how ambiguous narratives are articulated and shape client actions.

Neighbourhood Socio-economic Deprivation And Low Birthweight For Babies In An Ethnically Diverse Area In England

Shuby Puthussery[1], Pei-Ching Tseng[1], Erik Andervad[2], Thomas Puthusserry[3]

1University of Bedfordshire; 2Groundwork London; 3Independent

Background

Babies born with low birthweight (< 2500 g) are vulnerable to death, restricted growth, poorer development, and long-term health complications. Neighbourhoods represent structural and contextual conditions in which babies are born, but links between neighbourhood socio-economic deprivation and low birthweight are seldom examined in ethnically diverse areas. We analysed spatial variations in birthweight based on socio-economic deprivation at neighbourhood levels in an ethnically diverse area in the east of England, UK.

Methods

Using routinely collected anonymous data of births between April 2015 and February 2022 from a National Health Service maternity hospital in England, we conducted geospatial analyses of maternal residence postcode areas to understand associations between birth weight and neighbourhood deprivation based on 2019 English Indices of Multiple Deprivation. The analytical methods included generalised linear regression, optimised hotspot, and spatial autocorrelation (Global Moran's I) in ArcGIS Pro 3.0.2.

Findings

Of 36,359 births, 34·4% were to mothers from Black Caribbean, Black African, Indian, Pakistani, or Bangladeshi backgrounds. The prevalence of low birthweight (9·1%) was higher than the national average (6·8%). Low birthweight varied across Indices of Multiple Deprivation deciles, from 3·9% in the least deprived to 10·5% in the most deprived neighbourhoods, with significant clustering in the most deprived neighbourhoods (Moran's I 0·061; p<0·0001). Mean birthweight differed by 228g between the least (3402g) and most (3174g) deprived neighbourhoods. We found an inverse linear association between birthweight and neighbourhood socio-economic deprivation (R² 0·18).

Conclusion

Babies born to mothers in the most deprived neighbourhoods of ethnically diverse areas are more likely to have low birthweight, indicating significant area-based socio-economic health inequalities and highlighting the need for targeted primary and secondary interventions.

554

RN16 | T04_02: Exploring the intersections of health inequalities and social policy in diverse societies (2)

The contemporary landscape of European societies is characterized by increasing diversity, driven by factors such as aging populations, immigration, ethno-racial identity, and shifting dynamics in social class and gender. Within this context, there is an imperative for a comprehensive examination of the interrelationship between health policy and the different healthcare needs of diverse populations to effectively understand and address health inequalities. This session welcomes multidisciplinary contributions that critically examine the political economy of healthcare and the political framing health needs. The contributions should foster a deeper understanding of the implications that current social policies have on shaping the access and utilization of healthcare by diverse population groups, as well as the challenges posed by evolving demographic realities for healthcare systems in meeting the needs of their populations. This session invites scholars with theoretical and empirical contributions that offer insights into the intersection of policy and health from the structural, practice, and service user perspectives.

Treating the Prisoners amidst the Universal Health Coverage in Taiwan: Negotiating Between Punishment and Care

Ting-She Chang

National Taiwan University, Taiwan

Since the initiation of the National Health Insurance (NHI) in 1994, Taiwan has been famous for its universal health insurance coverage for all people, including almost all national and expatriate residents. However, one missing piece in the puzzle is the inmates inside prisons and other correctional facilities. Almost 20 years after the NHI initiation, the inmates were finally included by amending the National Health Insurance Act in the name of Health for All. In 2013, inmates staying longer than two months in prisons and correctional facilities could be covered by the NHI with the premium paid by the government, regardless of their economic status or crime records. Through the interview, the ethnography, and the archival data, this study tries to understand how and why this change was amended so lately, what is relevant to the human rights campaign and the politics in Taiwan, and how the healthcare inside prisons changed after this coverage for inmates. NHI program launched new prison clinics by cooperating with civic hospitals to replace the original scarce and insufficient public physicians hired by each prison. Although accessibility to healthcare increased after this change, I argue that authenticity and deservingness play central roles in the inmates' acquisition of healthcare and coverage with the NHI. The physicians, nurses, and the correctional staff in prison triage, diagnose and medicate for those who are sick and deserve care. The debate about their authenticity and deservingness of healthcare manifests the tensions and contradictions that prison should simultaneously confine and care for prisoners. The penitentiary staff, the medical professionals, and the inmates are trying to negotiate the tensions and the boundaries between punishment and care.

Medical Decision-Making Challenges among Migrant Populations in Belgium: A Focus Group Study

Amina Yakhlaf, Flore Vermijs, Josefien Van Olmen, Paul Van Royen, Veerle Buffel, Nina Van Eekert, Sarah Vande Velde, Edwin Wouters

University of Antwerp, Belgium

This study explores the challenges faced by individuals with a migration background in Belgium's healthcare system, focusing on medical decision-making (MDM). We intend to examine two primary challenges: (1) preferences for information disclosure and (2) responsibility in MDM. In Belgian healthcare, the law and ethical codes mandate clear disclosure of diagnoses and prognoses, yet migrant patients from collectivistic cultures often prefer limited information or truth concealment, sometimes favoring family involvement over direct patient communication. Additionally, these populations may prefer family-centered decision-making, contrasting with the emphasis on patient autonomy in Belgian medical practice. Our research specifically investigated these aspects of MDM among the three largest migrant groups in Belgium—Maghreb, Turkey, and Sub-Saharan Africa—through three focus groups comprising patient representatives and healthcare workers with a migration background. The aim was to understand the unique preferences and challenges these groups face in MDM across various contexts, including critical versus chronic care, decisions with severe versus less severe consequences, and choices concerning physical versus mental health disorders. Preliminary findings indicate distinct preferences and challenges within these migrant groups, which vary significantly based on the nature of the medical situation. This study highlights the importance of culturally sensitive healthcare practices to accommodate the diverse needs of migrant populations in medical decision-making processes.

555

Gender, Social Class And Health Inequalities. Beyond Who Has Worse Health.

Lucía R. Hernes

Universidad Pablo de Olavide, Spain

The aim of this research project, which is a PhD Thesis, is to broaden the knowledge about the huge disparities in health that still exist in our societies. There are many determinants of health to consider but this work focuses on gender, social class and, above all, the intersection of both factors from a sociological, feminist and intersectional perspective.

To do so, population aged between 50 and 60 years old living in Andalusia (Spain) will be studied to understand gender and social class differences in health, both quantitative and qualitative, as not only results in health will be examined but also health narratives and social representations about health and disease. Therefore, the focus will be on the experiences related to health throughout life, trying to find which differences exist between man and woman from different social classes and why those exist, knowing masculinity and femineity norms play an important role, as well as economic and social inequalities. The main contribution of this project is that it does not pretend to participate in the debate about which gender has worse health, but to understand and be able to explain what it means to be a women or a man from a certain social class in terms of health and disease.

A mixed-method approach divided into three work packages is proposed to answer those inquiries: 1) a statistical analysis of secondary data; 2) qualitative biographic interviews; 3) focus groups.

Exploring Social Inequalities in the Dynamics of Multimorbidity

Jesus Carretero-Bravo, Esther Ortega-Martin, Begoña Ramos-Fiol, Javier Alvarez-Galvez

Computational Social Science DataLab, INDESS, University of Cadiz, Spain

Multimorbidity, defined as the coexistence of multiple chronic diseases, poses a significant challenge to healthcare systems, impacting quality of life, service utilization, and mortality rates. This challenge may also worsen in more disadvantaged social strata, which shows us the need for further evidence to enhance our comprehension of its social ramifications. Our study seeks to profile the evolution of multimorbidity patterns using data from the population between 50 and 80 years residing in the province of Cadiz (Spain). Employing Latent Class Analysis and Hidden Markov Models along with socioeconomic data of the local health area, we characterized the dynamics of 14 chronicity profiles, stratified by sex and age. Within these profiles, the differences by sex stand out, with more mental and musculoskeletal patterns found in women, and men having a higher prevalence of patterns with dependences (mainly alcohol and tobacco). The dynamics of the profiles

shows cardiometabolic patterns as the basis of evolution towards complex and multisystemic profiles. Patterns that mix age-related diseases are more prevalent in higher status areas of the province, and these profiles tend to evolve to less severe combinations. On the other hand, the complexity of multimorbidity patterns increases more rapidly in localities with lower socioeconomic status. These trends are also maintained or increase as the age of the individual advances. These results show the persistence of social inequalities in multimorbidity, underscoring the imperative for targeted interventions in resource-poor areas and at younger ages to alleviate the impact on patients' health status and quality of life.

556

RN16 | T04_03: Exploring social capital's impact on health through sociological lenses

Social capital has been defined in different ways over recent decades, however, there is unanimous agreement in recognizing the value of social networks and the associated norms of reciprocity. At the individual level, starting from the definition of social capital provided by Putnam, who refers to "features of social organization such as networks, norms, and trust, that facilitate coordination for mutual benefit", it should be recognized that social capital creates value for the individuals who are part of social networks, but also for others. Conversely, from a Coleman viewpoint, the forms of social capital, such as trust, mutual exchanges, norms, and sanctions, define social capital from a social cohesion perspective, i.e., a collective property emerging from individual interactions. Scholars have demonstrated the relevance of social capital in different domains, such as economic and social outcomes. However, as Putnam states, "In none is the importance of social connectedness so well established as in the case of health and well-being". The variety of the empirical evidence indicating that individual and/or collective social capital is likely to be a significant determinant of some important health outcomes is impressive. Higher levels of social capital seem to produce healthier societies, but understanding the processes linking social capital to health in a broader sociological approach is challenging. To fill this gap, our session aims to facilitate discussions on qualitative and quantitative papers that focus on theoretical, empirical, and methodological issues to analyze the complex relationship between social capital – in its different forms – and health outcomes.

Explaining Inequalities In Harms From Gambling And Alcohol: The Role of Public Sociology

Laura Fenton, Katie Powell

University of Sheffield, United Kingdom

Gambling and alcohol cause more harm to health in economically disadvantaged places in the United Kingdom (UK), despite lower levels of product use among people living in these places. A public discourse that focuses on individual responsibility and 'problem drinkers' and problem gamblers' has obscured the role of industry and government in the development of inequalities. Our paper shows how public sociology can be used to develop approaches and frameworks that draw out public understanding of the complex processes through which alcohol and gambling practices contribute to inequalities in health. We present a synthesis of theories and explanations in the sociological, geographical and public health literature about the unequal harms from gambling and alcohol in economically disadvantaged areas and explain how this synthesis informed co-production with public health stakeholders. The paper describes our approach to co-production in the form of participatory systems mapping with stakeholders in disadvantaged communities, and presents the insights this method afforded into local processes of inequality. We show how sociological theory was used to sensitize stakeholders to global, national and local processes of power inequality, enhancing the development of shared knowledge on the issue of inequalities from gambling and alcohol in urban UK settings.

The Significance Of Identity And Ageing In a North Sami Community

Trude Gjernes

Nord universitet, Norway

This paper explore experiences of ageing based on interviews with female and male inhabitants in a North Sami community. The focus is on older adult's involvement in activities that emphasise and maintain them as participants in specific kinds of activities that require knowledge, skills and mentorship, and to what degree this provides them with social capital and ethnic identity. Thematic analysis of the data indicates that social capital and identity are particularly apparent within three contexts: 1. family and social relationships, 2.reindeer herding and other traditional labour and 3. Sami language. We conclude that older people hold vital positions in the local community regarding these three contexts and that this benefits the community. In return, older adults gain a position in the community as cultural authorities, they are respected, needed and considered as a resource the community depends on.

Types of Negative Ties and Self-Rated Health

Philip Adebahr-Maskow

University Halle-Wittenberg, Germany

Relevance: Tensions often arise when trust is broken. In this study, I look at tensions at the relationship level and their interaction with self-rated health. Sociologists have often studied the effects of social capital on health, showing that social support is beneficial. But we know little about the relationship between negative relationships and self-rated health, although findings from the University of California

557

Social Networks Study – UCNets – suggest that negative relationships are quite common. Approximately 15% of all relationships are rated as 'sometimes demanding or difficult' (Offer and Fischer, 2018).

Objective: To address this research gap, I examine the extent to which different forms of negative ties are associated with self-rated health.

Methods: I developed a negative tie scale (TNT scale). Furthermore, I conducted an egocentric network study (N:151) using a selective mixed mode approach (online and paper). In order to obtain representative data for the German population, I based the sampling on the random route procedure. In my analyses I draw on the network model of health inequalities (Klärner et al. 2022) and use OLS regressions, taking into account interaction effects.

The results show that the association between negative ties and mental health is independent of the type of negative ties and is specific to women.

RN16 | T04_04: Vaccination and (dis)trust: what sociology can teach us in the face of contemporary challenges

In the context of current sociopolitical tensions and challenges to trust in institutions, the issue of vaccine hesitancy has taken center stage. The proposed special session aims to explore vaccine hesitancy as both a symptom and an agent of tension, as well as a catalyst for a crisis of trust. The session intends to discuss how trust in vaccines, science, the healthcare systems, and public health authorities has been impacted by contemporary challenges, including but not limited to the COVID-19 pandemic. The understanding of the ways in which different forms of vulnerabilities may intersect with vaccine attitudes and shape it is key to this exploration. We propose to analyze vaccine hesitancy in the context of broader processes of constructing distrust in expert systems. Thus, the special section welcomes contributions that open a discussion on the ways in which trust in expert systems is both eroded and strengthened. We are particularly interested in papers that provide critical reflections on the role of trust in redefining the conceptualization of vaccine hesitancy, offering new frameworks and perspectives for understanding this complex social phenomenon. We hope to bring together papers using various methodological approaches and disciplinary focus, whether comparative or country-based, that address the following topics: i) critical reflections on the existing conceptualizations of vaccine hesitancy; ii) mechanisms that lead to trust erosion and/or restoration in the context of vaccine hesitancy; iii) comparative studies on vaccine hesitancy and trust in different European and global regions, highlighting cross-cultural differences and similarities; iv) exploration of how intersecting identities and vulnerabilities, including factors such as race, ethnicity, gender, socioeconomic status, and geographic location, shape vaccine attitudes and hesitancy.

558

Covid-19 and Vaccine Distrust: The Case of Turkiye

Ezgi Hazal Turhan

Ankara University, Turkiye

Although the Covid-19 pandemic, which emerged in 2019, officially ended in 2023, its effects on individuals still persist. Experts have explained that, following the epidemic, which caused radical changes in the daily lives of individuals, the primary solution was the vaccines developed for the pandemic. Ultimately, the Turkish Government was supportive of vaccines, and state leaders encouraged citizens to be vaccinated through the media. This research, conducted between August and December 2022 when the social impact of Covid-19 lessened, aimed to measure individuals' perspectives and confidence in vaccines in general. Meanwhile, Turkish citizens had been receiving specific vaccine doses since 2021. The research involved 474 people in Ankara, the capital of Turkey, and participants were reached through an online survey. According to the findings, most participants were vaccinated, believing that the vaccines protected them from the virus, yet stated hesitancy about receiving booster doses. One thing that participants were certain they would not continue to get vaccinated. When the data were examined in terms of gender, it was revealed that women were more prejudiced against vaccination than men. The research focused on vaccine hesitancy, exploring reasons for the general distrust of vaccines. These reasons are believed to stem from both biological factors and the perplexing comments made by the media, experts, and speculations surrounding the vaccine.

The Risks of Choice: a Comparative Analysis of the Tensions Related to Childhood Vaccination Decisions

Alice Scavarda[1], Ana Patricia Hilàrio[2], Jaroslava Hasmanová Marhánková[3]

1Università degli Studi di Torino, Italy; 2Instituto de Ciências Sociais, Universidade de Lisboa.; 3Charles University of Prague

The paper analyses the tensions intrinsic in childhood vaccination decisions by deepening the intersection between risk, choice, and emotional burden. The main aim is to disentangle the complex relationship between childhood vaccination decisions and intensive parenting. Parents, and particularly mothers, are increasingly held responsible for risk management and morally guilty for their children's social and health problems.

Although the choice whether to vaccinate the child or not may be considered a middle-class privilege and a source of empowerment, it is also a burden which consists in paying the price of this decision, in terms of stigmatisation. Moreover, the choice related to vaccination is risky, because prevented diseases may cause health problems, as well as vaccines may have adverse effects, both minor and severe (rare) ones. Vaccination decision making process is

performed under uncertainty, it is often a stressful and anxious endeavour, not adequately supported by healthcare professionals' understanding and information. Parents, and specifically mothers, react to this tension

between empowerment and burden in different ways, related to how they conceive the risks of vaccination and their parenting/mothering role. Drawing on the results of interviews and participant observations in Czech Republic, Italy and Portugal, we will outline the strategies play out by mothers to manage their children's health choices and to be considered "good mothers". While in Czech Republic and in Italy mothers express fears and anxiety related to vaccination choices, particularly when they cherry pick vaccines or express doubts, in Portugal mothers feel empowered by their choice because they are persuaded that their lifestyle promotes their child's health and prevent him/her from contracting diseases.

'You say yes, I say yes' Vaccination Homophily in Ego Networks During the COVID-19 Pandemic

Adam Stefkovics, Fruzsina Albert, Anna Sára Ligeti, Beáta Dávid, Szilvia Rudas, Júlia Koltai

HUN-REN Centre for Social Sciences, Hungary

Vaccine hesitancy is an inevitable risk for societies as it contributes to outbreaks of diseases. Prior research suggests that vaccination decisions of individuals tend to spread within social networks, resulting in a tendency to vaccination homophily. The clustering of individuals resistant to vaccination can substantially make the threshold necessary to achieve herd immunity harder to reach. In this study, we examined the extent of vaccination homophily and its association with vaccine uptake during the COVID-19 pandemic in Hungary using a contact diary approach in two cross-sectional surveys. The results indicate strong clustering among both vaccinated and unvaccinated groups. The most powerful predictor of vaccine uptake was the vaccination rate within the egos' social network. Vaccination homophily and the role of the interpersonal network in vaccine uptake were particularly pronounced in the networks of close relationships, including family, kinship, and strong social ties of the ego. Our findings have important implications for understanding COVID-19 spread dynamics by showing that the strong clustering of unvaccinated individuals posed a great risk in preventing the spread of the disease.

Pathways to (Dis)trust: an Analysis of Vaccine Hesitancy Through the Concept of Trajectory

Jaroslava Hasmanova Marhankova

Charles University, Czech Republic

The paper builds on the data from the international project VAX-TRUST: Addressing vaccine hesitancy in Europe, which explores vaccine hesitancy in seven European countries

559

through a combination of different research techniques. The analysis presented in the paper is based on 30 in-depth interviews with hesitant parents (all of whom deliberately delayed or refused at least one of the mandatory vaccinations), 19 in-depth interviews with health professionals and 60 hours of observation in three different paediatric practices during vaccination consultations conducted in the Czech Republic. Acknowledging emotions as pivotal, the paper employs the trajectory concept to dissect how vaccine hesitancy evolves within individual life courses. I argue that comprehending hesitancy as a trajectory provides a nuanced lens to capture the socio-cultural, psychological, and experiential factors influencing parental vaccination decisions. This paper emphasises the role of interactions with healthcare professionals in shaping vaccine hesitancy trajectories. A central aspect of the analysis is the exploration of healthcare interactions beyond vaccine-specific discussions, recognising their significant impact on parental perceptions. Our study sheds light on the often-overlooked aspect of (mis)recognition, exploring how feelings of being (mis)understood or inadequately acknowledged contribute to the construction or deconstruction of trust in vaccination. Moreover, I highlight the dimension of power and powerlessness as triggers for (dis)trust in the context of vaccination decisions.

RN16 | T04_05: Artificial intelligence and technology in health and medicine: uses, impacts and ethics

The Impact Of A Digital Referral To Improve Access To Children And Mental Health Services. A Prospective Observational Study With Real-world Data

Kristof Santa[2], Rafaela Neiva Ganga[1], Mustafa Ali[1], Grahame Smith[1]

1Liverpool John Moores University; 2University of Liverpool, United Kingdom

Background: In the UK, children and young people's (CYP) mental health needs are increasing, whilst access to care is worsening. This trend is sharper in the North of England and post-COVID-19. Health Information Technologies (HIT) has been shown to successfully simplify access to Child and Adolescent Mental Health Services (CAMHS), reduce waiting times, and provide anonymous support and reliable information.

Methods: A single-centre prospective observational study was conducted to evidence the impact of "CYP as One" – a single digital referral point to CAMHS – in reducing waiting times and referral rejection rates. The first 12 months of the "CYP as One" implementation was compared with the 12-month pre-implementation (historical control group) using non-parametric tests.

Results: "CYP as One" showed an increase in 1,314 referrals, particularly self-referrals (71%). There was an increase in 16.13 days of waiting time in the Implementation Phase (53.89) compared with the Pre-implementation Phase (37.76) (p< .001). However, the Implementation Phase led to a reduction in waiting time for months 10 (M=16.18, p=9.04E-05), 11 (M=17.45, p=1.38E-08), and 12 (M=31.45, p=1.51E-11). Rejection rates increased due to the increased volume of referrals (108%).

Conclusions: The "CYP as One" improved access and reduced waiting times for CYP after the initial phase. However, the available real-world data did not enable investigations on whether referrals with specific mental health-related conditions affect waiting times and staff time. "CYP as One" represents a promising model for digital transformation in youth mental healthcare, with ongoing research needed to assess its long-term impact and cost-effectiveness.

560

Medical Anxiety in SNS Users: Unravelling Health-Related Information Seeking Behaviours

Evgeniia Alenina, Elina Tsigeman, Olessia Koltsova

Laboratory of Social and Cognitive Informatics, HSE University, Saint-Petersburg, Russia

Health-related information (HRI) seeking is a routine activity of social networking sites (SNS) users that helps them satisfy the related information needs. However, social media exposure may also result in information overload and health related anxiety (Soroya et al., 2021). Anxiety, in turn, is likely to distort SNS users' assessment of health risks and of general HRI credibility. As existing research on HRI seeking behaviour rarely explores real-life social media usage data (Verelst et al., 2016), there is limited understanding of SNS-related factors affecting medical phobias and anxiety. This work seeks to cover the gap by establishing a relationship between different self-reported experience of SNS usage, HRI seeking and medical expertise, on the one hand, and the levels of health concerns and anxiety, on the other. For this, an online survey of a national representative sample of the Russian population (N=1200) was carried out. The results of the study will reveal factors that make SNS users susceptible to excessive health concerns and anxiety-related distortions in the perception of HRI.

Advancing AI Literacy in Healthcare: A Comprehensive Evaluation of Medical Professionals' Competence for Ethical AI Integration in Clinical Practice and Societal Impact

Monica Murero, Gabriella Punziano

University Federico II, Italy

Background: Artificial Intelligence (AI) integration in healthcare has highlighted the need for enhanced AI proficiency among healthcare professionals. Misunderstandings of AI can lead to data misinterpretation and inappropriate clinical decisions, compromising patient trust. Varied and sometimes conflicting attitudes toward AI among physicians and trainees, as shown in studies (Simões et al., 2022; Elhoseny et al., 2022; Wood, 2021), indicate the necessity for deeper research (Murero, 2020).

Aims: Our study evaluates AI literacy among medical professionals, identifying their strengths, knowledge gaps, and readiness for AI implementation. We focus on how doctors perceive the impact of AI on their work and their preparedness to integrate AI into their workflows, considering both socio-technical and ethical dimensions.

Methods: We use elicitation interviews (Patton, 2015) to assess AI literacy through stimulating scenarios and simulations, particularly in cardiovascular clinical cases (D'ancona et al., 2022). This approach aims to understand medical professionals' reactions to AI and their readiness for daily integration, providing insights into their knowledge, perceptions, and training needs (Yang, 2023). Our sample comprises medical students and practicing doctors, with analysis focusing on thought patterns, comprehension levels, and AI knowledge gaps correlated with demographic, professional, and socio-cultural factors.

Results and Impacts:

Our ongoing study (n=58) aims to clarify AI's role in medicine and to inform targeted educational programs for enhancing AI understanding and application. Improving AI literacy is crucial for advancing healthcare quality and fostering access to innovative care through evidence-based policy-making (Hosseinzadeh et al., 2023) and human-centered regulation.

This study emphasizes essential skills and training for doctors to integrate AI in healthcare ethically and responsibly, ensuring effective use of emerging technologies without exacerbating social inequalities or patient risks.

AI Revolution in Healthcare and Medicine and the (Re-)emergence of Inequalities and Disadvantages for Ageing Population

Annette Astrid Franke, Justyna Stypinska

Protestant University of Applied Sciences Ludwigsburg, Germany

561

AI systems in medicine and healthcare are being extensively explored in prevention, diagnosis, novel drug designs and after-care. The application of AI technology in healthcare systems promises impressive outcomes such as equalising healthcare, reducing mortality rate and human error, reducing medical costs, as well as reducing reliance on social services. In the light of the WHO "Decade of Healthy Ageing", AI applications are designed as digital innovations to support the quality of life for older persons. However, the emergence of evidence of different types of algorithmic bias in AI applications, ageism in the use of digital devices and platforms, as well as age bias in digital data suggests that the use of AI might have discriminatory effects on older population or even cause harm. This paper addresses the issue of age biases and age discrimination in AI applications in medicine and healthcare systems and try to identify main challenges in this area. It will reflect on the potential of AI applications to amplify the already existing health inequalities by discussing two levels where potential negative impact of AI on age inequalities might be observed. Firstly, we will address the technical level of age bias in algorithms and digital datasets (especially health data). Secondly, we will discuss the potential disparate outcomes of automatic decision-making systems (ADMs) used in healthcare on the older population. These examples will demonstrate, although only partially, how AI systems may create new structures of age inequalities and novel dimensions of exclusion in healthcare and medicine.

RN16 | T05_01: Tensions and transformations in the context of health care professionalism

The Managerialisation of Health Care: Exploring the role of management professionals as care providers in Sweden

Henrik Loodin

Lund University, Sweden

Most advanced welfare societies have worked hard to reform the provision of health care. After World War II, physicians and clinicians in Europe contributed to shaping professional medicine and to modernise the health care sector. During this period, a structure for a healthcare provision that was both scientifically based and effective started to take shape. In Sweden health care is universal and funded through progressive taxation. Since the 1990s, however, an increasing number of private actors have started to deliver healthcare, competing on price and results. Nevertheless, financing is still mainly grounded in tax transfers and fiscal policies.

This paper asks what processes are actualised when health care is incorporated into a welfare system where ideas from management experts have played a vital role in reshaping the health care sector as a welfare institution. Through an analysis of public reports and policy documents developed between 1945 and 2022, a genealogy of Swedish health care is constructed. To understand the mindset of management experts, the dominant management models implemented in the healthcare sector is also examined.

The results show that health care underwent three processes: legitimisation, rationalisation and organisation. In line with this development, healthcare has seen a shift in emphasis from egalitarian aspects of care to more utilitarian concepts of management. As a consequence, management professionals have become a major influence in the provision of healthcare.

"Unpacking Healthcare Providers' Legal Consciousness in Managing Discriminatory Patient Demands in Healthcare Settings: A Qualitative Study"

Naoual El Yattouti, Jolien Inghels, Kristof Van Assche, Sarah Van de Velde

University of Antwerp, Belgium

This qualitative research aims to explore the legal consciousness of nurses from diverse backgrounds concerning potential discriminatory requests by patients seeking treatment from healthcare providers based on race/ethnicity, gender/sex, or religion. The study will employ in-depth interviews to investigate nurses' attitudes when faced with such requests, examining whether distinctions are made between different types of requests, the patient's motivations, and relevant factors. Additionally, the research will explore whether responses to these requests vary based on the underlying motivations.

The study will also delve into nurses' perspectives on existing policies, or the absence thereof, addressing patient requests for a different healthcare provider on the grounds of race/ethnicity, gender/sex, or religion. Through this, we aim to gain insights into how healthcare providers navigate and interpret institutional guidelines and protocols related to such patient demands. Furthermore, the research seeks to uncover healthcare providers' perspectives on the perceived non-applicability of Belgian non-discrimination laws to patient requests for a different healthcare provider based on the specified criteria. In some countries such as Belgium, the Netherlands and the United States non-discrimination law is not applicable in these situations, leaving healthcare providers legally unprotected when confronted with discriminatory requests for a different healthcare provider. By exploring nurses' viewpoints on legal frameworks, this research contributes to the understanding of how legal consciousness shapes healthcare professionals' attitudes and responses to discrimination-related challenges within the healthcare setting. The findings aim to inform policy discussions and contribute to the development of more effective and equitable healthcare practices.

562

Health Professionals' Intervention in the Context of Domestic Violence Against Women: Exploring Perceptions and Experiences of Providing Healthcare.

Amélia Augusto, Solange Franco

Instituto Universitário de Lisboa (ISCTE-IUL), Centro de Investigação e Estudos de Sociologia; Univerisity of Beira Interior

Domestic violence against women is a complex, multidimensional and transversal social phenomenon, and a widely recognized issue of public health, which requires that all sectors of society, including the health one, take the necessary action to prevent and address it. It is still an important issue in Portugal, despite the existing public policies regarding the promotion of gender equality and the ongoing fight against all forms of gender violence.

The study aims to contribute to the knowledge on the role of the health sector in intervening in domestic violence against women, particularly in primary health care, by analyzing health professionals' perceptions of their practice in dealing with domestic violence, and by mapping the difficulties that, according to them, they face in providing healthcare and support to victims. To fulfill this aim, a qualitative methodology was chosen, using focus groups with health professionals working in primary healthcare, in a Health Centre Group in an inland region of Portugal.

The main findings point to the lack of a specific protocol and insufficient information and skills to deal with domestic violence situations and victims, which hinders the professionals' confidence in their intervention and tends to orientate it towards a more medical response, even though they recognize its limits. Resulting from these findings, some implications for practice are discussed, such as the need for clear and specific orientations to guide health professionals' intervention; the need to offer training that enables them to fulfill their role of providing appropriate health care to women experiencing domestic violence; and need to position themselves in the context of an integrated, multi-sectoral intervention aiming to support victims and combat domestic violence.

RN16 | T05_02: Trust and health (4)

Classical and contemporary scholars maintain – with robust argument – the centrality of trust in doing society. In a way, trust can be considered the concrete of social relationships. Defined as a positive expectation emerging in a condition of uncertainty and vulnerability (Guido Möllering), trust appears to be a pivotal notion in healthcare. Besides the commonplace about trust that patients must grant to healthcare professionals responsible for curing their vulnerable bodies, it is crucial to consider the trust that healthcare professionals must accord to patients, particularly when their vulnerability emerges. Two examples can offer a plastic view of the issue: childhood vaccination and psychotic crisis management. In the first situation, parents must trust healthcare professionals proposing inoculating medication in a loved, precious, healthy body. In the second vignette, we can imagine a psychiatrist made vulnerable by the behaviour of the disturbed patient, deciding if to carry on or suspend – for instance, by binding him/her to a bed – the therapeutic alliance. For this session, scholars are invited to discuss either theoretical or empirical studies, focussing on the cure and care relationships where the need for trust emerges in a frame of particular vulnerability of patients and/or healthcare professionals

563

Risk, Trust, and Responsibility in the Practice of Modern Medicine: Examples and Dilemmas from Radiology.

Androniki Kozana[1], Vasiliki Petousi[2]

1Consultant Radiologist, University Hospital of Heraklion, Crete; 2University of Crete, Greece

The practice of modern medicine increasingly depends on various diagnostic tools including imaging examinations with significant implications for doctor-patient relations, trust, risk to patients, responsibility, costs to health care systems and individuals, increasing workload for medical personnel, hospitals, and clinics, increasing demands of overspecialization, etc. Although all medical specializations are affected by these trends, radiology is both leading and impacted by them mostly. Responsible for carrying out all current imaging examinations and most likely to be impacted by AI and deep learning, the role of radiologists is multifaceted and includes the identification of pathological

findings in imaging examinations, the diagnostic interpretation of these findings, communication of the results for further treatment or imaging re-examination, and even the provision of treatment through image-guided intervention.

International research identifies the following problems unique to radiology that raise dilemmas and have implications for risk, trust, and responsibility for individuals and health care systems: overuse of diagnostic imaging / unnecessary imaging tests, radiation burden, wrong diagnoses, remote diagnosis (teleradiology), applications of artificial intelligence in medical imaging and issues of communication and trust between radiologists and patients.

In this paper we present findings of a focus group study and interviews with radiologists who work in the public health care system in Greece related to their everyday experiences, their understanding of doctor-patient relations, issues of responsibility and trust, and the use of AI in medicine. Our participants emphasized the need for evidence-based guidelines of good clinical practice, relevant regulation, and medical education and practice focusing on patient-centered medicine.

PCCP Project: A Worldwide Strategy To Eliminate Sexual Abuse And Improve Wellbeing And Trust With Scientific Evidence Of Social Impact

Sandra Racionero-Plaza[1,2], John Guiney[2]

1University of Barcelona, Spain; 2Society of Jesus, Rome

Introduction

Child sexual abuse and the sexual abuse of adults is a public health problem worldwide with devastating consequences for victims' health (Barth et al., 2013). It is present in all institutions of society and has social roots now well studied in social sciences (Melgar et al., 2021). Protocols and interventions addressed to mitigate sexual abuse are often not based on scientific evidence from social sciences and do not engage victims in their design, thus failing to achieve what they promise and this translating into a lack of trust in survivors and society at large. Given that according to research, bystander intervention is crucial to eliminate abuse (Tirion et al., 2023), it is central to recover the trust of communities in sexual abuse prevention and response initiatives. We claim this can happen when programs are grounded in evidence of social impact (Flecha et al., 2018). In this paper, we share the example of the PCCP Project launched by the Jesuits in 2018 to contribute to eliminate abuse in all their institutions worldwide.

Method and Results

After a baseline survey (2019) and a global safeguarding audit (2022), a main need was identified across Jesuit works in the world: quality training. To respond to such need, the Jesuits launched in December 2023 a new training programme addressed to all schools, universities, social works, etc, to ultimately transform all their institutions into safe places. The programme is grounded in scientific evidence from multiple sciences and is being designed in dialogue with key stakeholders. The evidence gathered up to know shows

that this programme is regaining the trust of survivors and communities in policies and training on safeguarding.

The Woman Who Trusted Too Much: From Chains To Webs Of Trust In Mental Healthcare

Fernanda Sousa Duarte[1,2], Patrick Brown[1]

1University of Amsterdam, Netherlands; 2University of Brasília, Brazil

The aetiology of mental illness remains controversial and scientific uncertainty surrounds the relations between work and mental illness. Depressive and anxiety disorders are commonly stigmatised but not necessarily contested by medical professionals. However these conditions may be questioned by medical and non-medical actors involved in the social security (sickness compensation) system. This paper investigates the relationships between interpersonal and system trust involving multiple institutions by exploring a single litigated case of sick leave due to occupational mental illness. The study is part of a broader project that researches (dis)trust amid psychology therapy offered to Brazilian bank workers experiencing workplace difficulties. Our longitudinal case study follows a female bank worker in her 40s, who received regularly (weekly or bi-weekly) psychology sessions over 30 months, using reflective notes made regularly by the psychologist over the duration of the psychological therapy, combined with in-depth interviews with the patient. We explore how mental illness stigma and the contesting of the illness' causation or of its existence are present in the relationships of the worker with her family, employer, lawyers, and medical and non-medical work compensation authorities. These three phenomena – stigmatisation, contesting of causation, questioning of illness existence – reshape existing trust relationships, revealing the role of different kinds of system expectations in processes of (dis)trust and highlighting the social functions of distrust. The study illuminates the complex entanglements between, across and beyond trust relationships in healthcare and contributes to broadening the understanding of how different trust relationships involving multiple systems influence one another.

Trust in the Doctor in Telemedicine (the Case of Russian Megacities)

Elena Bogomiagkova, Ekaterina Orekh

St.-Petersburg State University, Russian Federation

The report presents the results of a mixed empirical study implemented in 2020 – 2021, which included semi-structured interviews with residents of large Russian cities (N=90) and a telephone survey of residents of St. Petersburg (N=861).

It was revealed that it is necessary to separate remote medical consultations in general and telemedicine as one of its options. According to the results of the study, 25,2% of respondents have ever communicated with a doctor

564

remotely. As a rule, such interaction occurs with "trusted" doctors – those with whom personal, and often repeated, contact has proved effective, and can be the initiative of both the doctor and the patient. The situation is different in the case of telemedicine, the attitudes towards which can be explained by the perception of the features of interaction in the doctor-patient system. The inability to provide a physical examination and difficulties in establishing personal contact are among the significant reasons preventing the use of telemedicine. Since telemedicine involves contact with unknown doctors and is always the initiative of the patient, the basis for applying to it is not interpersonal trust in the specialist, but the presence of institutional trust in the healthcare system and a significant degree of patient autonomy. People who note the presence of health problems and have a habit of taking care of him in various ways, including by monitoring medical prescriptions, are more likely to communicate remotely with a doctor. A higher level of income increases the chances of using such consultations. Predictably, representatives of older age groups turned out to be in the group of outsiders.

RN16 | T05_03: Exploring the intersections of health inequalities and social policy in diverse societies (4)

The contemporary landscape of European societies is characterized by increasing diversity, driven by factors such as aging populations, immigration, ethno-racial identity, and shifting dynamics in social class and gender. Within this context, there is an imperative for a comprehensive examination of the interrelationship between health policy and the different healthcare needs of diverse populations to effectively understand and address health inequalities. This session welcomes multidisciplinary contributions that critically examine the political economy of healthcare and the political framing health needs. The contributions should foster a deeper understanding of the implications that current social policies have on shaping the access and utilization of healthcare by diverse population groups, as well as the challenges posed by evolving demographic realities for healthcare systems in meeting the needs of their populations. This session invites scholars with theoretical and empirical contributions that offer insights into the intersection of policy and health from the structural, practice, and service user perspectives.

565

Unraveling Socioeconomic Disparities: A Concentration Index Analysis of Health Insurance Coverage Among Households Affected by Depression and Anxiety in Kenya.

Peter Onchuru Mokaya, Hideg Gabriella, Ágoston István

Pecs University, Hungary

The top 25 major causes of diseases and disorders worldwide include depression and anxiety disorders. The main of this study is to unravel socioeconomic disparities by conducting a concentration index analysis of health insurance coverage among households affected by depression and anxiety in Kenya.

The 2022 Kenya Demographic and Health Survey (KDHS) data was used in this study. Through Emile Durkheim's

theory of Social functionalism and by conceptually taking into account hierarchical data structures, multilevel ordinal logistic regression evaluated the effects of several independent variables. Fitting multilevel mixed-effects ordered logistic models was made possible by Stata's "meologit" command. The concentration index was a measure of insurance coverage inequality connected to wealth, which determined whether insurance coverage was concentrated disproportionately among wealthier individuals.

A sample of 31,351 households was analyzed of 2.6% and 1.7% registered the presence of depression and anxiety depression respectively. It is only 0.8% of those who registered depression, anxiety or both were receiving treatment. A total of 37.6% of households with depression and/or anxiety were insured. Higher wealth indices are associated with a considerable rise in the probability of having health insurance coverage. For the wealth indices Poorer, Rich, Richer, and Richest, the odds ratios were 1.97 (SE = 0.618, $p < 0.031$), 4.09 (SE = 1.236, $p < 0.000$), 9.62 (SE = 3.140, $p < 0.000$), and 25.00 (SE = 9.670 $p < 0.000$), respectively. The Wagstaff normalized concentration index indicates a substantial Socioeconomic disparity in health insurance coverage, estimated at 0.5144 (SE = 0.0405, $p < 0.000$). The positive value indicates a concentration of coverage among wealthy persons.

To guarantee equitable coverage, measures addressing socioeconomic disparities should be implemented and outreach efforts for health insurance should be directed at lower wealth groups.

Sexual Orientation and Later Life Inequalities across National Settings: A US-England Comparative Study of Same-Sex and Different-Sex Households

Ariel Azar[1], Laia Becares[2], Dylan Kneale[3]

1Purdue University, USA; 2King's College London, UK; 3University College London, UK

This cross-national study explores later-life inequalities in health, income, and household tenure between same-sex and opposite-sex households, comparing findings from the United States and England. Utilizing nine waves of the English Longitudinal Study of Ageing (ELSA) and fourteen waves of the U.S. Health and Retirement Study (HRS), our research explores the evolving nature of these inequalities across the life course, revealing significant within and between-country differences. Findings indicate that individuals in same-sex households in both countries face distinct challenges in chronic health conditions, mental health status, and economic well-being. We argue that these challenges are the result of the interaction between life transitions and varying policy, legislative, and societal attitudes over time toward same-sex relationships. For instance, household tenure and retirement income inequalities, more pronounced in the U.S. than in England, reflect these dynamic, divergent social and policy landscapes. Our analysis, accounting for relationship quality/satisfaction, gender, age, urban/rural

living environments, and employment status, offers a comprehensive view of how these inequalities manifest and change throughout the life course. The life course perspective underscores the cumulative impact of national contexts on the experiences of aging individuals in same-sex relationships. Acknowledging data limitations due to the underrepresentation of sexual minorities in large nationally representative studies, we argue that these insights are vital for understanding how different policy contexts across the life course can shape the specific challenges and inequalities this demographic group faces, underscoring the need for informed policies and interventions.

Self-care in Unaccompanied Minors (MENAS)

Montserrat Monserrat Hernández, Juan Carlos Checa Olmos

University of Almería, Spain

Self-care is a widespread concept among health professionals but less explored in the field of social sciences.

In medicine, psychology and nursing it is defined as the ability of a person to act in the prevention of disease and, along these lines, most intervention programs have been developed to date, both at the institutional and private level. However, despite awareness campaigns, especially among young people, the rates of overweight and obesity, eating disorders, drug and alcohol consumption, risky sexual behavior, etc., are increasing. In this aspect, most research focuses on analyzing the descriptive behavioral profile, i.e., whether or not they do it, and less on the study of the factors influencing the behaviors manifested.

Consequently, this project has created and validated the Self-Care Practices and Management Questionnaire for young people between 12 and 17 years of age (PGJ), which serves to obtain detailed information on the different dimensions that affect this population as well as the level of relationship between them in order to subsequently be able to develop appropriate intervention guidelines.

The results show that the Psychological Practice dimension is the dimension with the lowest score in the surveyed population. In addition, significant correlations are observed between the risk factors with social support, self-esteem and life satisfaction. Along these lines, intervention strategies have been proposed (workshops with young people and caregivers) in order to subsequently analyze the changes produced.

566

RN16 | T05_04: Body, space and technology in health care

Layers of Senses – Experiencing Intercorporeality in Teletherapy

Ariela Popper-Giveon[1], Yael Keshet[2]

1David Yellin Academic College of Education, Israel;
2Western Galilee College, Israel

Teletherapy, namely, therapy that uses technology for communication between patients and therapists, became popular during the Covid-19 pandemic. It is challenged by the impersonal nature of remote and technological communication. Using Merleau-Ponty's theoretical concept of intercorporeality, which refers to the perceived reciprocity between two people's bodies during communication, this lecture aims to elaborate on spiritual caregivers' experience of interacting with patients during teletherapy. Semi-structured in-depth interviews were conducted with 15 Israeli spiritual caregivers who use various forms of teletherapy. Interviewees emphasized their physical presence with the patient as a main principle in spiritual care. They indicated the involvement of nearly all senses in physical presence therapy, which allows for joint attention and compassionate presence. When making use of various communication technologies in teletherapy, they reported the involvement of fewer senses. The more senses involved in the session and the clearer it is that space and time are shared by both caregiver and patient, the stronger the caregiver's presence with the patient. Interviewees experienced teletherapy as eroding the multisensory joint attention and intercorporeality and, hence, the quality of care. We point at the advantages of teletherapy for therapists but claim, nonetheless, that it challenges the main principles of therapy. Joint attention in therapy is, fundamentally, a multisensory phenomenon that may be understood as intercorporeality. Our use of the notion of intercorporeality sheds light on the reduction of the senses involved in remote interpersonal communication and its impact on care and, more generally, the interpersonal communication experienced during telemedicine.

The Social Value of Place-based Creative Wellbeing. A Rapid Review and Evidence Synthesis

Rafaela Neiva Ganga[1], Laura Davies[1], Kerry Wilson[1], Margherita Musella[2]

1Liverpool John Moores University, United Kingdom;
2University College London

Creative wellbeing is an increasing field of interest to which biomedical and social sciences have made uneven contributions. The instrumental value of culture and its subsequential public investment is grounded in the interplay of social, cultural and economic capital to attain and preserve wellbeing and health and foster social mobility. The current evidence addresses the effectiveness of arts interventions in improving illnesses. Little attention has been paid to the social value of creative wellbeing for the general population.

This paper is a rapid review and evidence synthesis that aims to answer, "What is the social value of place-based arts and culture interventions at an individual (wellbeing) and community (social inequalities) in the UK and Europe?"

After a systematic search of five databases, search engines and a call for evidence in August 2022, 14 out of 974 sources met the inclusion criteria. Studies were organised into three themes (Community, Events, Museums), and outcomes were analysed considering the indicators and dimensions of wellbeing (Office for National Statistics).

The review evidences that creative wellbeing leads to improvements in wellbeing outcomes and can contribute to alleviating social determinants of health. However, considering their impact on the underlying causes of structural social inequalities requires caution. While insightful, current conclusions are limited, emphasising the need for supplementary, high-quality mixed-methods research to demonstrate long-term impacts.

In partnership with What Works Centre Wellbeing and Spirit of 2012, the review shaped the evaluation of Coventry UK City of Culture 2021, offering evidence of community-based art practices' effectiveness in enhancing wellbeing and addressing health-related social determinants. Insights into efficient mechanisms and inequality drivers informed decisions on future UK City of Culture programme design.

567

Telemedicine in Rural Germany. Potentials and Hurdles from a Regional Peripheralization Perspective.

Tobias Mettenberger

Johann Heinrich von Thünen Institute, Germany

Particular potential of telemedicine is seen in the supply of sparsely populated rural regions far from urban centres. Where distances for general practitioners and patients are long, specialist doctors are lacking and the service spectrum of smaller hospitals is limited, digital information and communication technologies seem particularly effective. Likewise, digital transformation in such remote areas is associated with specific difficulties e.g. in view of financial, personnel and infrastructural resource bottlenecks.

Against that background my study addresses the question, how rural specific context conditions influence the potentials as well as the hurdles for digital medical solutions. Drawing on regional peripheralization theories and the empirical base of 27 interviews with 33 persons, I reconstruct the perspectives of crucial stakeholders in the field of Germany's rural telemedicine.

My results show that fundamental and mutually reinforcing processes of regional peripheralisation are expressed, both with regard to the potentials and the challenges of telemedical solutions. Relational peripheralization is addressed by problematizing asymmetrical relationships between rural

and urban areas, structural peripheralization by addressing various resources bottlenecks mitigating regional actors and institutions. Finally, discursive peripherisation, driven by negative self – and external attributions, is reconstructed, looking at the described regional situations as well as on the ways, in which the experts develop their narratives.

On this basis, I would plead for further specifying the interplay of group – and space-specific contextual conditions, shaping the use of telemedicine and other digital technologies, also in order to better understand much-discussed digital divides. My paper further concludes, that telemedicine solutions are by no means a panacea, but merely one building block within integrated medical supply concepts.

RN16 | T05_05: Exploring social capital's impact on health through sociological lenses (2)

Social capital has been defined in different ways over recent decades, however, there is unanimous agreement in recognizing the value of social networks and the associated norms of reciprocity. At the individual level, starting from the definition of social capital provided by Putnam, who refers to "features of social organization such as networks, norms, and trust, that facilitate coordination for mutual benefit", it should be recognized that social capital creates value for the individuals who are part of social networks, but also for others. Conversely, from a Coleman viewpoint, the forms of social capital, such as trust, mutual exchanges, norms, and sanctions, define social capital from a social cohesion perspective, i.e., a collective property emerging from individual interactions. Scholars have demonstrated the relevance of social capital in different domains, such as economic and social outcomes. However, as Putnam states, "In none is the importance of social connectedness so well established as in the case of health and well-being". The variety of the empirical evidence indicating that individual and/or collective social capital is likely to be a significant determinant of some important health outcomes is impressive. Higher levels of social capital seem to produce healthier societies, but understanding the processes linking social capital to health in a broader sociological approach is challenging. To fill this gap, our session aims to facilitate discussions on qualitative and quantitative papers that focus on theoretical, empirical, and methodological issues to analyze the complex relationship between social capital – in its different forms – and health outcomes.

568

Loneliness, Capabilities And Biographical Disruption: What Can Be Learned From Taking A Social Network Approach To The Everyday Management Of Long-term Conditions

Ivaylo Vassilev

University of Southampton, United Kingdom

Loneliness has been recognised as a growing problem for individuals and for the health and social care systems. A range of risks have been associated with loneliness, but there is limited understanding of the relevant mechanisms.

This paper explores loneliness in the context of living with a long term condition, and argues that it can be understood as the lack of capabilities to reconstruct disrupted valued ways of life. This conceptual framework is then applied to studies of self-management support for people living with long term conditions, with a specific focus on the processes that may lead (or not) to social engagement and social support.

Specifically, I draw on Morgan and Burholt (2020) and argue that loneliness can be conceptualised as a biographical disruption (Bury 1982). This is because its onset has been associated with different events and transitions (e.g. bereavement, relocation into a care home, the breakdown of a marriage in later life) that disrupt taken for granted behaviours, social roles, and identities and require a complete rethinking of one's biography and self-concept. I then draw on the capabilities approach, as developed by Nussbaum, and argue that identity reconstruction is dependent on people having the freedoms or opportunities to be and do what they value. Capabilities are here understood as genuine opportunities that depend on a combination of more 'internal' capacities and more 'external' circumstances including access to resources, material environments and social relationships.

The findings indicate that for people living with long-term conditions loneliness could be in part an outcome of limited opportunities for rebuilding social status outside of the labour market and the limited social value attached to such activities and work.

Social Bridges to Health Literacy: Examining the Role of Social Capital in Elementary School Contexts

Maria Świątkiewicz-Mośny[1], Magdalena Ślusarczyk[1], Małgorzata Bała[2], Natalia Ożegalska-Łukasik[1], Aleksandra Piłat-Kobla[2], Anna Prokop-Dorner[2], Oliwia Mandrela[1], Aleksandra Potysz-Rzyman[1]

1Jagiellonian University, Poland; 2Jagiellonian University, Medical Collage, Poland

Health capital demonstrates a strong correlation with social capital, where socio-economic factors play a significant role in influencing health status, lifestyle choices, and access to healthcare services. Our definition of health capital aligns with Bourdieu's concept, encompassing the aggregate of resources possessed by an individual that can impact their position in the social field of health (Schneider-Kamp, 2021). A crucial component of health capital is health literacy, denoting the ability to discover, comprehend, and utilize health information, emphasizing communication competencies and critical thinking skills. Health literacy remains an evolving competence, occupying a prominent place in the World Health Organization's objectives.

This presentation aims to explore the connection between the health literacy levels of primary school students and the socioeconomic capital of their families. Our study involved assessing the health literacy levels of over 1200 Polish pupils aged 12-15 using the Claims Evaluations Tool (CET) and the Health Literacy for School Age Children (HLSAC). To examine their social capital, we inquired about family living conditions, leisure activities, extracurricular engagements, and parental educational levels. The ensuing findings will explore the intricate relationship between health literacy levels and the socio-economic status of students.

Our investigation seeks to affirm hypotheses proposing that the socio-cultural environment molds students' perspectives on health. By analyzing health practices observed in schools, we aim to elucidate the school's role in shaping health competences.

Parental SES and Child Disability Using 41 Years of Cohort Data

Antwan Jones

The George Washington University, United States of America

This paper uses 1979 – 2020 National Longitudinal Study of Youth data to explore how transitions in socioeconomic status in childhood are related to the trajectory of childhood functional limitations. The project relies on materialist theory and the minority model of disability to hypothesize that parents of children with lower socioeconomic means are more likely to be functionally limited than those families with higher levels of SES. To model the trajectory of functional limitations, this research relies on population average

569

growth curve models to assess the temporal, longitudinal effects of SES instability on child functional limitation. Results from the study indicate that parental employment, net of other parental and child demographic characteristics, decreased the odds of a child being functionally limited (limitation of daily activities due to chronic conditions). In this case, higher SES translates to monitoring of warning signs of emerging limitations. In addition, parental employment means that their child will have health insurance coverage that enables them to see physicians who could assess warning signs of functional limitations. Other results are situated within the sociology of disability literature to highlight the role that SES affects child disability.

What You Can Buy, Who You Know and Who Listens to You: The Impact of Different Types of Capital on Health in Iceland.

Sigrún Ólafsdóttir

University of Iceland, Iceland

Sociologists have long been interested in the impact of social position on health. In general, those who are more vulnerable experience worse health than those who have more advantage in society. Research has focused on various positions, including class, race and gender, but scholars increasingly call for a more nuanced understanding of social stratification. Building on Bourdieu´s theory of different kinds of capital, I examine the impact of economic, cultural, social and symbolic capital on health. Using recent survey data from Iceland (N>1,000) which includes unique measures on these four kinds of capital, I ask how these more nuanced measure, independently and in interaction with more widely used measures of social location, impact physical and mental health. The results show that economic, social and symbolic capital impact health, specifically that those who hold more capital report better health. The impact is in addition to the effect of other measures of social locations. The broader implications are that in a society that may be more equal than most, there are still clear distinctions between social groups that impact health in meaningful ways, not only in terms of the position the individual holds in the stratification system, but in a more nuanced ways of who people know, how powerful they consider themselves to be and the economic power they perceive themselves to have.

RN16 | T06_01: Obstetric Violence between Transformations and Trust (2)

Obstetric violence refers to the mistreatment and abuse that women may suffer during childbirth, usually from health care workers. It is still largely unrecognized and underreported in many countries. Trust and transformation are two key concepts for counteracting obstetric violence. Trust is the basis of the patient-provider relationship and, more in general, of the relationship between care giver and care receiver. Health care systems transformation, on the other hand, involves addressing structural issues, such as promoting accountability, improving working conditions and ensuring that health care workers receive adequate training and support. In summary, addressing obstetric violence requires building trust between health care workers and women, as well as transforming health care systems to prioritize respectful, woman-centred care. By emphasizing trust and transformation, societies can work to reduce obstetric violence and promote positive birth experiences for all women. We believe that sociological research in this field represents an inescapable tool to combine the detection of the problem, the critique of the devices that foster it and, at the same time, to find, together with the different stakeholders involved, including institutional and medical area stakeholders, effective solutions in the field of medical practice, health management and practitioner training.

570

Sociological Ambivalence In Reproduction. The Applicability Of Obstetric Violence To Gestational Surrogacy.

Daniela Bandelli

Lumsa, Italy

This paper will discuss the main points of adherence and incompatibility between gestational surrogacy and the concept of Obstetric Violence (OV), which is "the appropriation of the body and reproductive processes of women by health personnel, which is expressed as dehumanized treatment, an abuse of medication, and to convert the natural processes into pathological ones, bringing with it loss of autonomy and the ability to decide freely about their

bodies and sexuality, negatively impacting the quality of life of women" (Venezuela law on the Right of Women to a Life Free of Violence, 2007) . This discussion will be built on the scientific literature on OV in the context of technically assisted reproduction (ART), and on the reflections emerged during focus groups conducted in 2023 by the author in Italy with midwives, doulas, and activists supporting the so-called "natural childbirth". The sociological theory of ambivalence will enable to look into the tension generated by the following contemporary social trends: an emerging collective consciousness about the structural violence in medicalised pregnancy and childbirth, and on the other hand the increasing normalisation of procreative paths with technical and expert control on different phases of the procreation process, disembodiment of conception, outsourced pregnancy, and separation of mother and child at birth. From the focus groups it emerges that the value of the woman's choice and self-determination provides the core repertoire to mitigate the above mentioned tension and to overcome an apparent ambivalence between medicalisation and nature.

Routinized Episiotomies in Türkiye: Obstetric Violence and Trust

Eylem Mercimek, Dilek Cindoğlu

Kadir Has University, Turkiye

This paper explores the relationship between obstetric violence and trust by focusing on how trust in the obstetric setting is built, instrumentalized, and abused by healthcare providers and receivers, with a specific focus on routinized episiotomies in Türkiye. An episiotomy is a surgical incision implemented to enlarge the vaginal opening during childbirth. While the World Health Organization does not recommend the routine use of episiotomy in spontaneous vaginal births and suggests a maximum ten percent episiotomy rate among all vaginal deliveries, routinized and non-consented episiotomies are widely practiced in Türkiye, particularly in first pregnancies. Focusing specifically on this practice, the paper explores the multidimensional relationship between medical decision-making and trust, including the trust between OB/GYNs, midwives, and doulas, trust between healthcare professionals and expectant mothers, as well as trust in both the woman's body and the healthcare system. The data for this paper is based on grounded theory research conducted between April and October 2023*. Seventeen focus groups and group interviews were held with OB/GYNs, midwives, mothers, and fathers in Istanbul, Ankara, and Hakkari. Additionally, ten in-depth interviews were carried out with experts in the field, such as NGO representatives. The research data are coded and analyzed with MAXQDA. Preliminary findings suggest that trust can be both a reason and a strategy for facing and dealing with uncertainties in obstetric settings, potentially resulting in obstetric violence. The findings point out the influence of power dynamics rooted in gender inequalities among stakeholders in the medical setting, affecting the decision-making process regarding the implementation of episiotomy. The significance of the research is to reveal the negative consequences of over-medicalization of childbirth and women's bodies, and gender inequalities in obstetric settings through opening up a discussion on the relationship between obstetric violence and trust by focusing on the ways in which trust is built, instrumentalized, and abused.

Eylem Mercimek, a Ph.D. student in Gender Studies at Kadir Has University, has not participated in an ESA PhD Summer School before.

A Latin American Response To Mistreatment And Abuse During Childbirth In Healthcare Systems

Giulia Stolfi

University of Florence, Italy

Obstetric violence is a kind of mistreatment often experienced by women during childbirth. It concerns the excess of medicalization, the pathologization of physiological processes, disrespectful and improper behaviors, related to the hegemonic medical discourse and to the abuse of the theory of medical necessity. In Europe, including Italy, there is a lack of legislation to protect women from these abuses. Obstetric violence has been treated for the first time in Latin America, where many States (including Brazil, Venezuela, Argentina, Mexico) have enacted laws on the subject, adopting instruments to prevent and combat the phenomenon with a perspective based on the protection of Women's Human Rights. This approach, recently, has been shared and supported also by many international organizations, who consider obstetric violence as a form of gender-based violence. In Brazil, Institutions, women's associations, and representatives of professional groups are working to improve the quality of obstetric care services with the aim to humanize childbirth and to ensure more respectful care, valuing the autonomy and protagonism of women in childbirth. The policies and measures adopted are an important transformative factor to promote social change. The analysis proposed is based on the research that I'm carrying out in Brazil as a PhD student in Human Rights theories at the University of Florence. In a comparative perspective, it's useful to look at the Brazilian experience to understand if this model can provide responsive elements to Italian and European healthcare systems.

Professional Ethics For The Prvension Of Obstretic Violence

Sara Fariello

Università della Campania, Luigi Vanvitelli, Italy

Obstetric violence is a form of gender-based violence and a serious violation of human rights in childbirth. Women's human rights include, in fact, their right to receive dignified and respectful reproductive health-care services and obstetric care, free from discrimination and violence, including sexism and psychological violence, torture, inhuman and degrading treatment, and coercion (UN, 2019).

571

In Italy, o.v. is addressed in the legal framework of medical responsibility and health policies differ on a regional basis. The literature is recent and focuses mainly on the testimonies of women. I argue that it's useful to show the phenomenon from the side of those who may be acting such violence, to illuminate aspects not yet investigated and to identify the conditions that may promote it or, conversely, limit it. Recent research has highlighted the importance of midwives' professional ethics in the prevention of obstetric violence (Fariello & Pratschke, 2022). The midwifery-led care model offers the foundations for a new paradigm in opposition to medicalization: it focuses on the one-to-one equal relationship between midwife and woman, communication, consensus, continuity of care, personalized care, and empowerment. This model is based on the concept of physiology to claim a sphere of responsibility and, at the same time, the involvement of women during pregnancy and childbirth. It requires a greater autonomy for midwives and more staff on shifts. Therefore, public policies can encourage a more respectful and holistic approach to labour and childbirth, also through the enforcement of the obstetric role.

Communication Between Mother and Midwife: Critical Profiles and Fiduciary Perspectives.

Chiara Magneschi

Università di Firenze, Italy

The so-called paradigm of social reproduction and the political ethics of care have declined the conception of motherhood beyond the destinal stereotype, advancing the demand for more fulfilling ways of becoming and being mothers. The ability to endure, as an index of perfect femininity, has for centuries invisibilized traumatic experiences of motherhood and childbirth. It is therefore essential to argue that motherhood is a choice that, if undertaken, demands the utmost care: the woman exposes herself to the wound, but the wound must be prevented by those institutionally competent to do so.

The research question that will be attempted to be answered is how we can make motherhood and childbirth places of authentic care. The hypothesis is that reference to a fiduciary paradigm can enhance the connotations of these phases of life, from a relational, shared, widespread perspective. For the woman, feeling that she can rely on the care of staff is essential; for the latter, perceiving trust in their work is essential. How this connection can take place is the more specific question that will move the development of the research. The attempt will be to create an operational perspective by exploiting precisely the value of trust, lately the focus of intense jusphilosophical reappraisal, for a new social ontology.

RN16 | T06_02: Vaccination and (dis)trust: what sociology can teach us in the face of contemporary challenges (2)

In the context of current sociopolitical tensions and challenges to trust in institutions, the issue of vaccine hesitancy has taken center stage. The proposed special session aims to explore vaccine hesitancy as both a symptom and an agent of tension, as well as a catalyst for a crisis of trust. The session intends to discuss how trust in vaccines, science, the healthcare systems, and public health authorities has been impacted by contemporary challenges, including but not limited to the COVID-19 pandemic. The understanding of the ways in which different forms of vulnerabilities may intersect with vaccine attitudes and shape it is key to this exploration. We propose to analyze vaccine hesitancy in the context of broader processes of constructing distrust in expert systems. Thus, the special section welcomes contributions that open a discussion on the ways in which trust in expert systems is both eroded and strengthened. We are particularly interested in papers that provide critical reflections on the role of trust in redefining the conceptualization of vaccine hesitancy, offering new frameworks and perspectives for understanding this complex social phenomenon. We hope to bring together papers using various methodological approaches and disciplinary focus, whether comparative or country-based, that address the following topics: i) critical reflections on the existing conceptualizations of vaccine hesitancy; ii) mechanisms that lead to trust erosion and/or restoration in the context of vaccine hesitancy; iii) comparative studies on vaccine hesitancy and trust in different European and global regions, highlighting cross-cultural differences and similarities; iv) exploration of how intersecting identities and vulnerabilities, including factors such as race, ethnicity, gender, socioeconomic status, and geographic location, shape vaccine attitudes and hesitancy.

572

Creating Bridges: Understanding The Role Of Materialities In Childhood Vaccination Encounter

Fábio Rafael Augusto, Ana Patrícia Hilário, Joana Mendonça

Instituto de Ciências Sociais, Universidade de Lisboa, Portugal

Whereas there has been some research on the role of the materialities of care in the healthcare interaction, less in known on how these materialities may influence the interaction between healthcare professionals, parents, and the child in the vaccination encounter. The current study intends to address this gap, by shedding light on how caring practices are performed in vaccination settings and their impact on children and their parents. The study draws on data from Portugal, namely on 71,5 hours of observations of different vaccination sites and in-depth interviews with 30 healthcare professionals. A thematic analysis was performed which allowed us to identify key themes within the data. The findings suggest that materialities are pivotal in the developing of caring relationships within the vaccination encounter. The focus on mundane materialities may help to bring light to certain practices that often go unnoticed in the vaccination encounter, but which may be key to manage childhood vaccination. The relational effect of mundane materialities upon the vaccination experience is demonstrated.

Blind Spots in Childhood Vaccine Hesitancy Research: Bilateral Trust, Child-Centeredness and Trajectories of Hesitancy

Dino Numerato[1], Jaroslava Hasmanová Marhánková[1], Mario Cardano[2], Alice Scavarda[2], Luigi Gariglio[2], Alistair Anderson[3], Petra Auvinen[4], Ana Patrícia Hilário[5], Pru Hobson-West[3], Aapo Kuusipalo[4], Esther Lermytte[6], Joana Mendonça[5], Paulina Polak[7], Tadeusz Józef Rudek[7], Maria Świątkiewicz-Mośny[7], Pia Vuolanto[4], Aleksandra Wagner[7]

1Faculty of Social Sciences, Charles University, Czech Republic; 2University of Turin, Italy; 3University of Nottingham, United Kingdom; 4Tampere University, Finland; 5Instituto de Ciências Sociais, Universidade de Lisboa, Portugal; 6Department of Sociology, Ghent University, Belgium; 7Institute of Sociology, Jagiellonian University, Poland

The topic of childhood vaccine hesitancy has attracted extensive social-scientific attention that has even increased amidst the recent COVID-19 pandemic. The complexity of vaccine hesitancy at micro-, meso – and macro-levels has been reflected by the voluminous scholarship that focuses on a variety of factors, including socio-characteristics, lifestyles, values or lay knowledge of parents, their trust in expert knowledge, healthcare authorities or healthcare professionals, the perceived risk of vaccination or vaccine-preventable diseases, and the role played by health care systems, politics, social and mass media. Epistemologically inspired by relational sociology, the aim of this paper is to identify and explore three blind spots in childhood vaccine hesitancy research. The study draws on the extensive empirical evidence generated through a rapid team ethnography in seven European countries (Belgium, Czechia, Finland, Italy, Poland, Portugal and the United Kingdom) as part of the international project VAX-TRUST. The findings of this paper are threefold: First, trust affecting vaccine hesitancy is bilateral and determined by trust of health care professionals in other actors involved in vaccination, in addition to the more commonly studied trust of parents in health care professionals; second, vaccine hesitancy is affected by the omnipresent yet analytically invisible role of children; and, third, vaccine hesitancy is processual, mutable in time and, therefore, trajectories towards or away from vaccine hesitancy have to be systematically explored. We conclude that these observations not only enrich the current academic debates concerning vaccine hesitancy but, at the same time, could usefully inform child vaccination policies.

It's The Companies I Don't Trust: A Focus Group Examining Vaccine Hesitancy and Institutional Distrust

573

Alec Cali

University of Amsterdam, Netherlands, The

In this article I explore the relationship between regulatory distrust and the adoption of vaccine hesitant beliefs in an American context. Focus groups were conducted through Zoom with 63 participants located in 22 American states in winter 2022 who indicated distrust with the American regulatory system and/or hesitancy towards any kind of vaccine. Qualitative analysis showed that, independent of other beliefs or identity, participants saw vaccines as just another medical treatment, something that should be consumed or avoided based on personal, biological risk factors. There was a stark contrast between those who continued to trust the regulatory system and those who did not: Those who did not were more likely to believe that pharmaceutical corporations "bought" regulators and public health officials. They also believed the institutions responsible for vaccine and medicine production and regulation could be fully trusted with their recommendations. There was a general understanding in this group that "the system" has stopped protecting or "working for the regular people." Several participants used the ongoing opioid crisis in the United States as both an example and the cause of their distrust in pharmaceutical companies and regulators. My analysis suggests that long-term pro-vaccination campaigns must begin focusing on fundamental causes of distrust between patients and the health system. I also suggest that the international crisis of trust reflected in the research is the result of the global system of neoliberalism. I conclude with

recommendations for future on research the intersection of anti-neoliberal sentiments and health decision making.

Sociological Theory and Intervention: Study on Vaccine Hesitancy

Alessandra Sannella[1], Lia Lombardi[2], Maurizio Esposito[3], Sara Sbaragli[4]

1University of Cassino, Italy; 2University of Milano; 3University of Cassino, Italy; 4University of Cassino, Italy

This study is part of a larger study that aims to gain a broader understanding of the phenomenon of vaccine hesitancy at the European level and support healthcare professionals' expert position when meeting with vaccine hesitancy and related challenges to expertise, specialist knowledge and evidence-based recommendations.

The study focuses on the second objective and, thus, on the design and implementation of public health interventions towards vaccine hesitancy. According to the objectives and actions of the project Horizon "VAX-TRUST – Addressing vaccine hesitancy in Europe", we thought it was necessary to deepen sociological theory and connect it with intervention in Public Health. Therefore, the main objective of this study, based on a literature review (LR), is to find answers to two fundamental questions concerning public health interventions: a) the usefulness of theory for the design of public health interventions and b) the applicability of theory to interventions. We thus explored the literature on the subject (social sciences and public health) and tested intervention models.

The study dwells on some specific theories (Actor-Network Theory, Social Worlds Theory, Normalisation Process Theory) which, due to the complexity of their approach and the consideration of some critical intervention elements (context, interaction, network, etc.), seem appropriate for the design and implementation of PH intervention.

Furthermore, the study shows examples of the interaction of the analysed theories with two well-known intervention models (the 6SQuiD framework and the TIDIeR checklist).

The analysis of this study shows that a complex public health intervention can be traced back to multiple theories to be more effective.

RN16 | T06_03: Disability and mental health at the intersection of policies, technologies and (new) inequalities

The session aims to discuss the possible transformations produced by both the introduction of new technologies of care and the recent Covid-19 pandemic in the disability field, in terms of both opportunities of inclusion, the expansion of old inequalities and the production of new ones. We will provide a space to critically discuss the effects of these phenomena on the international and national policy regulative framework; on the regional or local policy, services or practices; on families, persons with disabilities and disability welfare policy professions. International, national and local studies on tensions, barriers, boundaries, spaces and practices of care for and by persons with disabilities are welcome. The pandemic presented both threats and opportunities for persons with disabilities and their families/caregivers, as well as the introduction of new technologies of care. Persons with disabilities experienced not only isolation, but also new forms of support. Remote or hybrid forms of assistance increased the interactions between healthcare professionals, family members/caregivers and persons with disabilities, but they could not replace the role of direct contact in professional encounters. In order to tackle the multifaceted empirical dimensions of the topic this call for papers is intended to solicit both theoretical and empirical contributions, as well as reflection on ethical issues. We welcome papers from any theoretical and methodological perspective. Empirical studies may involve solo, collaborative and team-based research. Quantitative, qualitative, creative and art-based method are welcome along with experiments, ethnographic and autoethnographic ones.

574

Unravelling Intersectional Barriers: Access to Sexual and Reproductive Health Services for Women with Disabilities in Uganda

Rupankar Dey

International Institute of Social Studies Den Haag, under Erasmus University Rotterdam, Lilianne Fonds, Netherlands

This research delves into the accessibility of sexual and reproductive health (SRH) and family planning (FP) services for women with disabilities in Uganda, examining how intersecting identities create barriers to access and assessing the effectiveness of these services in enhancing sexual well-being. Drawing on the concepts of intersectionality and capabilities, the study adopts Levesque's healthcare framework to analyze barriers from both the demand and supply sides.

Conducted in semi-urban and rural areas of Uganda, the research utilized individual qualitative interviews with healthcare professionals, beneficiaries, non-beneficiaries, and focus group discussions. The findings reveal multifaceted challenges in SRH and FP service access for women with disabilities. Intersectional identities play a crucial role, emphasizing that access alone does not guarantee positive outcomes. Financial status significantly influences the realization of service benefits, with intriguing disparities noted between rural Kalangala and semi-urban Kampala. Disability type proves pivotal, impacting service accessibility, while education, financial dependency, and religion shape access for both beneficiaries and providers.

The study also critiques prevailing SRH policies for adopting a one-size-fits-all approach, neglecting the unique needs of women with disabilities influenced by their intersecting identities. The research underscores the necessity for nuanced and identity-informed SRH and FP policies tailored to address the diverse challenges faced by this demographic. It calls for a comprehensive understanding of the intricate dynamics influencing accessibility and advocates for policy adjustments that account for the complex interplay of factors shaping the experiences of women with disabilities in seeking SRH and FP services.

Addiction and Psychiatry: A Critical Intervention

Bruce Cohen

University of Auckland, New Zealand

Despite the increase in psychiatric, media, and public discourse regarding the prevalence and growing number of addictions in western society in the twenty-first century, sociological analyses of such conspicuous behaviour has remained relatively thin on the ground. This is perhaps surprising given the mental health system's continued inability to adequately identify and define what exactly 'addiction' is, or to provide effective treatments for those they have labelled as (for example) drug, alcohol, gambling, food, social media, gaming, or sex 'addicts'. In advance of the publication of Addiction and the Medicalisation of Conspicuous Behaviour: New Critical Perspectives (a sociological volume from Jo Reichertz, Martin Harbusch and myself, due out in 2025), this presentation performs a critical analysis of addiction to assess the key historical dynamics and current drivers for this form of medicalisation, including consideration of who ultimately might benefit from the pathologisation of such consumption practices. From consideration of the early moral entrepreneurs who first named certain behaviours as addictions in the late nineteenth century, through changes to the American Psychiatric Association's third edition of their Diagnostical and Statistical Manual of Mental Disorders in 1980, to the latest tests for efficacy within the field, this talk will also offer some useful pathways for future sociological research in the area. At the same time, my own Marxist intervention here will argue that, ultimately, addiction discourse reflects certain economic and ideological priorities of capitalism for both surplus value and the social control of (mainly) working class populations.

"Walking in the room waving a piece of paper" Understanding Mental Health Stigma in Turkey Through the Perspectives of Mental Healthcare Professionals.

Baris Kamyab Muhammedrezai

Polish Academy of Sciences, Poland

575

Stigma is an important barrier to health seeking behavior for mental health disorders. Therefore, it is crucial to understand and analyze the extent and the effects of stigmatization. The Republic of Turkey acknowledged this issue in 2006 and there have been efforts to tackle this issue from various institutions. In this study, my goal is to explore how mental health is stigmatized in contemporary Turkey through the perspective of mental healthcare professionals. To achieve this goal, I conducted semi-structured in-depth interviews with mental healthcare professionals consisting of 6 psychiatry specialists and postgraduate medical doctors in training. Results have shown that stigmatization is still prevalent in Turkey and the efforts to tackle the issue have not been effective. In the context of Turkey, there is a close relation between mental health stigma and somatic symptom presentation in clinics. Professionals can act as stigmatizers in certain situations and patient fear towards institutional stigma is a prevalent topic in clinical care. Even though the topic of stigmatization has been studied extensively, few studies have been done focusing on the perspectives and the experiences of professionals.

Mental Health Digital Solutions: The Twilight Zone Of Empowerment And Responsibilization?

Emilie Kristine Dyrlev Thorsen

Aarhus University, Denmark

Mental health has been announced as a pressing and ubiquitous issue worldwide. This paper investigates the transformative potential and sociological implications of digital mental health interventions in Denmark. The paper emphasizes the dual nature of these technologies as levers for empowerment and responsibilization, bestowing psychiatric patients with flexibility and autonomy while concurrently imposing a heightened sense of individualization and responsibility for managing their mental health.

Using latent class analysis (LCA), the paper uncovers latent classes based on psychiatric patients' experiences with, and attitudes towards, mental health digital solutions. Moreover, the LCA reveals patient groups along the lines of experienced empowerment and responsibilization. This is based on a representative survey sample distributed to 7.000 Danish patients being in psychiatric treatment in 2023.

In the subsequent analysis, the paper unearths the intricate relationship between mental health digital solutions and digital inequalities. Using multinomial regression analysis, the paper examines the association between socio-economic position, severity of mental illness, age, gender, geographic location, migration status, social support, and patient classes. The explanatory variables are accessed via population register data.

By shedding light on these connections, the research contributes to the broader understanding of how digital mental health solutions intersect with social structures, accentuating the need for targeted policies that address digital inequalities. This inquiry ultimately seeks to inform both academic discourse and public policy strategies for digitalizing psychiatric care practices.

RN16 | T06_04: Active ageing: the tensions between the end of working life and the beginning of a new (?) healthy and social life

After the two-years of Covid 19 pandemic emergency, the social and working life balance is quickly changed. The search for a new normality is still the objective of many segments of the world population. Indeed, if from the one hand, elderly have suffered from the lockdown in terms of sociality, from the other hand, workers have experimented a new organization of time between personal and working life. Considering the acceleration to a new organization of the society, even more attention has been focused by policy makers to the "active ageing", as the process which allows people to continue to achieve individual well-being objectives and participate in activities in society according to one's abilities, desires and needs (WHO). Indeed, "Health" is one of the four pillars proposed by the WHO in the Active Ageing Policy Framework (WHO) stating that the care system should focus on health promotion, disease prevention and equitable access to quality primary health care and long-term care. The aim of this session is twofold. From the one hand, we discuss policies promoting active ageing, based also on working life balance evaluation and considering not only retired, but also elderly workers, gender differences and other peculiarities. The purpose of these activities is aimed at improving physical and mental health conditions (e.g., encouraging physical activity or digital knowledge), and the participation in economic and social life with new roles. From the other hand, we discuss results from both qualitative and quantitative research, especially based on existing active ageing programs. Interdisciplinary approaches and international comparisons are very welcome.

576

Loneliness Among Old Age Dependents and the Role of Cats and Dogs as a Protective Factor

Marga Marí-Klose, Sandra Escapa, Albert Julià, Pedro Gallo

University of Barcelona, Spain

Loneliness is often associated with older age. Age-related losses and decreasing health may affect social contacts which in turn are expected to increase the risk of loneliness. Studies consistently demonstrate that older adults who are lonely or socially isolated have higher rates of depression, more health conditions, and greater mortality.

The purpose of this study is to identify whether being a cat/dog owner, among other factors, makes a difference in terms of loneliness in old age. Data were used from a representative sample of non-institutionalized dependent old persons (>65) in Barcelona-Spain (Survey on Care Strategies for Older Dependents 2023, DEPCURA-BCN project). Among the n=1,150 individuals 14% did own a pet. Logistic regressions show that owning a cat/dog reduces significantly the risk of feeling lonely (UCLA-3≥6) but only among women, once controlled by age, health subjective status, Duke-UNC Scale, household size, degree of dependency and household income. In the case of men, we found that household size, and particularly living with another person, reduces significantly the risk of feeling lonely, controlling by other factors too. Future research should focus on elucidating the underlying mechanisms, and longitudinal studies are required to deepen our understanding of this association.

Health And Education As Determinants Of Opportunities For Healthy Ageing In Poland

Barbara Worek[1], Magdalena Jelonek[1,2], Marcin Kocór[1]

1Jagiellonian University, Poland; 2Cracow University of Economics

Health is an unevenly distributed resource in society. Its state is influenced by a range of factors, from genetic predispositions, lifestyle, environmental conditions, to access to medical services and education. Conversely, health status is a major factor influencing market opportunities, social, and cultural participation. This presentation aims to examine the impact of health status, measured through self-assessment, on various aspects of life in Poland, particularly focussing on the relationship between health and education. As indicated by the nationwide, representative Human Capital Study research conducted since 2010, good well-being and positive health assessment are common among young people but vary significantly among older individuals. The primary explanatory factor for this disparity is the level of education, which is in turn related to the nature of the job, access to networks, information, and facilities to maintain good health. Based on multiyear survey data,

we will demonstrate how health problems become factors that exclude individuals from professional life or diminish its quality, act as barriers to learning and development, including access to information about medical services and prevention, which in turn hinders health improvement and maintaining activity in old age.

How Do Middle-Aged And Older Adults Maintain And Manage Their Social Networks? A Qualitative Network Analysis

Paula Steinhoff[1], Başak Bilecen[2]

1University of Cologne, Germany; 2University of Groningen, Netherlands

Background: Social integration is a crucial factor for physical and mental health, and therefore for active ageing. Managing social networks can be challenging for older adults, who are at risk of declining social networks and health. It is essential to understand how older adults maintain their social networks, especially during the transition from work to retirement. Our research aims to explore how middle-aged and older adults maintain and manage their social networks, with a focus on potential differences between working and retired adults.

Methods: Qualitative network interviews were conducted with 28 members of social clubs in Germany, aged between 45-80 years (mean 62 years). Additionally, 25 unstructured egocentric network maps were analysed. The network maps revealed the importance and frequency of contact of social contacts and provided information about alter-alter relationships. The data were analysed using reflexive thematic analysis.

Results: We developed five preliminary themes: (1) geographical proximity, (2) duration of social relationships, (3) contact maintenance, (4) network composition and (5) systematisation of social contacts. For retired participants, family relationships became very important but some participants invested more time into the social club, other volunteering organisations or friendships. Some participants actively joined the social club to have a fixed social group without having to put too much effort into it.

Conclusion: Joining a formal social network, such as through volunteering, can be a useful strategy to prevent social isolation and promote active ageing.

577

The Role Of Health Status In Network Tie Formation, Maintenance And Dissolution: A Prospective Study Among Community-Dwelling Middle-Aged And Older Adults

Amelie Reiner

University of Cologne, Germany

Previous research has shown that changes in the social network, including the formation and dissolution of relationships with confidants, shape an individual's health, and vice versa. While previous studies concentrated on adolescents or utilized standard regressions that primarily examine health as a predictor of subsequent sent and received friendship ties, net of baseline, focusing primarily on health as a predictor of subsequent friendship ties, this study investigates the entire friendship networks of middle-aged and older adults using longitudinal social network analysis. The approach recognizes the distinct needs and resources related to health and social networking in older populations, expanding the scope beyond previous research.

The aim of this study is to test whether health status shapes the formation, maintenance and dissolution in middle-aged and older adults` friendship networks, and vice versa. Because network processes are expected to differ by health problem, we distinguish between self-rated, mental and physical health.

We collected three-wave sociometric data among older adults in two local social clubs in Germany, from 2022-2024 (N=40—50, response=78—88%). SAOM test the aforementioned health variables and social network dynamics longitudinally.

While 39-42 per cent of ties were maintained out of all friendship nominations observed, 11-31 per cent of ties were newly formed, and 27-50 per cent of ties were characterized by dissolution. Tie formation is negatively correlated with the deterioration of health status.

This study investigates the interplay of social network dynamics and health status in the most vulnerable and largest population, guiding interventions to identify and support those at risk.

RN16 | T06_05: When the Medical encounters the Social: Exploring How Medical Conceptualizations and Practices of Care Affect the Social Provision of Long-term Care

Long-term care is a critical component of healthcare systems, serving individuals with chronic illnesses, disabilities, and aging adults with various healthcare needs. However, the provision of long-term care in contemporary societies is inscribed in a web of intersecting inequalities including gender, race/ethnicity, class, age, and immigration status. This panel aims to critically examine the ways in which medical conceptualizations and practices of care may participate in maintaining and reproducing these inequalities within the long-term care system or, alternatively, in how they can challenge them. Topics may include, but should not be limited to, how different medical personnel, ranging from primary physicians to nurses, from specialists to care coordinators, and others: – discuss Ideal forms of care, best practices, skills, qualities, and abilities fundamental to the provision of care – design or recommend long-term care projects for large groups or individuals – experiments with new forms of long-term care provision or simply theorizes the possibility of new ones.

578

Theorizing Masculinity, Ageing, And The Lived Body – The Case Of Prostate Cancer

Thomas Roland Johansson[1], Jesper Andreasson[2]

1University of Gothenburg, Sweden; 2Linneaus University, Sweden

Theorizing masculinity, ageing, and the lived body – the case of prostate cancer

Jesper Andreasson and Thomas Johansson

The concept of hegemonic masculinity is filled with cultural appropriations and descriptions of masculinity. In certain versions hegemonic masculinity turns into a more classical, restrained, stoic, disciplined, and emotionally disconnected

masculinity, while in other versions men can be described as caring, and emotionally present. This study aims to theorize on how masculine ideals are played out in relation to prostate cancer treatment side effects, such as incontinence, impotence, lack of libido and fatigue. Such transformations of bodily functions and capabilities may lead to an increased attention to the lived and gendered body, and to health issues. In relation to this we will investigate how the concept of hegemonic masculinity can be used to analyse the ill and ageing body. We will utilise an intersectional approach to masculinity and the ill body, acknowledging the multi-dimensionality of social factors, identities, and power. Adding to the sociologically informed theoretical framework found in feminist studies and critical studies on men and masculinity, we will further lean on theories and perspectives found within phenomenology and body studies. Indeed, many of the side effects connected to prostate cancer treatment are experienced in reference to the fleshiness of the self and to senses of ongoing corporeal ageing. We will theorize on the lived/experienced, socio-cultural, and inter-relational levels of masculinity and prostate cancer – as discussed by and among men – in relation to thoughts about ageing, sexual dysfunction, and incontinence.

Beyond Stigma and Biomedical Frameworks: Humanising Dementia Care and Ageing

Ieva Stončikaitė

University Pompeu Fabra, Spain

This presentation focuses on the complexities of long-term care for individuals living with dementia through inter-disciplinary humanities-based approaches. It argues that narrowly defined biomedical and neoliberal conceptualizations of old age and unidirectional care practices contribute to reproducing inequalities and diminishing the autonomy of older adults. Drawing on Foucault's observation, the presentation highlights how medical institutions have constructed an organic model of the body, health, and illness, subjecting it to a clinical gaze and medical repository. The prevailing notions of dementia as 'failure' permeate health and social care practices, as well as everyday interactions, which translate to the organizational structures of care institutions and public discourse. The social inability to see dementia beyond the lens of shameful and deteriorating bodies that lack personhood and agency underscores the need for alternative narratives surrounding dementia and long-term care. The presentation addresses the role of creative engagement and non-verbal communication as an alternative means to involve older individuals as more active co-participants. It also demonstrates how literature can bring to the forefront the realities of care and dementia, including the negatives of ageing bodies, which are seldom voiced in gerontological scholarship. Humanities-based research holds the potential to be translated into care policies, interventions, and practices with the aim of rethinking the dynamics of ageing and dementia care, and improving the lives of ageing individuals, their families, and caregivers, and rethinking the dynamics of ageing and dementia care.

"Ageist Practices Among Health and Social Workers: Preliminary Results from a Pilot Study in Italy"

Elena Allegri, Cristina Calvi, Eugenia Mercuri, Francesca Zaltron

University of Eastern Piedmont, Italy

Population ageing increasingly challenges health and welfare systems. Studies have revealed the existence of ageist practices and representations, i.e. age-discriminatory practices towards older people, in health and social care systems in the Western world. Such practices also have effects on the health outcomes of older people, reducing longevity. The contribution reports some preliminary results of a study conducted within the framework of the National Recovery and Resilience Plan funded project AGE-IT. In particular, the research presented here, conducted in northern Italy with professionals in the health (doctors, nurses) and social care (social workers) spheres who are most concerned with older adults, explores the ageist practices that can take shape in professional contexts of care and cure through the reconstruction of certain representations and definitions that guide the actions of professionals and that can favour ageist practices. The research adopts a qualitative method using the focus group technique (n.3) to reconstruct, on the one hand, the meanings that professionals attribute to the concepts of ageing and self-sufficiency/non-self-sufficiency; on the other hand, the possible ageist practices enacted in the three professions and in the organizations in which they work. The analysis sheds light on the coexistence of two mechanisms that can potentially generate ageist practices in the social and health care professions: the first acts at the micro (individual) level through stereotypes and prejudices that can condition relationships with older patients or users; the second is at the meso level and acts through the organisational constraints within which professionals work.

Mechanisms of Algorithmic Inequality in Medicaid Long-Term Care

Ailish Burns

Brown University, United States of America

States in the United States are increasingly using algorithms to determine medical eligibility for Medicaid long-term care (LTC), which provides institutional, in-home, or community-based care for the elderly and disabled. Though algorithms are often purported to be more objective than non-algorithmic methods, research has shown that they may increase social inequality. However, there is limited understanding of how the context in which algorithms are used shape their capacity to exacerbate or reduce inequality. In this project, I compare two Medicaid LTC programs and ask: How do bureaucrats use algorithms and other tools to determine medical eligibility for Medicaid LTC? I conduct in-depth interviews with Medicaid eligibility

579

screeners, administrators, and advocates in Wisconsin and Florida. While both states use algorithms to determine medical eligibility, applicants in Wisconsin undergo just one in-person assessment by a social worker, whereas applicants in Florida are subjected to at least one screening over the phone, an in-person assessment by social workers, and an assessment by their physician. One reason for this difference may be funding structure: Florida spends less per resident on LTC than Wisconsin, especially on non-nursing home LTC, which has resulted in very long waitlists for services. Preliminary results suggest that algorithmic eligibility processes require applicants to 'signal' their disabilities in ways that are legible to lay people and fit into particular pre-designated categories. This signaling requires significant cultural capital, especially in Florida where the eligibility process is more complex. The capital required to navigate supposedly "objective" assessments of disability may contribute to widening inequality in access to healthcare, particularly in states with less funding and more restrictive Medicaid programs.

RN16 | T07_01: Disability and mental health at the intersection of policies, technologies and (new) inequalities (2)

The session aims to discuss the possible transformations produced by both the introduction of new technologies of care and the recent Covid-19 pandemic in the disability field, in terms of both opportunities of inclusion, the expansion of old inequalities and the production of new ones. We will provide a space to critically discuss the effects of these phenomena on the international and national policy regulative framework; on the regional or local policy, services or practices; on families, persons with disabilities and disability welfare policy professions. International, national and local studies on tensions, barriers, boundaries, spaces and practices of care for and by persons with disabilities are welcome. The pandemic presented both threats and opportunities for persons with disabilities and their families/caregivers, as well as the introduction of new technologies of care. Persons with disabilities experienced not only isolation, but also new forms of support. Remote or hybrid forms of assistance increased the interactions between healthcare professionals, family members/caregivers and persons with disabilities, but they could not replace the role of direct contact in professional encounters. In order to tackle the multifaceted empirical dimensions of the topic this call for papers is intended to solicit both theoretical and empirical contributions, as well as reflection on ethical issues. We welcome papers from any theoretical and methodological perspective. Empirical studies may involve solo, collaborative and team-based research. Quantitative, qualitative, creative and art-based method are welcome along with experiments, ethnographic and autoethnographic ones.

580

Battles over 'unruly bodies'. Practitioners' interpretations of eating disorders and the Utility of Psychiatric Labelling.

Alison Fixsen, Damien Ridge

University of Westminster, United Kingdom

Our paper highlights the complexity of professional discourses, power plays, claims and counterclaims and the ongoing struggles over the 'unruly bodies' of patients with eating disorders. We conducted an inductive thematic analysis of data from five studies, covering thirty semi-structured interviews with UK health-care professionals working in the eating disorder field. Findings suggest that professionals engaged in various struggles over eating disorders (EDs), which were compounded by the labelling process itself. Whilst person-centeredness was valued, encounters with ED patients were frequently framed as outstandingly problematic in terms of treatment resistance, with clients' unruliness spurred on by ED competitiveness on social media and in-hospital rivalries. Paradoxically, the labelling of eating disorders created further expectations for patients in terms of achieving specific weight levels and diagnostic labels. Reportedly this resulted in competition over who was sickest, which was mirrored by treatment priorities within an overstretched public health system. Participant stories also highlighted interesting tensions between professionals rationalising their work with patients and acknowledging themselves as potentially vulnerable to societal pressures which promote disordered eating. We argue that, whilst lay narratives around EDs continue to be framed by authorities as unruly behaviours in deviant individuals, the gap between officially sanctioned and illicit ED discourses could continue to grow.

'I Don't Think There's Many Black African Caribbean Men That Talk Positively About Mental Health Services' : Mental Health Professionals' Perspectives on Distrust Amongst Black Men Detained in Psychiatric Hospitals

Jeremy Dixon[1], Caroline Leah[2]

1University of Bath, United Kingdom; 2Manchester Metropolitan University, Manchester

A growing body of literature has highlighted the importance of establishing and maintaining trust between people with mental health problems and mental health services. However, trust is a challenging concept within mental health care. Mental health laws in most jurisdictions, allow mental health professionals to detain people with mental health problems against their will, which can promote distrust between these groups. Quantitative research has consistently

shown that African Caribbean men are disproportionately detained under mental health laws, contributing to a lack of trust between them and mental health services. In this presentation we draw on Möllering's theory of trust and control as a duality to explore how mental health professionals believe that trust can be established with African Caribbean men.

Our qualitative study used experienced-based co-design and thematic analysis to explore how the experiences of African Caribbean men detained under the Mental Health Act might be improved. In this presentation, we focus on the views of 13 mental health professionals, including psychiatrists, psychologists, social workers, and police officers who were interviewed in 2023.

Professionals in the study identified that African Caribbean men commonly distrusted mental health services. This distrust was seen to be driven by stereotypical views within services about this group being 'risky' and 'dangerous as well as assessments and interventions not being culturally adapted. These factors were viewed within the context of socio-cultural and political factors, namely African Caribbean men experiencing higher levels of poverty, substance-misuse, trauma and discrimination. Furthermore, issues relating to the mental health workforce were identified, including the lack of diversity in the workforce and inadequate training relating to black people's perspectives.

Those 'In Limbo' Who Are Neither Healthy Nor Disabled: A Phenomenological Approach to Hearing Loss

Ayşe Nur Leblebicier

Ankara Yıldırım Beyazıt University, Turkiye

Disability statistics are obtained from people with 'disabled' status who are included in a certain degree/rate. However, there are also individuals who are not included in the prevalence. This study focuses on the hearing loss 'experiences' of individuals with mild or moderate hearing loss who are 'invisible' in society, despite being in a disadvantaged group in Turkey. In fact, to be considered disabled in Turkey, an individual must have a hearing loss of 40%.In this case, the person's hearing aid use is not legally defined, even though it is medically called 'mild', unless the sensory loss exceeds 40%. Therefore, calling these individuals 'disabled' remains ambiguous. Even though individuals with moderate loss have a disability status, they do not associate themselves with deafness and are educated in schools without special equipment. This population, which is neither sick/disabled nor healthy, is 'in limbo'. The study, conducted with qualitative research principles, uses a phenomenological design. The sample of the study is individuals who experience 'mild or moderate hearing loss' between the ages of 18-40. The questions of the research are what experiences they have regarding mild/moderate hearing loss, how it affects their daily life practices, what are the issues that prevent them from participating in society, and the strategies they apply when they want to be included in the system. The data collection technique is in-depth interview

and a semi-structured interview form is applied to the interviewers. Since they are difficult to access, the snowball technique is used. In the pilot interviews, some of the participants stated that they left their education unfinished due to the difficulties they experienced, while some stated that they received education in normal schools, saying 'I wanted to be a normal child'. However, this situation has deepened their disadvantaged position. As many researchers have noted, "there is no doubt about the serious impact of severe/profound hearing loss, but the impact of mild/moderate hearing loss is less well known." Because they are not included in the prevalence, it becomes difficult to study about them. This study aims to introduce these 'in limbo' individuals to the literature.

Depression and Its Major Risk Factors Among the Ukrainian Female Forced Migrants in the Czech Republic

Iryna Mazhak[1,2]

1National University Kyiv Mohyla Academy, Ireland; 2RCSI University of Medicine and Health Sciences

Around half a million forced migrants from Ukraine have received "temporary protection" in the Czech Republic due to the full-scale russian invasion of Ukraine in 2022. Forced migrants are facing a wide variety of traumatic and stressful events which cause increasing mental health disorders. This cross-sectional study was conducted as part of a bigger mixed-method research project with Ukrainian female refugees in the Czech Republic over 18 years old (N=919) via an online survey. The descriptive statistics showed that the respondents' average age was 38 years; 68.4 % were married; more than 70 % of respondents had children under 18 years old. 71% of the participants hold a university degree, 86.7 % have resided in Ukrainian cities and towns, and 73.8% have had employment in Ukraine. Before participating in the survey, the forced migrants stayed in the Czech Republic for an average of 15 weeks.

Depression symptoms were measured by using the Patient Health Questionnaire (PHQ-9). As a result, 53,4 % of females have moderate to severe symptoms of depression. Linear logistic regression analysis was performed to investigate the associations between depression and self-reported health adjusted by socio-demographics. Analysis revealed that discrimination, lack of the desire to talk with loved ones who remain in Ukraine, lower self-reported emotional and psychological status, employing avoidant coping strategies, and higher levels of perceived stress and anxiety are major risk factors for depression. As well to be employed, and having better relations with relatives, colleagues and neighbours are protective factors.

The study showed that more than half of Ukrainian female forced migrants in the Czech Republic experienced moderate to severe depression symptoms, and these findings have important public health implications.

RN16 | T07_02: When the Medical encounters the Social: Exploring How Medical Conceptualizations and Practices of Care Affect the Social Provision of Long-term Care (2)

Long-term care is a critical component of healthcare systems, serving individuals with chronic illnesses, disabilities, and aging adults with various healthcare needs. However, the provision of long-term care in contemporary societies is inscribed in a web of intersecting inequalities including gender, race/ethnicity, class, age, and immigration status. This panel aims to critically examine the ways in which medical conceptualizations and practices of care may participate in maintaining and reproducing these inequalities within the long-term care system or, alternatively, in how they can challenge them. Topics may include, but should not be limited to, how different medical personnel, ranging from primary physicians to nurses, from specialists to care coordinators, and others: – discuss Ideal forms of care, best practices, skills, qualities, and abilities fundamental to the provision of care – design or recommend long-term care projects for large groups or individuals – experiments with new forms of long-term care provision or simply theorizes the possibility of new ones.

Assembling Caringscape in End-of-life: Care Practices in Hospice Home Care

Anne-chie Wang

Academia Sinica, Taiwan

In a highly institutionalized death-prevailing context in contemporary society, how do family caregivers and medical professionals care for end-of-life patients at home? This paper adopts the concept of "caringscape" to explore the time–space practices of family caregivers and hospice home care teams for end-of-life patients in hospice home care, involving anticipating the dying trajectories, organizing care resources, doing bodywork and emotion work for the end-of-life patients. Data include in-depth interviews with 21 family caregivers and ten hospice home care members,

participant observation in a hospice ward in Taiwan for 12 months, and 18 times home visits to patients' households with the medical team. This paper found that caregivers assemble houses into caringscape, including arranging medical devices, human resources, and different trajectories of care practices. To care for end-of-life patients, caregivers do bodywork and emotional work to make patients dignified. This paper reveals that despite the widespread belief that homes are inherently good for caregiving, it depends on the family caregivers' and medical professionals' care practices, which are relatively invisible under the health insurance system.

Social And Organisational Prerequisites For Robotics In Home Care. An Exploratory Study From Italy

Ivan Galligani, David Natali

Sant'Anna School of Advanced Studies, Italy

Robotic technologies are seen as promising solutions to address the growing need for home care for elderly. At the same time, it is widely recognised that a greater diffusion of robotics depends not only on strengthening of the technological readiness, but even more on the level of social acceptance and organisational preparedness in the field (Pekkarinen et al., 2020). While clinicians and managers often consider robots as valuable options for promoting care effectiveness and efficiency, professional and informal caregivers tend to be more sceptical (Tuisku et al., 2023). Even setting aside the unjustified (albeit widespread) fear of being substituted by robots, care workers are worried about the risk of mechanisation of care, i.e. the subordination of professional practices to the needs of robots (rather than the contrary) (Frennert et al., 2021). Moreover, caregivers fear the loss of 'human touch' and, paradoxically, the reduction of autonomy due to the inability to manage robots. In conclusion, embedding these technologies requires the strengthening of operators' and beneficiaries' trust in robots, along with the adoption of the most effective organisational arrangements to meet users' needs.

In this perspective, the authors present findings from a research on the social and organisational prerequisites for the adoption of robotics in home care, conducted as part of an Italian NRRP-funded project (FIT4MEDROB). The findings are based on a series of focus groups involving clinicians, professionals and patient representatives, as well as field observation of relevant cases of robot experimentation for home care in the context of FIT4MEDROB.

Agency-In-Dying: The Consequences For Knowledge And Care

Rachel Cummings

Goldsmiths, University of London, United Kingdom

As the work of Margaret Locke (2001) has demonstrated, time of death is a complex, contested concept in modern medicine. Locke's work focuses on medicalised death: how modern technologies blur the transition from living to dead. In hospice care, a space designed in-part to minimise medical interventions and technologies, time of death is complicated otherwise. Experienced palliative care staff exchange stories about patient agency-in-dying: passing away on significant days (Christmas, birthdays), waiting for a relative to arrive, a grandchild to be born or a bedside vigil to end. This presentation will consider these discourses of agency and their use in medical settings: how they are used clinically to aid prognosis, and non-clinically to mark out meaning and individuality when both are threatened by death. Based on interviews and ethnographic field-work on a hospice in-patient unit in London, I will place these narratives of agency-in-dying in relation to discussions around care and agency in medicine (for example Mol 2008) and broader social life (such as Asad 2003).

How do Emergency Medical Services Deal with Death in a Death-denying Society?

583

Olga Nesporova

Czech Academy of Sciences, Institute of Ethnology, Czech Republic

The paper focuses on issues surrounding death and the related level of trust in emergency medical services in the Czech Republic. We combined the phenomenological and oral history approaches so as to discover more about the experiences of ambulance personnel when facing the death of a patient. We conducted 60 interviews with current and former emergency medical services personnel (physicians, paramedics, nurses and drivers). The issue of death was studied from three main perspectives: 1) dealing with death generally in the emergency medical services context, 2) communication with the relatives of, and those close to the deceased, 3) personnel strategies aimed at addressing death and related traumatic issues in the emergency medical services context. The role of trust is also discussed with respect both to emergency services personnel and their patients and within individual ambulance teams. The analysis of the interviews revealed that the level of preparedness for, and responses of emergency personnel to the death of their patients has improved in recent decades, whereas the degree of trust of relatives of, and those close to dying patients has generally decreased. Recently-introduced innovative palliative care services are gradually resulting in the introduction of new approaches to death for emergency medical services personnel in the Czech Republic, where the denial of death remains an attitude that is shared by a significant proportion of the population.

RN16 | T07_03: Illness narratives and contested illnesses: sociological perspectives

On the Limited Moral, Institutional, and Narrative Effects of ADHD: Israeli Mothers and Teachers Talk about ADHD in the Era of the Increasing Influence of Neuroscience.

Galia Plotkin-Amrami

Ben Gurion University of The Negev, Israel

Recent years have shown the growing influence of neuroscience on the understanding of self, brain, and personhood. This is particularly relevant for neurological conditions in which brain difference and personhood are perceived to be closely intertwined (Tan, 2018), such as ADHD. However, ADHD is perceived as a contested disorder characterized by blurred boundaries, a high level of comorbidity, and uncertain etiology (Malacrida, 2004; Singh, 2008). How does the scientific and clinical uncertainty around ADHD diagnosis penetrate the school and the family domains in Israel, given the dominance of the neurological etiology of ADHD?

Based on 42 in-depth interviews with Israeli mothers of children with ADHD and 27 teachers working in two Israeli schools, I explore teachers' and mothers' narratives of the origins of the disorder and how they see their role with 'troubled' children. I show that while they largely accept the neurological etiology of the disorder, it doesn't resolve the "blame games" among them (Frigerio et al. 2013). ADHD appears as an ambiguous signifier of disability.

I argue that the limited moral power of the neurological narrative of ADHD is closely related to its limited narrative and institutional effects. For mothers, the ADHD diagnosis is perceived as a narrow neurological problem of attention. It doesn't provide many pragmatic benefits at school and cannot qualify the child for personal aid. Furthermore, It doesn't explain the wholeness of the child's self and cannot account for the emotional, behavioral, and social problems. The neurological etiology does not free teachers from responsibility. They presented conflicting explanations of ADHD. The uncertainty around the disorder and the inclusion policy leads them to develop pedagogical solutions to cope with 'troubled' children.

Somatic Diseases Versus Psychosocial Disorders

Vibeke Klitgaard

University of Lund, Sweden

The study in question is based on three years of participant observation in two daycare centers of community psychiatry in the Municipality of Copenhagen. Diseases in somatic medicine are characterized by three elements: They are involuntary, involve functional reduction and suffering. In somatic medicine the body is in focus, but the body cannot produce meaning. However, according to Luhmann's (1971; 1984; 1997) systems theory all psychic and social activities take place in the medium of meaning. Even if it is invisible in itself, it becomes manifest in various forms, for instance, in forms of communication, i.e. as a social phenomenon. In "mental illness" you find the same three characteristics, but they take place in the medium of meaning, not in the body, as some psychiatrists tend to postulate.

The involuntary element is already part of the medium of meaning. The function reduction comes about when people lose their communicative skills and the suffering is caused by the hallucinations, massive delusions, bizarre communication and behavior, paranoid notions of self-reference etc. that all involve suffering. I consider "mental illness" a biased concept in favor of the medical/psychiatric profession. I think a more precise term would be "psychosocial disorders". In their serious forms, psychiatric patients come up with reasons for their acts and speech, that are not acceptable to their social environment. For instance, a patient stating that her reason for moving out of her flat, was that her voices told her to do so. You can call psychotic patients meaning-disordered.

Living With Fibromyalgia: Illness Narrative of a Contested Disease

Cristina Lonardi, Maria Gabriella Landuzzi, Roberta Fraccaroli, Valentina Moro, Michele Scandola, Vittorio Schweiger

University of Verona, Italy

BACKGROUND

Fibromyalgia (FM) affects around 2 million people in Italy, as the 2nd/ 3rd most common rheumatic disease. Italian essential levels of care do not yet include FM, which remains a contested illness in many care settings. Persons with FM are often misunderstood: having a chronic, invisible, and often contested disease frequently based on a diagnosis of exclusion can undermine the credibility of the person. FM impairs physical health and disrupts psychosocial functioning because it is difficult to explain and understand in lay social contests and the situation is exacerbated by the fact that women are most affected.

OBJECT

An exploratory study was conducted at AOUI Verona Pain Therapy Center on women with FM to investigate the social experience of illness.

584

METHODS

Qualitative narrative interviews (30) were administered to women with FM at the Pain Therapy Center in Verona – Italy.

RESULTS

Research shows that FM (its symptoms and social representation) has the following effects on social health: clinical stigma not only by GPs; intrafamilial practices of stigmatization, also within the couple's relationship; inability to perform consistently in professional, social and family settings, and related relationship management problems; hiding illness from others as a form of resistance.

At the same time, people's experiences of FM are proliferating on social media as a way of demanding recognition and access to essential levels of care: micro, meso and macro dimensions of illness are struggling to be reconciled in the life and illness biographies of people with FM.

RN16 | T07_04: Social challenges online and onlife narration

In the last few years critical events such as pandemic and war have increased the already existing democratic decline, geo-political tension, violence, and inequality, leading to an unprecedented global crisis. As sociologist, we need to better understand, explain, and address such crisis and its effects on people life and health. Narratives have been widely employed within social sciences for decades to comprehend in Weberian terms the point of view of the social actors and the meaning they give to what they do in their ordinary life (i.e., how people tell their stories starting from their health experiences). An epistemological assumption to observe how the sense of action is expressed by narrating itself in daily practices or by sharing their sentiments and emotion on digital platforms. Therefore, the textual analysis allows the sociologist to understand how the interaction between a social system and its environment works in a variety of socio-cultural contexts. There are a variety of qualitative and quantitative textual analysis methods and their application to narrations is increasingly popular and led to eminent work, e.g., online communication has been successfully used for capturing diverse trends about health and disease-related issues, such as people's storytelling on Covid-19, and sentiments toward vaccination. This session is dedicated to studies using qualitative, quantitative, or mixed methods to analyze narration. We are particularly interested in research addressing people response to recent time crisis and social challenges online and onlife.

The Intensification of Parenting and Generational Fracturing of Spontaneous Physical Activity from Childhood Play in the UK

John Day

University of Essex, United Kingdom

Despite an increased drive over the past two decades in Western societies to promote children's physically active play to improve their health, there are concerns that childhood has become less physically active. There are also fears that a previously naturally occurring aspect of childhood

has become less authentically playful. Both trends highlight changes over time in the amount and type of play practiced by children and are often cited as consequences of generational shifts. Yet, research which analytically employs the concept of generation to connect changes to childhood with relevant social transformations is lacking. Inspired by Mannheim's conceptualisation of generations, this paper draws on life history interviews with 28 United Kingdom residents born between 1950 and 1994 to propose a fracturing of naturally occurring physical activity from childhood play. As shifts in childhood and parenting have become inextricably linked, this argument illustrates the impact of an intensification to parenting upon greater parental surveillance of increasingly organised forms of childhood physical activity at the expense of spontaneous play. Future physical activity policy should be sensitive to the social climate in which recommendations for children are made, as this places expectations upon parents due to how childhood is currently understood within neoliberal contexts.

Understanding the Medicalization of Female Genital Cutting in Assiut, Egypt

Nina Van Eekert[1], Heba Mahmoud[3], Omaima El-Gibaly[3], Sarah Van de Velde[2]

1Research Foundation Flanders, grant number: 12g3322N; 2University of Antwerp, Belgium; 3Assiut University

Female genital mutilation/cutting (FGC) involves the partial or total removal of external genitalia or other non-medical alterations to female genital organs. This practice is increasingly becoming medicalized, defined by the World Health Organization (WHO) as procedures performed by healthcare providers. This study focuses on the qualitative examination of the decision-making process of mothers, traditionally regarded as primary decision-makers in FGC, regarding the medicalization of their daughters' cut. Conducted in Assiut, Egypt, a region with high medicalization rates in FGC, we interviewed 25 mothers to gain insights into their motivations.

Preliminary findings reveal that mothers seek the involvement of health professionals for various reasons. Chief among these are a heightened trust in healthcare providers to mitigate health risks associated with FGC for girls. Additionally, mothers express the belief that doctors can assess the necessity of the cut by examining girls beforehand, considering factors such as organ size. Notably, the latter is particularly interesting in relation to sociological medicalization theory, as the medicalization of the practice seems to go beyond the practitioner alone – but also refers to a "medical need" to cut or not.

On the Medical Stereotypes of Suicide: Social Representations Among Researchers and Psy Professionals

Andy Eric Castillo Patton

Complutense University of Madrid, Spain

In recent decades suicide has been a subject of relevant social and epidemiological interest, although it seems that a greater concern for this phenomenon has arisen in the (post)pandemic period. However, the causes leading to suicide tend to be surrounded by miscellaneous myths, something that has contributed to inaccurate narratives and aprioristic collective imaginaries, usually spread by mainstream media.

Besides social myths and prejudices, some researchers also point to medical stereotypes on suicide, referred to aetiopathogenic disproportions and psychopathological exaggerations (Hjelmeland, 2010; Marsh, 2013; García-Haro et al., 2019). Despite these meaningful views, there is a lack of research concerning how psychiatrists, practitioners, and sanitary workers think about suicide. Therefore, this communication delves into the stereotypes of suicide within mental health professions, particularly among psychiatrists and psychologists. Thus, considering the critical proposals on social representations and social imaginaries (Durkheim, 1898/2000; Morin, 1962/1966; Castoriadis, 1975/2007), this research analyses the discourse and impressions of 25 semi-structured in-depth interviews to psy professionals (psychiatrists, psychologists, and psychotherapists) from two European countries (Spain and Belgium).

The main results of this study point out, on the one hand, that suicide is conceptualised by psy professionals as an ambiguous behaviour, related to problems rooted in mental disorders, social problems, and cultural traits. On the other hand, the interviewees acknowledge there is a discussion about the veracity of suicide contagion, whether it is a myth or not. Hence, this research highlights the (dis)encounters among social actors professionally involved in suicide awareness and prevention beyond general stereotypes.

Experience as Evidence: Patient organization's as knowledge agents

Kari Nyheim Solbrække[1], May-Len Skilbrei[1], Mari Holen[2]

1University of Oslo, Norway; 2Roskilde University, Denmark

In recent years, a norm to include members of the group in question in the planning, execution and dissemination of research has been established. Within medical and healthcare research, this change represents a break with the traditional biomedical knowledge hierarchy where the patient and user perspective has long been ranked lowest, if not neglected. Today, we are dealing with a more

586

clearly democratic ideal, namely that the patients' voices and perspectives should also be included in the medical and healthcare knowledge production, thereby creating a more inclusive and perspective-rich basis for diagnosis and treatment.

In this presentation, we examine and problematize how the Cancer Association, the ADHD Association and the Endometriosis Association in Norway engage with research and present their members' experience as relevant expertise for research on these illnesses. The work is part of a wider sociological exploration of how patient activism possibly may takes shape and impacts on what counts as evident knowledge about health and disease in today's societies.

RN16 | T08_01: Disability and mental health at the intersection of policies, technologies and (new) inequalities (3)

The session aims to discuss the possible transformations produced by both the introduction of new technologies of care and the recent Covid-19 pandemic in the disability field, in terms of both opportunities of inclusion, the expansion of old inequalities and the production of new ones. We will provide a space to critically discuss the effects of these phenomena on the international and national policy regulative framework; on the regional or local policy, services or practices; on families, persons with disabilities and disability welfare policy professions. International, national and local studies on tensions, barriers, boundaries, spaces and practices of care for and by persons with disabilities are welcome. The pandemic presented both threats and opportunities for persons with disabilities and their families/caregivers, as well as the introduction of new technologies of care. Persons with disabilities experienced not only isolation, but also new forms of support. Remote or hybrid forms of assistance increased the interactions between healthcare professionals, family members/caregivers and persons with disabilities, but they could not replace the role of direct contact in professional encounters. In order to tackle the multifaceted empirical dimensions of the topic this call for papers is intended to solicit both theoretical and empirical contributions, as well as reflection on ethical issues. We welcome papers from any theoretical and methodological perspective. Empirical studies may involve solo, collaborative and team-based research. Quantitative, qualitative, creative and art-based method are welcome along with experiments, ethnographic and autoethnographic ones.

587

Depression and Family Formation

Sanna Kailaheimo-Lönnqvist, Heta Moustgaard, Pekka Martikainen, Mikko Myrskylä

University of Helsinki, Finland

Mental health problems are increasing, and fertility is declining. In this paper, we examine how depression medication prescription is related to family formation. More, we examine how an individual's own and possible partner's depression medication prescription history is related to union formation and family formation.

We use Finnish total population register data and use cohorts 1977-80. We perform separate analyses for men and women. We account for an individual's whole relationship history from the age of 18, including cohabitations and marriages, and we follow individuals until they are 40 years old.

Our preliminary results suggest that depression medication use history is negatively related to having a partner but positively related to the number of partners. This suggests that depression causes difficulties in finding a partner and on the other hand, also forming long-lasting partnerships. We also find that depression medication use is negatively related to age at first birth and positively to the number of children if both partners have a depression medication history. Thus, our study shows that having and not having children is negotiated within couples, and taking account also partnership history is also important.

The Rise of Mental Vulnerability at Work – A Socio-Historical and Cultural Analysis

Ari Väänänen

Finnish Institute of Occupational Health, Finland

Mental health emerged as a public concern and a problem at work in the late 1900s and early 2000s. This presentation formulates a novel history-based approach that diverges from ordinary frameworks of occupational health and mental health by developing the socio-historical and sociology-orientated perspective of mental vulnerability. It examines the contribution of both cultural (eg, medicalization, psychologization) and realism-oriented (eg, changing work, epidemiological transition) approaches in understanding the long-term rise of mental vulnerabilities and examines how these processes have taken shape as part of historical agency. The presentation analyses the formation of mental vulnerability over the decades using materials produced by occupational stress sciences, the media and occupational health professionals and by investigating long-term changes in different occupations (eg, teaching, social work, insurance sector). It suggests that we are witnessing the spread of subjective experiences of scarcity, the transformation of workplace challenges into rituals of mental health, and the expansion of wellness medicine. The presentation is based on several research projects carried out and led by Professor Väänänen. It combines archival, interview, and register research and uses frameworks from various scientific disciplines and discussions. The presentation brings together the central themes of the recently published book (Bristol University Press/Policy Press) "The Rise of Mental Vulnerability at Work – A Socio-Historical and Cultural Analysis" (Väänänen, 2024).

Methodological And Theoretical Issues In Research On The (Macro-) Social Determinants Of Mental Health Using Cross-National And Multilevel Perspectives. On Current Practices And Future Directions.

Christopher Etter

University Of Salzburg, Austria

Mental Health must be considered a crucial dimension of wellbeing at the individual and societal level. Therefore, the World Health Organization has prominently put the topic on its agenda by creating an action plan to promote mental wellbeing. Moreover, effective health promotion measures require inputs from various disciplines, including sociology, at all stages of implementation. Sociologists' research on the social determinants of health can be particularly valuable in understanding health risks external to the individual. To gain such insights, researchers typically use qualitative, quantitative, or mixed methods. However, when applying a cross-national approach to study the effect of macro-level structures (e.g. the welfare state) on health and health inequalities, comparative survey research can still be considered state of the art.

This contribution aims to further discuss this specific type of research and to demonstrate its potentials for effective health policy. At the same time, it critically reflects on theoretical and methodological issues, that may arise when applying cross-national and multi-level perspectives to mental health research based on population surveys. Among such pitfalls are the availability of suitable data sets, that allow for integrating sociological theories (such as the stress process model or health lifestyle theory) in health research, as well as issues of coverage, measurement, measurement invariance, data-structure, and the application of adequate methods of analysis. To address these issues and make them more visible to researchers, a theoretical model, which systematizes these issues along various stages of the research process and core dimensions of the "total-survey-error" concept, will be presented and discussed.

588

Psychotherapeutic and Clinical Treatment of Work-Related Suffering

Sabine Flick[1], Ina Braune[2], Alexander Herold[1]

1Pädagogische Hochschule Freiburg, Germany; 2Institute for Social Research Frankfurt, Germany

The fact that working conditions in contemporary society are undergoing a fundamental process of change has been recognised by the public at least since the debate about burnout, but at the latest since the Covid-19 pandemic. The increasing flexibilisation, precarisation and digitalisation of the world of work is accompanied by an increase in mental stress: Not only can work trigger or exacerbate mental suffering, it can also make it more difficult to respond appropriately to health impairments in good time. The rising number of psychiatric diagnoses therefore also raises the question of clinical, therapeutic care. How is the relationship between mental health and work dealt with in clinical facilities? What role do gender-specific assumptions and ideas about the origin and social status of patients possibly play? What influence do psychotherapeutic treatment methods have?

The paper presents result of a research project funded by the German Research Foundation that answers these questions based on a qualitative empirical study in various psychosomatic acute and rehabilitation clinics. In particular, the work of the multi-professional teams is focused on. The research led to a typology of the psychotherapeutic understanding of work-related suffering based on the reconstruction of practice theories that will be presented. It includes the analysis of collective theories of work and work-related suffering in the context of clinical treatment and possible differences in acute hospitals and rehabilitation clinics. It also includes the analysis of potential differences within psychotherapeutic paradigms. Finally, the project explores potential differences within the therapeutic teams themselves, which can manifest themselves both within and beyond their hierarchical structures and professional staffing.

RN16 | T08_02: When the Medical encounters the Social: Exploring How Medical Conceptualizations and Practices of Care Affect the Social Provision of Long-term Care (3)

Long-term care is a critical component of healthcare systems, serving individuals with chronic illnesses, disabilities, and aging adults with various healthcare needs. However, the provision of long-term care in contemporary societies is inscribed in a web of intersecting inequalities including gender, race/ethnicity, class, age, and immigration status. Unveiling the Paradox of Pain Relief: Analgesic Use, Chronic Pain, and Well-being in the Elderly

Vanessa Hoi Mei Cheung

Saint Francis University, Hong Kong S.A.R. (China)

Chronic pain affects a significant portion of the population, leading to functional disability (Dagnino & Campos, 2022). The global elderly population has grown considerably in recent decades, and the adverse effects of chronic pain on these individuals pose a current clinical and social challenges. This study employed a quantitative design to rigorously examine the prevalence of pain and patterns of analgesic consumption among elderly participants.

The results indicated that approximately one-third of the participants reported moderate to severe levels of pain, highlighting a considerable burden of discomfort within this demographic. Notably, nearly 30% of the participants resorted to taking Panadol up to three times per week, demonstrating a dependency on over-the-counter medications for pain relief. Furthermore, 35% of the individuals reported suffering from various chronic illnesses, such as arthritis and osteoarthritis, which are associated with persistent pain.

A significant discovery of this research is the positive correlation between the consumption of Panadol and the presence of depressive symptoms (p < .001), as well as suicidal ideation (p < .001). This indicates a potential psychological impact associated with the management of chronic pain through the use of common analgesics.

The aim of this research is to enhance our understanding of Panadol use and pain management among the elderly. In doing so, it seeks to improve the quality of life for the elderly by fostering more effective and psychologically sensitive pain management strategies. The implications of this study are substantial, providing a basis for the advancement of clinical practices and the development of policies to support the well-being of the aging population.

When the Medical Meets the Social: An Exploration of How Geriatricans and GPS Think of Home Eldercare and Its Provision.

Francesca Degiuli

Fairleigh Dickinson University, United States of America

Research on the relationship between long-term care and immigrant labor has traditionally focused on the triangle involving state, market, and families to understand how the organization of long-term care comes into place. Little to no attention, however, has been paid to the role of doctors in generating and sustaining these labor relationships. This paper begins to fill this gap by exploring how Italian general practitioners and geriatricians, both directly and/or indirectly, influence the decisions of aging adults and their families in designing individual long-term care projects which often involve hiring immigrant homecare assistants. The paper is based on qualitative interviews and participant observation conducted at regional and national scientific conferences between 2019 and 2020. The analysis of the data shows that geriatricians and general practitioners tend to converge on ideal practices of care often involving the notion of "aging in place." At the same time, however, the two groups differ on who should provide home eldercare, with what skills, and in what conditions. This because general practitioners tend to focus predominantly on protecting female family caregivers, while geriatricians are more concerned with the well-being of aging adults.

Multimorbidity Patterns in the Urban Population in Poland

Łukasz Kiszkiel[1], Piotr Laskowski[1], Paweł Sowa[2], Małgorzata Chlabicz[2], Jacek Jamiołkowski[2], Karol Kaminski[2]

1University of Bialystok; 2Medical University of Bialystok

The aim is to present the results of analyses realized on the basis of data from the interdisciplinary longitudinal study Bialystok PLUS. Based on the collected data, we estimated the prevalence of multimorbidity (physical diseases) in the general urban population in Poland by gender, age, education level, labor force participation and socio-economic variables. Sixty-seven conditions were identified based on interview (known conditions) and medical tests performed (unknown conditions). In addition, we utilized the Global Burden of Disease Study 2019 (GBD 2019) disability scale to assess health loss by disability severity.

Multimorbidity has become a major concern for public health, health systems and health care providers and has increased due to an aging population, changing lifestyles, better socioeconomic conditions and better treatment options. The prevalence of multimorbidity depends on gender, age or education level but also other social factors. The prevalence of multimorbidity in the urban population is higher than in the rural population. People with multimorbidity have higher mortality rates, high health care utilization and increased spending.

Bialystok PLUS is a single-center cohort study. The survey has been conducted since 2018 on a sample of residents of Bialystok (Poland) aged 20-80. Participants were randomly selected from the residents of Bialystok in order to obtain a distribution of proportions similar to the city's population. Nearly 2,000 people have been surveyed and medically examined at this point.

Our data can help select appropriate screening tests based on a respondent's socio-demographic profile to identify multimorbidity based on both known and unknown conditions. Based on this, it will also be possible to create more relevant health policies aimed to specific social (target) groups at risk for specific multimorbidity.

Innovating long-term care systems in a European comparative perspective in COVID-19 emergency time: Lessons from Italy, Spain, Finland, Germany and Poland

Georgia Casanova[1,2], Giovanni Lamura[1], Nehle Magdalene Penning[3], Monika Reichert[3], Jolanta Perek-bialas[4], Andrea Teti[2]

1INRCA – National Institute of Health & Science on Ageing, Italy; 2Institute of Gerontology – University of Vechta, Germany;; 3Department of Sciences, Social Gerontology and Life Course Research, TU Dortmund University,

590

Germany; 4Institute of Sociology and Center of Evaluation and Public Policy Analysis, Jagiellonian University, Cracow, Poland

Introduction: In Italy, Spain, Germany, Finland and Poland, long-term care (LTC) systems are integrated into different care regimes (Schulmann et al., 2014), characterised by different balances between health and social care and formal care and informal provision. Existing LTC models influence the effectiveness of care provision and their ability to respond to health and social emergencies. The five countries, therefore, reacted differently to the health crisis due to the Covid 19 pandemic. Recent studies have identified how the health crisis in some countries (for example, Germany) has functioned as an engine to promote social innovations (as defined by the European Commission, 2011) to support existing LTC.

Aims: This study aims to identify how the five LTC systems responded to the pandemic crisis, highlighting suggestions and lessons for effective and innovative LTC care policies and practices at national and European levels.

Methods: Expert interviews and focus group discussions with stakeholders conducted in all five countries were analysed using qualitative content analysis. Results: The health crisis caused by Covid 19 has highlighted numerous aspects of difficulties and opportunities in LTC systems. Regardless of the LTC model adopted, the experts underlined how better coordination and integration of LTC components promotes innovations in the LTC sectors, supporting the diffusion of more sustainable and effective care practices capable of counteracting emerging problems due to current and future social and health emergencies.

RN16 | T08_03: Illness narratives and contested illnesses: sociological perspectives (2)

This session highlights illness narratives. We particularly welcome narratives of long-term illnesses such as eating problems, CFS/ME (Chronic Fatigue Syndrome/Myalgic Encephalopathy), and other forms of illness often recognized as diffuse or contested by biomedicine. These conditions might be disabling, potentially fatal, and often substantially impair physical health and disrupt psychosocial functioning. Eating problems, from restrictive eating to binge eating and their subtypes, affect a high number of people, in fact, estimates from 2019 show a global prevalence four times higher than had been thought. Multiple reports also show an increase in the incidents of CFS/ME and other contested or diffuse illnesses. The increased incidence of these type of illnesses the last decades emphasizes the social and cultural component of these illnesses, and underlines their connection to contemporary societal conditions and context. Research on fibromyalgia, eating disorders, pain, CFS/ME and other illnesses is dominated by biomedical and psychological perspectives. There is a need for intensive sociological investigations of these phenomena. This session invites and welcomes empirical and theoretical papers that investigate the connection between different forms of eating disorders, CFS/ME, pain, or other forms of contested long-term illnesses and cultural and societal characteristics. Studies of treatment practices is also highly relevant and welcome.

591

Navigating 'Becoming' in Transitions: Unravelling Paradoxes in Transition to Self-Management of Type 1 Diabetes

Eluska Fernandez[1], Paula Leocadio[1], Carol Kelleher[1], Colin P. Hawkes[2]

1University College Cork; 2Cork University Hospital

A recent systematic review of adolescents' transition to self-management of T1D has revealed multifaceted factors which influence optimal transition for adolescents and their families, including achieving a balance between

normalcy and self-management requirements, and inter-dependence, which is understood as collaborative co-management among adolescents and their network of supports (Leocadio et al., 2023). Our paper presents findings that speak to some of the paradoxical processes that emerge and influence adolescents' transitions to self-management drawing on our recent qualitative study (2022). Eighteen in-depth interviews were conducted with adolescents (aged 15-18 years old) living with T1D, and their parents. Data was analysed using Thematic Analysis (Clarke & Braun, 2023). Firstly, we explore the transition from insulin injections to insulin pump as a simultaneous facilitator and inhibitor of transition to self-management. Secondly, we reveal contemporary narratives of adolescence drawn upon by both adolescents and parents which can simultaneously promote and inhibit transition. These paradoxes share light into the complexity of how these teenagers reconstruct a new identity based on new roles and responsibilities; problematize some of the categories and distinctions (such as, facilitators and inhibitors) often used to analyse transitions; and reveal the individual and social dimensions of 'becoming' in transitions (Allport, 1955), a concept that we propose can help us better understand the dynamics of health and illness-related life transitions as young people navigate and reconcile the pressures of medical and social expectations while striking out one's own place and autonomy in managing their diabetes.

The pandemic disruption of trust: Eating Disorder illness narratives
Hilde Berit Moen

Nord university, Norway

This paper explores the illness narratives of adults living with eating disorders or eating disordered behavior during the covid-19 pandemic time. The changes in everyday activities and lifestyle caused by the corona-virus pandemic and related lockdown had a strong impact on mental health of the general population. These social changes are regarded of additional burden to both individuals with pre-existing EDs and for people belonging to atypical categories of ED diagnosis. Impact of covid-19 on individuals with self-reported EDs show strong and wide ranging effects on eating disorder concerns and illness behaviors consistent with ED type.

Qualitative, digital semi-structured interviews were conducted with 8 adult women, aged 21 – 66, exploring their illness experience. The participants self-recruited to the study through a Norwegian eating disorder interest organization.

The narrated illness narratives represents the simultaneous challenges of handling both ED illness and personal lives in times of social lockdown. Applying 'illness trajectory' and 'biographical disruption', as key theoretical concepts, the processual and thematic analysis discloses the illness experiences typically containing a beginning, a middle, and an end. These three phases also represents the time before covid, the period during covid, and the stage after covid hit and social lock down, each phase with distinct characteristics.

Results show that as Covid strikes, the women's lives change dramatically, and simultaneously, so does their ED or eating problem. Rather than illness disrupting life, the pandemic disrupts illness. This paper elaborates on the tension this disruption causes, and on the shifting aspects of trust and ontological security during this period in history.

Beyond Diagnosis: A Context-Sensitive Exploration of Narratives of Recovery from Problematic Gaming
Benediktas Gelūnas

Vytautas Magnus University, Lithuania

Gaming disorder, officially designated as a diagnosis by the World Health organization in 2019, has become a focal point in discussions surrounding emerging behavioral addictions, exerting substantial influence on theoretical debates and public health approaches. Advocates of the diagnosis assert the necessity of a standardized approach to confront a growing public health concern, aiming to diminish stigma and formulate research, prevention, and treatment policies. Conversely, critics identify fundamental flaws in the illness paradigm, citing issues with its theoretical foundations, confirmatory methodologies, political implications, and a lack of consideration for social context and object specificity. Recovery processes and treatment or prevention options, particularly, remain inadequately researched and challenging to address within a symptom-centered diagnostic framework.

In response to the debates surrounding gaming addiction, I conducted a narrative interview study involving 30 adult men from different countries, recruited online, who identified as being in recovery or recovered from problematic gaming. I sought to both address the scarcity of qualitative, context-sensitive, exploratory research on the subject and find out what (ex-)gamers themselves perceive as helpful factors in the process of recovering from problematic gaming. In the participants' stories, recovery from problematic gaming emerges as intricately linked to the quality of social relationships, external support systems, and availability of meaningful alternatives. These findings question mainstream approaches advocating medical or professional interventions for gaming addiction. Instead, considering problematic gaming as proportional to challenging social circumstances suggests a need for support models emphasizing the facilitation of social connection and enhancements in overall quality of life.

592

A Preliminary Qualitative Study On Patients With Acute Myeloid Leukemia: Quality Of Life, Alternative Treatments, And Care Practices.

Elisa Castellaccio

Università di Bologna, Italy

The Horizon project called IMPACT-AML (Master Framework and Pragmatic Clinical Trial for Relapse or Refractory Acute Myeloid Leukemia) in which we (UNIBO) are involved as health sociologists aims to create a platform for rare blood diseases to conduct clinical studies on alternative therapies. Our goal is to investigate, in various phases, the social and quality of life aspects of AML patients and their family caregivers. Specifically, we aim to emphasize the main care and assistance needs for AML patients, highlighting areas for potential improvement in treatments.

This research presents the preliminary results of a qualitative study conducted on patients, caregivers, and healthcare professionals using narrative-based medicine interviews and Living Lab. The purpose is to confirm, deepen, and expand on what emerged in the literature, which already presents data on this matter: leukemia has an obvious negative impact on patients, caregivers, and their wider families. It is crucial that healthcare is delivered holistically at every point in the patient journey/pathway, considering wider quality of life issues in treatment, management, and ongoing care.

In particular, the research involved 30 AML patients who were interviewed through in-depth conversations based on narrative-based medicine. The patients were divided into three partner countries: Italy, Germany, and Spain. The two foreign countries provided us with transcriptions of the interviews they conducted, and consequently, we processed the results. Additionally, two Living Labs were conducted: one with healthcare professionals (using the Nominal Group Technique) and the other with caregivers (using the World Café Method).

RN16 | T08_04: Social challenges online and onlife narration

In the last few years critical events such as pandemic and war have increased the already existing democratic decline, geo-political tension, violence, and inequality, leading to an unprecedented global crisis. As sociologist, we need to better understand, explain, and address such crisis and its effects on people life and health. Narratives have been widely employed within social sciences for decades to comprehend in Weberian terms the point of view of the social actors and the meaning they give to what they do in their ordinary life (i.e., how people tell their stories starting from their health experiences). An epistemological assumption to observe how the sense of action is expressed by narrating itself in daily practices or by sharing their sentiments and emotion on digital platforms. Therefore, the textual analysis allows the sociologist to understand how the interaction between a social system and its environment works in a variety of socio-cultural contexts. There are a variety of qualitative and quantitative textual analysis methods and their application to narrations is increasingly popular and led to eminent work, e.g., online communication has been successfully used for capturing diverse trends about health and disease-related issues, such as people's storytelling on Covid-19, and sentiments toward vaccination. This session is dedicated to studies using qualitative, quantitative, or mixed methods to analyze narration. We are particularly interested in research addressing people response to recent time crisis and social challenges online and onlife.

593

Work and Mental Crisis. Biographical Narratives About Work, Illness and Recovery

Agata Krasowska

University of Wroclaw, Poland

The proposed paper seeks to delve into the complexities inherent in the experience of mental crises, particularly those associated with conditions such as schizophrenia, bipolar disorder, and severe depression. Grounded in extensive research, the study investigates how individuals undergoing crises navigate the challenges within the labour market.

A central inquiry driving this investigation is the potential therapeutic impact of work on those facing mental health challenges. Specifically, the study aims to ascertain whether work serves as a healing mechanism, discernible through the narratives of the individuals involved.

This exploration is twofold, focusing on the language employed by informants to articulate their experiences of illness and the dynamics of the recovery process. I am therefore interested in how the experience of illness is revealed in the language of the informants, but also in how the recovery process takes place: whether it takes place within the framework of trust in institutionalized forms of recovery, or whether these are more individualized forms of coping (mistrust to institutions). The analysis is inspired by three categories describing the types of work undertaken by informants: paid work, biographical work, and reproductive work. The empirical foundation for this study is derived from biographical narrative interviews (BNIs) conducted according to the principles of Fritz Schuetze methodology.

The paper is based on the projects: NCN OPUS „COV-WORK: Socio-economic consciousness, work experiences and coping strategies of Poles in the context of the post-pandemic crisis" which focuses on the consequences of the COVID-19 pandemic to the world of work and pilot studies: The experience of a mental crisis in the precariat and in the narratives of experts.

Narrative Recognition and Identification: A Qualitative Study into Reading Literary Texts with People with Advanced Incurable Cancer

Niels van Poecke[1,2], Michael Scherer-Rath[3], Nirav Christophe[4], Henny Dörr[4], Mirjam Sprangers[5], Esther Helmich[6], Hanneke van Laarhoven[1,2]

1Amsterdam University Medical Centers, dept. of Medical Oncology, Amsterdam, The Netherlands; 2Cancer Center Amsterdam, Amsterdam, The Netherlands; 3Radboud University Nijmegen, The Netherlands; 4HKU University of the Arts Utrecht, The Netherlands; 5Amsterdam University Medical Centers, dept. of Medical Psychology, Amsterdam, The Netherlands; 6Amsta Healthcare Organization, Amsterdam, The Netherlands

Objective

People with advanced cancer may perceive their disease as a contingency experience, disrupting one's life goals and shattering one's life-story. In the context of the research project, In Search of Stories, we investigate whether and how the reading and discussion of selected literary stories – presenting diverse ways of relating to contingency – may support participants in recognizing, identifying with and potentially relating differently to their own (disease-evoked) contingency experiences.

