Ricardo Soares
Diogo Vidal

Research Networks Coordinators

RN01 – Ageing in Europe
Coordinators:
Jenni Spännäri, University of Helsinki and University of Eastern Finland, Finland Anna Urbaniak, Krakow University of Economics, Poland

RN02 – The Sociology of the Arts
Coordinators:
Christopher Mathieu, University of Lund, Sweden, Dafne Muntanyola-Saura, Autonomous University of Barcelona, Spain

RN03 – Biographical Perspectives on European Societies
Coordinators:
Lyudmila Nurse, Oxford XXI, UK, Baiba Bela, University of Latvia, Latvia

RN04 The Sociology of Children and Childhood
Coordinators:
Phil Mizen, Aston University, Birmingham, United Kingdom Vicky Johnson, University of the Highlands and Islands, Scotland Aleksandra Zalewska-Królak, University of Warsaw, Poland

RN05 – Sociology of Consumption
Coordinators:
Marlyne Sahakian, University of Geneva, Switzerland Mikko Laamanen, Oslo Metropolitan University, Norway Piergiorgio Degli Esposti, University of Bologna, Italy

RN06 – Critical Political Economy
Coordinators:
David Bailey, University of Birmingham, UK Yuliya Yurchenko, University of Greenwich, UK

RN07 – Sociology of Culture
Coordinators:
Simon Stewart, University of Portsmouth, UK Rita Ribeiro, University of Minho-Braga, Portugal

RN09 – Economic Sociology
Coordinators:
Andrea Maurer, University of Trier, Germany Giacomo Bazzani, University of Florence, Italy Sebastian Nessel, Vienna University of Economics and Business, Austria Alberto Veira Ramos, University Carlos III de Madrid, Spain

RN10 – Sociology of Education
Coordinators:
Adriana Aubert Simon, University of Barcelona, Spain, Jannick Demanet, Ghent University, Belgium

RN11 Sociology of Emotions
Coordinators:
Yvonne Albrecht, Humboldt University of Berlin, Germany Nina Margies, Humboldt University of Berlin, Germany Natàlia Cantó Milà, Universitat Oberta de Catalunya, Spain Cécile Vermot, Supbiotech Paris – ICM Rotem Leshem, Tel Aviv University

RN12 – Environment and Society
Coordinators:
Audronė Telešienė, Kaunas University of Technology, Lithuania Çigdem Adem, Ankara Rivers Study Group, Turkey

RN13 – Sociology of Families and Intimate Lives
Coordinators:

6

Jacques-Antoine Gauthier, University of Lausanne, Switzerland Katarzyna Suwada, Nicolaus Copernicus University in Toruń, Poland

RN14 – Gender relations in the labour market and the welfare state
Coordinators:
Orly Benjamin, Bar-Ilan University, Israel Paula Koskinen Sandberg, Aalto University, Finland

RN15 – Global, Transnational and Cosmopolitan Sociology
Coordinators:
Marjaana Rautalin, University of Helsinki, Finland Peter Holley, University of Helsinki, Finland

RN16 – Sociology of Health and Medicine
Coordinators:
Guido Giarelli, University 'Magna Græcia', Italy Sandra Racionero-Plaza, University of Barcelona, Barcelona, Spain

RN17 – Work, Employment and Industrial Relations
Coordinators:
Valeria Pulignano, KU Leuven, Belgium Guglielmo Meardi, Scuola Normale Superiore, Italy

RN18 – Sociology of Communications and Media Research
Coordinators:
Thomas Allmer, Paderborn University, Germany Paško Bilić, Institute for Development and International Relations, Croatia Tatiana Mazali, Politecnico di Torino, Italy

RN19 – Sociology of Professions
Coordinators:
Christiane Schnell, Institute of Social Research at the Goethe-University of Frankfurt, Germany Nina Weimann-Sandig, Evangelische Hochschule Dresden, Germany

RN20 – Qualitative Methods
Coordinators: Ulrike T. Kissmann, University of Kassel, Germany Tea Torbenfeldt Bengtsson, VIVE, The Danish Center for Social Science Research, Denmark

RN21 – Quantitative Methods
Coordinators:
Jochen Mayerl, Chemnitz University of Technology, Germany Kathrin Komp-Leukkunen, LUT University, Finland

RN22 – Sociology of Risk and Uncertainty
Coordinators:
Maria Grazia Galantino, Sapienza University of Rome, Italy Bert de Graaff, Erasmus University Rotterdam, The Netherlands

RN23 – Sexuality
Coordinators:
Isabel Crowhurst, University of Essex, UK Eleanor Formby, Sheffield Hallam University, UK

RN24 – Science and Technology
Coordinators:
Ana Delicado, Institute of Social Sciences of the University of Lisbon, Portugal Heta Tarkala, University of Helsinki, Finland

RN25 – Social Movements
Coordinators:
Elena Pavan, University of Trento, Italy Mattias Wahlström, University of Gothenburg, Sweden

RN26 – Sociology of Social Policy and Social Welfare
Coordinators:
Hannu Turba, Kassel University, Germany Volkan Yilmaz, Ulster University, Northern Ireland, United Kingdom

RN27 – Southern European Societies
Coordinators:
Teresa Consoli, University of Catania, Italy Laura Oso, University of La Coruña, Spain

RN28 – Society and Sports
Coordinators:
Alessandro Porrovecchio, University of the Littoral Opal Coast, France Enrico Michelini, TU Dortmund, Germany

RN29 – Social Theory
Coordinators:
Mikael Carleheden, University of Copenhagen, Denmark Kornelia Hahn, Department of Sociology, University of Salzburg, Austria

RN30 – Youth and Generation
Coordinators:
Michela Franceschelli, University College London, UK Evelyne Baillergeau, University of Amsterdam, Netherlands and France

RN31 – Ethnic Relations, Racism and Antisemitism
Coordinators:
David Seymour, University of London, UK Karin Stoegner, University of Passau, Germany

RN32 – Political Sociology
Coordinators:
Alberta Giorgi, University of Bergamo, Italy Louisa Parks, University of Trento, Italy

RN33 – Women's and Gender Studies
Coordinators:
Elisabetta Ruspini, University of Milano-Bicocca, Italy Ana Vidu, University of Deusto, Spain Elzbieta Czapka, University of Gdansk, Poland Lise Widding Isaksen, University of Bergen, Norway

RN34 – Sociology of Religion
Coordinators:
Julia Martínez-Ariño, University of Groningen, the Netherlands Marta Kolodziejska, University of Warsaw, Poland

RN35 – Sociology of Migration
Coordinators:
Margit Fauser, Ruhr University Bochum, Germany Ilenya Camozzi, University of Milano-Bicocca, Italy

RN36 – Sociology of Social Transformations: East and West
Coordinators:
Matej Makarovič, School of Advanced Social Studies, Slovenia Agnieszka Kolasa-Nowak, Institute of Sociology Marie Curie-Sklodowska University, Poland

RN37 – Urban Sociology
Coordinators:
Gabriele Manella, University of Bologna, Italy, Katarzyna Kajdanek, University of Wroclaw, Poland, Vice-Coordinator

RN38 – Space, Society and Rurality
Coordinators:
Apostolos G. Papadopoulos, Harokopio University, Greece Maria Jesus Rivera, Public University of Navarra, Spain

7

Research Streams Coordinators

RS01 – Institutional Ethnography
Coordinators:
Morena Tartari, Babeș-Bolyai University, Romania
May-Linda Magnussen, University of Agder, Norway
Órla M Murray, Durham University, UK

RS02 – Sociology of Celebration
Coordinators:
Ismo Kantola, University of Turku, Department of Social Research/Sociology
Ozana Cucu-Oancea, Institute of Sociology, Romanian Academy
Sabina Hadzibulic, Stockholm University, Department of Social Work

RS03 – Interpretative Interactionism: sociology of Interactions and Meaning
Coordinators:
Don Weenink, University of Amsterdam, Netherlands
Evelyne Baillergeau, EHESS and University of Amsterdam, Netherlands and France
René Tuma, Technische Universität Berlin, Germany