Methods

This qualitative study describes the experiences of 25 people with advanced incurable cancer who selected a story from a curated collection of 10 literary texts. Subsequently, they were interviewed by a spiritual counselor, using a reading guide as a conversation template. The interviews were thematically analyzed for their conceptual content using a template analysis.

Results

Most participants were able to recognzie and identify with contingency experiences and related existential concerns presented in the texts, including impending death, bodily alienation, loss of self-control, and being muted or silenced by the social environment. Although some participants were unable to identify with the stories. The discussion of the text with a spiritual counselor enabled participants to find words for their emotions and experiences, and to move towards first articulations of their finitude. Participants explained that metaphors enabled them to share their illness experiences with their social environment, regaining a sense of agency in constructing their illness narrative.

Conclusions

A structured reading and discussion of literary stories suggests that it may support people with advanced cancer to become sensible of their cancer diagnosis as a contingency experience, from which they develop alternative modes of relating to their bodies, the self, the social world, and their own mortality.

594

Through Their Eyes: Understanding the Cancer Experiences of Polish Adolescents Using Interpretative Phenomenological Analysis

Magdalena Pluta, Piotr Siuda

Kazimierz Wielki University, Poland

Cancer profoundly affects adolescents, posing unique challenges due to their developmental stage. This period is marked by significant emotional, cognitive, and social changes that make cancer diagnosis and treatment incredibly daunting. Adolescents must manage their treatment side effects, fear, and heightened anxiety. Despite this, the adolescents' firsthand accounts of living with cancer are still scarcely explored. This study addresses this gap by exploring the meanings Polish adolescents attribute to their cancer experiences, focusing on how their perceptions and interpretations evolve during the diagnosis and throughout treatment. The study involved six interviews with Polish adolescents (15-18 years old) at these critical junctures. Interpretative Phenomenological Analysis (IPA) was used to delve into the participants' thoughts and experiences. Conducted over several months and numerous stages, the IPA interviews offer a thorough analysis of their narratives, highlighting the researcher's interpretive role in understanding patients' perspectives. This study revealed nuanced ways adolescents navigate and make sense of the illness. For example, they were prone to myths about cancer, especially during the diagnosis stage. Additionally, young people often feel misunderstood and stigmatized,

experience many previously unknown problems, and develop strategies to deal with them. The present research lays the ground for further research on adolescents' unique experiences. Additionally, we present guidelines for developing strategies for young people to cope with cancer, considering their developmental stages. Furthermore, we aim to inform programs aiding young cancer patients, including post-recovery returns to everyday life, and contribute to developing educational, care, and therapeutic strategies in hospitals and schools.

Communication Advertising and Health: The Italian Digital Platform for Online Psychotherapy

Francesca Greco

University of Udine, Italy

In Italy, the online psychological counseling and psychotherapy demand increased during Covid-19 pandemic to face the growing mental distress and avoid the spread of contagion. After the health crisis, this increase was such that of the companies providing this service on digital platform entered into the stock market, apparently overcoming the stigma traditionally associated with mental disease. Several factors supported this change, such as the technological progress, the lockdown increase in the internet use, the focus of media communication on people's need for psychological support, and the enactment of psychological services provision policies.

The research aims to study the online psychotherapy advertising communication to identify its characteristics and the possible repercussion on the job market. To this aim, we analyzed 16 digital platforms, in Italy and abroad, offering consulting in Italian language, and we interviewed 10 young psychological doctors working in this service to explore their choice motivation.

Results show that easiness, flexibility, economic advantage, professionalism, efficacy, choice, and customized matching are the main element characterizing both the advertising communication and the psychologist. Then, it seems that the change in the health practices determined by the pandemic has the positive effect to overcome the stigma connected to the psychological treatment. Nonetheless, this change will impact also the young psychologist's job market with a shift from the traditionally self-employed practitioner with his/her own set of patients to a digital platform's "employee", only fiscally self-employed.

RN16 | T08_05: The Power of the Use of Creative, Visual, and Arts-based Methods in the Study of Health and Illness

Social scientists investigating health, illness, and medicine issues face the crucial decision of selecting the most appropriate research methods and techniques to reach reliability and richness in their collected data. These methodological choices involve a reflective, dynamic, and continuous engagement of researchers with the health topics to be studied in regard to an array of dimensions such as ethical issues, analytical aspects, the researcher's own skills, and/or the sociocultural environment of the research. The selection of the best methodology is of paramount importance when dealing with complex or multifaceted health issues, sensitive or illicit medical topics, and vulnerable or marginalized groups (either patients or caregivers). Beyond more traditional quantitative and qualitative approaches to data collection, sociologists are making use of creative, visual, and arts-based methods solely or in combination with traditional methods to increase research participation, enhance reflexive discussion of health issues, and establish engagement during the research process of data collection. With this session, we seek to assemble and critically discuss a diverse and thought-provoking collection of contributions that showcase the relevance and transformative power of creative, visual, and arts-based approaches to studying health and illness experiences. We thus invite scholars and early-career researchers to contribute to this exploration by presenting their concrete case studies, highlighting its epistemological, ethical, and practical aspects, and especially how these data collection catalysts promote trust and enable multiple voices in health research, reducing verbal communication barriers, and facilitating the collection of rich data.

595

Fabulative Encounters: Rethinking Addiction Stigma through the Creative Practice of Filmmaking

Lena Theodoropoulou, Nicole Vitellone

University of Liverpool, United Kingdom

In the sociology of health and illness there has been much debate on the uses of Goffman's stigma theory. In this paper we consider the implications of Goffman's concept of stigma for sociological research on recovery from drugs and alcohol. Rethinking stigma through Deleuze's concepts of fabulation and minor practices, we propose an epistemological and methodological framework that reimagines the policy-making and practice of recovery. To do so we draw on our 4-year interdisciplinary collaboration with the visual artist and filmmaker Melanie Manchot, and people in recovery from drugs and alcohol from a Liverpool community arts group engaged in the production of Manchot's first feature film STEPHEN (2023). Focusing on observations of the method of filmmaking and impact of the camera on our participants, the paper addresses the transformative potential of interdisciplinarity and arts methods for sociological research on recovery. The project STEPHEN included three stages: a pre-production stage (workshops with recovery participants), a production stage (filming of STEPHEN) and a postproduction stage (participant-led dissemination of the film) which premiered at the Liverpool Biennial in June 2023. In voicing our participants' engagement with the different stages of the project, we account for the transformations that become possible through fabulative methods of filmmaking. In so doing we show how interdisciplinary research offers a new research agenda for the social sciences which points to the ways in which fabulation as a minor mode of recovery concerns an engagement with telling fables, the production of (un)realities, and creation of a people to come.

Staging Cancer: Participatory Arts-Based Research Into Narrative Meaning-Making And Identity Formation By Adolescents And Young Adults After Cancer Treatment

Emily Ruth Elizabeth Evans[1,2], Niels van Poecke[1,2], Michael Scherer-Rath[3], Gerty Van de Perre[4], Mirjam Sprangers[5], Jacqueline Tromp[1,2], Hanneke van Laarhoven[1,2]

1Amsterdam University Medical Centers, Dept. Medical Oncology, University of Amsterdam, The Netherlands; 2Cancer Center Amsterdam, Supportive Care, Amsterdam, The Netherlands; 3Department of Philosophy, Theology & Religious Studies, Radboud University Nijmegen, The Netherlands; 4Independent Artist; 5Amsterdam University Medical Centers, Dept. of Medical Psychology, University of Amsterdam, The Netherlands

The diagnosis of cancer may evoke experiences of contingency for people, shattering self-narratives, and compromising meaning-making and a sense of self-identity at large. Cancer's biographical valence, thus, may necessitate a process of narrative reconstruction, conceptualised as a sociocultural practice. Post-treatment adolescents and young adults (AYAs – age 18-39) are a growing population of (former) people with cancer, who may stand precariously in the (re)construction of their narrative identities. In project Staging Cancer, we conducted participatory arts-based research (PABR) to investigate: (a) day-to-day meaning-making practices by Dutch post-treatment AYAs; and (b) whether and how participating in a PABR project could support participants in narrative meaning-making. The project was comprised of eleven 2-hour workshops, during which professional performance artist Gerty Van de Perre, together with cultural sociologists and post-treatment AYAs, worked with a variety of artistic methods to co-create a (public) participatory artwork. Intertwined/synonymous data collection included: audio-visual documentation, participant observations, diary accounts, rich pictures, focus groups, and in-depth interviews. Data analysis included narrative, visual and thematic analyses. Preliminary results show that participants experienced alienation in everyday life – the world as flat and mute – arising from the desynchronisation of time-experienced as chronic and disrupted, and time-'external' as linear, accelerating and goal-oriented. This obscured participants to take a 'still' and 'higher' position perceived as necessary to engage in narrative (re)construction. PABR was experienced as a distinct, co-constructed universe of sincerity, recognition, and enaction – a sphere of resonance – in which participants could collectively work to self-distance and move towards integration of their contingency experiences.

My Culture, Our Culture, And the Culture of "the Others" – Constructions Among School Health Professionals in Sweden

Emmie Wahlström, Jonas Stier

Mälardalen University, Sweden

Trust is essential in institutional encounters between school health professionals and children. For children, trust conditions their participation in the encounters, whereas professionals work to establish trust by actively listening and motivating children. Trust is also conditioned by the embedded asymmetrical distribution of power and intersections in these encounters, i.e., between school health professionals and "patients" and by adults and children and with regard to variations in language, ethnicity, gender, culture etc. To establish interpersonal trust and manage power asymmetries and intersections, school health care professionals need to understand the embedded structures and cultures influencing the encounter. Accounting for a growing number of children with migrant backgrounds "questions of culture" need to be explored. Thus, this presentation addresses school health professionals' understanding of culture and migration – including understanding of their

596

own culture, the cultures embedded in the encounter and in relation to the construction of "the other".

With focus on and empirical data from Sweden, this study explores school health professionals' (e.g. school nurses and school social workers) understanding of culture, as they are key people in many children's everyday life. Data will be collected through 6-8 focus groups (3-4 with each profession) and analyzed using reflexive thematic analysis and discourse analysis. The discourse analysis will generate results on how the professionals conceptualize culture in relation to themselves and as well as the potential of potential consequences for the encounter. Data collection will be conducted during the spring and preliminary findings will be presented at the conference.

RN16 | T09_01: Disability and mental health at the intersection of policies, technologies and (new) inequalities (4)

The session aims to discuss the possible transformations produced by both the introduction of new technologies of care and the recent Covid-19 pandemic in the disability field, in terms of both opportunities of inclusion, the expansion of old inequalities and the production of new ones. We will provide a space to critically discuss the effects of these phenomena on the international and national policy regulative framework; on the regional or local policy, services or practices; on families, persons with disabilities and disability welfare policy professions. International, national and local studies on tensions, barriers, boundaries, spaces and practices of care for and by persons with disabilities are welcome. The pandemic presented both threats and opportunities for persons with disabilities and their families/caregivers, as well as the introduction of new technologies of care. Persons with disabilities experienced not only isolation, but also new forms of support. Remote or hybrid forms of assistance increased the interactions between healthcare professionals, family members/caregivers and persons with disabilities, but they could not replace the role of direct contact in professional encounters. In order to tackle the multifaceted empirical dimensions of the topic this call for papers is intended to solicit both theoretical and empirical contributions, as well as reflection on ethical issues. We welcome papers from any theoretical and methodological perspective. Empirical studies may involve solo, collaborative and team-based research. Quantitative, qualitative, creative and art-based method are welcome along with experiments, ethnographic and autoethnographic ones.

597

Psychic Suffering, Activism and Biosocialities: A Case Study

Filipa Queirós[1], Sílvia Portugal[2], Tiago Pires Marques[1]

1Centre for Social Studies (CES), University of Coimbra; 2Faculty of Economics (FEUC) and Centre for Social Studies (CES), University of Coimbra

Since mid-20th century, biomedical and psychological languages about suffering have reflected the impact of international agencies and scientific networks, with proposals in the fields of science, ethics and human rights in psychiatric therapies. The discourses and interventions of these actors interact with local contexts, creating a global culture of mental health, while opening spaces for a wide variety of idioms of suffering and local health policies. Since the 1990s, activism in mental health, namely the demand, by patient associations, for rights, therapies and greater social inclusion, has expanded significantly. Patients' and rights defense associations are today key players in defining public mental health agendas.

This communication is part of the work carried out within the scope of a research project – PSYGLOCAL – Psychic suffering and human rights: epistemologies of mental health, policies and activism in psychiatry (Lisbon, Portugal and Salvador, Brazil, c. 1950 – c. 2020) (FCT Financing Ref: PTDC/FER-HFC/3810/2021) – which discusses the relationships between different epistemologies of mental health and concepts of human rights.

In this communication, we present the results of fieldwork carried out with ADEB (Association for the Support of Depressive and Bipolar Patients), discussing "embodied epistemologies" of mental health and human rights vocabularies. Using a collaborative and qualitative methodology, a socio-historical analysis is carried out, using documentary research, individual and group interviews and direct observation.

Data shows that psychiatric diagnosis is aggregating. ADEB contributes to a biocitizenship that produces new identities, community and hope. But simultaneously, it disciplines and contributes to the hegemony of the biomedical paradigm.

Work Disability and Occupational Agency – How Work Environment Shapes the Mental Health-Related Work Disability Among Young Health And Social Care Workers?

Noora Amanda Heinonen[1], Anu Katainen[1], Hilla Nordquist[1,2,3], Tea Lallukka[2], Anne Kouvonen[1,4]

1The Faculty of Social Sciences, University of Helsinki, Finland; 2Department of Public Health, Faculty of Medicine, University of Helsinki, Finland; 3South-Eastern Finland University of Applied Sciences, Kotka, Finland; 4Centre for Public Health, Queen's University Belfast, UK

During the recent decades, work disability related to mental health, including sickness absence, has alarmingly increased among young adults, particularly women, in several European countries. In addition to individual risk factors, several adverse working conditions have been associated with an increased risk of sickness absence due to mental disorders. These adversities appear common in female-dominated human service occupations such as health and social care work. The objective of the current study was to enhance our understanding of the relationship between work and mental health in today's health and social care settings. Additionally, the study aimed to explore this relationship from the perspective of young workers experiencing mental health-related sickness absence, an aspect that has been less studied in the research literature of social medicine. The data, collected in 2021, consists of 23 interviews with young (aged 21–34) health and social care workers with self-reported sickness absence related to common mental disorders over the past 12 months. Methods of thematic content analysis were used. As our interpretational framework, we utilized the theories of relational sociology and agency (Emirbayer, 1997; Emirbayer & Mische, 1998) and the concept of professional agency. The findings contribute to our understanding of the relationship between mental health and the world of work. They also provide information that is instrumental in modifying working conditions and practices in health and social care organizations to improve the well-being of workers.

598

RN16 | T09_02: From complementary andalternativer medicines to integrated medicine

Reconciling Indigenous Holistic Health Philosophies with Biomedical Science: Towards a Culturally Inclusive Healthcare Paradigm

Maria Beldi Alcantara

USPFM, LIM-50, Brazil

This paper presents a compelling argument for a fundamental transformation in healthcare, advocating for the integration of indigenous holistic health philosophies with biomedical research. The aim is to cultivate a truly inclusive and comprehensive healthcare system. The necessity of this integration is underscored, highlighting its potential to deepen our understanding of health and well-being and to create a more equitable, culturally appropriate biomedical environment.

At the outset, the paper juxtaposes the indigenous holistic conception of health—an ontological view that seamlessly integrates physical, spiritual, environmental, and communal aspects—with the predominantly biological orientation of conventional biomedicine. This comparison serves to illuminate the limitations inherent in a reductionist approach when addressing the complete spectrum of health and illness.

Through methodical case analyses, the paper demonstrates the enriching potential of incorporating indigenous knowledge within biomedical practices. It particularly focuses on mental health, chronic illness management, and preventative medicine, showcasing how indigenous perspectives can enhance these areas.

The narrative then shifts to explore the broader implications of this synthesis for medical research and health policy formulation. The paper advocates for the inclusion of indigenous methodologies in research, arguing that such an approach can diversify research perspectives and foster more culturally inclusive health policies. This stance acknowledges the validity and critical importance of indigenous health practices in the scientific domain.

The findings of this paper suggest that marrying indigenous holistic health philosophies with scientific inquiry is vital for developing a more effective, culturally aware, and patient-centered healthcare system. It promotes a cooperative and respectful approach that values the depth of indigenous practices alongside scientific advancements, advocating for a healthcare sector that is both diverse and solidly rooted in scientific evidence.

Exploring the Cultural and Socioeconomic Differences Among Users of Complementary and Alternative Medicine through the Identification of Latent Classes

Roman Hofreiter

Matej Bel University, Slovak Republic

The purpose of the presentation is to introduce new insights into the usage of complementary and alternative medicine (CAM) by individuals. The presentation is based on two surveys conducted in Slovakia in 2019 and 2023. We will showcase three typologies of individuals and their association with CAM usage.

The first group is called "Experimentators," who simultaneously use multiple forms of CAM. The second group is called "Lifestyle users" who primarily use CAM as a component of their healthy lifestyle. The last group is the "CAM nonusers." We will also present selected social and cultural characteristics of these latent classes.

"Experimentators" have a strong distrust of the healthcare system and health professionals and lean towards an anti-scientist and strong individualistic interpretation of health. Both "Lifestyle users" and "Experimentators" share an individualistic approach to health. However, "Lifestyle users" have a higher level of trust in healthcare professionals and accept a scientific approach in medicine. They tend to combine elements of CAM with a biomedical approach to improve and maintain their health.

On the other hand, "Nonusers" share a low level of trust in medical professionals with experimenters. Their lack of interest in healthcare, lower education levels, and lower-income sets them apart from the previous groups.

"Primum Non Nocere" – Investigating The Relationship Between Healthcare Professionals And Complementary And Alternative Medicine (CAM)

Hélèna Schoefs[1,2]

1Laboratoire de Psychologie Sociale et Cognitive (LAPSCO), Université Clermont Auvergne, France; 2Faculté de Psychologie, Logopédie et Sciences de l'Éducation, Université de Liège, Belgique

Despite not being included in medical guidelines, Complementary and Alternative Medicine (CAM) are sometimes promoted by healthcare professionals, who may recommend or practise them. Based on the explanatory framework developed by Strauss (1982), Baszanger (1990) demonstrated how contested medical practices – such as CAM – rely on legitimation processes at multiple levels: within the medical community and towards the outside

world (in this case, with patients). Furthermore, the labelling theory developed by Becker suggests that the categorisation of a practice as deviant or not depends on its social perception, which may influence a caregiver's attitude towards it.

This paper explores French healthcare professionals' representations of CAM and the operationalisation of these representations in their care practices. The data is drawn from a mixed methods study, combining 30 exploratory interviews with caregivers from five healthcare professions (doctors, pharmacists, physiotherapists, nurses, care assistants) with diverse characteristics (duration of studies, existence of a deontological code, time devoted to the patient, possibility of informal interactions) and an online survey targeting all healthcare professions, which enabled me to refine my preliminary hypotheses.

By considering CAM heterogeneity, whose perceived legitimacy varies according to several factors (existence of recognised diplomas, scientific studies, integration into care spaces, colleagues' practices), this study proposes a CAM typology explaining how a caregiver classifies practices as acceptable or deviant. The data analysis also provided a basis for categorising behaviours towards CAM (rejection, recommendation, practice), identifying factors favouring each attitude, either towards the caregiver (trust in medicine, socialisation, ...) or the patient (stereotypes towards patients and their illness). In particular, the psychologisation of patients' symptoms may favour their referral to CAM, whether for their supposed virtues or as a placebo. This study provides a better understanding of how healthcare professionals construct their representations of CAMs, and the impact these representations have on care practices and patients' care pathways.

I have never joined an ESA Summer School before.

RN16 | T09_03: Exploring Mitigation Strategies, Preparedness and Response of Health Professionals in the face of Health Crises and Disasters

Healthcare professionals in Europe and Worldwide play a pivotal role in securing the health and well-being of populations in the face of health crises (e.g., pandemics) or disasters (e.g., extreme weather, flooding, wildfire, earthquakes). Sociological reflection can offer valuable insights into the mitigation strategies, preparedness, and responses elaborated by health professionals in order to ensure timely and effective crisis responses, highlighting obstacles and opportunities. Indeed, sociology is key for understanding: a) the influence of social structures and networks (either formal or informal), such as healthcare systems and organizations, and health-related associations (hospitals, government agencies, professional associations, online communities) on the establishment of inter-professional collaborative practice, and the role of resilience, adaptability, and interconnectedness going beyond organizational boundaries and institutional responsibilities; b) the impact of professional identities, norms and roles on shaping health professionals' behavior during health crises or disasters, either facilitating or hindering collaboration between them (physicians, nurses, epidemiologists, social workers, and public health officials); c) the effect of institutional factors and power dynamics within different healthcare systems (hierarchies, regulations, and resource allocation) on the establishment of collaborative and coordinated actions during health crises or disasters, regarding decision-making and distribution of responsibilities; d) the significance of the contribution of health professionals, as members of broader communities but with positions of authority and expertise, to fostering trust, public health education, community engagement, mutual support and social solidarity in critical times, thus mitigating its effects. Submissions should be based on empirical studies related to the sociological analysis of the mitigation strategies, preparedness, and responses

600

elaborated by healthcare professionals in the face of emergent health crises or disasters.

The COVID-19 Pandemic and Its Social Implications in the Organizational Context of a Brazilian Hospital Foundation

Camila Rinco[1], Leonardo Brescia[2], Adriana Melo[2], Helder Yankous[2], Igor Michalick[2], Maria Fernanda[2], Marcell Temponi[2], Rodrigo Otávio[2], Rogério Nunes[2], Allan Claudius[1]

1Federal University of Minas Gerais, Brazil; 2San Francisco of Assis Hospital Foundation, Brazil

With the speed of spread of SARS-CoV-2, the World Health Organization (WHO) declared the outbreak of the COVID-19 disease as a Public Health Emergency of International Concern. Characterized by the WHO as a pandemic, in the face of COVID-19, the States of Brazil organized themselves, installing Operations Centers and preparing Contingency Plans for the Public Health Emergency, whose objectives were to publicize the governance structure of the bodies' actions of the government, the response measures to combat the pandemic, as well as the alignment of information regarding the area of coverage, assisting health services in analysis and decision-making. In the State of Minas Gerais, the Department of Health published the Operational Contingency Plan by Health Macroregion, a document that described the organization of points of care, highlighting the role of hospitals in care due to COVID-19. In the city of Belo Horizonte, the San Francisco of Assis Hospital Foundation, a non-profit philanthropic entity that provides free hospital care through the Unified Health System, mobilized internally with the creation of the Planning Committee. This, with the mission of adapting care flows, allowed the opening of beds for patients with COVID-19 and maintained routine care, causing the least possible impact on the supply of beds. Despite this organizational context, the lethal virus has worsened poverty and social inequalities, adding to personal and physical insecurity, affecting patients, clinical and care staff in different ways, changing the profile of care provided and at the same time impacting insecurity in the necessary learning, forcing a change in the training and teaching method of health professionals.

601

The Reactions of Social-Health Networks To Catastrophic Events. The Case Of The 2016 Earthquake In The Marche Region

Sabrina Moretti, Francesco Sacchetti

Università di Urbino, Italy

In the field of healthcare, the tendency to seek organizational models based on the integration of all social and healthcare services emerges, as demonstrated by the WHO guidelines. In the Italian healthcare system, this has led to the creation of local integration systems that involve the

definition of protocols and formal relationships between centers that provide social and healthcare services.

Catastrophic events, such as earthquakes or floods, cause rapid and unexpected changes that undermine the planned structure of the inter-organizational structure. Existing network configurations must quickly adapt to the new situation.

Thiswork presents the results of a study involving ASUR (Azienda Sanitaria Unica Regionale) Marche in the province of Ascoli Piceno, which was hit by the 2016 earthquake, and the University of Urbino Carlo Bo, aimed at studying the evolution of the structure of the inter-organisational network linking the centres involved in providing social welfare services in the field of mental health, as a consequence of the seismic event.

The analysis was carried out using Social Network Analysis based on data from both databases and semi-structured interviews. In addition, in-depth interviews were conducted to investigate the meaning and context of social relationships within the network.

The results show that in emergency situations the network adapts and becomes denser. The evolution of the network depends both on how these external pressures are received by individual actors, and on contingent situations, such as geographical location and available resources.

Facing the Unexpected: Communities of Practice and Bottom-up Knowledge Production as a Source of Resilience

Micol Bronzini[2], Roberto Lusardi[1], Enrico Maria Piras[3], Flavia Atzori[2]

1Universy of Bergamo, Italy; 2Marche Polytechnic University, Italy; 3Bruno Kessler Foundation, Italy

The Covid-19 pandemic highlighted the importance of relying on resilient healthcare organizations, capable of anticipating and preparing for the unexpected, coping effectively when occurring, and transforming themselves afterwards (Duchek 2020). Weick (1993; 1995; Weick et al. 1999) identifies those features underpinning organizational resilience: virtual role systems and leadership, attitude of wisdom, respectful interaction, improvisation and bricolage. Studies focused on healthcare organizations during the pandemic, underline that the organizational capacity of improvisation (Lloyd-Smith 2020) requires clear lines of communication and coordination, a shared understanding of the situation, but also autonomy and self-organizing. This means involving in decision-making those at the frontline who experience the interplay of action and interpretation in their daily practice.

Drawing on this theoretical framework, the paper analyzes some informal networks of physicians, activated through various channels (WhatsApp, Facebook, Youtube) during the early pandemic phases, which acted as communities of practice (Lusardi, Bronzini, Piras 2023). Interviews with some of the participants in these networks and the analysis of the secondary sources (videos, documents, publications,

etc.) – reveal how the exchanges within these communities fostered the emergence of a shared representation (sense-giving), bricolage and creative solutions from the existing repertoire of knowledge, and the production of new knowledge. Recognizing their role in mitigating the impact of the pandemic is important to critically reflect on the limitations of an approach to crisis and disaster management that relies solely on 'social and institutional engineering,' undervaluing the role of informal relationships and processes or forcing them into predetermined procedures

Building Health System Preparedness Through Primary Care: Institutions And Professions In Czech Republic And Italy

Zuzana Kotherová[1], Stefano Neri[2]

1Charles University, Prague; 2University of Milan

The emphasis on empowering primary care (PC) services is one of the key developments in the European healthcare systems after the Covid-19 pandemic. These efforts reflects a common belief that a long-term, patient-centred and, above all, trust-based relationship between PC staff and patients is essential to ensure not only continuity of care in ordinary times, but also a timely and effective crisis response, increasing health system preparedness.

Against this background, the article compares the ongoing changes in PC in the Czech Republic and Italy. In both countries, the pandemic represented a "window of opportunity" for reforms, which had been long planned but postponed or aborted, within two healthcare systems which belong respectively to the Central-Eastern Europe health insurance systems and the Mediterranean national health services.

The paper aims to map the primary care reforms, its causes and consequences, by adopting a mixed research design. Based on a quantitative analysis of PC data, two country case studies were carried out, relying also on analysis of official documents and 10 semi-structured interviews. Our results shows that both reforms point to shift PC from solo practice to multi-professional services, while being committed to preserve the trust relationships between PC staff (especially GPs) and patients. Although the adoption of GP gatekeeping by the Czech system, organisational arrangements chosen for these purposes are different and do not substantially increase hybridisation. This not only depends on the institutional characteristics and heritage, but also on the role played by doctors and health professions in the two systems.

602

examine the extent to which embryos generated *in vitro* by ART users are understood by these patients as relational entities (i.e., whether they are thought about in terms of their relationships with other beings, such as their progenitors, like a baby, or deprived of relational properties, like a mere biological tissue, a device, or a resource). A qualitative methodology was applied based on semi-structured interviews with ART beneficiaries, both women and men, in different stages of their reproductive treatments or already with children. The criteria for the intentional selection of respondents took into account variables such as sex, age, marital status, sexual orientation, socio-professional and educational background, the existence (or not) of living children, and the stage of the ART process. Two types of discourse emerge among the 27 respondents interviewed so far. First, a rationalising discourse that establishes emotional detachment towards embryos while they are not transferred and a pregnancy is not achieved. Human embryos are perceived as mere cells or biological material that only make sense and gain (moral and social) value in a woman's womb. Second, an emotional discourse that imbues embryos with human and personal characteristics, establishing an affective proximity between them and their progenitors. This research contributes to the scientific and societal debates around human embryos' moral and legal status.

The Double-Edged Revolution: Biotechnology's Dualistic Impact on Birth, Death, and Ethical Transformations

Vincenzo Marc De Luca

University of Ferrara, Italy

The swift progression of biotechnologies has indelibly altered the landscape of human existence, ushering in an era where the fundamental aspects of birth, death, and the continuum of life are subject to unprecedented transformations. This abstract delves into the multifaceted impact of biotechnological advancements, which, while extending lifespans and enhancing human capabilities, simultaneously provoke profound ethical and sociological inquiries. This study juxtaposes the benefits of increased longevity and improved quality of life against the potential for exacerbating social inequalities and ethical dilemmas. The dualistic nature of biotechnology is exemplified through assisted reproductive technologies, genetic engineering, and regenerative medicine, which collectively challenge traditional conceptions of life, health, and mortality. The research methodology encompasses a comprehensive review of current literature, coupled with an empirical analysis of case studies that highlight the societal and individual ramifications of these technologies. Preliminary findings suggest a complex interplay between technological innovation and social structures, where the promise of biomedical breakthroughs is tempered by the risk of reinforcing existing disparities. The study further explores the transformation in the governance of life, where the convergence of biomedicine and ethics necessitates a reevaluation of the meanings and boundaries of human existence. The abstract culminates in a critical examination of the role of biotechnologies in reshaping not only the biological parameters of life but also the socio-political frameworks that govern it. This analysis contributes to the broader discourse on the transformative effects of biotechnological advancement, emphasizing the need for a balanced approach that acknowledges both its emancipatory potential and its capacity to engender new forms of social stratification.

Biomedical promises and temporal (in)justice: the case of egg freezing in Italy and Spain

Ilaria Galasso, Chiara Quagliariello

University of Milan, Italy

propose an analysis of the relational metaphors that beneficiaries use to describe the different social dynamics they forge with their embryos created through in vitro fertilization (IVF) in a laboratory setting. The analysis is based on data collected from 69 in-depth semi-structured interviews and 85 validated questionnaires (online survey) with IVF recipients, as part of a concluded research project on the plurality of meanings and statuses attributed by experts and laypeople to human embryos. The data reveals that embryos are seen as embodying a potential child or viable biological material, through medical visualisation technologies. Beneficiaries become emotionally attached to certain embryos, which must be nurtured and cared for, sometimes triggering feelings of abandonment towards the ones that become supernumerary, especially after the birth of an IVF child. Embryos can also be part of a reciprocity cycle relative to the possibilities offered by science and medicine.

Saving Lives: Transforming Human Biological Samples Through Caring Practices In A Biobank

Brígida Riso

Faculdade de Medicina da Universidade de Lisboa; ISAMB – Instituto de Saúde Ambiental; CIES-Iscte

Biobanks have established worldwide with a growing trend of standardization and automatization of the collection and storage of biological samples and associated clinical and lifestyle data.

This research explored how these normalized laboratory-like units contribute to reflect visions of health, illness, and the body, departing from a setting where usually patients or sample's donors are usually absent. Thus, through ethnographic research, I followed the biological samples trajectories from the harvest to the storage and samples' distribution to researchers.

Along their trajectory to the biobank, the biological samples were progressively transformed into objects of scientific practice: from their physical form and status to their codification and categorization – transforming body parts into ready made products to scientific research.

However, the nature of these objects is continuously defined through a wide range of practices that (re)invest the sample with its human nature and identity while refusing to render them into mere objects.

The organization of care and the caring practices mostly performed by the biobank staff play a key role in transforming the biobank into a healthcare place. Attributing human features to samples, reproducing healthcare spaces, or constructing health and illness narratives through biological samples are ways of resisting to the dehumanization, contributing to create meaning in biobank existence – to save human lives.

Enchantment of Birth and 'the Biomedical Empire'

Kaisa Mirjam Kuurne

University of Helsinki, Finland

Some mothers describe their birthing experiences as 'not quite from this world'. They share experiences of birthing that could be described as having a layer of something luminous, wonderous or enchanted. Jane Bennet (2001) has in discussing what 'enchantment' may be, suggested that 'enchantment entails a state of wonder, and one of the distinctions of this state is the temporary suspension of chronological time and bodily movement. To be enchanted, then, is to participate in a momentarily immobilizing encounter; it is to be transfixed, spellbound.' The state of wonder at birth is present in some birth-givers' narratives, but also in narratives of some birth professionals. However, most women give birth at hospitals that are primarily oriented toward medically safe birth care. The hospital environment, biomedical practices and medical power over birth may not very easily fit together with experiences of enchantment. In this presentation I ask, how to make sense of powerful birth experiences that do not seem to fit into our common everyday or medical understandings of birthing? Following Barbara Katz Rothman's (2022) claim that the power of medicine now fills the criteria for what she calls 'the biomedical empire', I analyse how 'enchanted experiences' fit in or clash with the biomedical system and its paradigm for birth care. My analysis draws on qualitative birth narratives and narratives of birth professionals (N=180). It utilizes narrative analysis and suggests that different paradigms of birth often clash or the biomedical approach dominates. However, sometimes birthing at a hospital may harmoniously reconcile biomedical readiness to holding a space for enchantment.

RN16 | T09_05: Social and cultural factors in health care

Factors Influencing Dietary Inequalities Among Adolescents In Spain

Jesús Rivera-Navarro[1], Áxel De Léon-Marcos[1], Guadalupe Ramos-Truchero[2]

1Salamanca University, Spain; 2Valladolid University, Spain

Adolescence is a period of important changes in various aspects of an individual's life, which influence an individual's health. Health problems encountered during adolescence can persist into adulthood and lead to different clinical conditions. Healthy eating behaviours are crucial during adolescence to support physical growth and development.

The aim of this qualitative study was to identify the environmental factors that can determine dietary inequalities among adolescents in two Spanish cities – Madrid and Bilbao – in secondary schools located in neighbourhoods of different socioeconomic status (SES).

The study area included six neighbourhoods (three in each city) of different SES — low, medium, and high. We sampled 12 secondary schools (six in each city: two per SES). We conducted 36 semi-structured interviews (SSIs) and 24 focus groups (FGs). We conducted 12 semi-structured interviews (SSIs) with school principals (they were considered key informants), 12 SSIs with adolescents and 12 SSIs with parents. We conducted half of the SSIs in Madrid and half in Bilbao. We conducted 6 FGS with adolescents, 6 with parents and 12 with teachers. We conducted half of the FGs in Madrid and half in Bilbao.

The analysis of the discourses obtained from SSIs and FGs showed the following factors as determinants of adolescents' diet: The influence of the image cult on diet, through social networks; the family models – Eating as a family is considered a protective factor for a healthy diet-; lack of time causes more pre-cooked foods to be consumed; The influence of the peer group. Furthermore, we found that in the low SES areas adolescents eat at home more often alone and is perceived an environment with more unhealthy food on offer.

Exploring the Role of Trust in Covid-19 Vaccine Uptake in Hungary

Marianna Kopasz[1], Zsófia Papp[1], Csilla Zsigmond[1], Ildikó Husz[1], Vera Békés[2]

1Centre for Social Sciences, Budapest, Hungary; 2Yeshiva University, Ferkauf Graduate School of Psychology, Bronx, NY

A number of studies have found that trust in science was associated with a higher willingness to be vaccinated against Covid-19. However, only a few of them drew on a theoretical framework developed in health psychology. The Theory of Planned Behavior (TPB), one of the most supported theoretical frameworks to predict health-related intentions, such as the intention to get vaccinated against Covid-19, posits that a behavioural intention is the outcome of three components: attitudes toward the behaviour, subjective norms (i.e. social pressure), and perceived behavioural control. Some attempts have been made to extend the TPB with further potential predictors. Related to this line of research, our study aims to explore the influence of trust in science on Covid-19 vaccination intention by using an extended TPB model. In addition to the hypotheses on the components of the TPB, we also hypothesize that more trust in science is associated with a more pro-vaccination attitude (and thus a higher willingness to get vaccinated). To test our hypotheses, we used a sample of 761 adults from a survey conducted in Hungary in late 2022. We applied structural equation modelling using vaccine acceptance as the main endogenous variable. Our findings support that trust in science is positively associated with vaccine acceptance, with the effect being mediated by attitudes toward Covid-19 vaccination. Results also show that people with higher education and income, and those with more epistemic trust tend to have more trust in scientists.

Unveiling Childhood Vaccine Hesitancy: The Role Of Religiosity And Political Ideology In Türkiye

Selin Ongan, Rümeysa Türkbey, Ceylan Engin

Boğaziçi University, Turkiye

605

According to the WHO, between two to three million lives are saved annually due to the development of vaccines. Despite such achievement, many individuals continue to refuse or hesitate to get vaccinated. In Türkiye, the number of families refusing childhood vaccinations increased from 183 in 2011 to 23,000 in 2018, and the vaccination coverage rate for measles decreased from 98% in 2016 to 95% in 2022.

The prevalence and determinants of childhood vaccine hesitancy have mainly been investigated in Europe. Yet, the influence of religiosity and political ideology on vaccine hesitancy has been under-investigated. Also, studies in Türkiye are mostly regional and examine other underlying distrust factors in childhood vaccinations. This paper aims to fill this gap in the literature and unveil the reasons behind distrust in childhood vaccinations in Türkiye. Specifically, we examine the question "How do political ideology and religiosity affect the prevalence of childhood vaccine hesitancy?" Drawing from the Turkish Covid-19 Values Study (N=1500), our descriptive results show that mean trust in childhood vaccination is 6.63 on a scale from 0 to 10.

Studies on the relationship between religiosity and vaccine hesitancy generally yield conflicting findings; whilst some research identified a positive correlation, others discovered a negative one. Our findings reveal that religious individuals are more likely to favor childhood vaccination in Türkiye compared to non-religious individuals. Moreover, unlike most European societies where right-leaning individuals tend to disfavor childhood vaccination, right-leaning individuals trust childhood vaccination more compared to left-leaning individuals in the case of Türkiye.

Examining the Policy Process of Protective Housing Policies in Portugal in Times of Crises

Raquel Ribeiro, Cristiano Gianolla

Centre for Social Studies, University of Coimbra, Portugal

The Covid-19 pandemic produced important disruptions worldwide. To mitigate the impacts of the economic downturn on housing, namely increased evictions, the Portuguese parliament, similarly to other countries, approved legislation that granted supportive protective measures for the payment of rents and mortgage loans. In the aftermath of the pandemic, has arisen the current cost of living crisis, combining rampant inflation with the continuous rise in housing rents and the abrupt increase in mortgage rates, once more putting housing security at risk. To support families in financial distress supportive measures were again developed.

To examine how these protective housing policies were discursively constructed during the policy process, a thematic analysis of the parliamentary debates concerning these protective policies will be conducted. In this communication the dimensions of analysis, such as the mobilisation of social representations of protection, of housing policies anchored in other European Union countries, of social identities of housing stakeholders (own and attributed), as well as of emotions, will be presented and described. The comparative analysis of the two crises will allow to identify the communalities and differences between physical insecurity (Covid-19) and socio-economic insecurity (inflation).

RN17 | T01_01: SPace & collective bargaining

Back To Its Old Tricks? Ryanair's Collective Bargaining Struggles

Darragh Golden

University College Dublin, Ireland

Following a rare instance of transnational strike action by pilots, Ryanair's post-2018 decision to recognize trade unions was an important step in an open-ended struggle. The European Employee Representative Committee, critical in forcing Ryanair's hand, sought a pan-European collective agreement, but Ryanair instead returned employment relations to the national level. Subsequently, Ryanair pursued an array of strategies to undermine workers' interests and the collective bargaining process. Such strategies included intimidating union members and concluding collective agreements with non-traditional aviation unions. This paper analyses how employment relations struggles unfold and evolve in a transnational context. In other words, how has Ryanair management sought to undermine collective bargaining and how have traditional aviation unions, on the other hand, responded? By using a critical case study, this paper seeks to develop the theorization of transnational labour activism by studying how workers' struggles unfold in a transnational context, on the one hand, and how they might be overcome, on the other.

Collective Bargaining on Telework in South Europe: Different Responses to post-Covid-19 Legislation in Spain and Portugal.

Martí Fernández Saboya[1,2], Pablo Sanz de Miguel[3], Oscar Molina Romo[2]

1Notus-asr; 2Universitat Autònoma de Barcelona; 3Universidad de Zaragoza

This article analyzes and compares dynamics in collective bargaining on telework in Spain and Portugal at the sectoral and company level, in three sectors where this form of work organization is technically feasible for a large number of employees: financial sector, ICT consulting and chemical industry. In these two countries, new legislation has been recently passed that comprehensively changes the legal regime for teleworking, in a context of increasing prevalence of teleworking as a result of the pandemic. Subsequently, negotiating telework has played an unprecedented role in collective bargaining. Using a qualitative methodology combining documentary analysis and semi-structured interviews with stakeholders, the analysis has been based on the behavioral theory of labor negotiations, recent research on the different types of flexible working arrangements at work and institutionalist approaches. Generally, the results show the predominance of distributive exchanges in negotiations. More specifically, national legislation and particularities of each sector accounted for different outcomes in negotiations. This paper is part of an EU funded joint study: TWING – Exploring the contribution of social dialogue and collective bargaining in the promotion of decent and productive telework in the post-COVID-19 scenario.

Digital Nomadism – New Opportunities And Tensions Of Location-Independent Work

Katharina Mojescik, Jessica Pflüger

University Innsbruck, Austria

During the pandemic, millions started working remotely for the first time. Remote work has since become an integral part of daily life for numerous knowledge workers. Concurrently, digital nomadism as a location-independent lifestyle has gained popularity. Digital nomads are knowledge workers who leverage digital technologies to blend work with (permanent) travel.

Studies emphasize shared values, privileges, and generational experiences among digital nomads, who, however, differ in terms of employment status (whether salaried employees, freelancers, or gig workers). Surprisingly, the employment status of digital nomads has been neglected to this point, although we know that it comes with specific opportunities and tensions (such as questions of autonomy and embedding in organizational structures, precarity and social security challenges).

Therefore, we focus on the heterogeneous employment relationships of digital nomads and address the following questions in our contribution:

How does employment status affect subjective working conditions and self-perception of digital nomads?

How do motivations and mobility requirements differ?

What tensions of location-independent work can be derived from this?

Drawing from interviews with digital nomads (n=16) conducted during field research in Madeira, Portugal, our contribution holds relevance in two key aspects: (1) highlighting the overlooked significance of employment status among digital nomads, and (2) examining the transformative potential of location-independent work in terms of employment status and mobility.

We aim to gain a deeper understanding of emerging tensions arising from digitalization and mobility by linking the discourse on digital nomads as a new lifestyle with discourses on the transformation of work.

607

Do Collective Agreements And Works Councils Narrow Immigrant-Native Wage Gaps For Disadvantaged Immigrant Groups? Novel Evidence from German Linked Employer-Employee Data

Florian Zimmermann[1], Tobias Wolbring[2], Eric Fong[3]

1Institute for Employment Research, Germany; 2Friedrich-Alexander-Universität Erlangen-Nürnberg, Germany; 3The University of Hong Kong, Hong Kong

In recent decades, workers' bargaining power has declined worldwide and immigrant-native wage inequalities have been widening. Previous scholarship has shown that immigrant-native wage gaps are smaller in firms with collective agreements and works councils using cross-sectional data, indicating an association between workers' bargaining power in firms and immigrant-native wage inequalities. Yet, it remains unclear whether this correlation is causal. We provide novel evidence using German longitudinal linked employer–employee data covering 542 firms and 878,403 employee observations. We investigate whether changes in collective agreements and works councils in firms narrow within-firm immigrant-native wage gaps, especially for disadvantaged immigrant groups, i.e., immigrants from non-Western countries. Using firm-fixed effects with double-demeaned interaction effects, our results show that collective agreements narrow immigrant-native wage gaps within firms for immigrants from non-Western countries by 62.0 percent, but we find no effect for immigrants from Western countries. For works councils, our results provide no empirical support for narrowing effects on within-firm immigrant-native wage gaps. Furthermore, potential sources of bias, such as reverse causality, do not drive our findings. Overall, our results indicate that if collective agreements were as prevalent as in 1996, immigrant-native wage inequalities for disadvantaged immigrant groups would be 23.6 percent narrower in Germany.

RN17 | T01_02: Platforms and digital work

Digital Labour Platforms And (In) Formal Jobs: Case Study On The Domestic And Care Sectors In Italy

Iraklis Dimitriadis, Diego Coletto

University of Milano BIcocca, Italy

Informal working arrangements characterizing the domestic and care sectors seem to be challenged by the rise of digital labour platforms (DLPs) that imply various changes, including the formalization of workers. However, recent studies reveal that platform labour may entail practices that perpetuate the precarity associated with informal labour markets. Yet, little is known about the imbrications between the informal economy and DLPs.

This article aims to explore on the one hand, how DLPs affect workers in occupations that have been traditionally characterized by high level of informality, and, on the other, how gig (in)formal workers represent their work and what meanings they associate to the formal and informal work in location-based platform economy.

Based on 24 interviews with gig workers and 3 interviews with persons performing administrative and managerial work for DLPs, research findings suggest that DLPs offer job opportunities to vulnerable social groups and flexibility. Concerning meanings attached to formal and informal work by workers in the domestic sector, these are various and/or contradictory. Digital labour may be perceived as a way to formalise employment relations. DLPs are considered as intermediaries between clients and workers that guarantee the existence of formal work through, for instance, the issuance of pay slips. Yet, this does not often reflect reality, as most platforms only match the demand and offer sides. Moreover, DLPs can be also seen as a source of safety, because workplaces and working hours are trackable. On the other hand, those who are aware of the nature of (informal) employment relations through digital labour platforms see themselves engaged in the undeclared work market and excluded from health insurance and work-related injury provisions.

608

Care Work in the Platform Economy: Compounding challenges for trade unions

Caroline Murphy[1], Ivana Pais[2], Tish Gibbons[1]

1University of Limerick, Ireland; 2Catholic University of the Sacred Heart, Milan, Italy

'Ageing in place' is now the dominant and preferred model of long-term care delivery across Europe. The commodification of care has given rise to an increasingly large home-care workforce with the private sector emerging as the

dominant supplier of care in much of Europe. Conditions for homecare workers are generally acknowledged to be poor, attributed to high levels of feminisation and migrant labour; a plethora of ad hoc and informal arrangements, and low union density (Murphy and Turner, 2017). The latter aspect is the focus of this paper with the emergence of digital platforms in the sector. Trade unions have always faced difficulties in organising homecare workers owing to the invisible nature of the work conducted within private homes as well as other structural barriers and workforce characteristics. This paper will explore and compare the situation in both Ireland and Italy via analysis of in-depth interviews with senior trade unionists and other stakeholders conducted during 2023. We find additional difficulties for unions organising care platforms as the techniques and actions associated with organising platform workers are based on those aimed at a predominantly young, male and highly visible workforce e.g. delivery couriers. We draw on recent EU initiatives including the European Care Strategy and the Directive on Platform Work to examine a range of pathways toward worker organisation in the sector. We contribute to the literature on trade union organising specifically regarding the representation of female and migrant workers.

The paper concludes with recommendations on regulation and organising in the sector.

How Care Platforms Shape the Market Where They Organize Their Economic Transactions : A Case Study in Belgium

Valeria Pulignano, Claudia Marà, Lea Milena Franke

Katholieke Universiteit Leuven, Belgium

Existing literature on labour platforms (hereafter only platforms) have considered platforms as market self-organizers which set the rules which govern the economic exchange between service providers and clients (Frenken et al., 2020). As such, platforms are said to operate as 'marketplaces' by controlling private market governance principles through deciding, for example, who can enter the platform, the rules that should be followed when labour provides services, and if and when to dismiss service providers (Kirchner and Schüßler, 2018). Platforms often do this by potentially bypassing national state regulation (Niebler et al., 2023). Yet, platforms are digital market organizers in markets which are neither inevitable nor natural. Hence the key question is: how platforms shape the market where they organize their economic transactions?

This paper will tackle this question by studying a case of a domestic care platform called Helpper, which is market leader in the care services in Belgium. We use both a social-constructivist approach in the economic sociology and labour process theory in the sociology of work to unpack the black box of market creation. We do so by examining how the platform, together with other market actors such as clients, workers and labour market intermediates, confront the problem of the supply and demand by governing

the labour force in line with their accumulation logic. We argue that the investigated platform makes it easier for those in need of care services to purchase care services at a cheap price, as the platform outsources cheap and/or unpaid voluntary work (see Taylor, 2005) by peer-to-peer self-employed workers to organizations that experience labour shortages or to clients directly.

Meeting With Care: The Transformations of Meeting Practices in Post COVID-19 Hospital Management in Belgium

Charlotte Isabelle Catherine Jewell[1], Sophie Thunus[2]

1Université de Liège, Belgium; 2Université Catholique de Louvain

In today's organisations, meetings are ubiquitous. In general, meetings are defined by their instrumental or strategic functions, setting aside the relational purposes. However, meetings as rituals, act as a reflection of organisational and managerial practices. This study explores meeting practices in hospitals to investigate hospital management and to question whether an ethic of care approach emerges from the changes administered during and after the COVID-19 crisis. This qualitative study is based on 153 in-depth interviews, collected between September – December 2022, with a diverse panel of hospital managers and staff in hospitals across the French-speaking regions of Belgium.

Meetings are a necessary tool for the good functioning of hospitals and hold both instrumental and relational purposes according to hospital staff. However, during the COVID-19 crisis, the sanitary context and regulations meant that the occurrence, and the form of meetings changed. The sudden changes made the relational aspects that were removed or transformed visible. Since the crisis, hospitals have adopted and integrated online meetings, raising a discussion around the tension between the heightened efficiency these allow, and the time and space removed from relational elements.

Meetings are spaces for social relations and attention to staff's needs. They're spaces of and for 'care' in organisations. Presence appears to be an important dimension of care – caring for each other and for the work in organizations. The crisis has made relational practices embedded in meetings visible and shown their importance for the hospital as an organization.

Labour, Precariousness and Digital Platforms: Couriers in the city of Porto

José Miguel Ricardo, Virgílio Borges Pereira

Instituto de Sociologia – Universidade do Porto, Portugal

Couriers have become a regular presence in contemporary cities and

are a profession that illustrates recent changes in the world of work.

This paper is based on sociological research, entitled "Labour, Precariousness and Digital Platforms: Couriers in the city of Porto", and embarks on a comprehensive journey through their lives and experiences. By mobilising a mixed methods approach, this research combines qualitative and quantitative research methods and aims to achieve a holistic understanding of these workers. The qualitative research includes interviews and participant observations and provides insight into the sociodemographic characteristics and career paths of this population, while the collection of quantitative data reveals broader trends in precariousness and the platformisation of work. This research highlights the internal plurality of this professional category and its composition full of migrant workers, mostly from Brazil and India. The prevalence of precarious working conditions and lack of access to social services are conditions faced by these migrant workers who find platform work an easy entry into the Portuguese labour market. The gig economy and platform-based labour practices transcend geographical borders, having a global impact on labour markets. This research situates delivery work via digital platforms in the European and Portuguese context and how labour laws, social welfare systems and economic dynamics shape the experiences and career paths of these workers. The aim is to contribute to a deeper understanding of this evolving profession and its implications for wider labour market trends. The experiences of digital distribution platform workers illustrate the intricate interplay between technology, labour practices and urban dynamics, offering an insight into the contemporary world of work and its social ramifications.

Labours Lost in Translation: Making Sense of Worker Compensation in the App Economy

Ori Schwarz, Shahar Mendelovich, Hadas Nur

Bar-Ilan University, Israel

What are we paid for while working? The answer is not trivial: the ways in which labour is conceptualized and its value is calculated and justified have been subject to labour struggles and transformations throughout history. The platform economy, which singularizes tasks and their compensation, offers new answers to these questions, that often provoke worker resistance. We explore this tension by analysing the discourse of Wolt couriers on the introduction of a new, opaque dynamic compensation model. Building on interviews and data from online currier groups (where resistance was organized), we suggest that when the calculation of worker compensation is delegated to opaque algorithms, algorithmic decisions must be translated into human language, explained and justified. Workers need translation to give meaning to the constantly changing sums they are offered for constantly changing tasks; decide which tasks to accept; and retain a sense of agency. Employers need translation to legitimize compensation models and manufacture consent. How successful translations are, informs workers' feelings and actions. In our case, a conflict arose from the gap between different translations: the management claimed payment depends on curriers' 'effort'; whereas curriers translated the algorithmic model differently. They viewed it as conflicting with their own understanding of effort and as problematically hybridizing distinct logics of hired labour and independent contracting; and experienced opacity as a threat to their agency and control over their income. The algorithmic imaginary turns then into a medium of labour relations and labour struggles, where the cultural work of translating algorithms becomes instrumental.

Self-Precarization and the Normalization of Atypical Work in Sweden: The Case of Digital Freelancers

610

Daniel Karlsson

Lund University, Sweden

This paper explores the tensions of the normalization of non-standard and precarious work in Sweden, a country still often categorized as a Social Democratic welfare state despite decades of neoliberal deregulation and restructuring. I examine how insecure and precarious work is subjectively managed, negotiated, and normalized by a particular segment of workers – freelancers and gig workers in the creative/cultural industries. Building primarily on interviews with freelancers finding gigs through digital platforms, I am interested in how different ways of managing and negotiating precarious work is connected to the formation of specific subjectivities. Here I seek to develop Isabelle Lorey's (2011, 2015) notion of "self-precarization", to understand how non-standard working conditions by some segments of workers are being understood as desirable, rather than being seen as something imposed "from above". Taking the ambivalence of self-precarization seriously, my results identify four reoccurring "tensions" in the narratives of the interviewees through which I argue freelance subjects are formed: choice and necessity, autonomy and constraint, temporal flexibility and colonization of free time, and self-realization and self-exploitation. As a mode of subjectivation, I argue that it is in these tensions – in a constant push-and-pull between the desire for good, meaningful work and the often-harsh and exploitative material realities

of digital capitalism – which self-precarization operates. Focusing on these tensions can help us better understand precarization as normalizing process, important to digital capitalism through the production of a flexible and contingent labor force, accustomed to doing precarious piece-work while also containing seeds of resistance against it.

In Search of Institutional Power? Collective Representation of Platform-based Food Delivery Motor Couriers in Turkey

Burak Ceylan, Asuman Göksel

Middle East Technical University, Department of Political Science and Public Administration, Turkiye

Location-based platform work, particularly food delivery, is increasingly dominated by the self-employment model worldwide. A major repercussion of this model is the minimal role for the state in industrial relations since the work relationship is mainly arranged between the platform(employer) and worker(courier) in a biased understanding of "equal" business partnership. Accordingly, self-employed couriers are deprived of their right to unionize and collective bargaining.

Many studies using the power resources approach based on Wright (2000) and Silver (2003) suggest that platform food delivery couriers have a certain degree of workplace bargaining power and disruptive capacity; however, their institutional power resources are almost non-existent (Vandaele, 2018). This is indeed considered as the major drive for the the self-employed couriers to develop novel ways of collective representation to mobilize their associational power.

This study focuses on the case of collective representation of platform-based food delivery motor couriers in Turkey. The study first delineates the broader landscape of the courier representation ecosystem, examining how various organizations seek to attain power via the logic of influence. This way, it aims to expand the scope of existing literature on collective representation in platform work, highlighting the specific institutional dynamics within Turkey as an illustrative Global South context. The analysis depends on the qualitative data collected from 12 representatives of courier associations, grassroots unions/initiatives, longstanding trade unions and the recently established Chamber of Couriers. The study argues that although coalition power among different courier organisations is constrained by internal tensions and lack of trust; organisational creativity through the Chamber may facilitate legal regulation as it formalises their relations not only with the employers, but also, for the first time, with the state.

How Welfare States Shape the Platform Economy: Analyzing Cross-country Variation in the Composition of Platform Labor Across Europe

Juliana Chueri[1], Petter Törnberg[2]

1Vrije Univestiteit Amsterdam; 2University of Amsterdam

This study assesses how welfare and labor market institutions influence the size and skill composition of the online platform economy. We conduct a cross-country comparison using comprehensive data from workers registered on up-work.com, combined with country-level variables from 34 European countries. Consistent with previous studies, our results reveal that lower-income countries tend to dominate the supply of low-skilled labor in the online platform economy. In contrast, countries with higher national salaries have a more balanced distribution of platform workers engaged in both low – and high-skilled jobs. However, our analyses challenge a purely market-driven perspective and demonstrate that welfare generosity is associated with a lower prevalence of low-skilled platform work. Our research highlights the significant role of the welfare state in shaping the online platform economy and underscores the importance of further comparative research on the impact of institutions on the platform economy.

Consumer Attitudes and Employment Relations in the Platform Economy: Evidence from a Survey Experiment

Jonas Hulgård Kristiansen

FAOS, Department of Sociology, University of Copenhagen, Denmark

The role of consumers as key labor market actors is periodically brought up in the employment relations literature. With the consolidation of digital labor platforms as an integral part of the labor market, consumers again warrant attention. Studies suggest that consumers significantly influence the platform economy, directly and indirectly, e.g., when platforms shift central labor management practices to platform consumers, both regarding performance management through ratings and reviews and assigning work. Despite the central role consumers play as initiators and evaluators of platform services, few studies have engaged with how consumers influence labor practices and the working conditions of platform workers. Following a pre-registered study plan, we conducted a forced-choice conjoint survey experiment administered to a representative sample of

3,029 Danish respondents. We sought to answer how attitudes towards working conditions and worker stereotypes potentially influence labor relations on gig-work platforms and whether differences exist across distinct platform services.

Across food-delivery and cleaning platforms, we find that respondents consistently indicate a substantive preference for workers with access to social benefits, while workers' wage levels have a minimal influence on respondents' choices. Secondly, we find significant gender and ethnic biases among respondents on both platforms, and while these biases are moderated by workers' ratings, they persist even for workers with perfect ratings. This study provides novel insights into consumer attitudes and their potential impact on labor practices in the platform economy. In conclusion, we discuss the potential implications of consumer attitudes toward gig workers' rights for policy and further studies.

The Future of Platform Work: Can Anticipated EU Regulations on Improving Working Conditions in the Platform Work Sector be a Game Changer for the Gig Economy? The Polish Social Partners' Perspective.

Dominika Polkowska

Maria Curie-Sklodowska University, Lublin, Poland, Poland

The platform work sector has been growing rapidly over the past 10 years. It is assumed that it will remain so in the coming years, and the number of platform workers will increase. So, on the one hand, digital work platforms seem to be slowly entering a phase of maturity. On the other hand, this is not followed by worker protection. The development of the platform sector is, therefore, largely at the expense of workers. Currently under procedure, the Directive on improving working conditions in platform work addresses this problem. The Directive introduces a presumption of an employment relationship, and it will be the platform's task to – possibly – rebut this presumption.

Based on IDI interviews with representatives of trade unions, employers' organizations, government, NGOs, fleet partners, platforms, and on FGI interviews with platform workers, I will show, using the example of Poland, that harmonization of the directive into national law can be problematic due to the conflicting interests of the various stakeholders. According to employers' organizations, its introduction may lead to the collapse of the platform sector in Poland. Trade unions, on the other hand, point to the chance to normalize work via apps. Experts believe that probably nothing will change. Platform workers also seem uninterested in changing the status quo, which is fostered by the platform work model adopted in Poland based on civil law contracts (not widely known in other EU countries). Based on the results of the research, I will try to answer the question about the actual future of platform working in the context of the newly proposed regulations and how, in the future, it should be organized.

RN17 | Work, Employment and Industrial Relations

Gig Workers in the Platform Metropolis: Delivery workers in the Netherlands and South Korea

Seonok Lee

University of Groningen, Netherlands, The

We are witnessing "platform capitalism" (Srnicek, 2016), which replaces traditional contracted labor with a more informal and flexible workforce. In the platform economy or gig economy, labor on demand is common, and hiring services take place via internet-based platforms. One of the main arguments of platform companies is that they are not employers but rather "facilitators that do not pick favorites" (Gillespie, 2010, p. 358). However, a burgeoning literature on gig workers and crowd workers/data workers illustrates how platforms enforce precarious, flexible work conditions and long working hours by manipulating the old cost-cutting strategy of denying the employment relationship. Platforms argue that platform workers are "self-employed." These workers exist in a state of "legal liminality" (Chun, 2019), in which they are neither fully protected nor fully denied by law. Exemplified by Uber drivers as self-employed couriers in The Netherlands and Bamin delivery in South Korea, this new labor relation has been called both "enabling and exploitative" (Kaine & Josserand, 2019). Additionally, there is growing evidence that gig work has become more migrant work (Van Doorn, 2021). This paper focuses on (migrant) delivery workers and "digitally mediated service work" (van Doorn, 2017) that residents of dense urban metropolises, such as Amsterdam (Groningen) and Seoul. Therefore, the research questions are "How do Amsterdam (Groningen) and Seoul deal with delivery platforms and gig workers?" and "How can we understand this new form of labor relations in platform capitalism?" This is a timely and globally relevant project that will provide academic researchers with a more global lens through which to understand and theorize the impacts of platforms.

RN17 | T02_02: Migrant labour

Addressing Unfree Labour: Migrant Workers in the Construction Industry

Christopher Pesterfield

University of Bristol, United Kingdom

There are various seemingly irreconcilable tensions around unfree labour, both in its presence and in terms of how to tackle it. This is especially the case for migrants, who occupy a particularly vulnerable position in labour markets. This has been exacerbated by recent legislation, such as the 2022 Nationality and Borders Act, which effectively repositions certain exploited workers as criminals rather than victims, undermining the modest gains made by the 2015 Modern Slavery Act. At the same time, the economy is dependent on migrant workers in many ways, producing tensions between political rhetoric – and in some cases policy – and economic reality. This research explores these tensions through a case study of the UK construction industry; a sector dominated by flexible and precarious work, opaque subcontracting practices, and cost-cutting driven by low profit margins. Data collected from interviews with 50 managers, directors and peripheral actors in the construction industry highlight why companies are failing to address exploitation risks in their labour supply networks. This is explained through a model comprised of four strategies that practitioners use in response to the competing and conflicting tensions between market forces, on one hand, and the pressures to respond to the presence of unfree labour on the other. These strategies reveal why even well-meaning managers and directors who are desirous of addressing exploitation feel constrained in doing so. It also explains, from practitioners' perspectives, what is required in order to bring about a transformation to reduce unfree labour.

Highly Skilled STEM Migrants as Boundary-Spanners in the Global Organization

Miguel Morillas[1], Nana Wesley Hansen[2]

1Department of Sociology, University of Copenhagen;
2FAOS Employment Relations Research Centre, Department of Sociology, University of Copenhagen

In the globalized economy, the role of highly skilled migrants (HSMs) in occupying hard-to-fill positions for enhancing organizational performance is well-recognized (Bound et al. 2017). However, less attention is paid to the impact of organizational norms on the transformative potential of these individuals. Despite HSM's capacity for driving change and technological progress (Parey et al. 2017), companies often perceive them as functional components, akin to 'cogs in a machine' (Peixoto 2001) or position them within limiting pre-constructed identity profiles (Wu 2021). This paper argues that STEM migrants act as agents of connection and change, both within and outside the organization, such as enhancing collaboration with external partners and across knowledge domains.

We investigate the perception of newly arrived HSMs regarding their ability to alter organizational norms using their unique skills sets. Employing the concept of 'boundary spanning' that refer to specific individuals' effectiveness in operating across complex inter – and intra-organizational, socio-cultural and geographic boundaries (Schotter et al. 2017) we show how HSMs experience organizational norms as constraints on their agency. The analysis draw on qualitative interviews with 40 skilled STEM migrants recruited for senior positions in seven multinational companies in Denmark about their workplace experiences.

The paper makes a twofold contribution to the understanding of skilled migrant labor. Theoretically, we argue that HSMs offer unique transformative agency that allows for boundary spanning within organizations. Practically, we unveil how organizational norms can inadvertently limit these employees capacity to act as bridges across different work dimensions. Our findings challenge suggest a reevaluation of how organizations engage with the unique capabilities of HSMs, promoting a more inclusive and dynamic environment for change and innovation.

A Complicated Story. Organising Migrant Workers in the Italian Shipbuilding Industry

Nicola Quondamatteo

University of Padua, Italy

In Italy, the shipbuilding sector is relevant in terms of people employed. Fincantieri's one of the larger multinational companies in the sector across the world.

Historically, the sector has been characterised by a strong labour movement. However, starting from the 1990s a production restructuring based on the increasing role of outsourcing involved the sector, weakening the union representativeness, eroding collective bargaining, generating situations of over-exploitation and non-compliance with labour standards. The global competition has acted as a market constraint to reduce labour costs and increase flexibility. Nowadays, hundreds of third-party firms operate within the largest group's shipyards.

Alongside the increased use of outsourcing, the presence of migrant – from Eastern Europe and Bangladesh – labour force has grown. The workforce is segmented on the basis of skills and nationality of origin: Bangladeshi workers often fill the low value-added jobs.

This paper's the result of a research conducted as a part of my PhD. I selected as a case study the company town of Monfalcone, hosting the largest shipyard in Europe. Monfalcone has less than 30.000 inhabitants and the shipyards employs 1600 direct workers and hundreds of subcontracted workers. The percentage of migrants living in Monfalcone is 30%. This has been instrumentalised by the anti-immigrant right-wing.

613

Following Burawoy's (1998) methodological indications (extended case method), I conducted a study in a paradigmatic context to analyse transformations characterising contemporary workplaces: globalisation, outsourcing/subcontracting, role of labour migration. Through semi-structured interviews, participant observation and archival research, I tried to find out what strategies are adopted by unions to organise migrant workers in this context. I focused on both established and grassroots unions, by adopting the analytical perspective of Power Resource Theory.

Bridled Labour in Delivery Platforms? Irregular Forms of Employment at the Intersection Of Flexible Labour Markets and Segregating Migration Regimes

Maribel Casas-Cortés[1], Pablo Sanz de Miguel[1], Miguel Montañés[1], Juan Arasanz[2]

1University of Zaragoza, Spain; 2Notus

Literature has extensively showed how digital platforms and their algorithms create controversial forms of work relationships which undermine labour rights. Although platform economy is a stronghold of migrant labour, the focus of research has mainly remained within the taken for granted worker-citizen framework of the nation-state. To gather a more accurate understanding of platform labour is vital to introduce the question of migration status and the migration regime within which platform delivery operates. Building upon Moulier Boutang analytical contribution, this article explores forms of "bridled labour" in the current configurations of platform economy. Studying the on-location platform sector of food-delivery in Spain, we focus not only on the strictly labour aspects such as contractual arrangements, an issue covered enough by the literature thus far. Innovatively, our study engages with the under-studied intersection of labour legislation with migration legislation. In the process, our study sheds light over the underside of delivery platform labour: its unspoken reliance on non-citizens. This approach builds on emerging literature on migration and platforms, which is further contributing to complexify the realities of platform labour. Methodologically, it combines scientific literature review, desk research analysing labour and migrant regulation and ethnographic fieldwork.

RN17 | T02_03: Trade unions

Trade Unions in Europe: Connected or Isolated?

Tomas Dosedel

Masaryk University, Czech Republic

Trade Unions have been losing their bargaining power over the last thirty years for two reasons. In all European countries, union density has declined by an average of 10 percentage points during the previous 20 years. In addition, trade unions' engagement in the broader organizational field is weakening due to the declining involvement of their members in other organizations. Unions are becoming weaker and more isolated in negotiating their agenda.

In this paper, I present the results of an analysis of four waves of the European Values Study covering the period 1990-2020 and all countries available. Using simple network analysis, I show how trade unions have gradually become isolated in European countries.

Performing a separate analysis for each country allows me to highlight the differences between Western, Central and Eastern Europe. Especially in the post-socialist countries, membership in trade unions and other organizations was often compulsory before 1990, when the communist regime collapsed. Resistance to official involvement can persist, especially if it is politicized, as in the case of trade unions.

Preliminary results of the analyses show that even 30 years after the fall of the Iron Curtain, differences between new and old capitalist countries are evident. The post-socialist context still has its specificities, manifested in particular by lower membership in organizations of all kinds and stronger isolation of these organizations from each other. These results will be discussed using the conceptual framework from organizational and social movements literature and Putnam's organizational social capital point of view.

614

Varieties of Industrial Action: the Use of Blockades

Jenny Jansson, Katrin Uba

Uppsala University, Sweden

In most Western European countries, including Sweden, the number of strikes has declined since the 1980s, giving the appearance of peaceful industrial relations. There are, however, other forms of industrial actions than work stoppages, one such form is blockades. Blockades are the act of interrupting work processes without starting a work stoppage. For instance, workers can refuse to work overtime, they can prevent new hires, and they can perform physical blockades of workplaces ('circulation struggle'). Blockades can be used either as the primary conflict method or as a complement to strikes.

In this paper, we investigate the utilization of blockades by Swedish trade unions from 1980 to 2020. We use unique

data of all announced blockades during this period, explore which unions employ blockades, and analyze whether and how the trends have evolved over time. We expect that working-class unions (LO-affiliated unions) will employ blockades more frequently than the unions representing white-collar workers (TCO-affiliated unions) and academics (Saco-affiliated unions). Existing research on strikes and protests has shown that working-class unions tend to be more inclined toward contentious actions, and we anticipate that blockades will follow this pattern. Furthermore, we expect that public-sector unions will make more frequent use of blockades than private-sector unions. Given the more restricted right to strike in the public sector, we expect these unions to choose alternative, less contentious strategies. Lastly, we expect that export sector unions have increased their utilization of blockades over time. This shift is attributed to the globalization of the economy, the creation of global value chains, and the implementation of just-in-time manufacturing, rendering blockades of overtime work an increasingly efficient means of conflict.

How Have Trade Unions Developed Their Engagement in Training Governance?: Case of Five Nations

Soorin Yoon

KRIVET(Korea Research Institute for Vocational Education and Training), Korea, Republic of (South Korea)

In the context of rapid labour market changes, the role of trade unions in representing workers' interests in skills has become more important. In light of this, this study aimed to investigate how trade unions have engaged in training governance in five countries: Denmark, Germany, and France, which are broadly regarded as coordinated market economies; the United Kingdom and the United States, which are liberal market economies. While the five countries have free market system under a democratic political system in common, they have very different labour market characteristics, union characteristics, and union agenda in terms of skill development of workers. We can also see that each nation falls into certain typology of the union participation in the training governance.

First, we distinguished the type of 'embedded participation', where unions' participation in the training governance takes place within a dense and structural social dialogue between labour market stakeholders. On the other hand, the opposite concept is 'fragmented participation', where trade unions are engaged in fragmented and segmented participation. We also distinguished the type of 'practical participation' when unions are directly involved in the governance of vocational training in a more practical and functional way, beyond the means of social dialogue. On the other hand, the opposite concept is 'perfunctory participation' where the union's involvement in VET is more discursive than practical, focusing on discursive activities and distancing itself from actual VET interventions.

RN17 | T03_01: Trade unions and social change

Employment Relationships in Just Transitions

Julius Pepijn Veenstra

Tilburg University

People at risk of losing their jobs because of the transition towards a carbon neutral economy are considered 'vulnerable' and 'in need of protection' against the adverse socio-economic affects of said transition. Simultaneously, the need for technically skilled workers turns them into the ones 'to get the job done', as can been seen in Europe's 'Just Transition Mechanism' (JTM). This mechanism was set up under the European Green Deal and aims to ensure the realisation of a 'just transition' across Europe's most carbon-intensive regions. As such, the region of Groot-Rijnmond (NL) – home to the port of Rotterdam –developed a 'Just Transition Programme' to turn European ambitions into reality. That is, regional authorities – together with employers – set-up (re)training and (re)skilling projects for current and future employees. Nevertheless, these projects lack guaranteed employment and concerns are raised on whether promises made in project proposals will be realised in practice, thereby risking a perpetuation of precarity. Furthermore, the actor generally considered most apt in advocating for the interests of labourers, i.e., the labour union, resigned from their involvement in the implementation of the Just Transition programme as a whole.

This is in stark contrast with public debate on the 'just transition' and existing scholarship on the topic, which sprouted from labour movements aiming to protect the livelihoods of factory labourers in the 1980s USA and Canada (Goods, 2013; McCauley & Heffron, 2018; Morena et al., 2019; Rosemberg, 2010; Stevis & Felli, 2015, 2016). Unions and just transition scholars contended that transitions towards a more sustainable society should not negatively affect workers and their communities (Banerjee & Schuitema, 2022). Yet the presented case shows that questions can be raised in regards to the extent to which 'just transition' policies do actually succeed in the 'protection' of those considered to be 'vulnerable' and what we can understand as 'employment' in the just transition in the first place. To shed a light on these questions, this paper builds on over 50 interviews, document analysis and (participant) observations with public officials, employers and (future) employees who contributed to or participate(d) in (re)training projects.

615

European Trade Unions and Climate Change

Bianca Luna Fabris, Philippe Pochet

European Trade Union Institute (ETUI), Belgium

The effects of climate change on the world of work are both undeniable and multifaceted, over the past few decades (European) Trade Unions have openly embraced environmental issues into their broader mandate and have vocally called for a just transition and brought increased attention to the social dimension of energy transitions. While the policy preferences of the labour movement at both local, sectoral, and national levels towards environmental transitions are widely addressed in the literature, the role of the European Trade Union movement has been so far overlooked (Felli, 2014; Räthzel et al., 2021; Thomas and Doerflinger, 2020). The paper analyses how the European trade union movement – particularly the European Trade Union Confederation (ETUC) and the European sectoral federations – have embedded environmental concerns within their political priorities and have pushed for just transition measures within the EU policy sphere.

The paper is structured as follows, we first provide an overview of the existing literature, followed by an exploration of the emergence of the key concept of 'just transition' at the global scale, and then analyse the development of the position towards climate change of the European Trade Unions since the early 2000s and finally of sectoral federations.

Dealing With Green Transition Dilemma. Union Strategies In Food Industry In Three Italian Regions

Marcello Pedaci, Marco Betti

University of Teramo, Italy

Within the scientific debate on green transition many studies highlight the risk that innovations implemented by companies may adversely affect work and working conditions, leading to tensions and conflicts. Against this backdrop, the 'just transition' concept is often considered very fruitful to overcome environmental-labour trade-offs. Within this debate, a stream of literature has called for the involvement of trade unions in shaping transitions. Different approaches, strategies, and outcomes have emerged, affected by multiple factors, including employment relations institutions, characteristics of the sectors, union identities, knowledge regimes. Some scholars have also emphasised the differences between national level and regional, local or company-level union action.

Our paper builds on this literature. It focuses on how unions deal with transitions 'on the ground': strategies, limits, tensions, outcomes. The paper draws on the findings of a research carried out within the project Vitality – Innovation, digitalisation and sustainability ecosystem for the widespread economy in central Italy, funded by PNRR. The paper makes two contributions. First it focuses on food industry, a sector of great relevance in many EU countries, but where

much less research has been conducted. Secondly, moving from the national level, it concentrates on sub-national level, on three Italian regions (Abruzzo, Toscana and Veneto).

The paper uses a comparative case study approach based on analysis of union data and documents and semi-structured interviews with representatives of the main sectoral unions (at national level and in each region), representative of union research institute and experts. Fieldwork has begun in June 2023.

Varieties of Precarious Work and Labour Exploitation of Migrant Workers in the Nordics

Lena Margareta Näre[1], Rasmus Ahlstrand[2], Sara Eldén[2], Markus Jäntti[3]

1University of Helsinki, Finland; 2Lund University, Sweden; 3Stockholm University, Sweden

Nordic welfare states are commonly considered as having comparatively low levels of insecure, uncertain, and unstable employment or precarious work and strong protection against adverse labour market shocks such as sickness and unemployment. However, these protections are enjoyed mainly by permanent residents with access to residence-based welfare-state services. Other groups such as migrant workers with temporary residence permits, posted workers, and irregular migrants encounter many forms of precarity and are subject to various kinds of labour exploitation (Näre & Maury 2024). Moreover, non-standard employment, measured as the prevalence of fixed-term contracts, temporary agency work, marginal part-time work, and solo self-employment are more prevalent in Finland and Sweden than in Norway and Denmark (Rasmussen et al. 2019). Drawing on interviews with experts representing trade unions, researchers, NGOs, police and labour inspection officials in Finland (N=17) and Sweden (N=14) and policy and legislative data, we analyse how migration, welfare and employment regimes produce precarity for migrant workers in Finland and Sweden. Our analysis shows the varieties of precarious work and labour exploitation of migrant workers in these two countries.

Between Coercion and Consent: Insights from Dark Stores into Middle Managers' Roles and Organizational Dynamics in the Age of Algorithmic Management

Tiago Vieira[1], Sander Junte[2]

1European University Institute, Italy; 2Autonomous University of Barcelona

While workplace monitoring and assessment through performance metrics are not new, the inception of so-called algorithmic management represents a giant leap forward in this direction. In light of this, some scholars have explicitly or implicitly predicted a future where the role of human low – and middle-level managers will become insignificant compared to that of algorithms. However, other studies have argued that this is a too excessively deterministic take, as in contexts beyond gig work managers remain present in the labor process of organizations despite the deployment of algorithms.

This article aims to understand how algorithmic tools reshape the role of managers and how this, in turn, transforms the dynamics of managerial control in workplaces. Drawing on 51 semi-structured interviews with managers and shop-floor workers from dark stores, our findings show that, notwithstanding the automation of several coordination-related tasks, human management retains a crucial, two-fold role.

On the one hand, middle managers use algorithmic and AI-powered tools to continuously improve workflow efficiency through trial and error, as well in real time as retrospectively. Such fine-grained surveillance exhibits clear traces of direct and technological control, akin to digital Taylorism. Nevertheless, our study also emphasizes in this context the managers remain central. Through mentioned technologies, they enhance 'consent-manufacturing techniques' that keep workers docilly immersed in the labor process in a way that Burawoy already described in the late seventies. Hence, even in the era of algorithmic management, managers and their unautomatable cognitive and emotional skills thus emerge as irreplaceable – even if augmented – "producers of consent".

Beyond 'Technological Unemployment': the controversial Relationship between Human Work and Technology

Erica Antonini[1], Emanuele Rossi[2], Maria Cristina Marchetti[1]

1Sapienza University of Rome, Italy; 2Roma Tre University, Italy

The relationship between technology and human work in a context of dematerialized economy is at the origin of contradictory phenomena. On the one hand, the amount of socially necessary human work is greatly reduced. On the other one, most dematerialized professions imply a growing use of cognitive skills. On one side emphasis is placed on the impact of flexibility to work in terms of professional and existential precariousness and new forms of exploitation of 'digital work' in machine learning processes, with the related phenomenon of the 'Great Resignations' by the 'working poors'. On the other hand, forms of profitable cooperation between technology and human work are manifesting themselves in the case of 'cobotics', as well as in the benefits brought by new technologies to work (especially through AI) in terms of productivity, environmental sustainability and improvement of work/life balance.

This paper aims to analyze the multifaceted relationship between technology and human work, focusing on the following topics:

– the personal and social consequences of productive models based on flexibility, both in terms of precariousness of people's professional and existential paths – with particular reference to the condition of young NEETs – and in terms of impact on social cohesion;

– the opportunity of updating traditional concers on 'technological unemployment' and 'crisis of societies based on labor', considering the role of technology also in terms of new forms of exploitation of human labor associated with machine learning processes, as well as new models of fruitful cooperation between technology and human labor itself (cobotics, smart working, etc.).

Occupational Transformations and Wage Inequality: A Comparative Analysis of Six European Countries

Guillermo Orfao[1], Enrique Fernández-Macías[2], Miguel Ángel Malo[1]

1University of Salamanca, Spain; 2Joint Research Center of the European Commission, Seville, Spain

This paper presents a comparative analysis of the role played by occupational changes in recent wage inequality trends in six European countries. In recent years, wage inequality has increased in most developed economies while there has been different occupational dynamics, such as job polarisation, upgrading and downgrading. This work

617

contributes to a better understanding of how within – and between-occupation differences have influenced wage inequality trends in Europe. The database used is the European Union Structure of Earnings Survey for the period 2002-2018. The variance and Theil decomposition analyses show two patterns in the share of wage inequality explained by between-occupation differentials: while the relative importance of between-occupation trends has grown in Finland and the UK, it has diminished in Spain, France, Poland and Romania. Although between-occupation differentials account for a great share of total wages' variance, changes in the occupational structure (in particular, the patterns of job polarisation and upgrading widely discussed in the literature) have not driven recent wage inequality trends in Europe, with the exception of Finland. Wage inequality, instead, has been mostly driven by changes in wage differentials within occupations. Consequently, we cannot reject the possibility that in certain cases, occupational change may have had an important effect on the evolution of wage inequality. What we can reject is that, in general, occupational dynamics explain recent wage inequality trends. Finally, we found that occupations effectively account for the distribution of wages, yet their explanatory significance markedly declines at the highest wage tiers.

No Turning Back: A Longitudinal Analysis of Remote Work Experiences Among Knowledge Workers in Italy During and After the Pandemic

Costanza Guazzo[1], Alessandro Gandini[1], Emma Garavaglia[2]

1University of Milan, Italy; 2Politechnic University of Milan, Italy

This study examines the evolving perspectives of knowledge workers on remote work in Italy from the initial Covid-19 lockdown to the summer of 2023. It is based on a longitudinal qualitative study conducted in Italy during two phases. The transition to remote work following the external shock of the pandemic represented a "vast social experiment" with profound implications for work organization. In particular, this contribution discusses whether and to what extent new forms of remote work management for employees may have influenced the sense of affiliation towards the company. Following Hirschman's (1970) perspective, when faced with deteriorating working conditions, workers have two options: defection or protest. Through a two-phase qualitative study involving 35 initial interviews in 2020 and 20 follow-up interviews in 2023, we demonstrate that, amidst a marked discovery phase of remote work during the initial lockdown, the more recent normalization of hybrid work has revealed new needs among interviewed knowledge workers. The second phase of interviews reveals a normalization of hybrid work routines. In certain cases, not transitioning to hybridization caused workplace conflicts and a crisis of trust, leading some to choose forms of voice (individual and collective requests) and others to choose exit strategies (voluntary resignations for better opportunities in the same sector in terms of salary, less rigidity, more remote work, proximity to home). Findings indicate a changing trade-off perception between salary and job characteristics versus distance, organizational rigidity, and control.

RN17 | T03_03: Populism and work

The Impact of Brexit on European Works Councils

Marco Hauptmeier[1], Anna Frisone[2], Federico Fuchs[1], Kevin Guillas-Cavan[2], Markus Hertwig[3], Marcus Kahmann[2], Patrick Witzak[3]

1Cardiff University; 2IRES; 3Ruhr University Bochum

This paper examines how Brexit affects European Works Councils (EWCs). EWCs provide employees with consultation and information rights in multinational companies (MNCs) operating in the European Union (EU). The decision of the United Kingdom (UK) to leave the EU had implications for EWCs as it concerned two threshold conditions of the EWC legislation namely the existence of sites in at least two European countries with 150 employees and a required total European company size of 1,000 employees. Brexit meant that some MNCs with subsidiaries in the UK no longer met these conditions. The paper uses the lens of institutional theory to examine how EWCs are impacted after the regulatory underpinning changed in the wake of Brexit. We conducted case studies in the UK, France, and Germany, employing problem-centered and semi-structured interviews, along with document analysis using content analysis. This approach revealed four institutional outcomes: stability, innovation, demise, and extinction. In a significant number of cases, EWCs managed to negotiate follow-up agreements that allowed continuity in the functioning of the institutions. In other cases, Brexit resulted, somewhat counteractively, in the invention of new practices and forms of representation such as the inclusion of countries from non-EU countries. A third outcome was demise, whereby Brexit weakened the functioning and representation of EWCs. Finally, in a minority of cases, EWCs entirely disappeared after Brexit. We identify the key factors and mechanisms that explain the varied institutional outcomes and develop an explanatory argument.

The Making of Populism at the Workplace. Enterprise Organizations as a Site of Political Preference Formation

Paulus Wagner[1,2]

1European University Institute (EUI), Italy; 2Sciences Po Paris, France

The theory of losers of modernization holds those who are "left behind" in processes of socio-economic modernization are prone to mobilization by the populist radical right (Betz 1994). A large empirical literature has put this claim in question, showing that not the poor, but individuals with stable jobs and incomes are more likely to support the far right (e.g. Antonucci et al. 2017; Kurer 2018). This literature conceives of socioeconomic grievances either in terms of monetary income or of labor market risks.

This article leverages biographical interviews with 150 German and Austrian citizens, most of them blue-collar workers, to show that however, not only labor markets, but also workplaces have changed during modernization processes of the recent decades. People with stable jobs in pressured sectors can face manifest grievances everyday at work, namely, in management-employee relations within the enterprise. Where such situations persist and do not seem resolvable, a recurrent pattern among interviewees is the formation of a resentful identity of being particular "hard-working" oneself – combined with blame-shifting on outgroups who are ostensibly "lazy" and "do not want to work", what resonates plainly with narratives propagated by the populist radical right.

I test the external validity of this claim with ISSP 2015 data for 18 advanced democracies, finding a significant and strong correlation between low subjective quality of workplace relations and voting intentions for the far right, which is barely sensible to income, however partly explains the effect of occupational class on voting intention. These findings highlight the importance to understand specific channels of political feedback to socio-economic change and raise more general interest in the workplace as a site of political preference formation.

Left-wing Populism and De-Dualization: A Comparative Study of the Movimento Cinque Stelle (2018-2021) and Unidas Podemos (2020 – 2023)

Walter Haeusl

Scuola Normale Superiore, Italy

In the 2010s new left-wing populist parties emerged in Southern Europe. Little attention has so far been devoted to the concrete policy measures pursued by left-wing populism in government. Against this background, this paper comparatively investigates the social, labour and income policies implemented by the Movimento Cinque Stelle (M5S) in Italy and Unidas Podemos (UP) in Spain, during Conte (2018-2021) and Sanchez (2020-present) governments, respectively.

Through the analysis of policy documents and secondary sources, I demonstrate that the Movimento Cinque Stelle and Unidas Podemos share a commitment to 'de-dualize' the national labour market and welfare institutions, i.e. extending protection to precarious workers. This shared orientation is manifest in key policies, such as the regulation of temporary work, the substantial raise/introduction of a statutory minimum wage, and the introduction of minimum guaranteed income schemes.

Despite commonalities, I argue that Unidas Podemos has gone far beyond the Movimento Cinque Stelle in de-dualizing the national labour market and the welfare state. I claim that this difference can be traced back to party ideology

and how precarity is framed within it, as Unidas Podemos has a more radical and coherent ideology than the Five Star Movement, as largely discussed in the existing literature. Ideological specificities, also explain why some policies implemented by the M5S are exclusionary towards foreign nationals. This is contrasted with alternative and complementary explanations, such as government composition and the role of the industrial relation system.

From Neoliberalism to Paternalism? Right-wing Unionism in Israel

Gadi Nissim

Ruppin Academic Center, Israel

Based on fieldwork during 2023-4, the lecture addresses the question of how The National Histadrut, a thus far marginal organization associated with the Israeli right wing, has become a main contributor to the national growth of union density.

The findings reveal that The National Histadrut presents itself as a nationalist, professionalist, and non-socialist labour organization. It does so by organising, on the one hand, security forces and other workplaces connected to the far right. On the other hand, it does so by successfully organizing a few prominent NGOs and business corporations. Thus, it is also attractive to mainstream workers. The National Histadrut leverages two other moves to gain cross-sectoral legitimacy: embracing Israeli soldiers, volunteers and victims of the war with Gaza and also developing welfare services for its members and families, pinpointing its non-conflictual activity over labour disputes.

Right-wing hegemony has been identified with the amalgamation of nationalism with neoliberalism. Yet, the right is not fully committed to market ideology, as it demonstrated, for example, in the rise of Populism during the last decade. The National Histdrut locates itself on almost every spot on the right-wing's map: ultra as well as moderate nationalism, mainstream workers who want a "soft" labour union as well as employers willing to accept organized labour as long as it abandons the idea of class conflict. It represents a paternalist ideology that embraces the collective without undermining social order and expresses solidarity with the nation instead of with class.

RN17 | T03_04: Changing labour market boundaries

The Power of the Powerless: Construction of Self-Employment in Czechia

Karel Cada, Ivana Lukes Rybanska

Prague University of Economics and Business, Czech Republic

This paper examines the construction of self-employment in public policy debates focusing on how political actors define self-employment and the moral implications of these categorizations. Employing critical discourse analysis and social construction of target population, the authors examine verbatim transcripts of parliamentary debates in the Czech parliament between 2021 and 2023. These debates reveal how legislators perceive the value of self-employment as part of the economy. The study explores the moral consequences of categorizing self-employment and the ideological underpinnings of public policy debates. It contributes to understanding precarity in the context of neoliberal work relations. We assert that mobilized moral arguments render aspects of the self-employment experience invisible and thus leave precarity of self-employed unaddressed.

620

We argue that politicians, operating in their dual capacities as discursive and policy actors, construct moral expectations of self-employment which are used for justification of policy measures. The moral issues of deservingness and control conceal socio-economic aspects of the self-employment experience and foremost the precarity of this work regime. This discursive obfuscation raises a critical issue about the friction between the morally laden depictions of self-employed lives and their precarious reality.

Tensions and Transformations at the Heart of the Medical-Self Work Bargain

John-Paul Byrne[1], Jennifer Creese[2], Niamh Humphries[1]

1RCSI University of Medicine & Health Sciences, Ireland; 2University of Leicester, UK

Becoming a doctor involves socialisation into an all-encompassing self-identity: 'the medical self'. This cognitive institution enables doctors to do their job, understand medicine's shared norms and 'rules of self-sacrifice' (Gerada 2021), whilst also legitimising the medical-self work bargain – the work and employment conditions associated with being a doctor. However, the epidemic of psychological distress in medicine, intensified by COVID-19, indicates a deterioration in the legitimacy of this bargain. Using a post-industrial work bargain framework (effort, boundary, employment), we explore the tensions and transformations

at the heart of the medical-self work bargain. The paper draws on qualitative data from the Hospital Doctor Retention & Motivation (HDRM) project spanning pre-, during, and 'post-'COVID-19; including open-ended survey responses (N= 469, 2019), online semi-structured interviews (N= 48, 2020) and a remote ethnography (N= 28, 2021).

Preliminary analysis illustrates a swathe of negative feelings (apathy, guilt, fear, anger, exhaustion) shaping doctors' relationship with work. Doctors experience undervaluing and apathy rather than autonomy [effort], intensified and extensified temporal demands leading to a postponement of non-work-life, exhaustion and unsafety [boundary], and a profound sense of uncertainty regarding career sustainability [employment]. The legitimacy of the work bargain may be weakening as working conditions move beyond the idealised rules and resources of the medical-self – to the extent that the way medical work is organised a threat to doctors' physical, mental and emotional well-being, and therefore a threat to healthcare systems globally. Both conceptually and practically, a re-alignment of the rules and reality of the medical-self is required.

Values at Work: The Spillover of Trust and Social Capital in the Nordic-Baltic Region

Inta Mierina, Ilze Koroleva, Maija Krumina, Ginta Elksne

University of Latvia, Latvia

The positive effect of cross-border flows on technologies, innovation and skills has been well documented. In contrast, our study focuses on a rarely acknowledged, yet no less important intangible contribution of international migration to spreading new ideas, values, and attitudes important in the labour market. As the Nordic countries have long been known for their high levels of trust and social capital, we explore how closer integration of the Nordic-Baltic region may spread these values to the Baltic states, and why it matters for productivity and growth. Combining econometric analysis of the European Values Study data with in-depth interviews, we show that those having worked in Nordic countries and Nordic companies may learn new approaches to management, work culture and work organization, learn to trust, discuss disagreements in a democratic way, and defend their rights. Thus, returnees along with Nordic workers and companies have a potential to fundamentally change the labour market dynamics in the Baltic states and elsewhere. Furthermore, we find that to facilitate trust and trustworthiness factors that create insecurities such as such as insufficient education, socio-economic deprivation and childhood poverty need to be addressed.

Transnational Labour Regulation through Global Framework Agreements. Preconditions for a Successful Practice of Implementation

Thomas Haipeter

University of Duisburg-Essen, Germany

Signed by company management and global trade union federations, global framework agreements (GFA) are the most important instrument of transnational labour regulation in multinational companies (MNC). After two decades of a rather steady increase in numbers, these agreements today seem to be at the crossroads. The dynamics of growth is slowing, and, at the same time, the practice of implementation is criticized in terms of its effectiveness. Against this background, the presentation discusses what a successful practice of implementation of GFA could look like, what the conditions for a successful practice might be and what can be learned from good practice cases.

The presentation is based on a research project financed by the German Hans-Böckler-Foundation in which 12 cases of GFA and their implementation in MNC from different industries have been analysed. It will be argued that there are three criteria for a successful implementation of GFA: firstly, that the procedural norms in the GFA support a strong practice of implementation; secondly, that they help to increase resources and capabilities of labour to act to influence implementation on the ground; and, thirdly, that in this way real improvements in labour standards and working conditions of workers are produced. A crucial precondition for a successful implementation of GFA has proven to be that global unions and headquarter unions make use of the institutional resources and their own organisational resources to form transnational arenas of action within the MNC and that they develop tight relationships with local trade unions. In some cases, this has triggered a dynamic of transnational institution building of labour regulation moving beyond the limits of the GFA.

621

RN17 | T04_01: Job quality and work satisfaction

Job Quality in the Age of Polycrisis: the Polish Experience

Jan Czarzasty

SGH Warsaw School of Economics, Poland

Job quality is a multifaceted and relative concept regarding a job-worker relationship, which includes both subjective and objective dimensions (see: Green 2005; Munoz de Bustillo et al. 2011). Despite a myriad of definitions circulating, what they all seem to have in common is the assumption that job quality is related to any such capabilities of work that may either enhance or lessen workers' well-being (see: Smith et al. 2014).

Since 2020, following the arrival of Covid-19, a series of parallel, interconnected crises and various endo – and exogenous shocks (inflation crisis, energy crisis, war in Ukraine and migration/refugee crisis), have emerged, prompting frequent using of the 'polycrisis' (Tooze 2021) label denoting all those (as well as number of minor ones) phenomena en bloc.

There is a substantial body of evidence that polycrisis has been affecting job quality in various sectors of economy (e.g. Eurofound 2023), either directly, such as, for example, in case of pandemic-related changes in work organisation, or indirectly, such as, for instance, in case of inflation eroding real wages, which adds up to work-related stress. In the Polish context job quality (especially in the government-sector) has been significantly impacted by refugee crisis following the outbreak of war in 2022.

The paper follows the dynamics of job quality in Poland on two levels: first, providing the general assesment based on the original data collected in course of the panel survey study (nation-wide representative survey) completed in 2021 (the first wave) and 2023 (the second wave) as a part of the COV-WORK project, and second, more specifically, focusing on selected sectors where essential work is performed using qualitative data gathered in the same project.

Workplace Wellbeing As Depoliticised Labour Reform

William Joseph Fleming

University of Oxford, United Kingdom

Workers' wellbeing is now an explicit and prominent concern in public and corporate policy. Yet many in critical management studies, industrial relations and sociology greet this trend with scepticism, claiming it is ineffective, instrumental, discriminatory, individualistic and coercive. Synthesising and advancing these critiques, this article articulates the hegemonic function of workplace wellbeing by recognising it as a macro-level process of depoliticised labour reform, beyond its place within managerial regimes.

As a policy agenda, ideal strategies of workplace wellbeing advocate sincere management-led attempts to improve workers' experiences of employment, but through strategies that are limited by an avoidance of regulation, contestation and materialist critiques of workplace practices and social inequality. This position emerges inductively from an innovative mixed-methods discourse analysis of the UK government-backed resource hub mentalhealthatwork.org.uk. Analysis reveals five primary strategies – individualism, economisation, voluntarism, anti-stigma and diversity – which can all be understood through a depoliticisation lens, while also recognising the real and ideological effects of improved worker wellbeing. Following the empirical and theoretical account of dominant work wellbeing strategies, this article invites critical performativity and an advancement of the critical position for a route out of analytical paralysis.

A MANSA Scale Study of Job Satisfaction, Social Relationships and Economics in the Lives of Young Adults

Dejana Momir Pavlovic[1], Dragan Ljubo Bjelica[2]

1Institute of Economic Sciences, Belgrade, Serbia; 2Faculty of Organizational Sciences, University of Belgrade, Serbia

Life satisfaction may help determine overall happiness among young adults. As a demographic highly affected by social, economic and political changes, life satisfaction is a pertinent factor when examining those under 30 years of age since they are most prone to such shifts due to their transitioning through education and entering the labour market. Our research seeks to identify patterns and disparities between life satisfaction in relation to job satisfaction, social relationships and economic well-being among youth to pinpoint potential areas to strengthen life satisfaction among this demographic through targeted strategies. In the research, we employ a mixed-methods approach combining quantitative data analysis using Mansa scale responses and qualitative insights through in-depth interviews. The Man-Whitney and Kruskal-Wallis tests are used while a correlation analysis is employed to investigate relationships between variable interrelationships. The sample comprises 1,638 respondents 18 to 30 years of age, drawn from diverse educational, occupational and socioeconomic backgrounds and were recruited through a stratified sampling method to ensure representation across demographic categories. Understanding the intricate relationship between job satisfaction, social connections and economics among young adults holds significant implications for policymakers, educators and employers. Our conclusions may help improve the overall well-being of youth, contributing to the development of strategies that strengthen societal health and cohesion. Furthermore, the findings may serve future longitudinal studies and policy recommendations to foster more supportive environments for young adults in both work and education.

622

Workers' Satisfaction during the Covid-19 Pandemic in Central and Eastern Europe

Kamila Fialova

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

This article analyses the determinants of worker satisfaction in Central and Eastern European countries, focusing on the effects of the COVID-19 pandemic. For this purpose, the latest European Social Survey data was utilised in a multi-level framework, covering 5,681 workers from eight countries. The results suggest that both the general stringency of policies aimed at containing the spread of the COVID-19 contagion and the resulting disruptions to individuals' working lives significantly affected the well-being of workers. The worker satisfaction with their jobs was negatively affected mainly through decreases in work income, but the impact on their overall life satisfaction was more complex. While income reductions and workplace relocation negatively impacted life satisfaction, the opportunity and possible necessity to stay home more positively affected the life satisfaction of workers. Nevertheless, the overall stringency of governmental policies related to COVID-19 significantly reduced workers' life satisfaction.

RN17 | T04_02: Work and class

Producing Subjectivities: Social Mobilisation of Labour and Mediations of Gender, Class and Migration

Gregory Schwartz[1], Ania Plomien[2]

1University of Bristol; 2London School of Economics

Engaging the concept of migrant productive subjectivities, we explore the problem of social mobilization of labour, through its differentiation and fragmentation via migration and class and gender mediations, as a process of reproduction of neoliberal social politics in contemporary Europe. Various analytical frameworks have explained these processes. Poststructuralist analyses have focused on the disciplinary power of normative constructions of migrants as 'others' and the biopower of markets to fragment the singular-class character of labour, accompanied by the divisive repertoires of the gender order, producing unique subjectivities. Critical political economy research has analysed migrant/local worker differentiation, including exploitations deriving from the gender order, as part of the global distribution of relative surplus value that forms social structures of accumulation. Marxist feminist scholarship has examined the complexity of the global gendered division of labour through the prism of social reproduction, which has been reshaped by relative changes in the role of states, markets and households in provisioning. We extend this approach drawing on our research on the marketisation of social reproduction across spheres of provisioning (food, housing, care), where globalisation and neoliberalisation have unevenly combined labour markets, contributing to a proliferation of a more exploitable mobile workforce and an articulation of historically distinct forms of productive subjectivities. Our extended case combines in-depth interviews with Polish and Ukrainian workers in the UK, Germany and Poland with secondary data of labour market and policy developments. Examining the gendered lived experiences of transnational migrant workers, we consider the ways in which differentiation and fragmentation are reproduced or challenged and assess how migrant workers' productive subjectivity formation perpetuates Europe's uneven and combined capitalism.

623

Un)Stratified Surveillance? Class-based Inequalities in Digital Workplace Monitoring

Giedo Jansen, Agnes Akkerman

University of Amsterdam, Netherlands, The

Introduction

There has been a rapid growth in the use of employee surveillance technology. We examine to what extent digital workplace surveillance may diminish, sustain, or intensify social class-based inequalities.

Research Questions

1. To what extent are there differences across social classes in the extent that they subject to digital and human monitoring in the workplace?

2. To what extent are there differences across social classes in the effects of digital and human monitoring on work-related outcomes?

Theory and Hypotheses

The dominant logic in the social stratification literature dictates that the working class would be disproportionately subject to surveillance. Alternatively, we pose that variation in monitoring across social classes might have decreased with the rise of digital surveillance technologies. Subsequently, we theorize that even if being monitoring is a new reality for all workers, it may have different effects across social classes. We formulate hypotheses on four outcomes related to workplace relations commonly found in surveillance studies: worker well-being, worker voice, trust in colleagues, and anti-organizational behavior.

Data and Methodology

This study the first to use large-scale survey data (N= 3000+) on employee monitoring practices across social classes. Regression models are used to examine class-based differences in monitoring, and its effects. Interaction effects (monitoring X EGP-classes) are estimated to investigate whether monitoring has different outcomes for different classes.

Conclusions

We find stronger class differences regarding digital monitoring vis-à-vis human monitoring. Working class employees are more likely digitally monitored than any other social class. We also find that this has negative consequences for worker wellbeing, interpersonal trust and anti-organizational behavior. We do not find, however, that the adverse monitoring effects are stronger for working class employees.

A Middle-class Disease? Occupational Differences In Overemployment And Unpaid Overtime Among Remote And Non-remote Workers

Anthony Rafferty

University of Manchester, United Kingdom

This article considers whether recent increased remote working has led to greater over-employment and unpaid overtime. Potential mechanisms for work extensification have been theorised through inducements to additional effort in the 'psychological contract', the effects of new forms of surveillance technology, or the additional duties associated with remote working and digital adoption. Whereas remote working research has focussed primarily on professional and managerial workers the expansion of such practices within other occupational groups such as clerical workers requires further exploration. Using the UK Labour Force Survey (LFS) (2008-23), findings suggest that although remote working is linked to greater overemployment, such differences are primarily explained by the occupational composition of remote workers. A 'service' employment relationship within professional and managerial jobs means such occupations have higher levels of overemployment and unpaid overtime generally. In contrast, levels of overemployment and unpaid overtime are lower in occupations where a more transactional 'labour contract' or intermediate employment relationships is expected. Such differences however likely reflect formal and not just 'psychological contract' differences in the employment relationship. A recently growing social class divide in access to remote or hybrid working arrangements is also documented.

RN17 | T04_03: Mobility and outsourcing

'We have to be both Workers and our own Boss!' A Cross-Sector Exploratory Analysis of Work Projectification

Luísa Veloso[1,2], Alexandre Silva[1,2], Clara Pelote[3], Filipe Reis[1,4], Joana S. Marques[1,2], José Soeiro[5], Patrícia Santos[2,6], Paula Urze[7,8], Telmo Clamote[2], João Lopes[9]

1Iscte – Instituto Universitário de Lisboa; 2CIES-Iscte; 3FCSH/NOVA – Universidade Nova de Lisboa; 4CRIA-Iscte; 5IS-UP; 6TNDM II; 7FCT NOVA; 8CIUHCT; 9FCT Nova & CIUHCT

The literature on project work has shown that, from a specific mode of organising work in some economic sectors and professions (e.g. architecture), projects increasingly dominate both organizational frameworks and individual work experiences. Seeking to analyse concrete modes of projectification and their pervasive implications, this paper presents findings from ongoing research on work projectification, focused on four key sectors: the arts; social economy; consultancy and management; and research and development. The paper reports on data produced at a world café, a methodological tool aiming at gathering and putting in debate different perspectives on a specific theme, conducted during the exploratory stage of the research. It involved a diverse and heterogeneous group of stakeholders from those four sectors, along with experts versed in transversal issues related to project work. The content analysis of the world café data informs the discussion of this trend of shifting from jobs into projects and its multiple impacts, such has: the implication for employment relations and labour rights; the repercussions on people's lives, both concerning the boundaries between work and personal life and between worker and (self-)employer; and the effects the intermittency of project funding can have on work activities themselves, on knowledge and expertise, on team work and on resource management.

Resisting Outsourcing: Migrant Workers' Power-Building Strategies in the British Service Sector

Davide Pero

University of Nottingham, United Kingdom

Based on the fundamental assumption that there is a structural antagonism between management and workers, labour process theory (LPT) has been examining processes through which employers organise production to extract maximum value from workers. An important dimension of this scholarship has focused on the response of the latter to these processes. However, until recently, the examination of workers' response has largely centred on workers' misbehaviour and undeclared forms of resistance, with limited coverage of workers' manifest contentious collective practices. This paper focuses on this understudied aspect in labour process theory, with special reference not only to how such collective agency can emerge but also to how it can be made effective. In particular, it considers how workers can build power and induce change in regimes of outsourcing, which are particularly exploitative. Using Schmalz et al.'s (2018) typology of powers as a heuristic device, the paper analytically describes how the outsourced migrant cleaners of British 'indie unions' have channelled their solidarity into collective actions and redressed some of the harshest conditions faced. Drawing on the power resources approach, the paper highlights the importance of no longer assuming the production site as the only crucial arena for precarious workers' power-building practices, as the relative autonomy of the workplace postulated in labour process theory would imply. Rather, this paper suggests extending the analytical gaze outside the workplace to comprise the 'community' and the public sphere where workers' contentious initiatives are also often staged and won.

Outsourcing as Institutionalised Racism: Trade Union Struggles in the Courts and in the Streets

Vera Weghmann[1], Eleanor Kirk[2]

1University of Greenwich; 2University of Glasgow

Our two main contributions in this paper are to: 1) highlight the (racialised) political economy of outsourcing as it operates in the UK – particularly London – and how it has emerged and developed historically towards its increasingly apparent role in constituting capital social relations that are racially segregated and highly unequal, facilitating and perpetuating institutionalised racism and structural disadvantage. 2) We add to the expanding literature on trade unions use of 'legal mobilisation,' using 'strategic litigation' alongside collective action and organising, drawing attention to the simultaneous and overlain nature of legal consciousness. We draw our analysis from a multiple method case-study of the independent trade union, the United Voices of the World's (UVW) campaign against outsourcing, dualistically framed as instances of indirect racial discrimination under The Equality Act (2010) at the same time as a wider social-political struggle more widely against outsourcing as an inherently unjust practice which tends to manifest in institutional racism. Outsourcing allows large organisations to treat encircled groups of workers as 2nd class citizens in the name of 'efficiency.' Specially, our research includes: socio-legal analysis of four legal cases supported by UVW that have addresses outsourcing as indirect discrimination; interviews with the key actors involved in the cases and wider campaigns, including the worker/members who acted as claimants, UVW staff as well as lawyers who acted as external counsel and representatives on the cases; further documentary analysis related to the cases and campaigns.

Lived Caesura And Role Discontinuity In Portuguese International Mobility Assignments.

Joao Vasco Coelho

CIES / ISCTE-IUL, Portugal

Work-related mobility has brought new conditions of action for individuals and organizations, as well as new managerial challenges for in and of organizations. This article analyzes the implications of business expatriations as contemporary global mobility setting, with the empirical support of 24 individual cases observed in the context of five international companies, born or present in Portugal, considered as a semi-peripherical economy. Results suggest that, as a lived experience, being or becoming an expatriate in a company can correspond to a work and life situation permeable to the experience of a sense of contradiction, diffluence and caesura, a circumstance that is associated with inherent objective attributes of an expatriation as contemporary global work arrangement. As research results suggest, this can be linked with short earlier international experience and employee exposure to international work settings, and somewhat aversive mobility-related attitudes, in what concerns job-related resource preservation dynamics. Three expatriate willingness profiles (conformist, protean, disrupted) and six attributes (e.g., permanent temporariness, multiple allegiances, role discontinuity, work-life imbalances, ill-managed return expectations) are described and discussed to this regard, as operators that contribute to differentiate worker agency and mobility subjective experiences.

RN17 | T05_01: Workers' power

Essential Workers in Poland: Unveiling Narratives and Power Dynamics in Industrial Relations During the COVID-19 Pandemic

Alicja Palęcka[1], Karolak Mateusz[2]

1University of Warsaw, Poland; 2University of Wrocław, Poland

Drawing on the Power Resources Approach in our paper we analyze the potential and utilization of the "essential workers" category as a narrative resource by industrial relations actors in Poland during the COVID-19 pandemic. The pandemic crisis provided trade unions with a discursive opportunity structure to introduce pro-worker narratives. In the Anglo-Saxon word the emphasis was placed on "essential work" and "essential workers", serving as an opportunity to strengthen work identities, mobilize, and gain public support in sectors like healthcare, social care, education, or logistics.

Taking into account the macro and micro-level of the ideational power in industrial relations (Carsten, Ibsen & Schmidt 2022), we scrutinize the narratives of trade unions, employer associations, and the government during the first two years of the pandemic. For this purpose we analyze press discourse, official communication on the social media channels of the IR actors, as well as interviews with unionized and non-unionized workers in sectors deemed essential. We analyze the facilitators and obstacles encountered by the narratives about essentiality in the process of identity rebuilding and mobilization.

We hypothesize that the potential of "essentiality" as a narrative resource was not realized, i.a due to cooptation of this narration by employers and silencing it by the state institutions. However, we point at the still existing resources in the direct narratives of workers.

626

Essential, Yet Overlooked – Tensions and Transformations in Cleaning Work during the height of COVID-19 in Germany

Ali Simon

LMU Munich, Germany

Since the global crisis of the Covid-19 pandemic cleanliness was redefined and became dramatically important. Understood as free of viruses and therefore 'safe', cleaning became an existential and conscious element of everyday life. In Germany, cleaning work was officially classified as 'essential', meaning e.g., that cleaning-workers could and should be exempt from lockdown measures, but cleaning remained barely visible, hardly recognized, and materially exploited rather than appreciated. Like many other essential fields of (care – and domestic) work, cleaning is a historically 'outsourced', i.e., intersectionally feminized, precarized and socially disregarded field, in which the proportion of migrant workers is extremely high.

Based on first empirical studies of the heterogeneous professional field of cleaning, my paper addresses the perspectives and experiences of cleaning companies, employers and trade unions during the height of the pandemic in Germany. The paper argues that cleaning is much more than (just) eliminating dirt and germs. Cleaning work often has an interpersonal and caring character, which played a major role especially during the peak phase of Covid-19, when cleaning and labor relationships changed (dramatically) for many.

My focus is on questions related to new forms of tensions and conflicts in a crisis that has especially precarized and massively affected the everyday handling of spaces, invisible actors (viruses, air, diseases, traces of other people's touch, breath, etc.) and one's own body and safety.

The article also explores the questions: How did the various actors experience cleaning work during the pandemic? How were the working conditions for cleaning professionals transformed during the pandemic? What further transformation do stakeholders in the cleaning industry see as necessary? And what lessons have been learned for the post-pandemic world?

Shortage of Skilled Nursing Staff in German Hospitals as Resource for Power and for Justification

Robin Mohan

Institut for Social Research Frankfurt am Main, Germany

The paper deals with complex developments in the field of nursing work in German hospitals. What can be observed here is a case of a dynamic interrelation between welfare policy and industrial relations/action. There has been a shift in the political regulation of nursing work. After decades of economization in the hospital sector, recent years have been marked by various measures aimed at revaluing nursing work by improving working conditions and changing the remuneration system in the hospital sector. These measures have increased the demand for nurses and thus exacerbated the shortage of qualified nursing staff. These developments are at least partly due to the increase in industrial action in hospitals, which is not aimed at better pay but at reducing the workload of nurses (an other staff) and improving the nurse-to-patient ratio. This means that in some workplaces nurses already exercise structural and associational power to shape their working conditions and the new regulation has further strengthened the power resources of nurses, for example by setting minimum staffing levels.

However, despite all these developments, working conditions for ward nurses have not yet improved substantially and across the sector. The question is why? Findings from an ongoing qualitative research project suggest that, in addition to the low level of unionization, the shortage of qualified nursing staff is a crucial but ambivalent factor: while it potentially strengthens nurses' power resources, it also serves as a justification for the reproduction of unsatisfactory working conditions for both employers and employees.

Power Resources and Independent Trade Unionism in Portugal: the Case of the SNQTB (banking Sector)

Maria Antónia Mota[1], Hermes Augusto Costa[2]

627

1Sindicato Nacional dos Quadros e Técnicos Bancários;
2University of Coimbra, Faculty of Economics, Centre for Social Studies, Portugal

One of the frequent debates on the strength (and weakness) of trade unionism within the framework of industrial relations is the debate on "power resources" (Lévesque and Murray, 2010; Schmalz and Dörre, 2013; Lehndorff et al., 2017: Estanque et al, 2020). Such debate is also relevant as it is one of the paths towards the renewal of trade unionism.

This presentation analyses the role of the Sindicato Nacional dos Quadros e Técnicos Bancários (SNQTB), an independent trade union (not affiliated to either of the two main trade union conferederations, CGTP and UGT) whose main mission is the support of bank employees with technical or managerial functions. The aim of this research was to find out (through surveys of the union's members and interviews with its leaders) which type of power (structural, associative, institutional and societal) is considered the main priority.

The conclusion is that, in terms of the predominant power resources in the SNQTB and the union revitalisation strategies that have been implemented, the union's main focus is on strengthening its associative power by providing services to members, especially in the area of health. Although the power of trade unions is currently limited at different levels, the SNQTB has managed to overcome these weaknesses with a constant growth in membership, in contrast to the banking sector (which is witnessing a reduction of workers). The other types of power are also analysed.

RN17 | T05_02: Care work

Shaping the Future: Insights From a Longitudinal Study On Women's Career Aspirations During Pregnancy And Postpartum

Vilma Ražauskienė

Lithuanian Centre for Social Sciences, Lithuania

This longitudinal study delves into the meanings of work for women during a transitional life stage. While the topics of opting out and opting in have garnered considerable attention, certain aspects of career development after childbirth remain underexplored. Existing literature often dichotomises women into two primary groups, and some theories propose a three-group classification. However, such divisions may be overly simplistic and not universally applicable to all women. The objective of this study is to enhance the understanding of women's career aspirations.To achieve this objective, two waves of individual semi-structured interviews with ten women at two specific time points were conducted: during pregnancy and four to six months postpartum [a third wave of the research – a couple of years postpartum – is underway and by the time of the conference will be 80 per cent completed!]. Although convenience sampling was employed for data collection, the research participants exhibited variation in marital status, educational level, number of children, breastfeeding practices, and other characteristics.The results of the study demonstrate that the meaning of work for the research participants varied both during pregnancy and after childbirth. Additionally, some participants unexpectedly adjusted their career aspirations after becoming mothers. The salience of the new identity as a mother is discussed as a precursor to temporarily stepping back from a career with aspirations to re-enter the labour market later on.

Work, Employment And Industrial Relations In Adult Social Care

Emma Hughes[1], Tony Dundon[2]

1University of Leeds, United Kingdom; 2University of Limerick, Ireland and University of Manchester, United Kingdom

Drawing on empirical data the paper contributes to sociological theory, policy and practice by developing a new framework to examine and understand work, employment and worker voice in the adult social care sector in England.

We contribute to research on the adult social care sector highlighting significant concerns regarding low-pay, precarious contracts, training and progression (e.g., Heery et al., 2020; Rubery et al., 2015). However, much empirical research on the adult social care sector tends to focus on a specific organization or service. This paper adds to existing knowledge by examining the adult social care system more broadly.

Our research question is: How are the work and employment challenges in adult social care experienced by actors across the system?

To address the research question semi-structured interviews were conducted with 76 participants working in the adult social care sector. Additionally, 9 interviews were conducted with relevant stakeholders including unions and charities. Respondents were asked about the work, employment and industrial relations challenges in the sector, the implications for different stakeholders and the institutional, economic and social changes required. The empirical data was supplemented with extensive secondary data.

The findings are organized under three themes which adopt a multi-level perspective to contextualise the empirical data. Worker, manager and stakeholder experiences of challenges in the social care sector are linked to individual, organizational and external factors. A framework is developed from the findings which contributes to sociological theory by providing a new perspective on the work, employment and voice issues in the adult social care sector. The analysis also contributes to policy and practice by suggesting how a more sustainable approach could be achieved in adult social care.

Role Conflicts in a Transformed Task Environment. Lessons from Research into Childcare Labour in Germany

628

Ingo Bode[1], Charlotte Herbertz[2]

1Universität Kassel; 2Universität Kassel

Regarding tensions around work and employment, human services can be seen as a very turbulent field in the 21st century. A case in point internationally is organised childcare, given strong policy commitments to develop a sector which had long been characterised by low public recognition and poor working conditions, in part because of its 'feminisation'. Engaging with the case of Germany, we explore implications of the sector facing a new task environment featuring ever more challenging expectations, among which high-end early education, the inclusive treatment of individual needs (including those of disabled children), and action against inequality and social marginalisation, also by developing co-parenting arrangements with families. Drawing on first findings from a research project started recently (together with colleagues from the Berlin School of Economics and Law), we examine the nature of this reconfiguration with a focus on labour-related role-sets arising from the evolving task environment. The paper is based on both a recent scoping review of studies in that sector and interviews with experts who have an overview over recent developments therein. We theorize about ramifications the above reconfiguration might have on the 'negotiated order' of work roles, also in the light of recent strike movements which, however, have widely concentrated on claims related to material working conditions (wages and staff ratios). The analysis suggests that, in the sector under study, the altered task environment elicits unresolved role conflicts susceptible to impede both loyalty-based employment relations and industrial action sensitive to the above reconfiguration and its problematic implications.

The Organizational Adaptation To Employees Who Combine Their Employment With Informal Care For Older Relatives

Andrin Altherr

University of Applied Sciences and Arts Northwestern Switzerland, Switzerland

Topic

Demographic change in Europe is leading to an increasing percentage decline in the working-age population and an associated labor shortage. An increase of the employment of older population cohorts and women are means to counteract this development. However, some older employees have specific needs, one of which is the reconciliation of employment and caring for older relatives, which particularly affects women. This study focuses on the adaptation of organizations in Switzerland and Austria to employees who care for older relatives.

Research question

How do organizations adapt to employees who care for older relatives?

Theory

The organizational adaptation perspective is used as a template to follow the organizational five-step process from (1) "scanning" for employees who care for older relatives to (2) "noticing" the phenomenon to (3) its "interpretation". And from the interpretation to (4) "choosing" among the available options to reconcile employment and caring for older relatives to (5) evaluating the approach to employees who care for older relatives (this final step is called "learning").

Method

In the COMBECA research project (2021-2024) a cross-sectional representative company survey is conducted in Switzerland and Austria. A structural equation model is applied to test the research question. In accordance with the organizational adaptation model, it is assumed that scanning is a predictor of noticing, noticing is a predictor of interpretation, interpretation is a predictor of choosing and choosing is a predictor of learning.

Findings

The findings suggest that the organizational adaptation perspective provides a viable model to assess the relevant factors in how organizations adapt to employees who care for older relatives. Organizations with a higher awareness regarding this challenge are more likely to implement concrete measures.

RN17 | T05_03: Work transitions

Buffering Labor Markets and Jobs: a Note on the Competition over Professional Labor Power

Hannes Landén

Uppsala University, Sweden

That employers' must compete with each other on labor markets to attract labor power could in principle entail an improvement of employment conditions as workers have the opportunity to deselect less attractive jobs. This paper examines Swedish pharmacy employers' strategies to attract pharmacists and, by that, what competition over – in this case – professional labor power means in practice. Swedish pharmacies are legally required to staff with licensed pharmacists who go through a 3-5 year professional university education, which means these employers in the short run will have to compete over a limited supply of workers. In addition, there is currently a shortage of licensed pharmacists, which makes this competition even more strategically relevant to these employers.

Based on an empirical material consisting of interviews (n=58) with pharmacy managers, recruiters and HR-managers, of observations of the employers' participation in labor market fairs, and of job ads, this paper presents results suggesting a partial decoupling between the labor market as an arena for employers' competition, and actual work conditions. The paper argues that the employers on the one hand attempt to differentiate and come across with unique job offers, but on the other hand do so without altering job content or remuneration. A theoretical implication is that the relation between jobs and labor markets may be rather contingent and that employers 'buffer' competition in labor markets from affecting the organization of work.

Job Searching in the Absence of Social Networks and Qualifications: Trying One's Luck on the Handshake Labour Markets

Didier Demazière[1], Marc Zune[2]

1CSO – SciencesPo Paris; 2UCLouvain, Belgium

The relational component of the job search has been extensively studied, in contrast to the so-called formal methods. In the wake of the seminal distinction between strong and weak ties (Granovetter, 1973, 1974), various studies have analysed the morphology of jobseekers' relational networks. Other have identified variations in the characteristics and effectiveness of relational networks: relational vulnerability of unemployed working-class people (Castel, 1994); specificity of networks in 'ethnic enclaves' (Wilson & Portes, 1980), variation in the respective weight of weak

and strong ties according to social position (Lin, 1982). The role of relational networks in getting a job is emphasised and recognised (Forret, 2018; Van Hoye, 2018).

Despite a few exceptions (Gowan, 2010; Lindsay, 2010) the relational dimension of job search of unskilled and/or long-term unemployed and consequently lack relational support, has been less studied. Based on in-depth biographical interviews, we analyse the ways in which they conduct their job search. We highlight three results: a) these unemployed people give priority to informal approaches after having experienced that formal approaches highlight the holes in their career paths and the weakness of their assets; b) lacking relational networks, they develop direct contacts with employers and thus seek to demonstrate moral or behavioural qualities that are difficult to attest to in writing; c) this job search only gives them access to subordinate positions on sectoral labour markets and traps them in degraded jobs and activities. We conclude by emphasising that they circulate in oral and handshake labour markets.

Critical Aspects of Digitalized Labour Market Research: Infrastructure, Instrumentation, and Parametrization of Job Vancacy Analysis

Diogo Silva da Cunha[1], Jorge Caleiras[1], Claudia Marchetti da Silva[2]

1CoLABOR, Portugal; 2CIDEEFF and CoLABOR, Portugal

Digitalization of labour market dynamics is one of the segments of the technological transformation of labour that are receiving less attention from social scientists. The use of job vacancies as a measure of statistical information about the labour market is not a novelty, but the reorganization resulting from the emergence of online job advertisements raises emerging questions. Preferred job search methods vary depending on qualifications. However, 90s' job portals maintain historical and situational relevance. The state of the art on online vacancy analysis is, notwithstanding, characterized by a strong contrast. While sociological research has favored the use of survey-based datasets, operational research in several engineering and management subareas has promoted (automatized) content analysis of online advertisements. Insofar the former tends to ignore the online job portal landscape, the latter tends to ignore limitations inherent to the national legal systems and to naturalize social categories. In this presentation we seek to overcome these difficulties discussing three critical aspects of digitalized labour market research. Within the scope of the first dimension, infrastructure, we map the aspects of digital transition involved in job vacancy analysis. The examination of the second dimension, instrumentation, focuses on the characterization of a set of labour market information instruments. The third dimension is parameterization and allows us to define the main categories used in this market. The synthesis of these dimensions feeds the definition of a sociologically informed strategy for the design of an online job vacancy plataform and its respective methodology.

Employability And Contemporary Labour Subjectivities: Analysing Evolving Narratives On Unemployment

Clara Acuña Rodríguez

University of the Basque Country, Spain

Theoretical framework: Since the 1990s European labour policies and the epistemic framework of interpretation and intervention on unemployment have experienced a reconfiguration, within the "labour activation" paradigm. This shift has emphasised the psychological and personal aspects of unemployment, influenced by coaching and self-management approaches. Concurrently, the administration of labour activation programmes for unemployed individuals has been decentralised through private entities that depend on external funding.

Research question: This study aims to explore the impact of participation in these programmes on the development of the discourses and labour market insertion trajectories of participants, focusing on primary discursive tensions. Additionally, an analysis will be conducted on the role of outsourced career guidance staff, who promote the activation discourse while dealing with the precarious nature of their positions.

Methodology: The fieldwork involves a range of programme group session observations in selected locations in Spain, according to socio-economic factors. These observations have helped to identify aspects for further exploration through qualitative interviews with career guidance staff and participants vulnerable to unemployment (considering gender and age).

Preliminary findings/conclusions: Previous studies suggest that this intervention model encourages the generation and regulation of subjectivities aligned with market requirements, beyond labour market insertion. Each individual is responsible for their employment inclusion, turning the paradoxes of the intervention model into personal factors and leading to demotivation, and self-blame among participants.

Original contribution and significance: The nature and extent of the impacts of these labour activation programmes have been examined primarily from cost-benefit economic perspectives. There is a need to qualitatively explore the consequences of the underlying psychologisation and disciplinary logic as well as the forms of submission and resistance generated.

In a challenging and uncertain labour context with emerging segregation sources among vulnerable groups, it becomes essential to promote labour market insertion itineraries aligned with their needs and demands. This involves an imperative discussion on the implications of the unequal distribution of duties and responsibilities within the activation paradigm.

Notes: The author has never previously joined the ESA Summer School. Due to ongoing research fieldwork, conclusive analyses are pending.

RN17 | T05_04: Digital and energy transitions

Energy Transition As A Process Of Social Change: Employment, Energy Poverty And Fair Decarbonization

Madalena Duque Santos

Instituto de Ciências Sociais, Universidade de Lisboa, Portugal

The response to the global climate crisis requires structural change in the current energy production and consumption system, and its planning must integrate the socio-economic conditions of the agents involved in the process, as to ensure a just transition that entails the reconciliation of climate action and social protection.

Throughout the year 2021 Portugal has permanently closed its two coal-fired power plants – in Sines and Abrantes, resulting in the extinction of hundreds of jobs (450 in Sines, representing 8% of its employed population; and 200 in Pego, 3% of the employed population of Abrantes), according to the European Commission (2020). At the same time, there is an increase in the presence of infrastructure to produce energy from renewable sources, in the context of the application of national, European and international policies for the decarbonization of energy production.

This presentation focuses on the analysis of the potential social impacts of energy transition on two interrelated dimensions of the just transition: employment dynamics and energy poverty, in the municipalities of Abrantes and Sines. The methodology to be applied to assess whether there are implications on employment and on energy poverty will also be presented. By understanding this context and key concepts, it will be possible to discuss relevant social outcomes of energy transition in literature review, and the preliminary results.

Opportunity or Constraint? Path Dependency in the Regulation of Work in the Just Transition

Vera Trappmann, Jo Cutter, Felix Schulz

Leeds University Business School, United Kingdom

Considerable commentary has emerged on the positioning of trade unions towards the climate crisis and climate mitigation policies (María-Tomé Gil, 2012; Stevis et al., 2018) with organised labour often seen as caught between more regressive and progressive strategies towards climate change (Thomas and Doerflinger, 2020; Pulignano et al., 2023). Less is known about the union role in emerging forms of labour market institutions that regulate work and support those facing change to existing jobs and skills requirements in the green transition. Drawing on data from a comparative study of the role of organised labour in Just

Transition in 13 countries, this paper focuses on three European nations with distinct employment models: Germany, Spain and the UK. The paper outlines the innovations taking place in the creation or re-focusing of labour market institutions taking place under the broad concept of just transition. In Spain, the creation of a Just Transition Institute has overseen the development of sectoral and territorial just transition agreements. In Germany, the policy of short-time working allowances, Kurzarbeitstransformationsgeld, has been adapted to the new challenges within the greening of work. In the UK, the lack of social dialogue or tripartite bargaining mechanisms has led to a variety of forms ad-hoc institution building, including successful lobbying for a more formal Just Transition Commission in Scotland and informal initiatives focused on collective responses in specific sectors such as steel, automotive and housing or at the workplace level. The paper examines how existing national systems of employment regulation have shaped the specific just transition responses, the role of labour movements and the implications for workers in the transition to net zero.

Navigating Autonomy: Unraveling the Dynamics of Remote Work and Digital Technologies in the Post-COVID Era

Tereza Svobodová, Vanda Černohorská

631

Institute of Philosophy of the Czech Academy of Sciences, Czech Republic

This paper investigates the relationship between personal autonomy in terms of the time, place, and performance of work and the use of digital technologies (DT) to work remotely. Drawing from the multidisciplinary project, TIMED (TIMe experience in Europe's Digital age), we investigate post-COVID-19 digital practices in Czechia, Switzerland, Poland, Germany, and the UK, examining their implications for individuals' professional and personal lives. Our findings are based on semi-structured interviews (n=450). From our interviewees' perspectives, the COVID-19 era marked a pivotal moment when remote work, facilitated by DT, experienced a sudden surge. Subsequently, for many positions, this option of working remotely or in a hybrid mode has persisted. Despite the advantages of increased flexibility in choosing when, where, and how to work, we identified various challenges that paradoxically impact workers' autonomy. While remote work using DT has been embraced for improving work-life balance, issues such as constant accessibility, blurred boundaries between work and personal life, and a higher workload (ironically caused by more efficient task accomplishment, such as online meetings instead of in-person meetings) have emerged. Despite the continued appeal of the flexibility remote work offers, particularly for individuals with caregiving responsibilities, it introduces tensions and potential risks of exhaustion, isolation, and a loss of drive. In collaboration with trade unions, a key cooperation partner in the TIMED project, we emphasise the necessity for more effective regulation of remote work enabled by DT and a comprehensive understanding of its

implications within broader sociocultural contexts with a special focus on gender+ inequalities.

Digitalization: Boon or Bane for Fluid Workforce? A perspective from India

Vrinda Viswanath Nair, Diganta Chakrabarthi

RV University, Bengaluru, India

A VUCA business environment accompanied by a rapid revolution in digital technology caused radical changes in organizations' talent management processes. In the post-pandemic business environment (termed by some as BANI – Brittle, Anxious, Non-linear, Incomprehensible), hybrid work models have become a norm. Agility, Adaptability, and Flexibility have become synonyms for the new work regime. In India, the workforce consists of independent workers, freelancers, gigs, and crowd-sourced workers (apart from full time employees) who play a pivotal role in the dynamics and success of the organizations.

The fluid workforce has become an important part of the success stories of organizations in India to meet spikes in demand or respond to crises. AI and Automation have created new roles like drone operators, AI developers, etc, that fluid workers can easily deliver. The new normal of 'remote working' has also changed the perception of how employees want to work without being fixated on a physical space to meet and fulfill their work and other requirements. An emerging nation like India has adopted the novel revolution due to the sheer presence of a technologically savvy young workforce and the widespread usage of smartphones and other gadgets.

In our research, based on surveys and case studies in India, we look at the recent developments in talent management, particularly in the fluid workforce. We critically review the status of crucial workforce issues like workers' rights and recognition, compensation and benefits, skill development and career growth opportunities.

RN17 | T06_01: The inequality of job quality

"Have You Ever Been in Burnout? Maybe, But I Am Not Sure" – Preliminary Results of a Survey on Burnout Among Portuguese Public Servants

Teresa Pinho Ferreira

Iscte – University Institute of Lisbon, Portugal

Burnout, defined as an occupational phenomenon by the World Health Organization (2019), has been studied since the 1970s. Since then, most studies have focused on human care occupations, coming from the psychological field, and adopting a positivist approach, operationalized by psychometric scales to measure occupational burnout.

Although in countries such as Portugal human care jobs are mainly performed in the public sector, studies on burnout in public servants whose work is not dedicated to human care are scarce, and no studies based on a sociological perspective have been found.

In a post-pandemic work scenario, where changes have shed light on work-related suffering, it is crucial to find multilevel and interdisciplinary knowledge on occupational burnout, especially in the broad field of public servants.

In order to fill these gaps, the online survey "Burnout among central government employees" was designed and conducted, targeting civil servants working in central public administration services in Portugal. Inspired by the framework of strategic analysis and adopting a descriptive statistical approach, this paper provides an organizational profile based on: 1) individual experience of occupational burnout and 2) main causes of occupational burnout in public administration.

The survey was carried out between February and October 2023 in three public organizations from different areas of government and it gathered 214 employees.

Of the 199 participants who had heard of burnout, 59 said they had experienced it (in the past or in the present) and 50 participants indicated the answer "maybe, but I am not sure".

The primary causes for occupational burnout at public administration organizations picked out by the survey were: 1) "daily work based on the need to respond to urgent and one-off requests"; 2)"leadership profile and behavior"; 3) "the system of performance evaluation"; 4) "competitiveness and hostile behavior between colleagues/superiors"; 5) "use of spare time to respond to work demands", and 6) "intimidation/bullying".

The results highlight the importance of understanding how this social phenomenon is shaped by the work organization model that frames public administration organizations in terms of working conditions and relationships, but also work-life balance and work organization.

632

Moonlighting: Understanding The Quality And Consequences Of Working Multiple Jobs

Wieteke Séphier Conen

University of Amsterdam

The contribution will present the ERC Starting Grant 2023 research project MOONLIGHT (Moonlighting: Understanding the quality and consequences of working multiple jobs). The project is a transdisciplinary and multi-method study of the quality of work and wellbeing of contemporary multiple jobholders. Working in the new economy is increasingly of a flexible and fragmented nature. Moonlighters, or multiple jobholders [MJHs], can be considered emblematic of how work fragmentation and combinations affect the quality of work and total worker wellbeing. MOONLIGHT will research the quality of work in first, second and other jobs and how this translates into total worker wellbeing. I introduce this concept of 'total worker wellbeing' to refer to the complex interdependencies and co-existence of features. This is both conceptually and empirically ground-breaking, as conceptual research and the development of comprehensive scales on wellbeing at work is still in its infancy and its inclusion enables researchers to make meaningful comparisons between groups of workers – both single and multiple jobholders. MOONLIGHT will study the quality and wellbeing of MJHs through comparative research in seven advanced economies: Denmark, Germany, Italy, the Netherlands, Poland, the United Kingdom and the United States.

In the presentation the literature review and analysis of international surveys on concepts and indicators of quality of work and wellbeing at work will be discussed.

The Distribution of Job Quality Within a Liberal Employment Regime: The Case of Ireland

John Geary[1], Lisa Wilson[2]

1University College Dublin, Ireland; 2Nevin Economics Research Institute, Belfast

A great deal of international research on job quality is concerned with measuring and identifying inter-country variation (Davoine, 2008). There is also considerable research examining whether the distribution of high or low quality jobs is explained by countries' institutional and employment regimes (Gallie, 2007; Holman, 2013). While there is much to commend this research, the level and focus of its analysis tends to depreciate the variation in job quality within countries and the variable manner in which different job attributes combine to create discrete job types.

We address this weakness by examining whether distinct job types are identifiable within one particular liberal employment regime country, that of Ireland. After reviewing the evidence, we then problematise the usual manner in which Ireland's labour market and workers' job quality is typified in international comparative research.

The data used in this study are derived from the Working in Ireland Survey, 2021.

We identify five job type clusters. They are (their distribution in the labour market is indicated in parentheses):

1. demanding, highly controlled, precarious jobs (14.9%);

2. precarious, low-paid jobs (12.1%);

3. secure, moderately good, unionised jobs (26.3%);

4. secure, moderately good, jobs with strong employee-management relations

(25.7%);

5. secure, high-quality jobs (21%).

The paper's empirical analysis is complete but its placing in its theoretical frame needs further development and refinement. It is at this point work in progress.