RS04 – Social Sustainability
Coordinators:
Kathrin Komp-Leukkunen, LUT University, Finland
Jolanta Perek-Bialas, Jagiellonian University, Poland
Konrad Turek, Tilburg University, Netherlands

RS05 – Active labour market policies: implementation, challenges and innovation
Coordinators:
Gianluca Scarano, University of Turin, Italy
Lutz Gschwind, Upp University, Sweden – Department of Government
Veronika J. Knize Estrada, Institute for Employment Research, Germany – Department Basic Income Support and Activation

RS06 – European intimate lives and reproductive choices in the face of planetary crises
Coordinators:
Anna-Maija Castrén, University of Eastern Finland, Finland
Lynn Jamieson, University of Edinburgh, UK

RS07 – Politics of engagement and new social pragmatism
Coordinators:
Eeva Luhtakallio, University of Helsinki, Finland
Veikko Eranti, University of Helsinki, Finland
Anders Blok, University of Copenhagen, Denmark

RS08 – Enacting solidarity and citizenship across social fields and scales
Coordinators:
Martin Bak Jørgensen, Aalborg University, Denmark
Sarah Schilliger, Universität Bern, Switzerland
Helge Schwiertz, University of Hamburg

RS09 – Representing society. Sociological cultures of publication
Coordinators:
Oliver Berli, University of Cologne, Germany
Patrik Dahl, Cardiff University, United Kingdom
Laura Behrmann, University Wuppertal, Germany

RS10 Producing, Contesting, and Reconfiguring Urban Sustainability
Coordinators:
Alessandra Landi, Department of Sociology and Business Law, Università di Bologna, Italy
Emiliano Scanu, Department of Sociology, Université Laval, Canada

RS11 – Sociology of Spatial Mobilities
Coordinators:
Knut Petzold, Zittau/Görlitz University of Applied Sciences, Germany
Heiko Rüger, Federal Institute for Population Research (BiB), Germany
Gil Viry, University of Edinburgh, UK

RS12 – Linking Ages – Towards a Sociological Theorizing of Age Constructions Across the Life Course
Coordinators:
Anna Wanka, Goethe University Frankfurt, Germany
Philip Mizen, Aston University Birmingham, UK
Michela Franceschelli, University College London, UK

RS13 – Emotions and Neoinstitutionalism
Coordinators:
Helena Flam, Universität Leipzig, Germany
Nina Margies, Humboldt-Universität zu Berlin, Germany
Åsa Wettergren, University of Gothenburg, Sweden

RS14 – Experiencing and Representing Precariousness: Emerging Labour Configurations and Worker Agency
Coordinators:
Annalisa Murgia, University of Milan, Italy
Renato Miguel do Carmo, ISCTE, Portugal
Joseph Choonara, University of Leicester, UK

RS15 – Armed Forces, Conflict Resolution, and Peace Building
Coordinators:
Kees Koonings, University of Utrecht, The Netherlands
Celso Castro, FGV CPDOC, School of Social Sciences, Brazil

RS16 – Tensions in the Transformation of Knowledge (Cultures): Exploring Stability and Social Order in the Second Modernity
Coordinators:
Barbara Grüning, Università di Milano-Bicocca, Italy
Paul Eisewicht Westfälische Wilhelms-Universität Münster, Germany
Ajit Singh, Universität Bielefeld, Germany

RS17 – Sociological Research in Portugal – Research Stream in Portuguese (abstracts and presentations to be done in Portuguese)
Organised by the Local Organising Committee
Coordinators:
Fernando Bessa Ribeiro, University of Minho, Portugal
Helena Machado, University of Minho, Portugal
Teresa Carvalho, University of Aveiro, Portugal

RS18 – Exploring and Consolidating New Research Strategies in the Post-COVID-19 Era
Coordinators:
Alessandra Decataldo, University of Milano-Bicocca, Italy
Brunella Fiore, University of Milano-Bicocca, Italy

RS19 – Rethinking Dependence: Trust and Social Hierarchies in an Era of Uncertainty
Coordinators:
Judit Durst, UCL, Hungary

8

Stefania Toma, Babeș-Bolyai University, Romania
Gergely Pulay, Centre for Social Sciences, Hungary