Job Quality in Portugal: The Importance of Collective Interest Representation and Voice

Dora Fonseca, Pedro Estevão, Ana Ferreira Teixeira, Jorge Caleiras, Diogo Silva Cunha, Filipe Lamelas

CoLABOR, Portugal

The collective dimension of labour relations occupies a prominent place in Industrial Relations. Over the last few decades, a vast set of transformations, such as the advancement of new technologies and digitalization or the emergence of new corporate/management strategies, have boosted logics of individualization of labour relations and decollectivisation.

Collective organisation and representation of workers and the institutionalisation of their action are crucial aspects and influence variations in job quality (Gallie, 2013; Gevaert et al., 2018). Attention has been drawn to the existence of a significant relationship between the centralization of the collective bargaining system, coverage rate of collective agreements and union density and a series of job quality indicators, highlighting the importance of social dialogue, but also to the importance of the (direct) participation of workers, particularly in the workplace. Representation and collective bargaining are taken as central dimensions (ILO, 2015; Piasna, 2023; Gallie, 2013; Gevaert et al., 2018).

Starting from the idea emphasized in the literature that collective interest representation and voice – which includes employee consultation, trade union representation, employee involvement in decision-making and collective bargaining – is a determinant of job quality, both from the perspective of workers and employers, it is intended to characterize Portugal regarding this dimension of job quality. Statistical indicators as well as qualitative data will be mobilized for that effect. In addition, an account of the evolution of the Portuguese reality in that field will be presented and its implications discussed.

The Re-Regulation Of Gig Work In Logistics: Labour Shortages, The Role of Unions And Workers Experiences Of Hybrid Statuses In An English Warehouse

Jo Cutter, Gabriella Alberti, Nicky Stubbs

University of Leeds, United Kingdom

This paper draws from a workplace-based case study of a major warehousing and delivery company in the UK exploring the trade union role in the regulation of gig work amongst self-employed couriers. The evolution of the sector has been notable for the move towards less regulated work, typically through forms of self-employment in delivery and courier services (Rolf et al., 2022). Studies exploring workers' ability to counter work intensity and precarity generally conclude this to be a hostile terrain for union organising set in the context of deep transformation using algorithmic control and lean management principles (Mrozowicki and Pilch, 2021; Gautié et al., 2021)

In this case study, a union agreement with one of the UK's leading warehousing and delivery companies that offers self-employed workers an option to transfer to self-employed 'limb b' status is a rare example of the re-regulation of courier work. Set within a larger ongoing research study across four low-paid 'migrant-rich' sectors facing labour market shocks in the post-Brexit and post-pandemic era (Alberti et al 2021) this paper examines the conditions that led to the agreement, the ways in which workers experience and engage with the hybrid option and the motives and outcomes for the union in engaging in this form of the re-regulation of gig work. Qualitative data from the in-depth workplace case are complemented by analysis of data from an original survey of UK warehousing employers and stakeholder interviews. The paper develops an argument about union role in the stabilising warehousing work and examines the tensions this creates for union organisation.

Inter-union Conflict in the Logistic Sector: Outcomes for Unions and Workers

Andrea Signoretti[1], Marcello Pedaci[2], Sabrina Perra[3], Katia Pilati[4]

1Department of Sociology and Social Research, University of Trento, Italy; 2Department of Sciences of Communication, University of Teramo, Italy; 3Department of Political and Social Sciences, University of Cagliari, Italy; 4Department of Sociology and Social Research, University of Trento, Italy

The area of workers' mobilization and representation is currently populated by multiple actors such as not profit organizations or grassroot unionism adding to established unions. Relationships between different actors have been especially studied within Anglo-Saxon countries where alliances have been observed. We follow recent research concerning Western European countries to investigate the case of Italy and the relationships between established unions and grassroot unions. The latter have particularly developed in sectors where employment conditions are poor. Theoretically, we engage systematically with the social movement literature considering the concept of frame bridging, frame contestation and the political opportunity structure. We also investigate if collaborative or conflict-based relationships yield positive outcomes for unions (i.e. membership expansion across firms) and workers (i.e. employment conditions improvements). We focused on the logistic sectors Bologna area in Italy, one of the most important logistic hubs in Europe. Si Cobas, a grassroot unions, resulted prevalent followed by the established unions Filt-Cgil. Local union officers were asked to indicate firms they considered representative of their activities and to differentiate them on the grounds of gender, size (large and medium) and prevalence of each type of union. We interviewed 38 people among union officers and shops stewards. Our results show a situation of fierce frame contestation between Si Cobas and Filt-Cgil. At the same time, an involuntary division of labour emerges from unions limiting their expansion, while workers are successfully defended by one of the two unions according to the political opportunity structure of business models.

634

Content Creators And Logistics Workers: The Algorithmic Instability Of Labour

Arianna Petrosino, Camilla Volpe

Università Degli Studi Di Napoli Federico II, Italy

The literature emphasizes the ongoing psychological pressure on young adults due to global neoliberalism, leading them to internalize guilt for their perceived incapacity in an unjust system. Despite developing coping mechanisms, this generation accepts precarity as inevitable, hindering structural change efforts.

In this contribution, we intend to examine the inextricable link between precarity and algorithms. We will explore some crucial aspects of how automation affects work, such as the reshaping of the employee-employer relationship and the redefinition of the nature of labour itself.

We aim to observe these dynamics in action by examining two different case studies. Firstly, we will analyse the world of platform workers, specifically content creators in the second-hand economy. Secondly, we will investigate the relationship between algorithms and control by studying warehouse workers in a multinational e-commerce firm. We will draw on semi-structured interviews and ethnographic (traditional and digital) observation.

The interconnection between precarity and algorithms that we expect our case studies to confirm is one element that

highlights that the impact of automation on work is more widespread and broader than we expect. Firstly, we expect precarity to arise as a fundamental structural requirement for the use and operation of algorithms, creating the ideal conditions for their implementation. Secondly, it should be emphasised that precarity is not only a condition related to employment but also extends its influence on an individual's entire life, permeating it with dynamics of control, self-management, competitiveness, and insecurity.

RN17 | T06_03: Regulation of platform work

Platform Cooperativism In The Food Delivery Sector. The Case Of Coopcycle

David Pac Salas, Jaime Minguijón Pablo, José David Moral Martín

Universidad de Zaragoza, Spain

The term platform cooperativism was coined by Scholz (2016), who sought to describe business initiatives with a social focus, different from platform capitalism. The aim of the paper is to present the results of a research carried out from a distributive perspective through a survey of the co-operatives associated with CoopCycle. CoopCycle is a federation of local cooperatives operating in 12 countries with 72 bicycle food delivery cooperatives that have a cooperative project and wish to work with social and ecological enterprises. To do so, we propose to operationalise the concept of 'creative resistance'. Specifically, we define 'creative resistance' as an opposition, whether collective or individual, to the market system that, in addition, is characterised by the search for social transformations through innovative and sustainable strategies within the Social and Solidarity Economy (SSE) (Moral-Martín, Pac and Minguijón, 2023). To carry out this process we have considered three basic dimensions of creative resistance: the governance of cooperatives, democratic algorithmic management, and working conditions and labour relations.

635

Protecting Platform Workers In Europe: What Can We Learn From The Differences Between Southern And Northern Countries?

Sara Ambrósio, Lara Patrício Tavares

Centro de Administração e Políticas Públicas, ISCSP, Universidade de Lisboa, Portugal

This paper seeks to explore how different European countries within the European Union have been tackling the challenge of granting social protection to platform workers.

Our contribution is threefold: to identify the barriers faced by platform workers in accessing social protection; to look at how different European countries have been protecting freelancers and self-employed, as this may suggest possible ways of extending social protection to platform workers; and, to provide evidence on what has been working and what needs to be improved, by analyzing the differences/similarities in the legislation on platform work in the few countries which have adopted it.

Document analysis will be used to compare the barriers to social protection faced by platform workers in countries

with different levels of generosity in their welfare state models and statutory employment laws. To do so we will create two clusters of analysis composed of southern and Scandinavian welfare states.

The mapping exercise of the measures taken to provide fair working conditions for all types of work and the subsequent analysis, by helping us to grasp the different level of compliance with EU guidelines between the countries, will help us to identify which welfare model has been most successful in protecting platform workers from precariousness and social exclusion. Analysis of the legislative acts and welfare reforms adopted following the creation of the EPSR action plan will make possible to compare the performance of the two welfare models, at a particularly crucial time when Europe is seeking to strengthen its social dimension.

Risks, Occupational Diseases and Possibility of Legal Regulations for Platform-Based Delivery Workers in Turkiye

İsa Demir

Zonguldak Bülent Ecevit University, Turkiye

There are important debates on couriers' working conditions and occupational diseases in social science. In the last three years, at least 136 motor couriers have lost their lives due to work accidents in Turkiye. The number of couriers who are unable to work due to injuries and emerging occupational diseases is unknown both in Turkiye and Europe. Motor couriers are classified as self-employed and isolated from legal protections. This job is not categorized as dangerous work, despite being open to all kinds of risks. Having a motorcycle is considered sufficient to do this work, and there is no definition of occupational disease for couriers. Interviews with 20 couriers show that sitting on the motorcycle for long periods, being exposed to the wind, to extreme heat due to helmet use in summer and to the effect of extreme cold in winter, being deprived of breaks and rest areas, and working by straining the joint areas are situations that indicate possible diseases specific to this profession. Despite all these facts, the high-profit expectation of delivery platforms, being a new profession, including the young workforce, and the lack of unionization and organization are the main reasons for the lack of regulation. However, in many regions, there have been protests and movements by delivery workers. This study aims to reveal the new areas of tension created by delivery platforms, to open up a discussion on secure and healthy work arrangements, and to address the possibilities of transformation in working life. This is because the reduction of tensions, the creation of an environment of trust, and the possibility of transformation cannot be understood independently from the field of industrial relations.

The Future of Social Dialogue in the Platform Economy: The Case of Slovenia

Blaž Rodič[1], Maja Turnšek[1], Maja Breznik[2], Jerneja Šavrič[1]

1Faculty of Tourism, University of Maribor, Slovenia; 2Peace Institute, Slovenia

This paper presents results from the research project "The future of social dialogue in the platform economy: The case of Slovenia", funded by the Slovenian Research and Innovation Agency. Slovenia's political system has a long tradition of strong labour regulation with trade unions representing the core of workers' rights movements. The global digital platform economy brings important challenges to this labour system at the global periphery.

Through co-participatory research in partnership with The Association of Free Trade Unions of Slovenia we examine how platform management practices, strategies and actions of workers and government regulation of mostly precarious non-standard forms of employment interact to shape pay and working conditions, enable control of the work processes and influence the bargaining position of platform workers. Focusing on delivery workers of Wolt and Glovo, we collected data with discourse analysis of platform website and public statements, interviews with the platform workers and their union (set up in 2023), and analysis of national regulation. Inspired by the systems thinking approach, the data was used to build a system dynamics (SD) model aimed at providing insight into the platform labour market dynamics in Slovenia and causal relationships between the stakeholders. System dynamics is the methodological aspect of systems theory, allowing us to model and study the dynamic behavior of complex systems. A causal diagram was drawn up to identify the variables, their mutual influences, and recognize causal loops, then the relationships between variables were formalized and statistical data were used to construct the SD model.

636

RN17 | T06_04: The segmentation of work in the platform economy

This joint session looks at the segmentation of platform work, combining research on specific categories of platform workers such as temporary migrants and domestic workers, and at specific cases of regulation and mobilisation

Visa Categories in Platform Labour: The Working Holiday Visas fuelling Berlin's Gig Economy

Barbara Orth

Free University of Berlin, Germany

As studies from across the world have highlighted, gig work is predominantly carried out by migrants and racialised workers (ILO, 2021; Piasna et al. 2022). Yet, although migrants are overrepresented in place-based platform work, very few studies systematically incorporate the role of visa and immigration regimes in their analyses of platform labour. Yet, visa categories and legal statuses not only have a profound long-term impact on migrants' lives and work trajectories, they also segment and shape labour markets. To address this research gap, this study takes one visa category, the so called 'Working Holiday Visa' (WHV), as a starting point to answer the following research question: how do migrants experience the nexus between visa-related temporariness and the transient nature of platform work?

For its theoretical framework, it draws on the literature of place-based platform work and the concept of 'middling migration' (Conradson and Latham, 2005). It employed multi-sited ethnography to trace the trajectories of prospective migrants from their pre-departure plans in Chile to the realities of 'making ends meet' once they arrive in Germany and take on platform jobs. The biographically focused interviews shed light on the process of 'becoming' a platform worker, and highlights the importance of diaspora networks, without which most of the research participants would not have engaged in platform work. The preliminary findings suggest that the temporariness of the visa is what makes platform work bearable for the migrant workers despite the precarity of the working conditions.

This paper contributes a closer look at the role of government regulations, and specifically of visas in the functioning of the platform economy. Rather than assuming all migrant workers are by definition marginalized and disempowered vis-a-vis platforms, the study understands them as 'middling migrants'. By researching platform workers who fall into middling migration categories the paper contributes empirical evidence leading to a more nuanced understanding of what being a migrant platform worker means.

I have never attended an ESA conference or Phd Summer School.

Negotiating Agency in Domestic Platform Work in Turkey and Russia

Kadir Uysal, Andrey Shevchuk, Denis Strebkov

Higher School of Economics, Russian Federation

While platform work attracts a lot of attention in terms of delivery and ride-hailing works, domestic work offered through platforms is an under-studied sub-field, although with a recently rising scholarly interest due to personal nature of domestic work, implications for gender issues, as well as to invisibility and informality of workers inherent in all kinds of domestic work. The article is based on the implications of platform-based domestic work on labour control, where due to the personal nature of domestic work, the role of clients are significantly increased in the control of workers, at the expense of algorithmic control features present in other forms of platform work. In domestic platform work, despite being present and dominant in matching, evaluation or arbitration phases of intermediation, platforms are missing in the work phase, due to difficulties in the algorithmic control of such work. We studied the interplay of worker and client agencies and the resulting negotiations in the absence of algorithmic platform control. We relied on qualitative data gathered from workers in home repair work platforms in Turkey and Russia. We found that platforms aim to control worker behavior by ensuring client superiority through various platform mechanisms. How workers respond to such control is dependent on country contexts and platforms designs. In such, the study is a contribution to the understanding of varieties of platformization under different forms of work and in comparative national contexts

637

The Flexible Platform Firm – Segmentation of Working Time in the Gig Economy

Christian Haldrup[1], Anna Ilsøe[2], Trine Pernille Larsen[3], Jonas Hulgård Kristiansen[1], Jakob Demant[1]

1University of Copenhagen, Department of Sociology, Denmark; 2The Danish Center for Social Science Research, Denmark; 3IER, University of Warwick, UK

The re-organisation of work via digital labour platforms has introduced fully flexible work schedules in courier services such as food delivery. However, little is known about the working activity and related inequalities evolving on such platforms. This article examines the working time patterns of food couriers (N = 20,090), supplemented by demographic characteristics, on a leading Danish platform over six years (2017-2022). The article combines a longitudinal research design with the segmented labour market approach (SLM). It identifies three segments of platform workers: Dabblers (part-time and few hours over a few months), Temporaries (part-time over several months) and Regulars (long part-time and full-time for around a year). The discussion suggests that the platform's core workers (Regulars) relate to

labour market outsiders with few job opportunities,while the periphery workers (Dabblers) instead are labour market insiders with better job opportunities. This suggests a reverse dynamic within the workforce composition on these platforms compared to Atkinson's (1987) conceptualisation of the flexible firm.

There's More to Struggle. IR Dynamics in the Platform Economy: The Case of Poland

Olga Gitkiewicz, Szymon Pilch, Adam Mrozowicki

Uniwersytet Wrocławski, Poland

This presentation examines the role of workers' and employers' power resources and the impact of the infrastructural power (Mann 1984) of GAFAM (Google, Apple, Facebook, Amazon, Microsoft) on the industrial relations (IR) landscape, with a particular focus on the case of Poland. The expansion of the platform business model challenges traditional IR: worker and employer are being redefined, traditional forms of employees' organising are changing. Traditional employers, struggling with the consequences of the influx of global capital, are seeking new avenues for business lobbying, and institutions are seeking new legislative solutions. In the paper, platformisation in Poland is analysed through the lens of theoretical debates on 'patchwork capitalism' (Gardawski, Rapacki 2021) and 'dependent market economy.' It is hypothesized that it adds to the heterogeneity of the institutional order and undermines the power of organised labour and domestic employers by magnifying the structural dependency of economy on foreign direct investments. Drawing from expert interviews with the IR actors supplemented by a variety of secondary sources, we analyse the strategies of different actors and the nuanced interaction that facilitates the entry and expansion of global actors, especially Big Tech, in Poland. Next, we present a case study of Amazon in Poland which has been an arena of diverse labour protests for years. Based on interviews with workers, managers and public administration, we explore the impact of the Amazon model of platformisation on conflicts between capital and labour and the transformation of interest representation. In conclusions, the contradictory implications of platformisation for the Polish variant of DME are discussed, including the emergence of new radical trade unions, new employer organisations and challenges for the established ones.

RN17 | T07_01: Employability

Strength and Activation of Job Relevant Social Networks among Persons with Mobility Disabilities

Frederik Thuesen[1], Ditte Shamshiri-Pedersen[2]

1VIVE – The Danish Center for Social Science Research, Department of Work and Late Life; 2Aalborg University, Department of Politics and Society,

The strength of social networks that may potentially assist persons with disabilities find a job is an underexplored field within sociology. This paper aims at shedding light over this topic based on a survey targeting a representative sample of the Danish population (N=5835), with an oversampling of persons with mobility disabilities. We find that persons with major mobility disabilities have fewer job relevant social contacts, especially among friends and acquaintances, compared to persons without disabilities. We also find that among persons with mobility disabilities, subjective health correlates positively with network size. Finally, we find that persons with minor mobility disabilities are more reluctant to reach out for help seeking to find a job from their networks ties. These results underscore the difficult situation of persons with mobility disabilities concerning access to employment relevant network resources and concerning activating these resources.

638

Rise of Remote Work Across Borders: Opportunities and Implications for Migrant-Sending Countries

Inese Supule

University of Latvia, Latvia

Contact restrictions imposed during the Covid-19 pandemic have contributed to the rapid expansion of remote work. With the rise of remote work, new opportunities arise for the typical migrant-sending countries in Central and Eastern Europe to both i) remotely involve their diaspora in their labour market, and ii) to promote return migration, as more returnees have an opportunity to keep their employment abroad. The aim of this paper is, by using the case study of Latvia, to show the potential of cross-border remote work for alleviating human capital losses caused by emigration. The author evaluates the main obstacles and necessary adjustments in taxes, social benefits, labour market regulation and other areas to facilitate the labour market transition and show what incentives the country can use to become a place of choice for performing remote work for the diaspora and return migrants. Combining the perspectives of employers, employees, and the government, this study sheds new light on the challenges and opportunities related to the rise of remote work for countries suffering from emigration. The comprehensive analysis builds on triangulating

secondary data, analysis of policy documents, a survey of employers, as well as a survey and in-depth interviews with cross-border remote workers.

Quitting The System: A Critical Investigation Of Quiet Quitting

Aron Szalay, Zsófia Rakovics

ELTE Eötvös Lóránd University, Budapest, Hungary

Quiet quitting has become widely known and researched since the Covid-19 pandemic. The phenomenon implies that employees only do the "required minimum" at work, not more than the contractual agreement (Lee et al., 2023). This trend goes seemingly against the tendencies of neoliberal societies, where the traditional boundaries of work and life have been increasingly blurred since the widespread accessibility of the internet (Voswinkel & Kocyba, 2005). Working from home changed the dynamics of work-life balance and brought new challenges to white-collar workers.

This research investigates quiet quitting from the perspective of the employees, and deals with it as a possible response to the advancement of neoliberal capitalism. In contrast to the mainstream approach of considering quiet quitting as a management issue (Johnson, 2023), this study argues that it is systemic and cannot be dealt with on the level of individual workplaces.

The novelty of our research is the qualitative investigation of quiet quitting, that gives place to the subjective interpretation of employees, providing an in-depth insight into the issue. The standpoint of quiet quitters will be highlighted through semi-structured interviews, connecting their feelings to the critical literature on neoliberalism, and the notion of alienation (Han, 2015; Honneth & Ash, 1982). The results suggest that employees at a workplace where the overall satisfaction with management is high, still quiet quit and disengage, as a result of their perceived meaninglessness of the job.

Take a Step Back to Make Two Forwards – Suplementig Labour Process Theory with Rental Theory of Ownership

Bartosz Mika

University of Gdańsk, Poland

The relationship between labour process theory (LPT) and Marxist Political Economy has always been ambivalent. The theoretical school, originating from groundbreaking work of marxian scholar Harry Braverman obviously frequently draws inspiration from Marxism. However, as Rowlinson and Hassard (2000) argue Braverman's work was influenced mostly by Baran and Sweezy's Monopoly Capital which deviated from Marx's political economics by replacing the analysis based on the theory of value with the concept of economic surplus. Rowlinson and Hassard (2000) demonstrate that the emergence of LPT has resulted in significant disputes with Marxism, particularly regarding the differentiation between labour power and the labour process.

The presentation will aim to assert that the Labour Process Theory should reconsider its connection to Marxism. It does not imply a direct adoption of revolutionary Marxism as outlined by Rowlinson and Hassard (2000), but rather a notion that can strengthen certain overlooked elements of the LPT. Specifically, we are discussing a shift away from analysing ownership, which is significant in the theory of exploitation but less significant in terms of power relations. Conversely, in Marx's original writings, power relations are explained by ownership relations, rather than the reverse. Regardless, the implementation of the rental theory of ownership, as proposed by Polish sociologists Stanisław Kozyr-Kowalski and Jacek Tittenbrun, can greatly benefit LPT.

The presentation will aim to identify the specific areas where the rental theory of ownership can enhance the analysis within the framework of the LPT, with a specific focus on the challenges related to the ownership of labour power and the class positioning of managers (and consequently, the differentiation between ownership and control).

RN17 | T07_02: The nature of employment relations

Employment Relations Effects on Socio-Politically Regressive Beliefs: Cross-National Empirical Evidence from Europe

Margaret Huizinga, Ryan Lamare

University of Illinois Urbana-Champaign, United States of America

While it is well-known that spillovers occur between workplace employment relations practices and wider civic society, examinations of these spillovers focus largely on individual and collective voice consequences for politically neutral civic participation acts like voting and signing petitions. The spillover from employment relations to other types of wider socio-political beliefs and attitudes is less established. Drawing from social capital theory, social identity theory/self-categorization, and the contact hypothesis, we theorize that positive employment relations (employee autonomy, voice, teamwork, collaboration, and support) may increase trust in others, norm compliance, and reciprocity. This is theorized to reduce individual-level socio-politically regressive beliefs, which we measure through conspiratorial thinking, climate change denial, support for authoritarianism, opposition to redistribution, and support for xenophobic and anti-LGBT policies. Using empirical ESS data from 31 European countries in 2020-2021 (Round 10), we find various spillovers between employment relations and socio-politically regressive beliefs. The effects hold after conditioning on numerous potential confounders, including the individual's own political ideology. Our findings have implications for the wider social and political consequences of workplace employment relations and suggest broadly that positive employment relations may help curb the development of socio-politically regressive beliefs.

Trustful Relationships in Local Employment Relationships

Glenn Sjöstrand, Bengt Larsson, Ylva Ulfsdotter Eriksson

Linnaeus University, Sweden

Trust is a crucial component of effective local employment relations within firms. Research indicates that trustful relationships between employers/employer representatives, like managers and HR-professionals, and employee representatives, like trade unions, are essential for the functioning, efficacy, and performance of different institutions, organizations, and firms. However, less is known about the importance of personal relationships in building and maintaining trustful interactions and the dimensions of trust that exist in these relationships. Sweden is used as a case based on the long tradition of the "Swedish model" and the recent changes in this model and for its reliance on trust for negotiations.

This research aims to address these questions through qualitative interviews with managers, HR professionals, and trade union representatives from nine organizations in the metal, finance, and transport sectors. The interviews focus on how these groups collaborate and negotiate on issues concerning digitalization, the uptake of new technologies, skills and training, and work environment and occupational health and safety.

This paper presents the first analysis of trustful relationships between HR/managers and trade union representatives and deals with tensions in employment relations for the benefit of the firm or the employees.

Transformations and Challenges in Work and Employment Relations among Delivery Workers in Post-Pandemic Turkey

Akın Bakioğlu

Erzincan Binali Yıldırım University, Turkiye

This paper examines the transformations and challenges in work and employment relations among delivery workers, particularly motor couriers, in post-pandemic Turkey. Focusing on the period from March 2020 to the present, it investigates the evolving processes of labor commodification, working conditions, and the emergence of new organizational models among delivery workers who collaborate with platforms. The study draws on a diverse range of data sources, including newspaper articles, reports, and social media postings, to provide a comprehensive analysis of these dynamics.

By exploring the dynamics of work and employment relations, including strikes, labor actions, and worker demands, this research offers valuable insights into the post-pandemic labor landscape for delivery workers. The study highlights the impact of pandemic-induced changes in work models, disruptions in production, and shifts in consumer behavior on delivery workers' experiences. Through the analysis of diverse data sources, this paper contributes to a nuanced understanding of the experiences and transformations of delivery workers in post-pandemic Turkey. It acknowledges the multifaceted nature of their work, considering factors such as labor commodification, employment instability, and the impact of platform-based work arrangements. The findings underscore the importance of recognizing and engaging with the specific challenges faced by delivery workers and the necessity of creating supportive frameworks that safeguard their rights and well-being.

In conclusion, this research provides valuable insights into the transformations and challenges experienced by delivery workers, in post-pandemic Turkey. By examining the dynamics of work and employment relations, including strikes, labor actions, and organizational models, and drawing on empirical research, news reports, and social media postings, the study offers a comprehensive understanding

640

of the evolving labor landscape in the context of platform-based work.

How Much Sociology is in Industrial Relations and Labour Research?

Bernd Brandl

Durham University, United Kingdom

Researchers in the field of industrial relations and labour have often discussed the nature, characteristics, size and boundaries of their discipline. Many of these discussions concluded that disciplinary openness is usually seen as one characteristic of industrial relations and labour research even though the sociology of work and labour is often seen as central for the area. This paper provides an assessment and analysis of the disciplinary character and knowledge exchange of the research field by applying a scientometric analysis. The analysis is multi-layered and novel as it is based on a bibliometric analysis based on publications as well as on the analysis of the disciplinary educational background of authors in leading industrial relations and labour journals in the past 15 years. Findings reveal, first, that the sociology of work and labour is definitely important and central but other disciplines such as economics and management studies are almost equally important. Second, the disciplinary orientations and characteristics of journals differ substantially and there are differences in the field across different countries. However, even though the sociology of work and labour might "only" be equally important compared with other disciplines when looking at "simple" bibliometric indicators, a deeper look reveals that it is far more influential when looking at other information including the knowledge authors are integrating indirectly.

RN17 | T07_03: Workers' experiences and subjectivities

From Work Ability to Work Potential

Mikko Henriksson, Matti Joensuu, Jarno Turunen, Elina Ahola, Vaula Siltala

Finnish Institute of Occupational Health, Finland

Work participation is crucial for individual and societal well-being. Increasing participation in work means both increasing employment and enhancing the input and productivity of those already employed. Central to this goal is the work ability of the working-age population. Traditional assessments of work ability focus on individual limitations and their negative correlation with employability.

We propose assessing work ability a) from a resource-oriented perspective, and b) as a phenomenon beyond the individual, influenced by various factors. We view work as a system and work ability as a dynamic and relational concept. These considerations lead us to introduce the term "work potential" to refer to the area of opportunities that an individual, workplace, or society can realistically utilize in the future. By employing the concept of work potential, the perspective on the relationship between work ability and work participation could be shifted and expanded towards a more systemic and resource-oriented approach to work and an individual's sustainable role within it. Elements such as work arrangements, work ability management at workplaces or changes in labor costs influence work potential and its realization.

We operationalize the concept in an EU-funded research project in which we offer aggregated population-level data from Finland on work ability and participation. Work ability is operationalized using proxy variables derived from comprehensive registry data. Working-age individuals are clustered based on their work ability, and the relation of each cluster to work participation is examined. Regional variations in work participation among clusters may indicate the work potential in that area.

641

From Workers to Victims: A Historical Shift in the Portrayal of Agricultural Workers in the Turkish Press

Elif Uyar

Çanakkale Onsekiz Mart University, Turkiye

Agricultural work in Turkey has changed profoundly in recent decades. Urbanisation and market forces have led to an increase in the share of seasonal migration and wage labour in the sector, which has begun to replace the unpaid work of rural families, especially women and children. This change has led to an increasing representation of ethnic minorities among seasonal workers, especially Kurds and

Arabs. Additionally, following the Syrian War, a significant number of refugees entered the agricultural workforce, further contributing to the ethnic diversity of the sector. Against this background, this study examines how these changes are reflected in national press coverage of agricultural workers. The analysis of newspaper articles, columns and pictures from Milliyet and Cumhuriyet since 1950 shows a clear change in reporting. Before the 1980s, agricultural workers were mainly portrayed as active citizens opposing their employers and demanding rights. News mainly focused on labour issues highlighting workers' agency and collective action. Today's news coverage paints a dramatically different picture. News stories frequently emphasise cultural/ethnic differences and worker poverty, often portraying the abusive relationship between middlemen and workers as a cultural problem rather than a symptom of a precarious labour market. This study critically analyses the shift in the representation of workers in the national press and argues that it obscures the larger political context. This context includes the post-coup restrictions on labour rights, the neoliberal restructuring, armed conflicts' impact on vulnerable groups, and the political processes themselves that perpetuate the precariousness of the agricultural labour market and workers' dependence on middlemen.

Socio-labour Profile of the Worker in the Chemical and Refining Sector in Spain. Data from Quantitative Research.

David Moral-Martín[1], Maria Angeles Serrano Alfonso[2], Montserrat Navarrete Lorenzo mon[3]

1Universidad de Zaragoza, Spain; 2Universidad de Extremadura, Spain; 3Universidad de Zaragoza, Spain

This paper presents the methodological process as well as some of the results obtained in the research on the working conditions in the chemical and refining sectors developed in Spain (2022-23).

Particularly, it is a quantitative study whose target group is fixed around 230,000 workers, according to official data. Its main aim is to analyse the occupational health of the sectors to study the viability of requesting a reduction coefficient in the retirement age.

Due to the scarce of quantitative research in this issue, a survey emerges as the fundamental technic to approach not only the reality of both sectors but also to obtain accurate and representative data. The data collection was conducted through an on-line questionnaire, specifically designed to this research although having as a reference prior survey such as the European Working Conditions Survey (EWCS). It was also distributed in collaboration with the trade union Sindicato de Trabajadores (STR).

The questionnaire is made up of 78 questions distributed in eight thematic sections: sociodemographic data, employment situation, occupational health, hazardous work, age, shift and night work, toxicity, and accidents at work.

The resulting sample size was of 2,060 questionnaires, establishing a sampling error of 2,15% at the 95% confidence level (assumption p=q=50%). Preliminary results show overwhelmingly masculine sector. Furthermore, workers point out the presence of toxic, dangerous and hazardous aspects in their working conditions that have a negative impact on their health. Consequently, most workers are in favour of the request for the reduction coefficient.

Workers' Experiences in Non-Profit and For-Profit Managed Asylum Systems: Insights from Italy and Ireland

Claudia Peroni, Camilla Devitt, Daniel Faas

Trinity College Dublin, Ireland

Asylum policy implementation varies considerably across Western countries; in all systems, however, a gap between the policy on paper and practice has been documented, with consequences for the lives of beneficiaries and the experiences of workers. This article examines understudied dimensions of asylum systems: asking whether the management of asylum systems by non-profit as opposed to for-profit organisations affects workers' experiences and job satisfaction. The study is based on interviews with workers and other stakeholders involved in the daily management of asylum systems in Italy and Ireland: Italy has a public system managed by civil society actors, whereas Ireland subcontracts management to for-profit actors. The findings show that despite generally high levels of job satisfaction and similar motivation and reward patterns, a non-profit system improves workers' experiences by providing value-based meaningfulness to their job and interconnectedness with other public services, whereas a for-profit system provides less support in terms of available networks, regulation, transparency and accountability.

RN17 | T07_04: Wages and work regimes

Losing Unequally: Financialisation, Productivity, & the Finance Wage Premium

Giorgos Gouzoulis[1], Iris Nikolopoulou[1,2]

1Queen Mary, University of London; 2Université Paris Cité

This paper provides an expanded framework for the analysis of the relationship between financialisation and the finance wage premium. Despite the aggregate income share of wage earners has been declining, not all workers have experienced an equal decline in their earnings. A well-documented stylised fact of contemporary labour markets is the persistent finance wage premium. While early work on the topic argued that this pay gap reflects productivity differentials, more recent research highlights how financial rent-sharing within this sector increases relative wages in finance. This paper builds on the aforementioned studies and argues that an important missing aspect is that financialisation also drives down wages in the rest of the economy. Two mechanisms contribute towards this outcome. First, non-financial firms face increasing financial payments which incentivise downsizing and wage reductions as a means of improving their balance sheets. Second, indebted households prioritise avoiding unemployment on the fear of defaulting on their debt, and become more conservative in their wage demands. Therefore, the conceptual framework presented in this paper claims that the rise of the finance wage premium is primarily driven by the dependency relationship between the financial and the non-financial sectors created through rising financial intermediation, rather than by financial liberalisation per se. Regression analysis using the case study of Greece between 1999Q1 and 2021Q3 provides robust evidence in favour of our argument that different components of private debt contribute to the growth of relative salaries in finance.

Social determinants of Low-Wage work in the Tourism Indsutry: Insights from Three Italian Case Studies

Francesco Eugenio Iannuzzi

Ca' Foscari, University of Venice, Italy

This proposal delves into the social determinants shaping low-wage labour within the tourism industry. Regardless of geographical differences and the international division of labour, tourism jobs are commonly classified in the secondary segments of labour markets, characterized by low quality, low wages, challenging working conditions, short-term contracts, high informality, and high turnover rates.

Conventional explanations link challenging working conditions to the economic and organizational characteristics of the sector, i.e., the redistributive defect is rooted in the "inherently and naturally poor and disorganized" nature of the industry. However, several studies have challenged the idea that the tourism industry is inherently poor, as well as the that low wages, and low status, are intrinsic features of these jobs.

Through empirical evidence collected through qualitative methods in three case studies in different Italian tourist contexts, this proposal argues that tourism labour has been socially constructed as poor. This "social construction" reflects the joint operation of 5 determinants: a) the vacuum of institutional labour regulation (including the presence and role of unions); b) the historical constitution of tourism jobs (continuity and contiguity with reproductive and servile labour); c) the composition of the tourism labour force and its gender and racial stratification; d) the transformation of the global political economy with its unequal power relations; and e) the discursive construction of tourist jobs as casual employment. The results show that the joint operation of these determinants and their variation on a local basis are crucial in shaping the social regulation of tourism labour.

Gig Economy And Belonging: Perspectives From Refugees In Norway

643

Benedicte Nessa

NORCE Research, Norway

A manifestation of the transformation of work and employment relations is evident in the increasing prevalence of gig economy employment. This occupational context is perceived by some as an opportunity for flexibility and tangible benefits. However, for others, it has led to a deterioration in the quality of employment. The latter perspective places gig economy within the longstanding discussions on precarious work.

Numerous studies across European countries indicate that migrants, particularly refugees, face increased vulnerability to precarious employment due to barriers hindering their acquisition of decent work. Despite gig work still being considered marginal in the Nordic countries, the pandemic prompted companies like Foodora (food-delivery platform) to double their turnover in 2021, with migrants forming a substantial portion of Foodora riders. Considering belonging as foundational to the development of social trust and cohesion, this paper employs gig work as a case in-point to investigate refugees' perceptions of how this specific occupational context shapes their sense of belonging.

Drawing on ethnographic fieldwork among refugees in Norway, the findings suggest that structural and individual constraints significantly predispose refugees to precarious work. This deprivation of opportunities for work as a 'connective tissue' to the broader Norwegian community, which limits social cohesion. Additionally, being consigned to precarious work at the bottom end of the labor market acts as an imagined boundary line of exclusion, dichotomizing

'us' and 'them'. Thus, this paper contributes to understanding how belonging is not only influenced by general labor market participation but is particularly conditioned by the specific occupational context in which individuals are embedded.

Hybrid Regimes@work: a Case Study on Organizational Context

Eugénia Pires, Ana Alves da Silva, Rui Ramos, Tiago Teixeira

CoLabor, Portugal

In view of the COVID-19, telework was key supporting social distancing, with companies and workers transferring their activity to remote forms of work. Although workers and employers considered the extension of telework beyond the pandemic it remains a residual model. In face of the pandemic experience, workers hold claims for telework. The autonomy, the work discipline, the mitigation of travel time, the flexibility in time management, both workwise as well as in the articulation of work with personal needs, are some of the positive features of the telework experience. In this context, a growing number of corporates have adopted those hybrid regimes, where presential work co-exists with telework.

As teleworkability is unevenly distributed among workers, and predetermined by qualifications, there are clear impacts for labour markets, and questions of social benefits access as well as working conditions and labour process implications. Moreover, telework also fosters further organizational fragmentation, dispersion across space and time, routinization of tasks and dissolution of occupational identities, with potential risks to labour relations´ stability and the individual experience of worker. Extending labour markets cross-borders may also bring the weakening of the labour relation ties and contractual decisions.

Based on research in broad organizational context, this paper presents the findings of the impact evaluation that follow up a hybrid regime implementation, exploring the contradictions in the individual experience of telework, while discussing organizational implications and, more broadly future policies that respond to the risks and challenges the new modes of work pose for workers, employers and economy.

RN17 | T08_01: Careers

The Impact of Social Networks on the Early Career Paths of Secondary Technical School Graduates

Jędrzej Stasiowski, Tomasz Płachecki, Grzegorz Humenny

Educational Research Institute, Poland

Our study examines the impact of social networks on the early career paths of vocational education graduates, focusing on the period of forming initial professional contacts with peers and employers. The analysis draws from a longitudinal panel survey of over 5,000 secondary technical school graduates at three distinct time points, which enabled us to follow their vocational and educational trajectories for a period of 18 months after graduation. We employed the personal ego networks method to analyse the students' social networks during their time at school.

The study employs Nan Lin's (2001, 2004, 2005) network definition of social capital, viewing it as resources accessible to an individual through their network of relationships. We concentrated on networks' aspects crucial for career development in chosen fields, observing how personal network resources are utilised professionally. Our findings reveal familial and professional contacts are vital for graduates, with gender-specific trends. The importance of these contacts also varies with the local labour market's performance. Our research underscores the complexity of social capital's role in the labour market, emphasising the importance of accurately operationalizing the concept and evaluating graduates' success based on their personal goals.

Career Penalties for Flexible Working: How Work Culture Shapes Managerial Attitudes

Agnieszka Maria Kasperska, Anna Matysiak, Ewa Cukrowska-Torzewska

University of Warsaw, Poland

Research questions

– Are there career penalties for using work from home (WFH) in the current times?

– Are men and women penalised to the same extent?

– Do organisational factors moderate such effects?

Theoretical framework

Existing research underscores the role of workplace norms in shaping the professional experiences of those using flexible working arrangements (Thébaud&Pedulla, 2022). Flexible workers, including those who WFH, risk devaluation due to deviation from the prevailing work devotion schema (Golden&Eddleston, 2020). This deviation can lead to stigmatisation as less committed, lower-quality workers, impacting performance evaluations, wages, and promotions (Williams et al., 2013). In organisations with demanding cultures, career progression relies on continuous service and merit (Vinkenburg&Weber, 2012). Thus, the organisational context, especially ideal worker norms and work-family reconciliation policies, can play a crucial role in moderating WFH's impact on careers.

Methodology

We use data from an online survey experiment fielded between July and December 2022 among 1,000 managers in the UK.

Findings

The findings indicate that employees who WFH are less likely to be considered for promotion and salary increase, and more likely to be negatively evaluated than on-site workers. These results pertain only to organisations with more demanding organisational cultures, namely those with stronger ideal worker norms and fewer work-family reconciliation policies. Varying effects for different WFH frequencies are found, with workers who WFH more frequently experiencing worse outcomes. Importantly, both men and women who operate in firms with more demanding organisational cultures and engage in WFH experience career penalties, however, they are substantially larger for men. We argue that this is because men engaging in WFH deviate from both the workplace norm of an ideal employee and the socially prescribed gender roles which assume that men ought to prioritise work above personal life.

Contribution

This study is the first post-pandemic study that provides evidence of the moderating role of organisational settings in the impact of WFH on careers and the gendered nature of such career penalties. The study carries implications for the theory and practice as we document the differential treatment of men and women who participate in activities prioritising work-life balance/family life over work-centric approaches.

OSH Regulation and Governance – the Coexistence of Legal and Self-Regulation

Barbara Bechter

Durham University, United Kingdom

The social dialogue between social partners at the national and European levels can be seen as a new governance approach that relies on bargaining by private actors to set OSH norms, as opposed to the traditional legislative routes. To compare the efficiency of different institutions in regulating OSH at work, we draw on agency theory, concepts of corporatist policy formation, and devolution of policy making. The regulatory process constitutes a collective action problem with asymmetry between capital and labour. Improved regulation efficiency means access to information, dealing with agency problems, producing tailored standards, and implementing OSH policies. The analysis is based on secondary data about OSH legislation and policies in hospitals and elderly care in the UK. This data is complemented by primary data collected in interviews about strategic actors and their policy preferences and perceptions. Legally binding OSH regulations can be perceived as too strict. This can be the case when standards created by the law are so undesirable or too strict that regulated entities have strong incentives to opt out and self-regulate. To shed light on OSH governance, legal, and self-regulation, this paper investigates different sectoral settings and industrial relations systems and their ability to develop more flexible approaches and meet standards.

The Effects of International Work Experience on Labor Market (Re)Integration: The Case of International Students

Vladan Vidicki, Snežana Stojšin

University of Novi Sad, Serbia

645

The globalization of the labor market affects the mobility of the labor force now more than ever before. This trend is also evident in higher education, as students are increasingly being encouraged to gain experience in international contexts, through internships and other training mobility programs. Once abroad, they become temporarily integrated into a foreign labor market which exposes them to a different socio-cultural and institutional environment. Characteristics of the host environment—such as professional norms and values, work ethic and conditions, forms of trade union organization, etc.—can shape these students' attitudes towards their profession and consequentially affect their reintegration into their home labor market.

The main goal of this research is to understand how international work exposure affects (later) professional experience of migrant students who spend at least one year abroad. We apply a mixed methods approach based on an exploratory sequential design. In the first phase of research, 18 students were divided into three focus groups: Serbian migrant students abroad, foreign migrant students in Serbia, and migrant students from both groups who have returned to their home countries. The data obtained in this phase was utilized to construct the instrument used in the second phase of research, which consisted of an online survey with 224 respondents from all three categories of students. The results show that experience in more than one labor market reframes the students' professional identities and may generate changes in their working conditions and future work performance.

RN17 | T08_02:
Multinationals and national employment systems

What Does Chinese Direct Investment Mean for Co-Determination? A Comparative Study of Acquisitions in the German Metal and Electronics Industry

Stefan Schmalz, Lea Schneidemesser

University of Erfurt, Germany

The German metal – and electronics industry has seen a wave of Chinese OFDI in the mid-2010s. These seemingly strategic acquisitions have not only led to industrial policy responses by the German government, but also influenced labor relations at the plant-level. Drawing on a sample of 15 company case studies in the metal – and electronics industry, we observe two important developments: 1) While Chinese state-owned investors tend to establish close relationships with the works councils, Chinese private investment tends to be more conflict-ridden at the company level, as in some cases Chinese employers terminate collective bargaining agreements or even support "yellow unions". 2) In many cases, Chinese investors undertook overpriced acquisitions of unprofitable companies which later led to financial distress and conflicts at the company level. This also contributed to a deterioration of cooperative relationships between the management and the works council. We discuss our findings by referring to labor process theory and comparative industrial relations, particularly to more recent discussions of the German model of industrial relations. We conclude that further research is needed on Chinese company sites (of both the investor and the acquired company) and on other European cases to have a full picture of the impact of Chinese brownfield investment on labor relations in the European industrial sector.

When Multinationals Relocate both Production and Workers: Employer Strategies and Union Responses in European Shipbuilding

Guglielmo Meardi[1], Ines Wagner[2], Aurora Trif[3], Jon Erik Dølvik[4]

1Scuola Normale Superiore, Italy; 2University of Oslo; 3Dublin City University; 4FAFO

Studies of multinationals' impact on employment have focused on either relocation of production, or on worker mobility through posting and intra-corporate transfers. The two have different effects on employment levels and conditions and call for different kinds of union responses at local and transnational level. In some rare cases, however, both processes occur simultaenously, causing more complex pressures and implications for actors' strategies. The paper analyses the dual mobility of capital and labour in European shipbuilding through the case of Italy-based holding Fincantieri, one of the largest companies in the sector, and its operations in Italy, Norway and Romania. Through the purchase of Norwegian company Vard and its shipyards in Romania and other countries. Fincantieri has reorganised production in a complex vertical and horizontal segmentation, while also making a very large use of labour mobility, both within Europe and from outside Europe. The two processes are analysed in combination and in detail through documentary and interview data, in order to interrogate existing theories on international division of labour, multinationals' effects on employment, and institutional factors. Propositions are drawn on the coexisting patterns of competition, convergence and segmentation, and on the difficulties of national and transnational union answers.

Voluntarism – A Barrier to return to work with Chronic Illness in Ireland

Eugene Hickland[1], Eugene Hickland[2], Eugene Hickland[3], Tish Gibbons[4]

1Dublin City University; 2Dublin City University; 3Dublin City University; 4University of Limerick

Ireland is a Liberal Market Economy with a Voluntarist system of industrial relations. The increasing numbers of people returning to work (RTW) after or with chronic illnesses is on the increase in the EU and Ireland. Key barriers and facilitators relating to RTW emerged from surveys, interviews with employers, unions and focus groups at company level. Underpinning those obstacles for RTW, is the institutional and structural features of voluntarism: a fragmented, localised sets of approaches to effective RTW for Irish workers.

Effective RTW procedures require a high level of workplace coordination and communication, as well as coordination with external services including medical services, rehabilitation providers, etc. Interactions with HR and the line manager emerged as important in return to work. Beatty and Joffe (2006) report that having an understanding and supportive supervisor is the most significant factor contributing to successful work experience. RTW coordination requires an understanding of both the worker with an illness and the work environment.

This paper is based on research conducted in Ireland in 2019-2021 as part of a wider EU project – "Negotiating Return to Work in the Age of Demographic Change through Industrial Relations (REWIR)" (Project No. VS/2019/0075). The conclusions of the report indicate that the lack of co-ordinated and integrated systems of benefits, education and supports across Irish society is mitigating against workers with Chronic illness being facilitated in RTW across Irish workplaces.

Labouring citizenship. Welfare state transformations between Italy and Poland

Luca Villaggi

University of Padova, Italy

The interlinked contemporary crisis exacerbated the effects of a crisis of social reproduction. This signals a key contradiction of contemporary capitalism, which fails to guarantee decent working conditions for workers employed in the life-making sectors and the livelihoods for the most disadvantaged social groups. Welfare services are at the centre of this contradiction due to social provision cuts, retrenchment of the public sector and outsourcing to private and non-state providers and a general reorientation towards market logics. As a result, working conditions in the social sector are increasingly characterized by low wages, precarity, work intensification and a devalued status. Changing labour processes in the welfare services also affect the communities serviced and the configuration of their entitlements to social care and support. The paper analyses how the labour process of care and social workers affect the recognition of social citizenship rights to the recipients. From this perspective, citizenship is understood as the outcome of social processes and practices rather than a formal condition, and especially as the outcome of labour processes and practices, constantly shaped by work organization, subjectivities and dynamics of conflict and collective action. It first examines how the welfare services restructuring has affected the working conditions of the employees, second how it has influenced the recognition of the social rights to the recipients, and finally how these processes have been shaped by care and social workers' agency and patterns of resistance. The data have been collected during an extensive fieldwork conducted in Italy and Poland through interviews with representatives of labour unions and local institutions and care and social workers employed in public, private and NGOs-run facilities servicing different types of recipients.

RN17 | T08_03: Worker resistance

Between Consent And Resistance: Absenteeism And Resistance Strategies Against Work Intensification In Carmaker Factories.

Clelia Li Vigni

Scuola Normale Superiore, Italy

In Labor and Monopoly Capital. The Degradation of Work in the Twentieth Century, Harry Braverman contended that workers' absenteeism from the workplace was to be interpreted «as an indication of a new resistance to certain forms of work» (1974:22). Additionally, he argued, the car industry represented a prime location for dissatisfaction with work, leading workers to exhibit especially high levels of absenteeism. After 60 years, absenteeism remains an important issue when it comes to manufacturing work in the automotive sector. The introduction of lean manufacturing in the 1980s was paired with the progressive intensification of work rhythms, leading to the deterioration of working conditions on the shopfloor (Skorstad, 1994). Management has consistently sought to implement strategies aimed at minimising conflict and avoiding disruptions to production, chiefly through the fostering of lower levels of strike activity that result from the strategy of 'permanent restructuring' (Siemiatycki, 2012). In Italy, former FCA factories (now Stellantis) plants have been characterised by a decade-long phase of 'permanent restructuring' which has displayed precisely these trends. It has been argued that workers in factories implementing lean manufacturing resort less to absenteeism (Oliver et al., 1994; Vieria et al., 2012). Conversely, through in-depth interviews with workers and trade unionists from Stellantis plants in Pomigliano d'Arco and Atessa, this paper presents preliminary evidence suggesting that, faced with the exacerbation of work intensity and as an alternative strategy to conflict, workers have increasingly turned to absenteeism as a resistance strategy. This raises questions about how management copes with the costs of absence from the assembly line while implementing a work organisation model that employs a just-in-time method of production, which is particularly vulnerable to production stoppages. Adopting the framework of Labour Process Theory, this paper represents an opportunity for a novel contribution on a traditional form of workers' resistance. This research thus sheds light on how absenteeism is employed within the current stage of social relations of production in car factories of an advanced capitalist country, where working conditions in the automotive industry have progressively deteriorated over the past decades.

[I have never joined ESA Summer School before.]

647

Work Deviations At The Assembly Line: Workarounds As Responses To Inefficiencies And Contradictions

Chiara Benassi[1], Lisa Dorigatti[2]

1University of Bologna, Italy; 2University of Milan, Italy

Workers often deviate from prescribed routines at work because, as argued in the

sociology literature, they are primarily motivated by the opportunity for personal gains. However, our analysis of 68 semi-structured interviews with assembly-line workers in an Italian manufacturing company revealed the widespread occurrence of work deviations that primarily contributed to the achievement of organizational gains because they mitigated (short-term) inefficiencies in the organization of work. Our study extends existing sociology research by incorporating the concept of workarounds from the field of information systems into a new typology that analytically distinguishes them from other types of work deviations such as games, organizational misbehavior and job crafting. We also reconceptualize workarounds as the response to inefficiencies stemming from contradictions between control and cooperation in the workplace. By re-interpreting workarounds from a sociological perspective, we create an analytical tool that can be used by other (work) sociology scholars in future analyses of deviations in the workplace.

Negotiating Subjectivity: The Encounter of White-Collar Workers with Tensions and Gaps in "New World" and "New Persons" Discourses in the Israeli Labor Market.

Meirav Hillel-Lavan

Bar Ilan University, Israel

The existing literature regarding the world of work addresses new employment arrangements that undermine employees' occupational security as a byproduct of broader neoliberal processes. These processes delegate responsibility to the individual and produce a discourse that binds market processes together with constructing a new self. Moreover, most writings tend to treat subjectivity constituted through these discourses as a mirror image of the discourse and neoliberal arrangements.

In this paper, I focus on the tensions that arise in the encounter between white-collar participants in the Israeli labor market and what appears to be the contemporary incarnation of the entrepreneurial and self-fulfillment discourses in the field – the "New World" and "New Persons" discourses that are idealizing new work arrangements.

My study critically examines how these discourses resonate during the formation of participants' subjectivity as they move from traditional employment to the realm of self-employment. Drawing on 40 in-depth interviews, observations, and textual analysis reveals that the "New World" discourse does resonate in formulating a self-employed subjectivity, but it is not adopted uniformly or automatically in Israel. Instead, individuals exhibit a complex process of personal adaptation, integrating and reinterpreting the discourse to deal with its inherent tensions and gaps and to align with their self-perception.

The paper outlines participants' five positioning strategies when interacting with the discourses in the transition to self-employment: validation and confirmation, concession, compromise, disappointment, and resistance. Using personalization strategies rather than looking at general sociocultural issues sheds light on how neoliberal discourse is validated and expanded.

Transformations in South Africa's Coal Industry: Implications for Miners in a Global Context

Olga Ustyuzhantseva

University of Johannesburg, South Africa

The coal industry in South Africa is undergoing a profound transformation driven by a confluence of factors, including global climate commitments and the surging demand for coal from European Union (EU) countries following the embargo on Russian coal. This research delves into the multifaceted impacts of these dynamics on the South African coal sector over the past years, with a particular focus on the implications for miners.

Drawing on a comprehensive series of interviews with industry representatives, the study reveals a significant restructuring of the coal mining landscape in South Africa. Large companies have exited the sector, leading to divestment and a subsequent void in investment. Consequently, smaller and minor mining enterprises have stepped into this vacuum, yet find themselves hindered by a lack of access to essential resources and technologies for safe and sustainable mining practices, owing to the overarching delegitimization of coal in the country.

The state's retreat from the coal mining sector further complicates matters. While South Africa witnesses a decline in state involvement, the escalating demand for coal from EU countries prompts an expansion of unsecured, low-technological coal mining activities. This raises critical questions about the necessity for state interventions to ensure the safety and technological proficiency of small local coal miners.

The study's findings contribute valuable insights into the challenges faced by South Africa's coal industry, shedding light on the complex interplay between global pressures, local transformations, and the well-being of coal miners. The research underscores the urgent need for strategic interventions to safeguard the interests of both the industry and its workforce, especially in the context of evolving global energy dynamics.

Management and work

The Management and Strategies of Worker Cooperatives in Finland

Ina Anni Johanna Kauranen, Taneli Vaskelainen, Matthijs Punt

Helsinki University, Finland

Worker cooperatives are democratic and fairer alternatives to organising work in a capitalist society. The potential in worker cooperatives is two-fold, on the one hand they provide a functioning alternative within the dominant capitalist structure of organising work and services , in which workers collectively owning the means of production is a rarity. On the other hand, they can function as places in which an alternative future is prefigured in the present. They can be a playground for practicing alternative ways of providing for societal needs. In other words, worker cooperatives can be viewed as alternatives within and alternatives to capitalist hegemony.

This qualitative study examines the strategies and management of worker cooperatives in Finland by interviewing their managers and board members. The study offers insight into the internal strategies and organisational structures with which cooperatives succeed and survive among competition.

Because cooperatives are often guided by more principles and aims than just efficiency and profitability – e.g., democracy and fair distribution – the management and strategies developed by worker cooperatives can serve a variety of purposes. Assuming that the aims also vary among the Finnish cooperatives, success in this study is not predefined, but rather for the interviewees to determine.

Initial findings show that being a cooperative bears significance for many of the interviewees, but this has few implications on how the cooperatives are managed. The Finnish worker cooperatives are managed much like conventional companies, even when their aims are supposedly different.

Changes in Mediation in the Management of Social Conflicts in Spain. The Transformation of the Mediator's Role.

Luis Manuel Vilas Buendía[1], Jose David Moral-Martín[2]

1Universidad de Zaragoza, Spain; 2Universidad de Zaragoza, Spain

Mediation in Spain has undergone a radical transformation with the implementation of Law 5/2012 and Royal Decree 980/2013. Both legislative changes have meant steps towards the professionalization of the sector, by consolidating institutions with a long historical trajectory and paying attention to the evolution of the figure of the mediator and his or her role in the resolution of conflicts, including those of labor etiology.

Thus, the figure of the mediator in the management of contemporary social conflicts is unquestionable and for this new scenario the mediator appears as a key figure. For this purpose, it is essential to have an adequate preparation, ranging from legal and social aspects to essential interpersonal skills. In this sense, we wondered about the level of compliance with the training among the body of mediators. This is why this paper aims to shed light on the effectiveness of the reforms implemented, especially with regard to the training and accreditation of mediators for their formalization and recognition.

Methodologically, an empirical study is carried out by means of a survey designed "ad hoc" that includes the use of digital tools such as Encuestafacil.com and that reflects an innovative approach to data collection. This has been distributed among the Professional Associations in agreement with the University of Zaragoza (for the training and design of mediation activities), as it seeks to evaluate compliance with the requirements of the Royal Decree in the practice of mediation.

This research not only has a theoretical value but is also crucial to understand the implementation and effectiveness of public policies in mediation.

Harmonizing the Dynamics of Employeeship, Motivation, Leadership, Management, and Ambassadorship: Insights from a Study in Swedish Public Workplaces

649

Mikael Nordenmark, Josefine Hansson, John Selander, Stig Vinberg, Erika Wall, Pär Löfstrand

Mid Sweden University, Sweden

This study explores the interconnected dynamics of employeeship, motivation, leadership, management, and ambassadorship within the contemporary public workplace. Employeeship, a concept embodying commitment, accountability, and proactive participation, forms the foundation of a thriving organizational culture. Motivation, a driving force behind individual and collective performance, emerges as a critical factor influencing employeeship. Effective leadership, characterized by inspiration, guidance, and a strategic vision, serves as a catalyst for fostering a culture of employeeship and motivation.

Ambassadorship extends beyond organizational boundaries, emphasizing employees as brand advocates, influencing external perceptions. Robust assessment mechanisms play a key role in gauging employees' contributions, identifying areas for improvement, and aligning organizational goals with individual aspirations.

This study underscores the symbiotic relationship among these elements, positing that a harmonious blend can

cultivate a resilient and high-performing workforce. As organizations navigate the evolving landscape of work dynamics, understanding and optimizing these facets contribute to a holistic approach that fosters employee engagement, work satisfaction, and sustained organizational success.

The study includes data from around 10000 employees and leaders in two Swedish municipalities. Preliminary results indicate that there is a strong correlation between the studied factors: motivation, leadership, management, and ambassadorship. However, the data also reveal differences according to factors such as gender and position (leader – employee). This study also raises theoretical questions and suggests improvements of the assessment methods often used to measure employee satisfaction in the Swedish public sector.

Who Should Be Sanctioned More Severely? Consequences Of Workplace Misconduct Across Corporate Hierarchy Levels

Luisa Wieser, Martin Abraham

Friedrich-Alexander-University Erlangen-Nuremberg, Germany

Digital workplace monitoring increases the chances of detecting workplace misconduct, especially for employees working with digital devices. However, it is still unclear how this misbehaviour should be sanctioned, especially since digital monitoring can be applied to employees at different hierarchical levels within the firm. Consequently, we conducted an experimental factorial survey where we varied the level of misconduct as well as the hierarchical level of the employee. We theorize that supervisors will react to the bargaining power of the misbehaving employee whereas employees without personnel responsibilities will find fairness more important. Based on 500 employees with and 500 employees without personnel responsibilities in Germany, our results indicate that when evaluating the appropriateness of consequences on digitally detected misconduct, employees without personnel responsibilities take into account hierarchy levels (judging managers more harshly for deviant behaviour) whereas leaders' punishment evaluations are driven by tenure and replaceability of the deviant employee (being more lenient with long-term or/and hardly replaceable employees).

Thus, leaders evaluate punishment regarding bargaining power – in terms of tenure and/or degree of substitutability – whereas non-leaders focus rather on ascribed status (hierarchy/management level). These findings provide insights regarding relevant facets of digital monitoring technologies and their application regarding the consequences of misconduct at the workplace. Especially, the importance of defining the crucial elements for deriving consequences on digitally detected misconduct to ensure perceived justice at work.

RN17 | T09_01: Precariousness and proletarianisation

Working in Education at Crisis. Coping with the Challenges of Teaching in Pandemic and with Job Quality Turbulences in the Experiences of Primary School Teachers in Poland

Aleksandra Drabina-Różewicz

University of Wroclaw, Poland

The focus of this presentation is reconstruction and interpretation of work experiences and ways of coping with new challenges in the conditions of introducing online education on a large scale in pandemic times. I will consider education as one of the work environments that was particularly affected by the effects of the lockdown in pandemic conditions as well as the permanent crisis of public institiucions in Poland. The teachers' experiences in my considerations are to be a litmus test illustrating the effects of introducing quick changes and modifications at work in crisis conditions. The coping mechanisms are based on: community and work resources (also institutional trust) (Franken et al. 2021), personal experiences and relational factors (also interpersonal trust) (Donati et al. 2021) and technological resources (Shagiakhmetova et al. 2022).

In this presentation, I will focus on the results of the analysis of the collected data from autobiographical narrative interviews and interviews in focus groups with primary school teachers thematically focused on the consequences of functioning in a pandemic crisis situation. The conclusions and results will be: (1) attempt to organize the teachers strategies of coping with the challenges of remote education, (2) defining and describing job quality as particularly important due to the context of introducing remote work in emergency mode in public education without any institutional preparation, (3) underlining the problem of mechanisms of coping with permanent job quality crisis in education. The presentation is part of the research of the currently implemented research project COV-WORK.

Precarious Young Professionals? The Work and Employment Conditions of Young Workers in UK Higher Education In The Context Of Sectoral Deprofessionalisation

Orestis Papadopoulos[1], Ed Yates[2], Jason Heyes[2]

1Manchester Metropolitan University, United Kingdom; 2University of Sheffield

This paper explores work and employment conditions of Early Career Researchers (ECRs) working in the UK higher education sector (UKHE). The paper aims to understand factors shaping job quality for ECRs and their subjective motivations for working in UKHE during a period characterised by erosion of working conditions. The paper presents findings from interviews with 35 ECRs from all academic disciplines, selected from two UK universities. Interview data is complemented with secondary data comprising descriptive statistical data from both universities and the UKHE sector, and employer HR document analysis. This topic is important due to the increased challenges facing young workers in the UK seeking to enter professional sectors and achieve decent working conditions.

This research is the first phase of a wider project exploring deprofessionalisation in the context of polarised labour markets and increasing Inequality. It uses the analytical framework of job quality and workplace power inequalities to theorise ECR work and employment conditions. The concept of job quality is used theorise and explain the wide range of ECR work and employment experiences; this theorisation is aided by drawing on concepts from political economy to explain changes to job quality resulting from increased managerialism and marketisation in UKHE.

The research reveals the importance of studying job quality and the specificities of work and employment at the individual workplace level to understand its effects on broader sectoral shifts. The research also finds broad concepts such as deprofessionalisation are of potentially limited use when analysing a sector characterised by multiple loose internal labour markets and markedly different career opportunities for ECRs, presenting challenges for those wishing to develop strategies to improve job quality in UKHE.

Precariousness and Proletarianization in Academia: Teachers' Working Conditions

Helena Antunes

Instituto de Sociologia da Universidade do Porto

This presentation is part of a doctoral project in Sociology that is being carried out at University of Porto. It focuses on the transformations in the working conditions and career paths of teachers in public higher education (HE) under the influence of managerial policies. For this presentation, the intention is to show the impact of the main transformations of HE on teachers' working conditions leading them to professional experiences similar to those experienced by industrial workers.

In recent years, we have witnessed a certain deterioration of the working conditions of HE teachers in Portugal. One of the main aspects is related to the weakening of employment relationships and bonds. We have been watching a scenario of depreciation and routinization of their work caused by the action of capitalist administrative power. Many HE teachers are subject to flexible hiring with temporary and part-time contracts.

Furthermore, teachers have to perform management tasks and knowledge extension tasks. There is now a rationalization of working time, a demand to increase productivity and efficiency and greater versatility of functions.

The precariousness of academic work derives from the pressure to reduce costs on higher education institutions (HEI). Those have responded by increasing the number of teachers hired to the detriment of placing them on career, and this reality is more evident in polytechnic institutes than in universities.

Based on the literature review and existing statistics on the working conditions and careers of HE teachers, some data will be highlighted.

Qualitative Research Methods to Transform Work and Employment: Documentary Filmmaking Using Critical Realist Ontology

Scott Hurrell[1], Genevieve Coderre La Palme[1], Ella Wright[2]

1University of Glasgow, United Kingdom; 2University of Birmingham, United Kingdom

The importance of filmmaking to generate and disseminate academic knowledge is growing (Rakić & Chambers, 2010), both to capture reality and for social persuasion (Nichols, 2016). While filmmaking enjoys a rich tradition within disciplines such as anthropology, it is increasingly being used within other fields, especially as part of participatory/ emancipatory research (Pink 2001, Parr 2007).

Nevertheless, documentary filmmaking remains limited as a research method, and form of dissemination, within the work and employment field, despite a rich history of fictionalised representations of workplace conflict and tensions. Using a research project on the inclusion of people with learning disabilities in the workplace as a case study, this paper explores how documentary filmmaking can be a transformative research method in our field. We address the ontological, epistemological and axiological underpinnings of documentary filmmaking as a method, arguing for the adoption of a critical realist (CR) ontology. A CR approach not only answers calls to increase the coherence and rigour of filmmaking as an inter-disciplinary research method (Belk, 2011), but also explicitly recognises axiology (e.g. political intent) and research projects' emancipatory potential (O'Mahoney and Vincent, 2014; Archer et al., 1998). This is because CR locates filmmaking in a layered social reality, allowing participants to elucidate tensions from their own perspectives, which can also help explain the reality of workplace phenomena and wider causal mechanisms at play (ibid). Dissemination then has a unique capacity to help address exclusionary labour market and workplace mechanisms through facilitating wider (public) corporate social agency (Archer, 2000), leading potentially to transformative and emancipatory change (or morphogenesis (Archer, 1995).

Questioning Working Life as a Unitary Concept and a Unifying Experience

Francesco Marcaletti

Universidad de Zaragoza, Spain

Ever since Richard Sennett introduced the notion of "character corrosion" (1998) to describe the "transformation of the social question" (R. Castel, 1995) in Western societies, what the precarisation of work has brought with it has been the loss of the unitary nature of working life. This has undermined and caused the very concept of working life, interpreted in historical time and in relation to individuals' life courses, to be neglected. Although its unified nature has been fading, the underlying assumption is that the diminishing subjective unifying character of working life marks the difference between cohorts of workers more than other personal characteristics do.

According to this assumption, the objective of the exploratory study is to question the unitary and unifying nature of the concept of working life by reconstructing its imagery across different population categories defined according to demographic cohorts and gender, i.e. individuals caught in different stages of their life course. The research, which is qualitative and in its early stages, is being carried out in Spain.

Based on literature review, a set of working life descriptors were identified and used as "reagents" for the construction of semantic maps of working life in the context of unstructured interviews conducted with a convenience sample of individuals. Preliminary results of this stage of the study return the picture of a working life that, although not unitary in its objective features, is interpreted as a unifying notion by those interviewed. The results of the interviews will also be used to operationalise the work life descriptors and semantic maps within a standardised questionnaire that will be administered to a larger sample of population in a second research stage.

Creative Workers at the Vulnerable Intersection of Flexibilization and Digitization

Wike Myriam Been

University of Groningen, Netherlands, The

The recent advancements in Generative Artificial Intelligence (hereafter referred to as 'AI') have revived classic debates reminiscent of those seen with all major technological developments in history. Questions arise about which jobs will be replaced or added, how tasks will evolve, and the implications for necessary skills, job quality, and inequalities in the labor market. Workers in the Cultural and Creative Industries (CCI) and their representatives are currently on the frontlines, expressing concerns about job displacement, ownership rights, and income levels. This is exemplified, for instance, by the Writers Guild of America strike in 2023. In the Netherlands, among the first to voice

652

concerns were freelance voice actors and animators. This highlights that their labor market position potentially renders them particularly vulnerable to the effects of AI on the workforce. Tying together the sociological research strands on the effects of technological developments on work and working conditions in the CCI, this contribution investigates whether and how the intersection of labor market flexibilization and digitization exposes workers in the cultural and creative industries to vulnerabilities in terms of job prospects and decent working conditions and how trade unions respond to this. Hereto it makes use of data collected through semi-structured interviews with voice-actors, animators and trade-union representatives in the Netherlands.

Organising Workers In BPO Industry And The Representation Of Tech Workers' Collective Interests in CEE. The Case Of Poland

Szymon Pilch

University of Wrocław, Poland

The paper aims to analyze the structural, cultural, economic and biographical determinants of tech workers' organisation in the BPO industry in Poland. I use the concepts of biographical and digital resources. I also use the workers' power resources approach, employing marketplace bargaining, associational, institutional and societal power resources. To research the marketplace bargaining power of workers, I use the concept of capitals (Bourdieu 1986).

Based on interviews with IT professionals, unionists, representatives of companies HR departments and regional labour offices, I examine what is the role of the marketplace, associational, institutional and societal power resources in organising of tech workers? What is the significance of workers' resources and capitals configuration as well as orientations towards work and life for organising?

Organising depends, firstly, on a high marketplace bargaining power of tech workers resulting from their structural position combined with varying working conditions in the industry. Secondly, it is determined by the slowly growing number of bottom-up cases of mobilisation in IT companies, an increasing interest of trade unions in the top-down organizing in the IT-related industries, and the limited number of collective agreements in IT sector. Thirdly, it is related to the flexibilization of employment, e.g., the ability to choose non-standard contracts influenced by the entrepreneurial discourse. Fourthly, it is linked with individualistic orientations in work and life. Finally, it is determined by global events, such as a pandemic, causing a reorganisation of work (shift to remote work).

RN18 | Sociology of Communications and Media Research

RN18 | T01_01: Digital Platforms (I)

The Hidden Side of Digital Media: Finding a Theoretical Approach to non-public Digital Communication

Jakob Wiesinger

Otto-Friedrich-Universität Bamberg, Germany

Compared to public communication on social media, non-public forms of communication such as messenger, direct messaging and email are used by significantly more people and continue to grow in popularity. Nevertheless, this is still an under-researched area despite its relevance for for issues of social radicalization, polarization and fragmentation. Communication channels away from public scrutiny carry more social context, emphasizing trust in the sender over media authority or journalist competence. There is an increasing tension between our lack of knowledge about the social logic of such communication channels and the amount of data available about social media communication, which may lead researchers as well as political actors to falsely believing that they understand the audience.

Non-public digital communication includes any type of digital communication that is limited in its scope by the technical basis of dissemination and concurrently requires a clear idea of the intended audience. In contrast to public communication, this is not an exchange between potential strangers, but its prerequisite is always a profound idea of who is a potential recipient.

This social component is decisive for the regularities to which the dissemination of information is subject. Firstly, boundary work is necessary in such groups to maintain the function of the group. Secondly, social relationships are stabilized by experiencing technical anchors that provide stability independent of space and time. Thirdly, this type of communication can be used to establish a public connection.

Platform Sovereignty. A Critical Reflection on Deplatforming and Deplatformization in the Context of Disinformation Governance

Sara Monaci

Politecnico di Torino, Italy

The essay argues the emergence of platform sovereignty observed through deplatforming and deplatformization practices (Rogers, 2020; Van Dijck, 2021a, 2021b) initiated by the dominant platforms (Google, META, X, Apple etc.), in the context of disinformation governance. Those content moderation measures have been implemented recently under exceptional circumstances such as the Ukraine war, targeting the main Russian media outlets online – Russian Tv and Sputnik – (Sisu et al. 2022), or in the aftermath of a coup d'etat such as the Capitol Hill assault in 2021 (Di Salvo, 2021) and, as the paper wants to highlight, they reveal the sovereign role of platforms in the social media ecosystem. Through the critical approaches of Shoshana Zuboff (2019) and Benjamin Bratton (2016), the contribution theoretically analyzes dominant platforms as socio-technical structures highlighting the complexities of the power relations among big tech, social media users and fringe environments (eg. GAB, 4chan, Rumble, Parler) in the social media ecosystem. Deplatforming and deplatformization are thus examined as pragmatic dimensions of dominant platform sovereignty that can illuminate the ambiguity and principles underlying its enactment.

In particular, the paper discusses the guiding principles of platform sovereignty, namely radical indifference to the communicative facts unfolding on social media, and the safeguard of the data stack, as the main objectives that allow platforms to preserve their sovereign role over the fringe environments in the social media ecosystem.

As a result, the essay emphasizes the heuristic importance of the concept of platform sovereignty to better understand the unfolding of power relations among dominant platforms, social media users, and fringe online environments, as well as the implicit principles that guide their enactment.

Sociological Analysis on TV Shows in Streaming Platforms: Theoretical and Methodological Contributions and Challenges

Tùlio Cunha Rossi

Universidade Federal de Uberlândia – UFU, Brazil

This paper aims to present some research insights on studies regarding audiovisual productions in sociology in the current context of mediatization. More specifically, it addresses theoretical and methodological questions on analyzing TV series on video-streaming platforms such as Netflix and HBO Max. This paper is based on my ongoing research into how notions of individuality are imagistically constructed in this type of show and how they relate to

contemporary processes of individualization (Martuccelli, 2014), which are deeply embedded with the everyday use of digital media. We believe that artistic and mediatic productions are much more than simple "representations" detached from reality, playing a role on how values, beliefs and ideologies are passed on, absorbed, and transformed through history, then, contributing to construct history and social reality itself. Thus, we start with the analytical contributions of Pierre Sorlin's (1987) film sociology, most remarkably, his approach to films related to ideology and the concept of relational systems. Then, we make the necessary adaptations and considerations for the analysis of series and rely on Jean-Pierre Esquenazi's (2014) study of television series, paying special attention to the affective attachment of viewers to characters and the close relation he points to viewers intimacy and daily routines. Finally, we use the concept of mediatization as presented by Couldry and Hepp (2020) to discuss the particularities of watching series on digital media platforms, considering the complex interconnections formed across different types of media and how these contribute to the formation of ways of perceiving the world, recognizing oneself and positioning oneself in relation to it.

Towards a Datafied Mindset: Conceptualising Digital Dynamics and Analogue Resilience

Rita Figueiras[1], Göran Bolin[2], Veronika Kalmus[3]

1Universidade Católica Portuguesa, Portugal; 2Södertörn University, Sweden; 3Tartu University, Estonia

The paper uses the insights from an interview study of one younger and one older generation of media users in Estonia, Portugal and Sweden to understand how different generations, with varied experiences of analogue, digital or datafied media during their formative years, respond to the datafied logics of social media. By "datafied media" we refer to online media that have the technological capacity to extract, process and package user data at scale into a commodity mainly for economic profit. By "analogue media" we mean media built on the technologies and business models that preceded digitalization and datafication. Since we are testing whether the ways in which the pre-datafied media operated has set its mark on the mindsets and practices among those who have grown up with them to the extent that they may have difficulties in understanding and managing the operational features of datafied media, we find heuristic value in this distinction. We show that belonging to a media generation does not produce a homogeneous mindset or a uniform attitude towards media technologies. These mindsets, being ideal-typical constructs, are not bound to individuals: the same person can display features of the analogue and the datafied mindset in relation to different parts of the datafied world. One mindset does not replace the other, but rather adds another layer to the social action of the individuals. The mindsets are multi-dimensional and moulded by contrasting understandings indicating that the tenacious structures of the analogue world linger on in the datafied social space.

RN18 | T01_02: Journalism and the Media (I)

Meta Journalism Project in Europe: To Be, or Not to Be a Media Maecenas?

Valentin Vanghelescu

Ovidius University of Constanta, Romania

In scholarly discourse, the Meta Journalism Project (MJP) is perceived as an instrument that captures journalism (Papaevangelou, 2022), reinforcing Facebook platform as an obligatory point of passage for journalism (Jurno & d'Andréa, 2020). This aspect is particularly pertinent in the context of Meta's responsibility in managing the MJP, especially given the digital advertising duopoly it shares with Google (UNESCO, 2022) and the effects it has on journalism as a modern institution. Moreover, the MJP is often referred to as a 'black box', for example in United States of America, due to the limited availability of information about its operational dynamics (Miller, 2023), compounded by the absence of comprehensive public reports from Meta Company on this initiative. This exploratory study delves into the execution of funding strategies for European media organizations by the Meta Journalism Project from 2017 to 2023. Our research corpus comprises content published by Meta and its beneficiaries, alongside articles from online media sources. By tracing these digital footprints, our aim is to construct a cartography that elucidates the criteria for grant allocation, the intermediaries in funding, the financial flows received by European media organizations, and the objectives of the projects awarded with grants. This analysis is intended to enhance understanding and foster critical discussions regarding the phenomena associated with the Meta Journalism Project and the construction of the Maecenas role of Meta Company in the informational environment.

The Importance of Working Conditions in Journalism. A Longitudinal Study of Slovenian Millennial Generation Precarious Journalists

Jožica Čehovin Zajc, Tinca Lukan

University of Ljubljana, Faculty of Social Sciences, Slovenia

Decent working conditions in journalism are valuable for employees, organisations, as well as citizens and democracy. Based on in-depth interviews conducted in 2017 and 2021, we gained a longitudinal perspective on the working conditions of precarious journalists in Slovenia and its implications. We found that emotions shape journalists' career trajectories. Love for the profession led journalists

to accept precarious conditions. Over the years, a cynicism developed that influenced careers in two ways: some moved into public relations, others worked as freelance journalists. In line with their love of the profession, journalists in the early years of their careers preferred to integrate work–home boundaries by being journalists 24 hours a day. Over time, they developed a preference for the segmentation of work–home roles. However, it is often not possible to segment the boundaries, so they use several boundary work tactics (behavioural, temporal, physical, and communicational). In addition to the already established typology, a new psychological boundary work tactic was recognised among precarious journalists. According to their role, they recognised their role as context-specific watchdogs, helping the weak and enhancing democracy. However, journalists faced challenges to their autonomy that limited their ability to put this role into practice, leading to a gradual deterioration of their professional autonomy. Most journalists did not find it useful to unite collectively to improve working conditions. We propose the term 'boiled watchdogs', which compares their situation to a frog that slowly boils over time.

Digital Transformations And The Crisis Of Trust In Journalists. Tensions Within The Liberal Economic Model Of The Press

Antonio Momoc

University of Bucharest, Romania

The (neo)liberal economic model of traditional media, fueled by advertising revenues tied to audience numbers, faces a financial crisis. In the digital platform age, competing for clicks and online traffic has forced journalistic content to compromise quality for higher ratings. The pursuit of audience on news websites has transformed many Romanian journalists into online influencers on social networks. While certain journalists became politicians and electoral candidates to capitalize on their image, others have embraced roles as activists or PR managers for civic or environmental causes.

The research questions: To what extent do Romanian journalists perceive that online activism, militancy and advocacy have led them to deviate from the classic values of traditional journalism, including accuracy, verification from multiple sources, impartiality, and honesty? To what extent do Romanian journalists believe that the dual role of being a journalist (on alternative investigative platforms or in traditional newsrooms) and an influencer on social media impacts public service journalism and the credibility of the journalism profession itself?

The research method: This preliminary study utilizes survey methodology, employing a 14-question questionnaire with closed-ended and open-ended questions, as well as multiple-choice questions to measure journalists' trust in the Romanian media. This qualitative research approach facilitated the gathering of a significant dataset to comprehend journalists' perceptions and their similar/dis-similar representations of traditional and alternative media. The

sample, obtained through the snowball method, comprises 53 journalists, primarily located in Bucharest and major cities within Romanian media newsrooms and alternative investigative platforms.

Preliminary Conclusions: The lack of trust in traditional mass media has enabled the ascension of dubious information sources promoting populist agendas, disinformation and hate.

Careers in Journalism in Romania: A Critical Approach to the Professionalization of the Field

Alexandra Codău

Ovidius University of Constanța, Romania

This research aims to analyze the media landscape in Romania to assess the extent to which being a journalist is considered an occupation or a profession. The paper raises the issue of institutionalizing the journalism profession, starting from the idea that, according to Peter Gross, "Romanian journalism has been considered a form of literature motivated more by talent than by a formation grounded in rules, techniques, and rigorous ethical norms" (Gross 2023: 119). Building on Bourdieu's considerations (2007), who argued that the media field is dependent on other fields for its legitimacy, Raluca Petre notes that the journalistic field in Romania is characterized by weak professionalization and low autonomy (Petre 2012: 53).

I will analyze ten journalistic careers to observe the entry rules into the field, the existence of self-regulation, and how these professional paths are defined. The hypotheses I start with are:

I1: If the field accepts practitioners without specialized studies, then professional self-definition is not uniform and convergent.

I2: If the field does not adhere to an unquestionable set of professional norms, then professional self-definition is not uniform and convergent.

RN18 | T01_03: Disinformation, Fake News and Conspiracy Theories 1

Tracing the Emergence of the Counter-Disinfo Field: The Rise of Disinformation Expertise in Europe's Eastern Periphery

Zoltán Dujisin

UCLouvain, Belgium

A counter-disinformation community consisting of policy-makers, think-tanks, NGOs and journalists is now well established in the Western world. This contribution argues the rise of a field of experts dedicated to fighting Russian disinformation in post-communist Europe was pivotal in allowing the topic of disinformation to gain wider, transnational resonance. Crucially, elements of this network were behind the creation of the East StratCom Task Force, an administrative body of the EU tasked with challenging disinformation campaigns by Russia specifically.

Based on in-depth interviews with journalists, disinformation experts and Russia scholars working on Hungary and the Czech Republic, the paper adopts a field theory approach to examine the emergence of a field of counter-disinfo. It locates this emergence in struggles over scientific legitimacy between expert networks. These networks exhibit radically different understandings of how disinformation should be framed and countered, as well as radically different abilities to access social, economic and symbolic capital from transnational sources.

In the counter-disinfo network we find journalists, Atlanticist think tanks, area scholars and state officials. Their narrative is consistent and matches journalistic accounts from across the Atlantic, depicting a centralized, Kremlin-lead disinformation effort aimed at sowing chaos and discord. A second and looser network comprises Russia-specialized scholars and journalists, media scholars and a less vociferous community of state officials. They depict Russian disinformation as less consequential, decentralized, symptomatic of more fundamental problems and often mistaken with domestic efforts.

The article concludes that, in spite of the higher scholarly pedigree of the second network, a combination of symbolic, social and economic capital has allowed the first network to frame perceptions of Russian disinformation and establish itself as a legitimate scientific field.

Structural and Cognitive Factors Shaping Diffusion of Political Conspiracy Theories

Paweł Matuszewski

Collegium Civitas, Poland

This presentation aims to identify factors that shape the diffusion of political conspiracy theories. Much social network research explains social diffusion by showing structural characteristics that facilitate (e.g. bridges) or inhibit (e.g. countervailing influences) the spread of ideas or behaviours. This study shows that the explanation of conspiracy theories diffusion requires the inclusion of not only structural but also cognitive factors. The hypothesis is that the factor responsible for the adoption of conspiracy beliefs is related to how well they are congruent with conventional knowledge, which is shared and generally accepted social beliefs in society at large. In other words, conspiracy theories that deviate more from conventional knowledge are less likely to be adopted, given the same structural conditions of communication.

This study uses Eviatar Zerubavel's concept of thought communities – social environments which socialise their members to process, collect, and recall information in a specific, transsubjective way. Consequently, in the social realm, different communities have belief systems that are less or more congruent with conspiracy theories. Therefore, Some of these communities are immune to conspiracy theories, even if they only slightly deviate from conventional beliefs, whereas others accept even extreme cases of such beliefs.

As a result of the qualitative content analysis, three levels of conspiracy theories were identified. They were then used to model the number of likes and retweets obtained by the political tweets. The research material was collected from Polish Twitter in 2022 and 2023, using the Twitter REST API. The original author's algorithm was used to identify the conspiracy narratives (F1 > 0.9). This research was funded by the National Science Center, Poland (Grant no.2020/39/I/HS5/00176).

Dealing With Distrust: How the Mainstream Media Respond to Conspiracy Theories

Jaron Harambam

University of Amsterdam, The Netherlands

Many European citizens no longer trust their own societal institutions to work for the public good, but imagine those to be governed by a shadowy cabal with nefarious motives. One particularly dominant stream of conspiracy theories refers to the so-called "mainstream media". Following that logic, societally dominant media organizations (both public and private) do not (aim to) cover world events in sincere ways, but are seen as instruments of the powerful to manipulate the masses into obedience.

657

While there is an increasing amount of scholarship on (such) conspiracy theories, there is little academic knowledge on how public institutions such as the media deal with rising levels of conspiratorial distrust. As if they have no agency when their existence is challenged, nor any influence on how conspiracy theories develop. This research gap is all the more surprising given the central democratic role of the media to inform public debates truthfully.

In this article, I qualitatively study how media organizations respond to the distrust embodied in conspiracy theories. To do so, I analyse a collection of media contents (43 newspaper articles and 13 TV-shows) about conspiracy theories that got published in the last five years in the Netherlands. The analysis reveals four ideal-typical reactions: Ignore, Debunk, Explain and Engage. I show how these reactions empirically look like, and what (unintended) consequences they have. Based on these, I conclude with normative recommendations about what the media should do in an era where public knowledge is widely contested.

The Political Instrumentation of Fear Narratives in Electoral Campaigns and the Emergence of a New Wave of Euroscepticism

Adriana Ștefănel

University of Bucharest, Romania

Against the backdrop of the (post)Covid pandemic, regional conflicts, and global confrontations among major powers, amid discussions concerning food insecurity, population aging, migration, and climate change, Romania is slated to conduct five rounds of elections in the year 2024.

According to the World Values Survey, trust in governmental institutions is very low (trust in the government – 18.8%; trust in the party system – 9.7%, combining responses "a great deal" and "quite a lot"). Similarly, trust in traditional media is also low (27.5% – trust in print media; 29.6% – trust in television, the lowest level of trust across the four waves of research). At the same time, there is a growing inclination towards the idea of having a strong leader who does not have to bother with parliament and elections (72.6% for responses "very good" and "fairly good").

In the context of this prevailing mistrust, populist parties leveraging narratives of fear are garnering increased support and votes. Starting from the premise that the tendency of conspiracy theories to spread rapidly, coupled with the imminent danger of exposure to contradictory information and the dissemination of fake news and disinformation, makes people more vulnerable and confused. We aim to analyze these discourses in a manner that combines qualitative and quantitative content analysis to identify the most influential narratives that will circulate in the Romanian online environment during the electoral campaign for the European Parliamentary elections. We will examine their dominant characteristics and assess user responses.

RN18 | T02_01: Digital Platforms 2

Digital Influencers: The New Symbolic-ideological Mediators of the Digital Age

Francisco Silva Fontes

Faculty of Arts and Humanities of the University of Porto, Portugal

During the era of digitalization, the emergence of the Internet, online social networks and new forms of communication have given rise to new dynamics of interpersonal relationships. Each user begins to play a dual role, not only as a passive receiver/consumer of information but also as an active creator/producer, publishing content online in an independent and autonomous way.

Companies realise that digital ubiquity is a lucrative opportunity and bet on Digital Influencers (DIs) as individuals who post advertisements on social media to influence their followers' purchasing intentions and decisions.

However, the daily work practices of these 'new' protagonists of the digital age transcend simple commercial boundaries. Reaching a broad audience, DIs disseminate, in the content they produce and publish, a lot of opinions, perceptions, beliefs, values, and representations and shape the attitudes and behaviours of their audiences across multiple spheres. They also (re)produce a variety of ideologies of capitalist social dominance and representations of power with significant impacts/effects on followers.

In a multidisciplinary dialogue between sociology, communication sciences, management and marketing, this paper proposes a theoretical and empirical incursion into various international studies and provides some analytical clues related to these topics. Specifically, this communication focuses on some types of ideologies spread by IDs, mainly related to consumption, authenticity, entrepreneurship, self-empowerment, body, beauty, health, well-being and politics, and in the effects/impacts on their audiences.

Minors Moderating Minors: The Issues of Moderation on a Group-Based Internet

Jonatan Mizrahi-Werner, Jakob Demant

University of Copenhagen, Denmark

As internet users shift towards group-based platforms new challenges arise in moderating problematic content. Moderation is often left to the users themselves – often minors, lacking the relevant skills. This study draws on six months of netnography in diverse online youth communities on Discord, Facebook and Signal, and ten interviews with moderators aged 16 to 20.

658

A central finding was that instead of adhering to defined rules, moderators tend to redirect problematic content to designated subforums as a means of balancing their social status with the platforms' terms of use – a process we term "sorting" as opposed to "moderating". When actually moderating content, moderators tend to rely on gut-feelings and instinctive reactions rather than clear rules. These practices displace issues rather than confronting them, allowing problematic content in forums visited by thousands of youths.

The consequences of this include the tolerance of e.g., neo-Nazi propaganda and potentially traumatizing content in youth communities moderated by inadequately skilled minors. We advocate for platforms to assume responsibility for content moderation by providing moderators with the necessary tools and knowledge to address and prevent malpractice.

Mastodon in Sociology: Theoretical and Methodological Reflections on Decentralized Communication

Vincenzo Laezza, Caterina Ambrosio

University of Naples "Federico II", Italy

This research is centered on the transformative trends in communication patterns among citizens, prompted by an escalating distrust in traditional media, leading them to increasingly gravitate toward new decentralized modes of interaction. A focal point of this shift is the emergence of Mastodon, a decentralized microblogging platform founded on open-source software. It is characterized by a network of interconnected communities dispersed across distinct servers. It is noteworthy to emphasize that these servers do not operate in the prevalent conception of separate units, but rather as independent entities always ready to communicate with each other. Mastodon's decentralization is underscored by the notable absence of algorithms dictating user feeds, a pivotal consideration for social scientists keen on scrutinizing communication dynamics. The overarching objective of this article is to delineate the distinctive economic and communicative aspects of Mastodon and to explore its viability as an instrument for social research.

This study positions itself as a pilot investigation, integrating walkthrough and digital ethnography methodologies. The initial empirical phase engaged with 10 servers, facilitating an exploratory analysis of Mastodon's interface, encompassing an examination of its operational mechanisms and embedded cultural references. Subsequently, the second phase concentrated on 2 of the previously identified 10 servers. These sequential phases provided an introductory panorama of the platform's salient features. The principal aim of the article is to furnish a theoretical and pragmatic framework for comprehending how Mastodon can be effectively employed as a research instrument in social studies, accentuating its decentralized nature and its capacity to furnish decentralized online communication contexts.

The Platformisation of 'Family Doings' – How Digital Platforms Afford Intergenerational Family Practices such as Communication and Play across Generations

Kristinn Hegna, Maja Nordtug

University of Oslo, Norway

Today, families are conducted through a myriad of digital platforms. Families for instance communicate through platforms such as Snapchat, Whatsapp, and Messenger, and they play with each other through gaming platforms such as Roblox. However, across generations, the different platforms afford differently, and digital inequalities between generations pose a challenge to intergenerational relations in an age of platformisation of the family. To further understand tensions and transformations related to the platformisation of the family, we wish to explore how digital platforms afford intergenerational family practices.

In researching how something affords, we must 'ask not only how objects afford but also for whom and under what circumstances?' (Davis & Choinard 2016: 244). In this paper, we aim to understand how, for whom and to what extent digital platforms afford family practices such as intergenerational communication and play across three generations in various Norwegian families. Family – , three generation – and particularly grandparent relationships are under-researched in this context.

Our discussion rests on preliminary analyses of a dataset of qualitative in-depth interviews with a diverse set of children/youth aged 9-18 years, their parents and grandparents, from up to 20 three generation families in Norway. The analysis of this paper is informed by perspectives of platformisation (van Dijck et al, 2018), 'doing family'/family practices, a relational perspective of affordances as well as relational processes across generations and in families.

Davis, J. L., & Chouinard, J. B. (2016). Theorizing affordances: From request to refuse. Bulletin of science, technology & society, 36(4), 241-248.

Van Dijck, J., Poell, T., & De Waal, M. (2018). The platform society: Public values in a connective world. Oxford University Press.

"One Cannot Remain Silent". Journalistic Reactions to the Social Media-Based Rule-Breaking Communicative Strategies of the Italian Radical Right.

Emma Bonutti D'Agostini

CREST (Institut Polytechnique de Paris) | médialab (Sciences Po Paris), France

The political repertoires of radical right parties combine ethnocentric nationalism with gender conservativism. These illiberal motives, often conveyed in rule-breaking ways, constitute a hotspot of the dialectic between RRP and legacy journalism.

To examine this issue, I analyze a pivotal event of the 2022 Italian election campaign. Giorgia Meloni, leader of Fratelli d'Italia (far-right), shared on Twitter a video of a Ukrainian woman being raped by a Guinean asylum seeker in Piacenza, conveying an anti-immigrant message. The incident illustrates how the convergence between RRP's ideological discourse and social media alters the dynamics of political communication, affecting the broader mediated public sphere and questioning the socio-political role and professional practice of legacy journalism.

Indeed, the episode was widely covered by the Italian press. Journalists compactly exposed the illiberal nature of Meloni's action, reaffirming the boundary of the legitimate election debate. However, media narratives often ended up mainstreaming rather than debunking Meloni's rhetoric, by foregrounding the immigrant background of the perpetrator, exposing the rape victim by re-evocating the video, and personally attacking Meloni rather than reflecting on causes and implications of women's and migrant's social vulnerability.

Combining a qualitative analysis of controversy-related Twitter and news content and 20 interviews with Italian journalists, I document these outcomes and elucidate which factors hinder journalistic adherence to professional ethics. First, the blurring of journalists' editorial control and gatekeeping power in the digital age. Second, audience-driven considerations incentivizing journalists to sideline critical analysis in favor of sensationalism.

By documenting how legacy journalism may amplify illiberal discourses rather than serve as a safeguard against them, I contribute to understanding its evolving role in confronting the challenges posed by radical right politics.

Social and Political Shaping of Digitalisation: Implementing Digital Technologies in Turkish Journalistic Regime

Ezgi Kaya Hayatsever

Ankara University, Turkiye

The claim that digitalization is a universal phenomenon that transcends social and geographic barriers and spreads regardless of distinctions or differences has grown prosaic. Variations in social and political environments shape the way people engage with and respond to digital technologies, leading to diverse paths of digitalization depending on the setting. This paper seeks to go beyond the apparent universality in digitalization by inquiring into how digitalisation is moulded by its engagement with social and political conditions in a specific setting. The present study centres on the journalistic regime in Turkey, a notion that is based on Michael Burawoy's concept of factory regimes. For the purposes of this study, this notion of journalistic regime forms the background through which the engagement with digital technologies is played out. Drawing on from the social shaping of technology thesis as a theoretical framework, the study delves into how the despotic journalistic regime that has been prevalent in Turkish mainstream media for the past ten years influenced the way digital technologies permeated Turkish media structures and journalistic practices. The analysis is based on data and insights from interviews with 19 journalists employed by digital news outlets in Turkey. The study focuses on how mechanisms for controlling journalistic labour in digital media interact with characteristics of journalistic labour supply. Through this inquiry, the study aims to gain insights into how the pathway of digitalization is altered in certain social and political contexts and delineate the groundwork for comparative thinking on digitalisation and journalism.

Continuity and Contrast: A Comparative Study of Romanian Journalism in the Worlds of Journalism Surveys 2012-2016 and 2021-2023

Natalia Vasilendiuc, Gheorghe Anghel, Alexandra Bardan, Andrada Fiscutean, Carmen Ionescu, Antonia Matei, Bogdan Oprea, Rodica Melinda Șuțu

University of Bucharest, Romania

This in-depth investigation explores the landscape of Romanian journalism through a meticulous comparative analysis of two periods: WJS2 (2012–2016) and WJS3 (2021–2023). WYS2 was particularly concerned with the cultural nuances of journalists, while WYS3 focused on the dynamic

dimensions of risks and uncertainties in the Romanian media milieu.

WJS3 broadens the perspective to examine the complicated facets of risks and uncertainties faced by journalists in Romania. This study meticulously examines editorial autonomy, external influences, journalistic roles, epistemology, professional ethics, security, resilience and working conditions. The aim is to decipher the comparative dimensions of these elements and to identify the patterns that persist or change across these different time periods.

In contrast, WJS2, with its focus on journalistic culture, has provided a basic understanding of professional norms, values, and identity within the Romanian journalistic community during the earlier period. By comparing these two phases, the study aims to provide a nuanced analysis of the continuity and contrast of journalistic perspectives over time.

The main research questions guide this comparative study. First, how do journalists adapt their practices and perceptions across these periods to respond to the changing landscape of risks and uncertainties? Second, what enduring patterns and shifts emerge in the broader landscape of journalism in Romania through this temporal perspective?

The research methodology involves a meticulous analysis of quantitative data, utilizing the theoretical frameworks established by WJS, to unravel the complex interplay between journalism and the evolving socio-cultural milieu in Romania.

Hegemonic, Counterhegemonic, or Pro-Women's Rights?: Meta-Journalistic Discourse on 'Women's Strike' in Poland

Kinga Polynczuk-Alenius[1,2]

1Polish Academy of Sciences, Poland; 2University of Helsinki, Finland

Feminist scholarship views mainstream media as part of the 'hegemonic domain', implicated in justifying and reproducing oppression. However, meta-journalistic discourses in which journalists reflect on media representations of minoritised groups remain largely uninterrogated. This paper seeks to bridge this gap by studying how meta-journalistic discourse on media representations of the 2020-2021 'Women's Strike' in Poland perpetuated and challenged hegemonic power relations.

In October 2020, hundreds of thousands of Poles protested against the introduction of the virtual ban on abortion. The demonstrations brought together women's rights and queer activists, feminists, opposition politicians, and ordinary citizens. The diversity of participants entailed a wide spectrum of postulates, ranging from the return to the conservative 'abortion consensus' to the pro-choice calls for full abortion rights to the ousting of the government led by the ultraconservative Law and Justice (PiS) party. For journalism, this heterogeneity meant that certain demands were foregrounded at the expense of others.

This paper draws on literature on epistemic democracy and feminist-philosophical scholarship on epistemic exclusion to examine how journalists reflect on media representations of the demonstrations and their implications. Empirically, it studies the articles by pro-PiS government media outlets, oppositional outlets that explicitly align with the Civic Coalition party, and media that do not ally with any political party. Generally, the pro-government media cherry-picked the postulates of the movement to demonise it as causing social unrest; oppositional media highlighted the calls to oust PiS to forward their own political agenda; and the non-aligned media tended to focus on the struggle for women's rights. Both pro-government and oppositional media, then, acted as agents of the hegemonic domain, while the non-aligned outlets attempted to step outside it.

RN18 | T03_01: Labour, Precarity and Play

In and Against the Platform: Navigating Precarity for Instagram and Xiaohongshu (Red) Influencers

Jiali Fan

University of Cambridge, United Kingdom

This paper presents an "alternative interpretation" (Tavory and Timmermans, 2014) of the precarity experienced by social media influencers. Existing scholarly discussions of the influencer industry often take a critical stance, marked by a consistent theme of precariousness. However, this narrative falls short in explaining why influencers persist in the industry despite its inherent instability. In other words, there exists an "imaginative challenge" (Tsing, 2015) in exploring the empirical dynamics of precarity—how it is managed and ultimately lived. Based on in-depth interviews with 15 Instagram influencers and 12 from Xiaohongshu (Red), this article reveals that influencers strategically adopt a positionality I term "in and against the platform." This dual approach involves both collaboration with and resistance to platform rules and rituals, ultimately enabling influencers to establish a sustainable way of living amidst precarity. I argue that this "in and against" framework brings to light the active agency and creativity often overlooked by academic discussions, and also introduces complexity into our understanding of precarity in 'post-work society'.

Tracing the Precarity of Film Work: From Organizations of Associated Labour, through Semi-permanent Workgroups to Gig Jobs

Jaka Primorac

Institute for Development and International Relations (IRMO), Croatia

In this presentation, I aim to show the trajectory of film work as precarious project work. Firstly, this will be done by examining the film policy instruments in the late Yugoslav period, where the market principles based on the project logic, nested themselves within the models of organising film work. This has been exacerbated by the entering of Yugoslav film industry in the global film industry through service productions. Decentralisation model of Yugoslav cinematography introduced in 1962 enabled different republics to have their own film policy trajectory. In 1976, the Law on Cinematography based film production on the self-management postulate that created the Self-Management Community for Cinematography of the Socialist Republic of Croatia (SIZ KIN). Thus, in 80ies Croatia, with film company/studio Jadran Film, organisation of funding of SIZ KIN through project applications on the one hand, and working on Hollywood and other market-based cinematographies', Yugoslav film workers have been among the first to experience the market project-to-project approach. Secondly, I will show how in the following years, the approach of semi-permanent work groups has been evident in organisation of film production in Croatia, especially with the introduction of the foreign film production incentive programme introduced by Croatian Audiovisual Centre. In conclusion, I show that the lack of tradition of unionisation of film labour from Yugoslavia to today, in the context of the small industry opens up possibilities of exploitation of film workers, especially considering the recent entry of the 'streamers' and their gig work policies for film labour.

Space, Place and Media Employment in Romania

Romina Surugiu, Aurelian Giugăl

University of Bucharest, Romania

It is well-known that place and space matter (Johnston et al. 2019), and "without journalism, there is no democracy" (Carey 1999, 91). The main goal of our research is to take a closer look at the media employees' geographical concentration. There is a spatial divide between counties and cities where the media employees are over-concentrated – the case of the capital Bucharest and its metropolitan neighborhoods. Only in this place, more than 20,000 employees work in the media sector. By contrast, in many counties/cities less than 100 people are employed by media outlets.

Using the official statistical datasets provided by the National Statistics Institute, our research comes up with the first spatial analysis of employment in the media sector in Romania. The paper employs the theoretical contribution of "news deserts" (Abernathy, 2023; Gulyas et al., 2023), which identifies and describes the places that lack access to local news and information.

The descriptive statistics show that the discrepancy between "media-rich" and "media-poor" places tends to increase in the last 15 years. The gap in employment rates translates into reduced or nonexistent media content in economically underdeveloped regions, where local media has reduced audience rates and faces editorial pressures from ownership or political factors. Similarly, it leads to uneven access to information and knowledge between communities.

662

Perceptions and Attitudes Towards Gambling: Public Opinion and Regulation

Iraide Fernández-Aragón[2], Aidee Baranda-Ortíz[1], Jonatan García-Rabadán[3]

1University of the Basque Country (UPV/EHU), Spain;
2University of the Basque Country (UPV/EHU), Spain;
3University of the Basque Country (UPV/EHU), Spain

In recent years, gambling has become one of the most polarised public debates in Spain. This has not only remained a social issue, but has also reached the political level, which has led to the formation of public policies and regulations regarding gambling, both at local and state level. Within this framework, the Basque Country stands out as the first autonomous community to regulate online gambling and to create a specific observatory for this social reality, as well as being one of the communities where the most money is collected.

In this context, the aim was to understand public opinion by analysing a regional survey on the assessment and perception of gambling carried out in the Basque Country in 2022, which analyses different aspects such as the practice of gambling, the assessment of gambling, as well as practices related to its regulation. To do so, the ATGS scale was applied, which was first used in the United Kingdom and has subsequently been adapted in other countries such as Finland and Australia.

In general, in relation to the results, Basque society has a negative opinion of gambling, as 68.7% consider it to be a problem for Basque society. However, opinions are divided on other issues, such as the control of gambling or the location of premises and machines, and there is no consensus. The main differences are obtained according to age, level of education and ideology of the Basques.

RN18 | T03_02: Disinformation, Fake News and Conspiracy Theories 2

The Complex Tension Between Knowledge Disorder and Information Disorder in the Italian Hybrid Media System

Giovanni Ciofalo, Silvia Leonzi, Lorenzo Ugolini, Fabio Ciammella

Sapienza University of Rome, Italy

The paper aims at proposing a reflection on the production, perception, and impact of information disorder, based on the results of a five-year academic research study titled "The Social Effects of Fake News" focused on the Italian context. The reflection is focused on investigating the social and cultural tensions that take shape regarding the relationship between media, information, and knowledge.

To this purpose, a distributed survey was developed on a non-probabilistic sample of the Italian population, representative for age and gender (N:399), and it was divided into three main thematic areas: media use, personal opinions, and socio-demographic data.

From the analysis of the findings emerges a crisis of the "quasi-statistical sense" (Noelle-Neumann 1974), resulted in the ability to create multiple truths, rather than recognizing the social and cultural limits of individuals' opinions as in the past. The paper argues that the main consequence of this crisis is an "appropriation of reality" by the audiences, that takes the shape of a redefinition of the information-knowledge relationship. It corresponds to an evolution from a macro to a micro perspective of the Foucauldian concept of alethurgy, which gives room to the construction of micro-regimes of likelihood.

The analysis of the collected data identifies four frames of interpretation of reality, which correspond to four models of propensity to believe in false contents:

– "Description" frame = ekphrastic model: the reality is described at all costs;

– "Denial" frame = ideological model: the reality is made up based on personal feelings;

– "Secret" frame = "know-it-all" model: the reality is explained through an overestimated personal competence;

– "Emphasis" frame = hypochondriac model: the reality is magnified in its fearful components.

663

From Impartiality to Partisanship. The Evolution of Media Bias in Poland (2015-2023)

Radosław Sojak, Andrzej Meler, Beata Królicka

Nicolaus Copernicus University in Toruń, Poland

Both researchers and EU institutions consider media bias as one of the important factors reducing the quality of democracy. At the same time, it is recognised that media bias is an effective strategy for market adaptation of media entities. The presented study on Poland from 2015 to 2023 aims to describe the dynamics of increasing media bias and to examine its impact on the internal functioning of individual broadcasters.

We recognise that the most significant dimension of media bias is the gate-keeping strategy of selecting guests representing particular political parties. Based on daily monitoring of representatives of political parties invited to journalistic programmes in media covering 97% of the Polish media market, we test following hypotheses: (1) media bias has been increasing since 2015; (2) media bias increases as the market position of the broadcaster weakens; (3) public (politically controlled) media are more biased than private media; (4) as media bias increases, the diversity of guests decreases, also within particular political parties.

Preliminary analyses based on more than 60,000 media presences of politicians confirm our hypotheses. The results indicate that media bias has been increasing since 2015, to varying degrees for public and private media. The high point of bias for public media was the 2019 parliamentary election campaign and for private media the 2023 parliamentary election campaign. To an even greater extent, the dynamics of media bias depends on the market share of the broadcaster. There is a strong inverse correlation here, as lower market share favours an increase in the bias. The fourth hypothesis was also confirmed; the internal diversity of parties' representatives in the media decreases with the intensification of the bias.

The Social Reality of Fake News: A Study of Discourses on Problematic COVID-19 Information in Taiwan

Winping Kuo[1], Sumei Wang[2]

1Chinese Culture University, Taiwan; 2Department of Journalism, National Chengchi University, Taiwan.

Fake news has been studied along four lines in existing literature: characterization, creation, circulation, and countering. However, false information is often treated as a social problem that can lead to conflict and harm. In this paper, I argue that fake news represents an alternative social reality for existing issues, as its content and style hybridize factual and false texts. Therefore, debunking fake news should focus on understanding the discourse fabricated within its content rather than simply discriminating between facts and mistakes.

Based on this perspective, the study collects nearly 700 fake news pieces confirmed by two fact-checking institutions in Taiwan during the COVID-19 outbreak to explore how the pandemic of the century is discursively represented and constructed. The corpus-assisted discourse method is adopted to investigate the linguistic features embedded in fake news and how these features are associated with the discourses of false information. Preliminary results suggest: (1) conspiracy theory is a frequent discourse strategy used in fake news, reflecting geopolitical tensions between Taiwan and China; (2) the discourse of folk medicine is also common within fake news stories. Folk medicine is discursively constructed as mild and harmless, rooted in Taiwan's general public's cognitive structure and food culture; (3) anchoring discourse with prior experiences is largely employed in fake news narratives, including experiences from SARS and H1N1 in Taiwan. Nevertheless, factual and fabricated information is mixed in fake news content, confusing collective memory and knowledge on public health.

White Victimhood and "Right Victimhood": Legitimating Racism and Mainstreaming the Far Right Online

Natalie-Anne Hall

Loughborough University, United Kingdom

Social media are often implicated in growing social tensions and a crisis in institutional trust. These phenomena are entangled with the so-called "rise of populism", the mainstreaming of the far right, and the reinforcing of everyday racisms. Yet the computational turn in the social sciences has meant there is a dearth of qualitative, interpretive evidence around people's experiences engaging with this form of politics on social media, and consequently the real impact this has on people's attitudes and worldviews.

I take the issue of Brexit as a case study for examining the diffusion of transnational far and populist right politics on social media. Based on two waves of in-depth interviews and month-long observations with 15 avid pro-Brexit Facebook users, I examine the relationship between Facebook use, support for Brexit, and the transnational far and populist right. I reveal the importance of transnational White victimhood and what I term "Right victimhood", and how these connected Euroscepticism to more extreme forms of right-wing politics on Facebook. White and Right victimhood work together to promote discriminatory ideologies. The latter posits that progressive cultural and minority rights agendas constitute malevolent oppression of those with conservative views. The power of this discourse is in its circumvention of accusations of racism while simultaneously legitimating hostile attitudes towards racialised and minoritised individuals. The spread and appeal of these logics, facilitated by social media, have had reverberating consequences for recent transnational reactionary right mobilisations, including the UK Conservative Party's "war on woke".

RN18 | T03_03: Gender and the Media

Social affordances of SoMe platforms: New Steps in the Study of Interrelatedness of AI, Algorithms, and Gendered User Perspectives

Kristoffer Aagesen, Jakob Demant

University of Copenhagen, Denmark

Affordance analyses are pivotal for examining the impact of social media. They scrutinize design choices, user interpretations, and likely outcomes, making them ideal for digital sociology and media science. The concept of affordance delineates the potential actions perceived by a subject when interacting with an object. However, this definition overlooks the fleeting affordances of contemporary social media. User experiences, and consequently affordances, vary due to AI-curated content based on demographic traits, search behavior, and social network.

By introducing 'social affordances', we aim to anchor affordance analysis in a specific social and behavioral context, considering the unique social makeup of individuals' profiles. In other words, we shift affordances from hypothetical user experiences to concrete, socialized perspectives. We Illustrate this with an analysis of illicit drug markets on social media, where we explore the impact of gender and social networks on buyers' access to drugs.

Based on online ethnography, we created male and female profiles on Snapchat to observe how available and suggested content is tailored according to gender, search behaviors and social network. Social media affordances prove highly specific to the social makeup of interacting profiles.

We propose a sociological approach to the affordance concept, including new methodological frameworks for online ethnography, providing researchers with a tool that accounts for specific social, demographic, and behavioral characteristics of profiles generating data. In conclusion, understanding and operationalizing social affordances is crucial for a nuanced analysis of the diverse ways individuals engage with and experience social media platforms.

The Use of the Internet by Portuguese Trade Unions: is There a Gender Effect?

Paulo Marques Alves

Iscte – University Institute of Lisbon, Portugal

After a period of great flourishing, the union movement saw the foundations of its power shaken from the mid-1970s onwards, entering a generalised crisis.

Some authors have emphasised that the rise of women to leadership positions has made a very important contribution to change the way unionism is done: in ideologies, programmes and agendas (Pasture, 1997); in union's practices, as women have a "different leadership style" (Cunnison & Stageman, 1995); in denouncing the rigidity, rituals, the accumulation of responsibilities, and in the adoption of collective working methods (Le Quentrec et al., 1999); and in creating a union's "friendly image" (Cockburn, 1991), what is strategic for reversing union decline (Kirton & Healy, 1999).

Moving from the real world to the virtual one, our aim is to analyse how the Internet is used by female-dominated and male-dominated unions. Do unions where there is a very high rate of feminisation of the leadership use the Internet differently from male-dominated ones? To what extent are there divergences or convergences in the way they use it?

We analysed the online content (website and social media) of four unions (two female-dominated and two male-dominated) in the education and health sectors. Our main conclusion is that there is no gender effect, but rather a broad convergence in the way unions communicate. On the other hand, the way the Internet is being used is not contributing to the emergence of new forms of action and politics, thus not allowing the revitalisation of trade unionism.

Women and Smart Working in Italy: Tension, Transformation, Polarisation of Voices

Tatiana Mazali

Politecnico di Torino, Italy

The COVID-19 pandemic has amplified pre-existing forms of exclusion and highlighted how certain phenomena – e.g. smart working – can turn from desirable opportunities into forms of "existential peripheralization" (Ruzzeddu 2020; Bolisani et al. 2020). In this scenario, the media played the role of amplifiers of the drastic changes that individuals and societies experienced.

The contribution will present the results of the empirical research "SWITCH", co-led by the author in 2022-2023 and conducted with quanti-qualitative methods on the topic of female smart working. Starting from the map of narratives and 'dominant voices' identified on Twitter through digital methods (Monaci, Mazali, Persico 2023), the analysis of interviews conducted with 33 women (smart workers of different ages and Twitter female 'influencers') will be presented. The study aimed to understand whether smart working is, or can become, a new mechanism for (re)producing gender inequalities and what the critical issues and actions to mitigate them might be.

Among the main findings, particular attention will be paid to the polarisation of opinions. Indeed, in our study we have witnessed a polarization of opinions and a co-presence of positive and negative voices (both online and offline) emphasizing divergent impacts of smart working: on the one hand, the positive voices highlighted the prospect of saving money, saving time to dedicate to their families or themselves, and being more calm and productive; on the other hand, other women highlighted the increased

665

working hours and higher rhythms that lead them to physical and mental fatigue.

"I Would Rather be Eroticized Than be Seen as a Threat"

Sujood Momani

University of Limerick, Ireland

Muslim women living in the West and beyond derive from a range of cultural, ethnic, and socioeconomic backgrounds. Despite reductive characterisations, particularly visible in anti-Muslim discourse, the rise of social media has given Muslim women a platform from which to be heard and seen in ways that were previously unattainable (Ryan, 2011). In this regard, Muslim women have discovered novel ways to break boundaries and challenge homogenized stereotypes by expressing themselves using the online space, particularly through the hijab and modest fashion (Lewis, 2013; 2015; 2017). Coinciding with an increasing online presence, global brands have recognised modest fashion as a niche market, marking the beginning of the hijabi influencer-brand collaboration relationship, further amplifying the online exposure of Muslim women. Drawing on original qualitative data from fieldwork conducted internationally with Muslim women as social media producers and consumers, alongside a semiotic visual analysis (Barthes, 1964; 1972; 1977), this paper examines how these hijabi influencers negotiate 'new', socially, and religiously constructed notions of Islamic modesty, while simultaneously trying to align with norms of what is currently deemed aesthetically attractive by Western standards. It discusses the impacts capitalist collaborations are having on Muslim women's interpretations of religiously defined 'Islamic' notions of 'modesty' and performative Muslimness, asking whether these interpretations are challenging Western stereotypes or complicating Islamic notions of religiosity. This paper concludes with a discussion of the utilisation of hijab, by both influencers and brands, and whether this is to be regarded as regressive or progressive for Muslim women living in the West. Theoretically, this paper is grounded in the works of Erving Goffman (1959), Roland Barthes and Lila Abu-Lughod (2013). Empirically and theoretically, this research extends and enriches current scholarship on Muslim women's self-representation and utilisation of social media, offering novel insights and contributions to the field.

RN18 | T04_01: Surveillance, Bureaucracy and Politics

Beyond Interest: Classed Dispositions and Political News-consumption in High Choice Media Environments

Gunnar Bugge Helle

University of Oslo, Norway

News avoidance and public disconnection among ordinary citizens remains a crucial challenge for democracy in "high choice media environments". This paper utilizes 46 in-depth semi-structured interviews with 23 individuals of different age and class positions to scrutinize how they use media to connect to the public sphere. We question how citizens of different social positions are integrated in the national political information environment to unequal degree. We conceptualize this "integration" as a relation between media repertoires which are unequally oriented towards the public sphere, and classed dispositions which to an unequally render this environment as politically meaningful. We empirically demonstrate that 1) there is a strong class gradient the political orientation of media repertoires which follows from differences in political interest. 2) Beyond differences in political interest, holders of cultural capital may demonstrate an ambivalent relationship to day-to-day news and political coverage, but also have dispositions which provide public connection beyond traditional news media. Finally, 3) Interviewees with a media repertoire primarily dominated by social media are found among the young working class. Lacking both a politically saturated media repertoire and dispositions to appreciate political content, their integration is fragile, and their "self-tailoring" of the media supply is dependent on contingent contextual factors such as unionization and having the right social network. These findings demonstrate the pitfalls of a too media-centred approach in political communication research, highlighting the increasing importance of cultural disposition and social networks in providing citizens with public connection in an information environment increasingly plagued by news avoidance.

Forms: The Fordization of Communication

Eran Fisher

The Open University of Israel, Israel

In the last couple of decades there has been a growing interest in studying the materiality and performativity of paper media in the context of modernity in general and modern bureaucracy in particular. Staples of modern bureaucracy, such as memorandums, files, documents, index cards, registrars, ledgers, calendars, business letters, etc. are seen primarily as registering and documenting an external reality. Mostly we treat them as vignettes through which we get

666

a glimpse into the reality they register, document, and communicate. An emerging body of research, though, attempts to shine a light on paper media and study them as devices, or technologies, which act on, and shape the content which is laid on them, thereby also exerting an effect on how we see the world and act upon it. My lecture offers a new understanding of forms as facilitating the Fordization of communication. The prominence of forms, and paper media in general, in modern society, and particularly in the context of state bureaucracy, has been understood in the literature via three theoretical frameworks: as means of rationalization, as creating subjectivities, and as performative devices. Building on these three (complementary) interpretations – from Weber, Foucault, and Science and Technology Studies, respectively – I offer a fourth, Marxist-inspired framework. Drawing on the homology between the production of goods and the production of communication, and on the Marxian critique of the assembly line, I wish to understand forms as the Fordization of communication between the sovereign and subjects, and as a key technology in rearranging communicative social relations through two key coordinates: informationalization and spatialization.

Manufacturing Consent for Surveillance Capitalism in Turkey: A Study on Younger People's VPN Use

Alım Irmak Mete

TED University, Turkiye

The rapid global rise in access to internet technologies facilitates quick access to information, communication, and products, while also demanding swift decision-making for efficient use. This shift in the political economy of the internet is theorized as "surveillance capitalism" (SC), characterized by the extraction and utilization of user behavioral data for insufficiently disclosed aims that eventually produce further revenue and profit. Explicit consent cannot be given without full disclosure or the option to refuse. Yet, user consent for data collection is presented as a requirement for using online facilities, rendering this initial consent null. The unequal power dynamics between producers and collectors of data are inherent in SC, and the systemic solution rather than structural regulations is in the form of privacy products like the VPN for the users to purchase. The political, economic, and cultural factors affecting the use of VPN services in Turkey offer a unique opportunity to examine how Turkish users view and manage their data privacy. Based on a theoretical comparison of Weber's social action theory with Chomsky & Herman's political economy theory on mass manufacturing of consent under Zuboff's framework of SC, this paper investigates how users perceive, decide on, and act upon privacy concerns during consensual processes. To do so, I focus on digitally literate undergraduates' VPN usage in Turkey by conducting in-depth interviews and qualitative data coding. This study aims to contribute to the literature by demonstrating SC's alternative manufacturing of consent under non-standardized political, economic, and social conditions, and discussing potential transformation.

Consumers' Fragile Relations with Privacy and Trust in a Surveillance Economy

Henry Mainsah, Dag Slettemeås, Helene Fiane Teigen

Oslo Metropolitan University (OsloMet)/ Consumption Research Norway (SIFO), Norway

Public trust in digital data, algorithms and devices is under scrutiny as digital platforms, apps, and devices have increasingly become indispensable utilities for social interaction and communication in everyday life among European citizens. This paper aims to analyze how trust in and dependence on digital platforms for mediated communication digital consumption is configured and the kind of consequences this has for user agency and public values.

The paper draws on a mixed-methods study about Norwegian consumers' experiences and perspectives on everyday life in a surveillance economy. The data consist of focus group interviews with 13 participants aged between 18-57 years and a national web-based representative survey of 1000 respondents.

We demonstrate how these apps and platforms which are an essential part of consumers' social infrastructure have become entangled with a corporate-computational infrastructure. This leads to a situation where consumers felt compelled to appropriate these socially indispensable infrastructures in everyday life, making them dependent on their corporate control mechanisms. It was difficult for the participants to establish proper relations with – what they experienced to be – elusive and intangible data, while assigning proper value to their own data as a transactional currency. They simultaneously voiced a desire to gain more knowledge and control over the use of their personal data, to avoid resignation, but found this task overwhelming. Their reactions towards personal data surveillance and privacy issues varied with the extent of invasiveness and tangibility of data extraction processes.

Our analysis builds on insights from the domestication perspective and infrastructure studies to examine user agency and trust, revealed through understandings of their actions, and affective dimensions in situated contexts.

RN18 | T04_02: Climate Change, Sustainability and the Environment

Extreme Weather Events As Media Events In Climate Change Era. The Italian Case Of Emilia-Romagna Floods

Flavio Piccoli

University School for Advanced Studies IUSS Pavia, Italy

Several studies have shown the difficulties that the news media are facing in highlighting the link between climate change and extreme weather events either during or after the events. Despite the fact that previous literature is rather controversial on the possibilities provided by these events to change beliefs and perceptions of climate risks, the media, through their agenda setting effect, play an important role in influencing the discourses and imaginaries constructed around climate change and its link to extreme weather events. Adopting a holistic approach that combines media event theory and media ecosystem analysis, we investigate the discourses, frames, rituals and narratives that shape media representation of the floods that hit the Emilia-Romagna region of Italy in May 2023. We use a mixed methods design involving qualitative content and narrative analysis integrated by descriptive statistics and quantitative text analysis. The data consists of news from five national newspapers, seven prime-time news programmes and tweets, covering the month of May 2023. Preliminary findings show that the different media have a relatively consistent narrative structure, agenda and circulating discourses, with some variations in the framing of news stories and the representation of the climate change-extreme weather link. We also identified two factors that may have hindered the communication of the risks posed by climate change and its influence on extreme weather events. First, the emphasis on mourning and loss, reinforced by the portrayal of resilience shown by Emilia-Romagna residents, created a ritual of national solidarity that relegated to the margins critical viewpoints considering causes and preventive measures that could have been enacted. Secondly, mainstream journalism in Italy seems to lack a dedicated space and expertise for environmental and scientific issues, resulting in underrepresented and sometimes misleading coverage of the connection between climate change and extreme weather events.

Redefining Sustainable Food Consumption – An Analysis of Public Television Discourses on sustainable food in Hungary

Zsolt Szabolcsi, Bernadett Csurgó

Centre for Social Science, Hungary

This paper examines how sustainable food consumption is portrayed on Hungarian public television, with a particular focus on the presentation of local food as a central element of sustainable food consumption. The study uses a content analysis methodology. 210 videos from the Hungarian public television archives from the years 2011-2022 are analysed. The analysis is based on domestication theory from media studies. This framework has been applied in various contexts such as war coverage, political events and migration studies (Alasuutari et al., 2013; Fengler et al., 2017; Ha and Shin, 2016; Sinalo, 2022; Achter, 2010).

In contrast to the global nature of sustainability narratives (Luederitz et al. 2017) around sustainable food consumption, our findings reveal a distinct divide in the Hungarian media. The representation of sustainable food consumption is clearly domesticated. It is detached from its global context and framed within a localised narrative. Despite the fact that issues such as zero waste and sustainable food are of global significance, their representation on Hungarian television lacks a direct link to the broader global discourse. Instead, the Hungarian media presents these global issues as parallel discourses that are transformed through processes such as re-narration and re-labelling (Olausson 2014). This paper highlights how the global trend of sustainable food consumption is reframed domestically on Hungarian public television, raising questions about how such framing affects public understanding and engagement with sustainable consumption challenges.

I had no previous application to the PhD Summer School.

Animal Care And New Media. An Exploratory Research On Imaginaries

Michele Varini, Matteo Moscatelli

Università Cattolica del Sacro Cuore, Italy

Pets have played, and continue to play, an increasingly important role in our lives, and communication around their care and welfare is increasingly varied, rich, pervasive. Not only has industry communication become increasingly relevant, but the presence of animals (both domestic and wild) has also become relevant within social networking platforms and in popular culture, reaching previously unthinkable numbers of people. Starting from a small literature review aimed at showing various research trends, this contribution aims at exploring different meanings of the phenomenon within the Italian context, approaching it from a mixed methods perspective in order to illuminate some of its main dimensions and perspectives. Following this intention, focus groups were conducted with petlovers, selected among the trainees of a specific training platform

668

for pet care professionals, and an online questionnaire was administered to the users of an e-commerce platform dedicated to pets. A netnographic research was also carried out to explore the content developed on the web, focusing on two fronts: on the one hand, online communities, a privileged place of comparison and discussion for more and more users, and on the other, profiles of animal influencers, sampled always within the Italian context. From the results of this exploratory study, some main polarisations of online discourses and several possible research frontiers for the animal care sector and its communication emerge.

Discursive Polarization in the Digital Media Ecosystem in Spain: The Case of 2030 Agenda and the Sustainable Development Goals (SDGs)

Diego de Haro-Gázquez, Raúl Lucena-Martínez, Eladia Illescas-Estévez, Tristán Pertíñez-Blasco, Eva Cataño-García, Ana Rocío Andreu-Pérez, Rubén Martín-Gimeno

Center for Andalusian Studies, Spain

In December 2023, Spain concluded its six-month rotating presidency of the European Council, during which a European Summit was held in the city of Granada during the first week of October. The main objectives of this summit were to address issues related to Open Strategic Autonomy, immigration, accession of new member states, and especially the Ukraine war, with the presence of President Zelenski. Although there was no direct mention of topics related to the UN's 2030 Agenda and the Sustainable Development Goals, they experienced the highest peak of media interest in Spain in the last five years, according to Google Trends data.

The 2030 Agenda (and the 17 associated Sustainable Development Goals) was unanimously approved by the United Nations in 2015 and has since become a polysemic concept within the Spanish digital media ecosystem. On the one hand, it has been conceptualized as a vector for humanizing public leadership (Romero-Martín et al., 2023), but it has also been linked, especially after the COVID-19 pandemic, to a populist anti-elitism movement that, at times, has bordered on conspiracy beliefs.

The objective of this communication is to conduct an analysis of the digital media ecosystem (including online press and social media) in Spain related to 2030 Agenda and the SDGs, and to identify the conversational communities that drive public debate on this topic. To achieve this, a digital content analysis was carried out using social listening and analytics tools, along with a segmentation of communities and polarization using a Social Network Analysis approach.

RN18 | T04_03: War, Invasion and the Media

The Trust to the Internet Activity and Information: Through the Ukrainian-Russian War Context

Olena Ihgorivna Goroshko[1], Nataliia Leonidivna Boiko[2]

1National Technical University "Kharkiv Polytechnic Institute"; 2Institute of Sociology of National Academy of Sciences of Ukraine

The biggest military conflict in Europe since the Second World War began on 24 Feb 2022, when Russia invaded Ukraine. The war in Ukraine has also accentuated problems related to Internet activity and trust on the Internet, in other words, the problems of obtaining reliable information online, consumption of fake and propaganda and its influence on the public opinion present one of the leading components either in digital-developed countries or countries at war. The excess of unreliable and fake information affects the change of Internet activity of the modern user and leads to a big loss of trust to the information transmitted through the Net. Therefore, the problem of trust to information disseminated through Internet becomes extremely acute for understanding modern information warfare.

The research objective is to study the peculiarities of Internet activity during the war and to fix the level of trust to the Internet information.

The problems are under investigation:

Has the activity of Ukrainians on the Internet during the war changed compared to the pre-war period?

Is there any dynamics of Internet activity during the war?

Have the sources of receiving information changed during the war and if yes in what way?

What are the indicators of trust in the Internet and how are they fixed and described?

What is the level of trust to various information sources in war conditions? And how can it influence the susceptibility to fake, and propaganda information?

The focused online interview is the main research tool.

669

Media, Vulnerability, and Civic Resistance: Unraveling Narratives on War and Hybrid Threats among Socially Vulnerable Groups in Lithuania

Dzina Donauskaite[1], Daiva Skučienė[1], Rūta Brazienė[1], Ieva Gajauskaitė[2], Viktor Denisenko[2]

1Vilnius University; 2General Jonas Žemaitis Military Academy of Lithuania

Media's portrayal of the Russian War in Ukraine has significantly impacted the previously occupied Baltic countries. Support for Ukraine's military efforts has been expressed at the highest levels of governments, translating into tangible military assistance. The war has led to a reassessment of defense strategies and societal reflection, prominently presented in the media.

Wars inflict profound impact on civilians, especially vulnerable groups, who have limited resources to escape as refugees when wars start. Simultaneously, these vulnerable individuals play a significant role in both active war participation and civic resistance during occupation.

Grounded in critical media theory, this research explores media usage by socially vulnerable groups in one of the Baltic countries – Lithuania – amid military tension, analyzing their narratives in response to mass and social media messages, and exploring their perceptions of potential roles and behaviors in case of a feared spillover of conflict.

Critical media theorists argue that mass media mobilizes citizens by providing narratives for war justification. Yet, global social media disrupts this, acting as a platform for hybrid warfare targeting vulnerable audiences, and impacting ideas of civic resistance.

This paper, part of the project "The Intersection of Social and Defense Policies in Lithuania: Resilience of Socially Vulnerable Groups to Hybrid Threats," investigates the media's role in shaping socially vulnerable groups during times of heightened tensions.

The study, funded by the Research Council of Lithuania (LMTLT, agreement No. S-VIS-23-17), employs qualitative interviews with 40 vulnerable Lithuanians. These interviews delve into questions about trust in the media, choice of media, and reactions to media messages about threats and civic resistance.

Russian Invasion into Ukraine and Lithuanian Public Agenda in 2022-2023: Victim and Persistent Issues

Vaidas Morkevicius, Vytautas Valentinavicius, Giedrius Zvaliauskas

Kaunas University of Technology, Lithuania

Focusing events (Kingdon, 2014) have the power to become dominant issues on any agenda including public agenda. They may become "killer issues" (Brosius & Kepplinger, 1995) that either replace or restructure attention to issues on agendas. Therefore, some issues may become "victim issues" that may disappear completely from some agenda or may lose a lot of attention. Other issues may be identified as more persistent and lose only some attention (or none at all). Yet, other issues may receive facilitating support from attention to the focusing events and become more prominent on the agenda. In this paper we aim to show how Russia's war in Ukraine restructured attention to issues on the Lithuanian public agenda. Specifically, our objectives are to study issue priorities among Lithuanian public and reveal changes of issue attention on the Lithuanian public agenda between years 2022 and 2023 (at the beginning of the Russian invasion and a year after the invasion).

For the purpose of analysis, we use data from two nationally representative surveys conducted in Lithuania on March, 2022 and May, 2023. They included an open-ended question asking respondents to identify (up to three) national level problems that the Government should pay the most attention to during the year of the survey. The answers were registered and coded according to the topic classification developed in the Comparative Agendas Project. This scheme contains 21 major topics. In addition, every answer and identification of a problem was coded whether it was directly related to Ukraine. For the empirical analysis we employed descriptive and multivariate statistical analysis.

The Role of Telegram in the Russo-Ukrainian War: A New Propaganda Model

Roman Kyrychenko, Vasileios Maltezos

University of Helsinki, Finland

The ongoing Russo-Ukrainian war has witnessed the emergence of social media as a significant battleground for propaganda. This study focuses on the role of the messaging platform Telegram in disseminating propaganda during the conflict. By analyzing a corpus of Telegram channels related to the war, comprising over 14 million posts, this research aims to uncover the strategies employed by Russian and Ukrainian factions to influence public opinion. The study proves that Russia employs a new propaganda model to disseminate the narratives efficiently for the enemy's auditory. The study uses various machine learning methods to analyze the content and structure of the Telegram channels. Content analysis and clustering techniques, such as sentence embeddings and UMAP, identify similarities and

670

differences in the narratives shared by different channels. Graph analysis, including the PageRank algorithm and Louvain method, is employed to detect influential channels and community structures within the network. Preliminary findings suggest that both pro-Russian and pro-Ukrainian channels actively engage with each other, challenging the notion of echo chambers. Mediating channels, including Russian liberal media outlets and anonymous channels disseminating "insider" information, play a significant role in facilitating interaction between the opposing factions. The study also reveals the presence of coordinated networks of channels which share similar characteristics and content. This research contributes to understanding the role of social media platforms, specifically Telegram, in disseminating propaganda during the Russo-Ukrainian war. The findings shed light on the strategies employed by both sides to shape public opinion.

RN18 | T05_02: Inequalities and the Media

Tangible Outcomes In The Real World: Measuring The Third-Level Digital Divide

Liliya Kuzina

HSE University, Russian Federation

Digitalization affects more and more people all around the globe. For example, in 2022 in some developed countries, e.g. South Korea, Netherlands and Norway, the internet was accessible to virtually everyone. Internet access has gradually risen in Russia as well. According to Rosstat, in 2022 the share of households with Internet access has doubled (86.6%) compared to 2010 (48.4%). However, some groups remain excluded from the benefits that digitalization provides.

One of the most widely used approaches to the analysis of digital inequality is the digital divide perspective. It proposes a model of three digital divides. The third-level digital divide is associated with inequality that appears offline as a result of differences in internet usage. These differences are called tangible outcomes (van Deursen & Helsper, 2015).

671

This research not only aims to systematize methodological approaches to the third-level digital divide assessment, but also attempts to measure it on the data of «A Monitoring Study of the Economy and Society's Digital Transformation». Employed data was collected by the Institute of Statistical Studies and Economics of Knowledge (ISSEK HSE) in 2022. The overall sample consisted of more than 10 thousand respondents aged 14 and above from 69 Russian regions.

The results demonstrated that more than a half of Russian internet users achieved some tangible outcomes. These outcomes are mostly related to communication and broadening of social networks, e-commerce and career development. It was also determined that the level of digital skills is associated with number of internet use-related tangible outcomes.

Inequalities In Managing Hyperconnectivity: Findings From A Portuguese Survey

Ana Jorge[1], Filipa Neto[2], Maria do Carmo Botelho[2], Nuno Nunes[2], Magdalena Kania-Lundholm[3]

1Lusófona University, Portugal; 2ISCTE-IUL; 3Dalarna University

Digital disconnection is an emergent practice in a mediatized, datafied and hyperconnected society (Couldry & Hepp, 2016; Van Dijck, 2013; Brubaker, 2023). Practices of opting out are socially embedded and stratified (Fast et al.,

2021; Treré, 2021), making the digital another arena where power relations and societal status are negotiated (Helsper, 2021).

This paper explores disconnection through (rather than from) digital media, asking how inequalities play out in digital users' management of hyperconnectivity online (Kaun, 2021; Light, 2014). We approach inequalities through an intersectional lens; and included questions about inhibiting factors to connect to the internet, pressures to be connected, as well as disconnection strategies and motivations (Nguyen et al., 2022). Our study consisted of an online survey, conducted in early 2023, with a quota sample with post-calibration to adjust to the characteristics (sex, age and education level) of the Portuguese population (n=1618).

This paper focuses on disconnection strategies. We found that self-preservation strategies (muting groups in messaging apps; turning off email, social media, news or messaging apps' notifications; and unfollow or block contacts or accounts) were taken up by highly educated, single/dependent or independent 35+ years old, and those who are part of the ethnic and/or religious majority. This indicates privileged digital users who can afford to refrain from social contacts if they find them overwhelming; in contrast with a technical savvy group that detains the abilities to modulate contacts but does not put them to practice, among which we find a greater portion of economically precarious women.