RS20 – Maritime Sociology
Coordinators:
Agnieszka Kołodziej-Durnaś, University of Szczecin, Poland
Birgit Pauksztat, Nordland Research Institute and Nord University, Norway
Maciej Kowalewski University of Szczecin, Poland

Tension, Trust and Transformation

What is the value in thousands of social scientists gathering in one location to discuss their work? What value accrues from a large international conference and what is lost without it? Since pandemic restrictions were implemented in the last few years, we have become more familiar with on-line meetings and seminars, with the 15th conference being held online and widely regarded as highly successful. Indeed, it is probable that many forms of work, especially that of academic research, will henceforth use online facilities to a much greater extent than in previous times when the technological capacity may have existed but the psychological mind-set to fully engage with the world of online, work may not have. However, it may also be fair to say that in-person meetings are also now being re-evaluated for their intrinsic value. We always suspected that there was equal value in interactions outside the conference seminar room and now, it is widely accepted that the physicality of a conference cannot be substituted by a screen call i.e. while online work may have resulted in greater efficiencies related to less travel and higher frequency of meetings, it has also inhibited the depth of communication that exists when working in-person with others. During face-to-face conferences, the dynamic within the seminar room, walking around book fairs and the continuation of discussions over coffee, lunch and evening meals are human activities which cannot be substituted.

The COVID-19 pandemic, while acutely felt the world over, was but another driver of inequality, which added to increasing geo-political tensions across the world. Societal challenges were manifold before the pandemic and are not likely to disappear. Arguably, the ways in which societies across the world have dealt with COVID-19 and other challenges has been in some ways correlated with regionally specific longer range socio-cultural traditions. No country has been immune to the tensions of societal limitations on working and family life, not least in the form of travel restrictions. Similarly, there is manifest variability in the trust that people have in scientists and policy makers responsible for dealing with COVID-19. Sociological work is fundamental for dealing with societal challenges, and sociological conferences are the engines driving the ideas which can address these challenges.

The title of the theme for the 16th conference: "Tension, Trust and Transformation", seeks to capture the experiences of recent times, crises and global challenges, such as the Covid-19 pandemic, climate change debates and activism, inequalities and violence, persisting levels of populism and the politics of instability. At the same time, it raises sociological concerns about perennial and new problems to assert the potential for sociological work to have a transformative societal impact in different social spheres.

What do the social sciences have to offer a world going through a persistent pandemic, increasing concern about the acceleration of climate change, a noticeable retreat from democracy and a crisis due to war in Europe?

We know that the heterogeneity of sociology in terms of both theory and methods is at the core of its strength. Given any aspect of society, there are likely to be a wide range of perspectives, each of which have established literatures,

9

case studies, endemic findings, and critiques of other perspectives. Theoretical frameworks span micro social relations to macro analyses of institutional structures. Methodologies help us to understand phenomena in terms of the actor's understandings and their lived context, through to statistical representations and models, making space for subjectivist as well as more objectivist scientific approaches. This multiplicity of possibilities means that sociology has always, well before the push for multidisciplinary, had the potential to throw light upon causes and consequences of inequalities in a variety of ways unhindered by a narrower approach. Debate and disagreement, discussion and discourse, hypotheses and evidence are at the heart of the discipline, and the 16th ESA conference will be the prime forum to showcase our work, argue for different positions, hone methodologies and arguments against opposing perspectives, as well as to joint networking.

Tension

Societies are riddled with tensions. Forms of nationalism are in the ascendancy where borders are being strengthened, cultural differences are being used to promote political ends, and forms of authoritarianism are taking hold. The consequences of political, cultural, historical and economic tensions are felt in harsh terms when conflict between nations escalates. There are, nonetheless, some familiar tensions in terms of the persistent inequalities of class, gender, ethnicity, intersectionality, as well as political and economic tension between rich and poor countries, and in many cases also between different areas of the same country. To these, we can add more recent tensions related to sexualities, gender, transgender, gender-based violence, climate change and the expansion of digital society such as the ways in which social media is used to leverage anger and negativity.