Left Behind? – An Empirical Analysis of Co-actions of Social and Digital Factors in Romania

Szidónia Rusu

Babeș-Bolyai University, Romania

The digital divide has been conceptualized as a gap in terms of access between individuals, households and geographical areas(Van Dijk, 2020). With the rise of technology, the digital divide now applies to both access to ICT and actual use of the internet, access modes, autonomy and a wide range of activities, literacy and skills (Hüsing and Selhofer, 2004, Hargittai and Hinnant, 2008; Van Dijk, 2020). In this presentation, I will examine digital literacy, levels of access, and media usage patterns and profiles, based on Eurostat, OECD, PISA and Hungarian Youth Research (2000-2024) results among young people in Romania. By comparing and analyzing the data, I want to identify the role of socio-demographic, regional, habitus and values differences in several areas of digital literacy and media usage. I present the inequalities in an economic and social context, with a particular focus on comparisons between Central and Eastern European countries, using a set of economic and regional development indicators. Finally, I will also consider user habits and behavioral patterns among young people in Romania, using time-series data over the last twenty years. After all, studying the different dimensions of online interactions and internet usage can help us to understand what factors influence inequalities and access to information in the digital field. In my presentation, I will therefore seek to answer how basic demographic, attitudinal and value system indicators affect digital literacy, access, inequalities

and media usage patterns. In the results, I will outline the challenges and opportunities in new technologies and digital innovations for reducing inequalities and exclusion.

Un-fracturing the Paradigm. Toward a New Framing Schema to Analyze Culture in Media, Social Problems and Policy Agenda: the Immigration-Problem Case.

Marco Binotto[1], Marco Bruno[2]

1Sapienza University of Rome, Italy; 2Sapienza University of Rome, Italy

The "struggles over meaning" are increasingly played out around framing processes, the ability to frame reality and define the situation (Castells 2009). However, the flourishing literature produces various definitions of framing and tools of framing analysis so varied that the paradigm of frame analysis prevalent in public discourse is still definable as "fractured" (Entman 1993). Over time the numerous researches on news frames have proposed different definitions and analytical patterns, in an attempt to address this fragmentation, the contribution (from empirical material collected over the years within the Italian case) tries to propose an approach to refine the description of dominant narratives, the analysis of frames and its "interpretive packages" (Gamson, Modigliani 1989) and its connections with the collective imaginary. The authors propose a heuristic tool to define structure, cultural resonances, and metaphors, with two aims: a) to suggest a new schemata to define and identify the main narratives and its relation to the different framing levels (key metaphor, general frames, policy and news frames ordered by level of generality); b) a taxonomy to describe the relationship between existing narratives, those that have been constructed over time to counteract them (counterframing), those that propose to reframe them (reframing), and those that propose to be new or different (alternative narratives). The theoretical attempt here is to bring order and construct a set of definitions of actions to counter the dominant frames, useful also for activists and minority voices. he more than 30-year history of the media coverage of migrations offers a vast array of research and case studies of great and enduring effectiveness to be used as examples of the scheme's use.

672

RN18 | T06_01: Health and Communication

Investigate Mental Health in Digital Spaces as Political Issue: #su1c1de, #sh.

Nicoletta Guglielmelli

University of Genoa, Italy

Within the social sciences, it is now widely recognised that mental health is a political and social issue. Starting from this observation, my contribution aims to critically analyse digital contexts of socialisation in order to reflect on the relationship between these and mental health. Furthermore, it attempts to investigate whether, even within digital platforms, processes of empowerment and individualisation of people with regard to their own mental health take place. The socio-technical structures of the platforms prevent both sharing and searching for mental health-related content and, as a result, users identify and implement 'resistance' strategies (through the skillful use of hashtags).

Drawing on Fisher's, Ehrenberg's and Fernando's reflections on the relationship between mental health and advanced capitalist societies, on the one hand, and on Ahmed's concept of lived experience related to critical phenomenology, on the other, I propose to analyse the case of TikTok in order to understand whether the regulation of content sharing within it reflects the processes of individualisation and empowerment specific to Western societies.

Research questions:

• What are (and how do they operate) the affordances by which the TikTok platform shapes the narratives inherent to mental suffering?

• In the practices of sharing one's mental health experiences on Tiktok, can strategies to circumvent the platform's affordances and forms of individualisation of one's mental health be recognised?

Methodology:

Digital methods (content and narratives analysis, walk-through analysis).

(I HAVE NEVER PARTICIPATED IN AN ESA Summer School.)

Disregarding Social Hazards. Advertising of Pseudo-Medicine in Legacy Media

Fátima Gómez Buil, Ana García Arranz, Salvador Perelló Oliver

Universidad Rey Juan Carlos, Spain

The economic and credibility pressures on news organizations have influenced editorial decisions, and their integration with commercial content has become increasingly common. In this context, so-called pseudo-medicine (Hellmuth

et al., 2019) is reaching astronomical figures globally with an estimated CAGR of 8.9% by 2030 (Euromonitor International, 2023). Advertisers, aware of the highly lucrative nature of these products, place their messages in legacy media, often with the backing of reputable journalists, in order to transfer their credibility and increase persuasive effectiveness, and disregarding the ultimate aim of the profession: to operate in the public interest and adopt practices to serve the needs of society as opposed to private interests.

The aim of this proposal is to explore the degree of implementation of editorial-commercial collaboration of these products in insertions in the legacy media, between 2018 and 2022. For this purpose, a content analysis of 4,078 advertisements was conducted. The crossing of all analyzed variables was submitted to prescriptive tests of significance ($\chi2$) and the reliability of the coding process was verified by Cohen's kappa.

Preliminary results show that 1 in 5 internet advertisements (20.8%) for supplements appear on generalist news media websites, 3.6% on TV, 16.3% in the press, and 0.9% on radio. On the other hand, in specialized media, their appearance on TV rises to 5.5%, in the press to 27.5%, and on radio, it stands at 1.0%. The significant weight of direct or sponsored advertising in these spaces evidences how the media, dependent on advertising revenue, becomes complicit in the publicizing of products which can pose serious health risks to society.

673

Werther vs. Papageno – Tensions Around Media Coverage of Suicide

Izabela Korbiel

University of Vienna, Austria

This paper discusses different positions in scholarship regarding content governance in case of media reporting on suicide. It is a dilemma how to report suicide in the media due to the evidence for copy – cat effect, called Werther – effect, occurring after media reports of suicide. In reference to the work of Goethe "Sorrows of young Werther" (1774) people after not sensible media coverage might be inspired to harm themselves.

On the one hand the study reviews voices advocating for certain media coverage collected in media guidelines for "accurate, responsible and appropriate"(World Health Organisation 2002, 2017, 2023) media reporting. Positive media effect is visible in preventive impact on the audience after certain content, for instance publication of help sources such as crisis centres or helplines for persons in suicidal/psychological crisis. The potential of media in suicide prevention is called Papageno – effect as a tribute to the character from Mozart's opera The Magic Flute (1791), who overcame his suicidal crisis after talking to three boys.

On the other hand this paper presents a critical view of media guidelines for reporting of suicide as mean of medicalisation via reduction of the social phenomenon – suicide – to mental disorder. The main criticism claims the will of the individual and the agency of the person who chooses to fulfil this ultimate act are neglected.

The aim is to review and systematise arguments collected by both positions and discuss their applicability in the current situation of multiple crises and changed conditions.

Contentious Politics in Pandemic Times. The Italian case during the first year of the pandemic crisis

Mattia Zunino, Emiliana De Blasio

Luiss Guido Carli, Italy

Since the declaration of a pandemic emergency by the World Health Organisation in March 2020, we have witnessed a critical event of global proportions. Governments around the world, in an attempt to manage a health emergency unprecedented in recent history, have adopted measures that severely restrict individual freedoms. Restrictions on physical access to public space and expatriation, lockdowns, quarantines, and and prohibitions on associating outside the family nucleus have been collective experiences that have shaped the lives of hundreds of millions of people. Given the unprecedented restrictions on physical access to public space and the numerous bans on association, one might have expected a stagnation of practices attributable to the dimension of so-called Contentious Politics. On the contrary, according to early published studies (Della Porta, 2022), it was an extremely dense period of contestations, protests and claims. A general tension, sometimes accompanied by a distrust of health institutions, characterised by the use of alternative practices, especially in terms of communication and presence within digital communication ecosystems. This paper present and analyse the practices of contention against the emergency measures adopted by the Italian authorities in response to the peaks of contagion in the first year of the pandemic emergency, 2020. Given the restrictive measures of physical access to public space that characterised the period under study, particular attention will be paid to analysing the communicative tactics and strategies of protest through the lens of some of the leading national newspapers and within digital communicative ecosystems.

Della Porta, D., 2022. Contentios Politics in Emergency Critical Junctures. In: D. Mayer & S. Staggenborg, a cura di Elements in Contentious Politics. Cambridge: Cambridge University Press.

Spectres of Marx in Critical Media and Communication Studies

Sašo Slaček Brlek, Boris Mance

University of Ljubljana, Slovenia

The presentation builds on our previous research (Slaček Brlek and Mance, 2023), which tracked citations of Marxist authors and the use of Marxist concepts in mainstream scholarly publications from the field of media and communication studies. While our previously published study uses co-citation analysis to identify patterns of co-occurrence of citations and keywords, it is limited by not taking into account the context in which authors and ideas are cited. We will complement these findings by examining which of Marx's ideas are taken up in communication studies and how. We will use the existing dataset of 7007 works from the WoS category Communication, selected on the basis of relevant Marxian keywords in the titles, abstracts and keywords, to identify which works of Marx are cited and how citation patterns differ between paradigms and over time. Second, we will analyze the full texts of publications in which Marxist authors are cited to determine the context in which they are cited and which ideas are specifically referred to. The study follows a mixed methods approach, combining qualitative and quantitative methods. Using fully digitized texts, we conduct a comprehensive search to extract passages that refer to Marx. While qualitative coding distinguishes between accuracy/abstraction (direct quotation, paraphrase/summary) and sentiments towards cited ideas (positive or negative citation), quantitative analysis constructs conceptual models from the words in the text that denote concepts. These are linked by varying degrees of strength (frequency of co-occurrence in the cited text) and their significance (centrality) within the network. By using community detection algorithms, different clusters of word collocations will be identified, representing different conceptual models.

674

Frankfurt School Legacy and the Critical Sociology of Media: Lifeworld in Digital Capitalism

Pasko Bilic

Institute for Development and International Relations, Croatia

Just as the Frankfurt School responded to the radicalisation of the working class in Germany and the rise of post-war consumerism in the United States, today, we are confronted by platform monopolies, automated hyper-consumption and technological control. Critical approaches to digital media have exposed the structural coupling of Internet use and capital accumulation for almost two decades. However, many authors building on this tradition can struggle to understand how online social interaction is controlled beyond the worn-out critique of false consciousness or beyond conceptualising all digital activity mediated by data as labour. This paper will attempt to theoretically untangle the Marxian ontology of labour and the Frankfurt School-inspired critique of everyday life. This is not just theoretical nit-picking. Society becomes completely dominated if we accept no difference between wage labour and lifeworld activities. Each contains its internal struggles. The value form regulates both in different ways.

Aesthetic Approach for Critical Sociology of Contemporary Communication Technology

Balca Arda

Kadir Has University, Turkiye

Critical theory has already marked that technology often threatens civil liberties, personal autonomy, and rights. Heidegger, later Marcuse, emphasized how technology is not value-free in its own revealing power of the surrounding environment, external and inner nature. Throughout this paper, I explore how the aesthetic approach engages with critical theory and contributes to the sociology of media and communication. For this, I will theoretically survey the terms of sociality under the forces of immediate communication, ubiquitous surveillance, and the compression of time and space that Baudrillard and Virilio once problematized through the lens of critical technology theory to adapt it to media and communication studies. I contend that techno-aesthetics that converge with Rancière's dissensus can provide practical suggestions on an updated vocation of critical sociology. This article discusses the potential of aesthetic and social criticism of media for democratizing technology that Feenberg inserted. It is urgent to acknowledge the changing spatio-temporal aesthetic regimes that affect the societal imagination and limits of sociality and action to determine the next steps for achieving a commons-based society.

Communicative Activity: Social Theoretical Foundations for Critical Materialist Media and Communication Sociology in the Digital Age

Sebastian Sevignani

Friedrich Schiller University Jena, Germany

This paper contributes to the social theoretical foundations of a critical materialist sociology of media and communication by making use of the cultural-historical school in psychology (e.g., Vygotsky and Leontev). Such a perspective gains relevance under the conditions of digital capitalism and phenomena of the blurring of production and Internet usage. The paper proceeds in three steps, it first revisits Habermas's influential notion of communicative action and agency. It secondly uses activity theory as an alternative, more promising way of theorising communication and media because it links them closer to work. This tradition starts with a humanist notion of concrete species being but pays particular attention to the use of cultural tools for human development. The paper then provides an activity theory-inspired model of communicative action and conceptually links media to human tool use. Building on this, the paper, thirdly, elaborates on the notion of activity in the digital world and posits that digitalisation can be understood as a 'machinisation' of mental and communicative-coordinative work. The developed perspective, the paper concludes, allows critical materialist media and communication sociology to operate with meaningful concepts of communicative expropriation, exploitation, and alienation.

RN18 | T07_01: Special Issue Launch 2

Launch of the Symposium: 'Critical Sociology of Media and Communication: Theoretical Contributions to a Disconnected Field' (Critical Sociology, Volume 50, Issue 4-5), edited by Paško Bilić and Thomas Allmer

Ibn Khaldûn and the Political Economy of Communication in the Age of Digital Capitalism

Christian Fuchs

Paderborn University, Germany

Ibn Khaldûn (was a philosopher, historian, and sociologist. This presentation asks: What elements of the Political Economy of Communication are there in Ibn Khaldûn's work and how do they matter in digital capitalism?

A paper that is based on this talk is part of the Critical Sociology special issue on "Critical Sociology of Media and Communication: Theoretical Contributions to a Disconnected Field":

https://doi.org/10.1177/08969205231206488

It has resulted in a debate between Graham Murdock and Christian Fuchs:

https://doi.org/10.1177/08969205231201050

https://doi.org/10.1177/08969205231201382

There are parallels between Khaldûn's main work "The Muqaddimah" and works in Political Economy, especially Karl Marx's approach of the Critique of Political Economy. Several scholars have pointed out parallels between Khaldûn and Marx. It, therefore, makes sense to also compare Khaldûn and Marx in the context of the Political Economy of Communication.

The presentation shows the relevance of Khaldûn's ideas in digital capitalism. Khaldûn's works are situated in the context of media and communication theory, digital automation, Facebook, Google, labour in informational and digital capitalism, Amazon, the tabloid press, fake news, and post-truth culture.

Khaldûn's "Muqaddimah" is an early work in Political Economy that can and should inform our contemporary critical analysis of communication in society, communication in capitalism and class society, ideology, and digital capitalism.

Marx and Khaldûn both were critical scholars who although living at different times in different parts of the world saw the importance of the analysis of class and communication. Their works can and should inform the Political Economy of Communication and the analysis of digital capitalism.

News Sources in the Sociology of the Media: A Political Economy of Communication Approach

Jernej Amon Prodnik, Igor Vobič

University of Ljubljana, Faculty of Social Sciences, Department of Journalism and Social Communication Research Centre, Slovenia

Sourcing practices are among the central research topics within the sociology of the media. Empirical studies have analysed what and who are the major journalistic sources, demonstrating that the selections journalists make not only depend on their subjective choices, but are connected to the norms and routines established in the profession. The major findings of the studies include journalists' excessive reliance on elite sources and the growing tendency for news homogenization and the recycling of ready-made information. However, while invaluable, these studies are primarily media-centric and focused on small-scale investigations, meaning they regularly ignore the social totality in which sourcing is inevitably embedded. They consequently encounter difficulties explaining why such sourcing practices exist and why they have evidently been intensifying, while paying too little attention to the external actors that provide 'information subsidies' to journalists. By employing the framework of the public sphere, we show that news sources should be viewed as a topic of central social relevance that touches on wider power relations within society. Sociological approaches should thus be complemented with other critical traditions, for instance political economy of communication (PEC), which can provide valuable theoretical support when uncovering some of the internal and external processes influencing sourcing practices. It can help explain the crucial fault lines of journalism-as-labour and the tendencies of commercial media at the present historical conjuncture, while also explicating general patterns of communication inequalities and hierarchies in capitalist society, which in many ways are connected to the growing dominance of information subsidies in public communication as such. The value of PEC is revealed in brief sketches that point to the possibilities of achieving deeper understanding of the topic.

Examining the Hybrid Media System Model from the Perspective of Critical Communication Research

Rok Smrdelj[1], Mojca Pajnik[2,3]

1University of Ljubljana, Faculty of Arts, Slovenia; 2University of Ljubljana, Faculty of Social Sciences, Slovenia; 3Peace Institute, Slovenia

In this paper, we start from the assumption that the hybrid media system model is a relevant starting point for any media analysis, as no phenomena or processes in the current media sphere occur outside the intertwining "older" and "newer" media institutions, practices, discourses, and content. However, we argue that while the hybrid media

676

system model effectively captures the technological developments in the current media sphere, it does not provide a sufficient theoretical and epistemological background for comprehending the social aspects of the digital media environment, namely social relations of power and subordination in neoliberal capitalist economy. Therefore, we propose a theoretical reconceptualization of the hybrid media system model by introducing structural and material conditions of contemporary media sphere with reference to critical theory. Utilizing the principle of historicization and the concept of social relations we demonstrate that those who wield dominant power within the neoliberal capitalist economy also have influence over the logic of the hybrid media system. Following the premise that the "agency" is bounded by hierarchical social relations, we enhance the hybrid media system model to explicate not only cases where digital media have enabled successful civic activism leading to social change, but also cases where new digital technologies reinforce pre-existing social relations of power and subordination. In this manner we expound that the main epistemological shortcoming of the hybrid media system model is not its emphasis on "agency", but its inability to acknowledge the structural circumstances that "defeat" or give rise to the "agency." The main contribution of our paper is to show that critical theory strengthens the explanatory power of the current eclectic-empirical media models without profoundly undermining their foundations.

Digital Labour and Precarisation

Thomas Allmer

Paderborn University, Germany

This talk will address questions focused on digital labour and precarisation.

The term precarious comes from the Latin 'precarius' (obtained by entreaty). It is associated with the lending of a thing that provides the giver the possibility to revoke its use at any time. It describes an insecure and unstable relationship granted on revocation involving a taker-giver dependency.

While there exist many forms of temporalities in digital capitalism, including fixed-term, part-time and hourly-paid, the question of how far digital labour relationships can be considered precarious is open to debate. The overall aim of my talk is to theorise and conceptualise precarisation and apply it to the realm of digital labour.

RN18 | T08_01: Public Sphere

Cancel Culture in Italy: Transformations of the Online Public Debate After Covid-19

Martina Masullo, Emiliana Mangone

University of Salerno

In Italy, cancel culture finds fertile ground in restricted social circles. With the health, economic and social crisis resulting from the covid-19 pandemic, however, the phenomenon of cancel culture has also exploded in Italy. This happened mainly through social networking platforms which, through their polarising power, define themes and topics that become priorities within the public debate. In view of this, we want to investigate the outcomes, consequences and products generated by cancel culture through social media and how the spread of covid-19 has accelerated the evolutionary process.

Considering the 'convergent culture' theorised by Jenkins, which later became one of the cornerstones of media studies, as the macro-area within which to move, and drawing on some fundamental theoretical concepts such as polarisation, homophily and trust, it is possible to observe how social networks give rise to a condition of ideological isolation of the user, amplifying debates and conveying opinions. It is in this context that the phenomenon of cancel culture adapts and revives in contemporary times. Following a qualitative methodology, through content analysis and netnography, the aim is to analyse some case studies in which those collateral phenomena occur which represent the preliminary actions to the act of cancellation: call-out (the act of unmasking), shitstorm (the media pillory), review bombing (the mass negative reviews), deplatforming (the boycott through the denial of access to platforms).

On the basis of preliminary results, it emerges that it is possible to draw the boundaries within which cancel culture can go and to analyse how (and under which influences) people's way of communicating is transforming and towards which perspectives it is turning.

Decolonization Of The European Public Sphere: Can Narratives And Representations Of Migration Be The Way Forward?

Subas Amjad, Sara Pane

La Sapienza University Rome

The public sphere serves as a platform for rational discourse, idea-sharing, and shaping public opinion. Despite its Eurocentric orientation, criticized for excluding women, workers, and minorities, language reinforces these disparities,

677

marginalizing diverse cultures. The debate extends to the European Union, questioning the existence and characteristics of a European public sphere.

Our contribution posits that a European public sphere exists, shaped by Europeanization but plagued by Eurocentrism. Migration emerges as a potential catalyst for decolonizing this sphere, aiming to challenge dominant narratives and promote inclusivity. Social media has empowered marginalized groups, yet resistance persists.

Decolonization involves dismantling biases and fostering narratives that reflect migrant realities. While efforts toward inclusivity persist, resistance from privileged groups complicates the issue. Dismantling oppressive structures, revising policies, and adopting inclusive practices can establish a just and democratic European public space.

Our study, combining critical literature review, an EU-wide online survey, and ethnographic studies, aims to deepen understanding and pave the way for further research. Structured in three parts—reconstructing the theoretical framework, data collection, and discussion—our contribution seeks to enrich the discourse on the European public sphere, acknowledging challenges and proposing avenues for progress.

Communicating Europe In The Post-Pandemic Scenario: Towards A European Post-Digital Public Sphere?

Sara Pane

Sapienza, University of Rome, Italy

The EU is striving to become more sustainable and equitable in the post-pandemic scenario through a twin transition towards environmentally and digitally livable environments. This transition requires successful management and communication of related public policies. Nonetheless, European public institutional communication has been often neglected and lacks proper accessibility and effectiveness. This deficit in communication has led to criticism of the EU for being distant from its popular base, leading to the rise of populist, Eurosceptic, and eurocritical narratives.

The development of digital technologies offers new perspectives for addressing these challenges. The platformed and networked societies, along with the rapid spread of generative AI, have caught the attention of European institutions. They recognize the potential as well as the risks associated with these new frontiers for renewing their communication strategies. The evolving nature of European public institutional communication is gradually shifting towards a citizen-oriented, multi-level, and user-friendly model centered around digital communication.

Recent measures taken by the EU in information, communication, and participation indicate that the digital realm is no longer just a possibility but a reality that must be harnessed while being mindful of its limitations and opportunities. The interaction between online and offline practices becomes explicit in this context. The transition from the Web 1.0 to the Web 4.0, which emphasizes interactions between humans, platforms, and algorithms, highlights the hybridization of communication practices. This framework sets the

stage for a new hypothesis: that of a European post-digital public sphere, which goes beyond traditional notions, poses new challenges and might find in the post-pandemic scenario a potential ground for development.

The Researcher Becomes The Researched: Accessing & Navigating A Public Institution

Sylvie Carlos

King's College London, United Kingdom

In recent years, the British Broadcasting Corporation (BBC) has faced scrutiny for controversies such as the sanctioning of Gary Lineker (a British sports broadcaster who critiqued the government's migrant policies) discontinuation of regional radio programs affecting Black and Asian communities, defence of a racial slur, and mislabelling of Black MPs during broadcasts.

This proposal delves into broader inquiries, exploring access, power dynamics, and accountability in researching public institutions. My PhD research specifically focuses on how British podcasts and radio platforms serve Black audiences and conducting an ethnography in one of the BBC's radio production teams had been proposed as a large part of the fieldwork. This proposal uncovers some of the challenges that have occurred when the researcher becomes the researched, even though they were originally viewed as an insider. Alongside being a researcher I am multi-award-winning audio producer.

Themes addressed include:

Researcher Vulnerability: Drawing on personal experiences accessing the BBC and an independent production company, the paper highlights researcher vulnerability and its impact on outcomes.

Access to Public Institutions: Examining access to public institutions, especially the BBC, it questions whether these entities can restrict research on public interest topics.

Accountability and Transparency: Emphasizing accountability and transparency, the proposal questions the responsibility of public institutions in maintaining openness and collaboration during scrutiny.

The paper provides a contemporary perspective on dynamics in researching public institutions amid controversy. Using personal experiences, it contributes to understanding power structures, fostering dialogue on institutional responsibilities, and advocating for transparency and equitable access in public institution research. The insights have implications for researchers, institutions, and policymakers in the media, power, and accountability intersection.

678

RN18 | T09_01: Action, Struggles and Resistance

Communication and Education as Tools of Resistance in Neoliberal Cities. Problems and Perspectives for Action

Michele Sorice[1], Volterrani Andrea[2]

1Sapienza University of Rome, Italy; 2University of Tor Vergata, Rome, Italy

The paper analyses the potential protagonism of vulnerable subjects (Castel 1995; Karwacki, Volterrani 2024) within liminal and marginal communities (Blokland 2017), deeply reshaped and permeated by social tensions after the Covid19 pandemic. Focusing on the interaction between digital communication ecosystems and urban spaces, particularly those identified as 'liminal', the research highlights the central role of communicative processes in civic engagement and broader citizen participation. The analysis of participatory practices considers the potentially inclusive uses of digital communication technologies, while acknowledging the risk that neoliberal rationality also absorbs practices of resistance.

The paper explores whether and how media can serve as a subspace for empowerment and mobilisation. The research is based on an empirical analysis (in-depth interviews and participant observation) conducted in liminal spaces in southern Italy as the first step of a larger study in six other European countries, which is currently underway.

The main – but not the only – aim of the research was to understand the complex relationship between liminal spaces and civic participation through communicative ecosystems.

Emphasising the theme of vulnerability, the paper argues for the incorporation of edu-communication principles into participatory processes, highlighting the potential of media not only as a tool for empowerment, but also as an environment where inclusive practices can be promoted, even within liminal and marginalised communities. This paper contributes to research on the relationship between civic resilience and communication, highlighting the transformative potential of hybrid participation and edu-communication in addressing individual vulnerabilities in urban contexts.

Distrust, Anti-politics and Social Media: Discursive Struggles Over Population Census In Serbia

Tamara Petrović Trifunović, Dunja Poleti Ćosić

University of Belgrade – Faculty of Philosophy, Serbia

Our presentation aims to explore the social media discourses surrounding the opposition to and advocacy for boycotting the 2022 Census of Population, Households, and Dwellings conducted in Serbia. The census serves as a vital source of national population data and holds significant importance for empirical studies and public policies, given the absence of a population register and prolonged reliance on outdated 2011 census data. The analysis delves into the contextual frames shaping the social and discursive dynamics surrounding the census, particularly the COVID-19 pandemic, which catalyzed political disaffection, uncertainty, distrust in conventional media, and the proliferation of conspiracy theories. The census itself can be seen as a political phenomenon and an act of power – the state's power over citizens and citizens' power of representation – and therefore provides fertile ground for anti-political contestations on social media platforms, nurtured by a fundamentally distrusting and suspicious vision of political life and media landscape. Our data sources include Facebook posts and comments, Reddit discussions, YouTube interviews, and comments on various media outlets and portals. We will examine strategies of delegitimization, interdiscursive connections, and ideological foundations of the anti-census discourse, as well as identify its prominent themes and topoi (i.e. the privacy abuse, suppression of the nation, theory of experimental totalitarianism, a call to a counter-action).

679

Democratisation from Above? Governance practices from the European Broadcasting Union to the Romanian Public Service Media (SRR & SRTV)

Raluca Petre

Ovidius University of Constanta, Romania

Public Service Media in Central and Eastern Europe have emerged out of a complicated authoritarian state legacy. More often than not, they have been considered state rather than public institutions; instruments of power and propaganda, a legacy of the ancient regime in the region. At the same time, PSM in Western and especially Northern Europe have traditionally enjoyed a respectable tradition and high trust at the level of their respective societies. Nevertheless, things have been changing in the recent years and the most recent Eurobarometer on Media & News Survey (2023) show no significant difference between Eastern and Western Europe when it comes to the distribution of trust

in PSM. In this contribution, I explore one of the explanatory reasons of this convergence.

The main focus of analysis is on governance practices and their potential of democratization from above. I take a view from top down and map the democratic governance practices of the largest association of public service media providers in Europe, the European Broadcasting Union. I address the way EBU democratic governance works and observe the criteria or representativity in its governing bodies. Further on, I analyze the transfer of governance practices from EBU to the Romanian PSM providers, namely the public radio (SRR), and public television (SRTV). I proceed with a neo-institutional analysis coupled with analysis of the contributions of current and former representatives of the two institutions in the EBU committees. The theoretical framework that underpins the analysis is neo-institutionalism and its focus on sector based practices.

RN18 | T09_02: Advertising, Promotion and the Media

The Role of CSR Activities in Preserving Brand Reputation – a Critical Perspective in Advertising Industry

Madalina Buga-Moraru

University of Bucharest, Romania

This study aims to highlight the dual role of a CSR campaign in shaping brand's reputation: addressing unpleasant aspects and advocating for causes related to product features themselves. Brand capital emerges from loyalty to the brand, its recognition, perceived quality, associations, and its name (Aaker, 1991). Brand equity is deeply connected to brand value, with two different perspectives rooted in economics and cognitive psychology. Brand reputation encompasses notoriety, brand memorability, market heritage and assets in comparison to competitors. Brands may encounter situations where their products have negative influences on diverse fields such as environment, education, pollution, health, and addiction. Consequently, CSR activities are designed to transform product/service disadvantages into advantages by engaging consumers/users in specific activities related to the brand's profile. As Garberg and Fombrun (2006) assert, CSR activities enhance brand reputation in the minds of customers, making it a strategically valuable investment that can be seen as a form of reputation building. This study aims to underscore the main themes of CSR activities and campaigns used by top 10 Romanian brands (2022 – 2023). The research design involves framing and thematic analysis applied to 50 CSR campaigns covering diverse topics, considering that brands belong to different categories of products or services such as finance, furniture, pharma, electronics, and soft drinks.

Hence, CSR activities conceal brand weaknesses, transforming them into strategic tactics to enhance consumers' critical perception and improve brand reputation.

"#alwaysbethere": Polizia di Stato in the Digital Era Between Promotion and Professional (self)representation

Elisa Begnis, Simone Tuzza

Alma Mater Studiorum University of Bologna, Italy

Over the past twenty years, the utilisation of social media by Police forces has captured the attention of scholars from different part of the world. This heightened interest can largely be attributed to the sociopolitical transformations that have transpired within this era and the upsurge in pervasive populism. However, literature shows an overall gap in the Italian police studies, which sees a noticeable deficiency in terms of social media analysis.

We employed a theoretical framework encompassing concepts such as image work, police presentational strategies and encounter theory in our endeavor to investigate the utilization of digital tools by the Italian Polizia di Stato (State Police). Our aim is to address the existing gap in literature and discuss how the PS utilises its official website along with social media platforms like Twitter, Facebook and Instagram as a medium for conveying a positive image of police work to the citizens.

To accomplish this objective, we will analyse both the structure of the PS' official website and 250 posts from PS' official profile for each social media, attempting to describe how the organisation uses the new medias as instruments to portrait themselves. The study aims to conduct a comprehensive analysis of the predominant digital platforms through thematic and textual/hashtag examination, evidencing the significant narratives and recurrent themes presented by the PS to appeal to a diverse audience and garner recognition.

Virtual Alchemy: Transforming Social Constructs into Compelling Place Brand through Communication – The Case Study of Șirnea Village

Ana Maria Gulpe[1], Arabela Gabriela Briciu[2]

1University of Bucharest, Romania; 2University of Transylvania, Romania

In response to the decline of villages against metropolitan dominance, this research investigates the digital communication involved in crafting a compelling place brand, using the case study of Șirnea Village. As the first tourist village in Romania, Șirnea provides important insights into stakeholder's contribution to shaping the village's image.

Image is the result of a social construct, so every voice involved is important. As such, the study analysed the collective digital communication of diverse stakeholders associated to the transformation of the village into a distinct place brand. Our primary objectives were to identify the main stakeholders involved in the digital communication, the main channels of communication used, the main themes approached and the key characteristics of the village communicated by each stakeholder.

We analyzed the online content disseminated between January 1st and December 30th, 2023, focusing on news channels and blog posts. Content analysis was applied as the research method, chosen for its systematic approach and the ability to facilitate both quantitative and qualitative data analysis.

The research findings reveal dominant themes and stakeholder perceptions and provide insights into the potential for sustainable development. Moreover, it added to the existing body of knowledge regarding the creation of place brand images for small and less recognized destinations by underlining the transformative impact of digital interaction.

Commercial Television as blind spot in emerging media systems. Romania and Bulgaria's Cases

Madalina Balasescu[1], Romina Surugiu[2], Vyara Angelova[3]

1University of Bucharest, Romania; 2University of Bucharest, Romania; 3University Kliment Ohridski, Bulgaria

The study explores the audiovisual in Romania and Bulgaria considered "emerging" media systems in post-communist studies (Sparks, 1995). It uses Hallin and Mancini's framework (2004) to analyze central aspects of the commercial television configurations. The study offers an institutional perspective on television by exploring the licensing frame and the general television offer. The interaction between commercial television, politics, and state underlines the intricate relations through powerful and influential networks, involving various interests of individuals and groups. The study fills in the blind spot of research on commercial television in both countries, aiming to contribute to the understanding of Romanian and Bulgarian media landscape. It offers a critical perspective on television systems in relation with Polarized Pluralist model of Hallin and Mancini (2004) considering its explanatory function within Eastern European media systems' analysis. In present, the commercial television is the most developed category of media in both countries. The research is explorative and descriptive, based on the secondary analysis that used similar categories of data series from both countries. Situated at the crossroads of post-communist regimes and EU modernization directions, The Romanian and Bulgarian commercial televisions contributed to the progressive and the irreversible replacement of the monopole of public television, being considered dynamic televisions' markets in CEE, reportedly pluralist and based on free competition. However, the commercial television is exposed in many ways to political factors and economic pressures (the limits of the national advertising markets).

Beyond Registration & Regulation: The Challenges Of Integrating Sociological Approaches Into Social Care Practice In Ireland's New Regulatory Regimes.

Lorcan Patrick Byrne[1], Lisa Moran[2], John O'Brien[3]

1Technological University of the Shannon, Ireland; 2Technological University of the Shannon, Ireland; 3University College Cork

The dynamic landscape of Irish social care work has arrived at a consolidatory threshold. The Irish state has made the term 'Social Care Worker' a protected title, with 'standards of proficiency' that hold a legal status; adherence mandated by legislation. However, the ways these standards are interpreted varies greatly, evidenced by the wide array of undergraduate programme content delivered across the state post-regulation. Our concern is that a critical sociological perspective, might be undermined, which would be a significant diminution of social care work undergraduate training.

Sociology can empower social care professionals to look beyond individual pathology, providing a holistic view that considers micro contexts and macro structures. The Irish state (CORU 2019) mandates that it is an ethical duty of professional social care workers to "…promote social justice in your practice through: challenging negative discrimination and unjust policies and practices; respecting diversity, different cultures and values… and working towards social inclusion" (p27). The risk for social care is that it becomes focused on proximate issues around individual need and fails to see the wider structural issues reproducing and exacerbating our clients' vulnerabilities.

This paper situates sociological analysis as a bedrock attribute for social care work; that an applied sociological approach amplifies the potential of social care work, to make empirically informed and meaningful interventions in the lives of their clients, in partnership with clients. This paper is a call to action and encourages partnerships and engagement between sociology and the entirety of the profession: frontline workers to policy makers.

Social Care And Social Work: Professional Status And Processes Of Legitimisation

Darragh Dermot Farrell

Technological University Dublin, Ireland

The profession of Social Care (residential care of vulnerable children) in Ireland has struggled to achieve full professional status. This is evident in the profession's relationship with that of Social Work (statutory child protection casework). While contemporary forms of both professions emerged in the early 1970s, the profession of Social Work had been established since the beginning of the 20th century in iterations such as the Hospital Almoner (medical social worker). Despite a recognition of Social Workers as predominant functionaries in the child protection figuration, little is known about their rise to dominance in relation to the allied profession of Social Care. Addressing this dearth of knowledge, this paper analyses historical documents, exploring the genesis of both professions in terms of conflicts and tensions, as well as the development of unequal power relations. Ireland provides a rich and potentially fruitful research context given its complex child protection history. The sociology of Norbert Elias, specifically his work on the genesis of the naval profession and his established-outsider theory, while underutilised in the sociology of professions, provides a useful framework for this analysis. This paper argues that the extent to which cultural alignment between these professions and State agencies existed, as well as the phase of development during which these relationships intensified, are significant as they inform the conditions under which legitimacy claims arise. The attainment of professional status over time is shown here as one aspect of a legitimisation process, and part of a broader developing professional care habitus.

Frontline Professionalism in between Specialisation, Hierarchies and Interdependencies

Tone Alm Andreassen, Therese Saltkjel

OsloMet – Oslo Metropolitan University, Norway

Young people outside education and employment have for long been a cause of serious worry for politicians and parents. Adding to that, young people have been among the hardest hit by the consequences of COVID-19.

Despite or because of the worries of politicians and parents, these young people end up at the offices and in the files and hands of frontline workers whose individual traditional professionalism leaves them ill-equipped to meet their complex challenges arising from difficult upbringings, mental problems, drug abuse, early school leaving and incomplete learning outcomes. Situated at the lowest levels of service hierarchies, in one of multiple services within a division of labour, with a mandate to manage only a single aspect of the young people's complex challenges, they find themselves in precarious interdependencies with other

682

organizations and professionals. Their conceptualisation of youth at risk must be considered fundamentally shaped by this organisational positioning.

A professionalism adapted to the situation of frontline professionals seems inadequately understood and theorised. The purpose of this paper is to discuss what professionalism mean in a street-level context. Our discussion is based on an analysis of Norwegian frontline professionals' conceptualisation of young people at risk of being marginalized from education and employment, i.e. how the professionals perceive and describe the young people and their problems.

A central point in our discussion is that to understand frontline professionals' conceptions of their clients and of their work we must understand not only how these conceptions are shaped by their professional background and the organizations within which they work but also by these organizations' locations in the system of services and the interdependencies between them.

Transformations of Caseworkers' Child Welfare Assessments Over Time: A Replication Study Using Vignettes to Track Changes in Practice

Kirstine Karmsteen[1], Tea Torbenfeldt Bengtsson[1], Sofie Henze-Pedersen[1], Anne Mette Møller[2]

1Vive – The Danish Center for Social Science Research, Denmark; 2CBS – Copenhagen Business School

This study investigates changes in caseworkers' assessment in child welfare cases over time. Drawing on a replication of a 2002 Danish study on caseworkers' assessments in child welfare, we examine if and how there are changes in caseworkers' assessments 20 years later. The 2002-study found that the responsibility for assessments were individualized and that the assessments lacked systematic and professional knowledge, resulting in inconsistent assessments. The new study apply the same methods as the 2002-study: focus group interviews with 30 caseworkers in total from seven municipalities assessing six vignettes with fictional descriptions of cases. Preliminary findings reveal three significant changes: 1) the level of collective deliberation has increased, 2) practices of assessments are more systematic, and 3) the deliberations and assessments are to a higher degree founded on professional knowledge and expertise compared to deliberations and assessments in the original study. These changes in practice reflect broader changes in social work, such as increased professionalization, changes in the view on children as well as structural changes and legal changes in the Danish child welfare system.

RN19 | T01_02: Health care professionalism

Scripting Work the Boundaries of Dying – Organizing Palliative and Oncological Expertise at the End of Life

Amalie Martinus Hauge, Didde Boisen Andersen

The Danish Center for Social Science Research, Denmark

How do healthcare professionals from different traditions respond to new ideas about what constitutes a good end of life? The Covid 19 pandemic and the resource crisis facing many European health systems have accentuated the challenges of delivering coherent patient trajectories when dying approaches. This paper reports from a Danish study of professional efforts of doing good when cancer patients' approach the point of medical futility, where further cancer treatment is unlikely to provide further clinical benefit. Drawing on the sociology of expertise and professions, the paper identifies three scripts of doing good: The evidence-based approach, the conversation approach and the integrative approach. Each script emphasizes a particular skillset, knowledge and professional virtue. The paper shows how during the last 20 years, the hierarchy between these scripts have shifted, calling for new forms of expertise and posing new dilemmas for the professionals involved. The analysis draws on a sociocultural knowledge analysis discourse (SKAD) approach and involves documents and interviews.

Clinical Decision Support System and the Formation of Clinical Reasoning among Swedish Amulance Nurses

Goran Puaca[1], Tora Nord[1], Ulf Andersson[1], Hanna Maurin Söderholm[2]

1University of Borås, Sweden; 2Lindholmen Science Park, Sweden

The question of Clinical Decision Support Systems (CDSS) is highly relevant in the healthcare sector, where technological innovations increasingly intervene with clinical reasoning and decision-making. The idea behind CDSS is to contribute to safer and better healthcare by assisting clinical reasoning with relevant patient information and medical knowledge to facilitate decision-making.

The purpose of the article is to illustrate how clinical reasoning in practice is shaped based on CDSS in emergency healthcare. The guiding questions of the study are (1) how CDSS in emergency medical services is integrated into work processes, and (2) how CDSS affects the professional action

683

and judgment of registered nurses (RNs) working in emergency medical services.

The empirical material is based on observations and interviews with RNs collected within the framework of a simulation project aimed at developing and evaluating CDSS for prehospital assessment of sepsis risk.

The results of the study illustrate how the clinical reasoning preceding decision-making is largely a collective process among colleagues and how emotions and tacit knowledge constitute central elements for professional judgment. Although RNs express confidence that various technical systems can assist the clinical reasoning preceding decisions, they are skeptical about the reliability of technology. This skepticism becomes evident, especially when RNs need to override their professional values based on what the systems indicate, leading to a conflict between the system and judgment.

For CDSS to be integrated, a harmonization process is needed between technology, work organization, and professionals. This involves creating a community of practice where the CDSS can be embedded with professional logic to enhance clinical reasoning.

Political Tensions And Challenges In The Work Of Health Professionals In Russia

Anastasia Novkunskaya[1], Yakov Scheglov[1], Anna Temkina[1,2]

1European University at St. Petersburg; 2Ben Gurion University

This project has started with the interest in grass-root initiatives launched by maternity care providers in order to challenge the existing status quo of resource and power allocation in the field of Russian healthcare (Temkina et al. 2022). This field in general is dominated by the managerial and market (neoliberal) logics of regulation, rather than professionalism (Rivkin-Fish, 2005; Saks, 2015). However, health providers in Russia do not give up struggling for their professional autonomy, and such a struggle with both neoliberal and statist tendencies concerns not only organizational, but civic and political issues as well.

With the start of the full-scale invasion of Ukraine our research continued with addressing the anti-war migration of medical professionals who opted to leave Russia, as they were no longer willing to align with the "aggressor state." We identified these professionals as challengers of the System, as they strategically used to criticize and transform the healthcare landscape. Basing on the data of in-depth interviews with healthcare providers who used to challenge the Russian healthcare System and emigrated after the start of the war, we argue that professionals appear to be involved in power struggles and are not politically neutral. With additional data of interviews with those health professionals, who remain in Russia, we intend to analyze how strategies for challenging health system and different political positions are intertwined and result in multiple tensions and challenges for their work.

Exploring Barriers To Certification Of Fit Notes By Nurses, Occupational Therapists, Physiotherapists, And Pharmacists: The Impact On Professional Roles And Identities

Diane Trusson[1], Stephen Timmons[1], Denise Kendrick[1], Kate Radford[1], Avril Drummond[1], Jain Holmes[1], Claire Anderson[1], Nick Pahl[2], Gill Phillips[3], Shan Martin[4], Jade Kettlewell[1]

1University of Nottingham, United Kingdom; 2The Society of Occupational Medicine; 3Deloite Consulting; 4PPI representative

Since 1948, UK doctors have legitimised work absence due to illness/injury using 'sick notes'. These were replaced by 'fit notes' in 2010, which include an option of 'may be fit for work' with appropriate adjustments to hours/duties that might facilitate remaining in, or returning to, work. This is important because of concerns over rising numbers of 'economically inactive' people, mainly due to long-term sickness. However, just 6.1% of fit notes issued in general practice between 2019 and 2023 included 'may be fit for work' advice. Possible reasons include insufficient time to explore patients' job roles and lack of expertise to advise on workplace adjustments.

684

Transformative legislation introduced in 2022 allows nurses, occupational therapists, physiotherapists, and pharmacists (NOPPs) to certify fit notes. Potential benefits include easing the pressure on GPs and utilising NOPPs' expertise in supporting patients to return-to-work.

Our mixed-methods study found only 47/198 NOPP survey respondents were certifying fit notes. Barriers include limited communication about legislation change, no opportunity to do training, poor managerial support, and insufficient resources (e.g. time). However, data from free-text survey responses and 17 interviews suggest that NOPPs believe fit note completion is appropriate for their role, and they are keen to undertake training and enhance their professional identities.

Organisational-level barriers (e.g. lack of policies/guidelines) to implementing the new fit note legislation seem to be hindering NOPPs expanding their professional boundaries and contributing to tackling the societal problem of long-term sickness. Addressing these barriers would optimise benefits for health services, patient care, and wider society.

RN19 | T02: Professionalization in education

Between Innovation And Challenge: The Impact of Artificial Intelligence on University Teaching – Opportunities for Professionalization and Risks of Deprofessionalization

Nina Weimann-Sandig

University of Applied Sciences for Social Work, Education and Nursing, Germany

The rapid progress of artificial intelligence has a significant impact on educational institutions, es-pecially on university teaching (HFD 2023). The introduction of AI technologies not only promises to increase efficiency, but also brings with it a critical reflection on the professionalization of teaching at universities (Weimann-Sandig 2023a; KI-Campus 2023). This paper examines the effects of the use of artificial intelligence (AI) on university teaching and analyses the resulting implications for the professionalization and deprofessionalization of teachers. Professionalization is discussed on two levels: firstly, on the level of the definition of professionalization as a predominantly individual development of professionalism (Cramer, 2012; Evetts, 2014). Secondly, on the definition of criteria of professionalism. Starting with an introduction to the changes in university teaching as a result of AI, central criteria of professional research are examined. It then explains why university teaching as an academic activity is classified as a profession. The focus here is on specialization, the applica-tion of abstract knowledge, autonomy in decision-making and commitment to the common good. Following Parsons (1968) and Oevermann (1996), a structural-theoretical understanding of profes-sionalism in higher education teaching is discussed as well as a more competence-based approach (Cramer 2016). In a next step, the paper is dedicated to the opportunities for profession-alizing teaching activities at universities through the use of AI. Furthermore a separate section takes a critical look at how automated processes could compromise the auton-omy of teachers and what impact this could have on the professional self-image and quality of teaching, particularly against the backdrop of central professional theories. The conclusion emphasizes the need for a balanced approach to the integration of AI into university teaching.

Reform Processes In The Norwegian ECEC Sector: Challenges For The ECEC Teacher Profession

Solveig Marie Borgund[1], Anne Homme[2], Kari Ludvigsen[1]

1Western Norway University of Applied Sciences, Norway; 2University of Bergen, Norway

This paper regards the unclear professional authority of Norwegian Early Childhood Education and Care (ECEC) teachers in policy processes. State regulation gives children aged 1-5 the right to attend ECEC services provided by pub-lic and private owners and combine play, care, and learning. Qualified ECEC – teachers lead the institutions but depend on unskilled assistants in the day-to-day work. Enhanced governmental ambitions for ECEC quality are reflected in reforms of ECEC curriculum and teacher education aim-ing at clarified standards, strengthened staff competence, and professionalization of ECEC teachers (Børhaug og Bøe, 2021).

In this paper, we aim to study two different reform process-es in the Norwegian ECEC sector, specifically the role and the possibilities for impact for the ECEC teachers in these processes. Our analysis is inspired by studies pointing out new forms of education policy design with broadening stakeholder representation that may alter actors' roles (Vukasovic et al., 2021). Building on empirical studies of framework plan policies in ECEC teacher education (2012) and ECEC services (2017), we find that teachers gained clearer roles and responsibilities through professionaliza-tion from above (Evetts, 2011). However, the reforms de-fining the framework for teacher education and practice were created as compromises activating a broad range of stakeholders. Thus, broader mobilization for ECEC policy processes may lead to weakened influence for the profes-sion when it comes to shaping the frames for their work (Ludvigsen & Homme, 2020; Borgund, 2022).

Unveiling Grading Principles, Processes and Decision-making in the Swedish Teaching Profession

Magnus Persson

Linnaeus University, Sweden

Deciding on grades holds significant authority in the Swed-ish teaching profession. Grading teachers must be certified and have decision-making power not possible to override by any authority or client. However, the professional auton-omy is circumscribed by the obligation to ensure national consistency in grading by making decisions based on gen-erally expressed grading criteria formulated by the Swed-ish National Agency for Education. Additionally, teachers are required to "specifically considering" national test re-sults in several subjects in secondary school. In addition, comprehensible and formative expressed transparency in assessment and grading, communicated through digital

portals that teachers often are obligated to use, is expected by employers and pupils/parents.

This study, based on semi-structured interviews with secondary school teachers combined with analysis of informal and formal assessment documentation, explores how professional discretion takes shape in grading decisions given demands for national consistency in grading and external communication about the basis for assessment and decisions. More explicitly, the professional principles grading teachers adhere to in making their decisions, how they are communicated and how this generates decision-making processes, and final decisions is in the focus of this study.

Preliminary results identify three levels of professional principles: firstly, formal principles closely aligned with national regulations; secondly, local principles shaped by school-specific approaches of how to organize the work at the school where the teacher is employed, and thirdly, individual principles unique to each teacher. Depending on these principles, diverse various approaches to assessment and communication emerge, governing the teacher's professional space between discretion and automatization.

Intensification, Outsourcing and Crumbling of Teaching Work: The Effects of School Policies on Teaching Work

Ludivine Balland[1], Mary David[2]

1Nantes University, France; 2Centre Nantais de Sociologie, France

Today's school institution faces a number of challenges, such as inclusive education and managing heterogeneous pupils. These challenges are driven in particular by school policies which, over the last twenty years or so, have transformed the teaching profession.

We show that these major educational transformations are also making the work of teachers more onerous and complex, without giving them the tools to tackle the underlying educational challenges. In this way, we could say that the main challenge facing teachers is how to respond to all the injunctions that weigh on their day-to-day work.

We use a collective ethnographic survey of teachers' informal work to show how these educational changes affect the activities they carry out, the time they spend at work and the ways in which they engage with their work. In other words, we find that the public policies that have been accumulating since the 2000s are helping to transform certain professional standards. The research is based on a study of timetables and lengthy interviews with primary and secondary school teachers. More specifically, we show that

– that the way in which tasks and working time are managed depends on family configurations, gender, level of experience and the context of the school, which produces differentiated standards.

– that these variations reflect different ways of engaging in work (of relating to work), which contribute to producing social inequalities between teachers.

RN19 | T03: Professions, Academization and Gender

From Laboratory Assistant to Biomedical Scientist: Academization and the lab

Ola Agevall, Gunnar Olofsson

Linnaeus university, Sweden

What happens to an aspiring profession as it is subject to rapid, pervasive academisation? How does it shape the professional group, their education and work tasks, their conditions and position in the labour market? In 1977, the professional formation of Swedish laboratory assistants was transferred to the higher education sector. They were part of a wider set of education programs, including nurses, occupational therapists, teachers, preschool teachers, and leisure time pedagogues – all of which had previously been trained in separate institutions outside of academia. Yet, the laboratory assistants stand out in other respects. First, laboratory assistant had long been a female dominated technical specialty, and it continued to be so. Second, their entrance into academia marked the beginning of a sharper academic turn than in most professions – evident in the surge of the number of biomedical scientists with a doctor's degree. A very modest trickle of seven PhDs in the 1980s was followed by hundreds in the decades to follow, so that their total number currently equals every fifteenth practitioner. In the same period, the professional group secured an occupational monopoly, first in the guise of a protected title and then as a professional license. In this paper, we draw on survey and interview materials, as wells as historical documents and trade press, to analyze whether and in what respects this has brought changes in terms of work content, work conditions and career trajectories for the group.

686

Engaging in "Third Mission" Otherwise: The Academic Profession in the Social Sciences and Humanities

Ricardo Ayala[1,2], Claudia Figueiredo[1], Teresa Carvalho[1]

1University of Aveiro (Portugal); 2Universidad de las Americas (Chile)

Professional groups face external pressures due to societal macro changes; notably in academe the rise of the knowledge society, leading academics to increase third mission activities. However, academics are not passive recipients of commercial rationalities imposed on universities. They grapple with pressures like the "third mission," encompassing knowledge transfer, community engagement and innovation. The growing acknowledgment of social sciences and

humanities in fulfilling this mission prompts reflection on how academics in these fields traditionally and currently engage with society. Yet, there is scant empirical evidence illustrating the specific engagement of academics from these areas and its implications for societal impact.

By using three examples that have attracted public attention in the Portuguese society over the past few years, we aim to illustrate how social science and humanities scholars engage intensively in public debates (i.e., in favour or against social movements), which depicts the multifaceted impact of such disciplines on communities, public policy, cultural understanding and ethical considerations.

In illustrating these cases, we argue that academics in social science and humanities play an active role in shaping external environments, influencing policies, and challenging dominant discourses about science and university. An awareness about their ability to shape the public opinion seems key in this process, while this requires facing demands for particular perspectives or the avoidance of controversial topics. This suggests that the extent to which academics resist these pressures may depend on their individual commitment to academic freedom as well as the perceived importance of their message.

Internationalization and Diversity in the Academic Field: A Study of Brazilian Professors' Recruitment in European Universities

Jéssica Ronconi

EHESS, France

This presentation discusses the preliminary results of an ongoing doctoral research on the professional integration of Brazilian professors in European universities, particularly in France, England, and Germany. While the traditional pattern of intellectual exchanges between Brazil and Europe once entailed academic training in the latter abroad followed by a return to Brazil, recent transformations in higher education—marked by a heightened emphasis on internationalization and diversity—have created more favorable conditions for Brazilian researchers to access and secure academic positions in Europe. However, recruitment procedures and strategies differ in every country, as the specificities of each national higher education system give rise to unique challenges in international academic mobility.

Furthermore, professional integration does not occur independently of existing power dynamics within universities and disciplines. Bearing that in mind, this study resorts to interviews and the examination of CVs of those recruited in France, England, and Germany to explore their personal and professional trajectories. The initial results indicate that their institutional affiliation is often limited to departments and centers of literature and cultural areas (Latin American or Brazilian centers), and their work tends to concentrate on exoticized topics closely related to their home country. It also interrogates how the articulation between transnational trends and national traditions shapes the access of foreign researchers through diverse teaching career models. As a result, it unveils strategies of integration,

differentiation, and concession employed by Brazilians, ultimately leading them to their current positions in the academic milieu.

Devotion in Growth: Female Scholars' Professional Career and Work Ethic in New China Generation

Sining Wang

The University of Hong Kong, Hong Kong S.A.R. (China)

The tension and intersection between professionalism and other social systems has always been a crucial issue in sociology of professions. While pioneer studies on Anglo-societies accentuated the exclusivity feature of professionalism, subsequent research on European and other societies revealed its intricate connections with nationalism and colonialism in historical context, as well as its new forms with commercialization and globalization nowadays. However, how professionalism functions as moral facts within a context of social transformation has been understudied. This paper focuses on the case of Chinese female scholars in New China generation to answer this question.

Using life history interview and biographical data, the author takes a processual theoretical approach to examine scholars' work ethic throughout their professional careers. The analysis shows that, in the Mao-era, female scholars' work ethic was shaped by their devotion to the nation and self-independence based on gender consciousness. The social transformation after 1980s brought new social meaning system, allowing scholars in New China generation take academic work per se as their aspirations and interests in their middle and late careers. Additionally, family relationships played a role in coordinating emotional aspects with female scholars' work ethic, thereby creating the integrative life-world and providing further incentives for career development. Ultimately, this study suggests that professionalism, as professionals' moral action, is embedded in multiple social relations and exhibits resilience in the face of social transformations.

Entrusting women. Gender, Professionals and Mafia.

Ombretta Ingrasci

University of Milan, Italy

The paper addresses the relationship between female professionals and Italian Mafias by analysing two case studies related to two women professionals charged with mafia association. The cases concern the professions of lawyers and accountants, that have been increasingly affected by criminal cases; two traditional mafia organizations in Italy, including Cosa Nostra and 'Ndrangheta; and two different Italian regions, Sicily – in Southern Italy –, in which Cosa nostra is rooted, and Emilia-Romagna – in Northern Italy –, in which 'Ndrangheta has been deeply embedded in recent times.

687

Framed within the literature dealing with gendered trust (Song, Vernet, Pryke, 2022), professional misconducts (Muzio, 2016), and Mafias' infiltration into economy (Sciarrone, 2019; Catino, 2019), the study is based on court files and interviews with public prosecutors and law enforcement agencies who carried out the two investigations. The paper will discuss the study's outcome, according to which when mafia actors choose professionals, the variable influencing their selection are not related to gender stereotypes, rather than to professionals' trustworthiness, competence, and availability of carrying out unethical and/or criminal acts.

The paper intends to bring an innovative contribution to the literature on professionals' misconducts, by adopting a gender perspective, and by increasing the knowledge about the relationship between mafia actors and professionals, a new and promising research area.

Professional integration and identity in a multi-professional organization. The case of Norwegian Intelligence Service

Trygve Jens Gulbrandsen[1,2], Stig Stenslie[2]

1Institute for Social Research, Oslo, Norway; 2Center for Intelligence Studies, Norwegian Intelligence School, Norway

The world is facing several serious crises – wars, civil wars, climate catastrophes. One group of professionals have a special responsibility for monitoring these crises and warn public authorities about the threats they represent for national security and interests – intelligence professionals. They work in intelligence services which are government agencies.

Intelligence services comprise a large and varied number of tasks which are assembled into a set of different occupations organized in different departments and sections. A main distinction is between 'collectors' an 'analysts'. Collectors are professionals who collect data about potential enemies and threats. Analysts analyze the data and transform them into meaningful information which are useful for national decisions-makers. The intelligence professionals have different educational background: engineers, computer specialists, physicists, political scientists, sociologists, economists, language specialists. In other words, intelligence services are multi-professional organizations.

Sociologists of professions have demonstrated that multi-professional organizations may have problems with getting the employees to pull in the same direction. Different professional identifications may for instance represent challenges to attain effective collaboration between the different professional groups. To what extent are problems of professional integration and unity prevalent in the Norwegian Intelligence Service? We will answer this question using data from a survey of employees in the intelligence Service.

We suggest that unity among intelligence professionals is about cooperation and shared values and understandings.

We will therefore empirically focus upon: (a) The degree of collaboration between professionals in different departments and with different professional backgrounds. (b) The degree of similarity in attitudes to work and to the intelligence service across various groups of professionals.

688

RN19 | T04: Changing welfare state professionalism

Conceptualising Wellbeing through the Lens of Homelessness Services Staff in Ireland: Relationships, Trust and Transformations to Work during COVID-19.

Dr Lisa Moran[1], Mr Liam O'Farrell[2]

1Technological University of the Shannon, TUS, Ireland;
2University of Sheffield

Despite their societal importance, the wellbeing narratives of service providers working in homelessness services are frequently overlooked in research and policy. This paper addresses that gap, presenting evidence from interviews with homelessness service workers in Cork, Ireland during COVID-19 lockdowns. We explore the multidimensional character of services staff members' wellbeing narratives, highlighting their connections to relationships, commitment to service users, trust, fears about COVID-19, and the motivation to fulfil the social mission of their work: to support homeless people who frequently present with multiple and complex needs, including stigma. We subsequently present a sociologically-informed theoretical framework to capture these narratives.

Our data reveals that stressors encountered in pre-COVID times, including burnout, emotional labour, and issues with inter-agency working were aggravated due to restrictions and novel challenges encountered by services users and services providers during pandemic times. We focus on the period covering COVID-19 lockdowns in 2020 and 2021, considering how homelessness services providers coped with transformations to work, including the importance of trust, and the value of informal and formal supports. Significantly, our analysis also reflects upon the longer-term implications of these findings, contextualised against the present Irish housing crisis, changing demographics of persons accessing homelessness services, and broader currents of social and economic change.

Inclusive Societal Frameworks for the Hard of Hearing: Professional Discretion in Danish Welfare Services

Inge Kryger Pedersen, Kim Sune Karrasch Jepsen

University of Copenhagen, Denmark

Hearing technology is a major scientific breakthrough as it restores hearing for people with hearing loss around the globe, thus offering opportunities to partake communicative in everyday life. However, social scientific research finds challenges in group relations. Problems such as social exclusion and loss of energy are prevalent. This paper's thesis is that the current professional field is characterised by a knowledge gap between individualized treatment and the ongoing social implications of usage of hearing technologies in everyday life situations.

The Danish welfare state serves citizens with hearing loss and offers guidance to rehabilitate them back to 'normal'. We investigate situations of professionals' discretions (diagnosis, inference, and treatment) when they handle citizens' challenges in balancing hearing loss and school (children and adolescents) or working life (adults). Drawing on in-depth qualitative interviews with a broad spectrum of professionals in public service within the field of hearing impairment in addition to survey findings and documents as background material, we investigate how professional groups approach issues of social inclusion for people with hearing loss – or not. The analysis demonstrates how technologies meant to standardize guidance of people with hearing loss make new types and mechanisms of discretionary responses necessary. The findings are discussed to synthesize multidisciplinary expert knowledge about social challenges used in rehabilitation service to people with hearing loss. The paper concludes by comparing professional knowledge forms and procedures concerning social inclusion with the possible tension between individual strategies and activities in social domains of school, education and work.

Navigating the Two-Party Decision: Asylum Claim Processing at the Swedish Migration Agency

689

Anna-Maria S. Marekovic

Linnaeus University, Sweden

The decision-making process in asylum claims at the Swedish Migration Agency (SMA) is a 'two-party decision', involving two distinct professional roles – the case worker who processes the case, and the decision-maker who is ultimately responsible for approving or rejecting the claim. While research on decision-making in asylum claims suggests that professionals have a relatively generous discretionary space, the work is shaped by uncertainty, ethical dilemmas, and ongoing legal and organizational changes. Adding to that list, the SMA has intensified its emphasis on digitalization measures to increase administrative effectiveness, shorten the time of admission processes and enhance legal certainty in case administration. This study explores the welfare professional decision-making balancing act between discretion and 'programming' through a qualitative study with SMA case workers and decision-makers. The study draws upon semi-structured interviews, central work-related documents and contextual inquiry, i.e., case workers showcase their work processes by interacting with digital system interfaces. Preliminary findings reveal that, with very few exceptions, consensus predominantly shapes asylum case outcomes. This indicates firstly that discretion in asylum decision-making is not an individual endeavor, as assumed in much literature on street-level bureaucracy but must be understood as produced in professional interaction and negotiation. Secondly, this also directs attention to the

regularities in professional decision-making, rather than the divergences. The analysis unveils how the daily work of welfare professional decision-making is organized, and how it is shaped by collegial negotiations, legal principles, and digital systems, thus contributing with a nuanced account of welfare professional discretionary practices.

The Well-being Of Migrant Professionals: Capturing Experiences In Changing Professional And Personal Environments

Gregor Schäfer, Miguel Morillas

University of Copenhagen, Denmark

Growing global migration will continue to be a central factor marking the future of sociology of professions. In particular, high-skilled migration is increasing both in absolute terms and as a relative share of international migration. The larger numbers of migrant professionals raise questions about the consequences of their migration – for themselves, for society and for employing companies. While the well-being of different professional groups is well researched, the well-being of migrant professionals has yet to become a central topic in sociology. In particular, the sociology of professions has not yet grasped the implications of highly skilled migrant professionals' well-being. We theorize an understanding of well-being that integrates both professional (workplace) and personal dimensions (family and out-of-work socialization). Following Veenhoven's conceptualisation of subjective well-being as a cognitive comparison with standards of the good life (contentment), and also as how one feels most of the time (hedonic level of affect), we answer the question of how and what affects the well-being of migrant in knowledge-intensive professions and in their personal lives. We show how the professional-personal interface is defined in the context of professional mobility. To do this, we can draw on our unique sample of 60 in-depth interviews with 30 migrants hired from abroad to occupy highly ranked positions in Denmark-based companies. In a two-stage interviewing, we capture both their professional and life experiences in the context of cross-national labour mobility. Our work will further the understanding of the complexity of well-being of migrant professionals and consequences for their professional activity.

Tensions, Challenges and Transformation of the Professions Related to the Provision of Medical Services in the Field of Psychotherapy and Psychiatry in Poland.

Justyna Zielińska

The Maria Grzegorzewska University, Poland

The aim of this paper is to present the results of empirical research on the contemporary tensions and challenges of psychotherapists' and psychiatrists' work in Poland.

Psychotherapy and psychiatry are professions of particular social importance since their goal is to provide professional support to people experiencing mental distress and mental disorders. The contemporary increase in global and local crises, referred to as poly-crisis, such as the outbreak of the COVID-19 pandemic, the government of far right-wing political parties and their introduction of extremely restrictive legal regulations, and the outbreak of the war in Ukraine contributed to a sudden increase feelings of uncertainty and rise of mental distress among various social groups – especially among youth and children (WHO 2022, CBOS 2023). Poly-crisis increased the demand for professional mental health support, which resulted in various tensions, challenges and transformations in the professions performed by these specialists.

The paper is based on qualitative research which was initiated in 2023 and field research (individual in-depth interviews with psychiatrists and psychotherapists) is scheduled for February-May 2024 in Poland. The research is based on the perspective of sociology of professions and sociology of work. It is comparative in nature between the two professions and includes issues such as work history, everyday professional experiences, emotional labour, job quality and transformation of work, adaptation to changes, challenges, and coping strategies with tensions and difficulties.

Alternative Paths of Professionalism at the Margins of the Healthcare System – The Case of Spiritual Caregivers in Israel

Yael Keshet[1], Ariela Popper-Giveon[2]

1Western Galilee College, Israel; 2The David Yellin Academic College of Education, Jerusalem, Israel

Much of the research on professions in the field of healthcare focuses on standard bodies of knowledge, jurisdictional claims, state regulations, and professional closure, which are characteristics of professions like medicine. However, new notions such as client-based professionalization, professional fluidity, and connective professionalism, have recently emerged in the sociology of professions literature. The present lecture suggests a new perspective on

690

alternative paths of professionalism at the margins of the healthcare system, drawing on the case of spiritual caregivers. Semi-structured in-depth interviews were conducted with 15 Israeli spiritual caregivers. The interviewees presented themselves as professionals by describing characteristics resembling the new notions of professionalism: the centrality of the patient, the fluid nature of the practice of spiritual care, and their connectivity with other healthcare practitioners. New notions in the sociological study of professions can help us to understand alternative paths of professionalism at the margins of the healthcare system and to characterize the practitioners in these margins. This could lead to a better integration between marginal and medical professions to the benefit of patients, medical practitioners, other staff members, and medical institutions at large.

RN19 | T05: Knowledge-power nexus revisited

Beyond Paternalism and Neoliberalism? On Contemporary Professionalism and Future Perspectives

Christiane Schnell

Institute of Social Research at the Goethe-University Frankfurt, Germany

Based on a brief reconstruction of the sociology of professions discourse and current tendencies in the area of professional work, the paper is led by the argument that the development throughout the last two to three decades has been characterized by reinforced liberalization of an anachronistic understanding and institutionalization of established professionalism. Professional work has therefore been exemplary of the ambivalence of liberalization and the new constraints of economization within the era of neoliberalism. If and how professions survive this transformation has been questioned now and then. At the same time, professional problem-solving is demanded but also discredited in the face of societal polycrisis. How to integrate these tensions into an understanding of contemporary professionalism will be discussed with reference to empirical research in different empirical fields.

691

Discourses of Professional and Enterprising Agency Revisited: Tensions and Transformations in Public Service Organizations

Antero Olakivi[1,2], Miira Niska[1]

1University of Helsinki; 2Finnish Institute of Occupational Health

The cultural ideal of enterprising agency is gaining ground in contemporary societies. Generally, enterprising agents are conceived as innovative, proactive, reflexive, self-governing, and target-oriented agents who develop themselves, solve problems in their environments, and make things happen. Individuals in various settings – from business organizations to schools – are expected to act in enterprising ways. Professional actors and organizations in the context of for example medicine, nursing, education and social work, make no exception. On the one hand, the enterprising values sit relatively well with conventional values of professionalism. Professional organizations, as well, highlight employees' self-development, reflexivity, and ability to make things happen, among other enterprising attributes. On the other hand, enterprising ideals also highlight flexibility, including actors' ability to overcome traditional and cultural structures and boundaries. Such boundaries

can include conventional divisions of labor and established fields of knowledge and expertise, often conceived as pivotal to professional collectives. Furthermore, while enterprising agency can imply constant self-development in line with the ideals of professionalism, it can also imply an individualistic and consumerist orientation to work and employment that may engender tensions between enterprising and professional values. In sum, enterprising discourses can create tensions in professional organizations in qualitatively diverse ways that have, thus far, been insufficiently articulated in the sociology of professions. This paper has two aims. First, it aims to articulate the general overlaps and tensions between the cultural discourses of professional and enterprising agency. Second, it empirically examines these overlaps and tensions in public service and welfare provision in Finland.

Tensions Between Traditional and New Professional Knowledge? An Insight into the Transformation of the Planning Profession in the AEC Industry

Marie Marleen Heppner, Ajit Jacob Singh

Universität Bielefeld, Germany

This conference proposal explores the socio-technical transformation of planning practices in the AEC (Architecture, Engineering, and Construction) industry which is driven by the digital planning method BIM (Building Information Modelling). In particular, the effects on the change in professional knowledge and the resulting tensions between the traditional knowledge of the planner and the additional knowledge of the BIM manager are analysed. The BIM method is increasingly being used in planning projects throughout Europe and is transforming the profession of planning. The introduction of BIM requires not only the conversion from 2D or CAD models into 3D models, but also changes in the frequency of information exchange, the transparency of work steps, and the verification of issues in the model. It includes requirements for the entire project team that are intended to streamline the flow of information during the planning phase of a project. In order to facilitate the fulfilment of these requirements, i.e. to accompany the projects, the BIM management function was introduced. Based on my empirical findings from qualitative interviews and ethnographic observations, I want to show how professional knowledge and communicative practices change using the example of actions and interactions between digital planners and BIM managers. Even though the tasks of a BIM manager are strategic corporate planning, BIM project control activities and specific technical developments, knowledge about the use of BIM is by no means standardized. It is rather a process in the field of tension between individual appropriation and organizational institutionalization.

The Professionalization of Security Management in Humanitarian Action as an Expression and a Driver of Neoliberal Hierarchies of Knowledge: an Informational Basis Approach Perspective

Giacomo Guizzardi

Alma Mater Studiorum – Università di Bologna, Italy

Abstractions have been acknowledged as central social forms of Capitalism's Neoliberal expression. Among the main attributes of this social configuration, indeed, is to be mentioned the complementarity between the generalization of the field of application of norms arising from the logic of market action and the private nature of the contexts of production of these norms. What can be traced back precisely to this aspect are the process of legitimacy acquisition of quantitative knowledge, as well as the primacy ascribed to the general-abstract dimension of knowledge over the practical-experiential one, which both characterize Neoliberalism. This development of hierarchies of knowledge has affected the realm of professions by way of a progressive emergence of new professional domains, expression of the institutionalization of specific areas of working action as cognitive domains ascribed to "experts". An excellent interpretative frame to investigate this dynamic in action can be identified in the Informational Basis Approach. Giving specific attention to the process of transformation of knowledge into "informational basis", i.e. the information that defines the "factual territory" over which normative evaluations are elaborated, is fruitful for investigating both the socio-professional differentiation process fostered by neoliberal orders of legitimacy and the effects of this same dynamic of socio-professional differentiation in terms of knowledge production. In this paper, I argue that the recent establishment of security management in humanitarian action as a matter of professional expertise is an emblematic example of professionalization both as an expression and a driver of the institutionalization of new hierarchies of knowledge.

692

RN19 | T06: Professionalism in health care

Lean Expertise as Situated Knowledge: Lean Translations in Healthcare

Helena Hirvonen

University of Eastern Finland, Finland

This presentation introduces results from a research project concerning the introduction of Lean, a management doctrine that has spread from manufacturing to human services over the recent decades. The qualitative data for the study includes 11 interviews from Lean consultants, 28 interviews from healthcare workers and ethnographic fieldnotes from Lean training events carried out in Finland. Here, the analysis focuses on the consultants' interviews and their role as facilitators of Lean transformation in healthcare organisations. The backdrop for the study is in the debates concerning reordering and transformation of expertise during organisational change. The contemporary management and production of expertise depict the ideal professional as an entrepreneurial individual equipped to adapt to multiprofessional teamwork and assume responsibility for their own work, challenging the idea of professional expertise as the position of individuals alone. The presentation takes off from a notion that that acknowledging persistent professional hierarchies and different 'ways of knowing' is crucial for successful implementation of Lean. The study asks how situated knowledges are generated when Lean is introduced to healthcare organisations, and what kind of boundary work this involves. The findings suggest that efforts to improve organisational work performance together as a shared initiative, in the spirit of Lean, easily understates the different ways of knowing involved in healthcare. Despite the attractiveness of the value-for-patient rhetoric as a means of boundary work, Lean implementation does not necessarily support professional values in healthcare and can reaffirm old hierarchies and create new ones.

Knowing Without Knowing – Integrating Narrative Medicine for Coping with Uncertainty

Liat Lifshitz-Milwidsky[1,2,3,4], Katinka Schweizer[5], Kerstin Hof[5]

1The Open University, Israel; 2Sapir Academic College, Israel; 3Peres Academic Center, Israel; 4Shamir Medical Center (Assaf Harofeh), Israel; 5Medical School Hamburg (MSH), Germany

Narrative Medicine (NaMe) emerges as a potential tool within the healthcare system for transforming the boundaries of medical knowledge and the knowledge-power nexus related to professional work. NaMe is an interdisciplinary approach that emphasizes the importance of storytelling, reflective writing, and both the professional's and patient's narratives. In medical encounters that are fraught with uncertainty, NaMe provides a framework for both, professionals and patients to express and manage diverse knowledge – a complementary approach aiming at enhancing evidence-based knowledge by appreciating narrative knowledge. Embedded within an interdisciplinary Israeli-German project on knowledge boundaries, this study employs writing-arts, sociological, and psychological methodologies to investigate how medical students and experienced doctors integrate NaMe into their epistemological framework and practice. The research question focuses on the potential of NaMe for dealing with the uncertainty inherent in medical encounters, and on understanding how professionals experience different ways of (not-) knowing when first getting in touch with the method. Using qualitative content analysis, the narratives of five medical students and six experienced physicians were categorized. Findings illuminate varied emotional reactions, including anxiety and fear of failure. After a phase of insecurity, participants explored their competencies in dealing with uncertainty by appreciating the open, non-directive approach in comparison to conventional approaches taught in mainstream medical curricula. Some participants addressed NaMe's sustainability and its potential to offer safer spaces for both doctors and patients. The boundary work of expansion, by allowing the integration of narrative knowledge into evidence-based knowledge, holds the potential to alter power dynamics in medical interactions, shifting from the traditional practice of maintaining distance to fostering a sense of safety in uncertain situations, and even encouraging a greater willingness to listen.

693

Regaining Epistemic Legitimacy: Medical Heroism as Rhetoric and Bodily Performance of Professionalism

Enrico Maria Piras[1], Micol Bronzini[2], Roberto Lusardi[3]

1Fondazione Bruno Kessler, Italy; 2Università Politecnica delle Marche, Italy; 3Università di Bergamo, Italy

The heroism of healthcare professionals has played a significant role, alongside techno-scientific advancements, in the establishment of medicine and its social role (Brown 2010; Fell and Sternberg 2018), but over time has become a residual trait limited to wars/disasters or strongly deprived contexts. Alongside changing contextual conditions, both Evidence-Based Medicine (EBM) and managerialization processes, contrasted the heroic narrative with one of progress based on standardized, rationalized, collective process of knowledge production and validation.

Heroism has re-emerged as a feature of care practices during the early waves of the pandemic (Skog and Lundström 2022; Mohammed et al. 2021) in line with the adoption of metaphors related to the semantic field of war (Giorgis,

Semenets, and Todorova 2023; Piredda 2023; Pangborn et al. 2023).

Alongside the widely discussed issue of self-sacrifice, on a less explored ground, we question the role of the heroic narrative in building legitimacy for action, starting from the empirical case of spontaneous networks of physicians formed during the early stages of the pandemic, providing early home care (Lusardi, Bronzini, and Piras 2023).

The narrative analysis of semi-structured interviews with participants in these networks and document analysis highlight that heroism is a rhetorically mobilized element to assert a right/duty to provide patient care and to redefine their place in the network of care and knowledge production. Beyond putting their health at stake, they claim a sort of 'epistemic courage' involving partial autonomy from institutional strategies and taking the risk of producing new knowledge, moving by trial and error.

As such, heroism is mobilized here as a rhetorical tool to regain spaces of agency and legitimacy in knowledge production and to reconfigure their professional role.

The Entrepreneurial Nurse? Professional Tensions on Digital Platforms

Francisca Grommé, Justien Dingelstad, Fenna Nijboer, Iris Wallenburg

Erasmus University Rotterdam, Netherlands, The

Digital work platforms (e.g. Uber) have entered the field of licensed nursing. In the Netherlands and other countries, nurses increasingly use these 'nursing platforms' to find on-demand 'gigs'. Nursing platforms can exacerbate existing professional tensions because they interfere with established values and control mechanisms. Instead of reiterating self-sacrifice and communalism, they support individual entrepreneurialism and detachment.

We ask how nurses in 'gig work' engage with nursing platforms and social media to negotiate these professional tensions. Our focus is the flexibilised work context of the Netherlands, where many nurses are leaving salaried work for self-employment. In public debates they are criticised for supposed commercialism and individualism. Based on interviews, an online ethnography on LinkedIn and TikTok, and a multimodal analysis, we suggest that we need to integrate the concepts of socio-technical affordances and performativity in analyses of professions.

Unveiling the Dynamics of eHealth Implementation: A Qualitative Exploration of Nurses' Perspectives in Swedish Home Health Care

Sara Karnehed

Halmstad University, Sweden

This study delves into the landscape of eHealth intervention implementation in home healthcare and primary healthcare centers in Sweden, with a specific emphasis on unraveling the perspectives and insights of nurses. Anchored in the relational character of data, where rationality hinges upon data creation and interpretation (Winthereik, 2023), the research endeavors to untangle the complexities of data utilization in healthcare settings. The study delves into the concept of data within the realm of nursing work, probing whether the aspiration for data-informed practices resonates with nurses' perspectives. The research scrutinizes the nuanced realities of technology adoption by nurses, thereby contributing to a profound understanding of their professional practices.

Semistructured interviews were conducted with 20 nurses within two municipalities in Sweden, providing a qualitative exploration of their experiences with eHealth interventions.

Theoretically, the presentation develops literature on nursing work and the relation between knowledge and professionalism using Mol's concept of 'good care' as a local and situation-specific practice (Mol, 2006). Mol's framework underscores the necessity for sensitivity and creative calibration in nursing, spotlighting the dynamic nature of professional practice where elements are finely tuned until they harmonize within a given situation.

The presentation attempts to yield practical insights into the challenges and opportunities entwined with the integration of eHealth interventions into nursing practice. By exploring the multifaceted realities of technology use in healthcare, the presentation contributes valuable perspectives to the ongoing development of data-informed nursing care.

RN19 | T07: Motivation, Identity and Practices in professionalism

Administrative Lawyers in Turbulent Times. Motivations in Professional Development in the Face of the Judicial Crisis in Poland

Łukasz Mateusz Skoczylas

Adam Mickiewicz University, Poznań, Poland

The speech is devoted to describing self-definition and the biographical understanding of the professional development path of administrative lawyers. Administrative law is a specific law regulating relations between citizens and state, governmental and local institutions. Although it constitutes the majority of written law in Poland, most lawyers deal with more typical types of professional activity: civil or criminal law. dministrative lawyers are often people who defend citizens against unjustified government influence or defend the common good against NIMBY-type phenomena.

The speech aims to show administrative lawyers' motivations in choosing this type of activity. An additional context is the judicial crisis that has been ongoing in Poland since 2015, caused by politicians' attempts to directly influence it. Therefore, European institutions, some Polish politicians, and citizens question the legality of judges elected after this year, professional promotions in this professional group, and the composition of the Supreme Court, the Constitutional Tribunal, the National Council of the Judiciary, etc.

The speech is based on data from 45 IDIs conducted in 2023-2024 with judges of administrative courts and representatives of the parties in the proceedings (representing both citizens and state institutions).

Burn(out) of Judges and Prosecutors: professional risks of working at Portuguese courts

João Paulo Dias, Paula Casaleiro, Gustavo Veiga, Teresa Maneca Lima

Centro de Estudos Sociais, Universidade de Coimbra, Portugal

Judges and public prosecutors are characterised as professionals with high demands in terms of workload and intensity. These have consequences for their health and well-being and may impact their professional performance, impairing the quality and swiftness of justice. Recent studies highlighted the existence of professionals working in courts with several health limitations, especially related with mental health (stress and burnout).

This paper aims to present the main findings of two researches focusing on the identification and characterisation of the occupational risks of judges and public prosecutors working in Portuguese courts. The application of an online survey and in-depth interviews allowed to collect relevant information on the causes for the emergence of occupational risks, mainly referred to work organisation, time and intensity of work and career evaluation and progression that influences the level of professional stress and the risk of burnout.

The percentages of professionals registering high levels of professional stress and risk of burnout, with direct impact on their working capacities and health, raises deep concerns. Furthermore, the results show that the work demands, in terms of workload, working time and work intensity, are normalised and seen, or experienced, as inevitable and even normal. These results contribute to the existence of judges and public prosecutors at risk and, even, working without the necessary mental and physical conditions to provide a quality work.

These results must be considered for a comprehensive approach to court management, with the aim of improving the performance of courts, safeguarding the respect for the rights of professionals and their health. The results sustains the necessity to adopt and implement several mechanisms to prevent, detect and support the professionals in need.

Workplace & Change Consultants: Navigating challenges in Profesionnal Identity and Workplace Consulting

695

Jeanne Fillonneau[1,2]

1Université Gustave Eiffel, France; 2Laboratoire Techniques, Territoires et Sociétés, LATTS, France

In France, and particularly in Paris, since 2020, the vast majority of companies are looking to reduce their office space, while promoting collaboration between their employees. They do this through the architectural and managerial concept of desk sharing. The number of desks is smaller than the number of employees for whom they are intended, to ensure that the space is occupied on a rotational basis.

Company redevelopment projects are large-scale projects involving many different players with multiple, sometimes contradictory logics. However, the sector has opened up to consulting. So-called workplace & change consultants are involved to ensure the managerial dimension of the project.

The proposed paper aims to document this population by showing the tensions in their professional identity. It will be based on a survey carried out as part of a PhD in progress since the end of 2022, including interviews with consultants.

These consultants, 9 women and 5 men aged between 30 and 59, are either humanities graduates or architects or engineers by training. Depending on their educational background, they have different views of what constitutes "dirty work" (Hughes 1999). However, all of them see their possibilities reduced by the real estate and financial framework given to the project.

Finally, the aim is to question the possibilities available to workplace & change consultants throughout the project towards the desk sharing, in order to grasp the dimension of their professional identity that is thwarted or, on the contrary, strengthened as a function of their social trajectories.

Stress is Self-inflicted – On the Influence of Digital and AI-supported Work on Job Autonomy of Employees in Outpatient Care

Gina Glock

Dresden University of Technology, Germany

The care sector is caught between economic and legal restrictions, a persistent shortage of skilled workers and the demand for high quality care in increasingly complex care situations. Faced with this challenging constellation, the care sector was nevertheless regarded for many years as an area in which technical support was neither necessary nor desirable.

This contribution employs semi-structured interviews to shed light on the influence of digital work tools and algorithmic decision support on employees' job autonomy and collaboration and the conditions under which this comes to fruition from an occupational sociology perspective. The present company example uses a highly integrated software solution that transfers personnel scheduling as well as working time and performance recording to the digital space. Route planning is AI-driven. On tour, care documentation is recorded using AI-voice input, handovers and service and time recording on networked tablets.

This technical system complex allows in particular to observe the change in digitalization-related paradigms, which are closely linked to autonomy-related elements of care work: The employees' comments paint a picture of increased work autonomy. They report more self-determined work situations due to the reduction of time spent on documentation and service recording, the increase in flexibility with regard to place of work and more efficient routing plans. The absence of using performance-related employee data as a control instrument and the visible prioritization of client requirements and wishes in all phases of the working day are conditions for these beneficial aspects of digital work.

Overall, technological support in planning and administrative work is perceived as clearly promoting autonomy in outpatient care – however, it hardly interferes the interaction work with people in need of care.

From Tension to Transformation: Influence of Mindfulness and Areas of Work lLfe on Burnout in the Social Work Profession.

Sandra Romero-Martín, Carmen Elboj-Saso, Tatiana Iñiguez-Berrozpe

University of Zaragoza, Spain

In recent years, tension in the dynamics of social work has increased, leading to increased burnout in the profession (Pastor et al., 2019). Social workers, traditionally considered at risk of burnout (Crowder and Sears, 2017), are increasingly recognising the need to develop caring tools to manage stress and prevent burnout (McGarrigle and Walsh, 2011).

These caring tools gained significance during the COVID-19, where social workers made substantial technological adaptations (European Social Network, 2020), faced and intensified workload without adequate protection or recognition (Fantova, 2020). As one of these caring practices, mindfulness is progressively common, showing benefits in health and quality of life (Hick, 2009).

This study aims to explore the relationship between burnout and mindfulness in social work, recognizing mindfulness as a transformative tool for professional care and potentially enhancing intervention quality.

Conducted among 271 social workers in Aragón, Spain, the qualitative study assesses three variables: Burnout (emotional exhaustion, depersonalization, low personal achievement), Areas of work life (manageable workload, control, reward, community, justice, values), and Mindfulness.

A descriptive analysis, significant relationships between variables, and multiple linear regression was carried out. Lastly, a Structural Equation Model (SEM) was formulated to assess the impact of mindfulness and areas of work life on burnout prevention.

The SEM reveals that elevated mindfulness levels, coupled with congruence in work life areas, predict and effectively prevent burnout. The study underscores the positive impact of mindfulness and work life congruence on social workers' burnout levels, suggesting mindfulness as a preventive measure against burnout in social work.

696

The Impact of COVID-19 on the Creative Dynamics of Social Interaction in the Culinary Industry: A Comparative Study of New Orleans and Tel Aviv

Noa Lavie[1], Vicki Mayer[2]

1The Academic College of Tel Aviv-Jaffa, Israel; 2Tulane University

This study offers a novel exploration into how the COVID-19 pandemic has impacted the culinary industry in New Orleans and Tel Aviv, not only as a business sector but as a vital part of the creative industries (Harper, 2019). Recognizing the culinary field as an integral component of the creative economy (Ibid.), the research examines over 60 interviews with industry professionals to understand the pandemic's profound effects on social interactions, which are pivotal in these culturally rich, culinary-centric cities.

In both New Orleans and Tel Aviv, known for their unique culinary heritage and vibrant social atmospheres, COVID-19 restrictions have not only affected business operations but also the very essence of creative and social engagement that defines the industry. The study investigates how these changes have influenced the dynamic between employees and customers, as well as between employees themselves. With a focus on how these altered interactions impact creativity and job satisfaction, the research reveals a significant shift in staff morale and creative expression.

Delving deeper, the study situates these transformations within the sociology of creative industries, applying theoretical frameworks like Symbolic Interactionism (Blumer, 1969) and Social Exchange Theory (Homans, 1958). These perspectives shed light on the changing nature of social interaction in the culinary industry, emphasizing the exchange of symbols, meanings, and creative energies. The findings underscore the pandemic's disruptive effect on the social and creative fabric of the culinary world, posing challenges and opportunities for reimagining the industry's future.

RN19 | T08: Professionalism and technological transformation

Professional decision making and digital support systems in the Swedish Enforcement Authority

Bengt Larsson

Linnaeus University, Sweden

Welfare professional decision-making has been at the centre of two debates over the past decade in Sweden. On the one hand, the balance between NPM and trust/discretion has been debated in relation to the so called "trust reform". On the other, both hopes and fears have been discussed regarding the possibility to replace professionals with automated AI-based decision-making. This paper presents one of several case studies from a project studying the actual balance in practical welfare professional work between discretion and "programming" of decisions in terms of rules and instructions, process maps and software programs. The case in focus is the execution/foreclosure (verkställighet/utmätning) process at the Swedish Enforcement Authority (Kronofogden). The study is based on interviews with staff working on the cases, documents guiding the work, and instances of contextual inquiry – in which case officers show their work process through interfaces with digital systems. Besides describing the context for case handling, this paper will try to theorize how decisions are taken (individually vs. collectively; at one point in time vs. in processes), to what extent principles (e.g. law and rules) and programs (e.g. software and information systems) delimit different aspects of discretion, and how digitalization is performed from both above and below (i.e., the extent to which input and "appification" of digital help systems trickle down from the central organisational management vs. to what extent they are initiated and adjusted at local levels).

697

R2: Digital Risk Assessment in Dentist Decision-making

Ylva Ulfsdotter Eriksson

Linnaeus University, Sweden

R2 is a digital risk assessment tool helping dentists and dental hygienists within the Swedish public dental health, Folktandvården, to assess and make decisions on risk classifications and treatment plans of patients. R2, as a computer program, is thus an example of how professional discretion and decision-making are being circumscribed by digital solutions.

A previous study on dental care professionals identified some preliminary approaches to R2: that they were fairly free to depart from the classifications proposed by R2, and could upgrade or downgrade depending on their

professional expertise on the patient's overall dental health, and that R2 could function as a pedagogical tool to motivate the treatment plans and risk classifications to patients, as some patients were more convinced by the computerized classification than the professional judgement (Ulfsdotter Eriksson et al 2017).

This paper returns to the relationship between dentists' professional discretion and the usage of R2 for risk assessment and risk classification, to explore and understand the relationship between discretion and programs in the decision-making processes. Drawing on qualitative interviews with dentists (approx. 20-22, collected 2015 and 2023/24), the study addresses the following research questions: 1) In what ways do R2, and other administrative tools, infold professional discretion and how do the dentists use and relate to them? The interviews are thematically analysed, and empirical themes are developed through iterative processes making use of core concepts such as structural and epistemic discretion.

Theories Professionalism Today: Conceptual Challenges, New Analytical Horizons

Roman Abramov

National Research University Higher School of Economics, Russian Federation

Sociology of professions is discipline with theoretical core, to which classical sociologists such as G. Spencer, M. Weber, E. Durkheim, T. Parsons, E. Hughes, and others have contributed. The sociology of professions has its own famous theorists: E. Abbott, G. Becker, E. Freidson, M. Saks, M. Larson, K. MacDonald, R. Dingwall, M. Noordegraaf. D. Sciulli conducted a comprehensive review of the theories of professionalism that had developed by the beginning of the 21st century. Currently, there is an active revision of concepts of professionalism and new theories that explain changes in the professional world.

Rapid social and technological changes challenge established theories of professionalism. New digital media technologies have blurred "old" professional identities in journalism, many creative professions, and show business. Artificial intelligence (AI) has become a new tool for creative professionals such as designers, artists, writers, and some programmers. The transition to platform capitalism (Nick Srnicek) initially affected relatively unskilled labor (couriers, taxi drivers, workers on marketplaces), but it also created a huge international market for professional work, including tutoring services, programmers, lawyers, and even medical consultants.

New social tensions arise related to the demand for decolonizing social theories, global changes in countries, painful processes of building national states in the territories of the former USSR create new variants of professionalism that require theoretical analysis.

In my presentation, I propose to conduct an analytical revision of established analytical approaches to professionalism and directions for new theoretical constructions and models of the sociology of professions.

Digital Influencers, Work And Acceleration: Experiences On Creative Independent Digital Labor

Marina Chiari

University of Coimbra, Portugal

Digital influencers and content creators propagate products, ideas, and lifestyles through content production on social media. Their activity generates income, influence, and also a new work experience in the digital context. This article attempts to answer what the conception of work is for digital content producers and how they reinterpret their relationship with work routines based on this experience. The article aims to relate the theoretical contributions of the German sociologist Hartmut Rosa on the social acceleration of time to the field of labor sociology and its application in understanding the development of new professional practices in a digital context. The author's thinking, discussed here, is applied to the hypothesis that the ongoing acceleration of content production on digital social media platforms is out of sync with the productive capacity of individuals who identify themselves as "digital content creators" or "digital influencers", the subjects of analysis in this study. Assuming that the exponential production of content on social networks fragments the meaning of the consumed and produced content, even in specific thematic niches, and stimulates a race for audience attention and satisfaction of metrics that feed platform algorithms, we analyze semi-structured interviews conducted with digital influencers who describe this experience in the face of a complex, accelerated world and the exploitation of individual subjective potential. To reduce digital influencers to mere advertising tools is a moral judgment of consumption (Barbosa and Campbell, 2006), and avoids a deeper reflection on the power structure in this field of digital work. Reducing these individuals to a superficial communicational practice means refraining from questioning the role they play in a chain of labor exploitation based on the attention and entertainment industry and the commodification of audiences.

The Judge And Artificial Intelligence

Stefania Adriana Bevilacqua

Sapienza University of Rome, Italy

The digitisation confronts us with a transformation of economic, social, and cultural patterns that is defining a new contemporary era.

This is also true in the judiciary, where AI is making its entrance by claiming a power to make the system more efficient, with concrete consequences on the work of judges.

The paper proposes an empirical study focuses on the consequences of judges' use of a database of case law applying artificial intelligence.

First of all, it focus on how the database may impact on the judge's interpretive function: in fact, the judicial discretion will depend on the relationship of trust, or mistrust, that will be established between the judging body and the

698

machine. Moreover, the judges' action will have to reckon with the verifiability of their performance.

Secondly, IA also impacts on the organization of judicial offices: in fact, the implementation of the digital database fosters new practices of sharing and discussion to such an extent that it has an impact on the working methods of the office towards the strengthening of team work and towards the standardisation of a common model for drafting judgments.

As can easily be guessed, all these aspects will be institutional-ised changing the overall design of the justice system. Therefore, in conclusion, this paper aim to describe some dimension of social interac-tion affected by the AI and intends to give an overview of its conse-quences to the work of the judge by declining a new professional model.

RN20 | Qualitative Methods
RN20 | T01_01: Visual and Digital Data in Qualitative Research

Visual Data of Violence: Visibilities and Non-Visibilities

Ulrike T. Kissmann

University of Kassel, Germany

With the increasing availability of bodycams, CCTV or smartphone cameras, street violence currently becomes subject of monitoring and evaluation through public as well as private entities. These specific forms of visual data make it possible to identify violence not only in the interaction itself, but also long after the event. The author will ask which physical or verbal assaults are considered legitimate violence and which interpretation and procedural rules are referred to. She will examine how the visual data of bodycams, CCTV or smartphone cameras can be used to frame the emergence of violence in order to develop a specific understanding of the event. In a first step, current publications will be presented that place the emphasis on how violence is contextualized by participants during the interaction. As these publications usually neglect how the data are stored, processed and handled by the users, the author will give evidence, in a second step, how data infrastructures and data practices contribute to contextualize violence long after its emergence in interaction. She will introduce empirical findings that show how the selection as well as the processing of visual data transform knowledge and create new phenomena. It will be argued that it is highly relevant to utilize methods and methodologies that make visible how visual data produce new worlds.

How to Site Ethnographies in High-Opportunity Neighbourhoods

Trevor Ray Auldridge-Reveles

University of California, Santa Barbara, United States of America

Many ethnographers in Europe have analysed how neighbourhoods restrict opportunities for low-income, racially marginalized young people. These studies are important for understanding how social transformation is stunted. However, some are calling on ethnographers to systematically study the daily experiences and mechanisms by which some neighbourhoods promote opportunities for these young people. Ethnographers tend to use a mixture of theoretical and convenience case selection methods to screen, and ultimately study, low-opportunity neighbourhoods. But the mapping of neighbourhoods with Big Data has provided avenues to theoretical and systematically locate high-opportunity cases.

In this presentation, I outline the case selection method I used to site my current project, a youth ethnography consisting of over 1,000 hours of participant observation and 250 in-depth interviews. I propose a three-step method for situating our ethnographies in high-opportunity neighbourhoods: First, utilise large datasets, such as the Opportunity Atlas (OA), to identify potential high-opportunity cases. Second, use these datasets to develop a criteria-based, composite index of high-opportunity neighbourhoods. Finally, evaluate potential high-opportunity cases online and offline.

Qualitative sociologists who want to transform European society can immensely benefit from case selection methods that enhance the study of high-opportunity places. Studying these cases could bolster the theoretical transferability of our studies. While the Opportunity Atlas and the dataset underpinning my site selection method are based on U.S. data, the principles and methodologies can be adapted in Europe. This adaptation would involve identifying and utilizing comparable European datasets to replicate the site selection process and to enhance cross-national theories of how high-opportunity neighbourhoods transform the lives of young people.

Visualising Place: Relationality and Intimacy in Virtual Mapping Methods

Sarah Wagner[1,2]

1University of the Highlands and Islands, United Kingdom; 2University of Victoria, Canada

Mapping exercises can enrich qualitative insights across disciplinary perspectives, advancing both political economy and phenomenological understandings of place. In care home contexts, mapping workshops combined with experiential tours, have shifted power relations with facilitators, exposed contexts of inequalities, and deepened tacit understandings of lived experiences (Wagner, 2022; see also, Fang et al., 2016).

This paper develops insights into the tensions and opportunities mapping exercises present within virtual research, reflecting on lessons learned from qualitative research conducted at four long-term care sites on Vancouver Island, B.C., Canada in 2022-2023. Research methods included digital storytelling (n=12), collaborative reflection meetings (n=22), in-depth interviews including communicative ecology mapping (n=39), and asset mapping workshops (n=10). Research was conducted entirely online, facilitated by video calls and audio calls. The methods were designed to develop insights into the interrelations of individual and institutional factors that shape care home residents' sense of social agency, while presenting opportunities to work with residents to develop actionable recommendations for services and practices. This paper explores the tactics that were developed by both researchers and participants to create intimacy and trust within virtual environments. The paper reflects on the role of individual relationships with media in shaping facilitator-participant relationships and the ways that visual aids can regulate, disrupt or enhance reflective experiences of place.

700

Open Science in Qualitative Studies: Transitioning from Quantitative Replication to Ethical Considerations and Democratic Data Sharing

Jakob Demant

University of Copenhagen, Denmark

The open science movement has exerted a profound influence across various scientific disciplines. While the discourse surrounding open science has gained momentum in quantitative studies, particularly in fostering data sharing to counter questionable research practices and facilitate replications, the fields of qualitative sociology have been relatively tardy in their engagement. This passivity has allowed others to dictate the extent and manner of involvement in open science.

This paper contends that qualitative sociology should embrace the notion of data sharing. However, the emphasis should not solely be on replications; rather, the focus should center on ethical considerations, ensuring a more judicious utilization of data obtained from often hard-to-reach and vulnerable populations. Such openness not only democratizes access to data for fellow researchers and students but also amplifies the voices of these populations in societal discussions.

Building on this stance within the open science discourse, the paper addresses the challenges inherent in practicing data sharing, particularly when dealing with a dataset from a hidden group, and hard-to-reach groups. Drawing on a qualitative semistructured interview dataset comprising 107 participants involved in drug buying and selling across the Nordic countries, the study reflects on the complexities associated with data sharing. Recognizing that not all qualitative data materials can be shared, the paper highlights challenges related to participant protection and GDPR, emphasizing that online data collection offers some avenues to mitigate these challenges.

In conclusion, the paper advocates that qualitative researchers stand to benefit significantly from the open science movement. It underscores the potential advantages, especially in the realm of digital qualitative data, and suggests that technical solutions can be pursued to align with the ethos of open science.

RN20 | T01_02: Biographies and Narratives

Capturing Temporal Experiences in Narratives of Everyday Life

Anne-Kirstine Mølholt

Aalborg University, Denmark

This abstract address using life mode interviews in a qualitative longitudinal research to capture temporal experiences and agency presented in narratives of young people in vulnerable positions. Life Course theoretically, Flaherty and Hitlin & Elder enhance that agency can be exercised through the control and management of temporal experiences. Flaherty (2003) presents the concept of 'time work' to highlight how the individual is not only determined by temporal structures but can modify time e.g. by extending time or letting time pass.

My findings emphasize that temporal experiences expressed through narratives of everyday life not only concern organizing the everyday life, but also are related to experiences of life circumstances and options. The empirical data are based on a qualitative longitudinal study conducted through a period of two years with interviews approximately every six months with eight young care leavers age 20 to 33. The interviews were inspired by life mode interviews focusing on the organization, experiences and sense-making of everyday life.

In their narratives the young people tell of mundane situations, such as eating breakfast or watching television, which intersects with experiences of temporality. These narratives reflect the young people's self-image and self-evaluated level of normality. By following the narratives of the young people through time the findings give insight into the negotiated processes that characterize the young people's experiences of life circumstances and their comparison to what they consider normality. In particular, the longitudinal approach emphasizes that processes are not progressive and linear, but rather nonlinear and changeable.

"They Were Not My Memories, But They Became My Story": A Reflexive Analysis Of The Narrative Construction Of Diasporic Identities During In-Depth Qualitative Interviews With Italian Migrant Women In Ireland.

Carla De Tona

University of Bologna, Italy

This paper focuses on the researcher's positionality and the practices of identification of Italian migrant women in

701

Ireland, which are reflected upon but also manifested during the very process of in-depth life story interviews (group and individual). This specific method of data collection is entangled in forms of social interaction that replicate, albeit with significant differences, migrants' experiences of socialisation in their encounters with other Italian migrants.

The paper is based on a longitudinal qualitative study with Italian women in Ireland, belonging both to older village-based chain migrations from central Italy, and to more recent waves of migration characterised by increased social and cultural diversification. The data was collected in two phases, before 2010 and after 2020, in which the researcher was positioned first as an 'insider' migrant and then as a 'returnee' migrant.

The analysis proposed in this paper follows Yuval-Davis's notion that identity construction does not only involve personal identities but also narratives of collective identity, which ensure collective sense of meaning making process (Yuval-Davis, 2010). Focusing on the narratives produced in interaction between the researcher and the participants during the interviews, the analysis shows how narratives are not just a mode for understanding and sharing experiences, but also for constructing a shared sense of belonging. As evinced starting from the very interviews' dynamics, migrant women's narrative practices link together disparate memories, locales and life stages, and ultimately contribute to the shaping of a fluid yet bounded diasporic collective identity. Limitations about the process occurring during the interviews (interviews' locations and participants' time and availability) are also reflected upon.

Re-doing Ethnography: Documenting Silence As A Methodological Tool Of Performing Research

Umtul Aleem Kokab

Indian Institute of technology Delhi, India, India

Documenting an experience is both a liminal and subliminal task the limitations of which are entrenched in the methodological implications especially when the experience is premised upon a conflicted and mistrusted sociality. Scott suggests what counts as experience is neither self-evident nor straightforward; it is always contested, and always, therefore, political. Thus , 'experience' as an analytical category constitutes a genuinely explanatory power to build a foundation for configuring the narrative of subjects in their own space of construction. The question of inquiry, then, is how does the documentation of experiences in a field setting native to the researcher comes into dialogue with the modes of performing research. Using ethnographic insights and interventions employed to study Ahmadi Muslims, a persecuted minority in South Asia, the paper tries to articulate their experience through anthropological descriptions and the dilemma of the ethnographer as an insider in the setting.

The omnipotence of an ethnographic narrativization relies on the thoughtful moulding of voices to represent the realities. Through the comparative analysis made in the paper using ethnographies of hearing and violence, another important understanding that emerges is that of remembrance and reinstatement. It becomes crucially emphatic to denounce what is it that the narrator wants to remember. The healing and reparation expected out of the textualized bodies of pain and suffering ,then, becomes a signifier of the unspeakable and unhearable zone' of the imaginaries possessed by the subjects of these writings. Through the paper, the silences of the narrations are brough to life through the implicitness of their experiences and lay bare the limitations that make narrators a perennial witness of the loss borne in past.

'A Look Inside the Black Box' – Ethical Aspects of the Biographic Narrative Interpretive Method (BNIM) Panels: A Critical Commentary

Zeta Dooly[1], Lisa Moran[2], Daniel Guigui[3]

1South East Technological University, Ireland; 2Technological University of the Shannon; 3University College Dublin

This paper provides a critical commentary of extant lacunae in international research on the Biographic Narrative Interpretive Method (BNIM). Developed by Tom Wengraf and the Quatext group, BNIM constitutes a distinctive approach to biographical data collection, analysis and interpretation using panels comprised of persons from diverse backgrounds, ethnic groups, and occupational statuses who work collaboratively, extrapolating new meanings and highlighting researchers' 'blind spots'. Hitherto, there has been scant research on BNIM panels and specifically ethical dimensions of panel analysis, which this paper addresses. Our research question is: 'what are the principal ethical considerations which need to be considered specifically in relation to BNIM panels?'

Drawing on insights from two sociologists and an educational socio-technologist engaged in biographical research (e.g. post COVID-19 realities, cosmopolitanism, education for sustainability and AI), we present a critical commentary on ethical aspects of BNIM panels, which are under-researched. Currently, most existing BNIM literature (generally) and research documenting panel analysis is descriptive, lacking in a unified research agenda on ethical aspects of the methodology per se. We focus on the value of interdisciplinarity in capturing the various ethical conundrums in using BNIM, whilst advocating and presenting a research agenda founded in sociologically-informed ethical frameworks on panel analysis.

Exploring Possibilities of Doing Situational Analysis in Interdisciplinary Inquiry on Sustainability Transitions

Anna-Lisa Klages

TH Ingolstadt, Germany

The recent crises such as the Covid-pandemic, the human-made climate change or the rise of populism across the globe alongside new and protracted national as well as international conflicts pose significant methodological challenges for contemporary qualitative inquiry to conceptually understand individuals, their behavior and attitudes in reciprocity with their environment (Or, 2024). As a theory-methods package (Clarke, Friese and Washburn, 2018), Situational Analysis (SitA) seeks to embrace complexity in inquiry in order to "engage in the sticky, multilayered messiness of life itself" (ibid, 2018: 364). Originally proposed by Adele Clarke (2005) as an extension of Grounded Theory, SitA offers analytical tools and instruments that allow to analytically reconstruct all relevant elements co-constitutive of a situation of inquiry (Gauditz et al., 2023). This includes a turn towards relationalities between and among human and non-human elements, discourses, (contested) issues as well as social worlds in what John Dewey, referred to as a "contextual whole" (1938:66) that make a situation.

SitA has been used in various fields of research and across academic disciplines (e.g. Clarke, Washburn and Friese, 2022; Friese, Schwertel and Tietje, 2023; Kalenda, 2016). In drawing theoretically on those experiences, this paper explores some practical implications on doing interdisciplinary Situational Analyses on sustainability transitions (Schneidewind et al., 2016).

Research on Discrimination: A Methodological Intersection of Discourse Analysis, Situational Analysis and Vignette based Research

Elisabeth Tuider[1], Tina Spies[2], Hazal Budak-Kim[2], Tom Fixemer[1], Manja Kotsas[2]

1Univ. of Kassel, Germany; 2Univ. of Kiel, Germany

In our lecture, we present an innovative combination of methods by which structural discrimination and inequalities in the post-migrant society can be examined in their intersectional interweaving.

So far, discrimination research has relied on a.) the collection of experiences of discrimination from a subjective perspective, or b.) survey-based datasets and statistics on discrimination risks and experiences of discrimination (see Makkonen 2016: European Handbook on Equality Data). Our question is a different one: How can the tensions, contradictions and persistences of structural inequalities be captured with a further development of established qualitative methods?

The focus of our presentation is on an intersectional methodological linking of discourse and situational analysis, expert interviews and vignette-based focus groups in order to adequately capture multidimensional structural discriminations and social inequality. We use the theoretical concept of „articulation" (by Stuart Hall 1996) as a hinge to suture discursive invocations and positionings (along ethnicity, race, gender, sexuality, class, ability) in hegemonic structures of power and inequalities.

Methodological Developments of the Case Study Approach: What Remains of the Chicago School's Case Method Today?

Barbara Sena

University of Bergamo, Italy

The case study as empirical method in sociology derives from the case history of U.S. social workers and their employment as the primary source of information for the first sociological studies on deviance at the Chicago School. In the 1930s and 1940s the "case study" label was extended to all the research managed by the Chicago School's sociologists and associated with tools such as participant observation, unstructured interviews, or personal document analysis (Platt, 1988, 1992). Although in sociology it has become a catchword which generically refers to qualitative research, since the 1980s it has been developed in different disciplines and research fields for the empirical study of innovations and complex problems in order to produce analytical explanations, evaluations or practical solutions (e.g. Swanborn, 2010; Tight, 2017; Yin, 2018).

Starting from this premise, this paper aims to focus on: 1) how case study method has overcome the epistemological and methodological misunderstandings of the interpretivist approaches of the Chicago School, through its pragmatic, multi-method, and holistic nature; and 2) how it has been applied and transformed as compared to its original use in the Chicago School's research, by analysing relevant changes that it has undergone over the years in interdisciplinary methodological literature.

Particularly, the paper will highlight some differences in relation to other qualitative approaches with which it has often associated, such as life history and ethnography, through the support of recent applications of the case study in significant contexts characterized by social tensions in our societies.

703

Audial Grounded Theory. Sound as a Specific Carrier of Meanings.

Rafał Wiśniewski, Izabela Bukalska

Cardinal Stefan Wyszyński University in Warsaw, Poland

The use of audio materials is obvious to social researchers because they've been using audio-recordings of interviews, talks from participant observations or historical materials for a long time. However, we will focus on non-verbal sound data and their value in social research.

Interest in non-verbal sounds, in relation to grounded theory, appears most often among soundscape researchers, where sounds appear as one of many types of used data: (Kim Foale; „A listener-centered approach to soundscape analysis", Semiha Yilmazer „A grounded theory approach (...): a case study on Hacı Bayram Mosque"). Audiologists showed interest in GTM in research on social aspect of hearing diseases (one article – Christine Meston, "A Grounded Theory Primer for Audiology"). Achievements of ethnomusicologists were collected by Ignacio Soto or Barbara Śnieżek. Studies in aforementioned areas are not numerous.

Our presentation will be based on the research project "Contemporary radio reportage in the light of symbolic interactionism theory" as part of the grant of Ministry of Education and Science in Poland (NdS/536812/2021/2022). We conducted, listening sessions, observations, focus group interview and 30 in-depth interviews with creators of radio reportage (artistic genre). Respondents are experts on using sound material to convey intended meanings and trigger states and reactions. We learned principles of "sound plans" creation, importance of music and silence, remembered situational sounds, and, above all, information contained in prosody – timbre and volume of voice, rhythm and dynamics of speech. We can perceive it as "paralanguage".

To conclude: non-verbal sound is valuable material for sociologists in research and theory building. Specific examples will be provided (GTM methods: triangulation, theoretical sampling and constant comparison are crucial).

We will play fragments of audio reportages to illustrate conclusions.

RN20 | T03_01: Analyzing Interviews

Interviewing Financially Precarious But Culturally Elite Workers: Power, Positionality, Poetics

Timo Louis Koren

University of Amsterdam, Netherlands, The

Sociologists have scrutinized the unique features of labour conditions in the cultural industries, the methodological implications for researching in this sector have not been given much attention (McRobbie 2016). Cultural sector workers are characterised by high cultural capital but relatively low economic capital: while (senior) employees in the cultural industries have considerable cultural influence as key gatekeepers, their financial situation often does not always reflect an elite status (Brook et al. 2020). Cultural sector workers navigate an industry 'in crisis' with limited space and resources available (Hesmondhalgh and Baker 2011), while gatekeeping practices reproduce or legitimise social inequalities (Negus 1999). Based on two qualitative research projects (nightclub promoters and literary professionals), this paper explores how qualitative interviews could attune better to the specific conditions of the cultural industries.

First, methodological literature often conceptualises the power in interview setting through the relationship between interviewer and interviewee (Ellersgaard et al. 2022). However, engaging with literature on whiteness (Ahlstedt 2015), the paper argues that researchers share their social position with interviewees, a 'sameness' that obscures the workings of power during interviews. Second, the informal work culture of the cultural industries adds to complexities around gaining access to elites: researchers need to navigate a particular 'elite informality'. Third, artistic and aesthetic discourses (poetics) are contingent on economic, social, field and career position – showing how power shapes cultural ideals. The paper adds to recent methodological debates in qualitative sociology that understand power as fluid and context-dependent rather than static (Lancaster 2017; Ellersgaard et al. 2022).

Erving Goffman And The Framing Of Meaning – Frame Analysis As A Sociological Analysis Approach

Maike Pötschulat

Liverpool John Moores University, United Kingdom

This paper is dedicated to Erving Goffman's least understood work: Frame Analysis (1974); a phenomenological piece on the structure of experience. Goffman considered it his most important publication and while the book has been responded to widely, it has either received criticism

704

or has been adapted to a degree that bears little resemblance to Goffman's original writings. In this paper, I establish the potential of Frame Analysis to provide a methodologically-grounded analysis tool for qualitative data and an alternative to other approaches such as themed or content analysis. In the book, Goffman unpicks the structure that underlies the (social) process of assigning meaning to occurrences and he explores how these meanings can be solidified, changed, manipulated and studied. Frame Analysis thus explores the complex processes that are involved in rendering everyday happenings meaningful. By now, frame analysis is a common occurrence in media studies and social movement research but besides the adoption of the term 'frame' these applications have little correspondence with the book. In adopting Goffman's concepts of strips, primary frameworks, keyings and fabrications, I develop an analysis approach that is sensitive to what people do, think or experience and how layers of meanings are built around these occurrences. Focusing on interview transcripts, I demonstrate, frame by frame, how frame analysis can be applied to develop concise conclusions from a qualitative research project. I present frame analysis as an approach that can be embedded in the methodological considerations that underpin the choice of research methods and an analysis type that highlights the role of the researcher in the generation of situated knowledge.

Framing Paid and Unpaid Parenthood – Identifying Telling Nuances in Interview Transcripts on Foster Care

David Wästerfors

Lund University, Sweden

Erving Goffman's frame analysis has been widely used to conceptualize a range of topics, from social movements to mass communication. This presentation closely examines how frame analysis can be applied in the analysis of local rhetoric production within interview studies, specifically exploring how interviewees shift between arguments during interactions with the interviewer. The focus is on foster care and questions related to payments and reimbursements. In an ongoing project, interviewed parents occasionally frame their foster care responsibilities as "work," advocating for payment legitimacy and improved conditions. Conversely, they also frame it as "family life" and "care" at other times, emphasizing different values. Similarly, social service officials interviewed tend to alternate between frames, discussing foster parents' "job" and negotiating skills on one hand, and idealized altruistic parenthood on the other. The inclusion of children with special difficulties or disabilities further complicates the application of these frames. The presentation aims to develop a methodological vocabulary and theoretical purpose for this type of analysis.

Reflexivity in the Study of Young Immigrant descendants: Overcoming the Ethnic Lens

Veronica Riniolo

Università Cattolica del Sacro Cuore, Italy

While a reflexive turn is taking place in many studies on migrants, a critical theoretical and methodological reflection on categories to be used when referring specifically to youth with immigrant parents is slowly emerging. Italy – a country where the recognition of immigrant descendants as an integral part of society is still far – is characterized by a non-reflexive use of labels to refer to immigrant descendants both in the public and sometimes also in the academic debate, with the risk to reinforce the processes of racialization and exclusion of those who have immigrant parents.

The present study – on the basis of 30 qualitative interviews conducted in 2023 in two main Italian cities (Milan and Brescia) with graduate and post-graduate students both natives and with parents born abroad – shows the necessity to overcome an exclusive ethnic lens when studying young immigrant descendants, benefitting instead of an intersectional and transnational perspective. The selection of research participants (with and without immigrant parents) and the explored topics were guided by the effort to overcome 'methodological ethnicity" (Glick Schiller 2008), avoiding the risk of producing and reproducing categories (of exclusion) also during interaction with interviewees. The research – benefiting from a process of reflexivity with those involved – also proposes possible alternative categories able to avoid making ethnicity the only criterion in the study of immigrant descendants, grasping their multiple identities and intercultural competencies.

705

RN20 | T04_01: Emotions in Ethnographic Methodologies

Emotional Connections: Observing Young People's Encounter with Criminal Court

Tea Torbenfeldt Bengtsson[1], Theresa Dyrvig Henriksen[2], Rikke Klarskov Hermansen[2], Josefine Frøslev-Thomsen[2]

1VIVE-The Danish Center for Social Science Research, Aalborg University; 2VIVE-The Danish Center for Social Science Research

Observation serves as an important methodological tool for examining complex social settings and encounters. In this paper, we use observations within the regulated setting of the criminal court to demonstrate how emotional dynamics influence the encounters of young defendants, aged 16 and 17, with the court. We do so by drawing on collective experiences and reflections from a four-member research team following young defendants through their court hearings and subsequently interviewing them about their experiences. The reflexive and social nature of the observations demonstrate a shared emotional response and connection between the young defendants and the researchers. The connections were formed under the strict formality of the courtroom and often communicated through subtle gestures and unspoken cues during the hearings. We analyse these emotional connections along three dimensions: 1. Confusion – limited understanding of judicial behavior in the courtroom; 2. Disempowerment – no room for correction and displaying emotions; 3. Resentment – unawareness of age-related considerations and absence of child friendliness. These dimensions show how emotional connections are an important methodological tool and provide unique insight into the emotional demanding situation of being a young person having to navigate in the highly formalised courtroom setting.

Emotions In The Field: How To Analyze Relationships Through Strong Reflexivity

Ingmar Zalewski

University of Kassel, Germany

The "reflexive turn" that the ethnographic method underwent in the 1980s and early 1990s must be considered incomplete. Critics emphasize the epistemic significance of researchers' emotions in the field, which has not yet been sufficiently addressed (Davies & Spencer 2010). However, traditions such as Zurich ethnopsychoanalysis (Nadig 1986; Parin et al. 1963, 1971) had already shown before the debates on Writing Culture how ethnography can also capture the pre – and unconscious practices and structures of a field by systematically following the emotions of researchers. The special issue "European Contributions to Strong Reflexivity" published in Qualitative Inquiry (Kühner, Ploder & Langer 2016) represents another recent advance. It is based on the prominent insight of Hungarian-French ethnopsychoanalyst Georges Devereux (1967) who stated that there is a significant "overlap between subject and observer" in the field which can be read in the emotions of the observer.

In my talk I will elaborate on this insight. Instead of a strict separation and fixation of researcher and researched, I follow a path to the processuality of interpersonal negotiations. Underpinned by the empirical example of my dissertation "Mirror, Play and Gift: An Ethnopsychoanalytic Study of Relationships with Unaccompanied Refugees," I will show how relationships can be systematically analyzed: Referring to the work of authors as diverse as Homi K. Bhabha, Donald Winnicott and Donna Harraway, I propose to understand relationships as situated in-between and transitional spaces, that can be explored through strong reflexivity towards the emotions of researchers in the field.

The method developed touches on both ethical aspects of ethnographic relationships and joins current debates on the status of subjectivity and situated knowledge in qualitative research.

Understanding Research Ethics Beyond Principles: Trust, Transformation, and Tensions As Ethical Dimensions

Carla Scheytt

University of Innsbruck, Institute of Sociology, Austria

Tension, trust, and transformation are not only essential research topics for qualitative researchers but also affect the relationship between researchers and participants. How this relationship is shaped, is the core question of research ethics. Traditionally, research ethics are understood as a set of guiding principles, like no harm, informed consent, anonymization, and confidentiality, that researchers have to follow. In this presentation, I will discuss that qualitative sociologists do not limit their understanding of research ethics to these principles. For this, I will present the preliminary results of my PhD project, where I conducted qualitative semi-structured interviews about research ethics with qualitative sociologists (PhD students, post-docs, professors) in Austria and Germany. My findings indicate, that qualitative sociologists consider ethical research as a broader concept that concerns the relationship between researchers, field, and participants. Based on these findings, I will explore how tension, trust, and transformation are interlinked with their understanding, and answer the following questions: Which role plays trust for ethical research, and how it is established? Which tensions do the interviewees face in the relationship with their participants, for example, due to different positions (class, ethnicity, gender)? And finally, which expectations do they have regarding the transformative potential of their findings, for example by supporting the social struggles in the field? In answering

706

these questions, the presentation shows empirically, what sociologists understand as good ethical research, and how tension, trust, and transformation are connected to this understanding.

Troubling Power Asymmetries and Empirical Knowledge Creation Limitations Through Research Subject Inter-viewing: Exploring the Field of Possibilities

Megan Marie Rådesjö

Gothenburg University, Sweden

Interviewing is a commonly used qualitative method in social scientific research. However, power asymmetries and knowledge creation limitations can be problematic. Power asymmetries lead to the research subject being more restricted than the researcher in how the interview is carried out and later interpreted, leading to limitations in knowledge creation. To trouble these problems, this article introduces research subject inter-viewing (RSI), which is an interview guide facilitated audio or video-recorded interview between at least two research subjects. In this form of interviewing the researcher is the organiser and coordinator, but not present during the interview. Instead, research subjects carry out researcher-defined questions, topics, or vignettes either in person or via video-conferencing. This article contributes to feminist critiques of social science and offers alternative frameworks for understanding and practicing knowledge production. Through the lens of situated knowledges and facilitated by the concepts of discursive practice and field of possibilities, this research attends to the power relations at play while doing RSI for empirical knowledge creation through the question: How does RSI create or limit possibilities for power asymmetries and knowledge creation? Through seven RSIs including fourteen research participants, this research shows shifted power asymmetries from the researcher to the research subjects during the interview process. In relation to this shift, RSI broadened the scope of knowledge creation through the research subjects' initiatives. Therefore, this interview method contributes an alternative type of interviewing that facilitates the transformative shift of power asymmetries and opens new ways of co-creating sensitive or cultural knowledge in an interview setting.

Trust Me, I Know What I'm Doing: Can A Structured Heuristic On Micro-Narratives Impact The Methodological And Transformative Tensions Of Action Research?

Ana Paula Pereira Marques, Luisa Salamanca Garnica, Helder do Carmo

CECS: Centro de Estudos de Comunicação e Sociedade (Universidade do Minho, Portugal)

Action research is a multimethod design centred in the protagonists' voices, to build its meaning and value. Encompassing multiple tensions (such as theory-practice, functional-emancipatory, qualitative-quantitative, formal-informal), at its core lies a recurring cycle of reflexivity, that many times lacks in dealing critically with these tensions, and to which resolution trust emerges as a central competence.

This presentation focus on a structured, relational and dynamic heuristic about social actions, with the aim ofto visualizing the participants' micro-narratives about their dynamics of competence building and its conditioning factors. Such an heuristic attempts to reveal the meaning as interpretability (both understanding-explaining, and personifying-(re)producing), and the value as usability (both appropriability and actionability) of organizational actors' micro-narratives to discuss the above tensions within the dimensions of control, change and communication.

The heuristic of social action is also considered an heuristic of conflict towards three possibilities: of emancipation, of common intentions and of valid knowledge. In this presentation the methodological triangulation, as in the set proposed by Denzin, is placed against these three possibilities, gaining a political dimension.

The presentation will conclude by using Pettigrew's Social Dramas and Adele Clark's Situational Analysis to test the creativity, methodological strength, and also the effectiveness of the proposed heuristics to solve the above tensions and to empower both researchers and protagonists by applying it to two action-research case studies (in an organizational setting and on the evaluation of public policies), in comparison with other tools of research.

707

Participatory Workshops as a Research Method to Identify Consensus and Dissent Around Key Research Themes

Ana Ferreira Teixeira, Jorge Caleiras, Dora Fonseca, Diogo Silva Cunha

CoLABOR, Collaborative Laboratory for Labor, Employment and Social Protection

Participatory workshops can be used as a research technique aiming at eliciting information on dissent, consensus, and innovative ideas around key research themes. The present paper describes the process of designing and implementing participatory workshops organized within the context of a collaborative research project on work, employment, and labour market(s) in Portugal. Additionally, the paper presents analytic strategies employed to analyze the data collected from the workshops and the processes through which these data contributed to the project´s research aims.

Researchers were interested in examining employment and labour market(s) dynamics around three main themes: skills, expectations, and quality of work; migrations and labour markets; and fiscal systems and employment. In order to achieve the objectives of examining and identifying diverse stakeholders' perspectives, as well as possible nodes of consensus and conflict among stakeholders, participatory workshops were organized on each of the research themes.

The workshop methodology was based on a specific set of criteria comprising: a) the identification of key stakeholder groups in each arena, including workers' representatives, businesses' representatives, state agencies, academics, and civil society organizations; and b) a context report distributed to all participants and providing common grounds for discussion. The participatory workshops were divided into three distinct moments: the first moment included the presentation of the context report; the second moment consisted in intra-stakeholder debate groups, and the third moment entailed inter-stakeholder debate groups. Intra-stakeholder groups aimed at building consensus around specific topics, while inter-stakeholder groups were expected to identify points of dissent and consensus among the problems at stake.

Researching The Military From Bottom To Top

Dana Grosswirth Kachtan

The open university of Israel, Israel

In recent years more and more researchers recognize the importance of micro research and focus on agents' performance and their subjective experience and understanding the military and its connection to society.

The aim of this paper is to examine the part of individuals in constructing, maintaining and even challenging perceptions, images, practices, and processes within the military. Focusing on the agent's viewpoint and performance reveals the probability of challenging military conceptions and images. Doing so discloses the fluidity and the potential of change in the structure, mechanisms, and social conceptions through individuals' performance.

Based on interviews with male and female who served in combat roles and in intelligence roles, I examine the way soldiers perceive their military service and the capitals they acquired during military service. Furthermore, I examine how these perceptions influence the potential of converting these capitals into civilian society and labor market. Emphasizing the active part of agents in creating and challenging meaning and perceptions, underlines the connection between micro and macro research and the importance of micro perspective analysis to military sociology.

Tension in Research Settings in Times of Societal Polarization: A Conceptual Analysis of Finnish Conscripts' Group Interviews

Elina Paju

University of National Defence Finland, Finland

Research is always situated in a wider social situation. This affects which research aims and questions seem topical and what kind of data is generated in the research process. In my presentation I focus on the interaction in group interviews and ask how does societal polarization affect knowledge generation in qualitative research.

My presentation is a conceptual analysis of group interviews I have conducted with Finnish conscripts completing their military service. The interviews covered such topics as home, homeland, will to defend, killing and dying. As military service for males is mandatory in Finland, the conscripts represent the Finnish (male) population in their – at times – polarized views.

I analyse the situations of the interviews through the concepts of pluriverse and diplomacy. Pluriverse is a concept coined by William James (1909) and refers to the plurality in existence. Discomforts, difficulties and tensions are, for James, part of the existence. To account for the tensions emerging on the societal level and affecting the situations of data generation is qualitative research, I propose Isabelle Stengers' (2010-11) figure of the diplomat. For Stengers, diplomats are practioners that emerge – or can emerge – in situations of conflict or crisis. Diplomats help to maintain the possibility of plurality. In practice, the opposing and polarized views presented and emotions expressed in an interview situation pose ethical challenges for the researcher. By combining James' concept of pluriverse with Stengers' figure of the diplomat I propose a way to know in a tense research setting.

708

RN20 | T05_01: Mixed Methods

Co-creation in Mental Health Promotion Research: Anticipating Risks and Tensions, Nurturing Trust and Cultivating Transformative Change

Cláudia de Freitas[1,2], Raquel Teixeira[1], Liuska Sanna[3], Wietse Tol[4]

1University of Porto – Institute of Public Health, EPIUnit, Portugal; 2ISCTE – University Institute of Lisbon – Centre for Research and Studies in Sociology, Portugal; 3Mental Health Europe, Belgium; 4University of Copenhagen – Department of Public Health, Denmark

Growing societal tensions deriving from climate change, digitalisation, epidemiological-economic crises, rising migration, and population aging are pushing at-risk groups to the edges of good mental wellbeing. While mental health promotion interventions are praised for their enhanced value and sustainability, acting before concerns become full-blown problems requires vulnerable groups to trust practitioners and researchers. However, persistent mental health-related stigma can cause people to experience difficulties in accessing accurate information about mental health, not recognise the benefits of research participation and become sceptical and distrustful of researchers, thus compromising recruitment and the validity of research. Based on a sociological understanding of vulnerability, we reflect on how using a participatory multi-methods approach to capture relevant stakeholders' perspectives may encourage power-sharing and contribute to align research design and implementation with end-users' needs and expectations. Our multisite study draws on a co-creation process entailing desk reviews and online Delphi surveys co-developed with locally-set Society Advisory Groups, and scenario-based workshops held with stakeholders in the six participating countries: Denmark, Germany, Italy, Lithuania, Netherlands, Switzerland (ADVANCE project). We discuss research teams' epistemic standings about participatory research and how they impact research planning, resource allocation and the unravelling of co-option risks and tensions during implementation. We also explore emerging stakeholders' interactions and the value of specific methods in inspiring transparency, promoting stakeholder empowerment and nurturing research trustworthiness. We argue that research co-creation adds pressure onto research teams' agenda and performance, but also provides avenues to improve research relevance and acceptability by cultivating the co-design of fit-for-purpose, transformative interventions.

Multimethod Sampling as a way of Slow Research

Adriana Eixarch Alejos, Pablo Bariego Carricajo, Laia Nualart Moratalla, Alejandro González Heras

Universitat Autònoma de Barcelona (UAB), Spain

In recent years, the scientific community has been discussing the need to rethink the ways in which scientific knowledge is developed. Approaches such as slow research put on the table the need to approach the research process from the perspective of reflexivity, proposing a form of research that prioritizes slow knowledge over the values of speed and productivity that seem to rule scientific work today. In the context of this debate, we support the development of slow multimethod research, understood as an integrated combination of different methods that allows researchers to address the complexity of the objects of study with the appropriate time. This necessarily implies a critique of the hegemonic conception of mixed methodology, that reproduces the logic of separation of the methods and fails to separate from the essentialist association between method and paradigm.

Taking as an example a research project based on case studies of three Barcelona's neighborhoods, we present a practice of multimethod and multilevel sampling which, by integrating quantitative and qualitative methods (cluster analysis, interviews and focused observation) to obtain a single sample, manages to develop an intrinsically mixed sampling and overcome the supposed immiscibility of methods. This results in a practice of slow research, which takes the appropriate time to address the complexity of the object of study from the very beginning of the research, in the sampling phase.

709

The Importance of Knowing a Language for Conducting Qualitative Research

Amalia Sa'ar[1], Dalit Simchai[2]

1University of Haifa, Israel; 2Tel Hai College

This paper demonstrates the inherent potential of detailed semantic analysis to the study of identity work. We draw on a mixed-methods study on feminine self-identity in Israel, focusing on the answers of 623 Jewish female respondents to the open-ended question, 'In my opinion, a feminine woman is...'. Responses revealed a recurring rhetorical structure, which directed us to apply a semantic analysis that proved key to understanding the respondents' worldview. We paid careful attention to the words used, and to the structure of using connecting words to include what the respondents perceived as contradictory gender traits: a feminine woman can be smart but still [sic] feminine, have opinions and also be graceful and sexy, launch a successful career but at the same time be a caring mother. Respondents, in other words, expressed a strong sense of

entitlement to gender equality yet retained an essentialized perception of gender differences.

There is an ongoing methodological debate about the level of familiarity with the language and the culture under study that is necessary in order to conduct qualitative research. Traditionally, in anthropology, language proficiency was a requirement. However, this changed with the growing popularity of qualitative research in sister disciplines, such as sociology, as researchers moved increasingly to rely on external translators. We argue that, while verbatim translations may indeed suffice for information gathering, they leave important layers of significance lost, which cannot be attained without a nuanced understanding of the local language

Photovoice, Empowerment And Drug Use Among Hard-to-reach Populations: A Case Study In Hong Kong

Karen Joe Laidler, Kate Lowe, Leona Li, Velda Chui, Jack Ng

The University of Hong Kong, Hong Kong S.A.R. (China)

Photovoice is increasingly viewed within sociology and the public health fields as an innovative and useful methodology to illuminate the social and personal context of individuals' lives in a range of settings, but particularly in relation to health and risk-taking behaviours. Studies of drug use in various communities have integrated photovoice as part of community based participatory action research with the objectives of not only engagement and empowerment, but bringing to the foreground, the invisibility and inequalities faced by drug use and marginalized populations. Drawing upon our preliminary experience of engaging three groups of hard-to-reach populations who use drugs (e.g., women, MSM, and ethnic minorities) in participant photography (N=12) in Hong Kong, we found this approach adds depth to their qualitative interviews by providing insights on their everyday life; understanding of how and why some people who use drugs (PWUD) are hidden, and whether and how stigma may impact their use and ability to seek services. Like other studies, participants have found the process empowering and increasing their sense of trust and communication. At the same time, these benefits must be understood in the context of challenges faced, particularly around ethics and safety. We conclude with a consideration of the potential of this methodology as a form of empowerment and as a strategy for frontline workers to engage hard-to-reach populations, and address access gaps in service provision. We also reflect on the theoretical implications of this approach for moving forward our understanding of stigma and marginalization in different cultural contexts.

RN20 | T05_02: Participatory Methodologies

Working Toward Inclusive Research Methodology: The Role Of Trust Between Researcher And Subject

Leen Sterckx, Maria Luce Sijpenhof

Netherlands Institute for Social Research, Netherlands, The

The Netherlands Institute for Social Research, an autonomous research institute committed to enhancing Dutch government policy through interdisciplinary scientific knowledge, recognizes the crucial role of inclusive research methodology. We feel responsible for conducting research that doesn't systematically overlook specific groups nor produce findings they can't identify with. Acknowledging that certain social minorities remain underrepresented due to limitations in conventional research methods, we have initiated a methodological investigation into the root causes of this underrepresentation.

Beyond apparent barriers like language or digital skills, our findings reveal that research participation fundamentally hinges on trust. This encompasses trust in the interviewer's persona, the careful and secure processing of data, and confidence in the research project's objectives. Moreover, trust extends to encompass faith in government, public institutions, and scientific research at large. In this presentation, we delve into the multifaceted ways in which a deficiency in trust on the part of potential research participants impedes their engagement in research. We will also discuss ways in which trust can be established or strengthened. We will go into the positionality of the researcher and the research institute, the importance of reflexivity and the incorporation of the perspective of the research subjects, as well as, to some extent, considering their interests in the research. This appears to be in tension with the objectivity or neutrality that is also demanded of our researchers. Does inclusive research and the trust of social minorities in research presuppose that researchers advocate for social justice?

Rethinking Methods In Indigenous Contexts. A Postcolonial Critique On Field Access And Participatory Research

Giuseppe Ricotta, Maria Chiara Fatigato

Sapienza Università di Roma, Italy

During the last decades the sociological debate especially in the post-colonial and decolonial studies (Quijano, 2000), has problematized the ways in which social science researchers think about methodologies and approaches in so-called "indigenous contexts" (Smith 1999; Cunneen C.,

710

Rowe S., Tauri J., 2017), highlighting how research has often reproduced Eurocentric extractivist dynamics, through the formal rules of scientific paradigms (Santos 2008). However, how the knowledge is collected by researchers during their field research activity, is a crucial methodological problem, because marginalized contexts have long experienced oppression by Western researchers (Datta 2018), where Western modernity has created a dominant scientific and north-centric knowledge that is generally recognized as valid, and outside of this there are usually little credible alternative (Fatigato 2023). The epistemological and methodological challenges consist in proposing a decolonial perspective in the field of methodology in indigenous contexts, through participatory and collaborative ways of research in community, "restoring participants voice in a show of respect, reciprocity and responsibility" (Datta 2018, p.21). In this perspective a transformation is required in the way in which the researchers enter in the community, who should build a trusting relationship through which enhancing the knowledge of community members, to realize research that can benefit both the academy and the community (Pellegrino, Ricotta, 2023). This has a very real impact on how we think about and design research tools. The paper aims to address these issues from a case study of the work of traditional "parteiras" in the state of Amazonas (Brazil): women who have expertise in delivering babies, based on "ancestral" knowledge, but also cooperating with the Brazilian public health system in several Amazonian contexts.

To Explict The Knowledge With Social Workers: A Methodological Reflection

Tiziana Tarsia

University of Messina, Italy

My abstract presents a participatory and collaborative methodology in a research project whose main topic is to understand and to analyze how the knowledge is co-produced by social workers in the territorial services. In this research, which is started in 2018, I have used different qualitative tools: world café, delphi method, storytelling, interviews, theater of opressed, ethnographic notes.

An important methodological aspect in this field work has been the building of setting: the characteristics of this dialogic but also conflictual space are interesting. These settings are the "participatory teaching and research boards". In the years, they have become permanent dialogue and training spaces and are a link between Academic world and voluntary organizations (or similar). Now four boards exist: 1) regarding refugee persons; regarding mental health; regarding poverty; regarding drug addiction. Finally, the way participants are engaged is also interesting.

I would like to discuss the strenght and the weaknesses of the use of these tools and the reasons that are under the choises of tools to explicit the tacit knowledge that is embodied in social worker's practices. The "participatory teaching and research boards" consist of with different types of social actors: students, social workers, users, academic researches but in this paper I want to give attention to how I (and the research team) have used different

methodological tools to facilitate the co-production of the knowledge with social operators.

Using Arts-based Research Methods in Forced Migration Studies: A Comparison of Photo Voice and Image Theatre in a Participatory Research Project with Young Refugees

Arne Böker[1], Judith Bucher[2]

1University of Applied Sciences Potsdam, Germany; 2Catholic University of Eichstätt-Ingolstadt, Germany

Due to the wars in Syria and Ukraine, the number of refugees in Germany rose sharply in 2015/2016 and 2022. It is mainly young people under the age of 30 who have immigrated to Germany. Providing them with access to the education system and the labour market challenge many social and educational stakeholders and increases various tensions in society. The social sciences are also called upon to contribute to these challenges. In a transdisciplinary and participatory research project, we are intensively investigating the educational conditions of young refugees in vocational education and training system (VET) in Germany. The aim is to identify and overcome the educational barriers that young refugees face. In a peer research project with young refugees, we used two established arts-based research methods to do so: photo voice (Wang & Burris 1997) and image theatre (Boal 1993). First, we will illustrate and reflect on the specifics and the potential of arts-based research methods in the context of participatory research to investigate and transform social inequalities using the example of our research project. Second, we will compare the two arts-based research methods of photo voice and image theatre and relate them to classic qualitative research methods such as narrative interviews and group discussions.

711

Beyond Classical Qualitative Research: Opportunities and Tensions in Developing Participatory Research with Persons with Intellectual and Psychosocial Disabilities

Paula Campos Pinto, Teresa Janela Pinto, Patrícia Neca, Bárbara Maltez

ODDH and CIEG, ISCSP-Universidade de Lisboa, Portugal

Persons with disabilities have been traditionally excluded from research processes. For persons with intellectual and psychosocial disabilities, exclusion and disempowerment in research processes is compounded by the invisible nature

of their impairments, and pervasive negative social representations. Addressing these inequalities implies seeking ways to foster meaningful participation in research production. Qualitative research methods can play a leading role in this transformation, through inclusive and flexible research designs that expand 'classical' qualitative techniques and tools to 'give voice' and visibility to the experience of groups often excluded from research production.

This presentation explores this issue, through the experience of a project that assessed the implementation of the law on legal capacity in Portugal, relying on a participatory qualitative approach, where co-researchers with intellectual and psychosocial disabilities worked alongside academic researchers to design and apply qualitative data collection and analysis tools, such as photovoice, interviews, focus groups and content analysis. We will present this experience, discussing issues pertaining to participatory qualitative research designs, advantages and shortcomings of qualitative techniques and tools, as well as the ethical, methodological and practical challenges that were faced and opportunities that were found.

We will discuss the advantages of combining 'classical' qualitative research methods, with visual and creative tools to stimulate participation, adjusting to different levels of need, while sustaining the relevance of qualitative inclusive research in empowering groups traditionally excluded from research production. We will also discuss the challenges, tensions, and lessons drawn from this experience and their implications for qualitative research methods and inclusive research.

RN20 | T06: Ethnographic Methodologies

Intersections of Identity: Navigating 'Halfie' Dynamics in Algerian Ethnography

Seréna Nilsson Rabia

University of Bergen, Norway

Conducting ethnographic research in Algeria as a woman with both Algerian and Swedish heritage places me at the intersection of 'outsider' and 'insider,' embracing the term 'halfie' conceptualized by Lila Abu-Lughod. This term encapsulates the complex negotiations part of my dual 'identity', further reinforced by my appearance and strong Algerian accent, setting me apart from the stereotypical Swedish image.

Despite my Swedish upbringing, participants often perceive me as an 'insider' during fieldwork, challenging conventional expectations. This presentation investigates the nuanced facets of my 'halfie' positionality, exploring its impact on participants' interactions and perceptions throughout the research process. 'Halfies,' like myself, grapple with a nuanced identity, carefully navigating the socio-political landscape of their communities.

This multifaceted identity significantly contributes to the complexity of my 'halfie' positionality, shaping participant narratives and interactions during fieldwork. The talk reflects on the challenges and privileges in my positionality as a 'halfie', drawing from diverse fieldwork instances in Algeria—engaging with various social categories during the Hirak protests, political elections, and interactions with the Algerian elite.

The presentation aims to highlight the intricacies of my 'halfie' positionality in Algeria's patriarchal and authoritarian context, offering insights into the broader dynamics of identity, negotiations, and 'othering' within ethnographic research. As a 'halfie' ethnographer, the investigation unfolds at the intersection of identities, revealing nuanced threads that connect together a narrative of identity grounded in ethnographic fieldwork in different socio-political spaces in Algeria with individuals of different social categories and intersections.

712

Navigating Gender In Male-dominated Research Contexts: Positionality, Reflexivity, And Feminist Methodologies

Minke Hajer[1], Laura Keesman[2]

1Utrecht University, The Netherlands; 2Vrije Universiteit Amsterdam, The Netherlands

What can we learn about positionality, reflexivity, and reciprocity from examining ethnographies by female researchers in male-dominated environments? The implications of negotiating gender relations in the research are often ignored or framed in terms of safety questions; doing fieldwork 'in a male-dominated environment' is, in this sense, considered problematic. Female ethnographers often focus on how their gender affected the research process, describing the various risks, challenges and ethical dilemmas they faced, for example, whilst gaining access and building rapport. However, such descriptions often remain specific to the case study in question and offer limited insights into the relationship between gender and the research process in general.

This paper examines gender relations and the use of feminist methodologies, specifically the notion of reciprocity, during ethnography. We take a holistic approach to the role of positionality, rapport, and gender during fieldwork to argue for a more open and inclusive reflection of its effects on the research process. Empirically, we combine insights from two long-term ethnographic studies conducted in male-dominated contexts: irregular migrant social movements in Italy and the Netherlands and the Dutch police. Focusing on the role of gendered negotiations during fieldwork access, and the building of rapport and trust, we show both challenges and advantages of minority gender ethnographies.

Brave Spaces of Art and Research: Co-creating Knowledge About Independent Trade Unions in the UK.

Ella Jones[1], Vera Weghmann[2]

1The Brixton Project, United Kingdom; 2University of Greenwich

This research-art project combines art making with participatory action research (PAR) to explore the organisation of largely migrant workers in the UK in cleaning, security, care work and hospitality alongside those in the 'gig economy' within independent, grass roots trade unions. Such work is characterised by insecurity, limited employment rights, uncertain hours, low pay and unpaid labour. The new independent unions are small in size but have gained wide academic and public attention for their 'significant high profile wins', of 'David and Goliath' battles (Hardy 2021; Pero 2020).

This project draws on the methodologies of popular education and participatory action research (PAR), developed by Brazilian sociologist Paulo Frere and Colombian sociologist Orlando Fals Borda's to create knowledge that is useful for low paid workers, trade unionists and activists. The aim of PAR is to break down the distinction between researchers and researched, and to (re)write history from below through participatory methods. The project develops an inter-disciplinary and multi-method approach combining semi structured interviews and art making focus groups that include reflective artmaking with different groups of workers and union staff; testimony story telling portrait sittings. This enables a process of collective knowledge creation by sensitively tapping into the lived experiences of low paid work and the struggle against it. Artmaking allows for the creation of a "safe space" that encourages "a certain license to speak and act freely" (Kenney 2001:24) as well as a "brave space" in which voices that fight to be heard can be amplified (Scott Bey Jones n.d.).

713

RN20 | T07_01: Qualitative Research Ethics

Dealing With The Dilemma Of Being A Distressed Researcher (When Doing Research On Sensitive Issues)

Katharina Kärgel, Frederic Vobbe

SRH University Heidelberg, Germany

The demands on the ethical and professional conduct of researchers have long been a subject of growing interest within the scientific community. They are of particular importance in research projects that involve an increased risk of stress for participants. Examples include research on violence, trauma, stressful life events or research with so-called vulnerable groups. Discourses focus on the protection and rights of research participants. In contrast, the psychosocial impact that the research process can have on researchers is insufficiently reflected upon. That is why this contribution deals with researchers being distressed, referring to emotional reactions or psychosocial stress that researchers experience because of dealing with their research topic. By drawing on key experiences in qualitative research projects on sexualized violence in childhood and adolescence, we illustrate the dilemmas that the researchers' distress may lead to and the impact they have on the entire research process. The direct contact with victims of sexualized violence in a participatory research setting, for example, presented our project team with countless questions about how to deal with personal suffering(s) in terms of research ethics, which were expressed in exemplary moments of stress during data collection and analysis, feelings of guilt, fears of failure, questions of closeness and distance. How do I deal with the fact that I am affected by stories of sexual abuse? How do I react appropriately when I encounter (re-)traumatization? How do I deal with entrusted information that would be criminally relevant in other settings? In the absence of a well-founded professional discourse on answers to all these questions, we would like to encourage a discourse with our contribution and provide impulses for adequate research ethics guidelines.

Accessing Closed Groups: Ethical And Methodological Limitations Of Studying Incel Groups

Gaia Antinelli, Gaia Peruzzi, Angelica Spampinato

Sapienza University of Rome, Italy

The issue of undercover research is a practice well known to the social sciences. Sometimes it appears to be the only way to penetrate marginal or closed groups and to know invisible (discriminated, violent, illegal) social worlds. However, it can lead the researcher to several ethical questions.

This paper aims to investigate the methodological and ethical limits of the study of the Incel community (online groups of "involuntarily celibate" men united by feelings of hatred towards women) and the qualitative methods of undercover analysis with which they can be studied. Violence against women is a global urgency and deepening its roots is a priority calling for new reflection on the tools and ethical limits of research. The current debate focuses on the question: if entering a closed community without declaring that members are being studied is an illegal practice, does it mean giving up the research on these topics? Are there other elements to be considered in this choice? Are there other qualitative research methods more suitable for these new models of social interaction?

Starting from a literature review of the empirical and theoretical research on this subject, we propose an updated critical reflection on the pros and cons of the dilemma relating to this specific object of study, in order to critically compare the various online ethnography approaches that allow us to grasp the transformative nuances of this community and the understanding of a social reality that exists, but which is still difficult to penetrate.

Surveilling The Surveilled: Ethical Implications Of Conducting Research With Activist Groups Exposed To Surveillance

Iga Gumulinska

Edinburgh Napier University, United Kingdom

714

This paper draws on the initial stages of the PhD project that explores activist groups' understanding of digital surveillance. The aim of the paper is to explore the questions of vulnerability of activist groups in the context of research ethics, discuss the challenges that have been encountered while designing the research, negotiating access, and building relationships with participating groups, and suggest possible ways of approaching research ethics. Activist groups, particularly ones that are openly anti-establishment, face threats of surveillance and repression, putting them in a vulnerable position as research participants. Despite a wide range of available scholarship detailing the ethical approaches to research with vulnerable groups and activist groups, there is still limited consideration given to ethics of research with groups whose vulnerability stems from a strained relationship with the state. While researchers acknowledge the risks, and approaches such as co-production offer frameworks that allow to develop research that mitigates some of the dangers, the scholarship largely lacks practical suggestions on how to conduct research with groups that are at risk of repression because of participation, especially when co-production is not viable.

The paper is guided by two research questions: a) How does the strained relationship with the government impact on the vulnerability of activist groups participating in academic research; b) What steps should be taken to mitigate the risks of further surveillance and repression. The paper emphasises the importance of participant inclusion throughout various stages of the research process. It considers the

strengths and weaknesses of researching from an 'insider' position and argues for a reconsideration of the category of vulnerability in bureaucratic forms to acknowledge the risks activists are likely to be exposed to. Importantly, while the paper suggests possible solutions to some ethical concerns, the goal is not to provide definite answers to how research with such groups should be approached but to advance the research ethics scholarship and share reflections that might support other researchers with similar issues.

The Balancing Act of Establishing Rapport with Participants and Ensuring Researcher Protection Within Qualitative Studies Involving Online Semi-participatory Netnographic Methods

Alessandro Moretti, Kristoffer Aagesen, Jonatan Mizrahi-Werner, Jakob Demant

University of Copenhagen, Denmark

The increase in various types of harmful content on social media including sexual violence, ideological hate, or the facilitation of both on – and offline crimes through illicit networks, raises important questions as to the methodological options available to researchers exploring such online environments. Of particular concern are the abundant risks that scholars expose themselves to, and the limited range of protections that they may or may not be able to rely on. This is especially important in the context of qualitative research and of semi-participatory netnographic research in particular.

Based on cases from two specific research projects – one exploring the sharing of hateful memes on social media and the other the selling of illicit nicotine products through smartphone apps – the use of forms of covert methodologies as not only justifiable but indeed as necessary to ensure sufficient levels of research protection is advocated for. While the cases show that the use of anonymous or neutral researcher profiles may limit the ability to establish rapport with research participants, it is also evident that the approach has simultaneously curbed potentially hateful attacks and attempts at doxing aimed at the researchers. Specifically, the creation and use of neutral accounts may be one of the few ways to gain access to what Artieri (2021) calls the "new geography of unsearchable small conversations" without compromising researcher safety.

This presentation offers empirical examples of researchers from both projects navigating this delicate balancing act through the establishment of structured protocols promoting ethical data collection and ensuring simultaneous researcher protection.

RN20 | T08: Visual Research

Challenges from Researching with Disabled Children

Maria Pires

ISCSP, Portugal

Research with disabled children – with complex and multiple disabilities, is still recent. In the quest to reach these children voices researchers have turned to participatory research via the mosaic approach facing the many challenges of research tools design.

The advantages of exploring the Mosaic approach grant researchers with the possibility of using multiple flexible tools intentionally designed to enhance children agency and voice but at the same time presenting researchers with additional challenges of pursuing inclusiveness and tool adaptation.

The discussion will engage into the concrete research examples and some of its ethnographic episodes showing the process of tool co creation during ethnographic research the challenges associated with this practice and how vulnerability and reflexivity came to be a lens into different dimensions of disability interpretation.

The Ethnographic research took place in four school settings involving a total of 48 children aged 9 to 16 years old we will bring the empirical data produced over a nine-month period, in the context of an Animal Assisted Therapy (AAT) program designed to offer therapeutical and educational skills to children with multiple and complex disabilities.

It is suggested that a better understanding on the process and procedures of co researching with children with multiple and complex disabilities in contexts of mix (dis)abilities should consider the different dimensions of vulnerability enacted by the situated encounter and process of co researching.

Filmmaking As A Sociological Genre

Laura Harris[1], Lena Theodoropoulou[2]

1University of Southampton; 2University of Liverpool

This paper explores different uses of film as a method within qualitative sociology. We argue that the relationship between film and sociology is so broad that it could be considered its own genre of thinking-doing sociology. To make this argument, we theorise the diverse ways in which sociological and filmic views of our worlds are interconnected and gather literatures on sociology and film that are currently in tension. First, we consider the methodological implications of the sociologist taking on the role of filmmaker. We do so by drawing on classic and contemporary examples, from Edgar Morin to Nick Mai, to explore how the camera mediates and transforms sociological views of the world. We argue that this often makes aesthetics a methodological issue. Secondly, we consider methods in which the sociologist collaborates with a filmmaker. What are the tensions between academic and filmmaking practices, and how can

715

novel standpoints be generated through these tensions? Finally, we zoom out to explore the entanglement between sociology and the history of the moving image. We argue that the history of moving image furnishes us with an archive for qualitative reassessments of sociological transformations over time—starting with the Lumière brothers' early experiments in filming workers leaving their factory in 1895. Taken together, these three discussions raise methodological, aesthetic, and disciplinary questions all of which speak to film as both method and genre of sociological thinking.

The Synchronicity of Bodies in Therapeutic Riding: Potentials of Video Hermeneutics for Investigating Non-Verbal Forms of Communication

Katja Richter

University of Kassel, Germany

Animal-assisted interventions are increasing significantly in recent years (Wesenberg 2020, p. 12). Therapeutic riding is one of the most professionalised areas among these interventions and builds on a special way of communication between horse and rider: It relies on the tension and relaxation of muscles (Despret 2004, p. 115).

In my talk, I will discuss the meaning of this muscular exchange as an important form of (non-verbal) communication in the corresponding therapeutic treatment. I will refer to the results of my PhD project on care work in the triangle of patient, therapy animal and professional. They showed the development of a synchronicity between the horse's and the patient's body, which became apparent in the relaxation of both bodies during the patient's therapeutic exercises. Using the example of a video sequence from therapeutic riding, I will illustrate how the synchronicity is taken up and utilised by the actors of the therapeutic treatment.

Methodologically, I will discuss my use of video hermeneutics for the investigation of (non-)verbalised embodied sports skills as well as the transmission of practical and theoretical knowledge in therapeutic riding. The distinction between practical and theoretical knowledge is a fundamental component of video hermeneutics, which is based on Merleau-Ponty's phenomenology of the subjective body. I will conclude my talk by discussing how this reference to Merleau-Ponty and his distinction between two forms of sociality – intercorporeity and dialogue – enables the exploration of the animals' autonomous contributions in animal-assisted interventions.

The role of Linguistic Anthropology in understanding the social meaning of language: presenting the Linguistic Audiovisual Multisited Ethnography (ELAM) methodology in the Dutch Caribbean.

Victor Navarro-Izquierdo

Universitat Autònoma de Barcelona, Spain

Linguists and sociolinguists have increasingly been using qualitative methods in their research in order to better understand the social functioning of language use in everyday life. Linguistic Anthropology offers a qualitative framework that can deepen into the social meaning of language use through in depth interviews with participants. In this research I developed a methodology that draws from Linguistic Anthropology and Visual Anthropology called Linguistic Audiovisual Multisited Ethnography (ELAM). The aim of this methodology is to deepen into the life stories of New Papiamento Speakers, people who have migrated to the Dutch Caribbean islands of Aruba, Bonaire or Curaçao and have learnt the local language Papiamento. The result will be a multimodal product, a written thesis and a documentary that want to portray what does it mean to be a New Speaker of Papiamento in different parts of the Kingdom of the Netherlands. The audiovisual product will show the great diversity of profiles with different nationalities and native languages that have decided to learn this creole language, and will explore the challenges, difficulties and rewards that they experience while trying to put this newly learnt language into practice. This research wants to point out the usefulness of Linguistic Anthropology in this field, and how productive transdisciplinarity can become in this type of research if Linguists, Sociologists, Sociolinguists and Anthropologists work hand to hand combining their fields of knowledge.

716

RN20 | T09_01: Visuality and Interview Methods

The Use of Photostories in a Youth Mobility Study.

Giulia Marchetti

University of Florence (Italy)

My contribution is based on a methodological description of Photostories, a photo-based interview which was recently systematised by Gomez (2020). This is one of the visual research techniques that I used in my PhD research on young Italians moving/migrating to Australia. The aim of my study was to assess how transnational mobility impacts young people's transitions to adulthood and Photostories contributed greatly to the emersion of data and to my analysis.

After outlining the main differences between Photostories and other two well-known photo-based interviews (namely Photovoice and Photo Elicitation), I will discuss how I used Photostories in my research: the preparatory work, the interview intercation, the participation rate among my research participants, the nature of data collected, problems related to double coding (one by images and one by text), positive and challenging aspects of this visual method and its link to the first, main semi-structured interview. By showing some examples, my presentation highlights the nature of Photostories not only as a visual but also as an emotional link to the first ethnographic interview, in the sense that it proved to be a deepening of meanings, a mnemonic support of aspects that during the first interview had not emerged, and a symbolic reference of their overall mobile trajectories.

Crafting Innovative Research Methods In Phenomenography With A Sociological Perspective

Hinna Abid

University of Sheffield, United Kingdom

The central theme of this paper is to introduce novel, innovative research methods when exploring mature male students' experiences of higher education funding structures within a cost-of-living crisis in England. Employing a phenomenographic research methodology with a sociological perspective, allows understanding of current financial tensions in English universities from male students' perspective, bringing forth their experiences of engaging with this reality. In exploring any phenomenon, the focus tends to be either on sociological factors or on individual experiences explored through a phenomenological lens. This study substantiates the importance of both, where sociological factors play out in varying ways owing to individual intersecting complexities, occurring in specific contexts of temporally and situationally bounded spaces. Also, research evidence males reluctance in sharing viewpoints and experiences, which requires going beyond the classical method of interviewing, normally employed in phenomenography and incorporating visual and modular illustrations, to capture a more nuanced understanding of these students intensified educational complexities. These creative methods expand the possibilities of eliciting enhanced responses in a safe environment, allowing a wider range of forms of expression of these students' educational experiences occurring within current financial tensions. Visual timelines help in the recollection and sequencing of life events, where educational trajectories are informed not only through current institutional processes but also through past experiences and future possibilities. Lego modelling through hand-mind coordination provides the platform for slow thinking, leading to richness of information. These innovative methods capture underlying meanings and intentional attitudes, drawing meaningful connections between students' educational experiences and institutional processes occurring within the wider social and political structures.

717

RN20 | T09_02: Space and Materialities

Beyond the Pale: Qualitatively Studying Unique Populations in the Absence of Direct Access

Smadar Ben-Asher[2], Noa Milman[1]

1German Center for Integration and Migration Research, Germany; 2Achva Academic College

Qualitative researchers seeking to understand the lives of marginalized groups can sometimes find it difficult to collect data from within due to physical or administrative obstacles, or due to social boundaries based on religion, norms, and lifestyles This article examines how researchers can cope with difficulties at gaining access, especially due to physical or administrative bordering practices. Drawing on the authors' own research of asylum seekers who reside in camps in Greece and in Germany, the article develops a theoretical and practical approach to studying hidden or concealed communities in the absence of direct access to the field of research. We conceptualize two actors and one region that can facilitate access and research of such concealed communities: 1. Border straddlers – actors from within the community, who have access – both physically and socially – to external spaces 2. Border commuters – actors who come into the bordered spaces on a regular basis to perform a professional task, and return to their lives outside the bordered zones at the end of the work day, and 3. Liminal border zones – geographical areas that are peripheral to the communities' residencies, and are positioned at the border – both within the designated enclaves, as well as outside of these spaces and their social and bureaucratic surveillance. The study examines what is gained by applying these strategies, and what are the limitation of each approach.

Research through Design: Performative Research Beyond Representation

Asier Amezaga

University of the Basque Country (UPV/EHU), Spain

This presentation aims to question the implications of using design as a tool in sociological research. Researching through design involves engaging in the creation of objects or products within a specific context, using knowledge and skills from other disciplines. This is a quite common sociological professional practice, but rarely receives academic or methodological reflection. The basis of this discussion comes from experimental research conducted by sociology students who applied design tools from fields like performing arts, gastronomy, basketwork, architecture, and IT. Through integrating design, these students explored objects and processes, displaying the potential of transdisciplinary research and broadening sociological inquiry.

The focus here is on how design-based research can offer a broader perspective on qualitative methods. Inspired by Judith Butler's concept of gender performativity, we can view research performativity as a material, embodied activity that shapes the social. Sociology, in this light, becomes the narrative enacted through these performances. The presentation first addresses the often-neglected performative dimension of research, challenging the prevalent view of sociology as primarily representational. Then, by placing design at the heart of research, it shows how sociology can break traditional boundaries by including new actors (transhuman), perspectives (transdisciplinary), and methods (transduction). Drawing from the above mentioned experimental research, the presentation queries the legitimacy of design-based methods in sociology and considers the possibility of turning from representational to performative research practices.

Transformative Methods or Methods Transformed? Following the Social Life of a Participatory Method

Jacob A. E. Nielsen, Kostas Stavrianakis, Zoe Morrison

Robert Gordon University, United Kingdom

718

In this paper, we will argue that following the social life of participatory methods is useful to both trace out their transformative potentials across different social contexts and to deepen our understanding of social dynamics. There has been increasing political and sociological interest in the potential of participatory methods to facilitate societal transformations and empower people. However, approaches to the social life of methods highlight how methods are both constituted by and constitute social worlds (Law et al., 2011; Savage, 2013) and there is much uncertainty about the implications of using these methods. We seek to understand how methods can travel and transform to contribute to our understanding of participatory methods by engaging with multi-sited ethnographic methods that follow materials, concepts and relationships to trace out connections and transformations across temporal, spatial, and social constellations (Marcus, 1995; Tsing, 2005).

We will examine the potential of following the social life of methods by drawing on findings from a project on social acceptance of carbon capture, utilisation, and storage (CCUS). We will illustrate how a conversation game method that sought to empower and understand community members perspectives transformed and took on different meanings as it travelled across different organisational, cultural, and social contexts in four different European countries (Denmark, Greece, the Netherlands, and the United Kingdom). We will argue that these transformations both tell us something about the method and the social, temporal, and spatial dynamics it travelled through.

Qualitative Geographic Information Systems (GIS) as a Link in the Methodological Integration of Interviews and Qualitative Observation

Alejandro González Heras, Laia Nualart Moratalla, Pablo Bariego Carricajo, Adriana Eixarch Alejos

Universitat Autònoma de Barcelona (UAB), Spain

The incorporation in recent years of Geographic Information Systems (GIS) in Computer-Aided Qualitative Data Analysis Software (CAQDAS) has allowed the integration of geographic data and qualitative data, thus opening a range of possibilities for a qualitative approach to socio-spatial reality. This communication explains the role played by qualitative GIS as a junction point in the methodological integration if interviews and qualitative observation in a study interested on the influence of urban space on the development of individual social networks. In the initial research design, the interview and observation methods were only indirectly connected, since they provided information on different dimensions of the object of study. However, the use of qualitative GIS allowed a much more direct and immediate link between both methods.

This communication will explain the way the use of CAQDAS, in particular Atlas.ti, and its integrated GIS, helped us to synthesise and contrast the data derived from the interviews, develop its spatial dimension, and visualise and identify relevant information for the achievement of our research goals. The results obtained guided the next stage of fieldwork, qualitative observation, enriching the understanding of urban space's impact on individual social networks.

This communication highlights the methodological innovation of using qualitative GIS as a link in the integration of two different sources of data, interviews and qualitative observation, providing a valuable contribution to the connection between geographical and qualitative aspects in network analysis.

Do Friends Make Us Thrive? A Panel Study On The Causal Effect Of Social Capital On Subjective Wellbeing Across Three European Countries (CH, DE, UK)

Axel Franzen, Sebastian Mader

University of Bern, Switzerland

The vast majority of studies on the effect of social capital on subjective wellbeing confirms that friends make us happier and healthier. However, there is scarce causal evidence exploiting individual-level national panel data and utilizing rigorous modeling approaches. More precisely, to the best of our knowledge, there is only one study on the effect of network resources on life satisfaction using general population panel data (Swiss Household Panel – SHP) and applying fixed effects regression (Lucchini et al. 2015). For the effect of social capital on self-reported health there is a multitude of such studies (e.g. Rodgers et al. 2019, Xue et al. 2020), some of them exploiting panel data using fixed effects models, too (e.g. Oshio 2016). Yet, the previous literature lacks thorough modelling as it essentially follows a "kitchen sink" approach and not a rigorous x-centered approach that only controls for potentially confounding factors. Moreover, the existing studies do not adequately account for potential bias introduced by selection on growth or by feedback processes.

Hence, in a first step, we replicate the findings of the previous literature applying fixed effects models to three major European panel datasets (SHP, GSOEP, and BHPS-UKHLS). Secondly, we enhance the literature by following a rigorous x-centered modelling approach. Third, we account for the potential influence of unobserved individual time-varying heterogeneity and feedback by using random trend models (fixed effects individual slopes (FEIS) and second-difference (SD) models).

Who Worries About What, when Dealing with the Impacts of the Current Polycrisis? An Analysis Based on the Most Recent Waves of the Social Survey Austria (SSÖ)

Wolfgang Aschauer[1], Christopher Etter[1], Dimitri Prandner[2]

1Paris Lodron University of Salzburg, Austria; 2Johannes Kepler University Linz

In contemporary Western societies many citizens share the opinion that we are living in a state of a polycrisis, which goes hand in hand with an increase in future pessimism. Nevertheless, this trend is not evenly distributed among all members of society: Recently, case studies in Austria highlighted that future pessimism was observed particularly among vulnerable groups who anticipated a deterioration in their own and the general living conditions in Austria.

However, insights drawn from surveys often rely on single item measurements focusing on general worries concerning the future. Our contribution wants to expand on this and takes a detailed look at specific recent global crises (such as military conflicts or the climate crisis) (so called macro-worries) which might have long-term and transnational consequences, as well as on developments that may influence the daily lives of people in a more direct way, such as loss of prosperity in the face of rapidly increasing living costs (so-called micro-worries).

Using data from the two most recent waves of the Social Survey Austria 2023 and 2024 (n=1200), we highlight (1) differences in macro – and micro-worries over time, we test empirically (2) if both facets of worries can be distinguished among the population and we analyse (3) which antecedents specifically contribute to a higher extent of macro – and micro-worries among the population. Using the method of Structural Equation Modelling we intend to empirically prove the distinction of two different factors and to detect the main explanatory factors influencing the extent of those perceived worries. We can also confirm that future worries are rather stable over time but dependent on the salience of the crisis discourse in the Austrian population.

In the Right Mode? Assigning the Preferred Mode Based on Administrative Data to Maximize the Response-Rate in a Household Panel

Patrick Lazarevic, Marc Plate

Statistics Austria, Austria

Choosing the survey mode is influenced by both quality considerations and budgetary constraints. Accordingly, reliance on self-administered modes, especially web surveys (CAWI), increased in recent decades. Additionally, personal interviews (CAPI) – formerly the gold standard of data

720

collection – has been increasingly called into question, at least for certain population groups. Yet, recruiting population surveys using CAWI alone might result in systematic biases. Thus, many survey employ mixed-mode designs, which offer several modes concurrently or sequentially.

In the Austrian Socio-Economic Panel, a household panel of the Austrian population, we tested a tailored mode-design using administrative data to assigning half of the sample's households to their presumably preferred mode (CAPI/CAWI). Further, both mode-designs used sequential mixed-mode-designs, as households were offered the other mode after persistent non-response. The other households were randomly assigned to one of the sequential mode-designs (CAPI-First/CAWI-First) as control groups.

To evaluate the tailored mode-design, we compare various data quality indicators between mode-designs, e.g., response-rates, the resulting non-response bias, proxy-rates, drop-outs, item non-response, or the number of mode-changes. We also investigate the influence of the systematic mode-allocation on mode effects. As of the date of submission, the survey was still in the field (until the end of 01/2024). Preliminary results are promising regarding the tailored mode-design as, e.g., response-rates were consistently higher than in the random mode-designs, while proxy rates were consistently lower.

With the tailored mode-design, we present an interesting and promising alternative to established mode-designs which could prove helpful in reducing both non-response bias and survey costs.

Investigating the Causal Impact of Changing Environmental Attitudes on Behaviour in Germany: A Replication, Reanalysis, and Extension

Henrik Kenneth Andersen, Jochen Mayerl

Chemnitz University of Technology, Germany

From a rational choice perspective, environmental behaviour can be seen as a function of individual preferences and constraints. We ask whether a change in preferences, holding constraints constant, can result in a change in environmental behaviour. In other words, if one's environmental attitudes become more positive, does their behaviour follow suit?

Andersen & Mayerl (2022) investigated this question using data from the German GESIS Panel Study and found that after controlling for time-invariant individual characteristics, environmental attitudes had no effect on environmental behaviour. Intentions to accept environmentally conscious policies were, however, affected by attitudes becoming more positive. The study concluded that interventions designed to make individuals more environmentally conscious (e.g., information campaigns) may not lead to more proactive environmentally friendly behaviour. But as environmental attitudes become more positive, individuals may be more willing to accept policy measures focused on protecting the environment and slowing climate change.

In order to increase the credibility of sociological work, empirical findings should be critically re-investigated. This paper will attempt to replicate the previous findings using the most recent data from the GESIS Panel Study. It will re-analyze and extend the previous work by looking at new model specifications with the existing and new data. Doing so will contribute to establishing the credibility of the previous findings and help provide the foundation for effective policy considerations.

RN21 | T02_01: Survey research

Reducing questionnaire length through the application of Item Response Theory (IRT) and Montecarlo Simulations.

Ramón Iker Soria Royuela, Unai Coto Suarez, Ana Muñoz Van Den Eynde

Center for Energy, Environmental and Technological Research (CIEMAT), Spain

In sociology, and more generally in social research, the length of a survey is one of the limiting factors in questionnaire design. This problem has been exacerbated by the popularisation of methods such as structural equation modelling, which require complex latent variables to be measured with at least two or more manifest variables. As a result, this complexity leads to long surveys which, combined with a population with shorter attention spans, increases the risk of bias and non-response. To address this issue, we propose the use of Item Response Theory (IRT), a paradigm in psychometrics traditionally used in psychology and education that has not yet gained much traction in sociology. IRT is a model-based measurement that can be used to minimise the number of variables of a latent construct. IRT has invariant parameters allowing the contribution of items to be assessed as they are added to or omitted from the questionnaires, thus ensuring comparability across different groups. In addition, IRT is based on the idea that the probability of a certain response to an item is a mathematical function of the latent variable and the item parameters, making the results unaffected by the type of sample used, whether probabilistic or non-probabilistic. In this case, we used IRT in combination with Monte Carlo simulations in the design of a questionnaire measuring conservative ideology, conspiracy beliefs, institutional trust, cultural capital, scientific culture and social class, with the aim of creating a tight-knit instrument for measuring multiple latent traits in a short format.

Respondents' Perception Of The Interview Situation And Their Future Participation In Panel Studies

Uta Landrock

LIfBi – Leibniz Institute for Educational Trajectories, Germany

The German National Educational Panel Study NEPS collects longitudinal data on educational processes, competence development, educational decisions and returns to education. Like probably all longitudinal studies, NEPS is also confronted with the problem of panel attrition. Identifying reasons for dropout may help to reduce panel attrition. We therefore want to research whether the respondents' perception of the interview situation has an impact on participation in future survey waves.

To answer this research question, we analyse, in a first step, two consecutive survey waves of the NEPS starting cohort of adults. We estimate logistic regressions with participation in the subsequent wave as the dependent variable. Explanatory variables are, besides basic control variables (e.g., age, gender), the respondents' perception and additionally the interviewers' perception of the interview situation. We therefore include both the perspective of the respondents and the perspective of the interviewers.

The respondents' perception of the interview situation is measured using five variables: how much the respondent enjoyed the interview situation, satisfaction with the interviewer and assessment of the interviewers' appearance as professional, friendly, and interested. The interviewer's perspective consists of their assessment of the respondents' comprehension, reliability, and fatigue.

Preliminary results indicate that the participation in future survey waves corresponds with the respondents' enjoyment of the interview situation in the current survey wave. In order to put these first results on a broader foundation, we will consider more survey waves in our analyses in the next steps. This will allow us to increase the reliability of our findings.

Surveying the Elderly: The Impact of Age on Data Quality

Stefan Stuth, Nicole Hameister

German Centre of Gerontology, Germany

The question of data quality arises in every type of survey. However, surveying elderly people may come with additional challenges: With increasing age, cognitive and physical performance declines. What does this mean for data quality and the conduct of studies targeting older respondents?

Initial analyses on the relationship between data quality and respondent age give clear indications of quality losses in survey data, especially among respondents who are 80 years old or older. This is true for item nonresponse, extreme response behavior, and the reliability of biographical information. Using longitudinal data from the German Ageing Survey (DEAS), we examine the reliability of responses that should be stable over time and focus on the role of panel conditioning. We also examine item-non-response and extreme responses and disentangle the age effect of the interviewees from the age effect of the interviewers.

We conclude with an assessment of data quality among older DEAS respondents and present some practical suggestions for survey design and for analyses of surveys of elderly people.

We are using data of the German Ageing Survey (DEAS), a representative longitudinal study of the German population aged 40 years and older, which has been conducted since 1996. The DEAS is an important source of information on age-related topics such as intergenerational relations, health, social relationships, leisure behavior, care and dependency, and many topics more. DEAS data is surveyed

722

via personal interviews supplemented by additional written questionnaires (since 2017 also as CAWI). Data for this presentation is based on survey waves 2014-2021.

Effects of Survey Methodology on the Inferred Prevalence of Minority Experiences Among Young People in Finland

Konsta Happonen

Finnish Youth Research Society, Finland

The way in which people use information technology is in flux, pushing survey researchers to develop their methodologies. Smartphones are decreasingly used for voice calls, which contributes to falling response rates in phone surveys globally, especially among young people.

Researchers need to be broadly informed about the advantages and trade-offs of different methods, especially when planning changes to long-running surveys. Alternative methods might offer increased response rates and decreased costs, but advantages do not happen in isolation of changes to the composition of reached respondents and survey biases. For example, it is well known that decreased interviewer presence accompanying a switch from telephone to self-administered interviews is associated with decreased social desirability bias. This in turn can lead to large changes in answers to so-called "sensitive questions", such as experiences of belonging to sexual or other minorities.

In my presentation I compare the inferred prevalences of young people's minority experiences between two survey methods: a traditional phone survey and a "post-to-web" survey, which involves sending invitations to answer an online survey via conventional mail. In addition to method effects on minority experiences, I discuss broader effects on response rates, costs and possible biases. My aim is to contribute to the ongoing discourse regarding the future and viability of telephone surveys in an increasingly digital world.

RN21 | T03_01: Quantitative methodology and data quality

Fuzzy Logic, Logistic Regression, and Big Surveys for Testing the Operationalisation of Concepts

Georg P. Mueller

Univ. of Fribourg, Switzerland

This presentation deals with the use of fuzzy-truth and fuzzy logic for analysing the content validity of indicators. It is based on the assumption that the truth of the representation of a concept by an indicator is on a continuum between true and false. Between these two poles there is a sigmoid fuzzy truth-function that can be determined by logistic regression of big survey data, which explains the presence or absence of the concept by the mentioned indicator. The resulting logistic function has three areas: One near the pole 0, where the indicator values stand for the absence of the concept, a second near the pole 1, where the indicator values point with high certainty to the presence of the concept, and a third uncertain area in between. The first two areas with fuzzy-truths close to 0 or 1 should be as large as possible and limit this way the area of indicator values with indeterminate truth. Thus, when comparing alternative indicators, the geometries of the logistic functions are as important as the r-squares of the related regressions. In order to improve these geometric properties, the fuzzy-truth of different indicators can be combined by fuzzy logic operators like AND, OR, etc. For illustrative purposes, the author explores the popular views of the concept of religiosity in the EVS-2008 surveys. The frequencies of church-going and private prayers are compared with regard to their validity as operationalisations of the mentioned concept.

Fully-labeled Scales Are More Cognitively Demanding: A Multimodal Cognitive Load Approach

Inna F. Deviatko[1,4], Aigul Klimova[2], Daniil Lebedev[3], Tatiana Semenova[1]

1Department of Sociology, HSE University, Moscow, Russia; 2Ronald F. Inglehart Laboratory for Comparative Social Research, HSE University, Moscow, Russia; 3Survey Design and Methodology Cross-cultural survey methods, GESIS; 4Institute of Sociology FCTAS RAS, Moscow, Russia

The paper investigates cognitive load in fully-labeled and end-labeled Likert-type scales. We compared cognitive load between two conditions using different methods of measuring cognitive load such as pupillometry, completion times,

723

and subjective evaluation of mental effort. We conducted a laboratory experiment (N = 170) among undergraduate students in which we employed eye-tracking technology and measured pupil dilation while respondents completed a web survey. Although some researchers have suggested that survey burden should be lower with fully-labeled scales because respondents are not required to generate a verbal definition for each scale point, we found the opposite. The mean pupil diameter was larger in the fully-labeled than in the end-labeled condition. Since more information is given in the fully-labeled scales and the respondents are required to read labels for all scale values, it increases neurophysiological load compared to the end-lables scales. Though the effect was small (Cohen's d varied from 0.25 to 0.32), it was consistent. At the same time we found no difference in completion time and subjective rating of mental effort between the conditions. Despite higher cognitive load in the fully-labeled condition, data quality benefits from the provision of clear verbal labels in the scale. Since there is an inconsistency between the results of the different measures of cognitive load, we suggest that one measure of cognitive load may not be sufficient to assess survey burden and there is a need for multimodal assessments of respondents' cognitive load and its impact on data quality.

Memes and Emoji-Scales in Web Surveys: Experimental Investigation of Multimodal Cognitive Effort and Data Quality

Daniil Lebedev[1], Ruslan Suleymanov[2]

1GESIS – Leibniz-Institut für Sozialwissenschaften in Mannheim, Germany; 2Independent researcher

As web survey participation rates decline, strategies to enhance respondent motivation gain significance. Gamification emerges as a potential solution, yet its impact on cognitive load remains unclear. This study investigates whether gamification mitigates cognitive load among 18-25-year-old respondents.

To adress this research question we conducted a laboratory experiment involving 128 randomly assigned students exposed to either a non-gamified or gamified web survey format. Gamification elements included emojis for ordinal scales and motivating memes interspersed between question sets. Cognitive load was assessed using paradata, subjective evaluation, and neurophysiological indicators (pupil diameter dynamics).

Contrary to expectations, the gamified group exhibited heightened cognitive effort based on pupil diameter dynamics, while the non-gamified group showed increased cognitive effort in subjective evaluations, mouse movements, and completion times. However, attention levels were higher in the gamified condition, with no discernible difference in data quality between groups.

This study sheds light on the complex relationship between gamification, cognitive load, and respondent engagement in web surveys. While gamification may elevate cognitive effort, it concurrently enhances motivation and attention, yielding comparable data quality to non-gamified surveys.

These findings contribute methodologically to understanding the efficacy of gamification strategies in survey research, informing future survey design endeavors within the sociological context.

The Story After Mobility: Debates and Critiques on Methods for Estimating Social Mobility Effects

Peng Wang[1], Ling Zhu[2]

1Fudan University, China, People's Republic of; 2The Chinese University of Hong Kong

Social mobility is one of the core research topics in sociology, and its implications have garnered increasing attention. However, accurately measuring the effects of social mobility has been challenging due to issues related to model identification. Over the years, significant advancements have been made in methods for measuring social mobility effects, progressing from Duncan's Square Additive (SA) model to Hope's Diamond Additive (DA) model, and subsequently to Sobel's Diagonal Reference Model (DRM). The DRM, in particular, has been widely utilized and considered the "gold standard" for estimating social mobility effects. Nevertheless, scholars have recently criticized the DRM and proposed alternative methods for measuring mobility effects, such as the Mobility Contrast Model (MCM). This study critically examines the debates surrounding these methods, systematically comparing them in terms of theoretical assumptions and methodological settings, with a specific focus on the widely employed DRM and the newly introduced MCM. Through model derivation, analyses on simulated and real-world data, this paper highlights the significant misconceptions in the criticism of the Mobility Contrast Model against traditional methods. The primary distinctions between these methods lie in their underlying theoretical assumptions and capacity to address diverse theoretical concerns, rather than the statistical superiority or inferiority of the techniques themselves. Consequently, the suitability of theoretical assumptions in practical contexts should be taken into consideration when selecting a method. Lastly, this study identifies key considerations in applying these methods and suggests approaches for conducting robustness tests.

724

RN21 | T04_01: Protests, populism and ethnocentrism in quantitative research

Between Gaze and History. Requirements And Strategies For Data Analysis Of Protest Events.

Daniel López-Roche

Instituto Complutense de Sociología para el Estudio de las Transformaciones Sociales Contemporáneas (TRANSOC), Universidad Complutense de Madrid, Spain

Protest Event Analysis is fundamental in Social Movement Studies. However, the specificities of the data analysis required in these investigations have been neglected. Protests are temporally situated, display serial dependency, and must be studied over time. If these circumstances are not considered, one may conclude that certain variables have an effect for which there is no evidence, decontextualize the protests historically, insufficiently analyze the temporal dimension of this phenomenon, or obtain unrepresentative results. In addition, the data in these studies often suffer from selection and description biases. To face these challenges, we offer a theoretical-methodological reflection and an analysis strategy for count time series, controlling for serial dependence and bias.

While we highlight the need for longitudinal and historically contextualized studies, the theoretical assumptions of the methods employed from Sociology and Social Movement Studies are examined. We review the state of the art of Protest Event Analysis to address the challenges identified. Furthermore, we discuss different theories in Social Sciences on serial dependence and the influence of the past on the present. These are then translated into the terms of a linear model. We sought a proposal that maximizes coherence and precision between theory and method. This is applied to a sample of protests in Spain between 2000 and 2020. First, we offer a general model of the protests in Spain that controls for serial dependence. Then, we study the influence of different variables, such as unemployment. Finally, we assess the impact of specific events on the number of protests.

Sociodemographic "Profile" of Feelings of Safety and Attitudes Towards Immigration in Southern Europe

Anastasia Charalampi[1], Joanna Tsiganou[2]

1Panteion University of Social and Political Sciences;
2Greek National Centre for Social Research

The present research investigates the sociodemographic "profile" of feelings of safety walking alone in local area after dark, a standard National Crime survey self-perceived question, based on the European Social Survey (ESS) data for Southern Europe. Moreover, the relation of attitudes towards immigration and previous victimization to feelings of safety are explored. The analysis was based on the 2020 (Round 10) ESS datasets of Greece, Italy, Portugal and Spain. Univariate and bivariate analyses were performed cross-nationally. Preparing the data for analyses involved transforming several variables by recoding their values according to the relevant variables incorporated in the World Values Survey (WVS) questionnaire and applying a clustering methodology. In most countries, the same sociodemographic "profile" of feelings of unsafety was detected showing that stronger feelings of unsafety were exhibited by women, the old (50+), those having completed primary education, the separated, divorced or widowed respondents, the economically inactive, those residing in the suburbs or outskirts of a big city and low-income respondents. Also, strong feelings of unsafety were displayed by the respondents with xenophobic attitude towards immigrants. Finally, respondents who had been previously victimized were feeling less safe than those who had not been victims. This work could be extended to cover other attitudes and human values in all participating countries of this and any other Round of the ESS.

725

Modeling Opinions Towards Immigration On Social Class Perceptions: A Mediation Analysis

Aggeliki Yfanti

Panteion University of Social and Political Sciences, Greece

In the literature, social class is considered important in all aspects of life. However, its relation to opinions towards immigration on a country's development has not been adequately researched. In this respect, the purpose of this study is to explore the mediating role of evaluating the impact of immigrants on a country's development in the relationship between opinions on the effects of immigration on this country's development and social class perceptions as measured in the World Values Survey (WVS) questionnaire that classifies respondents into five class categories: upper, upper middle, lower middle, working and lower class. The analysis was based on the 2017-2020 7th Wave WVS datasets for four countries: Germany, Greece, the Russian Federation and the United States. In all four countries, the

separate path analysis models provided adequate model fit. In all countries, social class perceptions were negatively predicted by the evaluation of the impact of immigrants on a country's development. Weak negative total effect of the immigrants' impact on a country's development on subjective social class was observed in all countries. In all countries but the Russian Federation, the findings showed significant but weak mediation effects of opinions on the effects of immigration on the country's development and subjective social class by the evaluation of the impact of immigrants on this country's development. These results indicate that this study could be extended to cover all participating countries of this and any other Wave of the WVS.

Shifting Trust in a Populist Era: Exploring the Nexus Between Institutional, Social Confidence and Conspiracy Theories

Nuran Öksüz[1], Hüseyin Batuhan Şar[2]

1Yeditepe University, Turkiye; 2Yeditepe University, Turkiye

This study investigates the impact of individuals' populist attitudes on trust in national and international institutions and social trust, and their influence on belief in conspiracy theories. It aims to understand how societal changes and technological advancements affect people's trust and views on global events, particularly focusing on how the rise of populist attitudes alters trust in institutions and belief in conspiracy theories. The hypotheses suggest that increased populist attitudes are positively associated with a higher belief in conspiracy theories, and this effect is amplified when social trust decreases. Additionally, the study posits that high trust in national or international institutions can be either positively or negatively associated with belief in conspiracy theories, depending on the level of populist attitudes. Utilizing data from the Comparative Conspiracy Research Survey (CCRS) collected on individual level across eight countries, the study employs a multilevel ordinal model to analyze the separate impacts of social, national institutional, and international institutional trust on belief in both global and country-specific conspiracy theories. This approach enables an examination of the effects both within specific contexts and more generally, capturing the nuanced interplay of trust and belief systems. This research seeks to contribute to our understanding of the dynamics of trust and conspiracy theories in the modern information age, with implications for social psychology, political sociology, and communication studies.

RN21 | T06: Quantitative methods for social media analysis

Identifying the (re)claims of identity and politics: An analysis of the discourses and the discursive networks within the Twitter debate on Scotland's Gender Recognition Reform Bill

Elmira Mansur

University of Oxford, United Kingdom

The objective of this paper is to examine the discourses within the Twitter debate concerning Scotland's Gender Recognition Reform Bill. This is achieved through a novel approach that harnesses the intricate interplay between social networking and semantic spaces. The research incorporates network measures such as homophily and applies a node embedding algorithm to both the hashtag co-occurrence graph and the retweet network. The vector representations of the users generated from this algorithm are subsequently combined as user features to validate the existence of two distinct semantic clusters within the online discussion of the Bill. With its synthesis of different methods validated by other researchers, this paper's methods contribute to the state-of-the-art understanding of how to establish stance detection both through and beyond networks. Subsequent to their identification, these two distinct clusters in the online discussion of the Bill are comparatively analysed for their language use and engagement trends within the discussion. Through these analyses, the paper aims to explore how the different groups in the debate signal or otherwise differentiate themselves. For this purpose, the methods make extensive use of hashtags and latent semantic spaces to understand such signalling within

an ongoing contentious discussion where the dispute is not only through language and expression but also for the very expressions and definitions such as that of "womanhood". This makes the context of this discussion an even more intriguing and potentially fruitful case study.

Google Trends Data on Different Search Terms: A Potential Reliability-Frequency Continuum

Tobias Gummer[1,2], Anne-Sophie Oehrlein[1]

1GESIS – Leibniz Institute for the Social Sciences, Germany; 2University of Mannheim, Germany

Google Trends makes aggregated search engine data available, which enable researchers to investigate trends of

726

search term usage on Google Search. The data obtained via Google Trends are relative search volumes (RSVs) for a selected search term across a predefined period of time and location. Recent research has questioned the reliability of these data when it comes to low-frequency ("rare") search terms—the distributions of RSVs varied between GT data obtained at different points of time. It remains an open question whether similar reliability issues exist for high-frequency search terms (e.g., on major societal events or prominent persons). In our study, we investigate reliability across different high and low-frequency search terms. Thus, our research question is: Does a reliability-frequency continuum exist for Google Trends data?

To answer our research question, we collected Google Trends data for 10 high-frequency and 2 low-frequency search terms. We collected up to 60 samples of Google Trends data for each search term, one each day. To assess reliability, (i) we compared data between all samples of a respective search term, (ii) we compared each sample to a high-granular Google Trends dataset that we obtained as benchmark distribution. In each comparison between samples, we tested whether RSV distributions and maxima of these distributions differed. We then compared these findings between search terms, focusing especially on comparing high – to low-frequency search terms.

Unveiling Online Sentiment and Hate Speech. An Analysis of the Effects of Platform Features and Content Creators' Social Characteristics Using a Representative Sample of YouTube Channels from German-speaking Countries

Roland Verwiebe[1], Sarah Weißmann[1], Chiara Osorio Krauter[1], Aaron Philipp[1], Nina-Sophie Fritsch[1,2], Claudia Buder[3]

1University of Potsdam, Germany; 2University of Economics, Vienna, Austria; 3University Paris 1 Panthéon-Sorbonne

Recent years have seen an increase in public debate about the spreading of hate and toxicity on online platforms. While the communicative features of these platforms allow for community building (Sweet et al. 2019), greater visibility of minorities (Green et al. 2015), and different forms of solidarity (Hosterman et al. 2018), they also seem to increase hate, bullying and misinformation. Thus, negative sentiment, or even "hate" comments, and different forms of discrimination are daily occurrences for some users, but especially for content creators (CCs) – our focus – who work on the platform (Döring & Mohseni, 2019).

Existing studies on this topic, do not consider account platform characteristics as a whole and do not systematically include possible at-risk determinants of CCs based on age, race, gender, education (Xin, 2023) and social media-specific variables like popularity on YouTube (number of subscribers, views count), and channel topic. Our paper deals with this research gap.

Empirically, we use a random sample of N=5,000 CCs from a total survey of N=115,975 YouTube channels registered in German speaking countries. To fill the lack of missing sociodemographic characteristics we first annotate variables such as age, race, gender, and education using a standardized classification survey (Seewann et al. 2022). In a second step we websraped all comments and all videos of these 5,000 channels (N=38 Mio. comments, N=430,000 videos).

First results show that hate speech can only be observed in extremely rare cases and that 75% of channel comments have a positive sentiment. Regression results indicate that both sociodemographic variables and platform-specific characteristics appear to structure communication patterns in terms of hate and sentiment; among those gender and channel topic are especially relevant.

Mapping The COVID-19 Pandemic: Exploring The Regional Dynamics In Infection Activity, Attitudes And Social Media Discourse

Manuel Michael Holz, Jochen Mayerl, Peter Kriwy, Julia Gränitz, Philip Adebahr-Maskow

Chemnitz University of Technology, Germany

727

This study explores the complex relationships between COVID-19 infection rates, political and health attitudes during the pandemic, and social media discourses. By including regional characteristics such as unemployment rates, population density, right-wing voter turnout and county-specific hospital bed availability; the study aims to identify patterns within the socio-economic and political context that influence the interplay between infection rates, attitudes (trust in government and fear of infection) and social media discourse. Using a comprehensive approach, the study integrates conventional survey panel data (GESIS panel, SOEP panel), epidemiological data (Robert Koch Institute), macro-level socioeconomic data, and social media content from platforms such as Twitter and Telegram channels. The findings of this study have important implications for both methodology and public policy. Methodologically, issues of data harmonization are crucial, especially as data fusion and linkage become increasingly common in social research. Understanding how regional characteristics contribute to shaping public discourse during a pandemic is essential for policy makers and the public alike. This knowledge will help to guide policy responses effectively in times of crisis and provide valuable guidance for informed decision-making.

RN21 | T07: Country-comparative studies in quantitative research

Depends on Whom You Ask: Discrepancies in Reporting Spousal Care Between Women and Men Across European Welfare States

Ricardo Jorge Alcobia Granja Rodrigues[1], Cassandra Elizabeth Simmons[2], Eszter Zólyomi[2], Afshin Vafaei[3,4], Johan Rehnberg[5], Selma Kadi[1], Marco Socci[6], Stefan Fors[5,7], Susan Phillip[3,4]

1SOCIUS/CSG, ISEG (Lisbon School of Economics & Management), Universidade de Lisboa, Portugal; 2European Centre for Social Welfare Policy & Research, Austria; 3Department of Public Health Sciences, Queen's University, Canada; 4Department of Family Medicine, Queen's University, Canada; 5Aging Research Center, Karolinska Institutet & Stockholm University, Sweden; 6Centre for Socio-Economic Research on Ageing, INRCA IRCCS, Italy; 7Centre for Epidemiology and Community Medicine, Region Stockholm, Sweden

Quantitative analysis of gender inequalities in caregiving for older adults hinges on survey instruments being able to appropriately measure care and identify informal carers. We investigate whether there are systematic differences across Europe in the reporting of informal care between caregivers and cared-for persons, within co-residing spousal care dyads, using a pooled sample of observations aged 50 and older from the Survey on Health, Ageing and Retirement in Europe (SHARE). Among spousal care dyads, a potential large share of informal care is underreported, since only 53.9% of dyads report care that is confirmed by both spouses. Multinomial regressions show that misidentification of spousal care is associated with gender. Men are more likely to underreport either providing or receiving personal care from their spouse, while conversely, agreement on care being provided/received most commonly occurs when women are caregivers. Prevalence rates of spousal care across Europe are sensitive to who reports care as is the association of care with health outcomes, although only for poor self-reported health. Relying on self-identification of carers, the most common method used in surveys, may underestimate their numbers, particularly along sex lines. Current prevalence rates of informal care across regions may also be affected, impacting our understanding of the distribution of care by care regimes. Discrepancies in the reporting of informal care are not random and they affect broader implications for the study of the impact of informal care, namely on health. We discuss the effect of differing social norms dictating gender roles in care and acceptability of men as carers, particularly across different strands of familialism, as well as policy implications.

Green Momentum? An Age-Period-Cohort Analysis of Support for the Environmental Movement in 24 Countries

Matthias Penker, Rebecca Wardana

Universitiy of Graz, Austria

Over the past decade, the climate movement and especially action groups like Fridays for Future have been effective in raising awareness of environmental issues and mobilizing protesters, especially among younger cohorts. However, it remains unclear whether this recent surge in activism reflects a broader societal shift or if this trend is primarily driven by younger generations. Using data from 24 countries that participated in waves three and four of the International Social Survey Programme Environment Module, this presentation applies an age-period-cohort (APC) analysis of active support for the environmental movement for the first time in an international comparative setting. Based on Bayesian negative binominal multilevel models, the results provide empirical evidence for a period effect: active support has indeed increased across generational cohorts and age groups. Notably, the effect of age has intensified in the most recent wave, consistent with the contemporary characterization of a youth-led movement. However, exploratory analysis also shows that the period effect varies considerably and depends strongly on the national context. Possible mechanisms underlying these trends are discussed and avenues for further research are suggested. Based on this substantive results the presentation critically reflects on methodological issues and opportunities when estimating APC effects in international comparative studies. opportunities when estimating APC effects in international comparative studies.

728

Exploring the Impact of Social Networks on Cognitive Decline Among the Elderly: Insights from SHARE Data through Structural Equation Modeling.

Hassan Rahnaward Ghulami, Cinzia Viroli, Francesco Scalone

University of Bologna, Italy

This study examines the impact of social networks on cognitive decline among the elderly, drawing on data from the Survey on Health, Aging and Retirement in Europe (SHARE) and employing advanced statistical techniques, specifically Structural Equation Modelling (SEM). The research addresses the imperative to understand the relationship between social networks and cognitive decline, recognizing the elderly as a distinct demographic vulnerable to cognitive challenges.

By extracting valuable insights from both the 6 and 8 waves of the SHARE dataset, our analysis focuses on a sample of 31,060 healthy elderly individuals (57.74% female, mean age 64.66 ± 13.68). We explore an extensive array of variables encompassing socioeconomics, health, social life, and cognitive functioning over time. The aim is to disentangle the complex factors contributing to cognitive decline, investigating how various dimensions of social networks, such as the frequency and quality of social interactions, emotional support, and community involvement, influence cognitive well-being.

Utilizing SEM enables us to model and quantify these relationships, providing a comprehensive understanding of the direct and indirect pathways through which mental and physical health conditions influence social interactions and subsequently impact cognitive well-being. In conclusion, our exploration of the interconnection between social networks and cognitive decline among the elderly, using SHARE data and SEM, offers a holistic perspective on this critical issue, providing valuable insights for both academic and practical purposes. This work suggests that a socially active and participatory lifestyle may mitigate the effects of the physiological process of brain aging.

A new transnational measure to beyond GDP: The World Love Index

Silvia Cataldi[1], Federica Floridi[1], Marco Palmieri[1], Gennaro Iorio[2], Angela Delli Paoli[2], Maria Carmela Catone[2], Fabrizio Martire[1]

1sapienza university of rome, Italy; 2University of Salerno, Italy

This study is based on the concept of social love which can be defined as "an action, relationship or social interaction in which subjects exceed (in giving, in receiving, in not giving or not to do, in neglecting) all its antecedents, and therefore, offers more than the situation requires in order to make benefits". Based on this definition, were identified four dimensions of Social Love: Overabounding, Care, Universalism and Recognition. This paper presents the construction process and the results of the second wave of the World Love Index. This is an index based on secondary data that aims to measure the concept of Social Love on a transnational level. The concept of Social Love refers to the social dimension of love, and can be defined as "an action, relationship or social interaction in which subjects exceed (in giving, in receiving, in not giving or not to do, in neglecting) all its antecedents, and therefore, offers more than the situation requires in order to make benefits".

RN21 | T08: Measurement instruments in quantitative research

Indexes As An Instrument For Measuring Social Inequalities In Higher Education

Petya Ilieva-Trichkova, Pepka Boyadjieva

IPS-BAS, Bulgaria

The aim of this paper is threefold: 1) to explore the potential of indexes as an instrument for measuring inequalities in higher education; 2) to discuss challenges related to the use of these indexes; 3) to highlight how indexes could be used in policy-making for inequality reduction. Building on the view that higher education is a complex and multidimensional phenomenon, this paper presents three indexes: index for inclusion in higher education, index of fairness in higher education and index for higher education as a common good. The data used for their calculation are taken from large-scale representative and cross-national surveys, such as EUROSTUDENT and the European Social Survey, and from official statistics.

Drawing on data for respectively 14, 22 and 15 European countries for these three indexes and by using different statistical methods (e.g. logistic regression) for indexes' construction, this paper demonstrates the advantages of indexes, such as allowing comparisons across countries and applying a dynamic perspective. A special focus is put on the challenges stemming from lack of data for certain dimensions or for some countries, or related to the fact that international surveys rely on self-reporting data. Other challenges are the non-equivalence of the cross-national survey data and the need to deal with the so-called "imperialism" of international surveys, which may "impose" concrete definitions and ways of thinking through the surveys' core questionnaires. Taking into account both their heuristic potential and the arising challenges, this paper discusses how indexes can be used as a tool for evidence-based policy-making.

The Subjectivisation of Labour. Development and Cross-Validation of a New Scale Using Confirmatory Factor Analysis

Britta Maskow, Jochen Mayerl

Chemnitz University of Technology, Germany

The subjectivisation of labour and the associated dissolution of boundaries of the workspace and enhanced flexibility are becoming increasingly important (Fritz et al. 2011b). Pongratz and Voß (2003) describe a quantitative and qualitative change in the relationship between companies and

729

their employees in new forms of work. The resulting shift of the transformation problem to employees has consequences for employment and could also lead to a change in the general constitution of labour capacity in our society (Pongratz & Voß 2003).

Measurement instruments for this construct have mainly been developed primarily qualitatively. For instance, Fritz et al. developed the first quantitative Workforce Entrepreneur Scale (16-items) based on e.g. Pongratz & Voß (2003), Nievergelt (2004), and Schmitz & Schwarzer (1999).

In our paper, we present the results of the development and validation of a subjectivisation of labour scale based on the Workforce Entrepreneur scale. Our research design involves a mixed mode (online, postal survey, N= 788) sample. The sample for the survey (3,000 people) was randomly selected from the residents' registration office of the city of Chemnitz, Saxony in Germany. Questionnaires were sent to parents with children aged 13-18 in Chemnitz. A response rate of 27.8 percent was achieved. We use confirmatory factor analysis with random split data to cross-validate the subjectivisation of labour scale. Our findings can help to understand the strengths and weaknesses of both approaches and provide insights into the latent construct of the subjectivisation of labour.

Comparing Item – and Image-based Measurements in Online Surveys: A Systematic Analysis Using the Example of Acceptance for a Virtual Caregiver Avatar

Patrick Kutschar[1], Knut Petzold[2,3], Wolfgang Aschauer[2], Christopher Etter[2], Markus Kreuzberger[2], Katharina Stiebler[2], Florian Nemetz[4]

1Paracelsus Medical University Salzburg; 2Paris Lodron University Salzburg; 3Zittau/Görlitz University of Applied Sciences; 4Vienna University of Economics and Business

Visual stimuli are increasingly utilized in online surveys to measure judgments, attitudes, or decisions, while it is often assumed that they provide more valid results compared to conventional item-based measurements. Images may help mitigate systematic measurement errors due to the standardized presentation of information supporting respondents' consistent retrieval of relevant information from memory.

In our study, we challenge this assumption by systematically comparing responses to image and text stimuli using the example of the acceptance for an avatar as a virtual caregiver. Data come from an online access panel survey on technology acceptance in healthcare in Germany, Austria, and Switzerland (D-A-CH region) in 2023. Using a split-ballot experiment, 5,538 adult respondents were randomly assigned to different conditions and evaluated the quality of various avatar environments operationalized either through pictures or conventional items.

Results from multiple regression analysis including interactions effects substantiate the assumption of distinct cognitive processing. On average, the surroundings are perceived better in image-based as compared to item-based presentation. A robust interaction with response time was evident: while acceptance remains similar in the image-based presentation, it decreases with respondents' higher response time in the item-based format. If respondents tend to answer spontaneously (in the form of satisficing), both presentation formats deliver comparable results. In a more reflective response processing mode (in the form of optimizing), however, different cognitive adaptation processes may be initiated. In addition to these findings, prospects for future methodological research are discussed.

Comparing Modularity Scores across Different Social Networks: Cautions, Illustrations, and Suggestions

Ling Zhu

The Chinese University of Hong Kong, Hong Kong S.A.R. (China)

In the thriving field of computational social sciences, scholars often employ techniques and methods developed by natural or computer scientists to model social phenomena. One salient example is the recently rising practice of social scientists to compare modularity scores across different social networks to evaluate the variation of network-module-related substantive concepts such as the levels of consensus, polarization, or community boundary rigidity. Although the rationale of this practice is comprehensible, we caution that it may suffer various conceptual and empirical issues. Conceptually, modularity scores may misalign with the substantive concepts that social scientists are interested in. Empirically, the commonly used modularity metrics are highly sensitive to various network characteristics that are irrelevant to those substantive concepts. We illustrate these conceptual and analytical problems with toy examples and systematic simulations. We demonstrate the practical significance of these lessons by re-examining an empirical study that uses modularity scores to evaluate the evolution of the rigidity of job mobility in the US labor market. We conclude with a summary of all these lessons and a list of suggestions for future applications.

RN21 | T09: New digital and graphical methods in quantitative research

Graphs of Marginal Effects Tables from Regressions

Modesto Escobar[1], Cristina Calvo[2]

1University of Salamanca, Spain; 2University of Salamanca, Spain

Graphs have been widely used to represent social structures and to study relationships between variables. In this paper, we present a novel approach to enhance the analytical potential of graphs by incorporating interactivity. Our proposed method focuses on solving multiple regressions and selecting coefficients with a significant positive relationship using weighted mean contrasts.

Using this approach, we generate graphs that highlight categories with predicted proportions or means significantly greater than those of the population, providing valuable insights into the elements being analyzed. To further enhance their analytical power, our graphs also offer interactive features, allowing users to filter elements based on their size or attributes, and to explore the most central and strongest links within the network.

We will also present both an advanced R package and a Stata ado program that enable the creation of these interactive graphs and provide a variety of examples to illustrate their applications. We will provide practical knowledge on how to implement this methodology and use its capabilities to visualize and analyze complex networks.

Using Motion Capture To Quantify Bodily Movement : An Experimental Study In The Sociology Of Embodiment With Walking Styles

Melvil Boschel

Ecole des Hautes Etudes en Sciences Sociales (EHESS), France

This study is based on an experimental methodology employed as part of a Ph.D. research project, studying how the social world shapes the way we walk, with a focus on the class variable (Bourdieu, 2000). The investigation begins with Mauss's seminal work on body techniques (Mauss, 1936). Notably, the methodology involves observation within a movement analysis laboratory (biomechanics laboratory). Two groups, each consisting of thirty men aged between 18 and 25, with distinct social characteristics (in terms of capital-volume) walked 20 loops of 50 meters each in a gymnasium. The first group comprised students from prominent French universities ("Grandes écoles"), while the second group consisted of workers, both skilled and

unskilled, in the blue-collar sector. Motion capture of their gait was conducted using cameras and markers placed on their bodies. A questionnaire was administered in the midst of this observation, covering individual social and bodily characteristics (such as social background, origin, sports practices, daily commuting patterns, working conditions, height, and weight).

Quantitative data were generated for each individual's gait, including amplitudes and spatio-temporal information. These data can be processed by statistical analyses, particularly factorial analysis (PCA) and linear regression, to identify variations in gait patterns based on social groups. The objective of this study is to introduce a novel methodological approach to the analysis of embodied products, contrasting with the predominant focus on qualitatively observing bodily movements (Mohr et al., 2020).

Institutional Trust and Crisis: the Use of Computationally Intensive Methods to Model Social Phenomena

Vincenzo Miracula, Elvira Celardi, Ornella Occhipinti, Antonio Picone, Francesco Mazzeo Rinaldi

University of Catania

There is no doubt that the last twenty years have brought radical changes to the use of computers in social research (Heise and Simmons 1985; Bianchi and Squazzoni 2019). In the past (and even today), social scientists used computers to provide analytic solutions to complicated equation systems that represented a given system's structure, or more generally to estimate statistical models for data. From the 1990s onward, they started to use advanced computational techniques in an innovative way to simulate and analyse implications of agent interaction in social structures (Epstein 2012; Klein et. al., 2018).

In this study, we use NetLogo (Wilensky, 1999) to create an Agent-Based Modelling (ABM) to simulate individual behaviour in terms of trust in institutions when faced with emergency phenomena such as the outbreak of war, the start of a pandemic and the impact of inflation on the economy. Our analysis is based on data from renowned research infrastructures, such as CESSDA or RISIS, and authoritative national and European research institutes, like ISTAT, NIE, and EUROSTAT.

Our simulation aims to identify the main factors that affect individual perceptions of institutions during crisis situations and how trust in these institutions changes at different stages of an emergency. The study proposes a research tool that can help in understanding complex social phenomena through predictive models of individual behaviour. This tool can be used to support decision-making at the political level to implement policies that contribute towards building institutional trust.

Epstein, J. M. (2012). Generative social science: Studies in agent-based computational modeling. Princeton University Press.

Critical Evaluation of Large Language Models as Survey Respondents

Zsófia Rakovics[1,2], Márton Rakovics[1,2]

1ELTE Eötvös Loránd University, Budapest, Hungary; 2ELTE Research Center for Computational Social Science

The emergence of large language models (LLMs) has created a new opportunity for social scientific research methods. For all research where language mediates empiricism, it has become a realistic possibility to generate responses using virtual respondents simulated by LLMs as data providers.

The potential impact of LLM-generated data necessitates its critical methodological analysis. In a positivist perspective, if the methodology of virtual data collection can be developed, the time and resources needed for real data collection can be drastically reduced, which could mean the democratisation and decentralisation of social research. In addition, the procedure could also address the problem of decreasing validity of survey data due to low response rates.

Using LLMs (GPT-variants and Llama-2), we generated virtual answers for politics and democracy related attitude questions of the European Social Survey (10th wave) and statistically compared the results of the simulated responses to the real ones. We explored different prompting techniques (e.g. zero-shot, few-shot, chain-of-thought) and the effect of different types and richness of contextual information provided to the models.

Our results suggest that the tested LLMs generate highly realistic answers and are good at invoking the needed patterns from limited contextual information given to them if a couple of examples are provided, but struggle in a zero-shot setting.

A critical perspective is essential to ensure that the effects of known biases of LLMs do not remain unexplored in these applications, and even more so to consciously consider the social reality that is not represented in the linguistic space of the Internet.

Our research explores the tensions generated by AI in scientific research, trust in science and technology, and the transformation of social science methodologies.

RN22 | Sociology of Risk and Uncertainty
RN22 | T01_01: Risk Communication

Shifting Vulnerabilities in Mixed Methods Research on Risk Communication

Minna Lundgren

Mid Sweden University, Sweden

Effective communication is paramount in preparing citizens to handle various risks and crises. This research addresses the intricate challenges of risk communication in heterogeneous societies, where diverse cultural, linguistic, and socio-economic factors influence both the understanding of information and the perception of and response to hazards. In such dynamic contexts, a one-size-fits-all approach is often inadequate, necessitating an exploration of tailored communication strategies to enhance community resilience.

This presentation synthesizes the results of two research projects focusing risk communication in the Swedish heterogeneous society. In these two studies multiple data sources have been used. The synthesis of nationwide survey data is complemented by qualitative insights derived from focus groups and interviews, offering a nuanced exploration of group-specific needs, cultural considerations, along with communication preferences. The qualitative methodologies not only elucidate underlying factors shaping risk perceptions, but also uncover community-driven solutions to enhance preparedness. Furthermore, simulation experiments were conducted to simulate realistic crisis scenarios – a long-term power failure and a shooting incident at a nightclub – allowing for the observation and analysis of human responses in controlled environments. Integrating simulation data with qualitative and survey findings enables the identification of critical gaps in preparedness and facilitates the refinement of communication strategies tailored to diverse populations.

The results indicate shifting vulnerabilities, where some of the least advantaged socio-economic groups may be hard to reach with information, they may have everyday life strategies better adapted to preparedness for long-term crisis. However, the findings of the research illuminate the necessity of nuanced, context-specific risk communication strategies to bridge societal divides of urbal/rural residency, age, migrant/non-migrant background, along with socioeconomic situation and digital competence.

The Construction of Risks in Medical Research Proposals and Reviews

Daniel Stein

Humboldt-Universität zu Berlin, Germany

In my paper, I am exploring how risks in medical research are presented, managed and evaluated. What is risky about medical research and how are those risks assessed? I investigate this question by analyzing documents submitted in the framework of the Reinhart Koselleck Program (DFG) – a funding program which invites "exceptionally innovative or higher-risk projects". Since this program explicitly expects research proposals to be risky, it is particularly suited for the investigation of risk in research. Furthermore, I am also analyzing the corresponding reviews, which leads to a total of 140 documents (35 Proposals, 70 reviews and 35 votes of the review board).

Due to this data basis, it is possible to not only investigate the presentation of risks, but also to show how those risks are interpreted in the reviews. I will pay special attention to the subject of risk-attribution and accordingly elaborate on the semantics of trust. Risky research proposals are not only evaluated by their inherent risks but also by the reputation of the applicant. Referring to the applicant as an (excellent) researcher is a common form of risk evaluation and rhetorical failure management.

My research contributes to the understanding of the processes of construction, negotiation and assessment of risks in medical research and will deliver insights into how risks are assessed in risk-affine funding contexts.

Conspiracy Theories, Social Media Use and Institutional Trust in the Countries of the Visegrad Group

Marianna Mrva

Slovak Academy of Sciences, Slovak Republic

The dangers of conspiracy theories for society have long been known: they can negatively affect the functioning of democratic institutions, social cohesion, and even state security or public health. Social media platforms are seen by many as a hotbed of conspiracy theories, whose algorithms allow them to spread rapidly. Others argue that social media are primarily responsible for the visibility of conspiracy theories, rather than for their mass adoption. They argue that the primary reasons for the spread of conspiracy theories are lack of trust in institutions, social insecurity or a sense of alienation from public affairs.

International comparative studies show that in Europe, the Visegrad Group countries (Czech Republic, Hungary, Slovakia and Poland) are among the countries with the highest levels of conspiracy theories. In this presentation, I will show that the popularity of conspiracy theories is not primarily driven by the use of social media, but by a lack of trust in mainstream media and political institutions, as well as by a sense of personal exclusion, alienation and political ineffectiveness. The data analysis is based on a

questionnaire-based online sample survey conducted by the Slovak Academy of Sciences in the V4 countries with 8,000 respondents. It allows us to better understand the social mechanisms that contribute to the spread of conspiracy theories in our societies.

Feed The Public With Reasonable Uncertainty. A Pilot Study On Trust Delegation In Science-Society Communication

Roberto Carradore, Alessia Papale

University of Milano-Bicocca, Italy

In the public discourse, science is historically depicted and conceived as neutral and objective. In recent years, the rise of the so-called post-truth era has broken this stereotypical representation, highlighting the crucial roles of uncertainty in the production of scientific knowledge and trust delegation in science-society communication. Learning how to communicate scientific uncertainty to laypeople effectively is increasingly essential in scientists' work, although a good top-down communication strategy does not guarantee citizens' trust.

Our contribution focuses on the relationship between uncertainty and trust, aiming to build a theoretical model based on qualitative research. In 2023, we conducted semi-structured interviews with twenty non-experts from Milan (Italy) as a pilot exploration. We used the vignette method to observe reactions facing a fictional uncertain situation (a gas explosion happened nearby) and the subsequent scientific communication in a press conference setting.

The results show different patterns of response and preference concerning the deemed legitimate/illegitimate communicative outcomes (i.e. guidelines, personal opinion, talk show fights between experts), which strengthen/weaken trust. At first glance, these patterns seem to be related to personal features (i.e. age, gender and knowledge capital), communicational expectations (i.e. reassuring, informing, sharing data and previsions), and experiences. In this contribution, we present a dynamic model which connects public behaviours towards uncertainty communication and conditions for trust delegation. For its flexibility and scalability, it can be tested in risk management and emergency communication.

Despite the inherent limitations of this pilot research, the results collected so far open up a broad prospect for future in-depth explorations to refine the theoretical model here discussed also in a comparative perspective (i.e. different scientific fields and social groups).

RN22 | T01_02: Disaster Management Policies and Practices

Women's Informal Voluntary Work After Disasters

Dominica Meade

The University of Melbourne, Australia

Disasters are gendered events that greatly exacerbate pre-existing inequalities for women, however the volunteer emergency management systems currently in place to help women in affected communities are heavily male dominated and in steady decline. There has been significant research which has found that women-led organizing and informal volunteering during and after disasters can alleviate hardship during recovery in affected communities. However, the ways in which this responsibility impacts the lives of women already enduring exacerbated hardship is under researched in the Australian context. Importantly, the informal voluntary practices led by women that contribute to sustained and more inclusive recovery periods have been seldom investigated in the Australian context despite possible learning opportunities for the male-dominated formal volunteer workforce.

To address this gap, this presentation aims to explore the gender dynamics of voluntary practices that occurred after a major flooding event in a regional town in New South Wales, Australia. Ethnographic and photovoice-led qualitative methods were used to investigate the gendered experience of volunteering for recovery. An ecofeminist citizenship framework was employed to politicise the role of women and challenge essentialist understandings of women's volunteering after disasters. Preliminary findings suggest that women's experience of volunteering after disasters burdened women with the responsibility of sustaining community life, with little recognition or help from the formal voluntary sector and government institutions. More gendered analyses of voluntary work for recovery in disaster affected communities are needed to contribute to more equitable recovery services and to redress the gender-neutral approach to emergency management in Australia.

Unveiling an Emergent Community: Examining the Long-Term Impact of Catastrophic Experiences on Disaster Mitigation Behaviors

Hsiang-Chieh Lee, Hui Hsuan Yang, Wai-In Chao

National Science and Technology Center for Disaster Reduction, Taiwan

This study delved into the disaster mitigation behaviors of survivors a decade after a catastrophic Typhoon event in 2009 by comparing two sets of survey data collected in 2019. One dataset represents the general Taiwanese population, while the other focuses on survivors of the catastrophic event. Employing hierarchical regression analysis, the study revealed that individual-level factors such as demographics and psychological factors exerted more substantial influences on the general public compared to survivors. Among all variables, education emerged as the most impactful for the general public. Notably, a group-level factor—social network—proved insignificant for the general public. Conversely, group-level factors, specifically family structure and social network, played more pronounced roles in shaping the mitigation behaviors of survivors, overshadowing individual-level factors. The psychological factor (at the individual level) was found to be insignificant for the survivors. Additionally, the results highlighted that family structure, particularly the presence of elders, significantly influenced disaster mitigation behaviors in both datasets, albeit with divergent directions. For the general public, families with elders exhibited less preparedness, while survived families with elders demonstrated heightened preparedness. These findings suggested that the lasting impact of the catastrophic experience gave rise to an emergent community where group-level factors took precedence over individual-level factors in influencing disaster mitigation behaviors. Moreover, the emergent community demonstrated increased awareness of disaster vulnerability associated with family structures, prompting families with elders to be more proactive in their preparedness efforts.

Flood Policies in the Italian Context: the Emilia-Romagna case study

Alexandra D'Angelo, Giliberto Capano

University of Bologna, Italy

In May 2023, two flooding episodes hit the Italian region of Emilia-Romagna, killing 17 people and displacing thousands. The flooding of 23 rivers in the territory of the regional plain and the dozens of landslides that occurred in the mountainous-Apennine territory made it an event of exceptional magnitude for the Italian context.

This paper intends to present the preliminary results of the research in fieri that is part of the RETURN (Multi Risk Science for Resilient Communities under a Changing Climate) project, conducted through fieldwork, interview collection from the very early emergency phase and, finally, policy analysis. The objective of the project lies in understanding the multiscalar and multilevel functioning of emergency governance related to flood and hydrogeological risks in the Emilia-Romagna region, with emphasis placed on emergencial policies at each stage of the disaster cycle. The complex structure of emergency governance is being challenged today by the multiplication of extreme events and the intensification of their magnitude.

The case study of the May 2023 floods in Emilia-Romagna constitutes an important context in which to (a) observe the application of emergency policies in their local, regional and national stratification, (b) monitor the functioning and effectiveness of their implementation on the territory and affected population, and finally (c) propose a policy evaluation and a policy proposal on contemporary disaster management in Italy. Alongside the focus devoted particularly to policy analysis is attention placed on the role assumed by volunteering in all its forms (third sector, associations, informal networks, etc.) in managing and overcoming the very first emergency phase, which in Emilia-Romagna took on connotations of an exceptional order.

Integrating Social Impacts And Social Capacities In Flood Risk Management: A Network Analysis Application

Guadalupe Ortiz, Antonio Aledo, José Javier Mañas-Navarro, Iker Jimeno, Josep Tur-Vives, Pablo Aznar-Crespo

University of Alicante, Spain

The rising frequency and intensity of flood-related disasters due to climate change place vulnerable populations at high risk of experiencing severe impacts on their living conditions. The Sendai Framework for Disaster Risk Reduction emphasizes the need for detailed attention to the social consequences of disasters, as well as the development of capacity-building strategies in local communities. In line with this demand, a primary aim of the AQUASOC project – funded by the Spanish Ministry of Science and Innovation – is to contribute with the expertise of social sciences in analyzing the social impacts of disasters to the identification of strategic lines of action for building resilient communities. This communication highlights the project's progress in exhaustively identifying and categorizing social impacts and linking them to necessary social capacities for impacts' prevention, mitigation, and recovery. Employing extensive qualitative fieldwork, including 115 qualitative interviews with key stakeholders across four case studies, and utilizing Social Network Analysis (assisted by Gephi software), the project has successfully mapped a network of social impacts and their connection to social capacities. This network facilitates the identification of critical nodes and, consequently, priority capacitation areas for effective social planning and management of flood risk. This network will be a key informational input for the SCABA (Social Capacity Building Appraisal) online tool, aimed at local risk managers, which is currently under development.

735

RN22 | T02: Theorizing Risk and Uncertainty

The Relevance of Fortuna in Late Modernity: Chance, Uncertainty and Social Change

Matthew L. Turnbough[1,2]

1Complutense University of Madrid, Spain (UCM); 2Complutense Institute of Sociology for the Study of Contemporary Social Transformations (TRANSOC)

The social changes tied to late modernity and an increasingly precarious labour market have facilitated the emergence of fortune as a potentially significant element for understanding contemporary society. This presentation approaches this contingent, individualised, secularised, and uncertain panorama from the perspective of the individuals tasked with navigating these societal transformations and the effects of a prolonged economic crisis. Based on a discourse analysis of 20 in-depth interviews and three focus groups with vulnerable young adults in Spain we examine how these individuals employ luck/chance highlighting four different relationships with fortune. In the participants' narratives we find a meritocratic approach, which involves an understanding that good luck is attained through individual initiative, but also relationships less concerned with human agentic power where it can be conceived as an interpretive device, as a threat or as an element tied to hope. Consequently, in this paper we seek to address a gap in sociological research, which has tended to overlook the analytical significance of chance/fortune/luck, arguing that it constitutes a central element to the symbolic frameworks of these young adults as they make their way through a changing world. Furthermore, we contend that the recognition of the sociological relevance of fortuna involves a shift in our apprehension of human reality and that by studying the impact of chance, alongside other elements such as social conditions/structures and agency, we might be able to analyse more assiduously the risks, unpredictability and indeterminacy of our late modern world.

Risk, Crisis, Disaster – Different Concepts and Different Types of Uncertainty?

Joris Steg[1], Tjorven Harmsen[2]

1Bergische Universität Wuppertal, Germany; 2Albert-Ludwigs-Universität Freiburg

We are living in times of dynamic uncertainty. Financial and economic crises, the problematisation of refugee and migration movements, the rise of nationalism and right-wing populism, climate change, the Covid-19 pandemic, inflation and the return of war: The present is characterised by multiple, overlapping and mutually reinforcing extremes. Disorder, insecurity, uncertainty, upheaval, transformation, and contingency seem to be the sign of our time. In our paper, we address these phenomena from the theoretical perspectives of risk, crisis, and disaster. Firstly, we will look at existing concepts. Risk generally refers to the possibility of the occurrence of future events with negative effects. Crisis classically denotes a moment of decision-making under conditions of threat, urgency, and uncertainty. Disaster, or catastrophe, refers to serious events with devastating consequences. Secondly, we analyse similarities and differences between these concepts and put their exclusivity to the test. All three concepts revolve around uncertainty as they indicate danger and signify potentially dramatic social developments. However, they differ in their temporal structure and represent specific notions of normality and exception. Thirdly, we will examine whether risk, crisis, and disaster address different types of uncertainty. The paper concludes with a call for a combination of all three concepts to analyse the dynamic nature of the uncertainty society is confronted with today.

Crisis, Catastrophe and Emancipation

Maria Grazia Galantino

Sapienza University of Rome, Italy

In recent years, several far-reaching crises have led to global instability, economic challenges, humanitarian disasters and political conflicts, contributing to a period of widespread uncertainty. In an era of unprecedented challenges, the neologism 'permacrisis' – Collins' Word of the Year 2022 – has become the terminological label to capture the meaning and novelty of experiencing a 'prolonged period of instability and uncertainty, mainly caused by a series of catastrophic events'.

As early as the second half of the 1980s, and without resorting to any particular neologisms, the social sciences had identified risk and uncertainty as distinctive features of contemporary societies. Drawing on this debate, we first situate the concepts of crisis and catastrophe within the sociological perspective of risk and uncertainty in order to understand whether they retain a capacity to interpret current changes. We then show how risks, crises and catastrophes can open up different ways of imagining the future in the present, which are not alternative but coexist and overlap, giving rise to different combinations of expectations and practices. Some insights from recent empirical research on young people in the pandemic and post-pandemic period will help to elucidate these reflections and, in the concluding section, to question the ambivalent trajectories opened up by crises and catastrophes and, at the same time, by new beginnings.

736

Conceptualising Trust in the Face of Risk. New Directions for a Contested Concept

Jens O. Zinn

University of Melbourne, Australia

The concept of trust has been debated in a range of disciplines characterising it as a rational (Coleman 1990), non-rational (Luhmann, 1988) or emotionally based construct (Barbalet, 2008). Also, the quality of trust as a conscious, reflexive, decision based concept (Luhmann, 1988; Giddens, 1990) in contrast to trust as routine preconscious behaviour (Lagerspetz, 1998) has caused controversial debate. Instead, the presentation suggests that trust is neither rational nor non-rational but has an own quality in-between, similar to the suggestion of Løgstrup (1997). Setting trust in the context of the "in-between" framework of modes of engaging with risk and uncertainty (Zinn, 2008, 2016) recent developments using neo-phenomenology (Schulz & Zinn, 2023) allows to integrate many of the different perspectives in a more conclusive framework of trusting as an in-between mode of reasoning, which also considers tendencies of rationalising or enchanting trust. The presentation discusses the conditions which foster different forms of trusting and the ways how trusting may be institutionally exploited.

RN22 | T03: Risk, Crisis and Resilience

A Challenged Society: Constructions of vulnerable and resilient subjects in Swedish total defence policies

Elin Montelius, Linda Kvarnlöf

Mid Sweden University, Sweden

This article engages in a critical debate on the dichotomy between vulnerable and resilient subjects and how these are constructed in Swedish total defence policies aimed at preventing and managing crisis, disasters and war. Taking our point of departure in Carol Bacchi's post structural policy analysis, also known as What is the problem represented to be? (WPR) the purpose of this article is to critical examine how desirable, and non-desirable, subjects are constructed in current Swedish total defence policies. Our analysis finds that desirable subjects are positioned as 'the resilient' while the non-desirable subjects are positioned as 'the vulnerable'. These subject positions are constructed in relation to three specific threats: security policy threats, climate change and a challenged democracy. In relation to these threats vulnerability (both societal and individual) is positioned as the problem represented to be in the policies analysed for this article. Resilience, personified as the resilient subjects, is suggested as the solution to this problem: where capable, active, and responsible citizens are expected to come to the rescue of a society challenged by the crisis, disasters, and wars of the 21st century. Such a solution to contemporary security problems is not only reminiscent of the individualism and responsibilisation associated with the ideal of the resilient citizen, but also a vivid example of how societal problems and welfare state challenges are securitized as they are presented as problems to be solved by resilient citizens and the forces of total defence rather than by investments in public welfare or climate policy.

737

Never Safe, but Sorry – the Precautionary Principle Between Risk Control, Adaption and Politicization of Ignorance

Alisa Madeleine Hirn

Vienna University of Economics and Business, Austria

The precautionary principle is an essential component of international environmental policy, although it has been criticized as unscientific, paralyzing and irrational. While it frames a normative obligation (better safe, than sorry), it struggles to provide explicit decision-making rules in situations of uncertainty (Empty Label Challenge). The paper discusses political applications of the precautionary principle in Germany in the context of radioactive waste, raising the question of how precaution can express both motives

of control and adaption. The aim is to further evaluate the precautionary principle against the social theoretical background of a transformation of late modern societies to societies of adaption.

While criticism of the precautionary principle is often based on concepts of risk and knowledge, this paper choses an interdisciplinary approach and provides literature review in the field of sociology of ignorance to highlight ignorance as key concept for critical environmental sociology.

Initially, the paper introduces different categories to analyze the social constitution of the phenomenon of "not knowing". Based on theories of scientification and technologization of the political, it is argued how controversies about knowledge dominate the political sphere today, while disputes over values shift to areas of the unknown, leading to a politicization of ignorance. By comparing strategies of handling the issue of final disposal for radioactive waste since the introduction of nuclear power in Germany, the author reconstructs the role of control-oriented and complex-oriented cultures of non-knowledge for justifying very different, even conflicting, precautionary actions.

The results illustrate cultures of non-knowledge that lead to motives of control (risk management and prevention) and motives of adaptation (self-preservation and mitigation). Thus, the paper goes beyond the argument of irrationality and emphasizes a political performativity of ignorance that contributes a further understanding of paradoxes in terms of the precautionary principle. The conclusion leads to a discussion about the role of the precautionary principle in the transition from risk society to society of adaptation and its relationship to developments such as (climate) adaptation policies.

Conceptualizing Risk, Resilience, and Crisis Management through the Lens of Sociotechnical Systems

Naomi Shulman, Lasse Wennerhold, Lars Gerhold

TU Braunschweig, Germany

Research on civil security is interdisciplinary, engaging varied perspectives on societal risk perception and the prerequisites of crisis management. The BeLIFE project, funded by the German Federal Ministry of Education and Research, analyzes how five regional civil-security projects are implementing new approaches to crisis management and what lessons can be learned from their processes. Using the analytical lens of sociotechnical systems, BeLIFE examines how social groups interact with technological tools intended to mitigate civil security risks and bolster resilience. By focusing on the specific promises and challenges produced by the interaction between human actors and technological instruments, BeLIFE addresses a number of questions: How can a systemic perspective on sociotechnical interactions help conceptualize resilience as a way to deal with the uncertainty of the future? How may sociotechnical systems help foster broad societal engagement with anticipated risks? How do the five projects under examination outline the relationship between social actors and technological

tools as an answer to expected needs in crisis management? Our contribution will address these questions by focusing on how (implicit) views on future developments shape the five projects' approaches to developing resilience. We will examine how these projects present resilience as an essential way of coping with certain risks to civil security, such as flooding, which are expected to increase in scope and frequency in the future. In the process, we seek to show how the relationship between psychosocial and technological elements plays a vital role in shaping strategic preparation for the future needs of crisis management.

Preparing for the Previous Pandemic: Resilience and Risk Translation in Governing Healthcare during the COVID-19 Pandemic in the Netherlands

Bert de Graaff, Sabrina Huizenga, Roland Bal

Erasmus University Rotterdam, Netherlands, The

In this paper we focus on risk translation in the governing of Dutch healthcare during the COVID-19 pandemic. We do so to explore crisis resilience in healthcare governance as a concrete practice. We built in this paper on a multi-sited ethnography of the Dutch crisis-organization in healthcare between March 2020 and August 2022. We zoom-in on regional networks of acute care delivery (ROAZ) during the second year of the pandemic in the Netherlands (from August 2021 to August 2022). During this period our participants sought to learn from previous experiences during the first 'waves' of the pandemic and started to look forward to a post-pandemic situation.

Our analysis underscores how the COVID-19 pandemic in healthcare is enacted through a multitude of relations of risk. These relations are translated between layers of crisis-governance through relation-building, data-infrastructures, modelling and scenario-building, (re)writing guidelines and protocols next to formal political practices. We argue that risk translation during crises allows for creating time-spaces and infrastructures, enacting crucial objects of governance such as care (acute/'non-COVID'), geographies ('the region') and beds ('an ICU-bed'). Risk translation appears as a crucial practice for resilient health care systems; showing the ad hoc, informal and manual risk work that mediates knowledge and values about how to act during crisis between layers of healthcare governance and emerging collective(s) (in) action. These practices are also inherently political, leading to the in – or exclusion of (alternative) concerns and their representatives in governing healthcare during crisis.

RN22 | T04_01: Risk Preparedness and Response

Crisis Biographies: Making Sense of Wildfires and Climate Change Temporalities

Linda Kvarnlöf[1,2], Sara Ekholm[1,2]

1Mid sweden university; 2Risk and crisis research centre

The following article is based on interviews with volunteers and evacuees from the wildfires that affected the northern parts of Sweden during the summer of 2018. The purpose of the article is to explore if and how people relate their experiences of a climate change-related crisis to the more extensive, and constantly ongoing, climate crisis. Through this article, the concept of crisis biography is developed, theoretically and methodologically, to illustrate how people's experiences of crises can be understood in the light of their personal biographies. The results show that the climate crisis, and its extent in time and space, is of central importance for both people's sense making of forest fires and for their personal crisis biographies.

A Safe Place For Preparedness

Erna Danielsson, Linda Kvarnlöf

Mid Sweden University, Sweden

This interview study explores how the home, and its characteristics influence an individual's thoughts on evacuation. It raises questions about what constitutes a secure and safe place and how material preparedness and the perception of home as a safe place impact our thoughts on evacuation in the event of a major societal crisis. The study is based on meaning-making and materiality, viewing the home as an integrated part of a person's identity. The results indicate that an individual's home preparedness and planning for crisis management generate a sense of security and safety, increasing the reluctance to abandon the home in the event of a crisis. For those residing in rural areas, everyday household planning is integrated as a form of crisis preparedness, motivated by the distance to societal functions in the rural environment. For urban dwellers, the home represents security, with proximity to conveniences such as the grocery store. Family, relatives, or friends are perceived as a secure place in the event of an evacuation. However, most prominent is the interpretation of the rural environment as a secure and safe place, such as "the cottage in the countryside," and wilderness, that provide warmth, food, and shelter – particularly to those present themself as outdoor person. For individuals who do not actively contemplate evacuation or engage in home preparedness, a more fatalistic perspective tends to prevail.

Exploring the Fire culture(s) in Europe

Maria Conceição Colaço[1], Leticia Oliveira[1], Fabricio Fava[2], Iryna Skulska[1], Ana Catarina Sequeira[1]

1Instituto Superior Agronomia, CEABN, Portugal; 2Research Institute in Art, Design and Society (i2ADS), Faculty of Fine Arts of the University of Porto (FBAUP), Portugal

Wildfires are a common event in Southern Europe but in the last decade several events have occurred in countries where this risk is not common. Research shows that European countries should be more prepared and communities should re-learn to live with fires. However, since the 20th century there was an abandonment of fire in rural practices and in the daily life. The ancient experience and knowledge remains in some small groups, particularly farmers and foresters, but it almost disappeared in the society.

In order to re-learn to live with fire, it's important that fire risk increases and for that, society needs to be aware of it, understand it, and accept it. To address this gap, an online tool called Fire Education Platform is being developed. This multimedia tool gathers information and explores the fire culture concept and scope in Europe, analysing topics such as fire ecology, fire risk, and its social dimension like oral and artistic practices, traditions and fire use by local rural communities. The platform is being developed under the scope of FIRE RES EU project. It has a common core with fire culture and arts, and three sections: to teach, targeted at educators; to learn, targeted at the general public; and to apply, targeted to professionals. For the collaborative design of the platform, a survey with 24 questions was launched in13 country aiming to assess the real needs of future users. The presentation will discuss the results of this survey, tales and oral traditions, analysing the different fire culture(s) in Europe.

Coping with Wildfires:Inquiry to a Rural Community in Inner Southern Portugal

Dr. Delta Sousa Silva[1], Dr. Margarida Rebelo[1], Dr. Marta Vicente[1], Prof. Maria Belem da Costa Freitas[2], Prof. Carla Rolo Antunes[2]

1Laboratório Nacional de Engenharia Civil, Portugal; 2Universidade do Algarve

Portugal has one of the highest rates of wildfires in Mediterranean Europe (Turco et al., 2016). Analysis of this problem stills dominated by forest and event-based approaches, downsizing the perspective of those who live in fire-prone communities. How do these inhabitants integrate wildfire threat into their daily lives? How do they respond to fires and recover from them? These questionings still much understudied in Portugal. To address this gap, a study (financed by Foundation for Science and Technology, PCIF/

739

AGT/0072/2019) was carried out in a rural community of inner Southern Portugal. The study aimed to describe inhabitants' cyclical wildfire experience and patterns of coping with it. Methodologically, the study followed a case study design, focused on Alferce (Monchique). As part of the fieldwork, 60 semi-directed interviews were undertaken and subject to content analysis.

Research findings indicate that fire trends in inner Southern Portugal reflect demographic, land-use and environmental transformations. Alferce inhabitants revealed to be aware of these root causes of vulnerability. They also revealed high levels of risk perception; experiential knowledge about fire dynamics and ways of responding to it; awareness of the importance of protecting their property. The transposition of such beliefs into protective action is, nevertheless, endangered by a set of attitudes and contextual factors such as: salient beliefs on wildfire recurrence; disbelief on physical capacity to implement certain protective measures; low expectations of returns on forest investment; difficulties in finding manpower and high costs of labor. Based on these findings, we will outline the main implications of such patterns of coping with risk both in terms of vulnerability and disaster risk management.

RN22 | T04_02: Risk Perceptions and Understandings

The Impact Of Individual Risk Perception On Community Resilience: A Case Study Of Polish Border Communities' Response To Humanitarian And Refugee Crisis Caused By Russian Invasion Of Ukraine.

Natalia Bełdyga

Kaunas University of Technology, Lithuania

Russia's military aggression against Ukraine which escalated into a full-scale invasion of Ukraine in 2022 has caused an unprecedented refugee and humanitarian crisis to which Poland, EU and other host countries have been responding and has greatly heightened a sense of tension and concern about the impact of an ongoing Russia's war in Ukraine on among others European security architecture. Within this risk and uncertainty context the aim of this research is to analyze the impact of individual risk perception on community resilience to crises and uncertainty by studying cases of responses to a humanitarian and refugee crisis caused by Russia's attack on Ukraine made by Polish border communities from two corners of Poland, one in Biecz, a town ca 100 km from the border with Ukraine and second in Suwałki, in the Suwałki Gap region which separates Russia's exclave of Kaliningrad from Belarus, also referred to as NATO's Eastern Europe weak spot. Theoretical framework encompassing a theory of riskscapes – orientation maps navigating complex risks (Müller-Mahn et. al, 2018) and relational theory of risk about individual interpretative nature of risk (Boholm and Corvellec, 2011) was developed to conceptualize a social phenomenon of individual perception and construction of risk. The results of qualitative analysis of empirical data collected during on site, in person interviews with community members from Suwałki and Biecz who were involved in response to refugee and humanitarian crisis, namely a sudden and massive arrival of refugees from Ukraine to Poland, will demonstrate how individuals perceived, interpreted and navigated risk as well as reveal the impact of individual risk perceptions on community resilience to crisis and uncertainty in this unprecedented context.

740

Navigating Uncertainty: An Analysis of Future Perceptions and Feelings of Uncertainty in Contemporary Russia

Kirill Gavrilov[1,2], Maria Butynko[3]

1HSE University, Russian Federation; 2Institute of Sociology of Russian Academy of Sciences, Russian Federation; 3Independent researcher, Russian Federation

Risk studies, from the very beginning, have emphasized the idea that the ability and need to control the future are central to modernity (Giddens, 1991). Simultaneously, at the individual level, people are compelled to make risky decisions in cases where outcomes are uncertain, and they lack reliable data and trust in others and institutions. Additionally, global events may influence the perception of the future: as studies on COVID-19 have shown, a pandemic can compress individuals' perceptions of future time horizons (Newton et al., 2023; Fynes-Clinton, Addis, 2023). We believe that the ongoing "special military operation" (SMO) of Russia in Ukraine, accompanied by the mobilization of men, may also contribute to this feeling of uncertainty, although not equally across different groups of the population.

In our online survey conducted in September 2023 (n=1254), we included indicators related to the perception of the future, such as feelings about the future and the self-estimation of the ability to plan one's own life. The key idea was to search for crucial factors that influence this perception of the future, including sociodemographic factors (especially age and gender), media consumption, attitudes toward the SMO, and the specificity of risk perception.

In this paper, we not only present the empirical findings based on regression analysis but also discuss methodological issues, such as the possibility to assess attitudes toward the SMO (we utilized a "list experiment" for this purpose, but it gives only an estimation within a subsample) and the possibility to use the "psychometric paradigm" methodology (Slovic, 1987; 2000) to infer individual measures of risk perception.

Disinformation and risk perception in Sweden

Maja Klinga, Sara Skott

Mid Sweden University Risk & Crisis Research Centre, Sweden

The role of disinformation in the digital society is gaining more and more attention in societal debates and research. On an institutional level, disinformation is framed as a risk and a threat to democratic values by experts and researchers. Furthermore, disinformation is viewed as a measure of increasing polarization while it also destabilizes a society by decreasing trust. However, few studies focus on how individuals understand and perceive disinformation. This lack of knowledge is problematic as it not only entails an incomplete understanding of how the perception of disinformation may differ in relation to different power orders such as gender, ethnicity and age, but also how this differing perception may affect people's behaviors and attitudes.

Studies on risk perception have a long history of gathering information about what people perceive as a risk or risky.

In this study, we are taking a similar approach to disinformation, analyzing understandings of disinformation through the lens of intersectional risk theory, informing the field of risk perception as well as contributing with new perspectives on the role of disinformation in Swedish society. Using data from a national survey (n=2480) conducted in Sweden during 2023 as a part of the project People, measures and Resilience: new ways to study risk communication, responsibility and preparedness, this study explores how the perception of disinformation differ between different groups and how this may relate to different intersecting power orders.

Covid-19 and Uncertainty in Italy. Exposure to High Mortality and Fertility, the Case Study on the City of Bergamo

Patrizio Lodetti[1], Victoria San Juan Bernuy[1], Elena Bastianelli[2]

1University of Florence, Italy; 2University Bocconi,Italy

741

The COVID-19 pandemic has had a significant impact on various aspects of daily life, including reproductive behavior. Women's fertility dynamics have been particularly affected, with many facing uncertainties and disruptions to their plans for having a child(ren).

However, it is important to note that the impact of the pandemic on fertility is multifaceted and varies between and within countries. In the academic debate, these variations in fertility dynamics can be attributed to several factors, including differences in government policies, cultural attitudes toward childbearing, and economic conditions. However few studies consider the role played by the perception of uncertainty (e.g. Guetto et al., 2022; Gatta et al., 2022). The goal of this paper is to fill this gap in the literature by studying the association between COVID-19, lockdowns, and exposure to death (two of the main sources of uncertainty) on the birth outcomes in Bergamo. We considered this city because it was one of the most impacted by the virus in the Western world. We used data from the national statistical agency to evaluate the relationship between the different components and birth outcomes, comparing the number of monthly births in the year before the pandemic and the second year of Covid-19. Preliminary results show that during the months of lockdown and high mortality, the number of conceptions decreases, and, conversely, during periods of re-opening and stabilization of deaths the number of conceptions increases. Our results seem to corroborate the argument that the perception of uncertainty has an important impact on the fertility dynamic, especially during a pandemic (and in general during catastrophic events).

RN22 | T05_01: Trust in Times of Crises

How Does Political Trust Associate with Economic and Environmental Policy Prioritization? A longitudinal analysis between 2017–2022

Sami Juhani Ahonen[1,2], Aki Koivula[1], Jukka Sivonen[3]

1University of Turku, Finland; 2Finnish Meteorological Institute; 3The Finnish Institute for Health and Welfare

Crises wield a considerable impact on individual's perceptions and attitudes. Thus, researchers have worked to unravel how attitudes towards ongoing long-term crises might be shaped by new significant adverse societal events. In our article, we examine the longitudinal development of economy-over-environment policy priorities during a period marked by several crises in Europe, such as the COVID-19 pandemic and the escalation of Russo-Ukrainian war, which have contributed to the recent polycrisis. Furthermore, we explore the influence of political trust on policy priorities over time. We utilize a five-round panel dataset comprising 2,155 observations (N = 431) to examine both within and between individual variations from late 2017 to early 2023. Our findings reveal a significant increase in the prioritization of the economy across each observation period following the COVID-19 outbreak. However, this impact is not observed among individuals who possess high levels of trust in political institutions. The within-individual analysis indicates that high political trust tends to moderate rather than cause higher economy-over-environment policy prioritization. Our study highlights the significance of political trust as a deterrent to the deprioritization of environmental policies, particularly when societies confront significant risks and uncertainty.

Navigating Conflict and Building Trust: Resilience Strategies in a Culturally Diverse Academic Setting

Rula Ibrahim Kurd – Badarneh, Edna Kapel-Green

David Yellin teachers college, Jerusalem

Our campus's cultural diversity provides a microcosm for investigating the dynamics of risk, conflict, and transition in a socio-politically charged context. The beginning of the war on October 7th exploded into uncertainty, stress, and deteriorating trust, dramatically affecting Jewish-Palestinian intergroup interactions. This study investigates the aftermath and consequences of these events, based on Nasraf's (2023) research, which emphasizes the critical significance of preserving a sense of normalcy in such volatile circumstances.

Our research investigates how shared academic activities, such as collaborative studies, joint projects, and mutual support, might help to alleviate concerns, perceived dangers, and profound mistrust between Jewish and Arab students. These interactions reflect a complex topography of risk assessment and coping methods inside the academic arena.

To build resilience and convert the college into a sanctuary of safety and inclusion, a dedicated emergency team comprised of Jewish and Palestinian personnel (including the writers) was formed in response to the crisis. We examine a unique approach established for this goal that is based on the ideals of respect, tolerance, and empathy. Staff seminars on supportive communication and visual exhibitions exhibiting Jewish-Arab partnerships, signifying unity and coexistence, were key initiatives.

This case study adds to the sociology of risk and uncertainty by demonstrating how educational institutions may act as crucibles for trust-building and solidarity during times of crisis. It lays forth a plan for institutional resilience and readiness in the face of sociopolitical upheavals, emphasizing the importance of education in bridging differences and building a culture of mutual understanding and respect.

COVID-19 and Governmental Trust in Turkey: Economic Determinants within a Heightened Risk Landscape

Altay Bayraktar, Barış Türkdoğan

Boğaziçi University, Türkiye

Throughout the world, the COVID-19 pandemic has created a precarious environment of substantial socio-economic risk and uncertainty that has greatly impacted the relationship between citizens and their governments. Accordingly, we center our study on the following question: "How has the change in people's economic status during the COVID-19 pandemic affected their level of trust in the government?". Studies investigating governmental trust during the pandemic have predominantly examined European countries, leaving other contexts in need of exploration. Furthermore, the literature has largely focused on the immediate aftermath of the pandemic while the economic consequences required a longer time frame for analysis.

As a country grappling with a severe economic crisis since 2018, Turkey presents a unique case to analyze the enduring economic impacts of the pandemic in a distinct context. During the early stages of the pandemic, the Turkish government distinguished itself from its European counterparts by not imposing a lockdown until April 2021 and keeping many businesses open. Nevertheless, many people were put on compulsory unpaid leave.

To determine the impacts of the economic changes on individuals' trust levels in the government, we employ data from Turkish Covid-19 Values Study (N=1500) from April-May 2022. Our main finding is that negative change in families' economic status since the start of the pandemic is strongly associated with lower trust in the government.

More generally, we suggest the COVID-19 pandemic has exacerbated the existing economic bottleneck and highlighted the interdependence between the economy and trust in public institutions in times of crisis.

Social Determinants of Trust in Science: An Analysis Based on European Social Survey (ESS) Data

Francisco Javier Jiménez-Loaisa, Diana Jareño-Ruiz

Universidad de Alicante, Spain

The still recent pandemic crisis of COVID-19 has underscored the importance of social trust in science. Scientific literature has particularly emphasized the positive effects of trust in science on the acceptance and adherence to health experts' recommendations. Therefore, in this contribution, we inquire into 1) the general levels of trust in science and 2) its social determinants. Utilizing data provided by the European Social Survey (ESS), we conduct 1) a descriptive analysis of general levels of trust in science, disaggregated by countries, and 2) a regression analysis to identify the social determinants of trust in science. The results reveal that the average levels of trust in science are high. Trust in science is notably high in Northern European countries and notably low in Eastern European countries. Regarding social determinants, ideological self-positioning is the only variable with significant effects on trust in science. Right-leaning positions are associated with lower trust, while left-leaning positions are associated with higher trust. In conclusion, regional and ideological differences in trust levels in science may jeopardize decision-making processes both at the community and national levels, in the context of health crises or any other kind.

RN22 | T05_02: Digital Risk

Digital Risks as Experienced by Mental Health Rehabilitees and Social Care Work Professionals

Piia Johanna Silvennoinen[1], Ulla Buchert[2]

1Laurea University of Applied Sciences, Finland;
2University of Helsinki, Finland

The intensification of digital society has generated new risks for individuals. Digitalization of public services has created situation in which the use of digital services involves risks that could lead to unpredictable and undesirable results for the individual and organization in question. Drawing on concepts from Beck's critical theory of the risk society, this study examines what kind of risks digitalization of society, and more precisely digitalization of public services cause for the clients of mental health rehabilitation services and the professionals working with them. The research data (7 focus group interviews, total 36 participants) was analyzed using both deductive and inductive content analysis. The results show that digitalization of public services cause risks which materialize in personal and organizational practices. The clients are excluded from digital society since they do not have access to digital public services due to various reasons. In addition, they encounter personal digital risks when using digital devices for example in recreational purposes (FB etc). Moreover, the professionals working with the clients find themselves in challenging professional and ethical situations when providing the clients digital support they need. They are forced to negotiate to whom the risks due to digitalization of public services are more harmful, to themselves or for the clients. Therefore, the strategy to implement digitalization in everyday practicalities on the organizational level challenges the professionalism of social care work and individual autonomy of the respective clients.

743

Sharenting – Distinguishing High and Low(er) Risk Practices

Silke Roth[1], Pamela Ugwudike[1], Natalie Djohari[1], Anita Lavorgna[2], Morena Tartari[3]

1University of Southampton, United Kingdom; 2University of Bologna, Italy; 3Babes-Bolyai University, Romania

The COVID-Pandemic has accelerated the digital communication on social media to maintain personal and professional relationships. Sharenting involves the sharing of identifying and sensitive information of minors, including photographs, information about health issues, birthdays, and the involvement in school and sporting events on social media. Disclosing personal data of minors can result in a wide range of data harms including surveillance and the contamination of digital and online identities of minors. In contrast to cybercrimes such as data theft, in the case of sharenting, child-centric personal data are shared

voluntarily. Data harms might result in cyber-crimes and both criminalised and non-criminalised online activities might affect minors in various, long-lasting, and irreversible ways. We consider sharenting a 'socio-technical practice' (Ugwudike et al. 2023) which is shaped by social expectations and the affordances of platform technologies. In this paper, we examine to what extent sharenters are aware of the risks of sharenting and how this shapes their practices, including their efforts to mitigate data harms and cybercrimes. Sharenters are not necessarily aware that their precautions are limited or can be undermined by other users. We draw on data from a from the ongoing multi-method research project, ProTechThem – Building Awareness for Safer and Technology-Savvy Sharenting which examines risky sharenting practices in both British and Italian social media contexts. While we are considering all forms of sharenting as risky, based on the analysis of semi-structured interviews we distinguish different forms of sharenting which vary concerning the risks (high, medium, low) they pose.

Systemic Risks and Organizational Challenges in Transformative Processes: 'Cybersecurity' in the Food Field

Manuel Nicklich[1], Leonie Dendler-Rafael[2], Sabine Pfeiffer[1], Annett Schulze[2]

1FAU Erlangen-Nürnberg, Germany; 2German Federal Institute for Risk Assessment

This contribution will use the example of the food field to show how 'grand transformations', such as digital transformation(s) – often framed as (technical) solutions to existing 'grand challenges' – can give rise to (follow-up) systemic risks, such as cybersecurity. Drawing upon a review of organization, risk, labor, science and technology as well as communication studies literature, it will help to understand how organizations can react to and shape these complex transformations. In particular, it will discuss how dealing with systemic risks addresses individual behavior as well as technical-organizational structures and that society needs to go beyond purely technical problem solving towards a more substantial change in the way organizations deal with (systemic) risks. Mobilizing empirical insights from the food field it will show that, as problem solving extends to several levels, all actors and their communication with each other need to be considered. This means that in addition to questions of interfaces and inter-organizational value creation structures, questions at the process level – and hence the 'risk work' on the frontline – are central to the challenge of cybersecurity and arguably also other systemic risks. The contribution aligns with authors who call for more participatory architectures and distributed experimentation to address the complexity, uncertainty, ambiguity and rippling effects of systemic risks and overall transformations. Conceptually, it develops multi-disciplinary perspectives on the complex relationship between risk, communication and organizing.

Understanding Or Underestimating The Risk? Stigma Perception And Fear Of Online Identity Theft In Expert Users

Annalisa Plava, Veronica Moretti, Antonio Maturo

University of Bologna, Italy

Contemporary risks take on new characteristics and their effects are potentially unlimited. Progress and the digital transformation of society have provided criminals with new opportunities to obtain and misuse personal identity information. The emergence and spread of Online IDentity Theft (OIDT) is an example of this. Our data profiles in detail habits, tastes, purchases. What we often forget is that as users, we generate this content (and data).

These are risks that we assume in a way that is not always conscious.

Very little is known about the profile, needs and experiences of people whose identity information has been compromised or misused.

European victims of OIDT often do not report the crime, believing that the harm suffered is not significant enough.

With the aim of analysing the impact of OIDT in different European countries, but also to profile victims, the aim of this proposal is to understand what social determinants online identity theft is connected to.

Regarding the methodology we carried out 23 semi-structured interviews with experts and 43 structured interviews with victims. Preliminary results showing that:

(1) OIDT also affects expert users; (2) expert users often underestimate their perception of risk; (3) the higher the degree of trust and digital literacy, the lower the ability to report for fear of stigma-related secondary victimisation.

744

RN22 | T06: Trust and Expertise

Why People Listen To Expertise. Citizens' Uncertainty And Reasons For Accepting Expert Knowledge And Advice

Lars Thorup Larsen

Aarhus University, Denmark

Discussions about 'post-truth' or science skepticism often seem to imply that lay citizens are either for or against scientific rationality as a whole, as if being on either side of this divide would in itself clarify for people what they should do about different kinds of knowledge claims presented to them. This underlines that we know too little about expertise as seen from the lay citizens' perspective, especially how they assess the different cues presented to them by various knowledge authorities in society and how they act on their assessments. A previous survey study found that citizens follow advice from professional authorities whose expertise they see as unsafe to ignore due to its 'legitimate complexity' (Harrits & Larsen 2021). This paper digs deeper into why people listen to expertise and how they balance making their own decisions about life matters such as health against their other motivations to accept or reject various kinds of knowledge authorities. The paper is based on a large data set of 150 in-depth qualitative interviews collected among both skeptics and admirers of science in five countries. The aim is to develop a better theory of when, why and how lay citizens perceived expertise either as authoritative, or in some fashion as optional, whether it concerns their own everyday life decisions or it concerns political authorities who may follow or distance themselves from experts. Which resources do people feel they – or political authorities – need to sidestep professional advice, and what constitutes, in their mind, expert advice that cannot safely be ignored? And do people's own education, experience and social networks feed into their decision process about listening to expertise?

Making Up My Own Mind: Epistemological Autonomy and Expert Authority

Luis Vila-Henninger

Aarhus University, Denmark

With a rise in skepticism and distrust in the United States and Europe, we see a tension between people driven to accept science while rejections of scientific findings also prosper (Mann and Schleifer 2020). Recent research investigates how conservative Americans navigate this tension through 'epistemological individualism' and 'othering' (Carlson and Ramo 2022), e.g. when conspiracists openly replace expertise with their own alternative research. This research project stems from an interest in achieving a broader understanding of the thought processes lay people use decide to accept or question expert knowledge. In contrast to the conspiracists' individualism, this paper identifies a more generic form of 'epistemological autonomy' among a broader group of citizens ranging from skeptics to people who appreciate science. The core of epistemological autonomy is not about trusting experts but rather about individual autonomy and having control of one's own thought process. In doing so, individuals accept or reject advice from experts based on their understanding of themselves as being a credible judge of information. In this sense, epistemological autonomy is not adversarial, but rather is a way for people to equate themselves with experts. Thus, people who use this logic comply with knowledge authority not out of a sense of duty, but rather through a process of making up their own mind about what the expertise says. This finding contributes to research and theory of knowledge authority and political sociology. To investigate this question, we conducted 150 semi-structured interviews with people across five countries spanning Europe and the United States about why people follow the advice of experts.

Ambivalent Motivations in Authority Resistance: Unravelling the Discursive Fabric of Czech Conspiracy Positions

Vendula Kolarik Mezeiova[1], Anna Durnova[2]

1University of Oxford; 2University of Vienna

Post-communist countries experience long-standing worse public health response than Western countries. It is associated with distrust in authorities, which raises questions about the implications of authority resistance for the legitimacy of public health regulation. In the Czech Republic, the understanding of authority resistance is underscored by the bipolarity of disinformation and facts and the interplay between the freedom of speech and public distrust in state institutions. Contrary to the prevailing approach that emphasises factual counter-argumentation, we contend that understanding the broader discourse of conspiracy positions is crucial for addressing the resistance to authority in science, politics, and media.

Employing a qualitative methodology, we conducted an interpretive analysis of 30 semi-structured interviews to unravel Czech citizens' motivations for resisting political, scientific, and media authorities. The study challenges the narrative, revealing a nuanced perspective that goes beyond a generalised opposition to experts embraced by 'post-truth' scholarship. While emphasising the importance of discursive framing in studying resistance and citizen response to risks, we explore how perceptions of individual autonomy, redistribution, merit, and social status relevant in a post-communist context construct a sense of control over individuals' decision-making and approaches to authority.

Our findings suggest that resistance to authorities is not a simple rejection but stems from complex interactions with

attitudes opposing the authorities. The analysis uncovers ambivalent motivations within the domains of science, politics, and media, highlighting references to "alternative" science or "common sense." These references serve not as support for authority but as reasons for disagreement. Specifically, citizens employ positivist and mainstream arguments, creating a discursive framework that allows them to oppose or challenge dominant scientific explanations, which are also involved in arguments legitimising public health regulation.

Trusting And/or Distrusting In Scientific Expertise: Exploring Continuities And Reasonableness

Patrick Brown

University of Amsterdam, Netherlands, The

Mainstream approaches in the social sciences, medicine and public health have often moved to problematise various individuals or communities who are wary or distrustful of science and medicine. A tendency to want to 'correct' mistaken or misguided views through a 'deficit model' approach has remained surprisingly robust in public health and related policy approaches, as seemingly undergirded by disparaging discourses in mainstream media and politics around those who doubt science. Amid this wider context, we explore narratives of public understandings, (dis)trust and use of science and medicine, drawing upon data from 150 in-depth interviews with a range of citizens – from science advocates to those who would often be labelled anti-science – collected across five countries (Czech Republic, Denmark, The Netherlands, The United Kingdom and the United States). Following work by Ruha Benjamin and Jaron Harambam, among others, we draw attention to continuities between trusting and ostensibly distrusting positions narratives regarding scientific and medical expertise. Virtually all our participants described themselves as being supporters of science, though what they understood as scientific evidence differed. More critical perspectives often echoed some common perspectives expressed by academics in medicine and social sciences. Moreover, all participants noted reservations about some features of medicine and science. In this sense our findings lead us to be critical of discourses implying two 'camps' (one pro-science, one anti-) or that we live in a post-truth / post-trust era. In emphasising the reasoned and reasonableness of more critical perspectives, we draw attention to the ways in which institutions (science, medicine, politics, media) have ignored, failed and/or harmed communities, rather than problematising these communities themselves.

RN22 | T07_01: Methods in Risk Research

Risk Storylines: a Methodological Proposal.

Claudio Marciano[1], Andrea Pirni[1], Antonella Peresan[2], Massimiliano Pittore[3], Gabriella Tocchi[4], Annamaria Zaccaria[5]

1Department of International Political Science, University of Genova; 2The National Institute of Oceanography and Applied Geophysic, Trieste; 3Eurac Research, Bolzano; 4Department of Engineering and Architectural Structures, University of Naples; 5Department of Social Science, University of Naples

In the field of risk management, the use of storylines has gradually become established as a method of describing the possible impact of emerging phenomena with a high degree of uncertainty that is only partially captured by the use of probabilistic models. The use of narrative techniques, which are based on research methods developed in the social sciences, is indeed considered increasingly effective for understanding the impacts of multi-hazard events, and for a deeper understanding of new socio-economic vulnerabilities.

Although Risk Storylines were first institutionalised by the IPCC and are increasingly discussed and used in the international policy arena, there is still little systematisation of them and little evaluation of how effective they are and how they can be used in combination with other social and strategic foresight tools.

The purpose of this presentation is to present a model for developing storylines in natural, environmental and climate risk management in cities. This model has been developed and tested as part of the project "RETURN – Multi-Risk Science for Resilient Communities Under a Changing Climate", supported by the Italian government with the aim of improving risk policies in urban contexts.

The first part of the paper presents the model for the construction of storylines, focusing in particular on two phases: an exploratory one, aimed at understanding the impact of multi-events, and a normative one, aimed at identifying good practices. The second part reports on the results of its application in the case of heat waves and extreme rainfall in two Italian urban contexts, different in size and complexity, but also in socio-economic vulnerability and exposure.

746

Dynamics of a Risk Regulation Regime: the Case of Head injuries in Swedish Ice Hockey

Olov Mikael Hemmingsson

Mid Sweden University, Sweden

This thesis explored the risk regulation regime related to head injuries in Swedish ice hockey, primarily by utilizing a corpus linguistic methodology. More specifically, three empirical studies were conducted for this purpose. The first one aimed to cover the media narratives through corpus-assisted discourse analysis. The second study aimed to map the information from the Swedish ice hockey community regarding long-term effects on athletes' health related to head trauma, including possible changes over time. The third empirical study aimed to map the contexts of local-political proceedings through collocation network analysis.

The thesis came with the ambition to contribute methodologically by applying corpus linguistics to a given risk regulation regime as well as theoretically by supplying a study to the bulk of such related to said type of regimes.

Results from the three empirical studies were analyzed using a theoretical framework where risk regulation regimes constituted the central analytical concept, while organizational legitimacy was used as a supporting framework.

The findings included an increased coverage of the risk in Swedish media and an increased tendency to promote positive societal effects from ice hockey among its community. Additionally, the political contexts in which the game of ice hockey was mentioned were mostly economically related. It was also found to be a crucial part of a general context of sports and other leisure activities in which benefits are emphasized. This was analyzed thoroughly by means of the theoretical framework.

Resilience Experience Index – Development of a new sociological tool to measure resilience

Miklós Gyorgyovich[1,3], Tamás László[2,1]

1Századvég Foundation, Hungary; 2ELTE Eötvös Loránd University, Budapest, Hungary; 3Károli Gáspár University of the Reformed Church

The epidemic situation caused by the coronavirus has also severely affected European societies, with curfews and other restrictive measures changing people's daily lives. In the last phase of the epidemic, Századvég Foundation conducted a questionnaire survey in Hungary in the summer of 2021. Based on the data, it became clear that the psychological approach widely used to study resilience is only partially suitable for sociological studies based on the concept of resilience through survey data collection methods. Following some theoretical and some methodological insights, our new research in 2023 sought to develop a set of questions that could be used in cross-sectional research, focusing on sociological aspects and taking greater account

of the individual's social relations. In designing the index, which is based on 20 statements, we took into account the theoretical literature that underpins the concept of resilience, as well as our own and others' empirical research. Each item sought to measure different aspects of resilience, for example agency and coping, abilities of being able to contact with others and to redesign, stress tolerance and creativity. The questions of the Experience of Resilience Index will be assessed on the basis of a large sample questionnaire survey that is representative of the Hungarian adult population according to the main socio-demographic criteria. In this presentation we will present the results of the testing of the instrument – based partly on quantitative data (the survey included additional standard question sets like individual and social resilience, stress, social support) and partly on complementary qualitative research (eighteen focus group discussions).

A Bibliometric Analysis of Articles Published on Risk Society and Uncertainties Between 2000-2023

Kayhan Delibas, Berivan Binay

Aydın Adnan Menderes University, Aydın – Turkiye

In the modern world, scientific knowledge production is increasing day by day. This situation makes it even more necessary to examine the knowledge produced about this world as well as the reality of the actual social world. Bibliometric analysis is a macro-focused analysis that measures and correlates the output of scientific items (author, journals, keywords, citation, institutions, countries, etc.) in a specific field. With bibliometric analysis, hundreds of studies belonging to a certain field can be analysed and the structure of the field and its course over the years can be obtained. Considering the social character of scientific knowledge, bibliometric analysis provides strategic data to understand the intellectual and social structure of the field under study.

The study aims to identify the reflections of risk society and uncertainties, which have become characteristic features of late modern societies, in the social science literature. The bibliometric method was used to evaluate the scientific production on risk society research between 2000 and 2023. Data were obtained from the online version of Web of Science. Scanning "sociology of risk and uncertainty", "trust, risk and social change", "media representations of risk" "risks and health", "risk and environmental", "resilience, disaster preparedness and risk", "reflexive modernity", It was made with the keywords "risk society" and "sociology of risk". The study will be discussed from a sociological perspective around the themes of (i) the frequency of discussing the subject over the years, (ii) keyword distributions of the authors (network analysis), (iii) research trends. Thus, the panorama of scientific production in the field of risk sociology will be revealed and will help determine the direction/course of future research.

Explaining Socio-spatial Dimension of Vulnerability and Resilience of Local Communities: Systematic Literature Review

Audrone Telesiene, Aiste Balzekiene

Kaunas University of Technology, Lithuania

Space is an important dimension in addressing and governing multiple risks. The susceptibility of local communities to multiple risks and the capacity for resilience vary depending on geographical location and spatial attributes. Moreover, the term 'socio-spatial' has been utilized in recent research to describe the interconnectedness of social and spatial dimensions. Studies have shown, that space related factors such as level of urbanization, access to resources, and exposure to hazards (among others) significantly contribute to strengthening (or undermining) the resilience of local communities. Despite numerous studies exploring socio-spatial vulnerabilities and resilience of communities, there is a lack of effort to systematically review the available evidence in this field. The aim of this presentation is to explore what socio-spatial vulnerability related factors are relevant to the resilience of local communities. We employ systematic literature review and quantitative content analysis methodologies to study the academic publications from Web of Science and Scopus databases. Our research follows the PRISMA-P standards (Moher et al., 2015) for developing and reporting the results of the systematic literature review. The results of this analysis allow classifying the socio-spatial factors that have already been empirically proven to significantly explain vulnerability and resilience at local community level. The results also contribute to the conceptual discussions on socio-spatial dimension of vulnerability and resilience.

This presentation is based on the project „Socio-spatial determinants of societal vulnerability and resilience to crises and strengthening the crisis response potential of communities" (SERENITY), funded by the Research Council of Lithuania, no. S-VIS-23-21

Urgent situation: Building Resilience through Interactive Learning in Risk and Crisis Management Education

Olof Oscarsson[1], Sophie Kolmodin[1], David Olsson[2]

1Mid Sweden University, Sweden; 2Karlstad University

This paper explores the significant role of serious games in the realm of risk and crisis management education for building resilient societies. Games as educational tools in higher education can be used to facilitate active and interactive learning activities, which have particularly strong potential for development of collaborative and functional knowledge among students, such as communication skills, resourcefulness, adaptability, and other action competences. The presented serious game, Urgent Situation, is a board game designed to facilitate discussion and transformative learning on resilience among students studying risk and crisis management. The players navigate diverse roles within the broader societal context of the game, gaining insights into negotiation strategies and decision-making processes. The game's overarching goal is to present players with various scenarios, prompting them to gather information, negotiate measures, and coordinate tasks to enhance societal resilience. Urgent Situation employs realistic scenarios, offering players a high degree of decision-making freedom within the game environment. Throughout the game, hazardous events strike the society at random, promoting the students to collaboratively seek to advance resilience to a broad range of possible scenarios. The findings suggest that the game effectively stimulates discussion on diverse perspectives regarding societal resilience, emphasizing the collaborative investment and decision-making necessary for synergistic benefits across the entire society.

Set up to Fail – When System Responses to Juvenile Crime Mirror Distrust and Counteract Desistance

Ann-Karina Henriksen, Britt Ø Larsen

Copenhagen University College, Denmark

This presentation centers on children's experiences of system responses to crime and how they can be counterproductive in desistance processes. In 2019, Denmark enacted a new policy reform, which introduced a new system of court-like proceedings and Youth probation service to children aged 10-17. Juveniles who commit violent or serious crimes are now adjudicated to so called 'Improvement programs' lasting 1-2 years with mandatory participation in interventions and supervision by Youth probation service. Based on interviews with 37 children who have been

748

enrolled in the new system, we analyze how the new system (de-)motivates desistance from crime. Drawing on desistance theory we argue that trust is a central perquisite in the desistance process, which punitive control elements can counteract. The lengthy 'Improvement programs' with monthly probation meetings and bi-weekly controls of compliance with all the program interventions sustain a deviant label and self-image and signal distrust in the child.

Despite the intentions with the reform to ensure timely interventions and support to children at risk of crime, children experience a system which centers on punishment, control and 'problem' solving. The system is inherently problem/failure centered, and it fails to recognize children's gradual transformation towards desistance. Children experience being trapped in a system centering on potential crime and deviant behaviour. For the most vulnerable children with adverse disadvantages, the new system is experienced as they are being set up to fail.

The Risk of Precatiate Among Young Graduates

Anita R. Fedor[1], Mihály Fónai[2]

1Univresity of Debrecen Faculty of Health Sciences, Hungary; 2University of Debrecen,Doctoral School of Humanities, emeritus score member

Our presentation describes the characteristics of precatiate among young graduates as well as the factors influencing it. It aims to map whether how regular the precar phenomena are among the young people who are in a favourdble labour market position. Thus, whether the risk of precariate is posed among them.

Precariate is defined as social and labour market uncertainity in which such unfavourable working conditions are concentrated as uncertain, short-term employment or temporary employment contracts (LaVaque-Manty 2009, Standing 2011).

Among other groups endangered by precariate, the presentation focuses on young graduates, and thus, it also analyses the theories dealing with their situation. In addition to the above mentioned factors, the empiric study also examines the risks for instance, unemployment or the horizontal and vertical match of professional skills and the work performed. The empiric secondary analysis is based on the 2018 database of Graduate Tracking System according to the answers of 15 102 recent graduates.

Results show that the risk of precariousness is made up of the following factors: type of contract (temporary), application of skills (not able to apply) type of work (does not require a degree), level of qualification (BA, BSc), place in the company hierarchy (subordinate). The risk of precariate is high in the case of 7.1 % of recent graduates, which indicates that Hungarian young graduates rather belong to the 'salariat' or 'proficians' groups defined by Standing. In this sense, a degree provides a certain protection against precariate (Standing 2011, 2014, 2018).

Reframing Risk And Uncertainty. An Analysis Based On The Everyday Rituals Of Young Adults Living In Milan In The Aftermath Of The Covid State Of Emergency.

Sonia Bergamo

Università degli Studi di Milano Bicocca, Italy

My proposed contribution is rooted in a qualitative study that entailed the analysis of 42 interviews conducted in Milan between 2022 and 2023. Specifically, I investigated how young adults aged between 15 and 34 years have redefined risk in their daily routines following the end of the COVID-19 emergency, which lasted from January 31st, 2020, to March 31, 2022. The analysis I conducted incorporates Mary Douglas's theories of ritual and emotion, along with Beck's concept of cosmopolitics generation. The contribution will offer insights into how young adults perceive and deal with risks and demonstrate how they redefined the COVID-19 risk through their interactions with bodies, places, and materials that they considered risky or protective. Moreover, I have identified how social and cultural factors influenced their changing risk perception. By analyzing their representations and behaviours towards risk, I will show the factors that influence their decision-making processes. The insights provided by this study can be useful for policymakers, public health professionals, and individuals alike who are looking for ways to mitigate risks associated with future crises.