Trust

Trust in institutions and key individuals such as scientists and politicians can be seen as being closely associated with stable and robust systems. The trajectories of trust in government, media, science, business and criminal justice ebb and flow but the rising tide of populism, the growing presence of movements founded on conspiracy theories, and the increasing difficulty with which democratic societies face the process of governing, suggest that there is a crisis of trust. A paradox for sociology is that it must remain at the critical edge of discourse to identify institutional and systemic failures and yet it must also be involved in finding solutions to wicked problems through in-depth analysis of the individual's practices and understandings, and thereby contribute to the building and maintenance of trust.

Transformation

For those engaged with funded research and evaluations of research and publications, the need to demonstrate impact has been a growing requirement over the years. For some this has been a distraction from undertaking pure research but for many it has been a welcome exercise in refocusing research to maximise its transformational potential. The theoretical and methodological diversity of sociology and

its importance to all cognate social science disciplines renders it productive at many levels from campaigning activists to policy makers, from ethnographic to (inter)national studies, incorporating subjective and objective perspectives, and through exploratory and explanatory frameworks. The desire to make a difference, to have an impact, to transform society for the better is widespread among sociological projects.

The 16th ESA Conference will be a place to tackle tensions and trust and to discuss alternatives for social transformation.

Types of sessions

While Research Network and Research Stream sessions cover the immense variety of sociological inquiry, Plenary, Semi-Plenary and Midday sessions offer the opportunity to engage in core debates. All session formats will include time for open discussion.

- **Plenaries (P)** address the main conference theme. They take place in the evenings (Tuesday, Wednesday and Friday).

- **Semi-Plenaries (SPs)** discuss the main conference theme from the viewpoint of different fields of research. They promote discussion between speakers, next to that with participants. SPs are based on proposals made by the ESA Research Networks.

- **Midday (MD)** sessions cover topics which are relevant for sociology as a discipline and/or for the day-to-day work of sociologists. They are offered at lunchtime (on Wednesday and Friday).

- **Research Network (RN)** sessions feature research papers submitted in response to the Call for Papers. The majority of sessions is organised by ESA's 37 Research Networks. RNs are open to all ESA members. All RNs hold a business meeting at the conference (this time on Thursday, August 29, at 13:00, after Time Slot 5. New members are cordially invited to join one or several RNs of their choice. Note that many RNs organise **Joint Sessions (JS)**.

- **Research Stream (RS)** sessions are made by sociologists from several European countries who come together to organize sessions on specific sociological topics. RSs are self-organised bodies with a loose structure which is determined by the researchers who join the stream. While some RSs are regularly organizing sessions at ESA conferences, other RSs offer ad hoc sessions around spur-of-the-moment topics.

Plenary 1

Tension

27 Aug 2024 | 17:30 | Super Bock Arena – Rosa Mota Pavilion

With: **Michael Burawoy and Anália Torres**
Chair: **Lígia Ferro (ESA President 2021-24)**
Michael Burawoy (University of California Berkeley, USA)

Exiting from Settler Colonialism: Comparing Israel/Palestine and South Africa

There are times when sociology must address real-world problems, however divisive and intense. Today the relationship between Israel and Palestine compels such a response, despite the risks – risks that are trivial considering the mounting death toll of the Gaza war. Many have already stepped up to the plate, trying to make sense of this human disaster. What tools does sociology possess to examine this problem fruitfully, constructively, realistically? My own approach is comparative history. That escapes the dangers of false uniqueness, directs us to causal analysis of why things are the way they are, and suggests alternatives. It cannot be neutral, but it can offer engagement at a critical distance. I compare the histories of Israel/Palestine and South Africa as two species of settler colonialism. This is a point of departure – inevitably controversial but a starting point that can be defended – for examining the internal and external forces that have led to their distinctly different trajectories and outcomes.

Biography

Michael Burawoy has been a participant observer of industrial workplaces in four countries: Zambia, United States, Hungary and Russia. His projects attempt to illuminate, in turn, the contradictions of postcolonialism; the organization of consent to advanced capitalism; the peculiar forms of class consciousness and work organization under state socialism; and, finally, the dilemmas of the Soviet transition to capitalism. No longer able to work in factories, he turned to the study of his own workplace – the university – to consider the way sociology itself is produced and then disseminated to diverse publics. His advocacy of public sociology has generated much heat in many a cool place. Of late, with teaching assistants, he has been developing a labour theory of pedagogy. He has been president of the American Sociological Association, president of the International Sociological Association, founding editor of the magazine, Global Dialogue, and co-chair and secretary of the Berkeley Faculty Association.