RN22 | T08_02: Risk Management

Balancing Innovation and Risk Management: The Role of Leadership in Performing Arts Organisations

Lies Wijnterp[1], Pauline Koeleman[2]

1HKU University of the Arts Utrecht, the Netherlands; 2Amsterdam University of Applied Sciences, the Netherlands

This paper investigates the role of strategic risk management in performing arts organisations (PAOs) such as theatre and dance companies and performing arts festivals. These organisations, and the cultural and creative sectors of which they are a part, face a number of inherent risks. Caves (2002), for instance, famously identified several distinctive characteristics of the cultural and creative sectors that point to major risk and uncertainty about the economic outcomes of creative activities. This paper looks at the role risk plays in performing arts organisations through an empirical study on its leadership. PAOs often, though not exclusively, work with a dual leadership structure based on structural ambidexterity consisting of an artistic and managing director (Järvinen, Ansio & Houni 2015). The paper investigates how risk is being perceived and operationalized by leaders in such institutions. How do artistic and managing directors influence risk culture and risk behaviour? Specifically, it analyses how leaders in PAOs balance risk management with innovation and risk-taking activities. Risk management and innovation are frequently seen as opposites: risk management and risk averse behaviour are considered to discourage and inhibit innovation (e.g. Gurd & Helliar 2017). We will also study responses to balance this tension between risk management and innovation, such as deletion, compartmentalisation, aggregation or integration (Mometti & Van Bommel 2021). This paper is part of a larger research project aiming to develop a risk management instrument for the performing arts sector, which helps managers make decisions on risk taking and mitigation, as well as on communicating about risks.

Challenging Numbers, Graphs and Decision Making – the Role of Digital Dashboards for Risk and Crisis Communication

Till Bueser, Thomas Kox

Weizenbaum-Institute e.V., Germany

Dashboards are increasingly important as medium for communicating complex issues to both experts and the general public. In addition to being used in professional environments, dashboards have become established as a public communication format for many different applications, in data journalism, as information platforms for public institutions or in the healthcare sector. The recent pandemic has further demonstrated how dashboards enable the visualization of important key figures and data in real time for risk and crisis communication purposes, enabling critical procedures and processes to be communicated amongst decision-makers and experts as well as to the general public.

Despite its frequent use, there is still a certain lack of clarity as to what is meant by a dashboard. Risk and crisis communication faces particular challenges, where dashboard-related information serves as a seemingly objective basis for control, decision support and risk-based decision-making. However, critical decisions can have a significant impact on the environment, social order, and technical processes, as the effects of these decisions are often unclear and can cause unknown cascading effects. Therefore, it is crucial to take into account the issues of uncertainty, ambiguity and illusion of control when making decisions based on digital dashboard applications as these applications may give rise to hidden communicative ruptures.

In our talk we would like to introduce a definitional framework on the topic of digital dashboards and discuss the challenges of using them in the field of risk and crisis communication, based on the results of a scientific workshop and ongoing empirical research.

Between Crisis and Recovery: a Multidimensional Framework for Understanding Organizational Restructuring and Media Discourse

Francesco Nespoli

LUMSA University, Italy

In recent years, the global economy has experienced several downturns leading organisations to implement restructuring strategies, often resulting in job cuts to regain lost competitiveness (De Meuse 2023). However, literature has observed that as the economy recovers, firms keep managing market uncertainties through temporary or permanent redundancies (Capelli & Bidwell 2016).

In this context, Industrial Relations has become a battleground for ideological debate, leading to a renewed public exposure of trade unions. Their aim is to present reported crises as a pretext for efficiency gains (Nespoli, 2018; Martin, 2019).

The recognised convergence of crisis and risk management communication (Reynolds & Seeger 2007, Hardy et al. 2018) is then crucial in organisational restructuring as companies must address the potential reputational damage from media coverage (Millar & Heath 2003, Stäbler et al., 2023).

Drawing on rhetorical arena theory, I emphasise that trade unions are not only collective intermediaries (Frandsen & Johansen 2016), but also have their own organisational goals (such as building trust and fostering solidarity) and

influence within the gatekeeping process (Schmitter & Streeck 1985, Shoemaker & Vos 2009).

This research then presents a theoretical model that identifies multidimensional, context-specific factors that influence the media coverage of organisational restructuring. The model highlights the interplay of socio-cultural, industrial, market, and company-specific elements yet not explicitly linked to media exposure.

The aim of this study is to create a comprehensive framework for interpreting how media portrays business crises in democratic capitalist systems.

It is recommended that future studies empirically test the validity of this framework.

Supporting or Preventing Change? Risk In Inmates' Self-narratives

Nichlas Permin Berger

VIVE – The Danish Center for Social Science Research, Denmark

In the criminal justice system today, risk assessments have evolved over the last decades to support a diverse set of institutional goals and processes. They play an integral role in shaping how practitioners understand and intervene in the lives of offenders in the service of lowering future crime rates. However, our knowledge about how inmates perceive and respond to their own perceived risks remains limited. This paper examines how inmates' talk about risk and how the concept of risk shape their self-narratives and expectations for the future. The study draws on qualitative interviews conducted with 40 inmates in 12 Danish prisons. A thematic content analysis of the data identified three overarching categories: 1) The initial encounter with the risk gaze, 2) When risk assessments fail to attend correctly, 3) A lesson learned for their future. By focusing on how inmates give meaning to risk, we can gain valuable insights into the often fragile experiences of self as reported by the interviewees. The discussion interprets these categories as contributing to narratives of personal transformation. The paper argues that risk assessments paradoxically generate uncertainty and mistrust, which is apparent when the inmates reflect on the present and their future. The paper demonstrates that risk as a discursive category, can hardly capture subjective understandings, the ambiguities of identity, narrative progression or the social context in which personhood is enacted.

RN22 | T09: Risk and Public Safety

Building cities, building capacity: Mixed methods to identify Good Practices

Anna Maria Zaccaria[1], Andrea Pirni[2], Antonella Peresan[3], Roberto Castelluccio[1], Veronica Vitiello[1], Gabriella Tocchi[1], Antonino Rapicano[1], Mariacarla Fraiese[1]

1Università degli studi di Napoli Federico II, Italy; 2Università degli studi di Genova, Italy; 3OGS, Istituto Nazionale di Oceanografia e di Geofisica Sperimentale, Italy

According to recent estimates by the U. N., 4.4 billion people currently live in urban areas, and it is expected they will rise to 5.1 billion by 2050. Due to the population, activities and services density, metropolitan areas have developed high vulnerability and exposure to risks, increasing the need of tools and strategies for risk reduction, emphasizing prevention and resilience building.

Various national and international programs have been initiated to manage the new elements of risk and to promote resilient communities. Among these, the U.N., through the Hyogo Framework 2005-2015, established a paradigm recognizing multi-risk in urban areas, emphasizing the need to consider multiple factors of exposure and vulnerability in risk management. The Sendai Framework 2015-2030 defines four priorities to identify risk mitigation strategies; within this framework, the program dedicated to local contexts is the "Ten Essentials for Making Cities Resilient."

Within this scenario, this contribution aims to suggests a methodology for approaching the operationalization of risk governance, which is currently under development in the PNRR project titled "RETURN – Multi-Risk Science for Resilient Communities Under a Changing Climate."

By analysing the dimensions and indicators of the Senday Framework, through the Disaster Resilience Scorecard for Cities, and matching them with other programs (such as: Australian Disaster Resilience Index, City Resilience Index, and Baltimore DP3), we highlight similarities and differences among the visions underlying these frameworks, providing a critical comparison of the different approaches. The main aim of the research is to identify the key elements and the socio-structural indicators for generating capacity building and resilience in metropolitan cities, which are exposed to natural risks and increasingly aggressive extreme events induced by global warming.

751

Environmental Risks through the Eyes of the Citizens: Participatory Mapping in Klaipėda

Paulina Budryte

Kaunas University of Technology, Lithuania

Participatory mapping is a tool with extensive application possibilities, which could help to assess the current situation, provide insights into geographical and physical conditions, and indicate opportunities and challenges. That is why it is considered as a valuable addition to the city planning toolkit. As cities gain more and more power due to the concentration of human resources and economic opportunities, cities also aim to empower their citizens to be responsible and contribute to the development of their neighbourhood or entire city. During the empirical investigation, participatory mapping activities were carried out in Klaipeda, the third-biggest city in Lithuania. It is also a seaport city close to the Lithuanian-Russian border with vast industrial ambition. Since the main focus of this investigation was public risk perception, participatory mapping allowed to accumulate data and explore what, how and why citizens described certain elements as risks to them directly or causing the risk. Such data served to create a visual representation of public perception of their neighbourhoods and city. Additionally, the comparison between such visualizations and different risk maps of the city prepared by the experts discloses the gaps of public perception and could be used as a foundation for communication strategies, awareness campaigns and general society education.

Experiences of Public Safety: An Intersectional Analysis of Unsafety in Public Space

Ida Sjöberg, Anna Olofsson

Mid Sweden University, Sweden

Safety is often oversimplified as the absence of crime, neglecting the intricate interplay between our bodies, social positions, experiences, and societal power structures that shape individuals' perceptions of public spaces and what is deemed unsafe. While existing critical (often qualitative) research acknowledges this complexity, the current study introduces an exploratory statistical method grounded in an intersectional perspective to deepen our understanding. The primary argument is that unequal power relations among social groups should be integral to safety analyses. This study aims to combine the strengths of intersectional theory, emphasizing diverse social experiences, with the generalizability and analytical capabilities of quantitative methods.

The study employs an intersectionally grounded exploratory quantitative analysis of safety, utilizing Multiple Correspondence Analysis (MCA) to unravel the intricate interactions between structural oppressions, privileges, and subjective experiences of risk and safety in public spaces. Empirically, the study uses survey data from The Swedish National Council for Crime Prevention (Brå) focusing on a local police district in northern Sweden. The theoretical foundation draws on intersectional theory. By integrating intersectional theory with quantitative methods, the study unveils the tangible impact of power structures on individuals' lives and societal dynamics.

Conclusively, the study reveals that feelings of (un)safety in public spaces are inseparable from power dynamics and individuals' opportunities to claim and appropriate public space. Thereto, the study contributes to how quantitative studies of risk and (un)safety can be further deepened.

Impact of Geopolitical Threats on Subjective Perception of Security in Lithuania

Eglė Vileikienė

Ministry of the Interior of the Republic of Lithuania, Lithuania

Due to Russia's war in Ukraine the geopolitical situation of Lithuania has changed. Inevitably, the changed situation affected subjective perceptions of security of the people. This paper examines subjective perception of security and public safety regarding a risk of becoming a victim of crime. In addition, this paper looks at behavioural strategies that people develop in response to the threats.

This paper is based on empirical data from numerous representative surveys that were conducted in the period of 2006-2023 at the Ministry of Interior of the Republic of Lithuania. As the research data shows, there is a positive tendency in peoples' attitudes regarding their safety. Data shows a significant increase in the number of people who feel safe in their immediate environment, have a positive assessment of the criminogenic situation and believe that a risk of becoming a victim of crime is low. However, the study reveals as well that the unfavourable geopolitical situation and Russia's war in Ukraine affected people's attitudes and adjusted perception of risks. The number of people who consider Lithuania a safe country decreased from 76% in 2021 to 69% in 2023, while illegal migration, violent crimes, cybercrimes and crimes related to drugs, as well as corruption, remain important public security issues for the people.

RN23 | Sexuality

RN23 | T01_01: Sexuality, Belonging, Inequalities

Taxing Sex Work in Europe: Citizenship, Belonging and Recognition

Isabel Crowhurst[1], Milena Chimienti[2], Alexandra Oliveira[3]

1University of Essex, United Kingdom; 2University of Applied Sciences and Arts Western Switzerland; 3University of Porto, Portugal

To address the overlooked link between taxation and sex work, in this paper we explore how sex workers in three European countries with different legal and fiscal approaches to prostitution, Italy, Portugal and Switzerland, understand and negotiate tax policies and practices. We approach the taxation of prostitution as a vehicle for exploring the conditions under which sex workers are, or are not, legible to themselves and others as citizens with full rights. We bridge three bodies of scholarship: sex industry studies, critical taxation studies, and citizenship studies to address these interrelated questions: How can we advance our understanding of citizenship by looking at the tax experiences of sex workers? How can we further our understanding of taxation as a marker and maker of citizenship by looking at the experiences of sex workers? Empirically, we present one of the few studies to explore sex workers' perspectives on the tax regimes they operate within and how they negotiate the challenges they face in their quest for full citizenship. Drawing on interviews conducted in the three countries, we show how our participants make sense of and negotiate very different fiscal policies and practices, how these affect their sense of self and belonging, and the challenges they face on a daily basis in their confrontation with economic, housing and social exclusion.

To Defy Is To Belong: WLW Identities In The Israeli Military

Anat Zalzberg

Tel Aviv Univeristy, Israel

Sexual practices and gender performances are well-studied aspects of queer citizenship, both as objects of state surveillance and control and as differentiating aspects of different models of queer identity. I look into how WLW Jewish Israeli soldiers perform sexuality and gender as part of their relationship with the military as a state institution.

Studies of homonational politics often focus on state institutions or LGBTQ political organizations, deemphasizing queer homonational subjectivity. This paper focuses on the experiences of WLW individuals as they contend with a state institution that is identified with homonational politics, militarism, and hyper-masculinity. This focus allows for an analysis of sexual and gender practices as tools to mitigate moral ambivalence and as a tenet of emergent homonational identities.

This paper is based on a qualitative, narrative analysis of in-depth, semi-structured interviews with Jewish Israeli WLW former soldiers. The informants described the military as a paradoxical site of belonging and othering. The hyper-masculine gender regimes exacerbated homophobia and misogyny while creating rare opportunities for sexual experimentation and performing female masculinity. These women channeled sexual and gendered expression to highlight distinctions between them and their male counterparts and maintain a sense of belonging to the military unit and the state.

This analysis innovates our current understanding of how bargaining with state institutions interweaves the formation of queer subjectivities. Furthermore, it sheds new light on attempts to harness and reinvent liberal or militarist feminism as narratives and tactics for opposing male dominance in settings shaped by powers that devalue women and femininity.

Women Who Pay for Sexual Services: A Study on Motivations and Empowerment Through Commercial Enactments of Female Sexuality

Kristiina Janica Vesanen

University of Porto, Finland

This dissertation study examines the commercial sex from the experiences of female-identified clients and the sexual service providers catering to women in Finland. Female clients have been overlooked in academic research due to prevailing assumptions that sex workers are exclusively women serving heterosexual men. Guided by the ethics of care as a theoretical framework, this study explores the motivations driving women to pay for and offer sex, examining how these transactions contribute care through sexual exploration and empowerment. The study delves into sexual service providers' perceptions of their role and the demand from female clients. Emphasizing participant-driven insights through in-depth interviews, this research recognizes participants as experts in their experiences and uses Interpretive Phenomenological Analysis (IPA) in the analysis. The initial findings reveal that women engage in these transactions for sexual exploration, empowerment, and the fulfillment of intimacy and pleasure, challenging established norms and stereotypes, and providing nuanced insights into female sexuality and the sex industry. Amplifying the voices of female clients and service providers, it aims to generate fresh knowledge about behaviours, practices, and experiences within the industry. The research further explores female sexual pleasure, desire, and agency, contributing to the development of novel theories of sexuality. In addition to destigmatizing sex work, this research holds potential implications for positive shifts in policy and gender relations. Building on more nuanced understanding

753

human sexuality within the context of commercial sex and ethics of care is vital to the gender emancipation in the economy.

Silence and Wait: Systematic Inequality On Trans People's Access To Reproductive Health In Portugal

Paula Durks Cassol

University of Coimbra, Portugal

Since 2018, Portugal has had one of the most progressive legislations on gender identity recognition, achieved after years of struggles and activism from the LGBTI+ movement. Nevertheless, there is silence on public policies to materialize trans people's access to reproductive healthcare, prejudice from healthcare professionals in providing those services, and long waiting lines to access proper reproductive health services. Using the Reproductive Justice framework, this paper conducts a systematic review of the literature on reproductive health in Portugal to question the discourses on trans people's access to reproductive healthcare, examining how this can be more comprehensively addressed. Drawing upon archival research spanning national legislation and healthcare guidelines from 2018 to 2023, along with insights gleaned from interviews with healthcare professionals catering to the trans community, this study constructs a critical analysis of the reproductive challenges encountered by trans individuals. The focus is on their symbolic sterilization and the subtle implications of passive eugenics. The examination delves into the discourse surrounding trans people's reproductive healthcare, scrutinizing the perspectives upheld by Portuguese normative standards and healthcare professionals. This work contributes to comprehending the social dynamics of reproductive health among trans people in Portugal so that it can be improved, and their human rights can be realized. Trans people are not sterile by default, and it is their right to have the opportunity to make informed choices at the proper time about their reproductive life, as well as to access proper reproductive healthcare to materialize those choices.

RN23 | T01_02: Pornography, Consumption and Representation

The Ethical Porn Consumer

Sidsel Harder[1], Peter Ejbye-Ernst[2]

1University of Copenhagen, Denmark; 2Netherlands Institute for the Study of Crime and Law Enforcement

Stakeholders such as police, NGO's, and therapists suspect that the people who report material to child sexual abuse hotlines often have sexual thoughts about children themselves, but research into this type of reporting is extremely scarce. This mixed-methods study draws on both quantitative reporting data from the Danish and Belgian hotlines and qualitative interviews with Danes, who have reported or considered reporting child sexual abuse material. We use descriptive and narrative analysis to explore how, when, and what people report. Quantitatively we find that – despite very different reporting rates and sexual cultures – the two hotlines from Belgium and Denmark have similar reporting quality in terms of how often the reported material warrants reporting according to national law. About a quarter of the reported images qualify as CSAM and can be investigated criminally in the two countries. We also find significant covariation in reporting times but different characteristics of the reported images themselves. Qualitatively we find that (potential) reporters explain to have stumbled upon the images while browsing online – in some cases for porn – and that they experienced a moral and ethical imperative to help the depicted child. These emotions are, however, mixed with shock reactions as well as shame, fear, and frustration. We argue that knowledge about the complexities of finding sexually abusive images online are currently poorly understood. Reporters' helping behavior is unacknowledged in the professional field of child protection – as well as in public discourse – which can negatively impact reporting rates because it stigmatizes reporters.

"Lesbian Porn Ticks That Box": Sexual Subjectivity and the Category of Lesbian Porn

Rotem Avgar

Ben-Gurion University of the Negev, Israel

In recent years, the growing number of women who watch porn received attention from scholars in various fields of research. Furthermore, Pornhub Insights, the statistical blog of "the world's biggest porn site," suggests that one-third of its dozens of millions of entries a day are of women, analyzing this demographic category with regard to preferences and habits.

A notable phenomenon within this demographic is the consistent popularity of the Lesbian category, challenging established assumptions concerning the category's intended

754

audience, i.e., men, and the role sexual identity plays in pornographic content choice.

In my talk, I will delve into the motivations underlying the engagement of heterosexual women with lesbian pornography. The methodology used encompasses an exploration of online articles written by and about straight viewers, seeking to unveil the multifaceted factors contributing to their habitual consumption of lesbian porn. This study posits lesbian pornography, even the highly criticized mainstream one, as a platform for straight women to explore and articulate their desires, thereby shaping a new sexual subjectivity.

In addition to this, I will present an analysis of a sample of popular lesbian pornos available on Pornhub, pointing to the ways in which characteristics of this mainstream category may, in fact, be advantageous for its straight women viewers.

Pornline: New Spaces Mean New Representations? Bodies, Gender and Sexual Practices Through the Lens of Pornhub, Xnxx and Xvideos Video Previews

Angelica Spampinato, Gaia Antinelli, Gaia Peruzzi

Sapienza University of Rome, Italy

If sexuality is perceived as a marginal topic in sociology, this seems truer for pornography, whose field of study seems to be considered a dirty work (Irvine 2014). But it is unquestionable that nowadays sexual contents are available more than ever (Paasonen 2019). This visibility is possible thanks to pornographic

platforms, which are the main containers of pornographic offer. The multiplication of sexual contents and the easy access open up new interrogatives related to new sexual practices and to the changes of morality.

The idea of this research is that the unprecedented number of representations of bodies and sexual practices offered by porn platforms today could be a useful opportunity – far away from censorship – to investigate sexual desires, by exploring the content offering. In addition, sociological studies around the topic of online pornographic contents are prevalent unexplored by literature.

For this reason, we are presenting a research that focuses the attention on representations of bodies in porn platforms. We have collected in six months – using the technique of the analysis of content – 850 previews of the videos categorized as Top of the day in Italy in the three most visited platforms in Italy and in the world: Pornhub, Xvideos, Xnxx. We have selected 386 previews from Pornhub, 284 from Xvideos and 180 from Xnxx.

The aim is to explore how bodies are represented in this kind of platforms: what are the effects of technological transformation of porn in bodies' representations? What the representations of sexual practices can tell us about sexual preferences and tastes in the contemporary era? Are there any differences related to gender roles in representation of bodies?

RN23 | T02_01: Sexuality, Digital Perspectives and Experiences

Beyond Consent: Navigating Digital Intimacy and Legal Discrepancies Among Danish Youth

Anne Mosegaard Gravholt

University of Copenhagen, Denmark

Until recently, research focusing on the production and sharing of intimate images non-consensually has primarily examined the phenomenon within the scope of sexual violation, abuse, and risky behaviour. Yet, little is known about how young people define and negotiate boundaries when non-consensually sharing intimate images. In Denmark, the concept of digital violence has similarly gained footing within the past few years in describing digital violations such as sextortion, hurtcore, and non-consensual sharing of intimate images. Despite legal efforts to address these crimes, an increasing share of young people in Denmark is exposed to (and often simultaneously guilty of) digital sexually transgressive behaviour. This paper presents research suggesting that there is a discrepancy between how young people perceive these violations and how they are prosecuted and sentenced within the Danish criminal justice system. Drawing upon focus groups and interviews with young people (15-25 years old), the paper provides insights into how socio-technological dynamics, sexuality, and legal boundaries form part of a complex practice, to some extent legitimising actions of sharing intimate images without consent.

Dicking Around: Choreographing Dick Pics in Public Sexual Digital Interactions

Doron Mosenzon[1], Dana Kaplan[2], Yeela Lahav-Raz[1]

1Ben-Gurion University, Israel; 2The Open University of Israel

The phenomenon of the "dick pic" has attracted much scholarly and popular attention. Most discussions around the topic focus on private one-on-one digital interactions, and studies that regard the public aspects of dick pics focus on issues of consent and harassment or subversive responses and reinterpretations of dick pics. While the affective force of the dick pic is recognized, the focus on private exchanges creates a monolithic view of how they are used in sexual interaction.

Studies of public digital sexual interactions are often examined through the theoretical prisms of community building, identity construction, and subjectification. Recent research

has considered how public digital sexual interactions create specific collective affects, yet there is still a paucity of studies examining how collective affective environments shape digital sexual interactions.

Based on ongoing mixed methods research, this paper analyzes the public exchanges of dick picks among Israeli gay and bisexual men on Twitter (X). Combining a symbolic interactionist perspective and theories of intimate digital publics, we examine how a sexual environment created on a public digital platform shapes different utilizations of dick pics within sexual interactions.

By studying textual, meta-textual, and visual elements of dick pic posts, we show how within an affective environment of constant collective arousal, dick pics become a form of participation and contribution to an ever-ongoing mass erotic conversation as the paradigmatic sign of male sexual arousal. More broadly, this case study allows us to better understand how digital affordances and collective affective spaces shape interactive dimensions of digital sexuality.

Navigating Digital Intimacies: Italian Teenagers' Insights into Their Everyday Digital Practices

Vittoria Bernardini[1], Cosimo Marco Scarcelli[1], Francesca Comunello[2], Lorenza Parisi[3]

1University of Padova, Italy; 2Sapienza University of Rome; 3Link Campus University

The relationship between digital practices, gender, and intimacy in teenagers' everyday life is gaining growing attention. Current research has explored digital media as environments that offer young people agency and spaces where they can construct and perform their identity, with specific regard to gender and intimacy.

In our paper we investigate how Italian teenagers (aged 16-18) (re)define their understanding of gender and intimacy by engaging with digital media and incorporating it into their daily lives. We adopt a media practice paradigm in order to analyse what young people do with and through digital media, examining how teenagers (re)negotiate their gender identities and intimate life in their everyday use of digital media.

We are conducting six focus groups with students aged 16-18 from secondary schools in six cities in three Italian regions. Focus groups employ mood boards as visual elicitation methods to prompt participant discussion and enable participants to express themselves and reflect about sensitive topics such as sexuality, intimacy, and gender identities. The empirical material collected from the focus groups will be analysed using critical discourse analysis (focus group transcripts) and visual content analysis (moodboards).

Our results are expected to cover a wide set of digital practices, including the management of teenagers' self-representations on social media, their use and views on dating apps, the exchange of intimate content via mobile phones and/or the Internet, as well as the practices of sharing information regarding gender or sexual issues with specific networked publics.

RN23 | T02_02: Doing LGBTQI+ History: between Memory and Future

The Importance Of Collecting LGBTI Historical Memory In Dictatorships: The Portuguese Case

Raquel Afonso

IHC-NOVA FCSH/IN2PAST, Portugal

The History learned at schools is the history of winners, directly related to the official memories of States, although another "history", or "stories", are written in the margins. These other stories are constituted of weak memories (as Enzo Traverso calls them) associated with subordinate and oppressed groups. When the concern with the collection of memories of subordinated people began to emerge in the mid-1980s, stories were collected about the oppression and resistance of people called "without history": workers, political dissidents, women, indigenous peoples, ethnic and racialized minorities. Following the path other European countries have taken, Portugal has witnessed a process whose goal is to make sexual and gender diversity visible. The academic world has launched several publications related to these themes, from the emergence of the LGBTI movement to the achievement of civil rights. However, these works only address a part of the history, that begins in the democratic period.

On the 50th anniversary of the end of the dictatorship, what has been done to recover these weak memories? This communication aims to take a journey through investigations and other initiatives whose objective was to recover LGBTI historical memory, particularly during the dictatorial period, which prevailed in Portugal between 1926 and 1974.

756

Daniela Ferrández Pérez, Mapping the Recovery and Dissemination of Memories of Sexual Dissidence in Spain: Status, Initiatives, and Future Perspectives

Daniela Ferrández

Universidade de Santiago de Compostela, Spain

[I wish this paper to be considered within the panel Doing LGBTQI+ History: between Memory and Future organized by the research project REMEMBER at CES-UC]

In recent years, there has been an international upsurge of memorialist movements calling for the inclusion of sexual dissidence in the memory policies developed by public administrations.

These demands point out that the LGBT collective, as we understand it today, remains

excluded from the public transmission of democratic memory. Therefore, recovering their

stories and memories becomes a necessary element for advancing social justice and civic values. Based on this premise, the objective of this communication is to compile and position the main academic, institutional, and activist initiatives that have been developed in Spain to recover the memory of sexual dissidence. Through this qualitative review, the interrelation and dialogue between academia, activism, and institutions in the development of these initiatives will be analysed. Similarly, the mapping will enable the identification of the territorial distribution of memory recovery projects, as well as the main contents and themes of interest from which they draw, and the primary means used for their dissemination.

The results of this mapping are not only useful for understanding the current state of the public recovery of memories of sexual dissidence in Spain but also for reflecting on potential future perspectives.

From Embodied Experiences To Future Intervention: Creating A Toolkit On LGBTQ+ Ageing People's Needs

Mara Pieri

University of Coimbra, Portugal

[I wish this paper to be considered within the panel Doing LGBTQI+ History: between Memory and Future organized by the research project REMEMBER at CES-UC]

LGBTQ+ people in later life tend to have poorer health and often harder experiences in healthcare than the rest of the population. Also, they show higher risks of chronic illnesses, dementia and/or mental health issues, as the effect of cumulative discrimination in life. The paper analyses the process of creation of the first toolkit on LGBTQ+ health in later life, created for healthcare providers in Portugal in 2024. The toolkit followed the inputs collected during the project "REMEMBER – Experiences of older LGBTQ+ in Democratic Portugal (1974-2020)". In the first phase, through biographical interviews with LGBTQ+ ageing people, we identified key issues to be addressed with healthcare providers and suggestions stemming from lived experiences. Second, we analysed examples of guidelines, toolkits and learning frameworks from different countries and identified additional topics of interest. Third, we constructed a toolkit in which personal experiences generate guidelines. The toolkit uses an accessible language and is available both online and on paper. In the paper, we advance that the process that led to the creation of the toolkit is an example of co-constructed scientific knowledge in healthcare. The interdisciplinary triangulation between academia, healthcare providers and LGBTQ+ people is fundamental to generating a positive impact on the practices of healthcare and can lead the way to shape a different future for LGBTQ+ ageing people.

Between Invisibility And Authenticity – LGBTQ+ Ageing In Contemporary Portugal

Ana Lúcia Santos

University of Coimbra, Portugal

[I wish this paper to be considered within the panel Doing LGBTQI+ History: between Memory and Future organized by the research project REMEMBER at CES-UC]

Ageing as an LGBTQ+ person in contemporary Portugal occurs over an era marked by the accomplishment of numerous legal rights, juxtaposed with a historical backdrop of prolonged dictatorial and social oppression. This historical context may have a profound influence on how older individuals perceive their later years concerning non-normative sexual orientation or gender identity. The dual stigma faced by this population, as both older citizens and members of a sexual minority, underscores the imperative of disclosing their unique experiences. This presentation centres on biographical interviews with LGBTQ+ people who have experienced significant life transitions, focusing on ageing in contemporary Portugal after experiencing youth and adulthood during a dictatorship. The presentation aims to highlight the life narratives of both transgender and cisgender individuals, evidencing the need for inclusive approaches, including creating inclusive social spaces and ensuring access to health services. By sharing life stories, this study seeks to unveil narratives of resilience, resistance, authenticity, and the ongoing advocacy for rights within the LGBTQ+ community.

RN23 | T03_01: LGBTQI+ Ageing in Southern Europe

Ain't I a Queer? Getting Old at the Crossroads of Queer Pride and Ageist Pain

Ana Cristina Santos

Centre for Social Studies – UCoimbra, Portugal

[I wish this paper to be considered within the panel LGBTQI+ Ageing in Southern Europe organized by the research project TRACE at CES-UC]

Abstract:

Portugal has been considered one of the safest destinations for LGBTQI+ people, raking highly according to the ILGA Europe's Rainbow Map 2023 and other prestigious indicators in the past decade. However, such acknowledgement of diversity does not take into account the full spectre of the life course, leaving older queers in a situation of extended vulnerability.

More specifically, there is a tension expressed by older LGBTQI+ people over 60: the idea of feeling torn between self-identity as sexual and/or gender diverse, on the one hand, and social expectations related to age and ageing, on the other. Such juncture of LGBTQIphobia and ageism is often a motif of unspoken pain at a moment when political resources are not (yet?) available to protect this population both within the LGBTQI+ community and the realm of legal and social policies. The complexity of queer ageing experiences is enhanced under the current climate of populism, anti-gender backlash and the resurgence of extreme-right wing ideals.

Drawing on biographic narrative interviews conducted in Portugal in the context of the REMEMBER and TRACE research projects, the paper will evolve around the experiences of ageing with pride and ageing with pain, focusing on the embodied knowledge offered by older LGBTQI+ people towards more inclusive and democratic societies.

A Queer Metamorphosis: Exploring the Evolution of LGBTQ People's Rights and Ageing in the Maltese Archipelago

Joana Brilhante

University of Coimbra, Portugal

[I wish this paper to be considered within the panel LGBTQI+ Ageing in Southern Europe organized by the research project TRACE at CES-UC]

In the span of approximately a decade, the Mediterranean microstate archipelago of Malta underwent a profound transformation. From being a nation where divorce was prohibited until 2011 and receiving a 0% score on the 2012 ILGA Rainbow Europe Index, Malta has metamorphosed into an exemplary country regarding LGBTQ legal protection among European counterparts and the world. Even though it is regarded as a bastion of queer rights, the existing literature still reveals a gap in what concerns the human rights of older LGBTQ individuals. This paper presents preliminary findings from a qualitative, multi-methods ongoing investigation in Malta. By examining the intersection of LGBTQ rights and ageing, the study delves into the complex interplay between the legal framework, stakeholders' opinions, and the lived experiences of the older LGBTQ individuals interviewed. These preliminary findings contribute to a nuanced understanding of the distinctive needs within this particularly vulnerable population, thus bridging the gap not only in the literature but also between law and practice.

Introductory remarks on LGBTQI+ Ageing in Greece

Pako Chalkidis

University of Coimbra, Portugal

[I wish this paper to be considered within the panel LGBTQI+ Ageing in Southern Europe

organized by the research project TRACE at CES-UC]

Although sexual practices between adult men were decriminalised in Greece in 1951 and the first homosexual groups were already formed since the late 70s following the fall of the seven-year military junta regime, it was not until 2014, amidst the Greek financial debt crisis, that Greece''s legislation regarding LGBTQI+ rights began to shift from a negative stance to a more inclusive one. This change was mainly due to pressure deriving from European guidelines, and the European Court of Human Rights. In the decade that follows, from 2014 to today, Greece according to ILGA-Europe (2023), has made significant improvements in the legal and policy situation of LGBT people, and now ranks among the highest of the 49 countries evaluated. This paper focuses on a society that is ageing at one of the fastest rates in the European Union, with people over 65 years old accounting for 22.82% of the total population (Statista, 2023), and seeks to unfold some preliminary remarks revolving around a yet-to-open question: How do people over 60 who have lived and aged as lesbian, gay, bisexual, transgender, and/or intersex (LGBTQ+) in Greece recount the traces, if any, generated in their life course by this tremendous legislative transition from the criminalized figure of the homosexual residing in the Penal Code (back in the 1950s) to the multicoloured statistics classifying the European Rainbow Map and Index of LGBTI equality rights, laws, and policies?

LGBTQ+ And Ageing In Italy: An Intersectional Perspective

Irene Massa

CES / Centre for Social Studies of the University of Coimbra

[I wish this paper to be considered within the panel LGBTQI+ Ageing in Southern Europe organized by the research project TRACE at CES-UC]

758

The history of LGBTQI+ rights in Italy is characterised by what is called "repressive tolerance": no openly hostile laws, but only as long as homosexual behaviour was kept in the shadows.

From the 1950s to the birth of the first associations in the 1970s there is evidence of

systematic persecution of LGBTQI+ people, who now fall within the age group considered "elderly". The condition of LGBTQI+ older people, known in the literature as "queer unwanted", can be placed within a framework of intersectional discrimination, as they are discriminated against by LGBTQI+ younger people due to ageism, by heterosexual older people due to homonegativity and by care services due to heteronormative culture. The current generation of older people is also the first to grow old with HIV, so they are also pioneers in this aspect. The increase in life expectancy in fact leads people to be confronted with polypharmacy, of which there are not enough studies due to the absence, so far, of a sample of older people. The current research is limited in number and does not provide enough information to understand the population in its entirety, which is made up of different economic and social conditions. The aim of this presentation is to understand the current experiences of LGBTQI+ people over 60 regarding intimate citizenship in a Southern European context such as Italy, where there are no laws protecting the quality of life of this population and where the threats of the extreme-right are becoming more tangible.

RN23 | T03_02: Sexuality and Trust: Critical Perspectives

On the Role of Trust in Sexting as Boundary Work

Rikke Amundsen

King's College London, United Kingdom

Focusing on the concept of 'boundaries', this presentation will examine how trust is used to navigate boundaries in the context of adult male sexting practices with women. 'Sexting' will here be understood as the creating, sending, and receiving of private sexual texts and images (still or moving), usually through the use of digital technology. The presentation will draw on interviews conducted between May 2022 and May 2023 with adult self-identifying men based in London and Cambridgeshire, UK, about their use of digital technology when sexting with women. Some of the 15 participants taking part in this study expressed high levels of concern about the worry that – in sending sexting material to women – they might inadvertently cross the receiver's boundaries. This concern was generally linked to worries about acting without consent and, consequentially, associated with some of the harmful sexual activities discussed in public and media discourse in relation to, for instance, #MeToo. At the same time, whilst these participants were concerned about crossing the boundaries of their receiver when sexting, sexting was also cast as an opportunity to rid themselves of limiting personal boundaries with regards to the expression of their sexuality. Indeed, these participants also discussed sexting as an activity that provided a space to cast aside restrictive factors and ideas – particularly with regards to male sexuality – thus enabling a less inhibited expression of desire. To navigate potential conflicts between the different boundaries involved in their male-to-female sexting practices, several of the interviewees taking part in this study turned to and relied on understandings of interpersonal trust between them and their sexting partner.

759

To Trust Or Not To Trust: Trust Dynamics In The Czech And Slovak BDSM Community

Steven Saxonberg, Lucie Drdová, Lucie Krivankova

University of Hradec Králové, Czech Republic

This contribution explores the nuanced relationship between the existing political landscape and the level of trust towards the mainstream population within the Czech Republic and Slovakia BDSM community. The political situation in both countries has a common history as one country. However, in recent years, the political context in both countries has undergone significant transformations in different directions, impacting various aspects of social life, including the life of sexual minorities.

Drawing on ethnographic interviews and participant observations within the BDSM subculture of both countries, this research examines the evolving trust issues of BDSM practitioners towards the mainstream population. Key factors include the political discourse about sexual minorities, legislative changes, media representation, and broader socio-political shifts that may contribute to feelings of trust or distrust. Furthermore, the study delves into the strategies employed by BDSM practitioners to navigate through particular societal attitudes in the evolving political climate. By focusing on the BDSM community in the Czech Republic and Slovakia, the study offers valuable insights into the ways political developments shape interpersonal relationships, foster community cohesion, or create tensions between minority groups and the broader population. The implications of this contribution extend beyond the BDSM context, providing a framework for understanding the impact of political dynamics on trust within diverse social communities.

Untangling Tension between Social Services and LGBTIQ+ Children and Minors in Italy. The Employment of Anti-Oppressive Practices to Build Trust Towards a More Inclusive Society.

Marco Bacio, Cirus Rinaldi, Riccardo Caldarera, Christian Di Carlo, Francesco Macaluso, Maria Urso

University of Palermo, Italy

This paper provides an analysis of the material collected for the EU project "Colourful Childhoods. Empowering LGBTIQ children in vulnerable contexts to combat gender-based violence across Europe", for which we were responsible for Italy. Alongside a quantitative survey dedicated to teenagers (aged 12 to 18), most of the data collected are qualitative, coming from interviews with professionals that work with children (psychologists, endocrinologists, training counsellors, educators, social workers, and LGBTIQ+ ONG national and local volunteers); focus groups with adolescents; a workshop and a series of events with children; an evaluation of services dedicated to LGBTIQ+ children and minors; and a training module and a series of events for professionals, in particular dedicated to social workers.

These data clearly show the needs of young LGBTIQ+ people for recognition within the family, at school, and in access to social services. Unfortunately, gender-based violence, sexual orientation, and gender diversity lack intervention from the State and other public actors. Moreover, young LGBTIQ+ have no space for confrontation where they can communicate and define themselves. It does not come as a surprise since Italy has a tightened history with conservative values, mainly driven by the Catholic Church.

The social and welfare workers who participated in the project acknowledge the need for children and minors to be recognised and are willing to take steps towards a more inclusive society. However, they need better instruments and tools to contribute to their growth effectively. For this reason, we suggest the employment of anti-oppressive practices. Indeed, achieving social justice through social change is the only successful mechanism for LGBTIQ+ children and minors to become members for all intents and purposes of our society.

The Motif of Heterosexuality: An Element of Tension and Trust in Constructing Sexist Violence. An Analysis of Anti-Violence Campaigns.

Sabine Wallner

University of Innsbruck, Austria

Sociological violence research suggests that the sanctioning of illegitimate violence fosters trust in modernity. Applied to sexist forms of violence, this thesis becomes shaky. Ubiquitous sexist violent behavior is not only comparatively less sanctioned, but it is normalized or even socially rewarded. Unexpectedly, the extent of these forms of violence doesn't lead to a fundamental crisis of trust in modernity.

Hence, I raise the question of what function sexist violence serves within this relationship of trust and modernity. Methodologically grounded in Fleck's »Denkstilanalyse«, I argue that the idea of heterosexuality is crucial to the »Denkstil« of sexist forms of violence as a trust-stabilizing praxis of an order that can be described as a modern colonial gender system.

760

Empirically I will show this on the largely unexplored format of the anti-violence campaign. Initial analyses show that the motif of heterosexuality unfolds a transformative tension: 1. sexist violence is portrayed as a norm violation of romanticized and idealized heterosexuality. By naturalizing heterosexuality as private sexist violence is 2. conceptualized as belonging to the sphere of the apolitical. Thereby 3. heterosexuality functions as a motif that enables to mark sexist violence as a battlefield of homosocial relations that are foundational linked to the societal-sexual contract. While 4. victims of violence remaining invisible, marking them as dependent on the validation of their experiences and protection by diverse masculinities.

These preliminary findings suggest that sexist violence is not thought as a fundamental breach of trust; on the contrary, it serves as a trust-stabilizing motif. This innovative approach enables an understanding of the persistence of sexist forms of violence as crucially functional for a modern societal order.

RN23 | T04_01: Contested Intimacies, Kinship and Sexual Practices

Reimagining Kinship Through Lala Families in Transitional China

Xiaowei Long

University of Essex, United Kingdom

This study examines the transformative dynamics of kinship within the context of Lala families in transitional China. "Lala" is commonly used for the self-identification of non-heterosexual women in China and serves as an umbrella category for female same-sex sexuality within urban settings in the country. Since the Reform and Opening-Up, traditional social structures in China have undergone tremendous changes. This transformation, occurring within the economic and cultural systems, reflects a vibrant coexistence and fusion of modernity and tradition. Concepts of family, marriage, and gender roles have evolved compared to before. In this process, families formed by same-sex female partners challenge and reshape traditional kinship concepts.

Through participants' narratives, three distinct forms of Lala families emerge: extra-marital families practised by Lalas trapped in traditional marriage families; contract marriage families based on traditional family norms which require understanding within the context of Chinese culture; and planned Lala families benefiting from advancements in reproductive technologies to fulfil their dreams of parenthood, creating new practices in kinship, parenting, and intergenerational interactions. Unlike previous kinship research focusing on mainstream family structures, this study prioritizes daily life practices, employing thick description to highlight the diversity and resilience of Lala families. This exploration contributes to a broader understanding of queer kinship in mainland China, unveiling the inherent complexity and possibilities of family transformations during societal shifts. It also aids in reimagining diverse concepts of family for the future.

Casual Sex Among Bulgarian Young People – Attitudes, Practices and Social Determinants

Gergana Nikolaeva Nenova[1], Tatyana Kotzeva[2], Elitza Dimitrova[2], Radostina Antonova[3]

1Sofia University "St. Kliment Ohridski, Bulgaria; 2Bulgarian Academy of Sciences; 3New Bulgarian University

Following the fall of the socialist regime, the Bulgarian society became more prone to discourses on sexual freedom and gender equality. In the last decades rapid digitalization provided unlimited access to the increasingly sexualized global Internet culture which exacerbated this process. At the same time, the recent anti-gender mobilizations relying on the discourse of a revival of 'the traditional family' has questioned the morality of "Western" norms of sexuality.

In the context of these socio-cultural changes and conflicting discourses, the paper explores the prevalence and approval of casual sex among Bulgarian young people by analyzing qualitative and quantative data. Based on 33 in-depth interviews with young people aged from 16 to 27 we conclude that a belief that casual sex is widespread is paradoxically combined with reluctance to engage in it. To better understand this phenomena we analyze empirical data collected through a nationally representative survey with 2461 young people aged 18-24. Items from the revised Sociosexual Orientation Inventory (SOI-R) are used to measure the behaviors and attitudes towards casual sex. We explore the influence of factors like gender, sexual orientation, ethnicity, type of settlement, etc. The results show that young adults who are students or have graduated, those who live in the capital and big cities and those who work are more inclined to engage in casual sex behaviors and to express tolerant attitudes towards it. Significant gender differences have not been found on the scale. The main conclusions are related to the role of digital technologies in destabilizing the traditional sexual scripts (prescribing sex within relationships) and the erosion of the gendered norms of sexual attitudes and behaviors.

761

Bisexual Masculinities in the Context of Intimacy, Prejudice and Identity Negotiation

Samuel John Lawton

University of Glasgow, United Kingdom

Bisexual men stand at the intersection of competing heteronormative, masculinist and homonormative discourses. Prejudices arising from media discourses of the AIDS crisis have an enduring impact on bisexual men's relationships today: stereotyping bisexual men as promiscuous, hypersexual and necessarily nonmonogamous. Large scale attitudinal studies have shown that bisexual men tended to be rated worse than most other sexual minorities, including bisexual women, gay men and lesbians. This paper draws on 17 qualitative semi-structured interviews with bisexual men and their partners, analysed using interpretative phenomenological analysis, allowing for the interplay between participants and researcher. Bisexual men's intimate relationships are examined, including how relationships are formed under heteronormative constraints, in the face of double discrimination from both straight and queer social spheres, as well as how identities are formed and negotiated within relationships. Additionally, this paper examines how bisexual individuals and their partners negotiate the family and the couple norm, whilst negotiating ethical nonmonogamy, sometimes for the first time. Results from this qualitative study show that there are general lacunas of understanding that persist about bisexuality, and that bisexual identities emerge in contested spaces. Bisexual men's

intimate relationships were sites of safety, transformation and experimentation, whereas familial relationships were often fraught with tension. The author also distinguishes between homophobic prejudice that bisexual men face, which were often perpetrated by unknown people in public spaces, with binegative prejudice which was often faced in more intimate settings, and founded less on violence than epistemic injustices. The author concludes by situating bisexual men's masculinities in the broader landscape of sexual politics in the 21st century, complicating claims of uncritical 'inclusive masculinity' and against rising social conservatism towards LGBTQ+ people.

Unveiling Queer Aging Realities: Preliminary Findings from "Imagining Queer Aging Futures"

Joanna Mizielińska[1], Agata Stasińska[2], Linn Sandberg[3], Rebecca Poldsam[4]

1Collegium Civitas, Poland; 2Collegium Civitas, Poland; 3Sodertorn University; 4University of Tartu

The international project, "Imagining Queer Aging Futures," (PI: Linn Sandberg, Co-Is: Joanna Mizielińska, Agata Stasińska, Rebecca Põldsam) delves into the nuanced experiences of LGBTQ+ individuals aged 50+ in Poland, Estonia, and Sweden. The Baltic Sea region, facing one of Europe's swiftest ageing populations, represents a vital yet underexplored terrain for ageing research. Within this demographic landscape, the experiences of sexual and gender minorities, grappling with persistent discrimination and stigma, remain conspicuously overlooked. Previous studies, predominantly situated in Anglo-American contexts, underscore the vulnerabilities confronting ageing LGBTQ+ individuals. However, these vulnerabilities are intricately linked to the unique sociocultural contexts of the region, marked by variations in eldercare provisions, civil rights, and attitudes towards minorities.

This project aims to bridge the gap in knowledge by focusing on the ageing trajectories of LGBTQ+ individuals aged 50 and older in Poland, Estonia, and Sweden. Participants are encouraged to articulate their visions of liveable later lives by employing a qualitative mixed-methods approach—encompassing focus groups, individual interviews, and innovative visualisation methods. The study seeks to unravel the everyday practices and adaptive strategies LGBTQ seniors employ as they navigate ageing.

Drawing upon our preliminary findings, this presentation offers early insights gleaned from workshops and interviews with LGBTQ+ 50+ informants in Poland. Our discussion extends to methodological intricacies and recruitment challenges encountered in diverse Baltic Sea localities where the study is conducted. Inspired by queer and ageing methodologies, alongside the principles of public sociology, our study aims to contribute valuable perspectives on the needs and aspirations of ageing LGBTQ individuals in the Baltic Sea region, thereby informing strategies to enhance their wellbeing.

RN23 | T04_02: Sexuality, Aging, Health and Vulnerabilities

Young Women's Sexual Expression and Vulnerability: Analysis of the Affective Atmosphere of "Attacking" Youth Leisure Spaces

Rachel Levi Herz

Bar Ilan University, Israel

This paper analyzes the Israeli case study of "attacking" to reveal different affective relations that inform both young women's intensified vulnerability and sexual expression. "Attacking" is slang to describe a common Israeli heterosexual script for casual interactions in youth nightclubs. Based on the theory of vulnerability and the theory of affect, it establishes a relational standpoint to offer the ambiguity of the affective atmosphere as a path to rethinking young women's sexual expression, challenging neoliberal perceptions that distinguish vulnerability and risks from the possibility to act. Data was collected through 39 semi-structured interviews with young women (aged 18-23). This research affective methodology relates to different affective responses as epistemic resources that open up alternative research questions and insights. The findings show how the affective atmosphere in "attacking" spaces reflects blurred social boundaries, intensified vulnerability, and affective relations that all inform young women's sexual expression. They demonstrate the tensions and conflicts arising from gender role division and objectifying heterosexual practices. Nevertheless, disputing the dichotomies that distinguish objectification from subjectification, they also show how young women's vulnerability emerges as an affective resource for subjectification. The paper contributes to theorizing young women's vulnerability as ambiguous, reflecting the tensions and complexities in young women's sexual expression. It reveals how the leisure space offers different affective experiences – some deconstruct the subject, while others allow relational subjectification.

762

Dealing With Sexual Health As A Gynecological Professional: Trajectories Of Specialization and Their Moral Costs

Gwénaëlle Mainsant

CNRS, France

In a context of politicization and healthization of sexual issues, my paper aims to grasp how sexuality is constructed as a "professional problem" (Abbott) in gynecological care practices in France. Even though gynecology is a medical

discipline focused on women's reproductive health, sexuality (considered in terms of desire and pleasure) remains marginal or subordinated to procreative and contraceptive concerns. Dealing with sexuality for health professionals implies to take care of a stigmatized professional object (Goffman) and it questions the boundaries of their professional mandate. Therefore, the gynecological care professionals who accept to deal with sexual disorders are a minority in France.

My papers aims to understand how gynecological professionals (e.g. gynecologists, midwives and general practitioners) include sexual concerns in their care practices.

Based on 25 in-depth interviews with health professionals, I analyze their trajectories in order to unveil the conditions under which they became likely to specialize in sexual health.

Findings reveal that specializing in sexual health has a moral cost for practitioners. In France, sexology is an additional formation to standardized cursus that distances health professionals from the most prestigious specializations in medicine. While it exposes professionals to intimacy and accounts of violence, it contaminates the professional. I have identified three pathways to sexual health professions: some were socialized to sexual health issues by liberal families; others were converted by patients' requests concerning sexuality, but these requests are only audible in a specific context (#MeToo…); others had professional opportunities, particularly if they specialize in andrology rather than female sexual health.

Medicalized Female Genital Cutting: Exploring Decision-Making Evolutions, Dynamics, and Cultural Variances among Maasai and Abagusii Ethnic Groups

Jolien Inghels[1], Sarah Van de Velde[1], Nina Van Eekert[1], Samuel Kimani[2]

1University of Antwerp, Belgium, Centre for Population, Family and Health; 2African Coordinating Centre for Abandonment of FGM/C, University of Nairobi, Kenya

Female genital cutting (FGC) refers to various practices involving the partial or total removal of the external female genitalia for non-medical reasons. In Kenya, where the current study is situated, the practice is progressively more medicalized, meaning that FGC is increasingly being performed by medical health professionals rather than traditional practitioners. However, performing FGC is prohibited by law in Kenya, regardless of who performs it. Research informing FGC abandonment strategies often focuses on coordinating change in norms and behavior among people interacting with one another, starting by identifying key actors in the decision-making process concerning FGC. However, how this information unfolds within the newly emerging evolution in the practice has not yet been identified. The current research entangles how the trend towards medicalization influences the decision-making process concerning a girl's cut, by looking at how the decision is made,

who influences it, and how this differs between people born in different birth cohorts. We conducted 60 in-depth interviews with mothers with at least one living daughter within the Maasai ethnic group, located in Narok County, and among the Abagusii ethnic group in Kisii County. Preliminary results show several important findings contributing to a better understanding of FGC medicalization and its evolutions. We found crucial insights into the agency for Maasai young women concerning medical decision-making, the normative framework surrounding medicalization among Abagusii mothers, and how its evolutions, underlying reasons for medicalization, and key actors in the decision-making differ between these ethnic groups.

Navigating Place through a Gendered Lens: Young Women's Experiences of 'Risk' and Sexual Violence in a Deprived Coastal Town in the UK

Hannah Joy Louise Jobling, Aniela Wenham

University of York, United Kingdom

Although deprivation is a persistent feature of many UK coastal towns, research on transitions to adulthood in such settings is limited and homogenises young people's experiences. Where gender is addressed the focus is on masculinities, for example how young men navigate precarity within local labour markets. However, international place-based research highlights how marginalised young women experience distinct 'risks' and dilemmas throughout their trajectory into adulthood which are strongly related to spatialised features, relationships, resources and barriers.

This paper foregrounds the voices of young women in a deprived UK coastal setting to explore how the intersection of place, gender and marginalisation shapes their experiences of 'risk' and sexual violence. The paper draws on qualitative research undertaken with 18 young women to illustrate: (1) young women's navigation of 'risk' through the everyday realities of the locale (2) how experiences of sexual violence relate to sociality, particularities of place, and private/public domains (3) the correspondence between normative depictions of 'risky behaviour' and young women's accounts of situated (sexual) agency.

The findings elucidate the complexity of young women's agency within spatial, social and structural bounds, resonating with the notion of young women as 'suffering actors' (Harris and Dobson, 2015) who confound binary conceptualisations of agency. By analysing place-based inequalities through a gendered lens, the findings also illuminate the relationship between structural context and regulation of gender and sexuality. In doing so, the paper provides an alternative policy agenda for supporting young women who experience sexual violence within the context of place-based marginalisation.

Sexual Consent Amongst Young Men Who Have Sex With Women: How It Can Be Conceptualised, Practiced And Influenced.

Emily Charlotte Harle

University of Birmingham, United Kingdom

Explicit, affirmative consent is taught in sex education lessons and campaigns as the "gold-standard" of consent communication, however, it is often taught abstractly. Most adults understand and value explicit consent theoretically, but this conflicts with their real consent practice due to pervasive sexual scripts for normative consent practice, which vary according to gender roles, expectations in relationships and type of sexual behaviour. Pornography can be a useful source of sexual knowledge, because it is not abstract, it is explicit. Some pornography is designed to educate as well as arouse, and has done so successfully, showcasing topics such as technique, condom use/safe sex measures and communication.

The present study firstly sought to understand how a group of young men who have sex with women, aged 18-25, typically conceptualise and practice consent with an initial interview. Consistent with previous research, the young men largely relied on non-verbal cues, and assumptions about gender roles and the heteronormative "stages" of sexual experiences to navigate consent. They were then given a sample set of pornography which showcased explicit consent, and completed diary entries and a second interview. The qualitative data was analysed using interpretative phenomenological analysis (IPA).

The process prompted the young men to reflect deeply on their conceptualisation of consent, and the explicit nature of the pornography made it a useful a tool to aid discussion and comparison. However, the young men with longer term, regular sexual partners, had created an interpersonal sexual script, a routine for consent with that partner over time. This consent script was unique to the relationship and not malleable, so their reflections did not impact their current consent practices with their partners.

Sexual Education In Portugal: The Experiences Of Women With Functional Diversity

Inês Neto Silva[1], Alexandra Maria Oliveira[1], Ana Cristina Santos[2]

1Faculty of Psychology and Education Sciences, University of Porto, Portugal; 2Centre for Social Studies, University of Coimbra, Portugal

Portuguese law no. 60/2009 (of 6 August) enforces formal sexual education to promote gender equality and respect for sexual diversity, as well as training to prevent risky sexual behaviour. However, that is not always reflected in its implementations.

764

In sexist and ableist societies, women with functional diversity are perceived as innocent, vulnerable, and physically and/or intellectually incapable of being sexual. Such justifies their exclusion from sexual health education, as their families, caregivers, school educators and health professionals believe it to be unnecessary and dangerous to raise this topic with them. The "invisibility" of their sexuality is even more prominent for non-heterosexual and/or non-cisgender women with functional diversity, condescendingly framed as lacking the cognitive ability to understand concepts such as sexuality and gender identity.

When sexual education information is available, it is typically limited to normative bodies and penetrative intercourse, failing to address their characteristics and needs. Thus, these women are denied essential clarifications to make sexual health decisions regarding the prevention of sexually transmitted infections and unwanted pregnancies, identifying sexual abuse, and discovering sexual practices suited to their bodies.

In this contribution, we explore the preliminary results from the thematic analysis of semi-structured interviews with adult women with functional diversity about their sexual education experiences in Portugal. The participants share common worries and doubts still unaddressed in sexuality discussions and uphold that avoiding normative generalizations and including their experiences in sexual health programs would be beneficial for everyone, regardless of gender, sexual orientation, or functional diversity.

Sexuality and Power Dynamics in Precarious Youth Milieus. Exploring Traditional Norms, Double Standards, and the Impact on Marginalized Adolescents

Thomas Wilke

IU International University, Germany

Contemporary youth sexuality research reveals a prevailing trend marked by the sexual and relationship behaviors of today's youth, cutting across social classes. These behaviors are described as egalitarian and permissive, emphasizing partnerships, departing from traditional norms like double standards and virginity in favor of love. However, the experiences of marginalized adolescents in precarious circumstances often go unnoticed. What significance does sex hold for them and how is it experienced and lived?

The study involves 16 in-depth interviews with individuals aged 15 to 21 in Berlin-Brandenburg, encompassing various settings like youth detention centers, probation facilities, and the streets. Many participants have economically unstable backgrounds, increasing their risk of future poverty. The data were analyzed using multiple methods, including the documentary method and grounded theory.

Findings reveal that within precarious youth milieus, gender-sexual relationships remain bound by traditional norms influenced by heteronormativity. This norm persists unchallenged, perpetuating a double standard: boys prioritize sexual conquests, while girls seek love and stable partnerships,

particularly during early to middle adolescence. The research uncovers practices within boys' cliques in these milieus, such as "sharing" girls for sexual activities, involving social and sexual manipulation and exploitation. Girls labeled as "easy" or "sluts" are used for group sexual activities. The severity varies by boys' social status.

These practices of "sharing girls" are part of a discourse on power and the preservation of male dominance within these youth milieus. They contribute to a disturbing trend of retraditionalization and an increase in violence as precarious circumstances intensify. This research highlights the absence of sexual liberalization in these contexts.

765

RN23 | T05_02: Reproductive Rights and Contraception

Abortion Timing, Access, and Trajectory Study (ATAS): Study Protocol

Anna Wallays, Sarah Van de Velde

University of Antwerp, Belgium

This study explores the trajectories of women presenting for abortion in Flanders, Belgium. It has two primary objectives. First, it aims to map the duration of the various stages of the abortion trajectory for women presenting for abortion. Second, barriers that cause delays within these stages will be identified. Data were used from the ATAS project, which collected data among all women seeking abortion care at one of the Flemish abortion centers; specifically, the LUNA centers, which are located in Ostend, Ghent, Antwerp, and Hasselt, as well as the VUB-Dilemma center in Brussels during the fall and winter of 2023-2024. Preliminary results show that a considerable number of women experience difficulties suspecting an unplanned pregnancy. This can be due to various reasons such as not immediately linking the symptoms to a possible pregnancy, mistakenly believing it is hard or impossible to get pregnant in their particular situation. Additionally, over one-third of women who completed the questionnaire up to now first had a consultation with a GP before they contacted the abortion center, which lengthens the trajectory. We also found that around 40% of the respondents indicated feeling ashamed or disappointed in themselves when deciding about the pregnancy. However, 94% indicated that their decision was set at the time they completed the questionnaire. Around 46% experienced fear of the procedure and associated pain. To our knowledge, this is the first study within the Flemish context to investigate abortion timing, access, and trajectories. Furthermore, this study is highly topical given the ongoing public and political debates on Belgian abortion legislation.

Correlates Of Pregnancies Ending In Induced Abortions: A Population-Based Analysis From The Life-Stage Perspective

Aidée Baranda Ortiz[1,2], Mikolaj Stanek[1]

1University of Salamanca, Spain; 2University of Basque Country, Spain

Induced abortions (IAs) constitute a fundamental element contributing to women's reproductive sexual health by granting them control over their motherhood, allowing them to decide whether they wish to avoid, postpone, space, or conclude their motherhood. The objective of this study was to analyze the sociodemographic variables influencing women's decisions to opt for an IA based on their life stage

For this research, records of IA, births, and late fetal deaths were combined, providing comprehensive information on all pregnancies and their respective outcomes. Binary logistic regression models applied to each age group (15-19, 20-29, 30 – 39 and 40-44 years) revealed that in the early reproductive stages, the probability of opting for IA was higher in women who did not have a partner than in those who had one. In contrast, in the later years of the reproductive cycle, women with more than 2 or 3 children are more likely to undergo an IA.

In conclusion, delineating women according to their age groups and other sociodemographic characteristics that make them particularly susceptible to unwanted pregnancies, combined with a detailed analysis of the personal motivations influencing the decision to opt for an IA, could guide the formulation of specific public policies aimed at these specific strata of the female population.

What Drives Couples' Contraceptive Choices? Within-Couple Predictors Of The Division Of Fertility Work

Katrin Firl, Nora Müller, Theresa Nutz

GESIS – Leibniz-Institute for Social Sciences, Germany

766

The ability to make informed decisions about fertility is a fundamental human right, yet gendered expectations and biomedical constraints often influence these choices. Despite both partner's interest in preventing unwanted pregnancies, women shoulder the primary responsibility for contraception, a task that can involve high costs and time commitments – aptly termed 'fertility work.' This adds to the responsibilities like housework and childcare that women typically bear.

In a parallel project, we propose a multidimensional index to assess the balance between the benefits and drawbacks of various contraceptive methods. Using this index, we investigate whether factors related to the gendered division of labor – relative resources and gender ideology – are associated with contraceptive choices and the extent to which women and men in heterosexual relationships engage in fertility work. We hypothesize that individuals with greater resources (income, education, and occupational status) seek to minimize their involvement in fertility work, while traditional gender ideologies lead to women shouldering a disproportionate share of fertility work. We analyze these associations by using data from the German Family Demography Panel Survey (FReDA).

Our study expands existing research on contraceptive choices and reproductive justice by examining the potential constraints on couples' contraceptive decisions arising from the interplay of within-couple decision-making processes and gendered expectations.

Our work sheds light on the intricate dynamics that shape fertility choices and the distribution of reproductive labor within heterosexual relationships. By understanding these factors, we can work towards a more equitable and informed approach to family planning, fostering greater reproductive autonomy for all.

Bridging The Relationship Between Sexual Pleasure And Contraceptive Counseling: A Scoping Review and Qualitative Research Study

Erica Selznick, Anneleen De Cuyper, Sarah Van de Velde

University of Antwerp, Belgium

Sexual pleasure is recognized as a critical aspect of sexual health and a fundamental sexual right by the World Association for Sexual Health. Yet, it receives insufficient attention in healthcare despite its relevance to topics such as contraception. Many contraceptive methods influence users' pleasure and during contraceptive decision making, users often consider this relationship, initiating, changing, or stopping using a method based on their perceived impact on how a method will influence their own or a partner's sexual pleasure. However, this consideration is often internalized and not communicated with providers, creating gaps in personalized care and possible unmet need, as choices might not be ideally suited to one's needs and therefore discontinued. Gaps exist regarding how contraceptive counseling can bridge the relationship between sexual pleasure and contraceptive decision making. There is limited execution of pleasure-based approaches in health care, particularly within contraceptive counseling, likely due to a lack of consensus across structural and provider-focused recommendations. This scoping review, focused on high income countries, will explore how literature linking sexual pleasure and contraception situates contraceptive counseling, and analyze different approaches bridging these factors. Complementing the literature, interviews with experts in sexual health and contraception will be conducted, exploring how to bridge the connection between contraceptive counseling and sexual pleasure, why recommendations vary widely, and why implementation significantly lags. Findings will provide strong foundations for future research on incorporating sexual pleasure based approaches in contraceptive counseling, identifying gaps in conceptualizations and developing a stronger consensus that can influence policy and recommendations.

Emotional Capital and Encounters with/against Heteronormativity and Cisnormativity: Negotiating Embodied Difference in Istanbul's Urban Neighbourhoods of Precarity

Mustafa Bilgehan Ozturk

Queen Mary University of London, United Kingdom

This paper offers an autoethnographic account of my lived experiences of heteronormativity and cisnormativity in urban spaces marked by a high degree of precarity around diverse expressions of sexual and gender difference. In the socially conservative context of Turkey, Istanbul almost uniquely contains neighbourhoods, where sexual – and gender-identity minorities can prise out spaces to express difference openly and publicly. Yet, these spaces operate in a highly fluid mode, vacillating between hospitability one moment and hostility the next, with fluctuating and unpredictable levels of social tolerance. In precarious urban spaces, such as Cihangir, Tarlabasi, etc., freedoms afforded to sexual – and gender-identity minorities can be momentary and conditional, as well as deeply vulnerable to abrupt foreclosures. The normative structures of the neighbourhoods are conflictual, as the social identities that they cater to are highly variegated, and the spaces evoke emotions of trust as well as distrust simultaneously for a variety of minority groups. Utilising Bourdieu's notion of capitals to theorise my emotional resources as emotional capital, my study offers a first-person account of embodied emotions as a means of navigating complex urban contexts inscribed by both tensions and transformative possibilities. While emotional capital is an accumulated reservoir of personal resources, it also operates dynamically with the inclusionary/exclusionary norms in precarious neighbourhoods, and the opportunities and constraints they involve. Linking emotional resources with social struggles in urban spaces of precarity, my autoethnography sheds light on dis/belonging as well as resistance and change in the city. Here, the autoethnography reveals emotional capital not only as a coping mechanism for survival, but also as a way of invoking freedom, when mobilised in solidarity with the emotional capital of disadvantaged 'others'.

Male Embodiment and Digital Technologies

Katariina Mäkinen

University of Eastern Finland, Finland

This paper traces the ways in which male embodiment is made and unmade with digital technologies in the context of social media. Based on qualitative empirical research,

767

the paper investigates the embodied narratives and experiences of men who produce content on social media on the themes of sexuality and/or embodiment. The aim of the paper is to first account for the ways in which diverse men live embodied lives and inhabit bodies in multiple, ambiguous, ambivalent ways, and how they make embodiment with and against normative imaginaries and with digital and material technologies. Second, the aim is to find novel theoretical gateways into thinking male bodies, male embodiment and sexuality as narrated, lived, ambivalent and fraught with tensions. Theoretically, then, the paper departs from the conceptual framework of thinking in terms of hegemonic masculinities and seeks to understand male embodiment in a way that takes seriously how embodiment and corporeality is theorized elsewhere, for instance in critical disability studies and in phenomenologically inspired research. The overall aim is to create theoretical space for understanding the workings of subjectivity and power in a way that is sensitive to the multiplicity of men's life worlds and bodily encounters.

Relational Embodiment In The Context of Gender Transitions

Lara Bochmann

Edinburgh, UK

Critical queer and feminist scholarship has criticised previous

conceptualisations of bodies as singular and independent and instead puts forward notions of interdependence and relationality. Drawing on trans studies, critical disability and crip studies, intersex studies, new materialist and posthumanist perspectives, this paper seeks to develop a conceptualisation of relational embodiment in the context of gender transitions.

Based on ethnographic research with trans people in Germany and Scotland, I explore

what could a relational perspective on embodiment could look like and how we can think beyond transitions as individual processes through relationality. Further, this paper focuses on transitioning as a relational and embodied practice and seeks to acknowledge the multiplicity of trans embodiments within more-than-human worlds. In tension with medical models of gender transition, transitioning is loosely understood without assuming linearity, coherence, stable gender identities or a prescribed set of practices as constitutive of transitions. Preliminary findings suggest that trans people achieve transitioning in manifold ways, e.g. through practices that expand the physical body, through the (momentary) incorporation of inanimate things, and through social and relational means, among others.

This paper seeks to contribute to the small body of literature on non-normative embodiments in theories of the body. I have not joined an ESA summer school before and would relish the opportunity to do so.

The Vulva Dialogues: The Sexual-Bodily Experience of Portuguese Cisgender Women

Adriana Maria Penna Quintão

Iscte-University Institute of Lisbon, Portugal

The female body is often subjected to prejudice, stigma, and misconceptions, driving women into genital alienation: they either have never seen their vulva nor can name its parts, or pursue infantile aesthetic ideals of the vulva, resorting to permanent hair removal, bleaching and labiaplasty, a surgery analogous to Female Genital Mutilation according to World Health Organization standards.

There is plenty of misinformation on the vulva and the clitoris, even within the scientific community: several Social Sciences papers use 'vagina' in reference to the vulva, and renowned anatomy books do not provide the correct physiology of the clitoris. This contributes to women's unawareness of their own bodies and puts their health at risk in the hands of poorly trained surgeons. The sexual-bodily experience of cisgender women is commonly observed from a phallocentric perspective, which tends to override and neglect women's agency.

The vulva and the clitoris play a central role in woman's sexuality but are surrounded by controversies. I seek to analyse the most relevant aspects of the sexual-bodily experience of Portuguese cisgender women, focusing on their relationship with their vulva, their clitoris, and their sexual pleasure, in addition to identifying the role of medicine and health professionals in such relationship, within the Western medicine perspective of the female body. The fieldwork is being carried out by qualitative methods, with semi-structured interviews with health professionals from various specialties, biographical interviews with cisgender women, and a study of the representation of the clitoris in the main anatomy manuals used in Portugal, to discuss how centuries of control over women's bodies have impacted their sexual-bodily experience, offering an in-depth debate to these subjects in Sociology.

768

RN23 | T06_02: Sexuality and Political Mobilizations

The Changing Landscape of Sex Work (Feminist) Policies. A Netnographic Exploration of the Antiabolitionist Field in Italy.

Giulia Selmi[1], Giulia Garofalo Geymonat[2]

1University of Parma, Italy; 2Ca' Foscari University of Venice, Italy

In Italy feminists have been central in elaborating an approach to prostitution and sex work that kept together in original ways an attention to the diversity of women's experiences in prostitution, an epistemic centrality of the collective elaborations produced by women in prostitution, and a radical critique of prostitution as a patriarchal institution. This conceptualization was closely linked to a practice of large alliances – within and beyond feminism – oriented to the development of effective tools – at the policy level and through projects of direct action – to fight institutional abuse and to concretely support women (and then men and trans people) in situation of heavy exploitation and trafficking.

However, in the present scenario, this 'feminist alliance' is jeopardized and new landscape of alliances, and corresponding new forms of collective identities and discourses are emerging. This paper will look in particular at the developments in the neo-abolitionist field through a netnography (Kozinets 2019) of the social media interactions during the process leading to the law proposal Maiorino (Senate n. 2537, 6 April 2022) that has at its center the adoption of the Nordic model. Indeed, we claim that social media represented a privileged space for the constitution of the neo-abolitionist field during the two years of public consultation that led to the Maiorino law proposal. By looking at the Instragram and Facebook profiles and pages, our paper proposes an analysis of the recent evolution of the neo-abolitionist field, including the actors in the field (within and beyond feminism), their practices of alliances, the construction of their collective identity, as well their main claims and discursive strategies.

Distrust and Discomfort: Talking About LGBT Issues Amidst Anti-Gender Mobilizations

Tanja Vuckovic Juros

University of Zagreb Faculty of Humanities and Social Sciences, Croatia

One of successes of anti-gender mobilizations in Croatia and especially of the 2013 constitutional referendum on the protection of heterosexual marriage was a construction of a new perception that the country was internally divided on gender and sexuality issues. In this new social climate, gender and sexuality – most often a shorthand for LGBT issues – became a new marker between the "conservatives" and the "liberals" that was now, unlike in previous years, played out in the formal political arena as well. Against this backdrop, I ask the question of how this perceived social climate plays into how the ordinary citizens think and talk about LGBT issues. To answer this question, this study uses the data from two rounds of focus groups (12 total) with 32 parents of school-aged children in Croatia. These data are further complemented with 6 focus groups with younger (under 30) and older (above 60) Croatian citizens (and selected follow-up interviews) and also contrasted with the data from 7 focus groups of Flemish parents of school-aged children in Belgium, the latter being a country in which anti-gender mobilizations failed to achieve any notable success. In the analysis, I pay special attention to the way 'we' and the 'Other' is constructed in relation to talking about LGBT issues and to the elements of distrust and discomfort among Croatian citizens, that became particularly visible through the comparison with the Flemish data. I use this analysis to reflect on the effects of anti-gender mobilizations on social climate on the LGBT issues.

Gender Justice and Sexual Liberation Struggles: Exploring the Transformative Potential of Counter-Trafficking Feminism in Portugal

Mara Clemente

Iscte – Instituto Universitário de Lisboa, Portugal

Over the course of the last two decades, the fight against human trafficking has gradually consolidated in a significant number of countries, with feminist organizations and activists playing a prominent role in shaping trafficking discourses. Counter-trafficking has also produced a significant number of material effects. Trafficking and, in particular, sex-trafficking debate has often been expressed via racist and colonialist stereotypes, alongside conservative moral fears about the sexual and economic independence of migrant working class women. More broadly speaking, counter-trafficking has often recast feminist struggles for gender justice and sexual liberation in terms of criminal justice, focusing on the punishment of traffickers, the stiffening of migration policies, increased controls at borders as well as in the sex market, practices of "cure" for "trafficking victims" in semi-carceral institutions of "protection". Focusing on the Portuguese case, this paper interrogates feminism's ability and its limitations in challenging or reinforcing some of the most controversial counter-trafficking outcomes. The paper draws on interviews with feminist and women's organisations as well as the analysis of policy documents and feminist materials and fieldnotes. The paper argues that, due to a structural weakness within feminism itself and the profound institutionalisation of counter-trafficking, any possibility of challenging dominant discourses on trafficking remains a distant dream. Rather, counter-trafficking attempts ultimately help create a controversial neoliberal

769

space that strains feminism's transformative potential while simultaneously strengthening bureaucratic state feminism.

Making of a Controversial Law: Population Planning, Sexuality, and the Cold War in Turkey

Zeynep Selen Artan

Marmara University, Turkey

In April 1965, the Turkish parliament enacted the Law on Population Planning that introduced a series of policies regarding reproductive rights, marking a new era in the biopolitics of the state. Having foregone the pro-natalist agenda of earlier decades, the state introduced birth control while granting permission to abortion and sterilization under certain conditions. Within the political landscape of the Cold War, the law was designed by a left-leaning political body with an emphasis on building a competitive economy through the creation of a nation based on "quality" rather than "quantity." Although it took the legislative body just under five months to adopt the law after it was scheduled for the first meeting, opposing views led to fierce debates during the process in both the Parliament and the Senate. Drawing on archival research, this paper focuses on the narratives that circulated on the legislative floor, either supporting or challenging the adoption of new technologies for population control. How did political actors across the spectrum envision Turkish modernity through the governance of the collective body at the time? How did they perceive the use of contraceptive technologies such as birth control pills and intrauterine devices (IUD) in Turkey? In light of these questions, this paper argues that while economic considerations took center stage in the debates, opposition was also rooted in concerns over female sexuality which, liberated from the fear of unwanted pregnancies, would supposedly get unleashed from its societal chains.

RN23 | T07_01: Expanding Perspectives on Sex Work

Sex Worker Vulnerabilities And Solidarities Under Conditions Of War In Ukraine

Agata Dziuban

Jagiellonian University, Poland

The launch of the large-scale armed attack by the Russian Federation on Ukraine on February 24th 2022 has heavily impacted the safety and security of Ukrainian citizens, and the overall economic situation in the country. It has also significantly exacerbated vulnerabilities and inequalities faced by people providing sexual services in Ukraine, already before the war subjected to criminalisation, policing, and multi-layered social exclusion. Building on the collaborative research project conducted with the Sex Workers' Rights Advocacy Network (SWAN) and sex worker-led organisation Legalife-Ukraine, my presentation explores the impact of the war on different sex workers communities in Ukraine. It documented how the war affected the living and working conditions of sex workers in Ukraine. Firstly, this presentation looks, specifically, at sex workers' economic and work-related precarities, and their access to healthcare and other basic services, including adequate housing and social protections. It also asks about continuities and shifts in policing and law enforcements strategies. Secondly, centring sex workers' needs and vulnerabilities in the context of the war, it looks into sex worker community-driven responses to the humanitarian, economic and socio – political crises caused by the war. And, finally, it explores challenges faced by sex worker organisations in supporting their communities in the times of war.

770

Transformations Of Sex Work In The Postsocialist Context – Framing Sex Work And (Mis)recognition

Anna Ratecka

Södertörn University, Sweden

This presentation discusses the transformation of sex work in the post-socialist context from the from the perspective of civil society initiatives. Problematising the temporality of post-socialism, I will explore the transformations of sex work and the different ways in which the neoliberal order and late modernity have affected both the vulnerabilities and strengths of workers through the lens of the struggle for sex workers' rights. Drawing on ethnographic fieldwork with sex worker support and advocacy groups support and advocacy groups and NGOs, this article explores how these actors have framed sex work. I will trace the transformations of framing of sex work across the economic and social changes that occurred as a result of the dismantling of state socialism and the introduction of the neoliberal economic

order, as well as shifting geographical and political boundaries of Poland's position as a 'second world' country, a new EU member state and, more recently, democratic backsliding.

This presentation is based on three case studies of civil society actors, an anti-trafficking foundation, a harm reduction NGO and a sex workers' rights collective. I will introduce the concept of regimes of recognition to explore how these actors have framed sex work and how these frames correspond to historical processes of transformation and post-transformation. I will show how the specific timeframes created particular framings of sex work and how they constructed sex workers as particular subjects – victims, marginalised communities, perverts, workers or digital entrepreneurs.

Who Sells Sex in a Welfare State?

Stefan Bastholm Andrade, Theresa Dyrvig Henriksen

The Danish Center for Social Science Research, Denmark

The question of who sells sex continues to attract attention in both public and scientific debates. Are sex sellers primarily victims of unequal social and economic structures, a group of strong independent women, or something in between? Combining police records from the Danish National Police Database with comprehensive life course data from the administrative records of Statistics Denmark, we present novel insights into the social background and life trajectory of female sex sellers. We use latent class analysis to analyze the prevalence of social problems during childhood, youth, and adulthood among women who sell sex (N = 2,532). Our findings reveal substantial variation within the population of sex sellers. Compared to our two control groups, each consisting of women from the same birth cohorts, of 10,000 randomly selected women and 5,000 women with similar parental background characteristics, sex sellers face a higher risk of experiencing social problems throughout their life course. While most sex sellers do not experience social problems, a small but significant proportion experiences mental health issues, criminal records, substance misuse, or homelessness. Intergenerational analyses further demonstrate that those sex sellers facing the most complex problems often come from families with limited socioeconomic resources and a history of criminal convictions among the parents.

Unveiling Precarious Working Conditions in Sex Work and Its Implications for Occupational Risks

Iztok Šori, Leja Markelj

Peace Institute – Institute for Contemporary Social and Political Studies, Slovenia

In contemporary post-capitalist societies, employment trends are marked by the rise of non-standard forms of labour, flexible markets and deregulated labour standards.

This paper delves into the effects of precariousness on occupational risks in sex work in Slovenia, starting from the premise that sex work corresponds in many ways to what is theorised as precarious labour. Employing a multidimensional definition of precariousness, we argue that precarity is not only defined by considerations of job security, control over labour processes, pay and working conditions, but is also shaped by the social context, including formal regulations of the labour market, minimum labour standards, and stigma. We aim to examine how different employment statuses and other indicators of precarity affect working conditions, job satisfaction and occupational risks in sex work, including physical and mental health outcomes, and sex workers' private lives. The analysis draws upon mixed-methods study in which empirical data was obtained through an online survey and focus group discussions with sex workers. Preliminary findings show that various forms of sex work are distinctively characterized by precarious working conditions. The vast majority of sex work is performed in the informal economy, but sex workers report various employment statuses that may stem from other forms of employment outside the sex industry. Respondents are generally satisfied with their working conditions, showing that the precariousness of sex work is not always comparable to other parts of the economy in some respects, however, precarious working conditions have been shown to have a significant impact on occupational risks.

771

RN23 | T07_02: Sexuality, Norms and Practices

Covering, Concealing, Passing? Private Shame, Public Performance.

George Dake

Manchester Metropolitan University, United Kingdom

Male sex workers experience significant, often multiple stigma. Much of this stigma is the result of discourses (understandings) that have been associated with male sex work. Selling sex has been conflated with homosexuality, which was seen as deviated and/or subordinated masculinity. Male sex work was also seen as an activity undertaken by psychologically maladjusted young men, opportunists and social misfits. The male sex worker has also been situated in research as a 'vector of disease', a risk discourse which presents them as men who take risks during sexual intercourse (through practices like barebacking, and sexual activity while under the influence of drugs and substances), significantly contributing to the spread of Sexually Transmitted Infections (STIs) including HIV/AIDS.

This experience of stigma is presented as sociological or psychological. Sociological stigma includes structural stigma, stereotyping, discrimination, status loss, social/societal exclusion (unfair treatment, exclusion or rejection experienced during social interaction and/or within a group). Psychological stigma includes symbolic, internalised, and felt experiences (individualised, internalised shame and isolation from fear of judgement).

Drawing on data from my PhD study with a group of male sex workers in Manchester, UK, I argue for a psycho-social understanding of stigma, to produce a more comprehensive understanding of the experiences of male sex workers. I will challenge the sociology-psychology split, making the case that stigma is simultaneously psychological (psychic) and sociological (social) psycho-social; existing in the liminal space between the micro and macro, personal and social, inner and outer worlds.

Boost Your Brand: Self-promotion in Grindr Profiles and the Globalization of MSM Sexual Culture

Robert Cserni

Rhode Island College, United States of America

Despite growing numbers of studies on MSM (men who have sex with men) usage of location-based mobile dating apps (LBMDAs), little is known about how local and global sexual culture shape strategic self-presentation and impression management—a practice that I refer to as self-promotion, since few scholars have taken a cross-cultural approach to studying MSM online communication. This study explores similarities and differences in how MSM deploy profile pics and text on dating apps like Grindr to increase their sexual capital, a strategic practice of self-presentation and impression management that I refer to as self-promotion. While most studies have investigated MSM self-promotion locally, relying primarily on qualitative data, this study explores MSM self-promotion internationally, providing a unique cross-national quantitative examination to generalize about a global MSM sexual culture and its associated expectations. The measures, analysis, and findings from 4800 user profiles in New York City, London, Vienna, and Tel Aviv revealed that in all cities users who had a toned/muscular body, were seeking sex, and were single, engaged the most in self-promotion. Regarding differences, London users exhibited the highest degrees of self-promotion that can be explained by a local culture emphasizing social class and the perceived pressure for social conformity. Overall, this study triangulates the axes of sexuality, technology, and globalization to map the extent to which globalization flattens difference at the same time it creates possibilities for the assertion of local variation. Understanding these significant differences among Western countries is particularly relevant today, as the world moves both closer and becomes more tribal.

Sex Toys and The Politics of Pleasure: The Case of Italy's First Feminist Sex Shop

Silvia Biasetton

University of Padua, Italy, Italy

772

From the 1970s, Northwestern countries have witnessed an exponential growth of the sex toy market. Since the rise of feminist and women-driven sex shops, the interplay between political instances and commercial branding became stronger. As it is often the case with commodification-related processes, this soaring market has given rise to a complex multifaceted cultural scenario: on the one hand, it has paved the way for the emergence of plural understandings of sexuality, broadening the emancipatory reach of feminist discourses on sexuality; on the other hand, it has 'domesticated' sexuality within capitalised forms of sexual representation and identification.

In this tangled affair, this paper aims to explore the practices of Sexy Shock, a political group born in 2001 in Bologna, Italy, which turned sex toys into a political medium. By conceiving them as means to speak about sex, pleasure, health, consensus, and violence, this group transcended the classical definitions of both political collective and commercial activity. Through the analysis of this case study, this article aims to discuss the urgent question of whether the interpenetration of the political and commercial spheres can be a site of transformation and to what extent. It will further question whether, in a moment in which feminism and sex-positivity are profitable brands, sex toys could still be considered as political objects and symbols able to be agents of change.

'I'm Not Surprised': The Emerging Sexual Subjects And Emotional Communities in Taiwan's #MeToo Movement

Mei-Hua Chen[1], Yi-Chia Taso[2]

1National Sun Yat-sen University; 2National Sun Yat-sen University

Sexual harassment is one of the highly institutionalized issues among gender equality policies in Taiwan. However, it is the belated #MeToo movement which started in Jun 2023 sparks the countrywide debates regarding sexual harassment. Echoing Sarah Ahemd's (2004) idea that emotion serves to produce active subjects, the paper aims to theorize how the #MeToo movement, by posting, reading, and sharing those detailed sexual stories, creates an intimate emotional community that ties female subjects together and motivates them to take collective actions.

Based on interview data with 40 Taiwanese women, we found that many participants reported that 'I'm not surprised' when the #MeToo movement mushroomed across Taiwan. The phrase 'I'm not surprised' not only indicates that women have been taught to tolerate sexual harassment daily but also refers to how the workplaces, schools, and even the courts ignore and mistreat women's complaints of sexual harassment. Furthermore, the unique writing style of Taiwan's #MeToo posts, always detailed the sexual misconducts of the perpetrators, and how victims were shocked and failed to move their bodies, also let women who read the posts could revisit the memories and emotions (e.g. anger, anxiety, fear, pain, and shame) surrounding sexual harassments, and thus strongly felt that they 'have to do something' for themselves and for helping other women. In this sense, the #MeToo movement serves to build up an emotional community in which women not only speak for themselves but also take collective actions to make the perpetrators accountable.

Is Self-centered Sexuality Accessible For Everyone? The Space Of Students' Sexuality Styles After Metoo

Romain Philit[1,2]

1EHESS, France; 2Ined, France

Originally focused on sexual and sexist violence, the MeToo movement has created a platform for the expression of feminist ideas, thereby contributing to problematizing a series of issues related to sexuality: consent, pleasure, heteronormativity, etc. While these social and political transformations are widely discussed in the media, their effects on individual practices remains relatively underexplored. Based on a questionnaire survey (n = 764) and interviews (n = 18) with students from diverse social backgrounds enrolled in four distinct higher education courses, this paper analyses how sexual norms and practices of young adults are being reconfigured compared to those of previous generations. Firstly, the questionnaire highlights a relative weakening of the gender division of sexuality styles, which previously opposed, on the one hand, an individual-centered model associated with men, and on the other hand, a conjugal model associated with women. Nevertheless, despite the growing symmetry in the sexual repertoires of men and women, differences persist in the sexual behaviours of students. Notably, women's access to sexuality for its own sake remains limited compared to men, and mainly concerns those who are highly endowed with cultural capitals and/or who deviate from heterosexuality. Secondly, based on interviews with students from an Institute of Political Studies, the paper examines how sexuality styles are embedded within social trajectories shaped by gender and class. More specifically, it details how the appropriation of feminist ideas supports a transformation of students' dispositions to sexuality, and how the claim to a "feminist" sexuality updates the boundaries between social classes.

Transsexuality, Liminal Representation and Health: Understanding the experience/s of hijras in India

Anwesha Bhattacharya

PHD scholar in Tata Institute of Social Sciences, Mumbai, Maharashtra, India

Transsexuality, Liminal Representation and Health: Understanding the experience/s of hijras in India

The hijra community has its roots in the mythical, historical, and religious accounts of India. There has been a 'liminal representation' of the community of the hijras in post independent India. The penal code of 377 which was introduced by the British to criminalise homosexuality and queerness was not repealed in post Independent India till 2018. The hijra community received partial visibility during the wake of the spread of the pandemic HIV/AIDS in India. As Bhaskaran argues that the hijras were brought under the category of MSM (men having sex with men) and a supervision by the state was only carried out to prevent further spread of HIV. Apart from being only a limited approach to improve the health conditions, the category of MSM only grouped hijra community based on sexual orientation whereas it had much deeper cultural connotations. This failed to provide a holistic representation of the hijras and in addition to that the hijras got targeted as the bodies carrying the disease. In my paper I concentrate on how hijras in India are and have been discriminated in health sectors. I want to elucidate the role played by NGOs in both assembling and integrating the homosexuals and queer population but simultaneously

773

widening the gap between western categories of sexual identity and indigenous categories of sexual representation ('hijra' being one) enabling under-representation and dissociation from the avenues to access better health facilities in the context of India.

Beyond Traditional Gender Roles: Exploring the Division of Paid and Unpaid Labour in Italian Same-sex Couples

Gioia Geremia[1], Agnese Vitali[2]

1CED-CERCA/UAB, Spain; 2Università degli Studi di Trento, Italy

The objective of this paper is to explore how the division of paid and unpaid labour is carried out in same-sex couples living in Italy. Revolving around the previous research conducted on this topic, and around the specialisation theory and the doing gender approach, we explored how partners in male and female same-sex couples divide their working hours, domestic labour and childcare. The existing literature highlighted an overall equal division of paid and unpaid labour between partners of same-sex couples. The necessary data was collected via an online survey distributed through mailing lists and websites of Italian associations concerned with LGBTQ+ experiences. The non-representative sample consists of 190 respondents in male (n=52) and female (n=138) cohabiting same-sex couples and it was analysed with descriptive methods and regression analysis. The results are in line with those of previous research, since they highlight on average a pattern of equal division of paid and unpaid labour in the majority of the couples analysed, although some small differences emerge between male and female same-sex couples. Regarding childcare, even though in the majority of cases couples equally divide childcare tasks, some patterns of specialisation of tasks emerge when tasks are unbalanced within the couple. Nonetheless, rather than being unbalanced towards the birth/biological parent, as highlighted by previous research, tasks are unbalanced towards the respondent regardless of the tie they have with the child.

RN23 | T08_02: Sexuality and Normativities

Religious Experience and the Reconstitution of the Queer Self

Claire Fletcher

University College London, United Kingdom

Asylum decision making in the UK, reifies the stereotype that religious belief and queer subjectivity are in tension with one another. It is expected by asylum-decision makers that people seeking asylum who are LGBTQI+ and have experienced religiously inspired harm should have rejected their religion. This is a simplistic standpoint and does not reflect the complex realities of individual experience. The research from which this paper is based, explored how those with queer subjectivities, who were claiming asylum, experience religion in the UK. Most of the 24 interlocutors I conducted life history interviews with had experienced religiously inspired harm in their country of origin (CoO), where queer subjectivity was often framed as a sin or an abomination. Despite these encounters, religion remained of great importance to most interlocutors, but their religious beliefs remained in tension with, and caused negative emotions for them regarding their queer subjectivity due to their CoO experiences. This research explored how religious individuals and communities responded to those with queer subjectivities in the asylum process and how those in the asylum process experienced this response. A key finding was that the responses from religious inspired individuals and communities helped individuals to reconfigure their understandings of their own queer selfhood and religious belief system. As a result, people released negative tensions and emotions and reconceptualised their religious belief system to navigate away from past homonegative understandings. This papers aim is to facilitates a more nuanced understanding of the part religion plays in the lives of those with queer subjectivities. These findings can also be used to challenge the stereotype in asylum decision making that religion and queer subjectivity are incompatible.

774

Homing Desires: Transnational Queer Migrants Negotiating Homes And Homelands In Scotland

Francesca Stella[1], Jon Binnie[2]

1University of Glasgow, United Kingdom; 2Manchester Metropolitan University, United Kingdom

This paper draws on the findings of an ESRC-funded project (2015-17), and explores the cognitive and emotional aspects queer migrants ascribe to the notion of 'home'. The project focussed on LGBT-identified migrants from Central Eastern Europe and the Former Soviet Union living in Scotland, and used qualitative methods to explore migration

trajectories, experiences of migration and settlement, and migrants' sense of belonging.

The paper draws on interviews and visual data from a sub-set of 18 migrants; all of them took part in a biographical interview and submitted a collection of personal photographs on the theme of 'home', whose meanings were further elaborated on in a follow-up interview. 'Home' was variously understood as a process of 'home-making', a physical space, a location where meaningful social relations are formed or maintained, and a place of memory.

In unpacking meanings of home, the paper brings into conversation insights from migration and sexuality studies. In migration studies, 'home' is often a heuristic device providing a window into migrants' identity and belonging by exploring attachments to multiple places across national borders (Boccagni 2017). While migration is often posited as estrangement from an original home, and its positive associations with familiarity, authenticity and security, Brah (1996) has pointed out that migrants' 'homing desire' is not necessarily a 'desire for the homeland', but rather a process of 'home-making'. Meanwhile, queer migration is often posited as 'homecoming', a journey from homophobic or heteronormative domesticity to another site to be called home, embodying queer authenticity and belonging (Fortier 2001).

A Fairytale for Everyone? A Case Study of the Printed Media Portrayal of a Hungarian Children's Book

Márton Bagyura, Alexandra Sipos

HUN-REN Centre for Social Sciences, Hungary

"We have to judge A Fairytale for Everyone book as pedophilia, and Labrisz Lesbian Association as a pedophile organisation. Because after all, that's what they are." (Német 2020). This sentence accentuates the controversy surrounding a children's book addressing social and human rights issues in Hungary.

Barát argues that "hate-speech has become the mundane practice of communication by government propaganda" (Barát 2022, 173) regarding the concept of "gender ideology" (Kováts–Pető 2017). Printed media outlets play a relevant role in the diffusion of anti-gender and anti-LGBTQI+ messages, allowing the government's centralized message to reach diverse social groups. The Labrisz Lesbian Association case, involving the publishing of said children's book exemplifies the impact of moral panic, social categorization, and othering on LGBTQI+ organizations and activists (Svatonova 2021, Gera 2022).

The paper analyses the Hungarian media representation of the book A Fairytale for Everyone (Meseország mindenkié). The corpus contains 173 articles from printed media sources from September 2020 (the publication date of said book) until February 2022 (the Curia's verdict on Labrisz Lesbian Association's right to good reputation). The corpus is based on a keyword search conducted at a large Hungarian online database of printed sources (Arcanum Digitheca). The searched keywords are "Meseország mindenkié", "Meseország", "LGBT*" and "Labrisz".

Initial findings show how the printed media portrayal of A Fairytale for Everyone mostly highlights the negative effects of said book, relying on pictures and messages "dangerous" for children. This portrayal seems to align with the government's rhetoric of fear while reinforcing hetero – and cisnormativity.

RN23 | T09: Sexuality, Research and Discourse

Close Encounters Of The NoFap Type: Navigating The Challenges Of A Feminist Digital Ethnography Within An Online Masturbation And Pornography Abstinence Subreddit.

Chiara Perin

University of Milan, Italy and University of Turin, Italy

The present research aims to explore the methodological challenges and positionality issues of conducting a digital ethnography in a male-dominated Reddit channel that seeks and promotes abstinence from masturbation and pornography and in which the literature has detected heterosexist, patriarchal and misogynistic discourses (Taylor and Jackson, 2018; Hartmann, 2020; Burnett, 2021; Smith et al., 2022). The research is based on a digital ethnography in the main channel r/NoFap of 1.1 million members on Reddit, which seeks and promotes the practice of abstention from pornography and masturbation as a means to overcome porn addiction and compulsive sexual behaviours. This NoFap community is mainly attended by heterosexual men aggregated by the belief that the NoFap practice can massively improve health and quality of life as well as work productivity and sexual life. The related conversations are dominated by "strongly heterosexual male tenor" tropes such as evolutionary narratives on gender and masculinity where men's sexual entitlement to women is an asset and the heteronormative coital an imperative. On my ethnographic journey in the r/NoFap subreddit, I had to deal with challenges that solicited mutable choices and questioned my research design, academic posture, political stance, gender identity, sexuality and desire. My lifeline was the distinctly feminist practices of self-reflexivity and the emancipatory use of writing poetry (Dorion, 2021; Lorde, 2017) that helped me to assuage epistemological anxieties, participatory doubts, ethical dilemmas, and personal and institutional shortcomings. While the results are drawn from a subjective experience, I believe this project speaks of more general difficulties in sexuality scholarship. My final hope is to unveil some tricks to equip the ethnographers better in this "dirty work" (Keene, 2021).

The Meaning Of The Research Interview For Men With Experiences Of Purchasing Sex

Ylva Grönvall[1,2,3]

1Malmö University, Sweden; 2Centre for Sexology and Sexuality Studies; 3Department of Social Work

The purchase of sex is criminalized In Sweden, and it is a phenomenon associated with shame and stigma. Sex buyers are a hidden population that can be difficult to recruit for research interviews, and conducting interviews with men purchasing sex can be a challenge. Based on interviews with 30 Swedish men who purchased sex, this paper explores the motivations for men participating in research interviews to talk about their experiences of purchasing sex. The focus of this paper is to explore their different motives for participating in a research study, how this is associated to their self-presentation and their perception of their experiences. The thematization of the material shows two major motives for participation, as a confession or as a political action. Participation as a form of confession can be understood as an expression of the shame and stigma associated with the purchase of sex, which makes it difficult for sex buyers to talk about their experiences. The motive to participate in a research interview as a form of political action can be understood in relation to the dominant political understanding of the purchase of sex in Sweden, which depicts it as a form of men's violence against women where men purchasing sex are viewed as perpetrators. To participate in an interview can be seen as a way to present a different story of the sex buyer and to distance oneself from the stigmatized view of the sex buyer as a perpetrator and as a deviant.

"What if I Will Not Have Sex Anymore?": Discourses on Sexuality and Aging in Women's Stories about dating apps.

Anna Temkina[1], Maya Lavie-Ajayi[2], Larisa Spakovskaya[3]

1EUSPb Russia, BGU Israel; 2BGU Israel; 3University of Helsinki Finland

The sexual life of older women, and especially the active search for partners, remains stigmatized and largely invisible. However, there is also evidence that a cultural shift in relation to discourses about aging and sex is occurring in Western societies, influenced by gains in life expectancy, higher rates of divorce and repartnering, changing gender norms and consumerization of intimacy. The aim of this research is to explore available discourses on gender, aging and sexuality in women's stories about their experiences on dating apps. We present findings from analysis of 62 semi-structured interviews with women over 50 years old from Russian, Finland and Israel who use dating apps to look for romantic or sexual partners. The analysis shows

776

three dominant discourses about aging and sexuality: 1. Medical discourse – sexuality as a biological process related to reproduction and penetration. Seeing any changes in sexuality as an individual problem that can be fixed by medicine or therapy. 2. Sex belong to young people – refers to normative sexuality and sexual attractiveness as linked mainly to young people. Seeing sex drive as naturally reduced with age and older people (especially women) as less attractive. 3. Sexuality as a generative project – discussing sexuality and sexual experiences as shaped by accumulation of experience, knowledge, self-awareness and major events in the life course. Our findings make contribution to contextual understanding of discourses on aging female sexuality in different cases.

RN24 | Science and Technology

RN24 | T01_01: Trust, Regulation, and Participation in the Age of AI

Unraveling the Trust Spectrum: Insights into the Preferential Trust in AI Over Human Judgment from a UK Study

Michael Gerlich[1,2]

1SBS Swiss Business School, Switzerland; 2London School of Economics and Political Science (LSE), United Kingdom

In an era where artificial intelligence (AI) increasingly intersects with human lives, understanding the dimensions of trust in AI is pivotal. Inspired by previous research on societal perceptions on AI, this study, conducted in the UK explores why a notable majority of participants exhibit greater trust in AI over humans. Garnering 894 responses, with 451 valid completions, the research utilized a mixed-methods approach, combining a 6-step Likert scale survey with open-ended questions. The questionnaire probed psychological, sociocultural, and technological aspects of trust, underpinned by Structural Equation Modeling (SEM) and correlation analysis.

Preliminary findings indicate a predominant inclination towards trusting AI, attributed to perceptions of AI's neutrality and accuracy, akin to traditional computing systems. This trust contrasts starkly with the scepticism towards human integrity, stemming from beliefs in human self-interest and dishonesty, compounded by a distrust in media narratives. Intriguingly, a marked correlation emerges between distrust in AI and an absolute trust in human judgment, underscoring a dichotomy in trust orientation.

This study illuminates the nuanced dynamics of trust in the digital age, revealing a complex interplay between technology and human psychology. It contributes significantly to the discourse on AI integration in society, highlighting critical considerations for future AI development and policy-making.

Chatbots as Mediators of Migrant Integration in Finland

Aaro Tupasela, Heta Tarkkala

University of Helsinki, Finland

This presentation looks at the rise and role of chatbots as mediators and technologies of integration in the public sector. Taking the case of the City of Helsinki and its various implementations of chatbots in its services, we explore challenges and possibilities that chatbots are seen to have in terms of operating as a service channel for different customer groups.

Chatbots have emerged during the past five years as ubiquitous channels for providing customer service and support, yet there are many caveats that relate to their implementation and operation. In public services, these relate for example to ensuring that people's rights are not violated and that the information bots provide is accurate. We argue that chatbot use and deployment in public services for people with different backgrounds call for new ways of service development that consider user needs in more concrete terms.

The presentation is based on the ongoing (2022–2025) multidisciplinary project "Trust-M – Designing Inclusive & Trustworthy Digital Public Services for Migrants in Finland" (https://trustmproject.aalto.fi/) conducted in collaboration at Aalto University, University of Helsinki, Tampere University, and the city of Espoo. The project examines and develops digital (AI-assisted) tools for public services in order to make them more inclusive, and accessible.

AI Futures: Participatory Perspectives For Citizens Engagement In AI Development And Narratives

Jussara Rowland

Instituto de Ciências Sociais, Universidade de Lisboa, Portugal

778

In recent years, the ethical, political, and social impacts of Artificial Intelligence (AI) have driven a growing demand for AI systems that not only reflect citizens' needs and perspectives but also encourage their active participation in AI development. This emergence of participatory AI raises several critical questions: How can public participation be ensured in a future increasingly shaped by these technologies? What opportunities for citizen engagement and agency exist when current narratives about the future societal impacts AI are often overstated? To date, participatory AI has primarily focused on methods that integrate citizen perspectives into the AI system design process and emphasized the need for democratic processes that allow citizen involvement in decisions about AI's governance. However, it is equally important to examine how current AI narratives shape our expectations about our common future(s) and to explore ways to ensure the inclusion of diverse perspectives in the discussion of AI's role in society. This presentation will discuss the potential of citizen engagement and co-creation in our AI futures from a sociological perspective. Using specific examples and bridging contributions from the sociology of science, environment, and expectations, the presentation will focus on the potential and limitation of participatory methodologies to effectively improve understanding, empower communities, and identify new areas for participation and co-production that could lead to more equitable and effective AI futures.

RN24 | T01_02: Gender Dynamics in Academic Career Trajectories

Unraveling the Gender Productivity Paradox: A study of the Impact of Sick and Parental Leaves on Scientific Careers

Dag W. Aksnes[1], Lynn P. Nygaard[2], Fredrik N. Piro[1], Rune B. Reiling[1]

1NIFU, Norway; 2PRIO, Norway

Numerous studies examining gender and research productivity consistently show that, overall, men tend to have a significantly higher publication output than women. While various explanations have been proposed for why these gender disparities exist, the issue remains complex and inconclusive.

In this study we focus on the role of sick and parental leaves and scientific career. More specifically we analyse how much of the gender gap in scientific productivity that can be attributed to unequal time spent at work, and to discern potential variations in this relationship across diverse scientific fields and academic positions.

We couple the publication records of 17000 Norwegian university staff members (from doctoral candidates to full-time professors) in the years 2011-2016 with data about the same researchers' leaves of absence in the period 2010-2015, and with information about their gender, age, academic position, and scientific field. This comprehensive dataset enables us to explore the association between absenteeism from work in a year and subsequent scientific productivity in the following year.

The study reveals that sick and parental leaves affect men and women differently. These disparities explain most of the gender gap in publication productivity observed in Norway. While the productivity gap may have a simpler explanation than commonly assumed, it remains a fact that gender disparity exists when not taking absence into account. Women are in a less advantageous position when publications serve as performance metrics, given that they tend to have shorter CVs and require more time to establish a comparable publication record as men.

The Academic Career Paths in the Context of Various Organizational Contexts: A Holistic Approach

Marta Vohlídalová, Mária Králová

Ambis University, Czech Republic

Many studies show that women's academic careers tend to be slower than men's, and many women academics end up in dead-end positions. The inequality regimes approach (Acker, 2006, 2009) points out that the organizational context plays a crucial role in the possibility of career growth for women and gender inequalities in the workplace. Although many studies have mapped the influence of different organizational contexts on women's careers, these mainly focus on a particular academic environment or type of organization. Studies systematically comparing various organizational contexts and domains of study and their effects on the long-term course of academic careers are scarce. Our paper focuses on mapping the course of gender inequalities in academic careers from a holistic perspective. Unlike comparing the academic career stage at one particular moment, we focus on the previous career course up to the present. The use of sequence analysis allows us to follow the timing of critical events in the work and life path of individuals in mutual contexts. We ask i) how the course of an academic career and the differences between men and women vary by field of study (SSH, STEM) and by type of organization (HEI, public research institutes) and ii) how the course of academic careers and gender inequalities changed between generations. The paper is based on a representative questionnaire survey of 2067 respondents conducted in 2017/2018, which mapped the Czech academic population employed at public research and higher education institutions.

Does Merit Matter in Research Promotion? A Comparison by Gender

779

Laura Cruz-Castro, Luis Sanz-Menendez

Spanish National Research Council (CSIC-IPP), Spain

We study factors affecting probabilities of promotion to top rank positions in research careers, with especial attention to gender differences. Promotion, the professional advancement of researchers to a higher category or scale, is a main career reward, even if there are differences about the criteria used to assess the candidates or the factors that influence their probabilities.

Scientific contributions and merit have been accepted as the main criteria for distributing rewards and peer review has been the traditional method for determining merit. However other ascriptive factors of candidates or the relationship with evaluators have been suggested as influential, as inbreeding dynamics demonstrate.

We analyse 90 different promotion events, including the attributes of 2,358 candidates and the 397 members of evaluation committees, at the Spanish National Research Council (CSIC) in a recent five-year period.

We create two different data sets: one of applicants, combining administrative records with scientific performance data (publications, citations, impact, projects, contracts, patents, PhD supervision, etc) and another one of Evaluation Panel members. We integrate the two data sets for each of the evaluation panels.

We find that gender is not relevant to explain individual promotion outcomes, while merit (specially research funding and impact) is an important predictor of the probability

of promotion, controlling for gender. We also find that the institutional proximity between applicants and evaluators has a positive and significant effect on promotion, and the degree of competitive pressure at promotion events is also relevant, independently of gender. We discuss these findings and some organisational policy implications.

Mapping Knowledge Transfer Trajectories in a Research System: a Matter of Gender?

Manuel Fernández-Esquinas[1], Olga Salido-Cortés[2], María Isabel Sánchez-Rodríguez[3]

1CSIC, Spain; 2Complutense University of Madrid, Spain; 3University of Córdoba, Spain

Knowledge transfer (KT) is a fundamental mission of universities and public research organizations. A diversified set of channels for KT, from patenting and contract research to public policy outreach and dissemination, facilitate the transmission of useful resources to business, government and civil society, while helping to feed fundamental research with additional resources, promote cognitive proximity and increase the legitimacy of institutions.

As in other aspects of knowledge production, there are notable differences between areas, research profiles and social characteristics. In particular, in an exploration of a massive registry of applicants to a public program aimed to provide incentives to academics and researchers for engaging in KT (The Spanish 'sexenio' for KT: 17.000 persons, 85.000 activities) we have found a big gender gap. Women participate significantly less in most kind of KT and concentrate these works on some phases of their careers.

The frameworks that try to explain the gender differences in knowledge production (ie. 'deficit model' vs 'difference model') provides scarce evidence about the specific configurations that contribute to such major gap.

In this paper we study both 'vertical' and 'horizontal' discrimination in different forms of KT. We use the mentioned data set as a strategic research site to investigate the gender dynamics of KT in relation to other social, economic and institutional factors for a population of academics and researchers in a whole research system.

RN24 | T01_03: Innovation Ecosystems and Socio-cultural Dynamics

Innovation in the Era of The 4th Industrial Revolution – A Socio-cultural Perspective.

Magdalena Zdun

Cracow University of Economics, Poland

Innovation is a special category of analysis. It is known as the explanans and explanandum of social change. On the one hand, it is a concept that describes social change; on the other hand, it is itself subject to diagnosis. Currently, the context of innovation is defined by the 4th industrial revolution (4IR). This is a spontaneous change that seems to have its own economic culture. This culture consists of three interrelated categories: material, social and symbolic. Each of these categories is associated with a different transgression, meaning crossing the boundaries using the 4IR instruments. These transgressions define innovation. The aim of this speech is to identify transgressions leading to the redefinition of innovation. The result of the analysis will be the presentation of innovation as a basic component of the 4th revolution. In the world of the 4IR, three dichotomies are broken: virtual and real; material and dematerialized, institutional and codified. Innovation seems to be the best way to implement this process.The presented analysis will be theoretical in nature and will end with a semantic reconstruction of the category of innovation. This means defining the ontology of innovation by examining its structure and the forms of its implementation. The theoretical background of this analysis is the sociological theory of development and innovation. As a result, innovation can be recognized as a model(pattern) of the economic culture of the 4IR and its basic social imaginary, in the meaning given to this concept by Charles Tylor. This, in turn, will make it possible to identify two basic cultural types of innovation in the modern world.

Territory and Technological Innovation: the case-study of the wood Industry in Campania region (Italy)

Ilaria Marotta, Anna Maria Zaccaria, Fabio Corbisiero, Feliciano Napoletano

University of Naples Federico II, Italy

This study aims to provide a comprehensive overview of the current opportunities in the reuse, recycling, and upcycling of waste wood within the furniture industry, incorporating both a territorial study and a focus on technological innovation. To achieve this goal, we will showcase the collaborative

780

efforts of the "MICS-Made in Italy Circular and Sustainable" project, which is funded by NextGenerationEU.

The ongoing findings from the Forward sub-project will be presented, offering insights into a case study on the wood industry in the Campania Region, located in the southern part of Italy. The fundamental concept is to establish circular supply chains in the furniture sector, especially in regions characterized by numerous small enterprises that face challenges in independently pursuing innovation.

Consequently, this work will contribute by reconstructing a comprehensive map of the wood industries in the Campania Region. Following this, we will delve into the socio-demographic characteristics surrounding these small wood enterprises. Lastly, we will develop a mapping of the sector's needs, particularly in relation to technological innovation processes, drawing from the experiences of various stakeholders.

As will be highlighted, the influence on innovation processes is intricately connected to territorial resources and relational skills within companies. Several studies underscore the significance of business networks as the focal point where the innovative process unfolds. These studies identify a mutually influential relationship between the structure of the network and its ability to generate innovation within the territory, emphasizing its proactive evolution over time (Tidd, 2005). This underscores the importance of understanding the interplay between network structure and its capacity to foster innovation within the region while adapting proactively over time.

Business Incubation As A Means To Achieve Innovation: Policies and Discourses

Gonçalo Marques Barbosa

Institute of Sociology of the Faculty of Arts of the University of Porto (ISFLUP), Portugal

In a framework of late capitalism (Jameson, 1991) characterized by intense competition in a global market between companies and between countries, innovation emerges as a key variable to achieve competitive advantages and economic growth.

Public policy wise, innovation enjoys a wide umbrella of instruments to help enhance innovative enterprise practices. One of those instruments is the business incubator (Leblebici, Nina, 2011), an organisational format that has disseminated worldwide during the last decades.

Often approached separately, this presentation aims to study and assess the interconnections and interdependencies between innovation and business incubation as policy instruments for the economic development of countries.

Our methodological approach is twofold. A first component is generated by content analysis of public policies around both innovation and incubation, at a European and national level. A second component is generated through interviews with business incubation managers.

The resulting analysis generated the following key conclusions:

– Innovation is far more rooted in EU and Portuguese political institutions, while business incubators are mostly absent at a European level and connected to innovation strategies at a Portuguese level;

– Innovation is positioned as a strategic goal and incubation emerges as an instrument to achieve an end, in a framework of institutional and systemic subordination;

– While not exclusively, innovation is often considered a key criterion by business incubation managers when recruiting and selecting new businesses for their programmes.

Scientific Partnerships and Knowledge Transfer On DNA Recombinant

Bernardo Valente[1], Hugo Pinto[2], Tiago Santos Pereira[1], Rita Campos[1]

1CES – Centre for Social Studies, Coimbra, Portugal;
2University of Algarve, Portugal

781

Biosensors have become indispensable devices in our daily lives, from wearable devices to smartphones that citizens carry in their pockets. The BioAssembler Horizon project has been dedicated to seeking sustainable solutions to build multiplex biosensors through DNA recombinant technology. The project's research until now shows that scientific partnerships with industries have been fundamental to the development of innovation research on biosensors and the animal-to-recombinant transformation associated with it.

This paper aims to map scientific-industry partnerships producing expertise in DNA engineering applied to biosensor technology and unravel the knowledge transfer mechanisms between universities and the private sector. Various factors might contribute to the opportunities for expertise exchange, from the regional clusters of science-universities synergies to the pursuit of applying science management models to consortium research teams.

The methodology involves modelling a structural social network encompassing knowledge transfer between universities and industries/enterprises. Data for this study was collected by scrutinising significant projects funded by international organisations, analysing co-authorship dynamics, examining authors' affiliations in publications within the field, and investigating collaborative efforts in patent creation.

The outcomes of this research aim to construct a comprehensive map of scientific-industry partnerships in the realm of recombinant engineering for biosensors. The mechanisms used to move knowledge from one sector to another are crucial to comprehending how science develops with economic, social and political impacts on biosensing innovation.

RN24 | T02_01: AI in Society: Ethical Implications, and Future Visions

Towards A Socio-Technical View Of Fairness In AI Systems: A Process Of Negotiation From The MAMMOth Project

Marta Gibin, Antonio Maturo

University of Bologna, Italy

Discourses on fairness of artificial intelligence (AI) systems are often framed in terms of technical solutions to fix algorithmic biases, thus promoting a computer science view of the problem. However, this approach often fails on the one hand to address the social context in which these systems are built and on the other to recognise the variety of opinions on what constitutes fairness when different stakeholders are involved in the discussion. As part of the EU-funded MAMMOth project, we investigated a) how the problem of fairness in AI is approached by different disciplines through 29 interviews with experts from either computer sciences or social sciences, and b) how fairness is perceived by those groups who are often discriminated and marginalised by AI systems through 6 co-creation workshops and a survey which collected 171 responses. The research focused on AI systems used in finance, for identity verification and in academic citations and collaborations. While the results show different approaches to fairness across disciplines, they also help to identify a common ground on which to build socio-technical views on the issue. On the other hand, the opinions and concerns of vulnerable groups show that fairness is a context-dependent perceived category, which has consequences on deciding when and how AI systems should be built. The presentation will show how these diverging approaches and opinions have been reconciled in the MAMMOth project, and how fairness has been negotiated both between disciplines and in order to translate the concerns of vulnerable groups into technical requirements.

The Rise of The Algorithmic Authors: Blurring the Boundaries of Human and Machine Knowledge Production

Maria Gretzky Shtoltz, Gideon Dishon

Ben Gurion Univesiry of the Negev, Israel

Algorithms are now integral to academic life, promising benefits like cost-savings and personalized services while raising ethical challenges related to surveillance, commodification, and algorithmic governance (Komljenovic & Robertson, 2016; Williamson, 2018). However, the emergence of large language models (LLMs) that produce human-like text has raised new questions. These LLMs exceed mere assistance by autonomously generating content, blurring the boundaries between human-authored work and machine-generated outputs. This research examines the destabilization of traditional perceptions regarding knowledge production as an exclusive domain of human intellect, examining the complex relationships forming in light of the emergence of an "Algorithmic Author".

While existing research mainly addresses LLMs' outputs and their implications, this study adopts the social construction of technology framework (Pinch and Bijker, 1984; Van Baalen, 2016), to examine how the Algorithmic Author is constructed, enacted, and interpreted by various academic actors.

Drawing from a 10-month ethnographic study at a public research university and 20 in-depth interviews with faculty and graduate students, this research reveals two key discourse levels regarding ChatGPT. The first examines the Algorithmic Author's political status in academic knowledge production, identifying two prevailing narratives: senior management viewed ChatGPT as a potential threat to academic integrity, while the R&D unit praises it as an innovative educational and research tool. These debates highlight the Algorithmic Author's contrasting roles in different academic sectors and its political function in framing epistemic views on knowledge production.

The second level focuses on academics' daily interactions with LLMs, identifying anthropomorphic and technomorphic perspectives. Together, these levels demonstrate how varied narratives within academia affect perceptions of the Algorithmic Author and human-machine interactions, influencing new conceptions of knowledge production and academic identity.

The Brave New World of AI: Exploring Scientists' Vsions of the Future

Emília Araújo[1], Paula Urze[2]

1Universidade do Minho, CECS, Portugal; 2FCT NOVA, CIUHCT, Portugal

Artificial intelligence (AI) has been studied for many decades and is now one of the main pillars of society's future. This is how it has been legitimized by science and technology and presented to the public. The last two years have been prodigal in reflections and considerations on the problems raised by its development in very broad areas, from culture to labour, science, health, and mobility.

Given the various forms of AI reification, questions about AI and its relationship with today's society and in the future can be raised, notably: What drives research on AI? What room do scientists give to the choices of social actors and governments? Are scientists' visions of AI deterministic? What are the implications of this determinism? To what extent do scientists feel responsible for the implications of AI? The answers are complex and take us back to the problems of technological determinism about the future, the neutrality of technology in highly complex societies, or the interests and values that rule the selection of technologies.

This presentation is based on an exploratory qualitative methodological approach that favours scientists' views, seeking to understand their positions on the central issues of AI innovation. This does not necessarily entail to find out how scientists think about the future and the role of technology in shaping it. Instead, it aims to understand what scientists' visions mean and how they can shape political and legal decisions with the capacity to structurally affect social life.

A New Team Member in Research: Artificial Intelligence

Marjoriikka Ylisiurua[1,2], Hannamaija Tuovila[1]

1VTT, Finland; 2University of Helsinki, Finland

The broad set of technologies called artificial intelligence is projected to affect white-collar workers, including the profession of researcher. Algorithms are already used during the research process beyond the analysis phase. Increasingly, generative artificial intelligence tools like large language models (LLM) appear efficient in helping researchers refine their administrative communication and manuscripts. The literature review, a fundamental task in research, is another promising application area as algorithms help condense a vast amount of scientific knowledge into a brief state-of-the-art.

Our work presents an example where an LLM algorithm was employed alongside researchers as a complementary team member coding a set of scientific publications for closer inspection during a literature review on sustainable consumption behavior. We argue that this simple one-purpose artificial intelligence was accepted as a peer in the geographically dispersed team as its developer harnessed it and embodied the algorithm's "intelligent" abilities as a real-life person. Our example thus highlights that the algorithm does not replace the human in research. Instead, its employment moves the need for highly educated professional knowledge and effort into a different discipline. In this fashion, our experiment presents a practical confirmation of the suggestion that artificial intelligence, like LLM, may replace human work in some corners of society while simultaneously introducing a need for new skills and professions elsewhere. However, our experiment also illustrates how artificial intelligence algorithms thus embodied can step out of their black box and be trained to work alongside humans during such multidisciplinary collaborations, where the old and the possible ways of working are also negotiated between different human professions. We invite a discussion and criticism of the consequences.

RN24 | T02_02: Precarity, Institutional Dynamics, and Career Mobility in Academia

Reproducing the Neoliberalized Academia through Precarity in Science

Ana Ferreira

NOVA FCSH, Portugal

Over the last couple of decades, the Portuguese higher education and science sector has been going through deep transformations that progressively resulted in a neoliberalized academia, characterized by hierarchical organizational settings, instrumentalized scientific practices and a culture of performativity. In this context, more than 90% of all Ph.D researchers hired after 2016 in Portugal, are precarious. Despite this scenario, no recent research has characterised this population, their work or their subjective experiences of precariousness.

Based on a questionnaire integrating quantitative and qualitative techniques, this paper characterises researchers on fixed-term contracts working in Portugal (n= 1026), their working practices, scientific trajectories and individual reflexivity processes, understood as the moments when individuals interpret their lives and consider future projects taking into account their social circumstances.

The results reveal long trajectories of precarity and a transversal reproduction of instrumentalized research practices. Concomitantly, a heterogeneity of critical discourses regarding their scientific practices and trajectories, as well as the scientific and technological system, is present. These discourses, configure moments of individual resistance and, in most cases, are not aligned with a collective agenda. As such, they are are not instigators of a transformative agency, but rather ways of managing tensions researchers experience through their working lives. Between guaranteeing their survival in academia, in the present, and enabling it, in the future, precarious researchers reproduce the neoliberalized academia and thus, the conditions that promote their maintenance in the disadvantageous structural position in which they are at.

"Institutional Inbreeding in Academia: A Critical Analysis of Meritocracy and Professional Orientation"

Wilfrid Martínez-Sánchez[1], Manuel Fernández-Esquinas[1], Jaime Aja Valle[2]

1Spanish National Research Council (CSIC), Spain; 2University of Córdoba

'Institutional inbreeding' in academia is one of the most sensitive issues in talent management in research and higher education. It is usually understood as the recruitment of staff trained at the same institution and their subsequent internal promotion, where thet eventually achieve tenure. Traditionally the term inbreeding has been used to critically describe the social closure in recruitment and promotion, but recent research underscores the need for a nuanced understanding of its context-specific implications. This proposal focuses on organizational dynamics in order to provide a nuanced and contextualized exploration of practices that promote or prevent institutional inbreeding. We use two sets of concepts: meritocracy and professional orientations. Meritocracy values contributions based on knowledge and achievements. In contrast, particularism focuses on the influence of social ties and relationships. 'Cosmopolitan' and 'local' orientations further segment meritocracy, highlighting the tension between global academic standards and organizational needs. This study operationalizes these concepts through a survey of the Spanish research system. Preliminary results suggest that the interrelation between meritocracy and professional orientation plays an important role in the configuration of labour markets, generating different models for hiring and promotion. This research therefore situates academic inbreeding within a broader institutional context, stressing the importance of understanding it as a phenomenon intertwined with institutional values, norms, and networks. In addition, the study identifies patterns of recruitment and promotion that are useful for constructing indicators capable of capturing different forms of inbreeding and mobility. Although still at a preliminary stage, the study suggests how the evidence can be used to inform university management and research policies that are sensitive to different contexts.

Digitalization, Internationalization and the Immobility Turn in Researchers' Careers in Portugal

David Cairns

ISCTE-IUL, Portugal

This paper looks at recent developments in digitalization and internationalization in Portuguese universities, focusing on researchers' careers. Using evidence from 100 interviews conducted at 28 research units in 2022 and 2023, the discussion presents a cross-sectional view of engagement with these issues, covering the early-, mid – and late-career stages. The more experienced interviewees illustrate how in the past, they were able to undertake substantial amounts of geographical mobility, particularly during the formative stages of their careers, a development reflecting the expansion of global interconnectedness at this time, theorized as a mobility turn in the social sciences. However, the evidence also suggests that the popularity of corporeal mobility may be declining among early career stage researchers, at a time when many aspects of research work have migrated to the digital realm. This position is interpreted as part of an immobility turn that became visible during the COVID-19 pandemic and has remained prominent. In the Portuguese context, other factors such a housing crisis and rising cost of living have also made many cities unattractive destinations for researchers, some of whom have adopted hybrid working modes to cope with precarity. In conclusion, it is argued that researchers' careers in Portugal may now be entering a de-internationalization phase in respect of corporeal mobilities, accompanied by greater use of digitalization in research work, including working modes combining physical and virtual mobilities.

Who Benefits from Job Security? Job Satisfaction and Performance in Academia

Jens Ambrasat, Gregor Fabian

Humboldt-University Berlin, Germany

784

Working conditions in the science system have long been complained about as insecure and lacking in perspective. It is an open question who could benefit from more secure employment. While a widespread rhetoric in political debates and some economic approaches suspect that greater job security undermines scientist's motivation, efforts and performance, psychological approaches on work and motivation see increasing satisfaction on the part of scientists as a driver for the development of higher performance potential. We are investigating the relationship between contract situation, satisfaction and performance in science on the basis of a representative sample of 4,134 postdocs from all universities in Germany. The results show positive effects of secure employment on both satisfaction and output. However, the output effect is only partly mediated by satisfaction. In contrast to earlier studies, relevant contextual characteristics of the work situation are controlled for, so that the effect of the secure employment is more clearly carved out. The study refutes negative attributions of permanent positions on work results and thus the hammock argument. Thus, all parties, scientists and organizations as well, may benefit from stable jobs for researchers.

RN24 | T03_01: Agency, Trust, Responsibility, and Participatory Research for AI

Thinking on 'Thinking Machines': On the Question of Agency Capacity of AI

Borabay Erbay[1], Emin Baki Adaş[2]

1İzmir University of Economics, Turkiye; 2Aydın Adnan Menderes University, Turkiye

The rise of AI and algorithms in recent history has made sociology turn its gaze on these new technologies. The 'learning' and a quasi-autonomous acting capacity of AI makes it unique for sociology. Sociological studies on AI can be grouped in two perspectives. Studies in subject-oriented sociology are widely concerned with the use and effects of AI and algorithms in various social fields, focusing mainly on the the agency of human beings. Through object-oriented sociology and the idea of 'agency of things', the agency capacity of AI and algorithms can be understood. Although making significant contributions, these perspectives have their limitations. Subject-oriented sociology of AI has a limitation of reducing AI and algorithms to a means in human-human interaction, thus, making it impossible to fully understand 'machine agency'. Object-oriented sociology, through the idea of 'agency of things' provides ab opportunity to understand the agency capacity of these technologies, but at the cost of obstructing the difference between human and machine agency as well as structural power relations that shape society. This study aims to provide a theoretical contribution to the understanding of AI in sociology through a collation of Actor-Network Theory (ANT), Marxist Political Economy and Bourdieusian understanding of habitus. While ANT lays the ground for AI to be understood as an agent, habitus contributes to understanding the human, who writes and codes it. Through this, human and machine can be understood as the foundational parts of a new, hybrid form of sociality. Lastly, as it is not possible to imagine high-tech technologies such as AI and algorithms without global capitalism, it is crucial to integrate political economy into debates on AI and agency question.

Trust In Artifical Intelligence. A Survey Experiment to Measure Attitudes Towards AI In Hungary.

Ferenc Orbán[1], Ádám Stefkovics[1,2], András Pavalacs[1]

1Századvég Foundation, Hungary; 2HUN-REN Centre for Social Sciences

With AI increasingly embedded in daily life, understanding public sentiments becomes pivotal. Investigating public attitudes towards AI is crucial because it informs developers and policymakers about societal concerns and expectations, enabling the creation of more ethical, acceptable, and beneficial AI technologies. In our research, we attempt to investigate attitudes toward AI via survey experiments, and measure how much people trust AI, and to what extent trust in AI is moderated by different social factors, such as gender, age, the level of education, institutional trust, political ideology or religiosity.

In our experiment, we created hypothetical situations in 4 different domains (public healthcare, hiring, financial advise, self-driving car) split into a control group, and a treatment group. The control group received a neutral situation, whilst the treatment group received the same situations but supplemented with AI assistance. Trust in the process was measured after the treatment. The survey is conducted on a representative sample of the Hungarian adult population (aged 18 or over) using a CAWI method (n=2100). In our analysis we show main effects as well as interaction effects to test treatment heterogenity.

Our results will be presented in the conference.

Between Responsibility and Self-Subjugation – The Framing of AI Development in Media Discourse

Marek Winkel

University Fribourg, Switzerland

785

Social attitudes towards artificial intelligence (AI) are fed to a relevant extent by the media discourses on the topic. It is therefore worth taking an empirical look at the question of how the development of AI is negotiated in the media. An initial examination of the topic of AI in the news media reveals that the focus lies often on society's social responsibility and its ability to intervene regarding the control of AI development. The narratives vary and range from calls for political intervention to technology-deterministic self-subjugation to supposedly uncontrollable developments. These different framings of AI development differ between individual media channels. Depending on the political orientation of different media, varying aspects such as economic development, human rights or ideas of freedom are brought together with the question of intervention in AI development.

The workshop-lecture presents the results of a discourse analysis on the negotiation of the mentioned topic in the newspapers Süddeutsche Zeitung, Zeit and FAZ. The newspapers represent the center-left – to center-right-spectrum of the major German newspapers. Thus, they provide a basis for reconstructing the different framings of AI development in terms of responsibility and ability. The analysis founds on 28 articles that appeared in the context of the publication of ChatGPT and the months after. Method of choice was the Sociology of Knowledge Approach to Discourse (SKAD). SKAD is particularly suitable for examining competing media patterns regarding the interpretation of social issues. The results of the discourse analysis promote an understanding of the question of why certain

interventions with regard to AI development are supported or rejected in politics and society.

Supporting the Development of AI through Participatory Action Research: A Case Study on Social Services in Catalonia

Albert Sabater, Roger Campdepadrós, Beatriz López, Cristina Sánchez

University of Girona, Spain

In exploring the application of artificial intelligence (AI) within social services in Catalonia, a region pioneering Spain's first AI strategy, our study employs a grassroots ethical approach through Participatory Action Research (PAR). This approach brings together a diverse group of participants including social workers, policymakers, technologists, developers, and social scientists, to critically evaluate AI's integration into social services in the region. Within the framework of the AI FORA project, two significant gatherings were instrumental in shaping the dialogue, emphasizing the need for ongoing, inclusive assessments to ensure the initiatives remain aligned with community values and ethical standards. Our research methodology included the use of focus groups to delve into the benefits and challenges of employing AI in social services, complemented by a World Cafe format to facilitate in-depth discussions on four pivotal topics: 1) leveraging data in social services for efficient resource distribution, 2) utilizing predictive analytics for preemptive actions, 3) fostering a culture of continuous evaluation and enhancement, and 4) enhancing cooperation among all stakeholders involved. The findings highlight the dual nature of AI in social services—while it offers innovative solutions and opportunities for advancement, it also raises significant ethical and practical concerns, particularly for those in marginalized or vulnerable positions, underscoring the critical need for cautious and informed implementation.

RN24 | T03_02: Competition, Institutions, and Aesthetics in Scientific Knowledge

Orientation and Role Strain: On Neglected Functions of Academic Competition Among Postdocs

Kathia Esperanza Serrano Velarde[1], Julian Hamann[2], Michi Hügel[3]

1Heidelberg University, Germany; 2Humboldt-Universität zu Berlin; 3Humboldt University, Berlin

The postdoc career stage is increasing in frequency and duration. At the same time, the postdoc role is complex, open, and uncertain: The tasks postdocs are confronted with are more diverse and complex compared to the Ph.D. stage. Yet, there is less guidance. This paper addresses the question how postdocs learn what it means to 'be a postdoc'. Bridging the literatures on the socialization of postdocs and on academic competition, we reveal a neglected function of academic competition: Competition is not only a mechanism for allocating scarce resources, it also has a socializing function because it conveys expectations and values to postdocs. Drawing on qualitative interviews with 60 postdocs in history and physics in Germany, we show that postdocs distinguish competitions for publications, funding, and jobs. Contrasting individual narratives from two most dissimilar research fields, we found evidence regarding the sometimes conflicting norms and demands articulated in each discipline. Although our study contributes a comparative perspective to the study of so-called early career researchers, we were surprised by the degree of commonalities in our findings – especially regarding the coping mechanisms of our interviewees. Doubts, stress, and identity conflicts, we argue, are not particular to disciplinary communities or specific types of competition. Rather, they emanate from the multiplicity of role expectations, value frameworks, and time horizons articulated in the different types of competition early career researchers engage in simultaneously. Thus, precarity is not only an inherent feature of the academic career path but also actively (re-)produced through the conflicting demands of competitive configurations in and through which researchers learn about their role as postdocs.

786

The Role of Science in the Eyes of Croatian Academics – Generational Differences in Attitudes and Behaviors

Marita Grubišić-Čabo, Marija Brajdić Vuković

Institute for Social Research in Zagreb, Croatia

This paper focuses on generational differences in perception and practice of social responsibility in four academic disciplines (natural, technical, social and biomedical sciences). It is based on a survey of N=800 researchers from different universities in Croatia and explores various aspects of academic ethics, research integrity, perceptions of relationship between science and society, as well as attitudes and behaviors related to open science. Drawing insights from past research and contemporary literature, we examine generational differences against the backdrop of evolving trends in the professionalization of science. This includes phenomena like the 'publish or perish' culture, 'new public management,' and the metric logic of evaluation. We analyze how these changes influence the perceived and practiced social role and responsibility of science. Broadening this inquiry by including more than only STEM fields, and using multivariate statistical analyses with the focus on generational differences, this paper aims to better understand the present and find a shape of future developments in the relationship between science and society.

What Do Academics Think About Their Institutions?: An Exploration Of Professional Trajectories, Institutional Quality And Commitment

Jaime Aja-Valle[1], Manuel Fernández-Esquinas[2], Wilfrid Martínez-Sánchez[1,2]

1University of Córdoba (UCO), Spain; 2Institute of Advanced Social Studies (IESA), Spain

The goal of this paper is to explore the institutional quality of universities and research centers from the perspectives of the people who work for them.

Literature on the social configurations of systems of knowledge production usually states that "institutions count". It is assumed that the character of institutions shape their internal dynamics and outcomes, although these issues are difficult to capture empirically. The construct of "institutional quality" has been used to observe some sociological dimensions: the existence of meritocracy, equal opportunities, immunity to particularistic interests, absence of island of power and lack of bureaucracy, in addition to the organizational climate, innovation and proactivity.

In this paper, we hypothesize that the trajectories and working conditions inside institutions are interlinked with the experiences and perceptions of institutional quality,

and shape the commitment of workers with their employing institutions.

We have operationalized aspects of institutional quality in an extensive survey to professors and researchers of the Spanish research system. In addition, we have built a typology of academic careers combining age of entrance (early or late) and institutional mobility (internal or external career), resulting in five types: early-mobile, early-internal, late-mobile, late-internal and mixed.

Our analysis observes how academic careers influence the assessment of institutional quality, and extends to other aspects of institutions, including the legitimacy of the institutional missions and the contributions to society at large. The conclusions suggest the convenience of using an integral conceptualization and research design of relevant sociological dimensions of institutions, while paying special attention to the working conditions and trajectories of researchers.

Aesthetics and the Social Construction of Scientific Knowledge: Evidence from a Cross-National Study on Biologists and Physicists' View on the Relation between Beauty and Science.

Benedetta Nicoli[1], Cesare Silla[2], Paolo Volonté[3], Brandon Vaidyanathan[4]

1Catholic University of Milan, Italy; 2Università di Urbino 'Carlo Bo', Italy; 3Politecnico di Milano, Italy; 4Catholic University of America, Washington D.C. USA

As Science and Technology Studies shows, scientific knowledge production is a social practice that embodies epistemological claims and ontological orderings, including aesthetic judgments and imputations. However, the role of aesthetics in scientific knowledge production has yet to be systematically covered by research, and the field encourages further investigation.

This presentation contributes to the field by addressing the role of aesthetic judgments and imputations in scientific work, as per the perception of scientists. Data derives from the "Work and Well-Being in Science (WWB)" international study, which is as of today the largest cross-national research initiative to understand key factors that affect the work and well-being of scientists. The study focused on scientists in physics and biology departments in four countries (India, Italy, the UK, and the US) covering, among other themes, the role of aesthetics in scientific work, and it consisted of a nationally representative survey (N=3442) and a set of 205 semi-structured interviews.

Our analysis focuses on images that scientists selected when asked to provide examples of what they consider beauty in science and their accounts of the choice. Beauty and related aesthetic judgments appear as significant at three different layers: an ontological layer, where scientists encounter beauty in the objects of science; a praxis layer, where scientists see beauty as part of the scientific research

787

process; an epistemic layer, where scientists weigh beauty as an epistemological tool. The presentation concludes. by discussing the relevance of the three layers in scientific knowledge production.

RN24 | T03_03: Knowledge, controversies and trust in Healhtcare and Food Systems

Efficient Ethics? Enacting Ethicality in Everyday Practices of Handling Donated Blood in Finland

Ronja Marika Tammi

University of Helsinki, Finland

Blood can be considered as a classical topic—as a metaphor and as an actual human biological material—in social sciences studying phenomena of the medical world, kinship, and donation practices. However, since Titmuss's famous book published in 1970, the world of blood and its donation have come a long way—or have they? In this paper, I examine how the ethics and moral properties of donated human blood are enacted in the context of the Finnish Blood Service's everyday blood-related work.

This paper stems from ethnographic fieldwork and expert interviews collected in 2023–2024 at the Finnish Red Cross Blood Service (FRCBS), that has been responsible for the Finnish blood supply since 1948. The fieldwork was conducted at the main FRCBS site in Vantaa, as well as in two blood donation sites. The premise in Vantaa is an extraordinary place: all blood donated in Finland gets transported there, where it is separated and processed into various blood products, tested for infectious diseases as well as for blood groups, and eventually sent to hospitals. During my fieldwork, I observed the journeys of donated blood from its donation through the testing and handling processes until the blood products were sent to hospitals.

This paper if part of my doctoral research project, in which I study the everyday ethics of donated tissues in Finland, analysing egg, blood and corneal donation practices in parallel. In my project I am particularly interested in the role and meanings of genetics in these ethical practices.

788

Experiential Knowledge And Scientific Controversies Over Health: A Symmetrical Approach

Mikko Jauho

University of Helsinki, Finland

Personal experiences are accentuated today in health care in many ways, driven by major social changes. The neo-liberal restructuring of the health services has promised individualized services and personalized medicine, expecting from citizens an entrepreneurial attitude towards their health. The inclusion of non-experts to increase the legitimacy of decision-making has introduced to the medical domain experts-by-experience to build awareness, guide patients and clients, and develop services. Structural changes

in both medicine and medical problems have foregrounded patient experiences, which give important information on various aspects of the treatment process, be it diagnostics, service utilization, or coping with a chronic condition.

Alongside these positive accentuations, personal experiences also have a central role in contemporary scientific controversies over health. Struggles over, for example, healthy eating or vaccinations are not only about epistemic propositions, but increasingly about the status of personal experiences with knowledge claims. Whereas critical individuals value their experiences over generalized expert advice, established experts reject them as false, claiming ignorance or misinformation.

In previous research, accepted and rejected forms experiential knowledge have been treated separately, utilizing different explanatory models. In this paper, I suggest that both types should be viewed symmetrically: why are epistemic claims related to personal experiences accepted in certain contexts and rejected in others? Putting the question in this way leads us to look at the structural features of such contexts. I will illustrate the idea by discussing one example, current mainstream nutritional thinking and dietary advice. The strict separation and clear hierarchy between food and nutrients that nutrition establishes leaves little room for experiential knowledge, which fuels the confrontation between official and alternative views.

Medical Gaze on Reproductive Bodies and Reproductive Decision-Making: Women's Experiences and Selection of IVF Protocols in Japan, UK and Taiwan

Pei-Chieh Hsu

University of Cambridge, United Kingdom

Of countries where In vitro fertilisation (IVF) has been widely implemented, Japan is distinct, given the prominence of mild-stimulation IVF. Mild IVF involves less ovarian stimulation and physical stress at a reduced cost. It is framed as a "patient-friendly" protocol. Research has debated its efficacy for over 20 years. However, how this technology intersects with reproductive decisions and embodied experiences in IVF is never examined. This paper asks why Japanese patients choose mild IVF more frequently than in other countries and compares IVF decision-making between Japan, the UK and Taiwan to contextualise women's perceptions when facing diverse treatment choices in different cultural, social and medical contexts.

This paper builds on one-year qualitative data collection and an online survey of over 1500 respondents, unpacking intertwined social constructions of bio-knowledge and reproductive bodies. The paper inquires how women perceive diverse ovarian stimulation methods and their impacts on treatment experiences and results, from the theoretical lens of reproductive governance and the complexity of care in Science and Technology Studies. The aim is to uncover the social configurations underpinning the medical rhetoric surrounding milder stimulation being beneficial for women

undertaking IVF and to examine how the concept of care is localised and framed as moral and political strategies for treating involuntary infertility.

Through comparison, this paper finds that having choices in ovarian stimulation methods enhances patients' engagement in treatment decision-making. Mild IVF's emphasis on the "closer to nature" framework, which collaborates with "caring for women" rhetoric, renders IVF more approachable and reduces the barrier between medical professionals and patients. On the other hand, this paper reveals that patients regard the treatment cycles required before success as a neglected aspect of mild IVF. Mild IVF traps women with repeated, unsuccessful IVF cycles more than the standard IVF protocol, questioning the "patient-friendly" framework. In sociological research, IVF has been considered a unified technology. How nuanced treatment approach selections lead to different IVF experiences has never been explored. This paper demonstrates that not only patients' social conditions and identities influence their reproductive decisions and that the diversity in IVF technology significantly shapes different IVF experiences and decisions.

No Matter of Trust? – Understanding Trust in The Context of Blockchain in the Food Supply Chain

Bianca Sybille Roth[1,2]

1University of Stuttgart, Germany; 2German Federal Institute for Risk Assessment (BfR)

789

Food safety and food fraud are global issues that have led to a decrease in consumer trust in food systems and products. To tackle this issue, digital technologies are emerging, with blockchain being one of the most prominent. Blockchain is said to offer a decentralised approach that improves transparency, traceability and a verified, tamper-proof record, which increases trust. However, the relationship between trust and blockchain is a topic of intense debate in the literature. Based on the conducted literature review, economics provides the most dominant understanding of trust in relation to blockchain. They define trust based on the blockchain's characteristics. Some economists even argue that blockchain can be considered a trust-free or trustless-trust system due to its architecture and attributes. However, the concept of trust can be misunderstood due to the lack of a clear operational definition of trust, including its dimensions and objectives. From a sociological perspective, trust in relation to blockchain is a complex concept that goes beyond its architecture and attributes. It involves the (changing) roles and perceptions of multiple actors, including elite actors such as blockchain-as-a-service (BaaS) providers and users, mainly producers and retailers. Therefore, this presentation provides initial empirical findings from elite interviews and documentary analysis on how blockchain has changed interactions between food supply chain actors and how the use of blockchain has affected food supply chain actors' perceptions of trust. In doing so, it raises questions about the impact of blockchain on traditional understandings of trust and the relationships and roles of trustors, trustees and trust objects.

RN24 | T04_01: The multiple senses of space

The Adventures Of Organoids: Cerebroids In Space

Fabien Milanovic, Cecile Vermot

Supbiotech, France

On November 10, 2023, the Dragon capsule took off for the International Space Station (ISS) carrying cerebroids. Cerebroids, or cerebral organoids, are derived from human cells that have been restored to pluripotency in vitro. By mimicking certain aspects of human organs, they enable us to better understand how they function. People who have sent cerebroids into space are taking part in the Cerebral aging mission, whose aim is to analyze neurodegenerative diseases by modeling them using these cerebroids. This paper will present the mission and propose an initial mapping of the human and non-human involved (donors, cerebroids, researchers, industrialists, astronauts, etc.). It will then address some of the tensions linked to these emerging entities that are organoids (production, conservation, links to industry, public-private positioning...) and more specifically discuss the question of the moral status of cerebroids. A thread running through this paper will be the consideration of emotions as a central element during these activities.

Bioregenerative Life Support Systems as Hybrid Assemblages of Human and Non-human Actors

Marco Serino, Maria Carmela Agodi, Ilenia Picardi

University of Naples Federico II, Italy

A multidisciplinary enterprise is currently engaging space scientists in exploring renewed possibilities of extending human and non-human existence beyond old and new frontiers. Although already achieved more than fifty years ago, the goal of bringing humans to the Moon is becoming central again to the projects of space faring and discovery of new worlds. The Moon is, indeed, the limit beyond which to go in near future, with Mars being among the destinations to reach one day. To face these challenges, scientists have to find feasible solutions to ensure the survival of space crews during longer travels (e.g. towards Mars) and to safely operate in orbit or on planetary surfaces, far from Earth. One key solution is to rely on bioregenerative life support systems (BLSSs), that is, closed ecological systems where different agents (human beings, plants, micro-organisms, and technological devices) coexist to function as producers and consumers of food, oxygen, water, and waste. Although inspired by earthly ecosystems, BLSSs are unprecedented forms of multispecies systems that have been studied for decades (from the early space age in the Sixties onwards). The present paper aims at situating research on BLSSs in a theoretical framework that redefines the bonds between society, technology, and environmental issues by relying upon multispecies narratives and conceptualisations of hybrid assemblages of heterogeneous actors. The key argument is that, to study BLSSs, scientists rely on the intricacies of the relationships between human and non-human agents, hence offering to social scientists an invaluable occasion to study new hybrids that could transform life and the idea we have of it from a terrestrial point of view.

Digital Knowledge Production and Un/Even Data Geogragraphies

Martin Schinagl

Technische Universität Berlin, Germany

This paper presents results of a comparative research on digital urban planning communities drawing on case studies in the US, Nigeria, and Germany. Through ethnographic workplace studies on urban planning offices, the construction of (spatial) knowledge through digital tools such as computer assisted design software, geographic information systems, and others were observed.

Local cultural differences and similarities between different planning communities in the use and handling of technology allow conclusions to be drawn about the conditions of digital planning processes and the techno-spatial contexts of situated planning practices of knowledge production across different scales.

Drawing on concrete observations the research demonstrates how spatio-temporal arrangements of planning processes correlate with uneven data geographies and power structures. Indicating towards the spatiality of digitally organized processes. Geodata are a central means of organising and constructing planning processes. These data practices are organized in a spatial division of labor. This implicates spatial inequalities in the control of and access to data on different levels. Competitive global and regional inequalities are reproduced and reshaped through digital planning processes.

Observations from different planning communities show how different techno-spatial preconditions correlate with the existence and emergence of planning and technological cultures. Global asymmetries between planning offices, between center and periphery on various scales materialize and emerge through digital infrastructures.

The findings of this research form the basis for a new research project that explores power – and technology-sensitive collaborative practices for the construction of spatial knowledge in a city-to-city project as part of a dialogue between global South and global North.

Building Certifications as Sustainability Devices. The Construction of a New Sociotechnical Imaginary in Architecture

Krzysztof Janas

University of Warsaw, Poland

The knowledge of how to design buildings and what characterizes good architecture today can no longer be taken for granted. Nor can it be treated as something immutable, even if it has the status of a scientific fact. As STS points out, scientific facts, too, are social constructs, and the path from establishing a fact about the world to its application in everyday practices is a winding one, requiring many complex knowledge-making processes and tinkering.

A similar approach has also been applied to architecture and urban studies. More evidence of the building industry's negative impact on the climate is forcing architects, planners and investors to reconsider their design and business strategies. A deeper understanding of the complex socio-technical relations in which architecture and designers are situated is required to find their way in a world of climate transformation, where every design decision or regarding materials and technologies used can carry unforeseen consequences.

The aim of the presentation is to analyze the building certification system as a "sustainability device" establishing and spreading the sustainability paradigm and developing a new "sociotechnical imaginary" in architecture. In my talk, I will draw on preliminary findings from doctoral research project in which I focus on discourse analysis around sustainable architecture and ethnographic research in design studios. The presentation will also reflect on theoretical questions, including the possibility of combining STS with Niklas Luhmann's theory of autopoietic social systems and the convergence of the concepts of translation with structural coupling and sociotechnical imaginary with sense structure.

RN24 | T04_02: Exploring Knowledge Transfer, Open Science, and Science Policy

Between Academic Requirements and Societal Impact: Inquiring Disciplinary Differences in Scientists' Navigation of Knowledge Transfer

Annika Just, Melike Janßen

Deutsches Zentrum für Hochschul – und Wissenschaftsforschung (DZHW), Germany

In the evolving academic landscape, researchers are increasingly tasked with demonstrating the societal impact of their work – besides conducting research and teaching. Our contribution explores potential tensions arising from these diverse responsibilities and how they are carried out in different disciplines.

Engaging in knowledge transfer is one way of achieving and demonstrating societal impact and thus legitimizing scientific work. Knowledge transfer has been integrated into science policy and research evaluation at various levels, making it a relevant term for all academics. However, there may be differing understandings of the term 'knowledge transfer' and its integration into research practice among scientists. To ensure a thorough understanding of science's contribution to society, it is essential to identify potential conflicts that may arise when navigating academic and knowledge transfer requirements, particularly in relation to disciplinary affiliation.

In the fall of 2023, we conducted a survey involving over 3,000 researchers in Germany as the quantitative part of an ongoing mixed-methods research project. Our aim was to provide a comprehensive empirical basis to develop a typology of knowledge transfer practice across disciplines. Consequently, the survey captured data on scientists' disciplinary backgrounds, their perspectives on the discourse surrounding knowledge transfer, and their involvement in knowledge transfer activities.

On this basis, we explore the perceived tensions between academic demands and knowledge transfer, and their manifestation in different disciplines. Our data showcases diverging understandings and practices of knowledge transfer and connects these to disciplinary differences, emphasizing the significance of comparative perspectives in the ongoing discourse on science-society relations.

791

Open Science – Can (And Should) It Be for Everyone? A Comparative Analysis of 2 Researcher Surveys in the Biggest Research Network in Hungary

Anna Horváth, Róza Vajda, Judit Gárdos, Julia Egyed-Gergely

Centre for Social Sciences, Hungary

In recent years Open Science initiatives, practices and regulations have been gaining momentum. Funding bodies and publishers have been increasing their expectations regarding making research publications and research data accessible. Researchers are faced with an ever-growing demand for planning, documenting and executing the collection, archiving and publishing of research data. There seems to be a general understanding and unison within the scientific community concerning the importance of free and accessible scientific communication, which has been recently highlighted by the Covid-19 pandemic and the pressing matter of the climate crisis.

However, Open Science practices and regulations come with their own set of challenges: unfortunately, both Open Access publishing and accessing publications from many reputed journals comes at a high cost that many researchers and institutions cannot afford. Another type of challenges lies within the existing practices, motivations, and doubts – in other words, the current culture – among researchers regarding management of research data, which proves to be an understudied subject. Some reservations and existing practices – which may differ by scientific discipline – might be more substantial than others (e.g. the worry about having research proposals plagiarised).

In 2022, the biggest survey (51 interviews; 129 questionnaire respondents) to date was conducted on researchers' research data management practices, needs, and difficulties in Hungary within the framework of a large project set out to construct a large, "user-beneficial" data repository for the 18 institutions of the Hungarian Research Network (HUN-REN). The repository has been tested by select researchers before opening and we are conducting a more inclusive follow-up survey to look at overall satisfaction as well as further needs for development to support the culture of open research data in Hungary.

Tension or Transformation? Interrelation Between Gender (equality) and Open Science in Context of Responsible Research & Innovation

Aurelija Novelskaitė[1], Laura Bagočiūnė[2], Raminta Pučėtaitė[1]

1Vilnius University, Lithuania; 2Lithuanian Center for Social Sciences, Lithuania

Responsible research and innovation (RRI) is still rather young concept in both political and academic discourses, but as covering such realms as governance, ethics, gender (equality) (G(E)), open science (OS), science education, and public engagement, significantly contributes to shaping of research practices and cultures as well as science as social institution in general.

In this paper, first, we focus on G(E) in RRI context considering gender (in addition to other intersecting features) as lurking in all domains of both personal and socio-political life; thus, gender prevails in any realm of RRI. Second, we consider numerous practices, principles and pillars of the OS in the context of claiming "most analysis and policy documents related to OS&OI adopt a gender blind approach". More specifically, we aim to explore an interrelation between G(E) and OS in light of scarce previous research findings, which suggest that (a) OS and, in particular, open access can be regarded as a means to "facilitate greater diversity and inclusiveness" and can be treated as predictor for gender equality developments; however, (b) gender equality achievements also can be considered as predictor of OS indicators; furthermore, (c) there are reportings on negative interrelation between gender equality in academic contexts and OS; as well as (d) there are reportings on absence of interrelation between the OS and gender equality.

From empirical perspective, we look at the interrelation trough available ES statistical data (She Figures) reporting on levels of gender distributions in research in general as well as in mobility, publication, and other R&I related activities in several research sectors in the 27 EU countries by employing such statistical analysis methods as correlation and regression analysis.

The Political Economy Of Science Policy Concepts

Martin Reinhart, Authorship Collective Merton Center

Humboldt-Universität zu Berlin, Germany

There seems to be a proliferation of concepts that are used to describe and prescribe what science is or should be. They are generally understood as ideals that the practice and governance of science should move towards – more openness, more responsibility, more impact. As such they imply that both scientists and the general public view them,

792

in principle, as desirable, not the least because their opposites are clearly nondesirable. The multitude and idealism of these concepts has been noticed and problematized already in the literature and in public. We claim that we are witnessing the establishment of a global arena for discourse on science policy, in which these concepts are key elements. The multitude of concepts opens up an arena in which actors in science policy, both old and new, can address the governance of science, both internally and externally. That arena for discourse is global in two ways: These concepts allow to abstract from the specificities of national science systems and from the differences between scientific disciplines to, in turn, keep the questions pertinent of how these concepts can be applied to national and disciplinary contexts. As such, these concepts open up an arena for global science policy discourse and drive a need for further explication and application of said concepts. The arena for global science policy concepts can be conceptualized as a symbolic market in which attention is invested in concepts. It is through these investments that the discourse around these concepts flows and through which some fall in and out of fashion or through which some become compatible or conflicting with each other.

RN24 | T04_03: Mapping Dynamics in Higher Education

Exploring the Rise of 'Research Culture Work' in UK Academia

Annika Klæmintsdóttir Olsen, Louise Whiteley

University of Copenhagen, Denmark

In the past decade, there has been growing attention to the importance of research culture for the wellbeing of researchers and the conduct of research (e.g., Noorden 2018; Science Europe 2021; Danish National Research Foundation 2021). This attention has been particularly pronounced in the UK higher education sector, where issues such as heightened competition, the prevalence of metrics, job insecurity, inflexible career pathways, and problematic workplace behaviours have raised concerns (see Moran et al. 2020). Responding to these challenges, prominent funding and science organisations like the Wellcome Trust (2020) and the Royal Society (2022) have emphasised the need for fostering a healthy research culture. Moreover, in 2021-22, Research England created a £30 million fund that was distributed among universities in England to enhance their research culture (see Research England 2021; this fund has since been renewed in the following two academic years). In response to these developments, most research-intensive universities in the UK have initiated activities to support the development of a positive research culture, ranging from surveys and events to the establishment of new positions, teams, and even entire sections dedicated to this cause.

This study is interested in what these initiatives look like across different universities, exploring their organisation, implementation, and the underlying agendas and values driving their development. To gain insights, qualitative interviews have been conducted with high-level university employees, whose position involves a specific focus on improving and/or examining the research culture of their institutions.

In the talk I will share findings from these interviews, and what they suggest about future work in this emerging field. Additionally, I will seek to situate 'research culture work' within related sociological and STS literatures.

793

Mergers in Norwegian Higher Education: Is There an Effect on Research Productivity?

Isis Vandelannote[1], Dag Aksnes[2], Jeroen Huisman[1]

1Ghent University, Belgium; 2Nordic Institute for Studies in Innovation, Research and Education (NIFU), Norway

Higher education institutions (HEI) across Europe are confronted with diminished public spending, and thus less resources to fulfill teaching and research activities. This has raised wide-spread concerns about HEI's effectiveness and efficiency. In response, governments implemented mergers to reduce costs and to increase HEI's research productivity. Yet, few studies have empirically investigated the impact of mergers on research productivity. Therefore, the main objective of this study is to explore whether merging impacts faculty research productivity. The few existing studies have often made the trade-off between large-scale bibliometric data but little demographic and/or attitudinal information, or small-scale bibliometric data but more extensive demographic and/or attitudinal information. By contrast, we use data of the Norwegian Re-Structure Project which includes a large-scale dataset of 3753 faculty members across 21 HEI's and contains a unique combination of detailed bibliometric data, information on academic positions and activities, attitudes and opinions regarding organizational change, leadership, and commitment. Preliminary results of bivariate analyses demonstrated that faculty in merged institutions reported having fewer research resources, lower organizational commitment, and were more negative in their assessment of transformational and transactional leadership of their leaders, yet no differences were found in terms of research productivity. Preliminary multivariate regression analyses confirm that research productivity is not affected by merger processes in the two years following the merge. Whereas previous research indicated a growth for all, but especially for merged institutions, our results indicate that there is no such increase in research publications at the individual level.

The Digital Technologies integration process in higher education

Stefania Capogna

Link Campus University, Italy

In the last 25 years, higher education institutions have undergone a series of waves of reform, driven by the need to adapt traditional organisational models to radical changes in global and local contexts, characterised by a loss of borders, turbulence, instability, a progressive lack of resources and epochal challenges. Within a triple polarity system, driven on one side by supranational regulatory pressures, on another by the rapidly obsolescent labour market and on the third side by a three-pointed transition (digital, ecological and social), universities are at the centre of complex processes of change that increasingly characterise them as complex organisations. For these reasons, the paper explores the transition that involves HEIs in the effort to introduce digital technologies in their organisational and teaching practises.

The paper will present the main results of the research work led by the D-challengHE Erasmus project, which strives to improve the quality of higher education at the European level by sharing best learning and teaching practices through a network of Higher Education systems that explore digital transformation and innovation.

Through the lens of the translation theory, the paper illustrates how the European recommendations, concerning university digitisation and the building of a digital university, have been translated into practice, also reflecting around the "naturalization" process of digital technologies in daily practices. The presentation will focus on the results of comparative research (mixed methods) conducted between 2020-2023 on 6 case studies of European HEIs, to reconstruct the actor network and the process of thematization of digital technology in the university.

Digitalization and Science: Prosumer Practices

Rima Žilinskaitė

Vilnius University, Lithuania

The development of the Internet and digital technologies has enabled non-professionals to participate on a larger scale in some activities that were previously only carried out by professionals. However, the impact of digitalization on the (perhaps changing) understanding of authority, professionalism, and authorship in society is not obvious and entirely clear. Participation (along with collaboration) is one of the essential features that characterizes user activities on the so-called social Internet. This feature is covered by the concept of prosumption (production+consumption), which captures the changing relations between producers and consumers of the material and intellectual products. Internet and digital technologies and platforms direct users' activities in such a way that they simultaneously become (or are able to become) producers or creators of the product and content that they themselves use. The concept of prosumption predates the Internet or digital era and it is not exceptionally a digital phenomenon, but it is supposed that the Internet and digital technologies, encouraging user participation, stimulates and facilitates the general trend towards participation in different areas of social life, including science. The aim of this presentation is to invoke the concept of prosumption (i.e. user's productive practices) to conceptualize the participation of non-professionals in scientific and knowledge dissemination activities and to explore how these practices manifest outside the institutional science. My objective is to evaluate the concept and practices of citizen science accordingly, and to provide with the analysis of Lithuanian case of prosumers' science-related projects on the Internet.

794

RN24 | T05_01: Trust and Engagement for Energy Innovations

Exploring The Trust-participation Nexus – Towards A Relational Concept Of Trust In Energy System Transformations

Danny Otto[1], Jason Chilvers[2,3], Karolina Trdlicova[4]

1Helmholtz Centre for Environmental Research, Germany; 2Science, Society & Sustainability (3S) Research Group, School of Environmental Sciences, University of East Anglia, UK; 3UK Energy Research Centre, UK; 4University of Nottingham, School of Sociology and Social Policy, UK

Trust is considered as a crucial factor for sustainability transformations in the energy sector (and beyond). It has been argued that building trust is strongly linked to processes of communication, deliberation and participation. In this presentation, we investigate this link by looking at the issue of trust in large energy infrastructure projects. We analyse how studies on energy technologies conceptualize trust and approach the relation of trust and participation.

To do so, we study how trust has been conceptualized in research on two energy technologies – carbon capture and storage (CCS) and wind energy – and if a relation between participation processes and trust building is established.

We find that trust has mainly been approached with a narrow theoretical lens and as a key factor for acceptance of specific technology projects. In this instrumental framing, participation serves as a means to gain trust or overcome distrust. How trust emerges, transforms or erodes, therefore, remains unclear beyond rationalistic assumptions on the role of actors, information provision or participation. We propose a new theoretical framework for trust (networks of trust) and its connection to participation based on sociological theory and relational perspectives in science and technology studies to enable a broader understanding of the trust-participation nexus.

A Socio-technical Approach to Support the Transition Towards a New Energy System. The Case of Hydrogen in South Tyrol

Federica Viganò[1], Monica Musolino[2], Francesca Uleri[3]

1Libera Universitá di Bolzano, Italy; 2Università di Messina; 3Free University of Bolzano

The energy transition process involves the territory in a multifaceted spatial, social, and energy system, where the choices made by the local population regarding technologies and energy utilization play a pivotal role. Applying the Actor-Network Theory (ANT) approach, our current investigation delves into the interaction and interdependence among various participants within the energy landscape in South Tyrol (located at the border with Austria, Switzerland, and Italy): we explore the sociotechnical system within the autonomous province of South Tyrol, according to its Climate Plan 2040, whose aim is to guide sustainable management of the territory through various measures, including energy production and efficiency, increase in renewable energy production and supply, development of an energy mix thanks to technological innovations, transnational collaborations, and research partnerships.

This process is facilitated by historical, organizational, and technological factors that render South Tyrol particularly intriguing in terms of advancements in the field of renewables. This interest extends to the direct involvement of citizens. One notable example is the territorial concentration of a high number of 'historical energy cooperatives,' which exemplify a well-established practice of community management of renewables (hydroelectric plants), in mountainous areas.

The ANT-driven exploratory analysis encompasses the cutting-edge technological framework of storing renewable energy, specifically focusing on the role of the Hydrogen Centre in Bozen South, a public-private partnership between Brennerautobahn AG, the operator of the local motorway, and funding from the European Regional Development Fund. Establishing a hydrogen economy necessitates collaborative endeavors in research, development, and investment to render hydrogen a practical and efficient element within local energy strategies. This emphasis is particularly crucial for advancing zero-emission mobility and holds future potential for broader domestic applications.

795

The Emergence of the Promise of Small Modular Nuclear Reactors in the Leading Finnish and Swedish Daily Newspapers

Mika Kari[1], Sarah Tornberg[1], Tapio Litmanen[1], Markku Lehtonen[2], Matti Kojo[3]

1University of Jyväskylä, Finland; 2Pompeu Fabra University, Spain; 3LUT University, Finland

In both Finland and Sweden, nuclear new-build has gathered growing support from policymakers and citizens. In particular, the promise of the small modular reactors (SMRs) is rapidly gaining visibility. While both countries are consensual Nordic high-trust welfare societies, with close collaboration between authorities and industry in the nuclear sector, earlier research has also highlighted significant differences between the two countries, including those concerning the role of the media. For example in the reporting on nuclear waste policies, Sweden's active media debates that give high visibility to a variety of voices and perspectives contrasts with the Finnish media's tendency to echo government and industry views. Similar differences between the dialogical Swedish and more straightforward, even authoritarian, Finnish approaches have been observed also in other policy areas.

This paper explores the ways in which the promise of SMRs is being constructed in Finland and Sweden. It does so by examining the print media reporting on SMRs, in two leading daily newspapers in each country, in 2000-2022. While the trends in the degree of media attention are highly similar – demonstrating rapidly growing hype from 2021 onwards – the analysis indicates that the media discussion, and in extension the promise construction, is firmly embedded in the societal contexts of their respective countries, and corroborates the above-mentioned earlier research, highlighting the differences between the media and policy cultures in the two countries. The analysis reveals a contrast between the near absence of counternarratives in Finland and the relatively lively debate between SMR promoters and critics in Sweden.

RN24 | T05_02: Social media, community and creativity

Online Bridges, Offline Bonds: Unraveling the Effect of Virtual Social Capital on Physical Community Engagement in two Facebook Neighborhood Groups in Zagreb, Croatia

Matea Milak, Geran-Marko Miletić, Krešimir Peračković

Institute of social sciences Ivo Pilar

Social capital is a complex and multidimensional concept that can be explored from various standpoints. If we consider social capital as a public good, as suggested by Putnam and Goss (2002), then Internet social networks and the norms of reciprocity that arise from them can be seen as a way of enhancing social capital. According to a recent study by You and Hon (2019), people in online groups with weaker ties are more inclined to engage in collective activities. Valenzuela et al. (2009) also found that Facebook can strengthen weak ties and encourage collective action. This paper takes a unique approach by examining the impact of social capital formed within the virtual dimension of the community on engagement in its physical dimension. This paper presents data from an online survey conducted in 2022 among 496 respondents from two Facebook neighborhood groups in Zagreb, Croatia. Results have revealed that social ties have a significant role in fostering emotional belonging and encouraging participation within the physical boundaries of neighborhoods. Trust, in particular, has been found to have a significant influence on both the perceived level of informal social control and functional belonging to the neighborhood. Furthermore, trust has a notable impact on perceived neighborhood safety but only in one group. Overall, the results suggest that social capital formed in the virtual dimension of the neighborhood has a favorable effect on certain aspects of community engagement.

Queer Feminist Perspectives on TikTok: A Critical Analysis of Platform Governance

Miira B. Hill[1], Luisa Runge[2]

1University of Bremen, Germany; 2M2C-Institute for Applied Media Research, Hochschule Bremen

As digitalization progresses, social media platforms like TikTok increasingly impact our daily lives, prompting critical analysis of how they perpetuate social hierarchies and injustices. TikTok, as a site of visibility, plays a pivotal role in what is seen and unseen, following regimes of visibility

(Foucault 2007; Foucault 2000; Bucher 2012; Beer 2016). This is particularly relevant in discussions of gender, sexuality, and intersectional discrimination, making TikTok a significant field for study, especially from queer feminist (Butler 2016 [1991]) and platform governance perspectives (Duguay et al. 2020; Tarvin and Stanfill 2022).

TikTok, popular among young girls*, women*, and queer users (Boffone 2021, 27), faces criticism for perpetuating patriarchal structures, leading to discrimination based on gender identity and sexual orientation (Caldeira et al. 2021, 37). The platform's moderation practices, particularly in relation to queer content, are scrutinized for censorship and marginalization (Zeng/Kaye 2022, 83).

An analysis of TikTok's Community Guidelines and newsroom articles from 2018 to 2022 reveals increasing visibility of sexism, but structural discrimination often remains unaddressed. The discourse tends to be individualized and depoliticized, with TikTok adopting Western, neoliberal narratives. The platform uses accounts of queer and oppressed users* to project progressiveness, while substantive protection and systemic changes are overlooked.

This study contributes to queer feminist research by examining TikTok's governance practices and its approach to social inequalities, particularly sexism. It underscores the importance of critically assessing digital systems from a queer feminist viewpoint. Platform actions and structures often reflect dominant and oppressive gender and sexuality norms, with platform governance functioning as a "sexist assemblage (Gerrard and Thornham 2020)." This work provides a basis for a queer feminist critique, integrating inter – and transdisciplinary perspectives.

Humour as Coping: A Multimodal Analysis of TikTok Comedy Content Before, During, and After Covid-19

Dan Bai

University of Essex, United Kingdom

This research examines how humour on the social media platform TikTok has shifted in response to the Covid-19 pandemic. As a form of entertainment that provides relief during difficult times, humour plays an important role in resilience and coping at both the individual and societal level. However, little research has investigated how major societal disruptions like Covid-19 impact trends in humour.

This study conducts a multimodal analysis of popular TikTok comedy content in China, the UK, and the US created between January 1, 2020, and December 31, 2022. Changes are identified in topics, language, presentation style, and format of videos before, during, and after the onset of the pandemic. In addition, the analysis considers how the political, cultural, and social context in each country may contribute to differences observed.

Findings provide insight into how humour adapts and transforms during times of tragedy. Results also further understanding of TikTok's emerging cultural influence and impact on online communication. By examining TikTok as a site of meaning-making during crisis, this research identifies opportunities for using social media platforms to promote resilience and positive coping strategies collectively in the face of future societal challenges

"How to Became an Online Creator? On the Example of Polish Digital Creators"

Renata Dopierała

University of Lodz, Poland

In the paper, I present the formation of people called "online creators" – individuals engaged in the production of original content posted on social media, websites, etc. The considerations is based on six autobiographical narrative interviews with Polish digital creators representing diverse areas of interest (e.g. political and social issues, lifestyle, circular economy, games). The narrators were born in the 1980s and 1990s so I discuss the differences between their experiences of being online creators by examining individual and socio-cultural conditions. In the first part, I analyse the role of technology and media in narrators adolescence, and I also pay attention to the context of their family life. In the second part, I analyse how their professional careers had evolved before they started the online activities, how they perceive the status of digital creator in contemporary society and what kind of challenges and benefits this career entails.

797

RN24 | T06_01: Gender and Sociotechnical Imaginaries for Domestic Technologies

What Makes a Store Smart and Autonomous? A Media Analysis of Sociotechnical Imaginaries

Ana Viseu[1], Ana Delicado[2], Joao Pedro Pereira[1], Paulo Nuno Vicente[1]

1ICNOVA – Institute of Communications, NOVA FCSH, Portugal; 2Instituto Ciencias Sociais, Univ. de Lisboa, Portugal

'Autonomous stores' are often characterized in the media as the future of shopping: smart physical environments augmented through digital technologies that can process data automatically, seamlessly, and without the need for workers, identifying both consumers and their actions. References to autonomy and automation conjure a set of imaginaries of technology in the service of innovation, progress and convenience.

Despite being hailed as autonomous, these spaces are vast digital assemblages that rely on infrastructures composed of people, knowledges, and numerous technological entities (such as, AI, sensors, cameras, among others). Portugal is one of the leaders in this future-making endeavor: it is home to Continente Labs, a Lisbon autonomous store powered by SENSEI and owned by SONAE.

This paper draws upon a thematic analysis of data generated from a media analysis of Portuguese and international newspaper articles from 2016 until 2023, as well as interviews with SENSEI and SONAE, to examine the sociotechnical imaginaries that are mobilized in the media to both drive and justify the development of these digital infrastructures. We pay particular attention to the discourses through which they are built: Who is pushing for them? Why? What are the main issues that are being discussed both in terms of advantages and problems? Who is included/excluded? And, finally, what futures are being built? This will then allow us to shed light on the concepts that underlie these spaces – What are "autonomy" and "smartness" in autonomous stores?

Digital Technologies and the Gendered Configuration of Care in Smart Homes

Nina Fárová[1], Julia Gruhlich[2], Petr Kodenko Kubala[1], Sandra Frydrysiak[3]

1Institute of Sociology, Czech Academy of Sciences; 2University of Göttingen; 3University of Lodz

Trends in home automation and the increasing use of digital technologies for diverse purposes have led to the emergence of what is referred to as connected, networked, augmented, intelligent, or smart home. Smart Homes come with the promise of a better living, including a relief from domestic care work which is mostly done by women. As the socio-spatial living conditions in the home, neighbourhood and the entire environment are important supporting or hindering framework for gender equality, we argue that the digital transformation of housing cannot be viewed in isolation, but should be analyzed in the context of other developments, especially family and gender relations. Based on our own empirical data from our ongoing ethnographic research project on smart homes and gender (SMARTUP) we discuss the transformation of gender-housing-relations.

In the theoretical part of our contribution, we develop a conceptualisation of care in relation to gender and housing, considering the emergence of 'digital housekeeping' and discussing whether the 'digital work' involved in the purchase, maintenance and use of smart devices can also be understood as a form of care work. In the empirical part of the paper, we illustrate the current spread of smart home technologies in Germany, the Czech Republic and Poland. For each country, a case study is presented. The aim is to show connections between gender, care and housing and to gain a deeper understanding of digital home transformation in relation to everyday processes of doing gender and doing care.

Simply Convenient? Valuing Smart Speakers In The Domestic

Lukas Schmitz

TU Dresden, Germany

The integration of smart technologies, in particular IoT devices like smart speakers, is reshaping domestic environments into connected smart homes. A key justification for smartification is convenience, be it in the marketing strategies of the consumer goods industry or even in the results of classic (often quantitative) appropriation and utilisation surveys. This talk aims to subject this vague term of convenience, which is all too often used to legitimise technical innovation, to a sociological analysis. Therefore, this talk explores the motivations behind integrating smart speakers, focusing on the perceived convenience they bring to everyday life in the domestic. Using a pragmatist theoretical framework and drawing on ethnographic research involving sixteen household visits and in-depth interviews, the talk examines these notions of convenience as valuation

798

processes. These processes are contextualised within the framework of different attachments (Antoine Hennion) and are made plausible through various justifications (Luc Boltanski/ Laurent Thévenot). From this perspective, the individual understanding of convenience is modelled based on the integration into specific material and discursive constellations and is linked to a specific dynamic of justification. By delving into the micro-sociological perspective, the talk reveals the complexities of the negotiation process people undergo when adopting smart speakers, shedding light on the nuanced experiences of convenience and inconvenience. Concrete examples from the ethnographic data will illustrate these findings, providing a additional perspective on the gradual smartification of domestic environments and contributing to a broader understanding of this societal shift.

How Do Conversational Interfaces Become Gendered? Gendered Patterns (Re)produced In The Conversational Artificial Intelligence Design Process

Katarzyna Cieślak

AGH University of Krakow, Poland

This study examines gender patterns (re)production in designing conversational interfaces. Conversational interfaces are computer programs that imitate human speech, such as Alexa, Siri, or Google Assistant (McTear et al. 2016). Previous research has explored the processes of anthropomorphizing conversational interfaces by users (e.g. Obinali 2019; Lima & Furtado 2019). Also, other studies have addressed technology-gender relations (Faulkner 2001; Wajcman 2004; Adams 2006) but they have not focused on gender patterns and practices during the design phase, especially in terms of conversational Artificial Intelligence. This study aims to uncover gendered patterns and practices by conducting a multi-sited ethnography based on 25 in-depth interviews with designers and participatory observations. Gendered patterns identified are inspired by integrative gender theories, which place practices at the center of analysis (Connell, 2009; Risman 2008). The research provides insights into how gender is constructed in the technology design process and identifies conditions that could lead to gender bias or inequality in new technologies. Initial findings revealed that gender in the design process is contextually dependent. I identified some conditions (e.g., technical limitations, business strategy, or labour order) that create a context for gendering practices. Many designers' practices assign gender intentionally, but many with liminal awareness of practising gender. However, both reflective and unreflective gendering activities lead to reproducing heteronormative gender patterns in the project outcome. Preliminary findings of this study as part of my PhD thesis and research project financed by the Polish National Science Centre (UMO-2022/45/N/HS6/02725) will be presented.

RN24 | T06_02: Evaluation and academic collaborations

Strategic Coauthorship: Prior Coauthorship Predicts Successful Funding In Kazakhstani Academia

Adil Rodionov[1,3], Darkhan Medeuov[2], Kamilya Rodionova[1,3]

1L.N.Gumilyov Eurasian National University, Kazakhstan; 2Nazarbayev University; 3The Institute of Eurasian Integration

Public funding for scientific projects is a common topic of research in the sociology of science. While intended to be merit-based, the actual selection process reveals—studies document—a variety of biases including the effects of prior collaboration and institutional proximity and brokerage. This paper builds on this line of research to analyze the system of public funding for scientific projects in Kazakhstan. Our data comes from two waves of grant competitions in 2015 and 2018 and covers more than 8000 applications. We augment the data with detailed information on projects' principal investigators, including the content of their proposals, institutional affiliations, publication activities, and prior collaborations. We show that net of previous publishing activity, success significantly depends on co-authoring academic papers with the selection committee members. Studies of grant funding usually relied on descriptive analysis and/or regression methods using observational data without a random assignment that created certain limitations. We employ a different type of identification strategy – a difference-in-difference estimator (DiD) and social network analysis – that overcomes many challenges of common regression methods that fail to account for the fact that, for example, more frequent awards of selection committee members might reflect their greater talent (academic excellence), activity, or nepotism. Applying experimental methods with observational data pushes up internal validity (causal links). Thus, the contribution of this research is to exploit novel, but widely recognized methods to investigate the causal effect of nepotism on the grant selection process.

From Impact Evaluation to Transformative Evaluation: Context and Institutional Constraints when Analysing the Impact of Public Support to Private R&D in Spain

Ana Fernández-Zubieta[1], José Molero[2], Antonio García-Sánchez[3], Manuel Fernández-Esquinas[4]

1Complutense University of Madrid, Spain; 2Complutense University of Madrid, Spain; 3Seville University; 4IESA-CSIC

The paper aims to analyse the effects of public subsidies to private R&D in Spain and to reflect on the contextual and institutional factors that limit innovative agencies to apply more transformative-oriented policies and evaluation practices. We focus on the evaluation experience of the main innovation agency of Spain the Centre for the Development for Industrial Technology (CDTI). The evaluation culture in Spain is dominated by a control function, reducing its distributive and learning functions (Molas-Gallart, 2012). It is also been argued that the country lacks of experience in evaluation practice (Bustelo, 2006). The impact of the CDTI's grants schemes to the private R&D have received previous attention (e.g. Molero and Buesa, 1995; Fontela et al., 1992; Huego et al., 2009). In addition, the centre has also received attention within the reviews of the Spanish R&I system (e.g. Sanz-Menéndez, 1997; Muñoz, 2001). However, the organisational and institutional aspects of CDTI have received less attention. These institutional and organisational aspects of innovation agencies (e.g. Arundel et al., 2015; Breznit et al., 2018) appear to be essential to successfully design and implement more ambitious innovation policies.

We use information coming from the evaluation assessment of the program aid of the Centre for the Development for Industrial Technology (CDTI) from 2015 to 2020 that is complemented with other organisational information coming from semi-structured interviews with employees and former employees of the centre at different organizational level following (Portes, 2006, 2017). We find that the context and organisational structure of R&I constrain the transformative potential of the centre.

Comparative Analysis of Academic Engagement and Knowledge Production in Germany, Portugal, and Sweden

Teresa Carvalho[1], Christian Schneijderberg[2], Lars Geschwind[3]

1University of Aveiro and CIPES, Portugal; 2International Center for Higher Education Research (INCHER); 3KTH Royal Institute of Technology

Academic engagement with society can significantly impact the way knowledge is produced. This engagement takes various forms, including citizen science, community-based participatory research, and even commercial research, which involves the emergence of spin-offs and patents. Any of these forms imply the creation of continuous interaction between community members and academics.

In Europe, taking the political relevance of the idea of the Knowledge society, academics have been encouraged to collaborate with society. Nevertheless, it is still unclear if and how academic engagement with society plays a crucial role in shaping the nature, dissemination, and commercialization of knowledge.

To contribute to this discussion, this paper analyzes the relationship between academic engagement and the way knowledge is produced and disseminated in three European countries with distinct levels of academic engagement, namely Germany, Portugal, and Sweden.

The study is based on a quantitative approach. The survey used for this study was part of the Academic Profession in the Knowledge-Based Society (APIKS) project. A representative sample of academics employed by doctorate-granting universities was given access to the online survey. By using the publicly accessible official statistics of the HE sector, the representativeness of the sample was guaranteed by taking into account the academic rank, gender, and discipline in the case nations.

The results analysis shows that there are significant national variations in academics' assessments of the significance of ASE activities, as well as significant variations in the creation and dissemination of information according to the engagement activities that academics participate in.

800

RN24 | T07_01: Trust in science, disinformation, controversies

Italians' Trust in Scientists: Changes over Time and Determinants

Barbara Saracino[1], Massimiano Bucchi[2], Giuseppe Pellegrini[3], Andrea Rubin[4]

1University of Bologna, Italy; 2University of Trento, Italy; 3Observa Science in Society, Italy; 4University of Ferrara, Italy

The concept of trust has been given a multitude of definitions within the literature. Trust is a relationship that exists between individuals, and between individuals and a system, in which one party accepts a vulnerable position, assuming that the other party has better interests and skills. In the context of technoscience, one party chooses to trust another to help it make a decision based on risks and benefits about which it has incomplete information.

The Observa Science in Society Monitor measures trust in scientists through various indicators; since 2007 it has been carrying out an annual sample survey on the Italian population aged over 15 years. The survey is carried out nationwide and involves a sample of 1000 cases, proportional and representative by gender, age, area of residence and educational qualification, through a questionnaire administered via web or telephone.

The report for the ESA Conference will present time series on data collected from 2007 to 2024 and multivariate regression models. Changes in the levels of trust of Italian citizens towards scientists and the determinants of trust will be discussed, considering as independent variables the socio-demographic characteristics of respondents, levels of education, scientific literacy and exposure to science in the media, participation in protests or mobilisations on scientific-technological issues.

Mobile Masts, 5G Technology and Trust in Science

Kinga Sekerdej

AGH University of Krakow, Poland

The recent decades have been marked by populist movements, gaining power in European countries and beyond. The bedrock of populism lies in constructing an antagonistic division of the social world into the ordinary, powerless people and the corrupt, powerful elite. Among other traits, the anti-establishment discourse of populist actors questions mainstream knowledge production, grouping science and technological experts into the untrustworthy "elite" category.

The populist denialist movements amplify concerns and perceived risks associated with policies, such as climate change mitigation and public health measures, including vaccines, as well as the implementation of new technologies. One of the contentious topics revolves around the deployment of 5G technology, which has garnered attention due to protests against the installation of mobile phone masts.

The often-used arguments against 5G technology relate to risk perception of electromagnetic waves from base stations and frequently recount the precautionary principle. However, those fears have been used by populist actors mongering doubt and spreading misinformation, including conspiracy theories. Although scientists may form part of the distrusted elites in the populist worldview, the role of science credibility in 5G fears is not obviously related. Here, I show that negative attitudes towards 5G technology are related to lesser trust in science credibility. Following a qualitative analysis of online petitions, a questionnaire on attitudes towards 5G was developed. Specifically, I juxtaposed prevailing arguments in online petitions protesting base stations with credibility in science and demonstrated that concerns about 5G are indeed associated with attitudes towards science and connected to political ideology identifications. The results show that 5G fears can be seen in a broader context of distrust in science.

Scientific disinformation and Ingenuous Trust in Science: Engagement and reception of scientific (dis)information in Italian High schools.

Simone Tosoni, Alessandro Ricotti

Università Cattolica del Sacro cuore, Italy

This intervention focuses the high-school classroom as a social group to investigate its role in mediating access, reception, and circulation of scientific (dis)information. It is based on a two year long mixed-method research that involved twelve high school classrooms selected from six schools proposing different curricula. Methods used included interviews with students, teachers and parents; focus groups with students and parents; qualitative media diaries; virtual ethnography; data donationon.

Especially when compared with the family, the classroom as a social group has by and large emerged as a weak mediator for the access and reception of scientific (dis)information: a role that is almost entirely fulfilled by the guidance provided by teachers within their educational programs. Beyond that, scientific information is rarely shared or discussed among classmates, with the exception of information delivered through infotainment formats on social media, or strictly related to common concerns for everyday life (in particular regarding health and nutrition). By far more relevant are smaller groups of friends, within and across classroom, who share the same interest or passions, like astrophysics.

Notwithstanding this role of the classroom, our observations suggested how students share the same criteria to distinguish between scientific information and disinformation

801

– generally based on stylistic features on the message and on the refusal of scientific populist or conspirative frames – and above all a similar – and somehow ingenuously unrealistic – idea of science, based on an unerring capacity of the scientific method to ascertain definitive truths, grating unanimous consensus in the scientific community.

This ingenuous trust in science can represent a vulnerability when probed by personal or social crises (like a disease or the pandemic).

The impact of science: A Comparative Analysis of Trust, Media Discourse, and Political Dynamics in Slovenia and Croatia

Martina Plantak, Maruša Gorišek

Institute for Development and Strategic Analysis, Slovenia

While it is clear that the authority and legitimacy for decision-making lie with the government, contemporary societies are too complex for governments to be able to make decisions without expert help and scientific input. The recent global pandemic showed that the relationship between science, politics and society is much more complicated than previously assumed. On the one hand, calls have been made to trust the science, or even leave political decisions directly to experts and scientists, while on the other, groups emerged thacrot distrusted or even denied science and expert advice. How can we navigate these complex relationships in light of the coming crises that require a long-term strategic approach and systematic cooperation between governments, experts, and wider society?

This contribution investigates the multifaceted interplay between science and society, with a specific focus on the nuanced dimensions of trust, media discourse, and political dynamics in Slovenia and Croatia. This comparative study is conducted through a mixed-methods approach corresponding with the mentioned dimensions. A critical discourse analysis is conducted to address the dimension of media discourse, investigating prevalence, framing, and biases, and delving into the media's role in shaping public perceptions. and a combination of secondary data analysis and policy examination is used to address the dimensions of trust and political dynamics, providing valuable insights into the broader discourse on science communication, trust-building, and the impact of political dynamics on public perceptions of scientific knowledge.

RN24 | T07_02: Engagements with science and technology

Citizen Engagement With Geoengineering Technologies: Geological Carbon Storage In Portugal

Ana Delicado[1], Jussara Rowland[1], Christian Oltra[2], Sergi Lopez[2], Lila Gonçalves[2], Ana Prades[2]

1Instituto de Ciências Sociais Universidade de Lisboa, Portugal; 2CISOT-CIEMAT, Spain

Carbon Capture and Storage is identified by the IPPC (Intergovernmental Panel on Climate Change) as one of the key technologies needed to mitigate climate change and achieve the goals of the Paris Agreement. In line with this recognition, the European Union (EU) has made significant investments in projects related to the development of CCS technology and provided funding for a range of CCS projects, including pilot plants, research, and development initiatives. While survey data shows that the public generally holds a positive view of the potential of CCS technology to mitigate climate change, it remains a controversial and contentious issue. The European Commission's attempt to encourage the development of CCS in several European countries in particular has been received with varying degrees of skepticism and acceptance/opposition from different stakeholders, sectors and citizens. While some express optimism about the potential for reducing emissions, others are concerned about the costs of the technology and its environmental impacts.

Citizen engagement has become an indispensable tool for assessing the acceptance of new technologies and to ensure that citizens' views and concerns are incorporated in projects. But is also yields relevant information on how citizens envision emerging technologies, how they conceptualise their advantages and drawbacks, how their perceptions are coloured by factors such as social demographics, place attachment, or values.

This presentation is based on of fieldwork with citizens of municipalities where geological storage is under study in Portugal (offshore) and Spain (onshore). It is supported by the EU-funded project CO2 Geological Pilots in Strategic Territories – PilotSTRATEGY (GA 101022664).

802

Everyone at the Table: Intersectional Inclusion for Democratic Food Transformation in Germany

Mariana Morais

Technical University of Berlin, German Federal Institute for Risk Assessment

Democratic participation is essential for fostering food system transformation. Citizen assemblies, also known as deliberative mini-publics, are increasingly adopted in democratic systems to generate inclusive contributions, combining scientific and tacit knowledge. However, empirical research indicates that the stratified random selection method used in mini-publics does not effectively address the overrepresentation of white and well-educated citizens (Dean et al., 2022; Dendler, 2021; Faas and Huesmann, 2017). With efforts on mini-publics since the 1970s, Germany has recently experimented with recruitment criteria and interaction methods in two national assemblies on food. These assemblies—the Citizen Assembly on Food in Transition by the German Parliament and the Citizens' Dialogue on Sustainable Food by the German Federal Ministry for the Environment—aim to integrate citizen contributions based on scientific inputs into legislative and policy processes. Exploring inclusion complexities requires a nuanced approach that considers multiple forms of oppression.

Drawing on visual ethnography research and biographical interviews, this study explores how social and spatial elements interact in these assemblies, affecting the participation of individuals with diverse ethnic and educational backgrounds. Introducing a theoretical framework that combines participatory democracy, spatial theory, and intersectionality, the research examines participation along three dimensions: placement, embodiment, and design of interaction. Findings reveal the impact of spatial arrangements, materiality of objects, and moderation on reinforcing/overcoming symbolic hierarchies, influencing participants' perceptions of sameness, difference, and belonging, for instance. The research challenges normative approaches to deliberative participation by offering nuanced perspectives on inclusion embedded in participants' experiences. It contributes to current debates on participatory governance, especially in complex issues such as food system transformation.

Beyond Deliberation: What Else Can Science (Dis)Engagement Be?

Lucilla Losi

Aarhus University, Denmark

This presentation focuses on exploring forms and ramifications of public (dis)engagement with science and its consequences for research and policy making. Public engagement with science has a key role in improving science access, promoting acceptance, as well as diversifying and expanding science itself. While deliberative engagement is set to meet similar goals of innovation and inclusion, an intersectional diverse audience is crucial. Studies have shown that this is still far from being achieved, as engagement is still more likely among middle aged, middle class, educated, white males. To go beyond elaborations on barriers of engagement, I explore perceptions and experiences of established and alternative forms of public engagement with science through 25 semi-structured interviews with England-based participants from demographic groups traditionally associated with low engagement. The interviews show that when considering established ways to engage with science, informants do not identify themselves as engaged and provide pragmatic reasons for their disengagement. However, as they elaborate on their personal experiences with science, they realize that science is more woven into their lives through casual, practical, or relational ways than initially acknowledged. Results underscore the pivotal role of personal perceptions and experiences in shaping engagement, emphasize the interplay between these perceptions and science institutions and challenge the conventional framework. This presentation aims at starting a debate in the room on the conceptualizations of science (dis)engagement and their consequences, but also on the participation opportunities that people encounter in their daily lives, the role of institutions, and the methodological challenges of measuring them.

Democratizing Science: An Investigation of the Innovative Process of Citizen Science with the Mixed Methods Approach.

803

Noemi Crescentini

University of Naples Federico II, Italy

In contemporary society, scientific and technological disciplines are configured as interconnected domains with the everyday life of each individual. These disciplines shape social dynamics, habits, lifestyles, and work activities, exerting a particular influence on public opinion. This conjunction requires a closer interaction between the scientific community and the general population, proving decisive in ensuring an evolution of the relationship between science and society that adequately reflects current social needs and values (Leshner, 2003). In this context, Citizen Science emerges as a promising means of ensuring public involvement in various scientific disciplines, assuming a significant role in the formulation of public policies in a variety of fields. Citizen Science initiatives and practices are currently growing at the European, national and local levels (Vohland, 2021). Basing the analysis on these theoretical assumptions and adopting a Mixed Methods approach, the present research aims to explore the phenomenon of Citizen Science in Italy in order to understand the motivations that guide and sustain participation, as well as the contribution that the actors involved can make to the relationship/interaction between science and society. In addition, the research investigates the ways in which participants, whether expert scientists or citizen volunteers, interact with each other and how Citizen Science can be configured as a useful tool for progress in science communication and policy formulation.

RN24 | T07_03: Platforms in the public and private sectors

Entering the Age of Interoperability? The Rise of Data Integration and Analysis Platforms

Simon Egbert

Bielefeld University, Germany

Many organizations are increasingly faced with the challenge of making a seemingly unmanageable mass of data processable to derive actionable information. In this context, digital platforms play a prominent role not only as the major creators of this flood of data but also as the currently most prominently discussed tools with which this flood of data is to be made manageable. It is above all data integration and analysis platforms, such as those currently most frequently used by the US software company Palantir Technologies, that have established themselves as a promising data research and analysis technology. Before this backdrop, in my paper I will introduce data integration and analysis platforms as a special sub-type of digital platforms, discussing their major commonalities and differences to the more commonly discussed internet platforms (Facebook, Uber, etc.), highlighting the generative role they should play: by connecting third parties (their clients) with data, as well as data (banks) among each other, they aim to enhance interoperability. That is, their main goal is de-silosation, which means transgressing data boundaries and breaking up data silos. And even if there are many points of criticism associated with these platforms, the criticism of automation that is otherwise often expressed with regard to algorithmic decision-making systems is largely ineffective here. Because these platforms are characterized by a special socio-technical interaction, in the context of which algorithms and analysts together generate new knowledge. As I will show, this makes it particularly difficult to analyze what is being done with these platforms and what risks arise from this.

Platform Companies On The Internet As A New Organizational Form. A Sociological Perspective

Ulrich Dolata

University of Stuttgart, Germany

Today's consumption – and communication-based internet is characterized by a great variety of mostly commercially operated platforms, such as search, networking, messaging, media, trading, service, crowdsourcing or crowdfunding platforms that not only organize economic processes but also coordinate and regulate broader societal contexts.

Against this background, the presentation develops a sociological concept of platform companies and the platforms they operate as a new type of enterprise that consists not only of economic features (business and revenue models, exploitation patterns, market relations) but also of action-orienting rules, institutional infrastructures and social relations between a great variety of individual, corporate and collective actors that clearly reach beyond economic contexts and far into society.

To this end, I specify the often fuzzy talk of "the platforms" by drawing an analytical distinction between (1) platform-operating companies as organizing cores whose goal is to operate a profitable business; (2) the platforms belonging to them as technically mediated markets and social action spaces that provide the basis for not only economic but also genuine social activities on today's internet; and (3) institutionalized coordination, control and exploitation mechanisms implemented by the platform operators, linking these two constitutive levels of the platform architecture.

In this configuration, the platform companies have a high degree of structure-giving, rule-making and controlling power. Paradoxically, for all the supposed freedom of access and movement of the users, this exhibits a remarkable renaissance of hierarchically designed regulation and control mechanisms in which elements of orchestrated participation of the participants are merely embedded—for example, in the form of decentrally distributed rating and control systems through which both evaluation and monitoring activities are delegated to the platform participants.

Duct-Tape Solutionism: Automation as Panacea and Stopgap in the Swedish Public Sector

Martin Berg

Malmö University, Sweden

This paper explores the Swedish public sector's response to an impending demographic crisis, particularly the challenges posed by an ageing population. It scrutinises the paradoxical perception of automation, especially Robotic Process Automation (RPA), as both a panacea and a stopgap measure. The paper identifies two main themes: the pressing need to rejuvenate the public sector through automation to avert potential collapse, and the reshaping of current work practices to suit an automated, albeit uncertain, future.

At the core of this analysis is the idea of automation as a continual journey, not a final solution. This journey is akin to a form of repair work, where automation technologies act as provisional, duct-tape solutions, perpetually pushing the boundaries of the future. The paper argues that the role of automation extends beyond the mere elimination of human labour; it is about its transformation. Automation emerges as a catalyst for organisational change, enforcing uniformity and challenging traditional, individualised work methods.

In summary, this paper highlights the nuanced use of metaphors of breakage and repair in steering the public sector's organisational transformation. It positions automation as a pivotal yet elusive concept, emphasising the complexity

and temporality of solutionism in the face of uncertain futures.

Ethical Dilemmas in Navigating the Dark Sides of Technology Adoption in Scottish Social Enterprises

Han-Ju Yang

University of Edinburgh, United Kingdom

This research delves into the intricate dimensions of information technologies (IT) in organisational studies, emphasising their entanglement with social practices to elucidate the shared moral responsibility of actors in the IT adoption process. The empirical focus is on Scottish Social Enterprises (SEs), organisations renowned for their ethical orientation but susceptibility to policy changes.

SEs grapple with persistent tensions arising from misaligned interests between the state and the marginalised individuals they serve, giving rise to an ethical dilemma when prioritising interests diverges between the institutional state and the organisational mission of empowering marginalised individuals. This ethical complexity intensifies when IT is integrated into the service delivery process, forcing SEs to navigate the delicate balance between ethical obligations to marginalised individuals and adherence to state policies. This balancing act significantly influences the extent to which marginalised individuals are subjected to datafication.

Grounded in Mumford's (1934) technology theory, the study views IT adoption as a morally charged practice necessitating constant negotiations within the neoliberal power structure. Consequently, the outcomes of IT adoption are seen as a manifestation of power struggles Methodologically, a qualitative approach is employed, involving two Scottish SEs using Augmented Reality (AR) and Artificial Intelligence (AI) to integrate disabled and homeless individuals. Preliminary findings reveal nuanced oscillation between empowerment and regimentation models in IT adoption outcomes, contingent upon the degree of datafication influenced by institutional policies. By shedding light on institutional forces shaping IT adoption decisions, this study advocates for systematic solutions to ethical dilemmas, exposes power dynamics, and calls for a reconsideration of normative visions of inclusion in the era of exponential technologies.

RN24 | T08_01: Intersections of Knowledge Production and Public Engagement

Fragmentations, Connections and Reflexivities of the Epistemic Community of Science and Technology Studies in and about Portugal

Nina Amelung[1], Ana Ferreira[2], Rafaela Granja[3]

1Institute of Social Science (ICS), Universidade de Lisboa, Portugal; 2CICS.NOVA, FCSH, Universidade Nova de Lisboa; 3Communication and Society Research Centre (CECS), University of Minho, Portugal

This paper reflects into the past and present configurations of Science and Technology Studies (STS) in and about Portugal, and critically engages with and imagines its possible futures. Following an approach inspired by critical feminist STS scholars, we, firstly, provide a brief overview of what research has been conducted under the wide umbrella of STS. We do so by building upon previous studies mapping the different thematic domains and reflecting on different institutional settings of the STS field and the bordering fields of sociology, history and philosophy of science and technology in Portugal (Duarte 2009; Delicado 2013; Simões 2016; Delicado et al. 2018; Machado 2020, 2022). Secondly, based on semi-structured interviews with self-identifying STS scholars, we analyze how this epistemic community understands the regularities and singularities of STS research in and about Portugal; and its relations with STS scholarship in the Global North and Global South. We identify fragmentations along disciplinary lines and empirical research fields, as well as deriving from academic working conditions under precarity. Furthermore, we observe senses of belonging to epistemic communities along historical trajectories of community building, institutional structures and particular collective research practices and collaborations. Finally, we discuss how reflexive engagements about STS knowledge production facilitate imaginaries of possible futures of STS research in and about Portugal. We conclude with a reflection about the particularities of ethical and political 'epistemic response-ability' (Haraway 2008), taking the locations, social hierarchies, political economy and processes of marginalizations of epistemic agents in knowledge production into account.

805

Positioning the Social Sciences – between Academic Knowledge Production, Public Sociology and Democratic Deliberation

Cornelia Schendzielorz

Humboldt-Universität zu Berlin, Germany

This contribution deals with the relationship between science and the public in democratic societies. Science is confronted with diverse internal as well as extra-academic demands and challenges. Whereas scientific findings and knowledge production are of considerable public interest and thus socially relevant, they are also embedded in heterogeneous objectives. These can be located in the tense relationship between scientific insight and knowledge production as well as the scientific nature of its findings in terms of quality, systematicity, rigor, robustness etc. on the one hand and the benefit to society as a whole, e.g. for political, economic, legal and other application contexts, on the other (Weingart 1999; Pielke 2007, Kaldewey 2013, Gauchat 2023, Durant 2023). As researchers and teachers, social scientists often simultaneously serve heterogeneous objectives and act in several roles. In sociology, these questions are central to the debates on public science and the positionality of science. Against this background, the contribution outlines the struggle for a positioning of the social sciences by contextualizing it in the debates about a public sociology (Burawoy 2005, Selke 2022, Hoppe 2023) and about contested sciences (Vogelmann 2023). I then elaborate on central points of reference that characterize current reflections on the legitimacy and the positioning of social scientists vis-à-vis the public. Finally, I examine the extent to which the positioning of social scientists is based on fundamental principles of the democratic societies in which they are embedded.

Researchers' Strategic Usages of Public Communication

Tobias Tönsfeuerborn

Bielefeld University, Germany

This paper examines the role of individual researchers' public communication practices in the academic field. I argue that researchers direct their public communication not only to external audiences, but also to different actors within the academic field. On the one hand, individual researchers might use public communication strategically to fulfil visibility expectations of different (organizational) stakeholders. Secondly, initial data indicates a strategic usage in order to increase researchers' own visibility among peers.

Given these different forms of strategic use, Bourdieu's concept of the academic field frames this research. It not only incorporates two forms of symbolic capital within the field it also opens up a perspective on public communication for negotiating competitive structures of the field. In this respect, the study addresses researchers' communication practices both at the individual level and also with regard to the concurrence of scientific and medial rationalities in

the field. The latter refers to Weingart's concept on medialization of science.

The main research question is how individual researchers use their public communication strategically in the competitive academic field. I investigate this issue employing qualitative problem-centered interviews to explore researchers' implicit knowledge and self-descriptions. Adding qualitative media analysis, I examine how researchers communicate in the public sphere. My investigation is set in the field of sociologists. As this study is work in progress, I will introduce and discuss the conceptualization of researchers' strategic usages of public communication in the academic field according to preliminary results.

What Makes Sociology Meaningful and How is it Achieved?

Oliwia Mandrela

Jagiellonian University, Poland

Since Michael Burawoy introduced the idea of Public Sociology, there have been many debates within the sociological community about its nature, boundaries and necessity. The challenges of Anthropocene such as climate change, human rights violations or recurrent social crises, make the relevance and application of sociological knowledge to real-world problems even more important. This paper aims to discuss the idea of Public Sociology as a guide for sociology graduates planning their further careers within Academia (and thus having the possibility to shape it).

Neoliberalism has impacted Academia profoundly. It is transforming the way scientific knowledge is produced and the status of scientific experts in the public sphere. In this general context I analyze the particular case of Poland, where science and higher education has been reformed in recent years. I present the results of 12 individual in-depth interviews with Polish scholars practicing public engagement. The purpose of analyzing their stories is to understand their perspectives on the role of a sociologist in contemporary societies, motives for social engagement and experienced tensions, dilemmas or deficiencies.

I aim to emphasize the present relevance of the discussion on the possibility and the need of Public Sociology, highlighting the key role of the way universities operate. By examining the scholars' voices I contribute to the discussion, considering its actuality and usefulness for constructing the role of a sociologist. Using a literature review, data from the field research, and my personal insight as a doctoral student, I argue that Public Sociology needs to be given more visibility and recognition in the formal evaluation of scholars. Moreover, institutional support in learning necessary skills is needed to facilitate practicing Public Sociology.

Finally, I propose to define Public Sociology through empirically observed 'public moments' (Burawoy) of one's sociological practice instead of focusing exclusively on 'big impact' sociologists. I believe this approach not only allows to involve more actions and thus to let more people to identify with the idea, but it also promotes a better theoretical recognition of important characteristics of Public Sociology. I believe that this frame may develop a deeper future understanding of Public Sociology.

RN24 | T08_02: Measuring attitudes towards science

A World Apart? Young People And The Spread Of Techno-Scientific Information In Everyday Life

Paolo Volonté, Marianna Musmeci

Politecnico di Milano, Italy

The crucial role that the scientific and technological apparatus has gradually assumed in modern societies, along with the crisis of legitimacy that science has undergone since the middle of the last century, have fuelled a growing interest in the study of the relationship between young people and science. The need to mitigate the risk of generalised disaffection from the techno-scientific apparatus and to promote greater critical awareness of the limits of science and the risks associated with it, has prompted numerous studies to focus on young people's attitudes towards science, their interest in techno-scientific subjects, the level of knowledge they have acquired and their propensity to pursue a scientific career. However, less attention was given about how scientific knowledge is processed and stabilised among young people: how scientific information and misinformation circulates, how it is received and used in their daily lives.

Starting from the results of a qualitative research conducted in high schools in northern Italy, the contribution highlights how techno-scientific information becomes part of young people's everyday practices and discourses. Although immersed in a technologically dense life, they seem to pay attention to techno-scientific information mainly in two contexts: when it takes on a character of extraordinariness, or when it concerns personal problems. Moreover, youth relationship with science appears to be highly individualised and characterised by a high degree of trust mediated by institutions (family, school) – which, however, do not always seem able to respond adequately to the risk of generalised disaffection.

Societal Affluence and Girls' and Boys' Aspirations for STEM: A Reassessment

Wilfred Uunk, Michl Bloching

University of Innsbruck, Austria

A surprising and troubling finding from the social science literature is that the gender gap in aspirations for and choices of Science, Technology, Engineering, and Mathemathics (STEM) studies and occupations is larger in more affluent societies. This societal affluence effect has been shown in cross-national comparative studies and (more appropriate) longitudinal assessments. However, despite some good arguments favoring the affluence effect, a causal interpretation can be doubted for methodological and theoretical reasons. In this paper, we, in particular, reassess and extend Charles's (2017) finding that societal affluence raises the gender gap in students' STEM aspirations. Using fixed effects regressions on several waves from the Trends in International Mathematics and Science Study (TIMMS), we observe that after including 'gender by country' – and 'gender by year' fixed effects (which Charles did not do), the societal affluence on the gender gap is considerably smaller. In addition, we find variation in the societal affluence effect for developing and developed countries (the effect being absent for the latter group), find that the societal affluence effect on the gender gap is attenuated by a country's math achievement, and find that societal affluence does not increase boys' math-job aspirations (contrary to the presumed greater opportunities for gendered self-indulgence). Our findings indicate that societal affluence affects gendered STEM aspirations less than previously assumed.

Measuring Attitudes Toward Science and Technology: a Synthetic Indicator for European Citizens and Countries

Leonardo Salvatore Alaimo[1], Federica Cagnoli[2], Paolo Parra Saiani[2]

1Sapienza University of Rome, Italy; 2University of Genoa

In times of global challenges and transformations, such as climate change debates, many researchers have strived to improve the laypeople-experts relationship to address science and technology (S&T) issues. Much research has been done on the attitudes that people have towards S&T. However, the results are often contrasting. One of the main questions is how to study attitude towards S&T. This concept is multidimensional and different aspects influence their definition and, consequently, have to be considered in its investigation.

This paper intends to construct a synthetic index of attitudes towards S&T for the EU countries and citizens. Starting from data from Eurobarometer 95.2, we use three ordinal variables to define a index with a value for each individual in the sample. Given the nature of the variables used, we construct the synthetic index by using the Partially Ordered Set (poset) method, a non-aggregative techniques allowing to define a synthetic measure without any aggregation of the basic indicators. At this point, we analyse the effects of potential factors affecting the attitude towards S&T, according to the literature: a number of sociodemographic factors and the level of scientific knowledge.

Once the indicator has been constructed for each individual in the sample, we will go on to define an index of "positive attitude toward SeT" for each European country, considering the percentage of people with a positive attitude in each country.

807

Measuring Interest in Science: Development of a New Scale Through Item Response Theory

Unai Coto Suárez, Ramón Iker Soria Royuela, Ana Muñoz van den Eynde

Centro de Investigaciones Energéticas, Medioambientales y Tecnologías, Spain

Interest, as a dispositional and motivational element, is a fundamental factor in the relationship between science and society, playing a decisive role in shaping scientific culture and fostering positive attitudes toward science. Typically, the measurement of interest in social perception of science surveys has relied on single-item measures, offering limited insights that fail to capture the complexity of interest in science. In response to these limitations, we developed a global scale that took into account the multidimensional nature of interest as a theoretical construct. For the development of the instrument, a survey was conducted with a sample of the Spanish population (n=630). Starting from an initial pool of 50 items designed to measure the epistemic, emotional and valorative dimensions of interest in science, a nuanced and more precise scale is constructed to provide a comprehensive view of what it really means to be interested in science. In order to reduce the number of items that compose the scale and improve the quality of the questionnaire responses, the Item Response Theory (IRT) is employed. Applying a polytomous IRT-based model, and through the analysis of item response curves, we assess the psychometric characteristics of each item individually, obtaining information about the position and discrimination of the items. In conclusion, the development of this instrument addresses the limitations of single-item measures, providing a solid framework for future research and contributing to the advancement of our understanding of the interaction between interest, science and society.

RN24 | T08_03: Literacy, Inequality, and Identity in the Information Age

The Features of Digital Literacy in Russia

Evgenii V. Popov

National research University Higher School of Economics, Russian Federation

The first part of the thesis revises the existing approaches to the theoretical understanding of digital literacy in order to provide a conceptual basis for the new Eurostat methodology for assessing the level of digital literacy. Four types of theoretical approaches are distinguished in the text: technical, cognitive, social and synthetic. On their basis, an extended understanding of digital literacy is constructed as a set of applied competencies of handling computer or smartphone software (including specific skills) substantiated by previous experience which allow an individual, group or community to solve emerging problems based on critical search, analysis as well as subsequent synthesis of data placed on the network. The second part of the thesis is devoted to approbation of the new Eurostat methodology for evaluating digital literacy on a Russian sample. The conclusion is made that the updated Eurostat approach does not quite adequately describe the level of Russians' digital literacy due to the specific realities of Russia: the special structure of the labor market and the distinctive «market of digital threats».

Information about the sample in Russia:

Size: 10021 respondents

Type: representative, stratified by sex and age (over 14 years old)

Time of data collection: August-September 2022

Main methodology: conceptual – DigComp framework; empirical: Digital Skills Indicator 2.0

Unveiling (new) Dimensions of Digital Inequality: A Comprehensive Analysis

Maria João Simões[1,2], Ana Filipa Martins[3], Carla Vaz[4]

1Universidade da Beira Interior, Portugal; 2Researcher at CIES-Iscte; 3PhD Student, Universidade da Beira Interior; 4Master's Degree, Universidade da Beira Interior

With this presentation, we intend to contribute to a more in-depth analysis on digital inequality by reflecting on the new dimensions that involve it. To this purpose, we will, firstly, approach the state of the art on the subject. Secondly, we will carry out an analysis, at three levels, of the

808

results of an empirical research on digital inequalities surrounding internet access and use, in which a qualitative methodology was used that encompasses interviews and document analysis.

On one hand, this analysis is done through a multidimensional concept of access. On the other hand, we introduce two more analysis dimensions: how reading habits and literacy influences people's use of the internet. The different literacy levels of the interviewees allow a more precise analysis of digital inequalities rather than just considering educational qualifications.

The different literacy levels also pose questions, to a certain extent, the role of schools in reducing digital inequalities. Moreover, new inequalities arise from the challenges linked to the design and requirements imposed by the big tech companies, namely the algorithms, which allow us to propose the designation of a Fourth Digital Divide.

The analysis of the data allows us to identify different types of inequalities in access and use of ICT by the interviewees, which is in line with the results of previous studies, and also inequalities in relation to the new dimensions worked on.

The outcomes of this research post a challenge upon technologically deterministic perspectives and some preconceived ideas that arise from them.

Defining Gendered Digital Identity Divide and its impacts

Lídia Arroyo

Open University of Catalonia, Spain

This work aims to understand to capture the digital identity divide and its impacts from a gender perspective, which refers to the symbolic distance of their self-representation in relation to technologies. The theoretical perspective guiding the research is a combination of the intersectional feminist perspective that considers both structural inequalities and those that explore the normatization of subjectivities in women.

The methodological development, based on a qualitative approach, consisted of two phases. A first exploratory phase considered the field of analysis, specifically the framework of digital inclusion programs, and a second phase of field work involving 49 women was carried out using episodic socio-biographical interviews and discussion groups. The interview sample consisted of 35 participating women and was based on a typological theoretical sampling considering social class, employment situation, and family responsibilities. Likewise, three discussion groups were held: one with a group of unemployed working-class women, another with immigrant women, and a third with inactive middle-class women.

The results shows that digital identity divide as affecting women of all social classes, and found that it is marked by gender socialization, as pointed out by the feminist STS perspective. With the acquisition of digital skills, and specifically with the key role of participation in digital inclusion courses, insecurity and the perception of technologies as something to fear was reduced. However, older middle-class women continue to point out the digital identity gap more often than their younger peers in the labor market.

Is the EU Accessibility Directive At The Forefront Of The World?

Juan Antonio Clemente Soler[1], David Rodríguez Guillén[2], Juan Carlos Solano Lucas[3], Mirella Martínez Rubio[4]

1University Of Murcia, Spain; 2University Of Murcia, Spain; 3University Of Murcia, Spain; 4University Of Murcia, Spain

The fact that Europe is facing a demographic transition that will increase the ageing of the population will have an impact on the number of people with disabilities. In addition, the penetration of the Internet and the use of ICT in our society are making new technologies more and more important in our daily lives. And this has an impact on persons with disabilities. That is why a regulation at the international level plays a key role.

Thus, the European Union, in its attempt to improve and harmonise its legislation on accessibility, developed the Web Accessibility Directive, under the umbrella of the European Disability Strategies.

The purpose of this paper is to analyse whether the European Union's Web Accessibility Directive is at the forefront of accessibility in the world.

809

This directive clearly sets out the main minimum standards in this area at EU level and is playing an important role in encouraging Member States to develop their own legislation based on key principles, as well as to develop training, awareness raising actions and share best practices.

For the study of this directive we will use documentary analysis (Lumivero, 2023), in order to review the main aspects of the directive, the examination of the different legislations of the countries at the forefront of accessibility and the research work on accessibility for people with disabilities, using the comparative methodology (Kaluza, J. 2023) with the aim of finding out if the directive really improves the conditions of users.

RN24 | T09_02: Issues of language and technology

A French-German Dialogue on Theorizing Space

Anamaria Depner[1], Anna Wanka[1], Marion Scheider-Yilmaz[2], Thibauld Moulaert[2]

1Goethe University Frankfurt, Germany; 2University of Grenoble-Alpes

How is space conceptualized within the distinct national traditions of sociology?

Spatial theories in France and Germany have reciprocally influenced each other, drawing from prominent authors such as Henri Lefebvre and Martina Löw. However. When exploring the historical interpretations and implied theories associated with the terms "Raum" (German for "space") and "espace" (French for "space"), as well as the ongoing research on this subject, substantial differences between the two countries emerge.

This paper delves into the discourse surrounding the emergence of a 'spatial turn' (Soja, 1989) in human and social sciences during the 1980s-90s in both France and Germany. It references the increasing attention devoted to space and spatial phenomena in these disciplines, proposing an inter-disciplinary circulation of spatial concepts.

To empirically substantiate this observation, we conduct a systematic analysis of space related definitions found in French and German sociology dictionaries spanning the past eight decades. Additionally, we incorporate insights from interviews with relevant experts from various disciplines in both countries. This comprehensive approach provides valuable perspectives on the current status of the conceptualization of space and it's traveling within the realm of sociology in France and Germany.

Our findings reveal a limited application of spatial concepts in contemporary general sociology in both, France and Germany. Moreover, when employed, these concepts often shed their material dimensions and, especially in the French case, lean towards symbolic approaches to social space (Bourdieu, 1979). The research underscores the diverse and multi-dimensional nature of coexisting theories and definitions of space, which draw from various disciplinary backgrounds.

Challenges of Neural Translations in Language-Community Operations and Representations

Eduardo Apodaka[1], Asier Amezaga[1], Asier Basurto[2]

1University of Basque Country Euskal Herrriko Unibertsitatea-Universidad del País vasco, Spain; 2Soziolinguistika Klusterra (the basque sociolinguistic cluster)

The aim of this communication is to present some results of a research project focused on the tensions, adaptations, and innovations introduced by the use of neural translators in the context of Basque language revitalization. This research involved various agents – including language instruction, secondary education, universities, health institutions, media, public administration, and private companies – with whom we co-designed an intervention to explore the broader implications of using neural translators in their activity systems. This context offers an intriguing insight, especially since the Basque language exists within a minoritized language community context, accompanied by the strong development of neural translators, such as elia.eus developed by the Elhuyar Foundation.

The presentation will focus on one aspect concerning how Natural Language Processing (NLP) is not only challenging the way minoritized languages should approach their prospective use, but also altering the operation and representation of language and community themselves. To this end, the presentation will compare the operations and representations of the language-community in the context of Basque language revitalization during the 60s and 70s with the current context, which is characterized by the growing implementation of neural translators across an increasing number of activity systems.

Exploring the implications of using Natural Language Processing technologies on the way we operate and represent language-communities will provide orientation for future scenarios. This is particularly relevant given that NLP is one of the key pillars in the development of Artificial Intelligence.

Thematic Mapping of Oral History Interviews – by Phrases and Beyond: How far can NLP be stretched?

Róza Vajda, Júlia Egyed-Gergely, Judit Gárdos, Anna Horváth

Centre for Social Sciences, Hungary

Pressed by demands of increased transparency, our staff at the Research Documentation Center has engaged in a project of metadata uplifting. In introducing thematic categories to describe the contents of thousands of interviews reposited in our 2 archives, we employed NLP tools for the analysis of texts. Assisted by IT experts, our team undertook the manual and automated indexing of our collections. For

810

this purpose, we first translated the ELSST, which is now the only available social science thesaurus in Hungarian. Second, on this basis we developed our own thesaurus covering the main topics of our archives. Third, we elaborated a system of annotation for manual coding, digging into the texts at the level of sections. Fourth, we tested various machine algorithms and selected the most efficient one. And fifth, we validated the results by a second round of manual coding.

The presentation discusses the lessons and main challenges of the project: What does it mean to map the contents of historically and methodologically contextualized and thematically versatile collections of texts by a web of concepts? How far can NLP be stretched in the search for meaning? In so doing, it asks if these tools alter how qualitative research is conducted. Finally, as a ramification of the project, it explores ways to allow a better grasp on the narratives contained in interviews by employing semi-automated discourse analysis to consider the relational aspects of texts, such as semantics, syntactics and pragmatics, beyond understanding interviews as a 'bag of words'.

The Future of Work as Imagined by Human Translators Facing Machine Translation

Azer Kilic

Istanbul Bilgi University, Turkiye

This talk aims to contribute to the debates on the future of work and the labor-market implications of artificial intelligence (AI), with a case study of human translators facing machine translation. New automation technologies are being introduced to the economic life, thanks to advances in AI, with neural machine translation being one example based on the use of neural network models and deep learning techniques. While AI-driven automation promises benefits such as increased productivity, it also leads to concerns about the future of work. Scholars predict problems such as job and wage loss, increased income inequality, deskilling, and unemployability across different sectors and occupations due to the workplace automation of varied tasks. While such predictions are important, it is impossible to foresee the future with certainty. But it is possible to imagine it. Drawing on the literature on future imaginaries, this talk aims to discuss what kind of imaginaries translators have of the future within the context of machine translation and automation technologies in general, including their possible effects on work and life under and beyond capitalism. The findings show that translators imaginaries are significantly shaped by their political values. The talk draws on 50 semi-structured interviews conducted in Turkey with translators, professional associations' spokespersons, translation company owners and executives, and experts in natural language processing and translation studies. The research was funded by the Scientific and Technological Research Council of Turkey.

RN24 | T09_01: Technological Innovations in Legal Systems and Cybersecurity

The Co-production of the Future of Big Data in Law Enforcement Through Imaginaries and Narratives

Laura Neiva

Communication and Society Research Centre (CECS), Institute for Social Sciences (ICS), University of Minho, Portugal

In 2014, the Executive Office of the President (US) claimed that "Big Data can be a powerful tool for law enforcement" and that it "holds the potential to substantially strengthen national security". Since then, these technologies have emerged in public discourse as a narrative of the extraordinary law enforcement revolution. This vision has been institutionalized and publicly performed in various countries as a sociotechnical imaginary of a promising and desirable future. Drawing on STS and the sociology of expectations, and based on document analysis of European and Portuguese regulatory papers, policy discourses, police reports, and fieldwork in two police departments in Portugal this presentation will explore the frames of Big Data and their impact on the development and implementation of these technologies in the present and future. I will analyze the narratives and expectations surrounding these technologies that promote an imaginary of a fixed and scripted, even inevitable, future that may be desirable. I will ask: How do the imagination and definition of Big Data technologies in law enforcement co-produce its trajectory? I will show how the co-production of shared visions may contribute to the expansion of these technologies and is problematic as it obscures alternative futures for law enforcement systems by limiting their evolution to the adoption of Big Data. This presentation will contribute to understanding the dynamics shaping the present and future of Big Data in law enforcement. It will also critically analyze the hardening of the socio-technical structures supporting it, reflecting on their societal implications.

Projected Futures For The Use of Electronic Monitoring in the Criminal Justice System

Rafaela Granja

University of Minho, Portugal

Electronic monitoring is a technology used to monitor the location, movement and specific behavior of people involved with the criminal justice system. Its use has increased

811

in scale, reach, and scope in several Western countries over the last few decades.

Electronic monitoring is a highly versatile technology because it can be used at all stages of involvement with the criminal justice system, namely as a pre-trial detention measure, as a condition for the suspension or enforcement of a prison sentence, and as a pre-release measure for prisoners.

The existing literature on electronic monitoring tends to focus on the use of either radio frequency, which monitors the presence of a person in a particular location, or GPS, which tracks the mobility of offenders (and victims). However, there are currently other possibilities for electronic monitoring that could ultimately determine its future direction, which remain completely unexplored, such as the use of smartphones and facial recognition systems. Another uncharted area is how electronic monitoring is increasingly being integrated with artificial intelligence in ways that could shift the use of this technology towards a predictive, rather than reactive, approach to crime. Electronic monitoring is, therefore, an issue of pressing political and public concern that is undergoing significant technological developments, yet remains underexplored. In this paper, I explore the projected futures of electronic monitoring by focusing on the technological developments that are being tested, developed, and implemented in different jurisdictions across Europe, and the associated societal, cultural, regulatory, and political implications.

From AI to Eternity: Navigating the Crossroads of Artistic Authenticity and Transparency in the Age of AI Generated Music

Jennifer Chubb, Yorgos Paschos

University of York, United Kingdom

How we produce and consume music in an age of Artificial Intelligence (AI) sits at the nexus of issues of tension, transformation and trust. As musicians and gig-goers grapple with tensions relating to techno pessimism and optimism, AI and digital environments can transform the ways we consume and produce music while challenging notions of trust related to the integration and acceptance of AI-generated works. Such generative technologies expand the boundaries of music with AI personalisation tools tailoring listening experiences and immersive XR experiences featuring in music festivals. However, their impact has sparked a debate across the creative industries. This paper aims to address this debate by exploring different perspectives from both music production and consumption. Whilst there is research into how listeners and musicians perceive artificially created music and the effects of AI consumption on societies, musician and gig-goer attitudes towards the disruption and innovation in music-making, performing and gig-going are only peripherally explored. Hence, this paper reflects on 46 responses from UK gig-goers and musicians about their attitudes towards AI in music and digital live experiences based on a qualitative survey executed between April 2023 – August 2023. Common themes emerging after

preliminary coding are the relative acceptance of AI providing its use is made transparent and under certain conditions of co-creation. An overall resistance towards AI's ability to 'mimic affect' or reflect (let alone replace) the role of the human in art and music creation and live expression also questions human connections, authenticity and relatability in an age of AI music-making. As such AI's transformative potential is framed considering issues of trust and transparency based on the tensions it creates.

The Rise of Anti-gender Politics in Spain: Frames, campaigns and political alignments

Igor Sadaba[1], Ines Campillo[1], Eduardo Romanos[1], Guillermo Fernández[2], Olatz Zeltzin Arriaga[1]

1Universidad Complutense Madrid, Spain; 2Universidad Carlos III, Madrid, Spain

Anti-gender and anti-feminist movements have remained largely unnoticed by Spanish scholars until the recent past, mainly due to their significant institutionalization and concentration within the Spanish church, coupled with the relatively limited visibility of feminist activism. Notably, Spain stood as an exceptional case during a period when the repercussions of the Great Economic Recession and austerity measures engendered the rise or consolidation of far-right anti-gender and anti-feminist actors in numerous European countries, particularly those most affected by the austerity agenda, predominantly in the Mediterranean region. However, Spain witnessed the emergence of the 15M movement and a

new political cycle characterized by the rise of progressive political parties, setting it apart from its counterparts (Turnbull-Dugarte, 2019).

Consequently, it was only in the late 2010s that anti-gender and anti-feminist movements gained prominence in Spain, prompting intensified academic inquiry and marking a significant shift in scholarly attention, primarily catalyzed by the ascent of the far-right political party Vox (since approximately 2018).

This paper draws upon the fieldwork of the European project FIERCE (Feminist Movements Revitalising Democracy in Europe), which aimed at mapping the diverse constellation of anti-gender actors in Spain and the campaigns, repertoires of actions and discursive frames that they have developed since 2010, putting a special focus on their impact on party politics and on the policy process. Thus, our paper will offer an analysis of the results of this fieldwork, which has consisted in an analysis of hundreds of press news, 10 gender related policy debates, 20 anti-gender movement campaign documents, 5 interviews with activists, and 5 interviews with party representatives or policy makers.

How are Women, Femininity, and Motherhood Conceptualized in Scholarship on Anti-gender Movements? Results from a Systematic Literature Review

Isabel Köhler

Gothenburg University, Sweden

I am going to present my findings on how female anti-gender actors, femininity, and motherhood are conceptualized in the literature on anti-gender movements. The first anti-gender campaigns that specifically organized protests in opposition to "gender ideology" were observed a little more than ten years ago. As the protests spread and took on different issues in different places, scholars from various social sciences quickly began to study, describe, and theorize the phenomenon. Today, there exists a variety of empirical and theoretical work on anti-gender movements.

As a part of my dissertation project on anti-gender motherhood, I conduct a systematic review of the scholarship on anti-gender movements in order to identify different theoretical approaches, research patterns, and gaps. I focus on female actors, because there is a tendency to associate movements on the right with men and masculinity and to neglect women as active and willing participants. My review sheds light on whether studies of anti-gender movements repeat these assumptions. Furthermore, I investigate whether and how femininity and motherhood are conceptualized or taken for granted in the literature.

Strategizing Against Equality

Stefanie Mayer[1], Judith Goetz[2]

1IKF Wien, Austria; 2University of Innsbruck, Austria

Targeting sexual and gender diversity as well as equality and anti-discrimination policies anti-gender campaigns have gained prominence in recent years. Developed from a specific Christian discourse, which was invented by the Vatican in the 1990s this modernized anti-feminism spread transnationally and is today articulated in similar, yet always contextually specific form in political contestations all over the world. Examples range from the BJP's hindu-nationalist and anti-muslim agitation, to Trump's election campaigns and Russian agitation against "Western decadence". Even though by far not all of these instances are directly connected by means of common (networks of) actors, similarities in terms of contents as well as political means are striking in many cases leading to the question of how to make sense of these transnational resemblances.

While it would certainly be an overstatement to construct these similar yet disparate policies and campaigns as one single social movement, our paper shows, that on the European scale we might see an emergent social movement or at least a coalition of actors consciously trying to build one. Starting from an examination of the ultra-conservative Christian network Agenda Europe and a frame analysis of its discussion paper Restoring the Natural Order we explore,

how this network aims to put into place a multi-tier strategy, including the establishment of grass-root mobilisations, strategies to gain hegemony in discourse and power-games in order to transform these into policies on national and international levels. Far from being just a counter-movement to recent social and political liberalisation efforts these actors aim to establish their vision of a supposedly "natural" order.

The Shape and Evolution of Anti-Genderism as a Transnational Discourse Alliance: Evidence from Twitter

Dominika Tronina

Humboldt-Universität zu Berlin, Germany

In recent years, anti-gender movements opposing women's and LGBTIQ+ rights have been on the rise, often using a distinct rhetoric that defames these rights as "gender ideology" (Kuhar/Paternotte 2017). This phenomenon has been conceptualized as a "discourse alliance" (Roth/Sauer 2022), effectively bringing together diverse far-right, religious fundamentalist, and social conservative actors, transcending national boundaries. This study explores the empirical manifestations of this theoretical conceptualization. To accomplish this, I examine ten years of Twitter communication from 148 organizations associated with the anti-gender movement in five European countries: Croatia, Germany, France, Italy, and Poland. Mutual hashtag usage serves as a proxy for identifying shared discourses within this transnational alliance. Employing discourse network analysis, I unveil the similarities among these actors and demonstrate the discourses that connect them, while also tracking how this connectivity has evolved over time. This study sheds light on the interconnectedness and evolution of anti-gender discourse across borders, providing valuable insights into the mechanisms driving this global phenomenon.

RN25 | T01_02: Anti-racist movements

Balancing on a Double-Edged Sword: Resources and the Norwegian Antiracist Movement

Kjell Erling Kjellman

University of Oslo, Norway

This paper explores the role financial resources play in defining strategies and goals for the Norwegian antiracist movement. Resources, variously conceived, have long been held as a key determinant in shaping social movements. While much attention has been given to the role of resources and mobilization in general, few studies have examined how the distribution of material resources impact Norwegian social movements. Norway presents a unique case for study with its institutional setting characterized by a close integration between civil society groups and the way the state allocates financial support to movement actors, including antiracist activists. Moreover, the Norwegian antiracist movement has received little scholarly attention, particularly from the standpoint of how institutional constraints and opportunities impacts its mobilization. Drawing on extensive interviews conducted with Norwegian antiracist activists, two interrelated issues are explored. First, how the understanding of strategic choices on the part of movement activists are conditioned, in part, by the Norwegian model of resource support to movement groups. Second, how these same resources serve as determinants of how activists come to perceive opportunities and constraints when developing and defining movement objectives. The study extends the literature in several ways. It aims to add to an understanding of how specific institutional configurations shape strategies and envisioned outcomes of social movements, assesses the analytic utility or resource-mobilization theory on current social movements, and contributes to knowledge on antiracist movements in Norway more generally.

Agenda setting and selective resonance – Black Lives Matter and media debates on racism in Germany

Sabrina Zajak, Elias Steinhilper

German Center for Integration and Migration Research, Germany

In this article, we explore how the 2020 wave of BLM mobilisations has impacted the media debates on racism in Germany. We analyse overall shifts in the salience of racism and the resonance of key frames articulated by BLM protesters. Drawing from a mix of quantitative content analysis and semi-structured interviews, we find evidence that the

814

BLM protests have changed the public debate on racism in Germany through agenda setting and reframing. Firstly, our data documents that the salience of racism in public debates increased after the protests. Secondly, specific movement frames, especially the distinction of anti-Black racism as one particular form of racism, became increasingly visible. Yet, resonance of frames has remained selective with some being hardly picked up in media debates. The article bridges insights from social movements, media, race and ethnicity studies to advance interdisciplinary scholarship on social and cultural change induced by collective action

Unveiling the Potential of Community and Union Organizing for Lived Solidarity in Addressing Racism and Fostering Social Cohesion

Judith Weger, Raoul Nozon

Friedrich-Schiller-Universität Jena, Germany

In the midst of persistent crises, calls for heightened solidarity echo across societies. While often confined to symbolic gestures, aiming to reconcile the fractured fabric of our communities, we take a practical approach to explore the untapped potential of lived solidarity that transcends societal divisions. A pivotal mechanism within social movements fostering this practice is the method of strategic organizing, particularly used in labor and housing movements.

Our study employs reconstructive social research methods such as qualitative interviews, ethnography, and activist research. By engaging directly with the lived experiences of organized workers and tenants, we seek to unravel the interpretative frameworks that individuals utilize to make sense of their precarious work and living situations.

Organizing, while not always inherently anti-racist, emerges as a powerful force capable of unveiling the contradictions inherent in common-sense thinking, including the pervasive influence of everyday racism. Instead of sticking to logical arguments or educational efforts, organizing efforts allow for a holistic approach that targets the social contexts nurturing racism, while concurrently empowering those subjected to discrimination.

Our contribution draws on empirical data conducted in four organizing endeavors surrounding union and housing struggles, located in West and East German cities. The findings reveal patterns in which workers and tenants link their notions of injustice with cultural stereotypes; they show opportunities for experiencing solidarity and questioning said stereotypes provided by the organizing approach; they give reason to scrutinize the interplay between social movements aiming at economic production and social reproduction.

The Making of Antiracist Identity. Boundaries and Identity Dilemmas in Norwegian Antiracism.

Mette Andersson

University of Oslo, Norway

This paper explores how the collective identity "antiracist" is figured and contested inside and outside of Norwegian antiracist networks. Seeing antiracist networks and organizations as representing a broader antiracist movement, the paper asks what unites and disunites social movement organizations and individuals identifying as antiracist. The paper is based on 54 in-depth interviews with representatives of social movement organizations, independent antiracist writers and debaters, media representatives and politicians, and on fieldwork related to anti-racist demonstrations and seminars on – and offline. Theoretical discussions about collective identities and identity dilemmas in social movements, and moral boundaries, inform the analysis. A concluding discussion concerns whether identity dilemmas and the configuring of a collective identity, challenges for all social movements, differs between anti-racism and other social movements.

RN25 | T01_03: Socio-economic mobilization

Socio-economic Protest in the Czech Republic on the Background of Tripartite Negotiations

Tereza Menšíková

Masaryk University, Czech Republic

The rise of socio-economic collective action and protest often indicates a failure of social dialogue and negotiations among influential interest groups or their restricted access to the decision-making process. In the Czech Republic, this process is represented by the tripartite body, including representatives of the trade unions, employers, and government officials, initially instituted in the 1990s to prevent social conflict during the "transformation period" after the collapse of the Communist regime. In this paper, I present an analysis of communication patterns in a unique corpus of approx. 200 structured records and textual materials from plenary sessions of The Council of Economic and Social Agreement of the Czech Republic. By applying theoretical framework and concepts from social movement studies, the research assesses communication patterns utilizing Natural Language Processing (NLP) techniques to explore the main topics, framings, and grievances discussed by the representatives in specific periods (2000–2022). Particular emphasis is given to how the structure of the dialogue and its content have been affected by the economic crises and changes in the government. The research also aims to compare the analysis with data from a dataset of protest events in the Czech Republic between 1989 and 2022 to examine if and how Tripartite negotiations are reflected in the quantity, character, and thematic content of the Czech socio-economic protest. Since public protest is perceived as the last form of repertoire to exert influence, this paper aims to address the communication patterns that precede its organization to explore their mutual dynamics.

Social Classes, Protest and Welfare Attitudes in Portugal (2008-2016)

Tiago Carvalho[1], Vasco Ramos[2]

1Iscte – University Institute of Lisbon, Portugal; 2Institute of Social Sciences – ULisboa, Portugal

Portugal presents one of the highest levels of income inequality in Europe with studies underscoring the significance of social class. In this paper, we analyze the changing relationship between class, protest, and position-taking concerning the welfare state in Portugal between 2008 and 2016. We begin by discussing the repercussions of austerity in the restructuring of the political space in Portugal. We will show how the external intervention by the IMF-ECB-EU troika provoked a wave of contestation and a sustained increase in protest levels. Using data from the European Social Survey and resorting to Multiple Correspondence Analysis, we compare the structure of the space of political practices along class lines in 2008 and 2016. Our findings reveal an important transformation – in 2008, protests were an exception and linked with leftist positions, whereas, by 2016, they had become a prevalent repertoire/practice of those with center-left and egalitarian welfare positions. Intriguingly, while a consensus existed in 2008 among individuals in the center-left and center-right regarding the welfare state, by 2016, they had diverged into opposite positions, indicating a polarization process within the political space. Finally, examining how these changes relate to class, we will show that in 2008 the overall volume of capital mattered, while in 2016 the nature of capital differentiates the type of action taken, with individuals with higher cultural capital engaging in protest, while those with economic capital engaging in institutional action. This paper helps to show the changes in the social basis of conflict and mobilization in Portugal.

Social Movements and Political Protests in Portugal during and after the Austerity Crisis

Cristina Nunes

Lusofona University, Portugal

Over the last decade, Portugal, like other southern European countries, has experienced high levels of social and political mobilisation against austerity measures agreed between the Portuguese government and the so-called troika: new groups of protesters and large-scale events have contributed to a reconfiguration of social movements.

However, since 2015 the parliamentary governance agreement between left-wing parties, along with the pandemic context, have produced a significant decrease in the activity of social movements. During this post-troika period, a return to micro-scale protests events based on a more diffused thematic agenda was observed. This includes grassroots movements, such as the youth mobilisations calling for climate justice, anti-racist campaigns against police violence and demands for the right to housing in urban areas.

Following a qualitative approach based on in-depth interviews and document analysis, we focus on social movements during and after the austerity crisis. We also seek to demonstrate that while mobilisation issues follow an international agenda, the national structures of political opportunity continue to have a strong influence on the organisation of protest groups in Portuguese society.

Social Movement Participation and Electoral Behaviour: Evidence from (post-)crisis Greece.

Angelos Kontogiannis Mandros, Costas Gousis

Panteion Universtiy Athens, Greece

The Greek Indignados movement played a determining role in the unfolding of the Greek crisis as it turned widespread social discontent against austerity into a full-blown legitimacy crisis of the established power bloc. At the macro-level this was manifested in the disintegration of the bipartisan system in 2012, the meteoric rise of SYRIZA and the proliferation of social struggles up until the 2015 Greek bail-out referendum. On this backdrop, our research focuses on the micro-dynamics at play and particularly on the long-term impact of social movement participation on people's political attitudes (institutional trust, levels of radicalization etc) and electoral behaviour. To that end we rely primarily, although not exclusively, on qualitative data consisting of 95 in-depth interviews with participants and non-participants in the Indignados movement and 10 focus groups of seven participants each (6 of them with people that vote regularly and 4 with people that abstain). Out of the 95 individual interviews 20 are with people that have been interviewed twice: on the immediate aftermath of the 2015 referendum and again in 2023. This allows us to follow the trajectory of certain dynamics over time and delve deeper into critical questions regarding a) the character and process of radicalization/de-radicalization in the aftermath of contentious cycles, b) the affective and identity parameters at play (e.g. empowerment/disillusionment, self-understanding, changing levels of political efficacy) and c) the way these dynamics shape not only people's voting behaviour but their overall engagement with politics.

RN25 | T02_01: LGBTQIA* movements

Can we Talk About Homonationalism in Italy? Italian LGBT+ Intersectional Activism and Homonationalism

Luca Falzea

Politecnico of Turin, Italy

This contribution dissects the nuanced landscape of homonationalism in Italy, starting from the point of view of LGBT+ activists that operates in associations with an intersectional focus. The contribution presents the results of a year long ethnography in a LGBT+ association with a focus on the intersection between sexuality, race and religion and of 8 semi-structured interviews with activists from this and other associations with a similar focus. In Italy the absence of a strong political support for LGBT+ at the institutional level, together with the erasure of race from public discourse, makes it difficult to use the concept of homonationalism to describe its context. However, the interviews and the ethnography showed that there is both an assimilationist stance in mainstream LGBT+ associations that creates hierarchies of race typical of homonationalism and a homonationalist stance in the institutions evaluating asylum requests on the ground of sexuality. This stance has consequences on the work of the LGBT+ intersectional movements as it forces activists to deal with a Eurocentric definition of homosexuality to help Queer migrants to obtain the refugee status and the residence permit. Activists, thus while acknowledging systemic injustices have to find creative ways to resist this system in which they don't believe. Through the word of activists and the observations carried out during the ethnography, the contribution showcases the possibility of defining Italian homonationalism as enrooted in institutional practices that influences the work of LGBT+ intersectional movements. In front of hegemony the activists interviewed chose to resist without fighting the system head on: in doing so they oppose the system while also playing a role in it.

Food Practices and Political Solidarity in Spaces of LGBTQ Activism

Jon Robert Binnie, Christian Klesse

Manchester Metropolitan University, United Kingdom

This paper examines food practices as an example of solidarity in transnational LGBTQ activism. We suggest that focusing on food can help us understand how care underpins the politics of solidarity within transnational LGBTQ activism. We examine how queer bonds of solidarity are nurtured and sustained through food practices as an example of practice of care among groups of activists engaged in LGBTQ political struggles. Our argument draws on data from two multi-site qualitative research projects

on transnational activism around LGBTQ cultural and political events in Poland and a comparative study of queer film festivals as activism in different geopolitical contexts in Europe. We argue that a focus on food practices within LGBTQ activism can help us understand the role of pleasure in sustaining queer solidarities and provide a more holistic critical understanding of solidarity beyond the wider political imaginary of militancy, while recognising how they can also become an explicit focus of contestation and conflict within spaces of LGBTQ activism.

Online And Offline Collective Action Against "Left-wing Collectivism": Analyzing The Plurality Of Right-wing LGBTQIA+ Activism in Brazil

Rodrigo Cruz

Université Libre de Bruxelles, Belgium

This work aims to contribute to the sociological debate on contemporary right-wing movements and online activism. Drawing upon online ethnographic work, documentary research and interviews with right-wing LGBTQIA+ activists in Brazil, I mainly emphasize the theoretical and analytical challenges that emerge when groups under study reject more conventional forms of organization and collective identity. How do we analyze online/offline activist groups that are, at the same time, highly active and considerably visible online, but refuse to embrace "traditional" or "coherent" organizational forms and collective identity due to an alleged rejection of the "left-wing collectivism" attributed to LGBTQIA+ movements and communities? How do we theoretically approach a form of collective action that challenges the need for identity-based LGBTQIA+ political organizations? And how can we analyze the many (and often fluid) styles of activism that emerge from fieldwork without falling into rigid categorizations? Combining theoretical contributions from the sociology of social movements, particularly studies on radical right-wing movements and online activism, I seek to discuss conceptual approaches to understanding the complexity of contemporary right-wing movements, taking as main focus how the internet and social media complicate the analysis of their identities and organizational plurality.

The Unexpected Success of the Gay and Lesbian Movement in Israel, 1975-1992: Lessons for Social Movements

Yuval P. Yonay

University of Haifa, Israel

With some significant reservations, one may say that since about 2000 Israeli society is one of the most welcoming societies for LGBTQ people. The emergence of Israel as an LGBTQ-friendly state is a surprising development given that deep into the 1980s, gays and lesbians' rights were hardly discussed, and LGBTQ issues were considered esoteric and irrelevant to Israel.

Based on interviews with veterans of the gay community, this paper seeks to shed light on the early activities of the first gay and lesbian organization and its role in preparing the ground for later developments. Three preliminary factors are offered:

A. Lesbian and gay refugees from Nazi Germany during the 1930s played an essential role in the creation of an underground sub-culture of gay men and lesbian. This sub-culture served as a bedrock for later organized activities.

B. The arrival during the 1970s of immigrants from North America and Western Europe and the exposure of Israeli Sabras who studied and worked in those countries created a cadre of women and men who were already familiar with the rhetoric and action of gay and lesbian movements.

C. Israeli activists were bitterly divided over the question whether the organization should fight for political rights or focus on strengthening the gay and lesbian community. It seems that eventually the two types of activity supported each other and led together to the achievements of the 1990s.

The success of the Israeli GL movement thus shows the important of social networks as well as the role of international models in developing a successful local movement.

RN25 | T02_02: Decoloniality and privilege

A Global Sociology after the Decolonial Turn

Geoffrey Pleyers

FNRS-Université de Louvain, Belgium

Is the project of global sociology still legitimate after this intense wave of criticism? Or is "global sociology" intrinsically bound to the Eurocentric modern project and worldview? Should sociology renounce this project to do justice to knowledge rooted in local experiences, struggles, and specific cultures?

In this contribution, I argue that the decolonial turn does not invalidate the project of global sociology. However, to rebuild global sociology after (and through) the decolonial turn, criticism of Eurocentrism and the visibilizing of alternative knowledge must be complemented by a third and indispensable step: intercultural dialogue. This requires researchers to acknowledge their position and be open to learning from others. The posture is at once sociological, cultural, and personal. Without this call for an open and intercultural global dialogue, the renewal of critical stances and theories runs three risks: fragmentation, isolation (through difficulties in reaching out beyond the most activist fringes of movements and critical scholars), and homogenization of Western social sciences and knowledge as dominant and Southern social sciences and knowledge as emancipatory.

The rising influence of actors and worldviews from the Global South calls for renewed approach, method and epistemology. It raises practical, theoretical, methodological and epistemological challenges. How to study actors in a global world without ceding to the pitfalls of methodological globalism and epistemic extractivism? Drawing on personal experience, explorations and mistakes in research on global movements as well as concrete implementation in the International Sociological Association, the contribution will explore possible paths drawing on multi-site research, transnational analytical tools, dialogues with local actors and researchers, and an ethic oriented towards intercultural dialogues.

Interconnected Resurgence: Global Anti-Colonial and Anti-Racist Movements Since 2014

Erik Ludvig Sunnemark

University of Oslo, Norway

This contribution explores the global surge of anti-colonial and anti-racist social movements since 2014, encompassing Black Lives Matter, Rhodes Must Fall, Land Back, anticolonial and Indigenous climate activism, Palestinian solidarity protests and resistance against Israeli settler colonialism, and protests against neo-colonialism in the Caribbeans and West Africa. In contrast to conventional research treating these movements as separate, bound entities, whose individual characteristics and strategies are to be described and explained with conventional social movement theories on political opportunities and strategic actions contra the national state, this presentation employs a critical, globalization-focused conjunctural analysis. It interprets these formations as interconnected instances of a globally dispersed movement, united by their opposition to racialized accumulation by dispossession in response to recent crises in global capitalism. Examining the interconnections, communications, solidarities, and shared characteristics of these movements, and drawing on literature on racial capitalism, accumulation by dispossession, South-South dialogue, and critical and Marxist social movement approaches, this presentation offers a relevant empirical intervention into a growing field of social movement activity. It also contributes theoretically and methodologically, proposing an analysis of social movements based on their positioning in global structural conflicts regarding the reproduction of historicity, as well as their related relations to hegemony and domination.

(Dis)comfortable Activist Experiences: Intersectional Reflections on Social Movements Participation

Cristina Pradillo-Caimari

Universitat Pompeu Fabra, Spain

819

Participating in social movements and activist spaces implies individuals' agency to collectively challenge, contest, and oppose prevailing unequal societal norms and structures. Within contentious fields, claims and demands are numerous and varied, usually advocating for the rights of marginalized communities and proposing broader systemic changes. Despite the transformative capacity of the different movements, activist spaces are also embedded in complex power relations that condition who has a legitimate (political) voice and who can plenty participate.

In this presentation, we argue that attending to intersectional experiences from spatial and emotional lenses enables understanding oppression-privilege tensions within social movements participation. Building on the idea that (dis)comforts can be interpreted as spatial markers of inequalities (Ahmed, 2004), we apply the Relief Maps model (Rodó-Zárate, 2014) to a large sample of residents in Catalonia (Spain). This theoretical-methodological tool helps collect, analyze, and visualize intersectional inequalities by bringing together three dimensions: the social (axes of privilege-oppression, e.g., gender, age, ...), the geographical (places), and the psychological (emotions). It focuses on everyday subjective experiences while acknowledging their social and spatial embeddedness.

Through this approach, we explore the principal axes of (dis)comfort within activist spaces. Furthermore, we delve into the role of these emotions as barriers to engagement in social movements or, conversely, as the catalysts for building bonds of solidarity. This analysis highlights the significance of considering intersectional positions and experiences for a more comprehensive understanding of contemporary activism.

RN25 | T02_03: Mobilizing identities and emotions

The Last Straw of Democratization? Understanding the Gezi Protests in Turkey through Participants' Narratives

Tülay Yılmaz

Doctoral Researcher / University of Helsinki, Finland

The 2011 general election was a significant event in Turkey's political and democratic trajectory. Having won three consecutive elections, the AKP ((Justice and Development Party) initially continued its governance with a liberal political stance. However, in 2011, the party shifted towards implementing conservative policies and legal changes in Turkish society. This shift predominantly affected the secular segments of the population, who quickly began to challenge and oppose the party's undemocratic political maneuvers. Secular citizens protested the AKP's aggressive capitalist and conservative strategies, evident in construction projects, urban redevelopment initiatives, and interference in personal freedoms such as restrictions on abortion, limitations on women's attire, and constraints on alcohol sales.

This growing discontent culminated in a small-scale protest on May 28, 2013, in Istanbul's Gezi Park, sparked by opposition to the government's plan to demolish green spaces for a shopping mall. The 2013 Gezi movement, a series of significant anti-government social protests in Turkey, stands as a defining moment in Turkish history. Initially catalyzed by environmentalist concerns, the movement rapidly evolved, drawing participation from diverse societal groups and culminating in approximately 5,000 related demonstrations nationwide.

Despite the widespread academic interest in the Gezi protests, a noticeable void exists in exploring participants' perspectives before, during, and aftermath of the movement. By employing narrative analysis and the sociology of emotions in social movements, the research investigates the emotional dimensions of the Gezi protests and their impact on Turkish society. This approach provides valuable insights into the emotions, narratives, and collective experiences that influenced the protests' development and aftermath.

"Nique la France": Islamic Civil Society Organizations and the mobilization of French Muslims in contentious times

Enrico Maria la Forgia

Università degli Studi di Padova, Italy

Ethnic and religious minorities mobilize to achieve or defend cultural rights whenever they perceive attacks on their identity (Alicino, 2016). French Muslims make no exception. In times of crisis, indeed, authorities multiply their attempts to regulate Islamic religious practices (Roy, 2007, 2018; Barras, 2010; Arslan, 2015; Parvez, 2017), triggering among Muslims a shared sense of discrimination that may turn into collective action (May & Moodood, 2011; Silverstein, 2018). As a matter of fact, religious affiliation is a valid source for the organization and expression of collective claims (Olzak, 1983; Diop & Kastoryano, 1991; Mandelbaum, 2000; Kastoryano, 2002; Della Porta & Diani, 2006; Pingaud, 2012; Peace, 2015; Talpin, 2017).

However, such a process could not take place without the participation of the Islamic Civil Society Organizations (here abbreviated ICSOs): Civil Society actors strengthening the role of the Muslim communities as policy-makers in counteracting the State invasion of private areas of life – in this case, religion – (Castells, 1983; Habermas, 1998; Cinalli, 2013), and negotiating with authorities the role of Islam as an integral part of French modernity (Kastoryano, 2004; Bowen, 2013; Faure, 2021).

The proposed paper – which is based on a set of qualitative interviews held with heads and members of ICSOs – aims to analyze, on the one hand, the historical development of ICSOs in France; on the other, the repertoire of action chosen by such actors in representing a highly stigmatized and visible community (Fregosi, 2020). The outcomes show an interesting frame of ICSOs' strategies in their relations with the State and potential partners within the political arena, partially answering questions related to French Muslims' political participation and the Social Movements representing them.

Do You Practice What You Preach? The Case of Brazilian Unionists' Mental Health

Maria Julia Mendina de Souza Martínez[1], Fernanda Souza Duarte[1,2]

1Universidade de Brasília; 2Universiteit van Amsterdam

Brazilian unionism played a fundamental role in the construction of what is understood legally as occupational mental illnesses in Brazil but, paradoxically, mental illness seems to remain stigmatized among unionists. In our research, we turn to Brazilian unionists' mental health – a neglected topic. We explore the contributions of Brazilian literature on the topic to develop a research agenda. We conducted a systematic literature review. The final selection included

820

seventeen works published between 2006 and 2022. We identified four themes: occupational mental health in unions' agenda, how unions conceptualize occupational mental health, what unions do when it comes to occupational mental health, and suffering within the union. While the three first themes evidence unions' discourse on work as a social determinant of mental health/illness, the last theme reveals unionists' negative experiences not only in the union activity but also within the union context, leading to the deterioration of unionists' mental health. Gender and class also shaped these experiences. Our findings point out the contradictions between unions' discourse on the relations between work and mental health and unionists' experiences of how work-related mental illness in union members is handled. Further research on mental health within unions may benefit from interdisciplinary dialogues between sociological studies on activism and occupational mental health studies. A consequence of this theoretical shift is the reframing of union activism as a form of work, which can contribute to examining the organizational conditions of unions and their influence on unionists' mental health.

Ruptures in Conscience: The Distinctive Chapters of the Conscientious Objection Movement in Turkey

Merve Fidan[1], Sibel Bekiroğlu[2]

1Middle East Technical University, Turkiye; 2İzmir Katip Çelebi University, Turkiye

In Turkey, anti-militarist movements and demands for peace follow a historical and political course that is more easily articulated in certain periods and, in this sense, is dependent on public opinion. Although the foundation of conscientious objection dates back to long before the establishment of modern states, the relationship between the state and conscientious objectors turned into a significant problem in the period after military service became compulsory. In Turkey's case, the conscientious objection debate is particularly troubling due to the sacred role assigned to compulsory military service and the militaristic attitudes that have formed the bedrock of Turkey since its foundation. The focus of the research will be a discussion of the periods of intensified violence and dissent in Turkey and its relationship with the authoritarian regime. In this work, the statements of conscientious objectors who have declared their refusal through various media platforms and shared it with the publicly open in video or written texts will be used. By analyzing the statements of refusal through a critical discourse analysis from a historical perspective, the conscientious objection movement will be discussed in the context of historical ruptures and the changing political climate in Turkey.

RN25 | T03_01: Movement strategies in and through time

Conceptualising Strategy: Fields, Practices and Projectivity in Collective Action

Kevin Gillan, Luke Yates

University of Manchester, United Kingdom

Strategy is invoked centrally in theories of collective action describing how actors coordinate tactics, make and debate choices and most commonly as a qualifier, as in strategic action, protest or frames. Strategic action is, today, frequently explained via the fields or arenas in which it takes place (Fligstein and McAdam, 2012; Jasper, 2006). Despite the useful features of such theories, we argue that they leave 'the strategic' as something of a black box. Exploring 'the strategic' invites theoretical development in two directions. Firstly, inspired by theories of practice (Schatzki, 1996), we highlight the need to understand the ways in which the accessibility and persuasiveness of different strategic practices varies across different social spaces or fields. Strategizing is a key strategic practice in itself and an area in which existing knowledge is particularly limited. Practice theory helps explain the patterning of strategic choice in different socio-political environments without unduly diminishing attention to agency or viewing agency through narrow forms of rational calculation. Secondly, we draw on sociological accounts of the future to portray strategies as instances of projectivity (Mische, 2014). This enables the specification of the features of strategies that differentiate them from other social orientations to the future, such as utopias, predictions, dreams or fears. Bringing the concepts of practices and projectivity into theories of strategic action enables a theoretical specification of analytical dimensions of strategy, which we offer as a framework for the measurement and comparison of concrete strategies for social change. The framework highlights a number of empirically testable propositions that together might inform a reinvigorated agenda for research into collective strategies, strategizing and strategic action.

821

Temporal activist repertoires and the cases of 'Fridays for the Future', '16 Days of Activism against Gender-Based Violence', and 'Thursdays' Demonstrations'

Zorica Sirocic

University of Graz, Austria

This talk will present the basic components of the novel concept of 'temporal activist repertoires' (TAR), which is envisaged for the study of political aspects and uses of temporality. Building on the literatures on repertoires of contention on the one hand, and on time and temporality on the other, TAR are defined as the intentional and meaningful selection and use of temporal elements such as time frame, timing, tempo, duration, and temporality in the tactics and frames of collective action. In doing so, groups' draw on culturally resonant temporal references to interweave the symbolic and strategic choices while making their demands, organizing political action, and/or sustaining commitment to the political cause. To answer the question of how social movements use TAR and how these are positioned alongside other repertoires of contention, the talk will draw on empirical findings from the study of 'Fridays for the Future', '16 Days of Activism against Gender-Based Violence' and 'It's Thursday Again!' ('Thursdays' Demonstrations'). The talk will first present some of the findings, such as that the innovative potential of TAR is linked to the use of technologically advanced media tools for coordination, pressure, recruitment, mobilization and visibility. Second, the talk will open a discussion on the potential and limitations of TAR to travel and be applied to other examples of collective action.

Shifting Currents: An In-depth Examination of the Contemporary Landscape of the New Wave in Climate Activism

Anders Svensson

Scuola Normale Superiore, Italy

In 2018, a new and global wave of climate activism emerged. Within this wave, Extinction Rebellion (XR) played, and still plays, a key role. Through acts of civil disobedience and different forms of artivism, XR aimed to compel world leaders to acknowledge the severity of the issue of global warming, adhere to scientific recommendations, and establish a citizen's assembly on climate and ecological justice. In 2021, several new branches started to emerge from XR, signalling a desire for strategic change in climate activism. Groups like Insulate Britain, Just Stop Oil, and The Last Generation, collectively organized under the umbrella of the A22 network have since become a major force within this cycle of contention.

Based on data from in-depth interviews, and non-participant observations from XR chapters in Sweden and the Netherlands, and the Swedish A22 group Återställ Våtmarker, this paper explores the causes for strategic sedimentation and innovation within new climate movement groups. Employing the strategic interaction approach, it aims to untangle the dynamics of strategy within these groups by highlighting central mechanisms in the strategic processes. Specifically, it will delve into how different configurations of organization, and central pillars of mobilization such as trust in science and the non-political approach, have contributed to the sedimentation of strategy within these groups. Additionally, seeking explanations for strategic change, it will also analyze how changing political opportunities and continuously increasing emission curves and global temperatures have worked to influence new strategic paths.

"That's the Bet": Frames, Strategies and Theories of Change in Climate Justice Action

Lorenzo Zamponi

Scuola Normale Superiore, Italy

The explosion of youth climate protest since 2018 has sparked a renewed interest on the issue of climate-centred collective action. What has been happening in the last four years, with massive numbers of young people showing their concern and engagement with the issue of climate change in different venues, including the streets and squares of several countries around the world, has little precedent in history. Such a significant and widespread movement, of international characteristics, with a specific generational characterisation and a clear focus on the issue of climate change, represents an exceptional and exciting case for scholars interested in collective action. This movement was not born out of nothing; rather, it is rooted in a long trajectory of mobilisation. Research has been focusing for a long time on the emergence of the "climate justice" frame within this trajectory as a way out of post-political understanding of climate action. Furthermore, research has been pointing out internal tensions on the "radical" vs. "reformist" axis. Still, recent cases of climate action such as FFF, XR and A22 seem to call for a deeper analysis: while the climate justice framework is ubiquitous, internal tensions within the movement are far from over. This paper aims at addressing this issue focusing on the strategic choices of movement actors, and in particular on the ideational component of strategy, trying to shed light on the "theories of change", i.e. the meta-strategic visions/logics on which actors base their strategic choices, in the context of climate action. The paper draws on qualitative interviews of FFF, XR and A22 activists in Italy and on the analysis of social media material.

RN25 | T03_02: Feminist mobilizing

Resource Mobilization In The Argentinian Women's Movement

Dagmara Ilona Szczepańska

The Maria Grzegorzewska University, Warsaw, Poland, Poland

The activity and visibility of the Argentinian women's movement increased significantly since the emergence of the Ni Una Menos collective in 2015. Since then, the Argentinian society voiced its concerns through mass protests about different issues concerning gender discrimination, including femicide, sexual education, reproductive rights, economic rights and many more. Importantly, the Argentinian women's movement is an example of a successful social movement, as it led to the legalization of pregnancy termination in 2020. Moreover, the inclusivity of the movement could be observed, for example, in its incorporation of an intersectional approach to gender discrimination and a horizontal organizational structure.

In the present paper, I propose an analysis of factors contributing to the Argentinian women's movement's success by referring to resource mobilization theory. Specifically, the research question formed in this project was how women's organizations mobilized different types of resources (moral, cultural, socio-organizational, human, and material) to support the women's movement. Moreover, I also focused on the way specific resources were mobilized (self-production, aggregation, co-optation/appropriation, and patronage), also considering the type of organization in question (autonomous, associative, and directed). To answer these questions, I draw on results from ethnographic research conducted between 2015 and 2020 – ethnographic observations, 21 semi-structured interviews with leaders of 9 different women's organizations, 9 interviews with local informants, and an analysis of manifestos and statistical data about the situation of women in Argentina. By emphasising the role of women's organizations, the present findings offer a new perspective on the process of achieving social movements' goals.

Towards Intersectional Social Justice One Post at the Time. A Multisite Network Analysis of Feminist Mobilizations Across Europe

Elena Pavan[1], Aurora Perego[2], Conny Roggeband[3]

1University of Trento, Italy; 2University of Trento, Italy; 3University of Amsterdam, Netherlands

Over the last years, feminist mobilizations have taken back once again the streets and digital spaces in a wave of protest that speaks not only to the growing transnational opposition to gender and sexuality, but also to the increasing interconnectedness of multiple marginalizations and inequalities grounded in interlocking systems of discrimination. The extent to which feminist mobilisations act as a pivot for collectively fighting social injustice across fields through an intersectional perspective remains a crucial point of analysis and political concern. This paper contributes to ongoing reflections on the development of intersectional feminist solidarities within and across movement sites by looking at multiple types of networks that emerge from mobilization events and online conversations taking place in seven European countries (i.e., Belgium, Hungary, Italy, Poland, Spain, Sweden, and the UK). Starting from events promoted on Facebook by feminist actors in these seven countries in the period between 2021 and 2022 as well as from Twitter discussions on themes relevant to feminist agendas in this same period, we map three sets of networks: semantic networks that emerge from discussing different themes in mobilization events; socio-semantic networks linking multiple feminist and non-feminist organizations that co-organize on different themes; and online social networks discussing feminist issues within the broader public space. Our analysis uncovers similarities and differences in social and semantic (dis)connections reflecting, in a comparative fashion, on the structure and the contents that lay at the core and at the margins of intersectional feminist collective actions.

Symbols of feminist movements for abortion rights: Insights from Colombia and Poland

823

Carolina Mosquera Vera

University of Warsaw, Poland

This paper delves into the symbols, representations, and discourses shaping the feminist fight for abortion rights in Colombia and Poland, emphasizing the transnational dynamics of feminist mobilization. The study identifies shared symbols, such as the green scarf associated with Latin America, and discourses related to abortion decriminalization. It seeks to unravel how these symbols transcend borders, acquire new meanings, and contribute to the creation of common spaces of significance across diverse collectives.

Examining the Latin American context, where movements in countries like Colombia, Chile, Argentina, and México have spearheaded the struggle for reproductive rights, the study highlights the solidarity of feminist activism beyond linguistic and geographical boundaries. Similarly, in Poland, the feminist movement gained prominence in 2016 and 2020 through massive demonstrations marked by symbols such as dressing in black, incorporating asterisks as a critique of the conservative Law and Justice party (PIS), and adopting the lightning bolt as a symbol demanding the decriminalization of abortion. In recent protests (Manifas), this symbol has started to be used with the green scarf, influenced by Latin American countries.

The study employs a mixed-methods approach, incorporating critical discourse analysis and social media mapping. This research aims to contribute to gender studies

by revealing how symbols and performative expressions strengthen feminist mobilization and shape collective identities in transnational contexts.

Gendered Forms of Nonviolent Resistance in Israel's Pro-Democracy Protests : How Women's Movements Creatively Engage in Intersectional Activism

Liv Halperin[1], Veronica Lion[2]

1Hebrew University, Israel; 2Bar-Ilan University, Israel

Triggered by the planned judicial overhaul of the current (far) right-wing government, a massive nonviolent protest movement emerged in December 2022 to fight for Israel's democracy and repair the broken trust between the state and its citizens. Women's groups seeking social transformation have reached unprecedented visibility in light of their creative practices and embodied performances, most notably through the performative adaptation of the dystopian "Handmaid's" imagery. Through a variety of practices, they managed to highlight the government's explicit attack on women's rights. Women in Israel have historically both participated in social activism and developed their own, women-led/-only practices, thereby often finding a way to voice their interests while mostly being sidelined from official decision-making processes and leadership positions. Our research comparatively investigates gendered, embodied, intersectional and symbolic expressions of resistance of five women's groups, namely Building an alternative [Bonot alternativa], Mothers On Guard [Imahot al hamishmar], Breaking Walls [Shovrot kirot], Mothers Against Violence [Imahot neged alimut] — as well as the peace movement Women Wage Peace [Nashim osot shalom]. The paper draws on qualitative methodologies, namely feminist ethnographic research (in person and digital) and interviews conducted from January to October 2023. It answers current calls in social movement research for more nuanced intersectional analyses and contributes to countering a "gender bias" in the study of nonviolent resistance and social movements. Our paper also highlights various creative practices of nonviolent resistance used by women's groups within the complex power structures of a democracy in decline and a society riddled with tensions.

RN25 | T04_01: Activism and digital technologies

The New Era of Hacktivism: Blurring the Line between Online Activism and Cyberwarfare

Jared Matthew Wright

TED University, Turkiye

In the social movement literature, scholars have conceptually delineated "hacktivism" from "cyberterrorism" or "cyberwarfare." The former is typified by acts of computer hacking which temporarily disrupt digital infrastructure without causing permanent damage (such as a DDoS attack on a website), while the latter involve computer hacking which causes real damage to physical infrastructure or people (like causing a city's power grid to fail). Historically, hacktivism has typically involved non-violent symbolic acts of protest, which some activists claim are analogous to traditional forms of civil disobedience. But since the Russian invasion of Ukraine in February 2022, there has been an unprecedented rise in both hacktivism and cyberwarfare in this conflict, not only digitally disrupting institutional infrastructures, but also sabotaging physical ones. Ukraine's besieged government has called upon volunteer hacktivists worldwide to join them in what might be thought of as the first ever crowdsourced cyberwar. This spells a new era in which the line between cyberwarfare and online activism, digital violence and non-violence, is becoming dangerously blurred. Through a historical analysis mapping the development and trajectory of hacktivism as a sociopolitical phenomenon, this study identifies four major phases: (1) Emergence, (2) Popularization, (3) Cooptation, and (4) Evolution. While previous studies have discussed the first two phases, this study identifies the latter two illustrated by examples from cutting-edge cybersecurity research. These stages represent a significant shift in the tactics of state power with major implications for the future of online activism. This paper seeks to bring attention to this social change and its implications for society.

824

Mapping The Discursive Landscape Of Data Activism: Articulations And Actors In An Emerging Movement

Agnes Liminga, Simon Lindgren

Umeå university, Sweden

In recent years, civil society is becoming more engaged in addressing the social and political implications of datafication.This article aims to examine the discourse surrounding data activism. Using a combination of methods, we analyse how new forms of civil society action related to data justice express their goals and ideas in relation to other types of activism, political conflicts, and political problems. We also identify different kinds of social actors involved in these

articulations. Our analysis reveals a difference between bottom-up and top-down approaches in the discourse on data activism. The former involves grassroots actors, such as community organizations and individual citizens, who challenge existing power structures and advocate for social change. The latter, on the other hand, is practised by academics, capitalists, and policymakers who already hold positions of power and influence. This asymmetry aligns with previous in this field. We encourage future research to further explore this typology and expand on it through additional methods and case studies. This will contribute to a more nuanced understanding of data activism within the context of civil society.

Challenges and Opportunities of Transnational Anti-Corruption Activism: Insights from I Paid a Bribe and its (Attempted) Diffusion Across Countries.

Alessandra Lo Piccolo, Alice Mattoni

University of Bologna (Italy), Italy

In 2010, the Indian NGO Janaagraha launched the crowdsourced anti-corruption platform 'I Paid a Bribe' (IPAB), which allows citizens to anonymously report cases of bribery. Hailed as a successful innovation in the global fight against corruption, IPAB attracted significant international attention and was replicated worldwide, with 14 official members and 14 potential partners, and inspired the launch of several unaffiliated initiatives. A heterogeneous network of NGOs, social movement organisations, and concerned citizens had thus mobilised around this Anti-Corruption Technology (ACT) to expose corruption from below. However, many national IPAB chapters were closed within a few years, while potential partners often failed to implement their platform. IPAB is, therefore, a relevant case study for understanding the dynamics of transnational anti-corruption activism and, within this framework, the diffusion of grassroots ACTs from one national context to another. The paper draws on qualitative interviews with initiators, early adopters, late adopters, non-adopters, and secondary data. The resulting dataset is analysed using inductive thematic analysis to describe how IPAB has (or has not) diffused across countries and to explain why diffusion has (or has not) occurred in the way it has around the world. The analysis highlights the exogenous and endogenous factors that helped or hindered the diffusion of IPAB and its transnationalisation, discusses the sustainability challenges facing anti-corruption activism at the transnational level, and calls for a situated approach to the study of the diffusion of ACTs. In doing so, the paper enriches discussions on ACT diffusion by examining the divergent outcomes of IPAB at the transnational level and then advances the understanding of the transnational diffusion of activist initiatives by moving beyond binary categorisations of success/failure.

RN25 | T04_02: Repression and resistance

Becoming Politically Aware: Involvement and Disengagement in Rioting

Alba Arenales Lope

Universitat Oberta de Catalunya, Spain

In the intersection of social movement studies and political violence, research has aimed to understand the involvement in collective action by activists within their life trajectories. The Northern Irish case has notably captured attention of researchers interested in understanding the paths leading to involvement in armed organisations. Yet, little is known about the processes of involvement in forms of action that although high-risk may not necessarily entail membership in armed groups. Drawing on 19 in-depth biographical interviews with rioters, in this paper, I explore the process of engagement in and disengagement from riots as part of the provisional republican cause during the period known as 'the troubles' in Northern Ireland. Embedded in a context where violence was part of the quotidian, rioting very often took place during the formative years of participants. Consequently, rather than being the outcome of a long trajectory, their involvement in riots was one of the first contentious political actions participants employed, which had an impact in their later political involvement and dispositions. The argument I will present is that the frequent practice of rioting allowed rioters to become 'good players' (Bourdieu, 1990), developing a remarkable dexterity in the use of this form of action, an ability that helped a very quick and effective organisation of riots.

The Role of Memories in Individual Responses to Police Violence: an Exploration of the 'Chile Woke Up' Movement

Lidia Angelina Yañez Lagos

university of manchester, United Kingdom

Repression is a crucial factor in understanding cycles of collective action and barriers to participation in protests of excluded groups. However, its impact on social movements continues to be disputed in the literature, since there is no agreement on how repressive episodes affect protests by increasing or decreasing their intensity. As has been recently discussed, the different individual responses to repression and the tactics carried out by protesters to confront police violence could be an important piece in solving this puzzle. From a perspective that emphasises the realities of the 'global south', this research proposes that memories of past struggles are a crucial dimension of social movements that influence responses to repression. Specifically,

this study seeks to address this gap by exploring the case of the "Chile woke up" movement, which emerged in 2019 and radicalised in a context of brutal repression and human rights violations. Considering all, this particular paper develops a novel theoretical model to address the impacts of two types of memory – communicative and cultural – on the responses to repression of three agents – dominant class, organisations and families, individuals-. It also presents a preliminary exploration of the qualitative results of the study based on interviews with participants of this movement.

Religious Figures and Lawyers as Brokers, Mediators, and Shock Absorbers in the Contemporary Social Movements in South Korea.

Doohyeong Lee

Université Lumière Lyon 2, France

How do social movements expand? How can the violent atmosphere and intense tension between police and demonstrators be alleviated during social movements? A social movement is a moment of collective interaction between various actors (Favre, 1990). For example, "brokers" link between different groups and disseminate social movements (Tilly and Tarrow, 2015). In the space of social movements (Mathieu, 2012) in South Korea, religious figures and lawyers particularly play the role of brokers in social movements due to their special status as priests and sages.

They serve not only as brokers, but also as shock absorbers and mediators during social movements. Religious figures play the role of the "last resort" to protect the movements, relying on the sanctity of religion, while lawyers leverage their legal expertise to limit the use of violence by the authorities.

By examining the roles of the clergy and lawyers, we can better understand the roles of the different actors involved in a social movement and the interactions between them. This serves as a reminder that social movements need to be considered from multiple perspectives.

For this purpose, based on about twenty semi-structured interviews with activists, clerics, and lawyers, as well as an analysis of documentary materials, this presentation focuses on two social movements related to the sinking of the Sewol ferry in 2014, and the Halloween crowd crush in Itaewon in 2022.

Changing the Debate? The NoG20 Protests in Hamburg and their Effect(s) on Parliamentary Debates About Police Reform

Dorte Fischer

University of Trento, Italy

Scholars have connected particular policy reforms to instances of collective action by drawing on concepts such as "focusing" or "transformative" events. Although these studies often argue that such events establish new parameters for action, they rarely specify why certain opportunities result in policy action, whereas others do not. This article demonstrates how a framing approach may help to bridge this gap by assessing whether and how opportunities for policy change are—or are not—perceived as such. By means of a frame and discourse analysis, it examines the evolution of parliamentary debate on a police reform that was introduced after the NoG20 protests 2017 in Hamburg. It compares core diagnostic, motivational, and prognostic frames deployed in debates in 2008, 2014, and 2018. In so doing, the paper demonstrates how the framing of this debate changed after the NoG20 protests, and how the protests were made sense of in ways that allowed seizing them discursively as an opportunity to both rationalize the policy change and challenge its ethical appropriateness. In particular, opponents of police reform successfully deployed a framing to constrain the debates. The results are discussed as a shift in "discursive opportunity structure", supported by a change in "feeling rules". The study demonstrates how focusing events may a) be used to direct attention to a variety of problems, rather than automatically focusing policymakers' attention on a single problem, b) both enable and constrain policy debates, and as such, c) both open and preclude opportunities for change. It contributes to a better understanding of the various ways in which focusing events may impact policy processes, if the event allows for multiple, potentially conflicting interpretations.

RN25 | T04_03: Gender in movements

From Fathers' Rights to Seahorse Dads: Five Shades of Fatherhood Activism in Europe

Katarzyna Wojnicka

University of Gothenburg, Sweden

Fatherhood activism is a type of social mobilization where collective identity is focused around (differently defined) father figures and plays an important role in creating politics and discourses on men, masculinities, fatherhood, and gender (in)equality. Despite its gradual growth, the father-oriented networks, NGOs, and informal groups are still underresearched, which results in a superficial understanding of this type of mobilization, usually limiting it to the antifeminist activism aimed at fighting for custody rights. Hence, my paper aims to present the variety of fatherhood activism that has been identified in contemporary Europe. Out of a larger data corpus consisting of a pan-European survey, individual interviews with 70+ activists from Germany, Poland, Spain, Sweden, and the UK, and focus group interviews with transnational actors, I present five cases that offer insight into diverse forms of goals, ideologies, grievances, and forms of activism that have been identified among European actors. The study is informed by theories developed within critical studies on men and masculinities and social movements scholarship.

Between Tradition and Reaction: Redpill Realities and Evolving Narratives in the Italian Manosphere

Mauro Giordano

University of Amsterdam, Netherlands, The

Recent years have seen substantial advancements in the study of the "Manosphere" across media studies, gender studies, and social psychology. This research advocates in-tegrating social movement theory and social phenomenology into Manosphere-related studies, responding to Ging and Murphy's (2021) call for a nuanced understanding of its dynamics, genealogy, and the production and diffusion of knowledge. The paper address-es these aspects through an empirical case study focused on the Italian Manosphere, par-ticularly exploring Incels (Involuntary Celibates) and Redpill blogging. Drawing from a year-long netnographic fieldwork in their major hubs, it presents the first timeline and internal morphology study of the Italian Manosphere. The analysis scrutinizes the Redpill community as a countermovement rooted in sentiments of aggrieved entitlement and relative deprivation. This examination observes how Redpill frames bestow empirical credibility upon the experiences of men aligned with conservative perspectives against gender equality movements. Traditional patriarchal norms act as foundational assump-tions, gaining prominence amid mounting challenges coming from gender equality movements. This approach helps understand how Redpill's frames lend empirical credi-bility, consistency, and experiential commensurability to the experiences of men suscep-tible to conservative views against gender equality movements and critiques of the patri-archal system. Through a genealogical approach, the article traces the diffusion of Redpill norms in the pre-existing Italian "brutti" (ugly) community. The resultant constant rene-gotiation within the broader Italian anti-feminist conservatism creates frames conducive to more institutional reactionary effectiveness, and the continual discursive re-evaluation calls for a shift from the singular 'Manosphere' to plural 'Mano-spheres', influenced by ge-ographic, linguistic, cultural criteria, and internal structuring.

"When Women Take the Lead: Exploring the Intersection Between Gender Equality and Women's Environmental Political Engagement from a Comparative Perspective"

Summer Isaacson

University of Konstanz, Germany

827

Research on gender differences in environmental behav-ior has long claimed that women engage less than men in environmental political participation (EPP) (protests, peti-tions), despite their higher levels of environmental concern and vulnerability. Using recent data from the ISSP's 2020 Environment module including 28 countries around the world, we revisit the gender gap in EPP. Firstly, we ask: Are there consistent gender differences across different forms of environmental political participation? By creating a ty-pology which distinguishes individual from collective, and non-confrontational from confrontational engagement forms, this study offers an encompassing understanding of gendered patterns of participation. Secondly, we ask: Does a country's level of gender equality matter more for wom-en's environmental political participation than for men's? Arguing that increasing gender equality and socio-econom-ic development can create gendered opportunity structures which allow women to voice their environmental grievanc-es, we use multi-level models with random slopes for gen-der to examine the effects of macro-level gender equality on gender differences in environmental protests, petitions, and boycotts. In line with our hypotheses informed by gen-der socialization theory, our results show that women do participate more than men, but mainly in more individual and non-confrontational EPP forms (boycotts, petitions), and are on par with men in collective and confrontational forms (protests) – with substantial variation across coun-tries. Moreover, considering how women have historically been restrained from participating in politics, we argue that structural gender inequality remains an important limita-tion to women's engagement. Cross-level interactions indi-cate that in more egalitarian countries, women are indeed more likely to engage in several types of EPP than men. The study contributes to the literature by showcasing new

angles and findings on gender differences in EPP, in particular highlighting the impact of structural gender inequality on women's participation.

A Contentious Convention: Frames and Actor Constellations around the Istanbul Convention in Turkey and Croatia

Ivan Tranfić, Damla Keşkekci, Batuhan Eren

Scuola Normale Superiore, Italy

The Council of Europe Convention on preventing and combatting violence against women and domestic violence, also known as the Istanbul Convention (IC), has become an object of contention in recent years. The Convention was highly politicized, even in countries with vastly different contexts, with various religious and political actors mobilizing in its opposition, while using similar discourses. How did similar patterns of opposition to the Istanbul Convention emerge in Turkey and Croatia, despite different actor constellations and highly dissimilar political contexts? To answer this question, we first use Contentious Episode Analysis to investigate the variation in the strategies and action sequences performed by supporters, challengers, and third parties, as actors engaged in contention. We also qualitatively analyze their discourses, focusing on exclusionary frames (i.e., opposing "gender ideology", advocating heteronormative family values), thus investigating (dis)similar patterns of discourses and actions. Our original dataset consists of articles mentioning the "Istanbul Convention", sampled from daily national newspapers, namely Sözcü and Sabah for Turkey (N=~400), and Večernji list and Jutarnji list (N=~420) for Croatia. Hence, by using an innovative interactional approach, we capture the complexity of (dis)similar radical right actor constellations, strategies, and discursive patterns in Croatia and Turkey, used in opposition to the IC. Consequently, we aim to contribute to a deeper understanding of the illiberal turn, focusing on backsliding on gender equality, anti-gender mobilization, and violence against women.

RN25 | T05_01: Analytical and methodological innovation in social movement studies

Navigating the Protest Data Archipelago: Digital archives, Datasets and Collections

Maciej Kowalewski[1], Jennifer Ramme[2]

1University of Szczecin, Poland; 2European University Viadrina, Germany

Contemporary protest activities are being meticulously documented, collected, and disseminated on an unprecedented scale (Canella 2017, d'Urbano 2020). Archives, collections, data sets, and text repositories employ a diverse array of forms (centralized and crowd-based, digital, and paper-based), procedures (methods and regulations), and operating actors (both institutional and non-institutional). We refer to those theoretical approaches in which archiving is a form of political activism (Fleming 2018; Zamponi et al. 2018; Wallace et al. 2020, Hoyer, Almeida 2021), with a significant role in shaping a claims agenda, defining radicalism, and establishing criteria for truthfulness and authenticity.

Our presentation aims to provide an overview of the state-of-the-art research on protest data landscape and present as well as an analysis of the uses, purposes, and challenges associated with self-archiving and sharing protest data. We argue that currently we are experiencing "too much data" and therefore raise questions about the possible consequences of protest information overload. Drawing amongst other on initial research from our project on activism and knowledge production, we will discuss how this overload is potentially transforming both archival practices and access to protest data.

Collective Actions' Dynamics Of Social Change: A Processual Perspective

Lorenzo Bosi[1], Katrin Uba[2]

1Scuola Normale Superiore, Italy; 2Uppsala University, Sweden

Debates on how and when collective action shapes social change have progressively taken a processual turn over the last decades. Processual approaches do not aim to test hypotheses or seek decisive external and internal factors, nor do they search for single grand theories. Instead, they aim to provide plausible analytical explanations of how the interactions of multiple actors shift, unfold and change over time, producing particular outcomes or patterns of transformation. This analytical move entails a process tracing

backwards from the diverse outcomes under investigation (e.g., a policy change) and reconstructing sequences of interactions between different collective actors over time in a different context. It also involves investigating how collective actors change in this process. Building on our previous empirical studies in diverse empirical contexts and regarding different forms of collective action, this chapter aims to describe and trace sequences that explain variation in how and when collective actors shape social change. Following these trajectories allows us to show how the processual perspective improves our understanding of collective action's role in social change and propose future avenues for new empirical studies, allowing scholars to ask questions they might not otherwise ask.

Bridging the Gap: Exploring the Moral Dimensions of Prolife Feminism in the Irish Prolife Movement

Ann Maria Burke

South East Technological University, Ireland, Ireland

This paper utilises Boltanski and Thévenot's pragmatic sociology's justifications model to reorient social movement theory towards a focus on moral justifications and actions and contributes to the emerging discussion on the insufficient attention given to morality in movements, having been considered only fragmentally since its marginalisation and then in sometimes abstract and ad hoc ways albeit with a couple of notable exceptions. The proposed model facilitates an opportunity to critically evaluate theoretical assumptions within social movement studies and critical sociology.

Foregrounding the critical capacities of actors themselves and taking critiques at face value as opposed to critical sociology which sees actors as unreflexive 'cultural dopes', ensnared in historically reproduced structures of domination, pragmatic sociology's justifications model offers an innovative methodological tool which allows for a departure from understanding movements such as the prolife movement in terms of countermovement dynamics and locates such sociological objects as analytical in their own right.

The study that informs this paper involved in-depth qualitative interviews with self-identified prolife feminists in Ireland coupled with a justificatory analysis of prolife movement media content. Justifications analysis expands approaches to content analysis and frame analysis in response to the neglect of 'the moral dimension of public deliberation' and political claims in the public sphere and the relational dynamics originally associated with framing theory.

The study analysed the broad meanings of ethics, care, and justice generated by those who challenge what it means to be feminist.

RN25 | T05_02: Environmental protest strategies and experiences

A Legal Turn In The Swedish Climate Movement

Lotte Schack

University of Gothenburg, Sweden

In recent years, an increasing number of climate activists across the world have sued states, municipalities, oil companies, and other fossil industry actors – and an increasing number have won. Nevertheless, lawsuits are but one of multiple ways climate activists use legal means to fight for climate justice. In this paper, I examine how Swedish climate movement actors make use of these means. Based on ethnographic fieldwork, I primarily look at three examples: 1) the case of Auroramålet, a group of young activists suing the Swedish state, 2) the Fossil Fuel Non-Proliferation Treaty campaign and 3) the legal aftermaths of climate direct actions. Though different in both their tactics and intended outcomes, I argue that these can be interpreted as turns towards legal means among climate activists. I show the ways in which activists make use of the legal system and connect these to their theories of change. While I show the possibilities of these strategies, I also show the limitations of relying on existing modes of juridical justice and representative democracy for climate activism, drawing on Vergara's concept of 'systemic corruption'. However, with Fraser's notion of 'abnormal justice', I discuss alternative forms of addressing justice claims and consider in what ways the sketched examples challenge and expand existing conceptions of justice.

829

Between Legitimacy And Effectiveness: A Comparative Analysis Of Antispeciesist Movements In France And Quebec

Nolwenn Veillard

Université de Rennes, France

This paper is part of a political science research project on the anti-speciesist movement in France and Quebec. This movement, which rejects the domination of animals by humans, has legitimacy issues and struggles to find its place in the "space of social movements" (Mathieu, 2007). Indeed, it is not recognized as a fully legitimate movement, which leads actors to engage in "strategic legitimization" (Dubreuil, 2013). From this perspective, the movement has followed various, sometimes contradictory, inflections aimed at better inserting antispeciesism into the vein of these legitimate struggles. Actors and organizations are indeed trying to achieve this, while optimizing the outcome of their mobilization (which aims to undo all forms of animal

exploitation). So, what strategies has this struggle for legitimacy devised to succeed in imposing the animal question on public debate? And what difficulties does it face?

Using the case studies of the French and Quebec antispecies movements as a starting point, we will examine the strategies that actors and organizations can employ to achieve effective results. To answer these questions, the paper will draw on material gathered as part of an ethnographic survey carried out in France and Quebec, as well as on a corpus of around 100 interviews conducted with movement actors.

Online And Offline Activism As A Mutually Reinforcing Process – A Case Study Of The Hungarian Fridays For Future Movement

Orsolya Kovács-Magosi[1], Anna Vancsó[2]

1Corvinus University of Budapest, Hungary; 2Eötvös Loránd University, Hungary

In the last decade, several studies were conducted concerning the relationship between online and offline activism, which was intensified by the outbreak of COVID-19, when, due to the global lockdowns, mass demonstrations organized by environmental movements were forced to take online form. Nowadays, social movements can mobilize people and create a unique self-representation online using social media, which requires specific knowledge and skills. In our research conducted among the members of the Hungarian Fridays for Future movement for three years, we aimed to describe these skills gained through online activism. We focused on mapping the connection between offline and online activism using various qualitative methods such as participant observation, interviews, focus groups, and digital ethnography. In order to get a clear image, we put heavy emphasis on the Hungarian context, namely the structure of the public sphere, the politicization of environmental issues, and the general approach toward activism and social movements. Our results show a mutually reinforcing process between online and offline activism in which numerous learned skills exist in parallel, in the frontstage and the backstage. The most essential skills are building the image of a strong online and offline community with explicit values and objectives as the most effective way of attracting youth to be activists, and skills to keep boundaries between personal life and activism similarly to adult experiences of keeping work-life balance.

RN25 | T06_01: Far-right and anti-immigrant mobilization

Far-Right Contentious Politics in Hostile Environments: a Local Comparative Perspective

Davide Rocchetti

University of Trento, Italy

In recent years, besides an eye-catching rise in electoral support, the upsurge of the far right has also materialized in an increasing and enduring activity in contentious politics. Yet, how this contention is articulated in the streets and how it is affected by contextual factors is still largely overlooked, especially in regions historically hostile to nativist claims.

By joining the literature on contentious politics with that on the far right, the paper aims to address these concerns with a comparative and longitudinal investigation of local dynamics of mobilization supporting far-right politics. While previous studies have mostly focused on protests promoted by pre-selected actors, the paper innovatively integrates this predominant actor-centered perspective with an issue-related one. The aim is to better catch the blurring and dynamic nature of the far right.

To do so, the empirical study examines contentious events that happened in two southern European regions: Andalusia in Spain and Emilia-Romagna in Italy. They share a leftist electoral tradition and a recent rise of radical right-wing parties, although with different magnitudes. Following the PEA approach, data was collected through quality local newspapers. The original dataset covers 546 contentious events from 2015 up to 2022.

The investigation follows a twofold direction. Firstly, it explores event-specific characteristics, such as the actors partaking in this far-right mobilization, the issues raised, and the tactics adopted. Then, it shows how the contention is affected by different electoral and societal contexts.

'Us' Vs 'The Others': Discursive Events, Collective Identities, And Far-Right Mobilisation

Anja Schmidt-Kleinert

Bielefeld University, Germany

The broad and successful mobilisation of protesters by, or in cooperation with, far-right actors in Chemnitz, Germany (2018) and to Querdenken demonstrations during the Covid-19 pandemic and beyond (2020 ongoing) was largely achieved by addressing the supporters as "us" vs. "the others". At first glance, extreme right-wing organizers have used familiar enemy constructions – refugees, Muslims, and groups identified as political opponents – for mobilisation. However, a closer analysis shows that the enemy

830

images used are hierarchically organised via conspiracy myths against "us", or, 'the people', and point to a deeply antisemitic core, rooted in a collectively shared knowledge. In both case studies, the application of enemy images has culminated in questioning 'the system'. Simultaneously, collective actors make references to various symbols of (peaceful) collective resistance and national symbols to create a collective identity of the participants. Applying a discourse approach to the material, I analyzed online communication in public groups on Facebook, the actors' main public, i.e., open, social network. I will present empirical results from a comparative analysis of the two case studies of 'Chemnitz' and 'Querdenken' about how collective identities have been created in both social movements, and which adaptations and updates made by far-right actors can be traced from one discursive event to another.

Mapping Far-Right Contention Within Civil Society

Christin Jänicke, Hans Jonas Gunzelmann

Berlin Social Science Center, Germany

In recent years, the far right has expanded its structures and activities not only within political institutions but also in civil societies across Europe. However, existing research on far-right contention has focused primarily on protest behavior and neglected the associational side of civil society. Civil society research, on the other hand, has tended to ignore its dark side and focus on positive examples of civic action. This is surprising given that far-right actors and issues frequently challenge individual volunteers, civil society organizations, and entire fields of civic action. Our paper addresses the blind spots in these literatures by theorizing and mapping far-right contention within civil society. We build on the contentious-politics paradigm in social movement studies to conceptualize far-right contention as episodic actions that emanate from far-right actors and/ or make far-right claims and thereby break the routines of civil society fields, actors, or their members. We develop a mixed-methods approach combining expert interviews with qualitative and quantitative content analyses of far-right media, newspaper reports, and watchdog documents. We apply this method to map far-right contention in Germany from 2018-2023. Our analysis demonstrates how far-right actors and claims politicize various civil society fields.

The Diversification Of Contentious Performances In Anti-Migrant Violence

Måns Lundstedt, Anton Törnberg, Mattias Wahlström

University of Gothenburg, Sweden

This paper investigates how changes in the composition of movement actors and repertoires of action interplay during a period of shifting political and discursive contexts. To capture this, we study the diversification over time of anti-migrant violence in Sweden. By applying the concept of contentious performances to a continuous dataset of violent attacks in Sweden from 2007 to 2017, we argue that the ongoing mainstreaming of far-right politics, and specifically the heightened focus on migration issues around 2015, led to the emergence of a new and recurring mode of violence. Prior to this period, the typical incidents involved small – to medium-sized groups of youths openly confronting individual migrants and inhabited properties, engaging in minor acts of property damage and assault. Around 2015, this pattern was supplemented by a dramatic rise of actions in which individuals or small groups employed highly destructive violence against uninhabited properties, often without prior warning or subsequent claims of responsibility. These actors appear to be generally older than those engaged in larger scale but less severe violence. A provisional comparison of the local contexts surrounding both types of violence reveals that the highly destructive small-group violence is more commonly linked to preceding local nonviolent protest campaigns against migration. In contrast, the larger scale, yet less severe, violence appears to stem from group dynamics within subcultural settings.

RN25 | T06_02: Movements and their trajectories

The Role of Background, Education, and Value Orientations in Affinity for Fridays for Future and Black Lives Matter: A Study among Italian Secondary School Students

Alessandro Bozzetti

University of Bologna, Italy

Today's younger generations are characterized by particularly fluid forms of engagement: environmental issues and the fight against structural forms of racism are two of the issues that can mobilize them more than others. Based on the results of a survey sent to secondary school students in Italy, which yielded 12,658 responses, the contribution proposes to examine the dimension of proximity to an environmental movement (Fridays for Future) and to a movement against racism (Black Lives Matter) on the basis of students' socio-educational background, considered a possible predictor of youth activism. If the forms of student activism depend on the capital that young people have, what role do educational institutions play in encouraging or discouraging them? Given the heterogeneity of youth, the paper asks whether belonging to a lower social class and having followed a short-term educational path (such as vocational training) can be a barrier to youth activism, or whether, on the contrary, mass access to secondary education has blurred these possible differences. The question of how social class and educational background – but also gender, origin and values – structure youth engagement is relevant to defining the ways in which this engagement is articulated and the dimensions it addresses. To what extent do these variables influence their engagement? What is the impact of students' immigrant backgrounds, given that one of the movements analyzed is characterized by the defense of minority rights? And again, how widespread and interrelated are the affinities with these different movements?

Network Alliances between Fridays for Future local groups in Italy: an homophily mechanism investigation

Alice Ferro

Scuola Normale Superiore, Italy

Between November 2018 and March 2019, different local groups had been created to coordinate the local protest events of the Fridays for Future mobilization in Italy. A peculiarity characterizes this diffusion process: the organization of two National Assemblies. No other country saw such an effort to formalize a national coordination level. The paper aims at investigating the interplay of alliance and ideological congruence adopting a relational approach to the study of collective action, and a mixed-method research design. I hypothesize that the alliance construction process has been influenced by the collective action frames through the activation of an homophily mechanism. The data were gathered combining the survey instrument for the relational data and the participant observation technique to observe the "speech-in-action". Through the implementation of social selection exponential random graph models, the effect of the collective action frames (nodal attributes) on the alliance network (social structure) have been tested. It emerged that on average FFF local groups have a propensity to build alliance ties with nodes adopting their same CAF. The reformist-rejectionist line of division reported that rejectionist type of FFF local groups appeared to have more chances to build ties with similar others than reformist. This evidence can be interpreted as an increased polarization among FFF local groups which has been also observed in the solutions elaborated. The reformist FFF local groups, in general, proposed a set of demands regarding the ecological transition, while the rejectionist FFF local groups proposed the adoption of radical tactics and of an anticapitalistic ideological position.

Constructing Collective Action For Digital Rights In Europe: Addressing The Relevance Of Events In Collective Action Processes

832

Pietro Casari

Scuola Normale Superiore, Italy

Over the years, the study of events has acquired considerable relevance in sociological investigation, as well as, more specifically, in the study of collective action and social movements.

The political process tradition, introducing the protest event analysis method, has given greater importance to the temporal dimension of these phenomena, using events as the main unit of analysis. Often, however, it underestimated – or omitted altogether – the relational dimension underlying these phenomena, preferring an explanation based on an aggregative perspective. More recently, stronger emphasis has been placed on so-called 'critical events', adapting eventful temporality theory to the field of social movement studies. Although this perspective has shed light on fundamental issues, it excluded from the picture all those social situations of which collective action is composed and is organized around, especially in the latency phases that are argued to characterize it. Following the footsteps of the Networks and Social Movements research programme, this study is aimed at discussing these gaps and contributing to the field by widening the perspective on the relevance of time and events for collective action. In particular, the main questions it proposes to investigate are: how do co-participation at and co-organization of events contribute to processes of collective actor construction? How do interpretation of critical events by social actors influence such processes? To empirically address these questions, I investigate the development of the digital rights field in Europe

within the last two decades, selecting the trajectory of the European Digital Rights (EDRi) Network as case study.

Patterns of Diversification and Institutionalisation: The Development of the Swedish Climate Movement 2018-2023

Magnus Wennerhag

Södertörn University, Sweden

When Greta Thunberg's climate strikes spread globally in 2018 and contributed to the revival of the climate movement, Sweden became strongly associated with climate activism. This new wave of climate activism was rapidly associated with school students demanding politicians to follow climate scientists' recommendations, recurring global mass demonstrations, and an increased use of civil disobedience in the climate movement. Six years later, the momentum of the climate movement seems to have waned; partly due to the restrictions of the COVID-19 pandemic, but also due to changes within the movement in terms of strategies, forms of protest, and organisational forms. This paper traces the development of the Swedish climate movement from 2018 to 2023, to examine how the composition and activities of the movement have changed over a protest cycle. Different types of data are analysed to shed light on the movement's activities, participants and organisations in Sweden. First, protest event data is used to show how the movement's protests have evolved over time, in terms of intensity, claims and geographical diffusion. Second, we use protest survey data (from 2019 and 2023) to investigate how the socio-demographic characteristics and organisational affiliations of the movement's individual participants has evolved over time. Third, an organisational survey is used to describe the organisations within the movement, their centrality and organisational strength, as well as how their interrelationships and contacts have evolved. The preliminary results suggest, among other things, a simultaneous diversification and institutionalisation of the movement, its participants and organisations.

RN25 | T07_01: Social movements, volunteering, and civil society

Who Gets to Care?: Relational Possibilities and Neoliberal Captures in Pro-Migrant Community Organisations

Oyku Hazal Tural

University of Edinburgh, United Kingdom

As numbers of organisations providing life-saving care and support for the displaced groups grow in the Global North, focusing on good intentions often obscures racialised/gendered hierarchies experienced by those who are at the receiving end of care. Drawing on data gathered through participant observations in 2 of the major community organisations supporting asylum-seeking and refugee (ASR) groups in Glasgow which is the largest migrant resettlement site in the UK, and in-depth interviews with administrators, service users and volunteers of those organisations, the analysis contrasts different visions of "community" these organisations hold to interrogate relational impacts of organisational decisions around who gets to care, when, how and linked practices of representation. It illuminates volunteering as a key site for ASR to reclaim dignity and a social place against the idleness, "unworthiness", or "dangerousness" inflicted upon them through the hostile administration of the policy, and focuses on questions of subject and subjectivity to address shifting positions of the subject and the object of care through the advancement of corporate volunteering schemes in one of the organisations at focus. This paper's contribution is to discuss the possibility of and raise the political thinking around embodied relationality that spaces of care might enable, yet often remain constrained in the face of the neoliberal pressures that increasingly characterise care work with the displaced.

Beyond Choice? Civil Society Actors Making Sense Of The Structural Conditions Of (In)Voluntary Work

Sophie Kolmodin[1,2], Linda Kvarnlöf[1,2]

1Mid Sweden University, Sweden; 2Risk – and Crisis Research Center (RCR)

The significance of civil society and social movements has long been recognized in crisis and disaster research (Solnit, 2010), where voluntarism has been described as filling a void when official resources are scarce. While volunteers often frame their actions as a "way of living", exclusively emphasizing positive aspects neglects the complexities surrounding voluntary work within civil society. To emphasize the complexity surrounding voluntary work in crisis,

this article analyses how civil society actors make sense of spatial-political structures to motivate their"choice" to perform voluntary work and engage in collective action.

Constructing a theoretical concept of involuntary work, we argue that we need to view volunteerism in both voluntary and involuntary terms and as a result of structural conditions such as financial cuts in official service, changing political ideology, and the changed organizing of society. Drawing on 53 semi-structured interviews with individuals active in Swedish civil society, both affiliated and unaffiliated with Civil Society Organizations, from rural and urban areas and who have been active in refugee support or voluntary work during wildfires, we identify various types of voluntary and involuntary work and collective action. The collective action and (in)voluntary work respondents perform is often intertwined with political ideology and societal critique. Therefore, the article demonstrates that (in)voluntary work extends beyond altruism, encompassing internal and external struggles marked by politicization, power dynamics, positioning, and the collective pursuit of societal improvement.

Collective Action in Crisis: Unveiling the Power of Crowdfunding in Ukraine's War Response

Oleksii Kolesnykov[1], Olga Matveieva[2], Dmytro Khutkyy[1]

1University of Tartu, Estonia; 2Ruhr University Bochum, Germany

This paper presents a comprehensive exploration of collective action in crowdfunding initiatives during the ongoing war in Ukraine. Since the full-scale Russian invasion, Ukraine has faced significant challenges, prompting a remarkable response from its civil society. To explore this phenomenon, we posit the following research question: what factors contribute to the success of a crowdfunding collective action in shaping social and political landscapes during times of war? Theoretically, we apply the collective action framework that reveals the modified role of cooperative and collaborative efforts among community members in influencing sociopolitical reality and the delivery of public services. Methodologically, this study employs a qualitative case study approach. As a result, it proposes a synthesized approach to framing the "success formula" of effective crowdfunding campaigns, based on interviews with managers of top crowdfunding initiatives in Ukraine. By providing a nuanced understanding of how civil society actors utilize crowdfunding in times of crises like war, this paper offers insights into the empowering role of collective action. It highlights innovative approaches to addressing urgent needs, supporting humanitarian causes, and maintaining resilience. The study showcases the extraordinary capacity of civil society actors, organizations, and their networks to unite and persevere in adversity through innovative means of crowdfunding, emphasizing the phenomenon of civil society uniting. Also, it serves as a practical guide for policymakers, NGOs, and civic activists on organizing successful crowdfunding campaigns. It underscores the potential of crowdfunding as a tool for collective action, offering lessons applicable to crises worldwide.

Professionalization And Movementization – Civil Society Organisation's Internal Coping Mechanism With De-democratization

Márton Gerő[1,2], Áron Buzogány[3], Rafael Pablo Labanini[4]

1ELTE Faculty of Social Sciences, Hungary; 2HUN-REN Centre for Social Sciences; 3Freie Universitat Berlin; 4Institute of Political Science, University of Bern

In the last decade, one of the main questions in the research on civil society was how civil society organizations respond to de-democratzation. The question arises especially in Central and Eastern Europe and the Western Balkans, although, the shrinking space tendencies were also discovered in old democracies of Western Europe and North America. The majority of this research focused on the changing strategies of independent and critical civil society organisations (CSOs). Besides de-scaling their activities, one important response is "movementization", i.e. CSOs applying a more participatory repertoire. Another response to de-democratization is professionalization, i.e. the increasing differentiation of the organizational structure and specialized distribution of work. While movementization mainly refers to the changes of repertoire, professionalization is an internal change of the organization. How do these two tendencies relate to each other? How does movementization of CSOs affect the internal structure of the organization? What is the impact of professionalization on other activities?

Our paper addresses these questions by examining Hungarian civil society organizations through a new online survey. The survey is conducted among 2000 Hungarian CSOs, in the field of human rights, environmental protection, and welfare-oriented organizations, examining professionalization, organizational activities with a special focus on lobbying and interest-representation, as well as basic patterns of funding and fundraising activities, and the mobilization of volunteers and members.

Climate Movements, Young Generations and Their Critical Approach to the Ecological Transition, Between Distrust and Aspirations for Change

Raffaele Albanese[1], Lidia Lo Schiavo[2]

1University of Messina, Italy; 2University of Messina, Italy

Climate change is one of the main issues behind the poly-crisis in contemporary societies, and the ineffectiveness of intergovernmental measures to combat global warming has triggered growing tensions between the approaches taken by global climate governance and the critical stance of climate movements struggling for climate justice: in other words, between the institutional, political and economic, and actors who pursue an "ecological transition from above", and civil society actors who propose counter-hegemonic perspectives for an "ecological transition from below". This tension can be analyzed both in terms of distrust towards governments and intergenerational conflict, since young climate activists feel their future has been stolen from them, recognising the reluctance and Inability of political actors to deal with the environmental emergency. Influential scholars have recently highlighted how the younger generations, who make up the vast majority of climate movements, hold the older generations responsible for the shortcomings and pitfalls of current climate crisis management policies, a point which also emerged from our research fieldwork. The empirical basis of the research work includes 50 interviews with climate activists and direct observations at their assemblies and mobilisations, such as the pre-COP26 in Milan, the COP26 in Glasgow (2021), the Climate Social Camp (Turin 2022), the global climate strike in Naples and the World Congress For Climate Justice (Milan 2023), together with 50 interviews during ethnographic observations and 10 online interviews with students belonging to student organizations active within the Italian Fridays for Future movement (2019-2023).

Climate Visions and Their Dimensions

Mattias Wahlström[1], Joost de Moor[2]

1University of Gothenburg, Sweden; 2Sciences Po, France

One of the challenges for the climate movement is arguably to articulate its visions, broadly conceived as possible and desirable climate futures. This paper discusses the concept of movement vision as a distinct analytical concept and applies it to the empirical case of the Swedish climate movement, elaborating on empirically identifiable and salient visions, their elements, and dimensions, as well as the sites where more elaborated visions are found. The visionary content in the movement's discourse is structured around a number of key themes: democracy/governance, distributive justice, technology, environmental conditions, and welfare. Although an analytical focus on visions implies an emphasis on goals/ends, the latter need to be made sense of in the context of explicit or implicit narratives of how to reach them, that is, the means/strategies and the hurdles that these strategies are constructed as responses to. Hence, the paper identifies the main narratives of change associated with the visions and the central dilemmas that are embedded in visions of a just and sustainable society. The dilemmas are discussed with reference to variation of the visions in terms of temporal reach, breadth of alternative paths, and volition, that is, agency and influence over the envisioned outcome.

Exploring Climate Activism in a Workplace Context: How Institutional Insiders Adapt in a Large Firm

Cristina Mendes

Université Paris-Dauphine, France

Research on social movements in workplace contexts has highlighted the need to better understand how employees who are sympathetic to a social movement mobilize to transform their organization from within, in line with their convictions. I explore the question: How do institutional insiders adapt their climate activism tactics to the organizational context? This paper is grounded on field data collected as part of my ongoing PhD, in a large firm in France, and in a French coalition of environmental grassroots groups of employees. Using interviews with members and former members of one grassroots group, this paper empirically explores the complexity of insider activism. I have found evidence that support the perspective that the availability of cultural and political opportunities for grassroots groups, within and outside their firm, is relevant to support their creation and development. Data also shows that although grassroots groups adopt persuasive tactics to influence their company, its members have multiple affiliations. I argue that affiliations to different groups, including outside the firm, give individuals access to skills, information, networks, and even legitimacy, which are fundamental to promote organizational change. I have identified two additional forms of activism which individuals combine with their engagement in a grassroots group: disruptive activism by setting up ad-hoc groups to challenge the firm on controversial topics, and embedded activism by importing to their workplace external resources from social movement organizations. My research aims to contribute to better understand the organizational insider-outsider spectrum, and it complements prior research on collaborative forms of activism.

835

In search of a definition: A Systematic Literature Review of the Relational Consequences of Collective Action

Federica Stagni[1], Alessandra Lo Piccolo[2]

1Scuola Normale Superiore, Italy; 2Università di Bologna, Italy

This paper proposes a systematic literature review of the existing studies on social movements and collective action, focusing on identifying and delineating a distinct category of collective action consequences—relational outcomes. While biographical, political, and cultural outcomes have been extensively studied and established in the literature, our research aims to shed light on the nuanced nature of relational outcomes, exploring their unique characteristics.

Drawing on a consistent sample of peer-reviewed articles published in leading sociology and political science journals over the last 30 years, our study seeks to systematically analyze and synthesize findings related to relational outcomes within the context of social movements. Relational outcomes encompass the social bonds, networks, and interconnections forged as a consequence of collective action. We hypothesize that these outcomes play a crucial role in shaping the trajectory and impact of social movements. Yet, they have not been explicitly delineated as an independent category.

The implications of our findings extend beyond academic discourse, offering valuable insights for activists, community organizers, and researchers alike. Understanding the unique impact of relational outcomes can inform strategies for fostering social cohesion, community resilience, and sustainable collective action. This work contributes to the evolution of social movement theory by expanding the conceptual landscape, defining a specific set of collective action outcomes, and encouraging a more nuanced understanding of the diverse outcomes that emerge from collective social endeavors.

Prefigurative Politics Through Commoning: The Experiment and Experience of Fatsa in 1970s
Anıl Üner

Middle East Technical University, Turkiye

This study examines the link between prefigurative politics and commoning in the mobilization process of social movements. I shall employ a conceptualization of prefigurative politics that conceives representative politics with the nuances of representation as acting for and representation as standing for. The subjectivization process that changes the existing order necessitates utilizing the frame alignment conceptualization to explain the development of the social movement. I shall present that link with a relational methodological approach by emphasizing commoning as a process rather than focusing on commons as static things. The sociopolitical experience in the 1970s Fatsa province of Turkey, a critical event in the history of Turkish social and civic movements, is the case in this research. The eradication of trust in formal politics and its institutions amid the underlying tensions was the escalation of political violence and economic hardship at the country scale. Thus, on the local scale, tensions could be named as the exploitation in hazelnut production (a primary source of livelihood), usury, indebtedness, dispossessions, infrastructure failures, and the enclosure of the market resulting in inaccessibility of necessities due to black market and stockpiling. Derived from that, the main research question is how prefigurative politics worked in 1970s Fatsa through communing practices. Based on a literature review of theoretical works, archived data of the historical accounts, and of interview data, this study depicts how the emergence of The Revolutionary Path, a left-wing social movement organization, became an alternative that mobilized people and transformed the sociopolitical environment through their commoning practices.

The Unconscious Countermovement and Conscious Polanyian Movement in Rural China's Transformation
Rowan James Alcock

Tsinghua University, China, People's Republic of

This presentation brings together a published reassessment of Karl Polanyi's countermovement concept with empirical evidence and political analysis of social movements in China from a paper currently under review. It is especially relevant to the RN25 theme of the interplay between movements and their political/discursive/legal context as well as bringing original theoretical perspectives

836

from Polanyi to the social movement field. Polanyi's countermovement theory demonstrates how social movements protect society from the negative effects of marketisation. However, this paper argues the countermovement concept has been mis-interpreted and mis-applied. It argues countermovements are not fully-fledged ideological movements but 'unconscious' atomised moves to protect society from market threats. Polanyi's definition demonstrates countermovements are neither progressive or regressive but unconsciously undermine the market system with no inherent ability to create new ideological solutions. The paper uses this Polanyian dynamic to interrogate rural China. Rural China is chosen due to its recent, but incomplete, transformation from a less to a more marketised society. Through surveys and participant observation I demonstrate there is an unconscious countermovement that places peasant agriculture as a sphere of safety in contrast to large-scale marketised agriculture. Using Polanyian insights I link this 'unconscious' countermovement to 'conscious' Polanyian movements for safe food and the protection of the political/social category of the peasant. These conscious Polanyian movements articulate an anti-market ideology that is absent in the unconscious countermovements. However, both movements are linked through their implicit or explicit reach towards the peasant for protection from the industrialised and marketised food system.

Fields of Economic Contention: Cross-Country Perspective

Jiri Navratil

Masaryk University, Czech Republic

Several decades of neoliberal restructuring led to inquiries related to the societal responses to economic transformations, notoriously captured by K. Polanyi´s concept of societal countermovement (Polanyi 1944; Almeida, Pérez Martín 2022). Various protest cycles challenging the logic of neoliberal policies arise and are coordinated by labour, civil society organizations or political parties. Despite their differences in organizing structures, repertoires, or political ideologies, these actors become part of the specific field of economic contention (Melucci 1996, Crossley 2002). These are relational arenas or meso-level orders of collective action (Diani, Mische 2017) where different actors have topical (sometimes contradictory) stakes, strategies, and targets. Over time, new structures of coordination of collective action occur, are reproduced, or transformed: depending on the change of short-term political-economic opportunities or threats, some actors engage in contention and participate in protest alliances while others withdraw and isolate. This paper aims at further conceptualization and empirical mapping of fields of economic contention using the relational perspective in the study of collective action (Emirbayer 1997; Diani 2015). More specifically, it compares fields of economic contention in two post-socialist countries with the history of rapid re-instalment of capitalism after 1989 – Czechia and Slovakia. The cultural and institutional proximity of these countries enables longitudinal comparison of how short-term political-economic contexts (main type of conflict, access to the institutions, economic and welfare policies) relate to the structure of the field of economic contention: Who engages? Who cooperates with whom? Who crosses sector boundaries? And how is it related to the change of political-economic context? I rely on the dataset of economic protest events (1989-2021) in Czechia (N= 2042) and Slovakia (N=2077) and apply network-analytic approach.

Discursive Coherence and Framing Strategies in the Rejoin Movement: A Post-Brexit Analysis

Kai Alexander Steemers

King's College London, United Kingdom

Recent scholarly literature has suggested that the failure of pro-European mobilisation in the UK has, in part, resulted from the absence of a coherent strategy of how the case for EU membership was made. Existing research focusses on the period following the Brexit referendum up until the UK's departure from the EU in January 2020. Examining the post-Brexit landscape that followed, this paper investigates the extent to which this issue persists among the embryonic UK-based Rejoin movement.

Contributing to the existing literature on framing tasks, this study delineates diagnostic and prognostic framing concepts and systematically unpacks their relationship by separating them further into 'issue' (diagnostic grievances and prognostic solutions) and 'agent' (diagnostic perpetrators and prognostic strategy) components. This allows for a systematic assessment of concomitant processes of development between framing tasks that are crucial for a movement's capacity to foster consensus mobilisation.

To investigate these framing components, the study employs a discourse network analysis of social media posts on Twitter (now X) made by key activists within the Rejoin movement following the National Rejoin March on October 22nd, 2022. This analysis reveals several themes of strategic importance, in particular economic arguments, within Rejoin's framing approach and expands existing knowledge of the mechanisms by which framing tasks are intrinsically connected. In doing so, this paper contributes to the literature on the politicisation of Europe in the UK post-Brexit and enhances our comprehension of the relationship between framing tasks.

Populist Narratives, Imagery And Strategies: The Online Political Actions Of Portuguese Youth Groups

Ricardo Soares, Pedro Ferreira, Carla Malafaia

Centre for Research and Intervention in Education, Faculty of Psychology and Education Sciences, Portugal

Social media are currently unavoidable platforms in the lives of young people. The political role of these contexts includes their potential to express demands and articulate claims, but also their effects in conveying populist discourses and increasing polarisation. While the literature highlights these double-edge consequences for social movements and democracy, there is a lack of Portuguese studies exploring how social media constitutes a battleground for performing, disseminating and contesting populism by institutional political actors and activist groups.

This communication will discuss the relationship between social media and populism based on two main research questions: i) what populist narratives are expressed and contested by different political groups? and ii) which visual-digital strategies are mobilised to compose those narratives? We will present the results of a 6-month observation of the social media activity of Portuguese youth parties and youth activist collectives, encompassing the period before, during and after the Portuguese parliamentary elections of 2024.

We will draw on an analytical grid developed to analyse populist posts, examining: i) anti-system narratives (anti-elite populism), challenging institutional political actors, as well as other economic and social elites; ii) discriminatory narratives (exclusionary populism), blaming external and minority groups for the problems of "the people"; and iii) narratives extolling the virtuousness of the national people and the defence of their sovereignty (nationalist populism). We will explore the interplay of these narratives and the visual strategies employed by youth activists and institutional political actors, including protests' visualities (e.g., protest posters, eventful pictures) and satirical contents (e.g., memes, cartoons).

A European Antipopulist Movement? The Emergence And Diffusion Of The Italian Sardines And Finnish Herrings

838

Batuhan Eren, Manuela Caiani

Scuola Normale Superiore, Italy

This research investigates the emergence and diffusion of antipopulist mobilizations. Resembling the iconic image depicting a school of small fish chasing a big one, the Italian "6000 Sardine" (Sardines) and the Finnish "Silakkaliike" (Herrings) emerged as two movements with antipopulist claims. Although the scholarship on populism is abundant, antipopulism remains mostly neglected, especially its mobilization from below. Drawing on extensive fieldwork including a grounded-theory approach applied to twenty-seven interviews with activists from these two movements, plus the analysis of offline and online organizational documents, this study shows the mechanisms—cognitive, affective and relational—of their national and crossnational diffusion, relating them to the opportunities of the context. Exploring the internal movement dynamics and actors' perceptions and motivations, this study also contributes to the conceptualization of antipopulism from below, defining the main characteristics and the ideological underpinnings of these two antipopulist movements.

Perceived Emotional Synchrony and Political Protest Across Cleavage Lines

Christian von Scheve, Yi-Ping Lin, Elisabeth Gerling

Freie Universität Berlin, Germany

Research in in social movement studies and the sociology of emotion and has consistently ar-gued that emotions are mobilizers of collective action and civic engagement, such as protesting, participating in marches and demonstrations, signing petitions, volunteering, or donating money. On the one hand, studies have shown that specific discrete emotions, for example fear and anger, have strong and distinct effects for political mobilization and collective action. On the other hand, following a Durkheimian tradition, scholars have long suggested that collective and group-based emotions are important motivators of civic engagement. However, there is comparably little evidence regarding this assumption. This contribution aims at filling this gap and investigates associations between perceived emotional synchrony (PES), a specific type of collective emotion, and political protest across different cleavage lines. Using original survey data collected in Germany, the study specifically looks associations between perceived PES and protest behavior ("keystroke" vs. "street" protest) across two cleavages, climate change (N=1706) and immigration (N=1783). We hypothesize that PES is positively associated with whether a person engages in street protest (such as joining a protest march) as compared to keystroke protest (e.g., signing a petition), and that this effect is qualified by cleavage type and partisanship. Our findings support the hypotheses, indicating that PES is positively associated with street protest for both cleavages, but only for the climate cleavage when controlling for partisanship. This suggests that PES is especially important for political protest when cleavages are not (yet) clearly associated with party politics.

RN25 | T08_03: Environmentalist framing and movement communication

Media Representation Of Environmental Movements: Unveiling Frames In News Articles On The Last Generation In Austria

Rebecca Wardana[1], Beate Klösch[1], Markus Reiter-Haas[2], Matthias Penker[1]

1University of Graz, Austria; 2Graz University of Technology, Austria

In this paper we examine how one of the most controversial and polarizing environmental movements of our time, the Last Generation, and its messages are portrayed and framed in the Austrian media. While supported by parts of the population, some politicians have labeled the activists as climate terrorists for their disruptive forms of protest (e.g., gluing themselves to the streets). The Last Generation strategically uses the media to generate attention and promote their warnings and demands. Our goal is to understand how different media portray the movement and how their representation contributes to the public discourse on environmental movements and climate change. With this aim, we conduct a media analysis on two of Austria's largest daily newspapers, exemplary comparing the what one could label as 'yellow press' with 'quality' newspapers with the help of computational social science methods. The media corpus consists of ca. 400 news articles about the Last Generation published between February and December 2023. In addition to the article analysis, we plan to analyze some 200,000 comments on these articles. Surprisingly, first results from a sentiment analysis show hardly any differences between the yellow press and the quality newspaper. In order to gain a more nuanced insight, we extend our analysis to include a combination of content and framing analysis, shedding light on emerging frames in the portrayal of the Last Generation. By contrasting these with existing frames from the literature, we make a fine-tuned empirical contribution to the current debate on the media representation of environmental movements.

Do the Police Distort Grassroots' Narratives?

Jessica Patricia Lang

European University Institute, Italy

Grassroots tell stories: they mourn or criticise what is, demand what should, and imagine what could be. The police enforce the hegemonic understanding of what are legitimate ways of telling stories. Mass media comment on these stories and the way they are told, thereby affirming,

839

questioning, or criticising their legitimacy. Both actors hence affect grassroots' capacity to narrate, shape the content of, and influence how these stories travel. There exists a vast literature on the police's and journalists' engagement with, and the public perception of grassroots and protest events. However, it is rarely inquired whether and how police involvement influences the way mass media describes the grassroots' narratives. I approach these questions concentrating on temporal and spatial variation. I, firstly, conduct a narrative analysis of newspaper articles reporting on grassroots' blocking the Gotthard tunnel in Switzerland in 1991, 2002, and 2023. I intend to assess if and to what extent the activists' narratives find entry into the articles, whether police involvement change the way journalists talk about these narratives, and whether attribution of legitimacy changes over time. I repeat the analysis for articles on climate justice grassroots' protest events between 2018 and 2023 in the Swiss cities of Basel, Bern, Geneve, Lausanne, and Zurich. I am particularly interested in whether the ongoing intensification of grassroots' tactics affects how journalists make meaning of their narratives.

The Digital Visuality of Trust in Climate Change Politics: Emotions and Polarization on Twitter #COP from 2018-2021

Nicole Doerr, María Florencia Langa

Copenhagen University

Trust is a key issue in political discourse and mobilization especially with rising misinformation and polarization. However, the role of visual communication in the construction of trust remains unexplored, despite the emphasis digital platforms place on visual content. We address this gap by looking at 6000 images and text shared on Twitter under the hashtags for COP24, 25 and 26. We analyze the way in which a wide variety of climate activist groups and NGOs as well as counter-movement actors express and elicit emotions to construct or undermine trust of key institutions, groups or individuals in climate politics. We find that the construction of (mis)trust is tied to how actors affirm or challenge emotional norms, constructing emotional regimes for their social and political groups. Official COP and some civic society actors emphasize rationality and hope, while climate deniers often legitimize feelings of fear or indignation to undermine trust. We show that this dynamic creates a corresponding visuality and identify four ways in which actors use images: i) peopling, the use of images of people to inspire trust; ii) subverting, the use of imagery that opposing actors use to construct trust in order to undermine it; iii) visualization of data and information; iv) romantization, appealing to a sense of beauty or attachment through images often conveying symbolic meaning. We argue that these visual strategies map with three emotional regimes distinguished primarily by the role and orientation of emotional sincerity or attachment and emotional detachment or cynicism, which play a significant role in the construction of trust and mistrust respectively.

Conflict, (Dis)trust and Social Change: A Complex Perspective of the Communicative Dimension of Social Movements

Lazaro M. Bacallao-Pino

University of Salamanca, Spain

Social movements' analysis provides a complex understanding of important processes and dimensions in current societies. There is agreement in pointing out the centrality of communication for them, but some authors consider that their communicative dimension has been the object of certain instrumental understandings or also remained a "black box" for theories about them. Based on a literature review of texts that offer an analysis of communication in recent social movements, this paper aims to provide a complex view of this dimension, considering it a scenario of the articulation of social conflict, (dis)trust and social transformation. The main findings show that communicative practices developed by these collective actors are central for the visibility of the social conflict they represent, by making public their demands, which find autonomous, undistorted expression, in their alternative communication spaces, as opposed to mainstream media representations. Besides proposing an alternative agenda, these communication spaces promote distrust in instituted politics, in line with the refusal to participate in it assumed by social movements, that propose developing trust in social transformation based on their internal practices. This process of social change also has its expression in communication, through the communicative articulation of new individual/collective interrelationships, based on the development of participatory communicative processes, as part of their collective action repertoires, which point to "other" social order. Consequently, we conclude that the communicative dimension of social movements is a complex scenario of tensions between protest (conflict) and proposal (social transformation), showing the complexity of a dimension that is associated with conflict (external) and consensus (internal).

Mapping COVID Protests in China: Insights from News and Surveys

Ying-Chieh Huang, Chih-Jou Jay Chen, Kai Deng

Academia Sinica, Taiwan

This paper examines the spatial dynamics of popular protest during the COVID-19 pandemic in the highly controlled communist state of China. In 2022, in response to the pandemic, China enforced strict lockdown measures. Despite this, protests, known as "White Paper Protests," surfaced in various regions in November and December. While media coverage predominantly focused on COVID-related protests in major Chinese cities, our study uncovers a wider range of protest locations. Our research aims to identify the cities where residents participated in protests against China's zero-COVID policy during this period and to explore common characteristics among these cities. Moreover, we analyze the influence of local political economies in driving these protests. Using national internet survey data, social media analysis, and news reports, we investigate these aspects. Our findings indicate that COVID protests were widespread, occurring in nearly half of China's cities. Notably, these protests were more prevalent in politically significant cities with higher levels of economic development and urbanization. The widespread nature of these protests, cutting across geographical boundaries in China, reflects significant grievances among the population. Even under a tightly controlled authoritarian regime, these grievances sparked popular protests. However, these protests were isolated, unorganized, and short-lived, and for the time being, they did not pose a serious threat to the state.

Claiming Space and Rights: Persuasion, Crisis, and Everyday Practices in Tacna's Street Markets

Janna Dallmann

Universitat Autònoma de Barcelona, Spain

The paper carves out how persuasion as part of itinerant selling practices connects the economic with the political character of Tacna's street markets.

Street markets in this bordering city between Peru, Chile, and Bolivia are the result of people's movement from rural-often aymara or quechua speaking-areas to the city and the lack of other more "formal" working possibilities. As such, they contain the claim for participation in the local working order and a defense of the "right to work". Vendors regularly claim public space, building their stalls in common streets and thus converting them into vivid spaces of consumption. Organization and coordination is at the heart of the market places. However, that does not mean that

vendors generally have a directly political interest or that there is a political consensus. Members of the heterogenous group of merchant's-far from simply being the "urban poor"-share the interest of "keeping their business going". Therefore, even in the context of an extraordinary crisis, vendors adapted to the new conditions and requirements as much as they organized protest in a highly routinized way.

The paper draws on qualitative observation and interview material on the one hand and newspaper articles on the other hand to reconstruct selling practices, protests, and negotiations in two times of crisis regarding the "Feria del Altiplano" market and the respective process of its relocation.

It elaborates how claims-making does not only take place in moments of explicit protest, but that it is at the heart of the every-day selling practices. It thereby theoretically contributes to the conceptualization of claiming rights as processual and itinerant practices.

841

RN25 | T09_02: Protest parties and policies

Student Activism in the Higher Education Decision-making of Uzbekistan: Context and Challenges

Furkat Sharipov

University of East Anglia, United Kingdom

The higher education landscape in Uzbekistan reflects a systemic structure rooted in authoritative governance, where student involvement in decision-making processes remains absent. The government's emphasis on internationalization and quality improvement in higher education overlooks the critical role of students in shaping educational policies and practices. Policy documents stress moral and patriotic development, promoting adherence to traditional values rather than fostering critical thinking or democratic participation among students.

Cultural norms emphasizing conformity and obedience pervade educational institutions, limiting students' opportunities for critical inquiry and expression. Students view education predominantly as skill acquisition for future careers, with minimal emphasis on societal contributions or critical engagement. Institutional discouragement from questioning the status quo, limited resources, and a culture of obedience further impede meaningful student involvement.

Challenges such as fear of repercussions and a lack of avenues for dialogue inhibit students from actively participating in decision-making. Institutional dialogue between students and authorities is crucial to bridge this gap and foster a more inclusive educational environment.

The paper analysis underscores the pressing need for systemic reforms, advocating for increased student empowerment and meaningful participation in decision-making processes to shape a more inclusive and participatory higher education landscape in Uzbekistan.

Protesting Parties in Poland, 2020.

Daniel Platek

Institute of Political Studies, Poland

Much ink has been spilt on conceptual and empirical analysis of the relationship between parties and social movements. The analysis of these relations has also become an important area of research in the contemporary sociology of social protests, but relatively little has been said about how parties participate in collective actions. In 2020, extraordinary political opportunities have arisen for the formation of broad protest coalitions in Poland. Most notably, the COVID-19 pandemic resulted in the government introducing regulations which provoked objections from many social groups. Political parties also took part in the protests in an effort to manifest their presence.

The primary unit of analysis employed in this study is the protest event, with daily newspapers serving as the data source for these events. Such events fall under "non-conventional" forms of political engagement and typically take place in the streets. I employ dynamic line-graphs to bipartite networks for incorporating time directly into the network. Bi-dynamic line-graph is an innovative way to visualize the evolution of actors' participation in successive events. The main implication of this method is that all time steps corresponding to events, are, in fact, directly taken into account, and actions, linked together by the common participation of actors, are represented as a chain, in a sort of continuous social process. The method will allow us to look at the degree to which the COVID-19 pandemic influenced the nature of political parties' involvement in protests. The findings suggest that the pandemic had a significant, albeit varied, impact on the strategies of different political factions.

Unlikely Allies? Protest Co-Participation Networks of Civil Society Organizations and Political Parties

Matthias Hoffmann[1], Felipe G Santos[1,2], Dan Mercea[1,2], Sorana Constantinescu[1], Henri Pozsar[1], Claudiu Vlasie[1], Fernando Varga[1], Gabriela Teresa Zenteno[1]

1Babes-Bolyai University, Romania; 2City, University of London

The rise and electoral success of so-called 'populist', 'challenger', or 'movement' parties has shed new light on the intersection of institutional and extra-institutional politics. Recent debates have refuted a neat distribution of labour between civil society organizations who voice grievances through means of (street) protest and political parties, who channel demands through electoral participation, instead pointing toward intricate dynamics of co – and counter-mobilization that depend on both the type of (party) organization and their ideological positioning (Borbáth & Hutter, 2021, Hoffmann et al. 2022). At the same time, only few studies have taken an explicitly relational perspective that seeks to apply a field approach to the study of protest and which can therefore enrich our understanding of the way political parties and civil society organizations build, maintain, or dissolve political alliances through joint protest participation (Pirro, Pavan, Fagan, & Gazsi, 2021) and mutual learning. We enrich and develop this approach through an analysis that combines an original protest event dataset from six countries over fifteen months. We operationalize the co-participation in protest of political parties and civil society organisations in a social network analysis. We explore political parties' position in relational protest fields, in conjunction with protests' action form, issue, and actors' ideology, to advance academic knowledge on political participation and the complex interplay of the institutional and extra-institutional fields.

Feminist Voices. Frames, campaigns, and alignments of the Spanish feminist movements.

Inés Campillo Poza, Elin Peterson, Blanca Alonso Gracia, Mar Nacher Escarti

Universidad Complutense de Madrid, Spain

Since the end of the anti-austerity mobilization cycle (2010-2013), feminism has been one of the few state-wide social movements in Spain that not only has resisted demobilisation but has strengthened and greatly impacted the public agenda and policy process. In the last five years, this development has prompted a reinforcement of antifeminist movements and a fracture of Spanish feminist movements. Existing literature on the Spanish feminist movements has tended to focus on their campaigns and repertoires of action, their organizational and generational diversity, and their ideological differences, especially in relation to cooperation with institutions. Nevertheless, movements discourse frames and impact on party politics and the policy process have received less attention. The European research project FIERCE (Feminist Movements Revitalizing Democracy in Europe), on whose fieldwork this paper is based, aimed at filling this gap. Its main objective has been the mapping the diverse constellation of feminist actors in Spain and the campaigns, repertoires of actions and discursive frames that they have developed since 2010, putting a special focus on their impact on party politics and on the policy debates. Thus, our paper will offer an analysis of the results of the FIERCE fieldwork, which has consisted in an analysis of hundreds of press news, 10 gender related policy debates, 20 feminist movement documents, 20 interviews with activists, 10 interviews with party representatives or policy makers and a co-creation process with activists and academics.

Visualised Protest through Digitality. The Role of Visualisation for Social Movements in the Digital Space

Johanna Raphaela Wahl

Technical University of Berlin, Germany

Digital space is increasingly becoming the base for social movements to connect, publicly criticise and formulate demands on politics and society. Images and videos posted on social media play an important role in determining the nature of protest and can enable new forms of protest. As a result, the relationship between protest and public communication is changing; protest actions are increasingly oriented towards the structure and visuality of digital space. The research project analyses current protest movements such as Fridays for the Future, street blockades and other protest cultures, and explores the relationship between the increased visuality brought about by digitalisation and changing or entirely new types of protest.

The theoretical framework is drawn from the sociology of knowledge, visual studies and communicative constructivism. In addition, research on movement and digitalisation provides a theoretical background. (see, for example, the work of Hubert Knoblauch, Boris Traue or Alice Mattoni).

Initial analyses show that the images shared by protest movements on social media and their circulation in the identity-forming profiles of individuals are of enormous importance and that protest cultures are aligned with them. The groundbreaking aspect of the work is the combination of image science and sociological perspectives with a view to visuality in digital space, which plays an important role in collectivisation and is evident in social movements.

The project is currently looking at examples such as the images used by the Last Generation group, posted on social media and shared in the mass media. It examines textual-visual communicative expressions in the form of images, signs and symbols in the digital public sphere using image annotation tools developed specifically for use in machine learning models (e.g. Rectlabel). This, together with qualitative interviews, will examine the influence and significance of the visuality of digital space and the increased circulation of images for the (self-)representation of protest movements and their actions. This will allow to classify the role of digital communicative action in the insurgency and positioning of social movements for socio-ecological transformation.

I have not yet attended a summer school.

843

By Any Means Necessary. Networks, activists and media processes in the Era of the Digital Turn: the three Generations of the No TAV Movement

Giuseppe Michele Padricelli

University of Naples Federico II, Italy

This work traces the digital expressions of social movements, using the last 13 years of the No Tav movement (Italy) as a case study.

The purpose of the work is to comprehend the capacity of activists to navigate the free space of communication networks while simultaneously exerting a transformative force, reclaiming urban space for citizens. The main object concerns the Internet as an innovation that continually reconfigures itself, intertwined with the changing nature of the struggle in Valsusa, characterized today by the convergence of over three generations.

– How do activists problematize the pervasiveness of digital media in their daily lives?

– How has the relationship between the Internet and different generations of activists evolved, impacting the processes of meaning construction and interpretative frameworks of the key actors?

– What characterizes current mobilization mechanisms, interplay, and direct relationships between different generations of activists operating inside and outside the Internet?

These research questions guide the study through the following methodological itinerary:

– a digital ethnography that includes a content analysis from the framing perspective built by the online narratives of the movement (2008-2022);

– a second phase focused on the performance perspective, integrated with semi-structured interviews and participant observation sessions.

In this way, the comprehension of the claims embedded in the frames constructed online by activists and their materialization in the direct action repertoires inevitably required the adoption of a nested mixed-methods research design capable of testing the complementarity of new and traditional research methods in examining an object in continuous motion within an ever-evolving context.

Social Learning from Tweets to Streets: Exploring Frame alignment in the Romanian #rezist Protests

Dan Mercea[1,2], Felipe G. Santos[1,2], Matthias Hoffmann[2], Sorana Constantinescu[2], Henri Pozsar[2], Claudiu Vlasie[2], Fernando Varga[2], Gabriela Teresa Zenteno[2]

1City, University of London, United Kingdom; 2Babeș-Bolyai University, Romania

Triggered by plans to water down legislation on misconduct in public office, the #rezist demonstrations were a set of rolling protests in Romania, widely described as the most momentous since the fall of communism in 1989. In this paper, we use a dataset of 45,871 #rezist tweets collected for the period between February 2017, at the start of the protests, and the end of 2022. This setting allows us to study the evolution of online communication even after the end of the on-site protests , in 2018. Drawing on social learning and framing theory in social movement studies, we examine the hashtagged communication as a medium not solely for the aggregation and transmission of information but also for a process of frame alignment supported by social facilitation and contextual imitation. The latter two are social learning mechanisms whereby the presence of key individuals who champion one or more frames for the protests (social facilitation) enables alignment, over time, around those frames evidenced through the circulation of similar messages by other people than those key individuals (contextual imitation). First, we expect to find little evidence of alignment before social facilitation. Second, we posit that contextual imitation will facilitate an alignment of frames among on-site and online protesters. Third, we expect alignment to wane once the protests subsided. This study aims to contribute empirically to the understanding of framing processes, in social movements, by showing how social learning can be applied to a process thus far more generically described as frame negotiation.

844

Feminist Hashtagging – Articulating Gender Justice on Swedish Social Media

Lisa Magdalena Lindqvist

Karlstad University, Sweden

The hashtag is a technocultural element, a feature of social media platforms that brings disparate units of content together into an assembled feed, and frames content in particular ways. When mobilized for social justice, hashtags can merge individual experiences into collective witnessing. In recent years, there have been many examples of feminist mobilization via hashtags globally. Scholars have emphasized that digitally mediated feminism is a feminism through messy affinities based on personalized narratives rather than women's rights – in line with Donna Haraway's well-known 'cyborg feminism'. Using feminist media theory

and theory on technocultural entanglements, this study looks into how feminist affinities and narratives are articulated through hashtagging practices. I trace two contemporary Swedish feminist hashtags – #kvinnostrejk and #jagvetvadensnippaär – to elicit social media users' strategies and intentions behind feminist hashtagging, and to analyze how gender justice narratives are articulated through these hashtagging practices. The study uses digital ethnography as its method. I employ discourse analysis on feminist social media content to see how hashtags are used as discursive tools, and how they are negotiated and reappropriated to further feminist narratives. Further, I interview communications specialists at feminist organisations, journalists, and feminist digital activists about their strategies for feminist hashtagging, and the effects that these practices might have had. The results can shed light on how hashtags can be used as feminist discursive elements in several ways, for instance, to shed light on news stories, to connect feminist content to viral hashtags, or to perform framing work in social movements.

RN26 | T01_01: Parents and caregivers

Motherhood Under Control: Ideology, Reality and the Israeli Welfare State

Esther Hertzog

Zefat Academic College, Israel

The paper will elaborate on the regulation of disadvantaged mothers, particularly those heading single-parent families, by various State authorities, mainly the welfare services and the courts. Disqualifying women's motherhood involves the removal of their offspring from their care. Few studies on disadvantaged mothers in neo-liberal regimes have examined the connection between the threat on their motherhood and welfare policies. Moreover, the research on out-of-home placement and on single mothers has largely ignored the phenomenon of the nullification of underprivileged mothers' parenthood by State authorities and the coercive means employed in the process.

The role of ideology (or 'rhetoric' or 'discourse') in regulating underprivileged mothers will be emphasized in examining the means and mechanisms that are involved in this phenomenon. Various means of regulation relevant to this context include formal documents issued by the Ministry of Welfare and other state agencies; budgeting (such as the allotment of minors' placements in welfare frameworks, for local municipalities); laws (such as the mandatory obligation to report any suspicion of harm done to minors in families and the prohibition to publish any identifying details relating to minors whose cases are being discussed in the courts); committees formed by the Ministry of Welfare (the most conspicuous of which are the "decision making committees" which issue recommendations for the courts in the process of declaring a minor as "needy"); Knesset committees that support regulation mechanisms (the sub-committee of the child's rights in particular); and court verdicts which provide justification and public credibility for the welfare policy and practices. All of these, it will be argued, are tightly bounded with an ideological apparatus, which serves to justify the welfare system's policy and practices.

Ethnic Bias in the Child Protection System in Hungary

Marianna Kopasz[1], Tamas Bartus[2], Ildiko Husz[3]

1HUN-REN Centre for Social Sciences; 2Corvinus University of Budapest, Hungary; 3Corvinus University of Budapest, Hungary; HUN-REN Centre for Social Sciences

Roma children are over-represented in the child protection system in many European countries, but little research has explored why this is so. Ethnic-based treatment is problematic in many ways, not least because it undermines trust between social service providers and minority clients. This paper examines child welfare workers' perceptions of risk at the early stages of child protection decision-making. The research question is whether they perceive a higher level of risk when the parents are Roma. We use data from a vignette-based survey conducted among child welfare workers (N = 600) in Hungary. Factors influencing social workers' risk perceptions are analysed using multilevel ordinal logistic regressions. The regression models of risk perception include case variables and the individual characteristics of the social worker. Ethnicity is examined individually and in interaction with other case characteristics. The results indicate that some case variables increase the level of risk perceived by child welfare workers. Family ethnicity does not have a statistically significant impact on risk perception (main effect), but it moderates the effects of some case characteristics, such as physical abuse and the mother's non-cooperative behaviour (interaction effects). Overall, our findings show that even if social workers perceive some characteristics of Roma clients' behaviour as ethnocultural, this does not affect their perception of risk. The poverty and exclusion of Roma families and the resulting higher risks might be more relevant factors behind the disproportionate presence of Roma families in the child protection system. However, communication between social workers and minority families needs to improve to enhance trust between them.

846

Playing the Snakes and Ladder Game: Caregivers' Experiences in Applying for Cash Benefits when Caring for a Child with ADHD in Norway

Andreea Alecu, Marthe Hårvik Austgulen

Oslo Metropolitan University, Norway

A substantial number of children live with disabilities, and caring for children with increased care needs can be demanding. Existing research highlights a link between childhood disability and child poverty. States can partly counter these adverse relationships through targeted cash support and respite care systems. However, families caring for children with a disability often struggle to take up cash benefits and welfare services beyond the immediate caregiving needs. The literature provides limited insights into why this occurs, particularly regarding how caregivers perceive their interactions with the state during benefit applications.

To address this gap, we explore the experiences of caregivers caring for children with Attention-deficit hyperactivity disorder (ADHD) in Norway. We focus on reasons for non – or limited-take-up of a non-means tested cash benefit and ask: How do caregivers experience the basic benefit scheme and the application process? Why do they, or do they not, (re)apply for the benefit? Qualitative data collected through two rounds of semi-structured interviews with

15 families in 2022 inform the study, covering 18 children with ADHD aged between 7 and 16 years.

In our analysis, we integrate van Oorschot's model of benefit receipt with a game theoretic perspective, revealing the delicate interplay between strategy and chance for caregivers navigating the system. We find that the process of applying for basic benefits resembles a game of snakes and ladders, where the game board represents the application process, the snakes symbolize potential hurdles, and the ladders represent potential support. This analogy highlights the repeated interplay between individual, administrative, and policy design level factors.

When Father Leave Policy Expands And Lags Behind

Martin Gurín[1,2], Janet C. Gornick[3]

1University of Kassel, Germany; 2TU Dortmund, Germany; 3The Graduate Center (CUNY)

Only recently has the importance of fathers as child caregivers been recognized and developed into an important policy issue. Welfare states around the world are experimenting with father quotas, father-only entitlements, and bonuses that give families more leave and resources if both mothers and fathers share the leave in an effort to increase fathers' involvement in childcare.

However, there is still no nation in the world with a fully father-sensitive, gender-equal leave policy. There are also striking differences between countries in timing of introduction and extent of changes in father leave policies. To date, there has been a lack of attempts to shed light on these phenomena, as the major focus of research is on describing policy changes or take up.

In this contribution we try to fill this important research gap by focusing on four driving forces of change: public preferences, electoral competition, resistance, and the crisis (financial, fertility, and pandemic). We maintain that addressing these determinants is particularly important in understanding policy change in this policy field. This argument is substantiated by a more detailed exploration of these drivers of change in a comparative analysis of father leave policy change in the Czech Republic and South Korea. Our analysis reveals that, in these two countries, only in Korea does the government seem to be responsive to the growing voter preferences for father leave policies. Crisis and party competition have a buttressing effect here. In the Czech Republic, instead, crises postponed reforms and father leave policy is perceived by political parties as a policy that harms their chances of re-election. Resistance prevents fully father-sensitive, gender equal parental leave in both countries.

RN26 | T01_02: Knowledge and learning

Invoking and Contesting Expert Knowledge in Legislative Debates Over Social Policy in the Parliament of Finland, 1962–2022

Lauri Heimo, Jukka Syvätertä

University of Helsinki, Finland

The literature on the relationship between expert knowledge and democracy is underpinned by two arguments. The first suggests that politics has 'scientized', pointing to the increased necessity to justify decisions with evidence. The second asserts that the dismissal and questioning of expert knowledge has become normalized, and that political discourse increasingly relies on personal experience and feelings. Both trends have been seen potentially detrimental for democracy. Our broader research project traces the intertwined development of these seemingly opposing trends. With this paper, we focus on parliamentary debates over new legislation in social policy, which we examine through the lens of epistemic governance framework. Social policy legislation has always provided a field for ideologically driven political struggles, wherein also experts have played a notable role. Depending on the perspective and situation, their role has sometimes been considered either too powerful, or too easily dismissed by governments in power. However, there is very little earlier research about the changes within politicians' practices of using and contesting expert knowledge. To shed light on the discursive and rhetorical shifts, we analyze a dataset consisting of all plenary debates over new social policy legislation which have taken place in the Parliament of Finland within the timeframe extending from 1962 to 2022. The first layer of our analysis utilizes corpus linguistics to examine the trends of invoking expert knowledge throughout seven decades, and the second focuses on discursive and rhetorical analysis of extreme cases wherein expert knowledge has been contested particularly intensively.

Welfare and AI: An Experiment in Co-Learning for Local Governments

Giuseppe Luca De Luca Picione, Lucia Fortini, Domenico Trezza

University of Naples "Federico II", Italy

The digital era has profoundly transformed social policies, pushing towards a new welfare model. This approach aspires to innovations in offered services and influences policy management (Campedelli and Vesan, 2023). In this context, artificial intelligence (AI) is viewed as a solution to reduce repetitive work and provide new tools for policymakers (Toll et al., 2019). However, rapid advancements in

847

AI have raised concerns about the possibility of crucial decisions for social security escaping direct human control. To address and discuss this tension between the benefits and threats of generative AI in welfare, we present preliminary results from a research and intervention program called Govern-AI, focused on the regional welfare of Campania (Italy). The main goal of Govern-AI is to understand the interaction between institutional actors and new technologies through the introduction of an AI chatbot for local policy making. The construction of the chatbot follows a participatory research approach, as data provided by participating institutions not only constitute the chatbot's learning foundation but also significant empirical evidence. Before construction, preliminary focus groups identified relevant aspects of institutional imagination regarding AI, generating opinions and representations that translate into actual "policy frames" (Rein e Schön, 1996). Govern-AI not only provides a practical tool for decision assistance but also acts as a catalyst for co-learning between humans and the AI system, relying on information from human actors while providing outputs used by them.

The Aura of Evidence? The Production of Recommendations for Policies in Social-research-based Projects

Seweryn Rudnicki[1], Katarzyna Wojnicka[2]

1AGH University, Poland; 2University of Gothenburg

Currently, social research knowledge is widely used as a basis for interventions and policies. Yet, while there are established methodologies in sociology for making descriptive knowledge ('what is'), the production of prescriptive knowledge ('what should be done') has been largely unguided by such well-defined approaches. This question remains underexplored not only in general sociology and in social research methods, but also within the specific fields like social policy. This presentation is based on a retrospective analysis of an extensive, European Commission-funded study about the role of men in gender equality in Europe, which was done though in-depth interviews with the project teams and secondary data analysis. The reconstruction was focused on how recommendations for social policies were developed in the course of the project. Our analysis suggests that translating social research findings into policy recommendations may pose a significant methodological and practical challenge. Specifically, we found that it may receive lower priority than producing findings, be unguided by any specific method or approach, and remain largely untransparent and even unreflected before, during and after the project. Discouraging an all-too-easy criticism, we argue for more reflection, frameworks, and methods that could support sociologists in the development of research-based guidelines for policies.

The Making Of Good Practices

Jitse Jonne Schuurmans, Oemar van der Woerd, Roland Bal, Iris Wallenburg

Erasmus University Rotterdam, Netherlands, The

Inspired by pragmatist beliefs and theories on collaborative governance, various administrations in the global North embrace experimenting in pilot projects as a fruitful strategy to bring about large scale institutional change. In such policy programs, experimentation in pilots is often combined with the development of large scale infrastructures for learning (e.g. quality collaboratives). The idea is that through experimentation and reflection new ways of organizing can emerge and that through the sharing of good examples and lessons learned the organizational transformation in other localities can be accelerated. This dynamic provides an incentive to actively produce good practices to showcase in infrastructures of learning. We take this dynamic as our analytical starting point. By drawing on a large scale ethnographic study to a program directed at healthcare reform, we show how good practices circulating in such infrastructures of learning are often fictions; in practice these initiatives seldom function as smoothly and effectively, or they do not exist at all. By drawing on a relational approach (Asdal & Cointe, 2021), we investigate how good practices are constituted by various interlocking mechanisms enacted by professionals, policy makers and technologies on different levels of the healthcare system. Our analysis raises important questions about what constitutes organizational learning in institutional reform processes.

848

RN26 | T02_01: Charity and social entrepreneurship

Business Plus Charity? Tensions between Conflicting Logics from the Perspective of Street Paper Buyers, Vendors and Project Managers

Hannu Turba

Kassel University, Germany

The sale of street newspapers by people experiencing homelessness or poverty is common practice in many metropolitan areas across Europe. Combining logics of the market and entrepreneurship with logics of charity and social welfare, street paper projects are generally characterized by a high degree of institutional complexity.

On the one hand, they promise "business solutions" for social problems, while on the other, a morality of charity is involved, e.g. rooted in ideas of religious duty or social responsibility in urban communities. According to the first logic, street paper vendors (seemingly) make their own money in the sense of self-entrepreneurship, according to the other, they are nonetheless supported by alms.

Drawing on interviews and focus groups with street paper buyers, vendors and project managers, the presentation explores the question of how each of these groups relate to business and charity logics, trying to combine these logics in a meaningful way. Among other things, this provides insights regarding the perspective of "resource and product consumers", which has hardly been considered in the previous discourse on institutional complexity in the field of social welfare.

It becomes obvious that the buyers' views often differ both from the street paper vendors and the people involved in the projects behind them. The question of how these views are related to each other is particularly relevant, because the realization of the promise of participation inherent in street paper projects decisively depends on spreading the "good news".

The Cultural Transformation of Welfare and Charity

Guro Wisth Øydgard, Ann-Torill Tørrisplass, Christian Lo, Johans Tveit Sandvin, Janne Breimo

Nord University, Norway

While social inequality in Norway has gradually increased in recent decades, in the last few years we have experienced a marked increase in actual and visible poverty. The Covid-19 pandemic had serious consequences for the most vulnerable groups. Later, a sharp increase in interest rates and general prices have caused many to experience real hardship, while the government holds back social spending to bring down inflation. Our research emerges from the reality that the welfare state, along with the forms of autonomy that it made possible, is withdrawing multifariously throughout Scandinavia. As the welfare state gradually withdraws from the responsibilities that have characterized welfare policy during most of the post-war era, new forms of poverty, marginalization, and personal dependence have emerged on an entirely new scale. The needs of citizens have hardly disappeared when the public services addressing them have, the voluntary sector has expanded to fill in new gaps, a shift that is altering the relationship between state and society. Based on analyzes of existing research and policy documents, this presentation will explore; possible convergences and divergences between the development of state policies for volunteer organizations and those developments within volunteer organizations themselves; to uncover explanations for and consequences of such convergences and divergences.

Institutionalization of Finnish Food Aid in a Narrowing Welfare State

Vera Johanna Kauppinen

University of Jyväskylä, Finland

Charitable food aid violates the fundamental pillars of the Nordic welfare state ethos: equality, strong democracy, and universalism. However, since 2015, the Finnish food aid field has been slowly institutionalized by the establishment of centralized food pantries, where all food donations from the area are collected and delivered onwards to satellites for further distribution to food aid clients. For the first time, the new government program in autumn 2023 included an entry of consolidation of food aid funding by the state, simultaneously with significant cuts in social security. The institutionalization of food aid as part of basic income is a trenchant illustration of the ongoing change in the political climate in Finland and the tacit transfer of welfare responsibility between the welfare state and the third sector.

In this article, I approach the field by pointing out the satellites by asking:

What are the satellites like in the food aid field centered around a centralized food pantry?

I`m raising changes brought by centralization from structure, agency, and resources perspectives. I explore the dialectics of structure and agency of the field by deepening the theoretical discussion of the critical realist research tradition (Archer 1995, 2000). Changing the structure of food aid affects actors and organizational activities, while the experiences of the actors themselves influence how structures ultimately take shape.

I started collecting data for this ethnographic case study at a centralized pantry in the summer of 2023 to learn about the field. I`ve visited all satellites once during the autumn and will collect the actual data during the spring of 2024, through participant observation. In addition, I`ll collect semi-structured interview data, and photographs, and use other documents of satellites. To combine and analyze the diverse data, I`ll use analytical triangulation.

849

Institutionalization has expanded and consolidated the local field, and many of the misuses taking place on the field have been eradicated. Meanwhile, many key characteristics used to justify food aid (social inclusion, preventing poverty, and a secondary route to reduce food waste) have been lost. It´s an ongoing development, which impact of the food aid field has not yet been studied.

Government Outsourcing and Faith-based Institutions

Éva Perpék

HUN-REN Centre for Social Sciences, Hungary

The outsourcing of traditional state services to non-state actors is not a new phenomenon. From the beginning of the 2000s, the outsourcing of governmental services – primarily in the developed northern and western countries – began to grow noticeably. Nowadays, OECD countries spent an average of 9.5% of their GDP on outsourced expenditure. Within this, 3.3% of GDP was spent on goods and services provided to the public by the market or third sector. (OECD 2011, 2023) These may include variety of social, healthcare, educational, housing or other services. The present paper focuses on outsourcing of social services to faith-based institutions as specific actors of the service provision scene. Through a Hungarian case study, we present main experiences of a development program implemented by faith-based organisations. We highlight peculiarities of project-based social service provision, its perspectives and limitations. We examine the role of host organisations, their networking activities, embeddedness in local communities, and relationships with relevant institutions. We evaluate methodology applied by the project which is composed of diagnosis and permanent presence on the field. Our analysis is based on 224 interviews conducted in the framework of project evaluation. According to our results, faith-based organisations became accepted players of the local service provision. Host institutions and their implemented projects responded local needs adequately. They were able to complement insufficient local social system, introduced new services, channelled missing expertise, and provided flexible solutions to crisis situations. At the same time, some parallel services have been discovered with the state care system, and sustainability of interventions is also questionable.

RN26 | T02_02: Social care

Exploring The Boundaries Of Care: Personal Attitudes And Professional Ethics Of Professional Therapists In The Treatment Of Pregnant Opioid Users

Ioannis Zacharopoulos[1], Vasiliki Petousi[2]

1Therapy Center for Dependent Individuals (KETHEA), Greece; 2University of Crete, Greece

Unwanted pregnancies among women opioid users in Western countries ranges approximately between 70% – 86% proportionally much higher than unwanted pregnancies in the general population (30%-50%). Drug use during pregnancy extenuates the related somatic and psychosocial changes experienced by women and results in high-risk pregnancies. At the same time drug use during pregnancy potentially hinders the provision of care and places limits on the therapeutic relationship to the extent it interrelates with attitudes, beliefs, and professional ethics of the care provision personnel. Scholarly literature and research provide ample evidence of conflicting approaches (therapeutic vs punitive) towards the treatment of pregnant opioid users. This study based on semi-structured interviews of a sample of professional therapists (treatment staff of a harm reduction program in Athens, Greece) investigates the attitudes of professional therapists towards treatment of pregnant drug users and the way professional ethics delineate their daily practice. The analysis highlighted three main themes: i) the conflict of personal beliefs and professional ethics determine the attitudes of professional therapists, ii) gender and parenting do not appear to influence the quality of the therapeutic relationship iii) a strong duty of care to the fetus is recognized, independent of the provision of care to the mother. The study concludes with basic guidelines for therapists and public policy recommendations.

850

Platformization of Care: How Do Care Platforms Transform the Reproductive Sphere in the Netherland and Italy

Elifcan Celebi[1], Michael Kemmerling[2]

1University College Dublin, Ireland; 2University of Cologne

According to a recent report, care platforms providing home services and domestic work have grown, representing 30% of the digital labor platforms in the EU (European Commission 2021: 40). Despite this emerging phenomenon, social care services are overlooked in the platform economy literature, and gendered analysis of the welfare states literature understudies care platforms as new business models. To fill this gap, we ask the following research question: "How do care platforms trigger institutional change in care

regimes?" Bringing together digitalization and social reproduction literature, the paper analyzes care platforms as a new business model introduced to the traditional care mix of national settings. Traditionally, care is provided through public institutions, the (grey) market, or within the family and can be formal/ informal or paid/unpaid. However, emerging care platforms match caregivers and households for tasks ranging from a single instance of housekeeping to long-term elderly care.

Drawing on theories of institutional change, we argue that institutional configurations of national care regimes determine whether care platforms complement or substitute for existing forms of care provisions, thereby challenging or reinforcing national care regimes. We compare the Netherlands and Italy as two ideal types representing community-based and family-based organizations of care. The study triangulates three primary data sources: published European Commission consultations on the European Care Strategy in 2022, quantitative data on care platforms and care policies, and semi-structured interviews with platform managers, traditional care providers, and policymakers. We contribute to the existing literature by studying digital disruption in the reproductive domain, which is at the core of national political economies.

Policy Paralysis And Social Care In Northern Ireland

Susan Hughes

Ulster University, United Kingdom

Purpose

This paper will present a study of self directed support (SDS) in Northern Ireland (NI). SDS is a form of personalisation, a common approach to social care which aims to provide individuals with choice and control over their support. This study considers the decision to implement this practice in the absence of policy and the implications for citizens and professionals.

Methodology

A policy analysis was followed by qualitative interviews with service users, social workers and policymakers. The data were analysed using a constructivist grounded theory approach to develop a theoretical understanding of the lived experience of SDS.

Findings

The ongoing policy vacuum has led to inconsistent implementation and unclear expectations of social care. Reform proposals are ideologically ambiguous, committing neither to welfare universalism nor to laissez-faire marketisation. A labour shortage and unregulated market have contributed to an unstable monopsony. Choice and control were limited for individuals who opted for Trust arranged care. Flexibility and autonomy were experienced primarily by those in receipt of Direct Payments. Social workers and policymakers expressed frustration that Managed Budgets have yet to be implemented. This was attributed to a lack of top-down support.

Research implications

Policy recommendations include urgent updated social care legislation in NI which clearly defines SDS ideology and objectives. A long-term strategy is required, taking into consideration sustainability and workforce reform. State regulation of the social care market is necessary to ensure quality and cost-effectiveness. Investment and clear implementation plans are crucial to embed SDS into daily practices and cultures.

Transformations in Senior Care: Exploring the Intersection of Commercialization, Welfare Policies, and Institutional Dynamics in Romania

Ionut Foldes[1], Mihaela Haragus[2], Neda Deneva Faje[3], Denisa Ursu[4]

1Babes-Bolyai University, Romania; 2Babes-Bolyai University, Romania; 3Babes-Bolyai University, Romania; 4Babes-Bolyai University, Romania

The migration on a broad scale that has occurred in the past twenty years has resulted in a notable reduction of skilled workers in Romania, impacting various sectors of employment, including healthcare and caregiving. The complex phenomenon, exacerbated by the diminishing influence of the welfare state, necessitates a reevaluation of intergenerational care frameworks, leading to the development of new care models led by institutions. This study focuses on the institutional, policy-oriented, and legislative aspects of senior care arrangements that involve outsourcing and commercialization. It explores how these arrangements shift the responsibility of care away from the private family sphere. Preliminary observations, derived from the analysis of official data, reveal substantial disparities in the spatial distribution of licensed services across counties and within each specific county. The significant variations in the accessibility of government services throughout the country are primarily determined by the interplay of legislation, financial systems governing these services, and commercial interests. The study provides an in-depth understanding of the intricate relationships among social welfare, commercialization, migration, and the evolving landscape of aged care in Romania. The findings address both immediate challenges and offer insights into broader societal implications within European and global contexts.

RN26 | T03_01: Poverty

Serving The Poor Or Serving The State? The Ambiguous Role Of Fbos In Poverty Governance In Hungary

Judit Keller, Tünde Virág, Alexandra Szőke

Center for Economic and Regional Studies, Hungary

In recent decades churches and faith-based organizations (FBOs) have taken increasing presence in social service delivery across the globe. These organizations moved into institutional spaces unlocked by the neoliberalisation of welfare states, i.e. the outsourcing of former state responsibilities to various non-state organizations. In Hungary, due to a "new alliance" between churches and the state, FBOs and churches enjoy more autonomy and state support than state institutions. Our presentation focuses on the operation of an FBO, the Hungarian Charity Service of the Order of Malta (Málta), which has ascended into a hegemonic position in a particular segment of poverty governance, targeting the social integration of deprived communities. As such, it provides complex services in mostly rural marginalised communities, which has been abandoned by the current Orbán regime due to the dismantling of services and decreasing social support for the poor. Málta's hegemonic position entails that the organisation not only fulfils significant state roles of service provision in the most marginalised settings, but it has gained discretionary power to frame and develop policies and decide about the distribution of resources, participants of a network of implementors, the parameters of service delivery and the approach and methods of implementation. Our presentation will examine the ambiguities of an FBO in the current illiberal hegemonic context of Hungary to instrument new or alternative modalities, approaches, methods in dealing with inequalities and marginalization.

The Principle of Conditionality in Social Policies. Precarious Rights and the Discipline of the Poor.

Sandro Busso

University of Turin, Italy

The paper focuses on the principle of conditionality, understood not only as a policy instrument, but as a veritable paradigm of public action, which regulates interactions between actors in a condition of asymmetry of resources and power. According to this principle, access to a resource is conditional on the beneficiary's willingness to implement certain behaviours and courses of action through positive incentives, sanctions, pressure. Its diffusion in recent decades has increased exponentially at different levels: from the provision of aid and loans by International Financial Institutions to income support policies in Western countries.

The presentation has a twofold objective and is divided into two parts.

The first part analyses on a broad scale the expansion and transformation of conditionality and its application to different areas of social policies, linked to the spread of paternalistic and disciplinary approaches that rely on the idea of going "beyond entitlement", as the title of L. Mead's famous book suggests.

The second part analyses conditionality at work, starting from a research conducted in Northern Italy on the implementation of income support policies. By relying on a broad qualitative empirical documentation, I will focus on the different representations of conditionality, on their justifications (based either on the principle of effectiveness and on that of justice) and on the practices and experiences of social workers and beneficiaries in their everyday experience

They're Not All Bad: Cross-National Comparison Of Single-Parent Poverty

Roxana Diana Burciu

Bocconi University, Italy

Single motherhood is one of the leading explanations for poverty in high-income countries, leading to increased inequality and other negative outcomes. This study underlines important cross-national variation and uses data from the Cross National Equivalent File (CNEF) to investigate three mechanisms behind these differences. First, we consider the influence of pathways into single parenthood (never getting married, divorce, widowhood, and separation) on personal histories and children's life outcomes. Next, the research explores demographic characteristics and their interaction with economic capacities, emphasizing the importance of protective factors such as education and stable employment. Lastly, we identify family policies as a fundamental tool in reducing poverty among single-parent families, with measures like affordable childcare and paid parental leave playing a substantial role. Results demonstrate that single parenthood varies in prevalence, pathways, and demographic characteristics across countries. The analysis underscores the fundamental role of family policies in mitigating vulnerabilities faced by single-parent households and its interaction with pathways and demographic characteristics in explaining poverty among single-parent families. The study contributes valuable insights into cross-country differences in child poverty.

Financial Inclusion at the Nexus between Social Policy and Finance

Lavinia Bifulco[1], Maria Dodaro[2]

1University of Milano Bicocca, Italy; 2University of Padua

Extensive literature employs the concept of financialization to elucidate the increasing impact of financial actors, markets, and representations across diverse scales and domains. This phenomenon is acknowledged for its role in shaping welfare states and social policies, impacting governance models, and introducing financial instruments and principles into institutions and programs of the welfare state. This contribution delves into the intricate interplay

852

of the social investment welfare state, emphasizing the lack of attention to the role of the life course in the distribution of social risks and the normative importance of social investment policies that enable individuals to manage these risks throughout their lives.

We then proceed to develop a normative framework that takes seriously the temporal dimension of social risks and the life-course perspective. Drawing on the capability approach and the notion of 'capacitating solidarity', we argue that the social investment welfare state should be understood as a normative project aimed at enhancing individuals' capabilities and fostering their autonomy and well-being across the life course. We contend that this perspective offers a more robust normative foundation for the social investment paradigm, one that goes beyond the narrow focus on economic productivity and human capital formation that has characterized much of the existing literature.

Finally, we discuss the implications of our normative framework for the design and implementation of social investment policies, highlighting the importance of a balanced and integrated approach that combines investment in human capital with adequate income protection and social inclusion measures.

Social Investment In Action? The Case Of Active Labour Market Policies In Europe

Author Name

Institution, Country

Text continues here describing active labour market policies across European welfare states and their relationship to the social investment paradigm.

of the social investment shift. Similarly, we also reject a 'luck egalitarian' interpretation of the social investment approach and its tacit conflation with Third Way welfare reform. After these critical precursors, we then explicate our conceptualization of the normative framework of the social investment approach, taking heed from Elizabeth Anderson's relational understanding of 'democratic equality' and Jonathan Wolff and Avner de-Shalit's work on 'secure capabilities'. Finally, we flesh out the notion of 'stepping-stone solidarity' as the normative anchor for social investment welfare provision.

Welfare as Social Investment: Framing Marginalized Citizens as Objects of Investments

Ditte Andersen

VIVE – The Danish Center for Social Science, Denmark

At the turn of the millennium, leading social scientists suggested a new welfare state architecture centered around the rationale of social investment. Policymakers across Europe have since made it a well-established policy paradigm with Nordic welfare states often depicted as frontrunners. In this paper, I consider the political, ethical and social consequences of translating the rationale into operative policies and instruments. Empirically, the paper focuses on Denmark and draws on more than a decade of research on welfare services for marginalized citizens experiencing drug problems, mental illness and homelessness. Theoretically, the paper combines a Foucauldian analysis of governmentality with a Goffmanian orientation to the framing of face-to-face interaction. The paper suggests that the rationale of social investment works on a continuum of manifestation. Sometimes policymakers, welfare professionals or citizens use the concept of investment as a metaphor to argue that allocating resources today will pay off in the future without actually calling for a measurement of return; at other times the social investment rationale manifests in tangible contracts that explicate expected economic return. The power to define value and make decisions on welfare allocation remain pivotal but the investment framing risk camouflaging political judgements as technicalities. The paper ends with a discussion of how the investment rationale may impact lay perceptions of the social contract in a welfare state, and marginalized citizens' sense of deservingness. The discussion outlines two competing frames for investment rationales: One embarking from the market and an economic conception of returns; and one commencing from a democratic society and a social conception of value.

Rethinking Street Level Bureaucracy: Navigating the Tension Between Enacting Everyday Borders in Social Care Practice and Supporting Migrant Families

Julie Claire Walsh, Maria Teresa Ferazzoli

The University of Sheffield, United Kingdom

The global movement of people is an increasing feature of contemporary life that European nation states position as a problem that needs to be controlled. It is widely acknowledged that the UK has created an intentional hostile environment towards immigration, which includes restricting a person's access to social welfare, dependent upon their immigration status. As such, everyday bordering practices have increasingly become a feature of this control, with some social and health care practitioners being required to check the immigration status of migrant families they support and their subsequent entitlement to service provision; in the words of Lipsky, they are expected to be street level bureaucrats.

This paper draws on qualitative data generated during the ESRC funded 'Everyday Bordering in the UK project', with a focus on the narratives of a diverse range of social care practitioners working in the UK. Analysis of their detailed accounts reveals the myriad ways in which practitioners navigate the tension in their practice; they directly and/or indirectly enact everyday borders, whilst also working creatively to support families to manage the impacts of the wider hostile environment on their lives. In doing so, we disrupt and develop conceptions of street level bureaucracy, offering a more nuanced perspective on the relationship between the state, social care practitioners, and the migrant families with whom they work.

RN26 | T05: Children and young people

From Empowerment to Control? The Case of a National Programme for Young People in Peripheral Territoriee

Pedro Abrantes[1], Otávio Raposo[2], Lígia Ferro[3], Pedro Varela[2], Beatriz Lacerda[3], Liliana J. Moreira[3], Teresa Seabra[2], João M. Teixeira Lopes[3]

1CEG, Universidade Aberta & CIES, ISCTE-IUL, Portugal; 2CIES, ISCTE-Instituto Universitário de Lisboa, Portugal; 3Faculdade de Letras e Instituto de Sociologia, Universidade do Porto, Portugal

This paper aims to discuss public policies for young people in peripheral areas, exploring the case of the main programme in Portugal on this area, launched in 2001 and currently supporting 118 local projects throughout the country. Based on the international literature on social policies for vulnerable youth integration, sketching different models and ongoing controversies, we will provide a systematic analysis of the institutional guides of the 9 editions of the program insofar (from 2001 to 2023), as well as external evaluation reports and other studies. Besides, we will enrich our analysis with data collected from interviews with national board members and project local coordinators, as well as some statistical data regarding territories, target-groups and methodological approaches privileged in different editions. Our main goal is to sketch the main trends and challenges in Escolhas programme, as a way to contribute to the international knowledge on social policies for young people in poor outcasts. Although the programme's rationale tends to focus on young people as individuals, our analysis takes into account their structural position, as members of segregated communities. A key issue is how such interventions are actually integrating, empowering and/or controlling young people, as well as which groups are involved and which ones tend to be aside. The ability to effectively improve young people's conditions – on wellbeing, safety, employment, education, political participation, social capital – is examined, along with the impact on the whole communities, while the risk of generating new illusive promises, dependencies and exclusions is discussed.

Affective promises of the Equity Saving Account for Newborns and Finansialisation of the Welfare State

Annika Mikkonen, Armi Mustosmäki

University of Eastern Finland, Finland

As part of Finland's new Government Program (2023-2027), a proposition was made to establish an Equity Savings Account for Newborns (ESAN). The State would grant each newborn Finnish child an initial investment (e.g. 300euros) as part of the maternity pack. Further, mother-child clinics and primary schools would participate in financial education of parents and children, utilizing the ESAN as a tool for financial cultivation. Following political and public discussion spurred on this proposition, we ask, to what problems does ESAN and investing offer solutions? What kind of affective promises are linked to ESAN? In our article, we use the Gramscian concepts of common sense and hegemony to interpret how neoliberal imaginaries on causes for poverty as well as ideas on citizenship and the welfare state were promoted, circulated and re/configured in the discussion. We illustrate how the advocates of the ESAN (politicians, social media influencers, and commentators from public websites) promoted ESAN as an instrument to solve social problems, such as poverty, and even provide an opportunity for future generations to work up their way from generational poverty. Our analysis suggests that the institutions of the welfare state are harnessed to discreetly advance the transforming neoliberal hegemonical ideas, promoting the cultivation of 'future investor-citizen', who act as self-sufficient, financially knowledgeable individual, in the vortex of financialized welfare state. We propose that the rolling out of asset-based welfare in forms like ESAN, works to lay down a path for future welfare retrenchment, gradually weakening the universal social security.

Monitoring of Norwegian Foster Homes

Esben S. B. Olesen

Nord University, Denmark

Based on interviews, this paper explores how the monitoring of foster homes is experienced by children and youths who have been exposed to what they consider abusive behaviour by foster parents. Using a thematic narrative theoretical framework, the article shows that a common narrative in the youths' accounts is a story of mistrust towards social workers and monitoring officers, which relates to a general mistrust towards the child welfare service. The young individuals are reluctant to tell monitoring officers about how they truly experience their situation in their foster home. At the same time, some of the youths have difficulty comprehending what normal parenting behaviour is like, due to previous experiences of neglect from adults. The paper discusses how successful monitoring of foster homes largely stands or falls on the children's and youths' ability to disclose their experiences to their supervisors and monitoring officers. We argue that the youths' narratives

855

tell a story of disempowerment. This represents a dilemma in the monitoring of Norwegian foster homes and in the children's right to protection.

In the Pursuit of a Transformative Welfare State: the Curious Cases of Chile and South Africa

Rommy Morales Olivares[1], Jelena Vidojević[2]

1University of Barcelona; 2New South Institute, South Africa

The experiences of post-apartheid South Africa and Chile in the aftermath of the military dictatorship in "reimagining and reforming" the welfare state, are telling. Return to democracy has not been followed by the "great transformation", instead what happened was a "fine tuning" and "parametric" adjustments of existing policies. Despite of the (left) orientation of the governments in both countries, unquestionable support that they have enjoyed from their constituencies, dire socio-economic situation that required urgent response, structural transformation did not occur, and a comprehensive and inclusive welfare state still represent a distant dream as it was in the times of the "struggle". Over the last couple of decades, capitalism has exhibited increased instability and susceptibility to crisis. Its relationship with democracy has become more delicate in both countries. The fundamental underpinnings of the post-war settlement appear to have been significantly shaken. The symptoms of crisis are mutually reinforcing, and they can be found, to varying extents, in Chile and South Africa.

The 1970s neoliberal revolution has given us dystopia, justified on the grounds that there is no alternative. What we are witnessing today appears in hindsight, as a continuous process of gradual decay. The precarity became the condition of our time, while the promise of the progress can no longer be taken for granted.

The "blueprints" for reforms, that emerged after the 1970s, but also in the aftermath of the 2008 economic crash, made little difference in preventing further decay.

In this paper, we to uncover possible underlining reasons for that. understanding South African and Chilean (within the wider Latin American context) "developmental path" will allow us to better understand the lack of alternatives emerging from the Global South.

RN26 | T06_01: Trust

Exploring the Trust Relationship with the Jobcenter from the Perspective of Sanctions Welfare Recipients

Magdalena Backes

Institut für Arbeitsmarkt – und Berufsforschung, Germany

Concerns about the citizens' declining trust in the government and public administration are very present in political discourse. This applies in particular to controversial policies such as sanctions policy in the basic income support. Understanding trust as a relational concept defined as „the willingness of an entity to become vulnerable to another entity "(Schilke et al.2021, p.240), it is relevant to examine the trust relationship in citizen-state interactions. Therefore, the perspective of sanctioned welfare recipients becomes crucial for how they perceive social and sanctions policy. Focusing on the German basic income support, the presentation explores how experiences of sanctions shape the perception of trust and the relationship between sanctioned welfare recipients and the jobcenter. Empirically, the analysis draws on interviews conducted with welfare recipients in 2022 and 2023.

856

How welfare recipients understand trust and their relationship with the jobcenter in the context of their experience of sanctions depends on how they perceive themselves as trust-givers and trust-takers at the jobcenter and how they identify the object of trust as such. In this regard, various factors and constellations can be identified that can foster the trust relationship or even lead to mistrust. Particularly noteworthy here are the expectations that are placed on various levels such as employees, organisation, institution and system, which are closely interwoven in the perception of trust. These insights into the citizen-state relationship of trust provide important implications for policy implementation at the street level of the welfare state.

Spaces of Equality: Universal Healthcare, Trust and Redistributive Preferences

Tobias Schillings

University of Oxford, United Kingdom

This paper explores the relationship between universal healthcare and individual perceptions of social and public trust by conceptualising universal policies as 'spaces of equality' that shape citizens' relationship both vertically with the state and horizontally with society. In using healthcare as a case study of wider universal welfare programmes, the paper establishes a theoretical link between public trust and the support for redistribution as a political

economy mechanism behind social expansion – with trust acting as a mediator in the relationship between universalism and the political support for redistributive policies.

In relying on a novel Healthcare Universalism Index (Schillings and Sánchez-Ancochea 2023) to measure varieties of universal healthcare provision across the world, and on data from the World Values Survey (WVS) and the European Values Study (EVS), the theory is tested using multilevel regression models across 108 countries.

After establishing a strong association between universal healthcare and social trust, the analysis highlights that a combination of improvements in universal healthcare and trust is necessary to strengthen the support for redistributive policies. With the precondition of trust, universalism has a significantly positive relationship with individuals' preferences for both taxation and social security. As such, the study finds evidence for the hypothesis of 'virtuous cycles of universalism' that universal policies can strengthen social trust by creating 'spaces of equality' which, in turn, can foster cross-class coalitions for supporting redistribution.

Tensions And Trust In Hybrid Social Work – Observations From An International Laboratory Of Case Studies

Ivan Harsløf[1], Ingo Bode[2], Wenche Bekken[1], Simon Innvær[1], Dag Jenssen[1]

1Oslo Metropolitan University, Norway; 2Kassel University

This paper explores the evolving landscape of human service provision in 21st-century welfare sectors, particularly through the lens of social work practice in ever more prevalent hybrid settings. It argues that social workers are increasingly embedded in domains outside of the core social work environment, such as health institutions, labour market administration, educational institutions, or charities in homeless assistance, to mitigate tensions occurring from specialized service delivery, and fostering trust among collaborating organizations and with service users, particularly those in marginalized positions. The presentation is drawing on contributions from an international network of authors (extending beyond the list of authors of this paper) who have conducted case studies on these complexities across different countries and sectors, focusing on domains where social work is not the dominant player and considering dimensions such as the epistemic culture and scope for policy practice among social workers in that situation; professional strategies to solve setting-specific problems; the sense-making about interprofessional collaboration among affected social workers; and dynamics shaping the interface between organisations (including administrative bodies). Most of the evidence emanates from open interviews with professionals. For this paper, we chart configurations of 'hybrid social work' in the above sense and in the aforementioned dimensions, by identifying overlapping issues and common experiences across sectors and countries as documented in the case studies contributed by the above authors. A basic observation is that both institutional and organisational conditions matter greatly concerning the development of both trust and tensions in the settings under study.

Social Policy and Resilience Against Disinformation of social vulnerable population in Lithuania

Daiva Skuciene, Ruta Braziene, Dzina Donauskaite, Ieva Gajauskaite, Viktor Denisenko

Vilnius University, Lithuania

The threats in the geopolitical situation (War in Ukraine) require the society's preparedness and resilience against disinformation, especially in Eastern countries of Europe. Trust in government and democracy are well-known indicators of society's resilience to disinformation and propaganda (Sternisko et al., 2020; Fominaya, 2022). However, the trust in government and democracy varies among groups of society (Dagdeviren et al. 2020). Social vulnerability/resilience literature (Valverde-Berrocoso et al. 2022; Weitzel et al. 2022) tells us the unemployed, low-income or those at risk of poverty, and single or older age populations are more vulnerable to disinformation and propaganda. Their trust in the government and democracy relates to their attitudes to social welfare and socioeconomic position. The trust in the government and resilience against disinformation were analyzed by Morkūnas (2022), Galdikienė et al. (2022), and others. However, the trust in the government about the attitudes to social welfare and resilience to the disinformation of social vulnerable in Lithuania wasn't analyzed. Thus, our research aims to analyze the attitudes to social welfare and trust in the government of the socially vulnerable population in Lithuania as leading indicators for resilience against disinformation. We used Eurobarometer data to implement the aim (2021-2023). The data of the Eurostat in 2022 are used to evaluate the adequacy of social security of benefits receivers. The semi-structured interview data with unemployed, social assistance benefits receivers, and retired persons is used to evaluate the satisfaction of social security benefits receivers with their living standard, their expectations from the government, disinformation recognition level, and media literacy.

857

RN26 | T06_02: Justice and social rights

Predictability versus Flexibility: Dilemmas When Providing Strong Legal Rights to Welfare

Einar Overbye

Oslo Metropolitan University, Norway

In the tradition of TH Marshall and R Titmuss, strong legal rights is the hallmark of good social policies. However, are very strong rights always desirable? The paper investigates five possible dilemmas if all welfare programs are based on strong legal rights. A "dilemma" is defined as a situation where actions leading toward one policy aim simultaneously weaken the ability to reach other, also desirable aims.

1) The activation dilemma. The emphasis on "activation" may weaken legal rights to welfare, assuming that activation is easier to achieve when bureaucrats have a large room for professional discretion. A large room for discretion makes it difficult for agencies handling complaints to decide if claimants were not given their rights.

2) The outcome management – dilemma. Rather than giving people rights to welfare benefits and services, there is a NPM tendency to give them rights to "satisfactory welfare outcomes" – which are more difficult to operationalize if complaining.

3) The flexibility dilemma. A government may not want to 'tie itself to the mast' when issuing an expensive future welfare promise. This may clash with a concern that citizens should live in a maximally predictable welfare environment.

4) The disability dilemma. If we adopt the "social model of disability", the criteria for when someone should receive something may become more difficult to operationalize than when "the medical model" was dominant.

5) Someone's stronger rights may imply someone else's weaker rights. For example, how to balance protecting a child against abuse, and granting its parents due process.

The paper analyses these dilemmas, and discusses how their importance may depend on – and influence – citizens' trust in politicians, welfare professionals and street-level bureaucrats.

Social Class Perspectives on Social Justice and Redistribution. Insights from Contemporary

Cristian Pop, Anca Simionca

Babes-Bolyai, Romania

This study investigates attitudes and values related to social justice, trust, and redistribution from a social class perspective, in Romania. Employing a telephone representative survey of 3666 respondents, with data gathered in December 2021, this research describes how individuals' perspectives on various facets of social justice differ based on social class. These facets include the equality of access to wealth and income, the meritocratic principle linking remuneration with work volume, the principle of unconditional assistance to those in need, and the perception of education's importance in forming social and job-related skills. First, from a methodological perspective, the results reveal a social class schema predicted on a set of objective socio-demographic criteria such as occupation and education, merged with subjective parameters linked to individuals' self-perceptions of their living standards. This class schema reveals gender and age divides, with women overrepresented in aged lower classes. Second, the study provides insights into reasons behind variations in attitudes and ideological stances through the categories of the developed social class schema. Key findings reveal class-based responses to what a just society means, with significant differences between those in more privileged positions and those in less privileged positions. Despite these disparities, there appears to be a widespread societal consensus attributing the existence of poverty to individual factors such as people not working enough. These results underscore the nuanced interplay between social class, perceptions of social justice, and societal values in contemporary Romania.

Sociology in Urban Public Policy Testing: Requisites for Justice as Fairness

Luís Miguel da Silva de Almeida Chaves, João Afonso Bivar de Sedas-Nunes

NOVA University Lisbon and CICS.NOVA, Portugal

This paper has four interconnected stands, merging political philosophy, fundamental and applied sociology. We will argue that a) firstly, a welfare state guided by Rawls' Justice as Fairness principles should provide the keystone for public action in territories on the outskirts of urban centers, especially those characterized by poverty and social exclusion; b) secondly, public intervention guided by these principles must, through direct or indirect means (local partners), seek to substantively mollify the estrangement from the school system and the labor market which numerous segments of these territories population experience, a well-known source for high intergenerational reproduction of inequalities; c) thirdly, the quality of these interventions will profit from: 1) sociology' manufacturing the dimensions and indicators driving the evaluation of the "social actions planned" for "excluded" territories; b) sociology' carrying out research on each constructed dimension. Climaxing, we will present a script drawn up to monitor the intervention carried out in three particularly populous and mediatized territories in the Lisbon Metropolitan Area, the first two with an "immigrant profile" and the last with a "national", and an assessment of how the intervention is being carried out. We believe that the sociological study of these "projected social actions" will render possible an analysis of how intensely and effectively the Portuguese public authorities are conveying the principles of Justice as Fairness. While using Portuguese empirical examples, we

858

intend to establish close links with similar efforts in the European context, in terms of the various identified stands.

Restorative Justice in Italy: New Challenges for the Socio-Legal System

Chiara Scivoletto, Benedetta Polini

University of Parma, Italy

The proposal concerns the Restorative Justice approach in the current italian socio-legal scenario. Considering the variety of definitions, models and origins of this approach, the authors will introduce some questions about the implementation of a recent italian law reform, that, inter alia, establishes the introduction of public services of restorative justice. The presentation will also report some data collected in the Emilia-Romagna Region by the ERVIS research programme, promoted by the italian Ministry of Justice, and carried out by a research team of the University of Parma to evalue the implementation of public services for victims of every kind of crime in the regional territory (as prewieved by the Directive 2012/29/EU of the European Parliament and of the Council that established minimum standards on the rights, support and protection of victims of crime). The presentation will try to show the involvement of various players in the legal culture context, differently equipped in terms of power, resources and useful tools. The presenters aim to highlight the vision ability needed by professionals, mediators, judges, lawyers, social workers to really implement the restorative justice in the public system, given that it asks to protect the victims and the offenders in the meanwhile.

RN26 | T07_01: Work and employment

Between Social Participation and Labour Market Integration: The Role of Case Management in German Jobcentres after the Introduction of the Citizen's Benefit

Claudia Globisch, Peter Kupka, Franziska Berger

Institute for Employment Research (IAB), Germany

Germany's "Hartz IV" law combined unemployment assistance and social assistant to form one benefit. Unemployment Benefit II was bound to lead to social tensions because 2,5m former recipients of social benefit were suddenly considered fit to work. Activating counselling and the use of sanctions were criticized widely and put a strong emphasis on labour market integration. The newly introduced „Citizen's Benefit" (Bürgergeld) attempts to replace pressure by trust and abolishes most sanctions, thus regarding social aspects more strongly. Now the criticism comes from another direction and fears are uttered that incentives to take up work are lacking.

Against this backdrop, it is not surprising that case work in job centres oscillates between social participation and labour market integration. Particularly in the case of unemployed who are remote from the labour market and have placement barriers like health conditions, the question arises whether the dominating employment orientation in counselling is still feasible. For these persons, case management units have been implemented with the aim to reduce employment barriers. They too, however, face the same conflict of objectives.

In our research, we use interviews and non-participant observation to assess how case managers as frontline workers deal with this conflict. Initial results indicate that conflicts between social participation and labour market integration are unavoidable and lead to different types of service – one being more socially inclusive, the other more oriented towards labour market integration. Performance management plays a significant role, often impeding the social aims of case managers.

Coverage Gaps And Policy Design In Contexts of Subemployment: The Case of Spain

Emma Rose Alvarez Cronin

Universitat Autònoma de Barcelona, Spain

In labour markets with structural problems of subemployment, traditional social protection schemes are failing to

859

fully cover non-standard workers. On the one hand, when it comes to contributory unemployment benefits, unstable work conditions make complying with minimum contributions to social security very difficult. On the other, means-tested benefits do not only face important problems of implementation (high rates of non-take-up), but also exclude vulnerable workers by design: income thresholds below the poverty line, incompatibility with labour income, etc. This creates gaps in social protection and income instability for many households, especially the most vulnerable. The aim of this work is to analyse the current coverage gaps in the Spanish income guarantee system based on policy design. Using the microsimulation model EUROMOD, I first undertake a descriptive analysis of the coverage gaps taking into account unemployment benefits and subsidies, regional minimum income schemes and the national Minimum Vital Income. Secondly, I identify the main social and labour market factors that determine the probability of a working-age person of being eligible for contributory benefits, means-tested benefits or being excluded from social protection by design, considering gender as a moderating variable. Lastly, regarding those eligible for either form of social protection, I analyse potential benefit generosity and impact on poverty reduction.

Conditional Inclusion: Employer Engagement in Work Inclusion of Migrants in Norway

Kjetil Lundberg

Western Norwegian University of Applied Sciences, Norway

Active labour market policies (ALMP) are a key approach in European integration policies. While we have much knowledge about the variation of ALMPs, and views from key stakeholders such as management, frontline workers, and service users of ALMP organizations, less is known about the employers' roles and perspectives in these policies. This paper reports from a research project of a local ALMP program that targets migrants in Bergen municipality in Norway, with the aim of transitioning them into job training and/or employment. The study includes fieldwork and interviews with management and street level bureaucrats, service users and employers. A range of sectors and types of employment are represented, but low-skilled jobs are most prevalent. The research is situated within theoretical orientations of street level bureaucracy theory (Lipsky, Brodkin, Zacka) and symbolic boundary work (Lamont). I explore employers as the extended part of street level organisations' role in ALMP, and as moral agents. I find that employers across business sectors generally talk positively and enthusiastically about engaging in work inclusion with migrants, and they draw lines against social exploitation. However, their orientations and motivations vary in terms of social responsibility and will to 'making good' on the one hand, and work demand and pragmatism on the other. The paper analyses various versions of boundary work that are drawn related to conditions for work inclusion, related to candidates' motivation, culture, and skills, and how to distinguish between promising and non-promising candidates for employment.

Observation In Portuguese Labour Courts: Trials and Appeals On Work Accidents Cases

Vanessa Rodrigues[1,2]

1Faculdade de Letras da Universidade do Porto, Portugal;
2Instituto de Sociologia da Universidade do Porto, Portugal

Since 2020 a sociological investigation on the legal compensation regime has been underway as part of the doctoral thesis, now in its final phase. It pursued to understand how the relationship configured between exposure to risk, inequality in the distribution of economic and cultural capital and problems of coverage and democratic access to institutions in the context of legal reparation aimed at labour accidents. Using an "extended" case methodology (Burawoy, 2009), the investigation focused on: studying the relations between individuals and institutions at the interactional and procedure level, by analysing the stages of institutional framework of the injured workers and the respective forms of face-to-face interaction; understand the framework of relations structured between the institutional coverage and the economic and cultural capitals of claimants; understand the configuration of social relations that underlie the reproduction of significant frameworks of inequality in the relationship between citizens who suffer accidents at work and the institutions, the analysis focuses attention, in particular, on the institutions of justice. This contribution seeks to share some of the main results of the ethnographic work, specifically from the direct observation of work accidents trials in Labour Courts and from the analysis of pleas to Court of Appeals.

Resilience, Crisis Response, and Transformation in Lithuanian Social Services (2020-2024): A Mixed-Methods Exploration

Eglė Šumskienė, Violeta Gevorgianienė, Laimute Žalimienė, Eugenijus Dunajevas, Rasa Genienė

Vilnius University, Lithuania

This study investigates the resilience of the Lithuanian social services system in the face of external threats, focusing on its capacity for transformation. Inspired by the imperative to respond to existential threats such as pandemics and wars, which pose challenges to welfare systems, state security, and social cohesion, the research examines the transformative potential of the social services system. Vulnerable populations are particularly susceptible to the impact of such threats; therefore the social services system's role is pivotal in adapting and responding to their needs. Drawing on the shared features of threats, including risk, uncertainty, and tension, the study aims to assess the system's ability to proactively transform itself, ensuring sustainable functionality and contributing to the well-being of society.

This research employs a mixed-methods approach, utilizing semi-structured interviews and focus groups to capture nuanced perspectives from key stakeholders within the Lithuanian social services system. The exploration is guided by the conceptual framework of social spaces, social networks, and the self-regulatory system. The social services system is envisioned as a dynamic social space with interconnected networks of actors, interacting with other social spaces to counter threats and enhance resilience. 'Boundary work' analysis, inspired by Liu (2015), is employed to uncover how resources are exchanged across social space boundaries, how new actors and services enter the market, and how both formal and informal interactions contribute to the resilience of the social services system.

Social Services and Digitalisation

Andreas Mairhofer

German Youth Institute, Germany

Digitalisation is one of the major transformations of our time, not only in terms of technology, but also socially. It influences almost all areas of life. Accordingly, it also affects the welfare state and social services. For example, digitalisation is leading to changes in the needs and risks of the people, it leads to changes in forms of information and communication with citizens and it promises to optimise working processes.

Local social services have long been accused of being sceptical about digitalisation issues. However, the coronavirus pandemic has led to a digitalisation boom in the field of social services. This was accompanied by a shift in the perspective on digitalisation. Before the pandemic, the focus was on digital tools to optimise work in the back office. These developments were often criticised as a formalisation of social work. It was argued that digital tools shift the balance between bureaucratic and professional tasks, that is constitutive for work in social services, in favour of administrative requirements. With the pandemic, the use of digital media as a tool for information and communication with service users has moved to the centre of the discussion about digitalisation in social services. This use of digital media in the front office also harbours challenges. Nevertheless, it is predominantly viewed positively, e.g. as an expression of responsiveness to the communication habits and needs of service users.

Based on a Germany-wide survey of local authorities` children and youth welfare offices conducted in 2022, empirical findings on the status quo of digitalisation – both in the back office and in the front office – are presented and current trends and challenges are discussed.

Family Services Beyond The Pandemic: Bottom-up Innovation And New Models

Giuseppe Moro, Caterina Balenzano

University of Bari, Italy

861

The pandemic has exacerbated existing social inequalities in many countries, with implications for the planning of social policies and the organization of social services. In this context, this paper evaluated how some Family Support Services (FSS) in Southern Italy have developed innovations to better meet the social needs of vulnerable families in a post-pandemic society. Following a mixed approach, the study is based on desk analysis, focus groups and a survey, involving coordinators, social workers, and some user groups.

Despite some critical elements for improvement, the results show that, without changing their mission, FSS have been able to innovate some practices and models from the bottom up, thanks to their flexibility. While some of the activities experimented in the emergency period remain limited to that period, some innovations have been generalized over time, such as the remote spazi neutri (Child contact centers).

However, new fragilities and new targets that are emerging in the post-covid society require a re-definition of working methods to contrast the social exclusion of disadvantaged social groups, as well as to develop new ideas to engage social groups that are traditionally distant from local welfare services, by decentralized activities throughout the territory. These objectives require a long-term investment for destigmatize welfare services and improve social workers' training, in order to promote the trust and well-being of individuals, families and communities.

The Implications and Sustainability of Project-based Outsourcing of Social Services

Márta Kiss

HUN REN Centre for Social Sciences, Hungary

In Hungary – like in other parts of Europe –, the state is gradually withdrawing from the provision of social services and more and more different actors (churches, NGOs, or project institutions) are getting involved (Keller-Virág 2022, Kiss-Perpék 2023, Soliño 2019, Szikra 2018). The central question of our presentation is what are the consequences and how sustainable is when the state tries to fill the lack of social services in disadvantaged areas on a project basis.

The focus of my research is a complex catching-up program covering the most disadvantaged areas of Hungary, from 2017 to 2023. The program aims to prevent the intergenerational transmission of poverty in families with children, primarily by filling gaps in the social care system, but also by providing services such as learning support, community services, etc.

The main methodology of the research is a five-year follow-up study, with three rounds of interviews (270 in total) and field observations in six sub-regions, besides questionnaire surveys in all regions.

Our final results show that project implementation was hampered by several structural problems, like the shortage of social workers and the sudden influx of development funds, resulting in much parallelism, and competition between the projects. Results also show that in resource-poor areas, projects cannot rely on local people, local governments, or NGOs to maintain high-cost services. During the maintenance period, projects are abandoned, which not only leads to a lack of supply for the target group but also makes it more difficult and extremely costly to restart the projects later.

Storytelling for a Change: Instigating Welfare Reform Through Policy Entrepreneurship

Jonathan Berg

Erasmus University, Netherlands, The

European welfare states are at a peak of wealth but nevertheless fail to address persistent poverty (Cantillon 2022). In recent years, this reality has reignited policy researchers' interest in welfare reform. There is, however, a striking imbalance in academic accounts of welfare reform, which is primarily described as a top-down process focusing on regulation and standardization (Oosterlynck et al. 2019). Consequently, the literature lacks an understanding of the role of experimentation and 'bottom-up' innovations. This is problematic, as currently many welfare states are decentralizing and thereby increasing the importance of initiating policy innovations from the grassroots and municipal-level. In this paper, we will address this gap by describing the work of policy entrepreneurs to make experimentation and social innovation possible.

Our case study concerns the controversial (politically and legally) implementation of guaranteed income experiments in the Netherlands. Our research question is: 'How do policy entrepreneurs create 'space' for policy experimentation and social policies in a situation that is experienced as legally ambiguous and politically complex?'. Data was gathered by participant observation in an activist network of NGOs trying to promote income experimentation and by interviews with civil servants and alderman from 12 cities who try to implement these experiments. The theoretical framework that inspired our (narrative) analysis consists of a combination of policy entrepreneurship literature (e.g. Mintrom 2019) and narrative theory (Squire 2020; De Fina & Georgakopoulou 2015).

Our preliminary analysis indicates that to understand how policy entrepreneurs create 'space' for policy experimentation it is important to study different 'layers' that interact and give meaning to their actions – and the outcomes of these actions. Through coalition building, storytelling and framing by policy workers and aldermen, similar policy innovations of giving money to people in vulnerable situations gained widely different meanings in cities in accordance with their heritage, crucial historical events, and social demographics. This shows that policy entrepreneurship is an embedded and highly contextual affair.

Our empirical analysis contributes to the literature on social innovations by revealing the (invisible) work that policy entrepreneurs undertake to enable social innovation and contextualize the innovation to local settings in interaction with other stakeholders.

Disconnected Agendas: Participation and Democracy in EU Social Sector Discourses

Michael Rasell

University of Innsbruck, Austria

Strengthening democracy and promoting social rights are two policy priorities for the European Union. This paper analyses whether these two agendas align in terms of recognising the importance of democracy, participation and voice by people who use social services. It reviews key EU strategies on social rights, the rights of the child and persons with disabilities along with recent European Commission documents on social services. The position of EU-level networks of people who use social services and providers of social services are also considered.

Findings show a disconnect between discourses on democracy and the social sector. Reports and strategies on the social sector rarely consider democracy and may approach 'participation' instrumentally as a means to improve 'effectiveness' rather than the means to instantiate fundamental principles of democracy. These blind spots are worrying because people who use social services often face high levels of structural vulnerability and exclusion from key societal and political structures and are therefore an important group to consider in terms of democratic and civic participation. Linking agendas on participation and social services can also be a valuable opportunity to tackle the 'non-take-up' of social rights and support (cf. De Schutter 2022). Overall, the analysis has implications for understanding issues of democratic citizenship within social welfare systems.

The paper is based on research as part of the Horizon Europe project 'Increasing responsiveness to citizen voice in social services across Europe' (2023-2026).

The Governance of Care: Concepts, Levels And Care Services in Multilevel Contexts

Maria Jesus Rodriguez[1], Francesca Donati[1,2]

1Pablo de Olavide University, Spain; 2Universita degli Studi Milano-Bicocca

The European welfare legitimacy and economic crisis of the 1980s led to a top-down shift of power and responsibility, creating a multi-layered welfare system. New social risks are highly territorialised, and municipality is considered to be the best level to deal with them. The application of the subsidiarity principle and the localization of welfare became and effective, democratic and sustainable solution to deal with macro social and economic changes.

The main objective of this paper is to understand the importance of the municipal level in shaping social care policy, i.e. the relevance of local decision making in choosing the policy framework. To do this, we focus on the concept of care from a multilevel perspective and cross it with the typology of ECEC (Early Childhood Care and Education) and

elderly-targeted servicesin 2 Italian and 2 Spanish municipalities. We carried out a content analysis of 94 documents: 36 Spanish documents: 17 national and 19 regional and two municipal websites; 58 Italian documents: 12 national, 30 regional and 15 local.

We found four main results: firstly, we observed a difference in the conceptualisation of care in both countries depending on the policy issue (0-3 years old and elderly); secondly, regional level is the most influential; thirdly, at the local level some services' innovations exist but the problem's conceptualization converges with the regional and national level. Finally, Spain shows a more gender equality orientation following the global trend while Italy remains stuck.

Beyond Participation: Towards A Concept Of 'Responsive' Social Services

Carla Cristina Pinto[1], Michael Rasell Rasell[2], Fernando Serra Serra[1], Mette Romer Romer[3], David Furtschegger Furtschegger[2], Agnieszka Naumiuk Naumiuk[4], Agathe Osinki Osinki[5], Ana Radulescu Radulescu[6]

1ISCSP Universidade de Lisboa, Portugal; 2University of Innsbruck; 3Aalborg University; 4University of Warsaw; 5Paris Nanterre University; 6IFSW Europe

863

This paper presents the concept of 'responsiveness' as a new way to think about democracy and citizen participation in social services. Responsiveness is defined as the process of learning from and reacting to the perspectives of diverse people who use social services. It has been formulated against the backdrop of scholarly and activist concern that participatory and co-production mechanisms do not fully instantiate the democratic rights of people who use social services to participate and be heard. It aims to specify the conditions in which citizen voice can have an impact on social services and ensure that participation leads to transformation.

The concept is based on a review of critical discussions about democracy, participation and co-creation in literature on governance, public administration and social services. Seven core elements of responsiveness are identified: mandatory responses to user input, active discussion of user feedback, an organisational culture of valuing user input, transparency, promoting diversity, resourcing and accessibility. The paper discusses the interlinkage between participation and responsiveness as well as how its elements are mutually reinforcing and continuous processes involving effort and action over time.

The paper is based on research as part of the Horizon Europe project 'Increasing responsiveness to citizen voice in social services across Europe' (2023-2026). The project seeks to strengthen theoretical understanding and the practical 'infrastructure' for democracy and participation in the social sector.

RN26 | T08_02: Changes in the welfare state

The Evolution Of The Ukrainian Welfare State Since 1990s And Challenges Encountered

Dmytro Mamaiev, Jolanta Aidukaite

Lithuanian Centre for Social Sciences, Lithuania

The fall of the communist regimes across CEE since 1989 has opened a plethora of welfare state and social policy research in this part of the world. The focus was on primarily comparative research carried out in the CEE region, which includes ten EU member states. These studies highlighted that the welfare state in CEE evolved in a similar way as in the West, except the distinct interaction of the communist period, which, however, was also marked by extensive and generous social policies comparable with those in the West. There is, however, less know how the welfare state evolved in the other countries of the Eastern European region which do not belong to the EU such as Ukraine.

The evolution of Ukrainian welfare state is in particular worth of study. Ukraine is being considered the largest country of European continent in terms of its territory. It is a 'newly' emerged state after the collapse of the USSR that pass through the different state of state-building, including such unfortunate ones as a warfare and revolutions. Understanding and contributing towards building of social policies across the country could also impact on stability and prosperity of the CEE region in the mid-long term prospective. Thus, it becomes important to understand how welfare state evolved in Ukraine? What challenges it encountered? What could be learned from its development?

This article seeks to review the evolution of welfare state and social policy in Ukraine since the 1990s. The overarching aim is to document the evolution of the Ukrainian social policy and to reveal which factors contributed mostly to its dynamic.

Temporal Tensions in the Encounter with the Welfare State

Merete Monrad[1], Ghita Dragsdahl Lauritzen[2]

1Aalborg University, Denmark; 2University of Copenhagen, Denmark

When citizens interact with the welfare state, they confront temporal patterns deeply engrained in bureaucracy. Although, literature has highlighted the causes and repercussions of administrative burdens for citizens, few studies within this strand of research direct attention towards the temporality of citizen encounters with state bureaucracy. In this study, we engage with experiences of temporal tensions that arise from citizen-state encounters in context of employment services to examine when waiting turns from an inconvenience to a significant strain on citizen agency.

The article is based on ethnographic fieldwork in Danish job centers, particularly 82 interviews with unemployed claimants and frontline workers. Our study makes three main contributions: First, it shows how administrative burdens nest within temporality. Second, it deepens understandings of the role of time for agency of vulnerable citizens in state encounters by building a typology of the ways citizens exert agency during waiting. Drawing on Bourdieu, we further develop the notion of dead time to illustrate different ways, in which citizen-state interaction may disrupt temporal flows undergirding citizen agency. We illustrate how dead time involves a breakdown of the ability to facilitate temporal structures between past, present, and future, effectively hampering citizen agency. We argue that dead time is a fruitful concept to understand a variety of current forms of social marginalization, suffering and disadvantage arising from encounters between welfare state and citizens. Finally, we highlight how the stratification of time affects experiences of administrative burdens, thereby, illustrating how temporal triggers of administrative costs are unequally distributed.

Declining Social Empathy in the Welfare State? Attitudes towards the Clientele and Level of Social Assistance in Finland, 1995-2020

Heikki Ervasti[1], Tanja Grönroos[2]

1University of Turku, Finland; 2Finnish Institute for Health and Welfare

We analyse what the general public thinks about the clients of last-resort social assistance and the levels of their benefits in Finland. Recent theoretical speculations suggest that social empathy towards social assistance recipients is continuously declining as the majority of the population lives in prosperity and well-being, and therefore lacks contextual understanding of the conditions surrounding those living in poverty and in need of social assistance. This trend is likely to be reinforced as austerity policies are accompanied by public debate on the need to cut social benefits and activate social assistance recipients into the labour market. To test whether the general public is becoming more negative towards social assistance recipients and more willing to cut the level of the benefit, we use a Finnish nationally representative time series survey data from 1995 to 2020. Our results do not support the idea of declining social empathy towards social assistance clientele. On the contrary, attitudes have become slightly more positive towards social assistance recipients during the research period. Most respondents also consider the level of social assistance too low, although demands for a higher level of the benefit have decreased. We find attitudinal differences between individuals according to their socioeconomic background variables, but no increasing polarization between the better off and the worse off respondents. In contrast to theoretical expectations, an empirical analysis of time series data suggests that a large majority of Finns understands the contextual conditions of the disadvantaged and show support for policies designed to help them.

Fighting Violence against Women: Examination of State Institutions in Turkey

Kezban Çelik, Aylin Görgün Baran

TED University, Turkiye

Turkey is a country with a high incidence of domestic violence against women. However, domestic violence against women has been on the social policy agenda since the 1990s. To this end, an action plan to combat violence against women was developed, the first of which was completed in 2007. The fourth action plan, which covers the period 2022-2025, is currently being implemented. The action plans provide for the fight to be carried out within the framework of five main objectives: the development of legislation, awareness-raising and changing attitudes, the provision of protection services and the empowerment of victims of violence, the provision of health services and the development of cooperation between institutions/organisations. 48 institutional structures were identified as responsible in this area. This study sought to understand practitioners' assessments of the institutional structures responsible for implementing the Action Plan. The results of the interviews with experts from 13 different institutions can be summarised as follows: studies on changing the social mentality are insufficient, there are problems with policy implementation and understanding as we move from the centre to the periphery, local governments do not take responsibility and experts have opinions on gender equality. According to the study, the competence of practitioners is the determining element of policy effectiveness. Policies become more localised when they reach the local level.

RN26 | T09: New challenges to the welfare state

Exploring The Nexus Of Social Policy And Humanitarian Policy & Programming

Talita Cetinoglu

University of Groningen, Netherlands, The

This is an exploratory paper discussing the intersection of the study of social policy and humanitarian studies and potential for future research. There is an increasing literature on the interplay of immigration policies and humanitarian programming, and a growing policy interest to link humanitarian assistance and social protection aiming to bring humanitarian and development actors closer in delivering social welfare and assistance schemes to create safety nets against poverty, reduce human suffering in conflict and crises situations.

Overall however, the research and policy debates within the humanitarian sector are mostly blind in engaging with the analysis of actual social policies, failing to explore the domestic and global political dynamics that underlie the evolution of policies and practices. This also hampers a critical appraisal of the faultlines emanating from political normative choices that shape the public sector capacity and positioning vis a vis international norms and globally set standards of humanitarian protections.

Developing a line of research that explicitly examines the interplay between specific social policies and humanitarian policies & practices going beyond the project/programme evaluation logic would: 1) enable a comprehensive analysis of services across multiple sectors (e.g. health, education, labour, child protection..) and how they affect people's lives and wellbeing, 2) help examine the governance mechanisms including tensions and limitations that are at play at the intersect of public policies (or their lack thereof) and humanitarian responses, and 3) explore the role, capacity and leverage of both domestic and international civil society actors within such governance structures.

865

Double Aging Effect: The Challenge of Migration as an Accelerator of Aging Population for Welfare States

Abdyl Nentor Musliu[1], Ridvan Azizi[2], Mehmet Fatih Aysan[1]

1Marmara University, Turkiye; 2İstanbul University, Turkiye

Aging population is widely recognized as a global issue, presenting a significant challenge to the sustainability of welfare states. While the discussions often revolve around developed countries, developing countries are increasingly grappling with the ramifications of an aging population. The dearth of research and policy initiatives regarding aging

populations, particularly in Western Balkan countries, emphasizes the need for comprehensive research and strategic planning. In light of this, this study aims to fill this gap by focusing on identifying and analyzing risk factors associated with aging population in developing countries, especially Western Balkans. More specifically, it delves into migration – people leaving their countries – as a potential risk factor affecting the aging population and its impact on the sustainability of welfare states. Our research pioneers a new framework by introducing the concept of "double aging effect," underscoring the role of migration as a key accelerator of the aging population, alongside fertility and mortality. To understand the impact of migration on the aging pace of Western Balkan countries, we will compare their trends with those European counterparts. We will integrate national statistical data on fertility and mortality rates with insights drawn from national and international research and reports on migration in Western Balkans. Our exploration of demographic transformation in Western Balkan unfold through the lens of the Demographic Transition Theory and goes beyond by emphasizing the pivotal role of migration as a potential catalyst in accelerating the aging process.

Residence-based conditionality and Mobile EU Citizens' Social Rights

Majka Ryan

University of Limerick, Ireland

Based on the empirical findings from a case study in Ireland and a comparative analysis of the implications of residence-based conditionality for mobile EU citizens in the UK, Germany and Sweden, this presentation examines the role of residency-status in limiting mobile EU citizens' social rights across different welfare regimes. Built around the notion of the mobile EU citizen as a self-responsible labour-active worker, the EU Citizens' Rights Directive 2004/38/EC discriminates against vulnerable labour-inactive groups by disregarding the needs of children, ill, elderly and victims of domestic violence as well as certain low-income precarious jobseekers and employees. Thus, fair treatment is extended to those who are socio-economically well off.

The national contextualisation of the Directive and its residency rules are being manipulated by some nation states to discourage the 'unwanted type of migrants' from staying and in some jurisdictions this is forcing groups of people to the margins of society and destitution. Moreover, mobile EU citizens' social rights are impeded not only for those who do not have the EU's right-to-reside but also those who have it. The latter practice is in direct violation with the supranational EU laws and the protections guaranteed to mobile EU citizens by the principle of free movement and equal treatment and non-discrimination. I argue that the Member States' resistance against uncontrolled migration accommodated by the EU principle of free movement highlights the issues of distancing from the Union and heightened nationalism, and points to a rather bleak future of EU social citizenship for mobile EU citizens.

Exploring School Absenteeism in Nordic Elementary Schools: A Meta-Epistemological Analysis

Ingrid Fylling, Esben S. Olesen

Nord University, Norway

This paper presents a systematic literature search examining the issue of school absence in elementary schools across the Nordic countries. Compulsory school is one of the major welfare institutions for children and young people in Nordic countries, responsible for children's well-being during school hours, as well as preparing children for vocational life. Nordic schools are meant for everyone, regardless of condition or qualification. However, acknowledged as a growing problem globally and particularly in the Nordic region, school absenteeism at the primary education level is a concern for policymakers, administrators, and researchers. Its implications are far-reaching, impacting various aspects of children's lives, including academic development, a heightened risk of upper secondary school dropout, and precarious connections to the labor market.