Anália Torres (University of Lisbon, Portugal)

From turbulent to dangerous times: Gender issues on the battlefield

From Turbulent times, the theme of 10th ESA conference held in Geneve in 2011, where I used financial war as a metaphor for what we were living by then, times turned out to be very dangerous. This is far from imagining that 15 years later we would end up with real war in Europe; or that the rise of extreme right parties, and of xenophobia, nationalism, racism and sexism would be realities we had to deal with nowadays daily.

From all terrains of confrontation gender issues are also a real battlefield. Actually, "Fighting a Battle Our Grandmothers Won" is a phrase that we can read in posters in prochoice demonstrations. Gender issues, as well as women's and LGBTQ+ rights, are hot topics on the polarized political debate in many countries around the world.

After decades of progress concerning gender equality rights, and the constitution of a study field that impacted on not only social sciences and humanities, but also on natural sciences, today gender issues, and gender studies are highly contested and controversial matters. What has been called antigenderism became a central theme in extreme right wing political agendas.

How come that granddaughters and grandmothers now join the same demonstrations and file for rights that years ago seemed guaranteed? How did we get here? I will discuss this topic using sociological tools, mainly benefitting from a very rich field of knowledge constituted by theoretical frameworks and empirical research coming from women, gender and feminist studies.

Biography

Anália Torres, PhD in Sociology, full professor and coordinator of the Department of Sociology in the Higher Institute of Social and Political Sciences (ISCSP), University of Lisbon. She has founded and directs the Interdisciplinary Centre for Gender Studies (CIEG), the only centre for Gender Studies in Portugal graded as Excellent by international panels of the Foundation for Science and Technology (FCT). She was President of the European Sociological Association (2009-2011), of the Portuguese Sociological Association (2002-2006) and has been a member of the European Research Council's (ERC) evaluation panels.

Expert on gender and family issues, she created doctoral, master's, and postgraduate courses on sociology and on these fields, and coordinated several research projects in national and international research networks. Author, co-author, and editor of more than 20 books and of 80 book chapters and articles in national and international scientific journals in several languages. She was awarded the Medal of Scientific Merit in 2023.

11

Plenary 2

Trust

29 Aug 2024 | 18:30 | Alfândega do Porto

With: **Chantelle Lewis, Jason Arday and Nira Yuval-Davis**
Chair: **Teresa Sordé**
Chantelle Jessica Lewis (University of Oxford, UK) and Jason Arday (University OF Cambridge, UK)

"I'll Stand by You: Love, Trust and the Politics of Neurodiversity"

Over the past 5 years, social justice movements have garnered unprecedented levels of media coverage. The zeigeist of this moment continues to be in the struggle to imagine liveable lives for as many people as possible. In this plenary presentation, we position the possibilities of disability justice as providing some of the most imaginative and plausible suggestions for a better world. Through its origins in the toxic fusion of capitalism, racism and ableism; we posit neurotypical hegemony as one of the primary urgencies for modern day social justice work. Expect to be taken on a hopeful, loving yet critical exploration of how race and class become the modality in which neurotypical hegemony persists.

Biography

Chantelle Jessica Lewis is the Andrew Pitt Junior Research Fellow in Black British Studies at Pembroke College, University of Oxford. a public sociologist, presenter, broadcaster and social commentator. Her interests are situated at the intersections of sociology, politics, Black feminism, families and love. Dr Lewis is currently a trustee at The Sociological Review and on the editorial board of Lawrence Wishart Books. Dr Lewis co-founded and presents on the hugely popular and Radio Academy award nominated Surviving Society, a political podcast exploring the local and global politics of race and class from a sociological perspective. She is regularly featured as a commentator and expert on radio, podcasts, and in magazines.

Jason Arday is Professor of Sociology of Education at the University of Cambridge, Faculty of Education. Previously, Jason was Professor of Sociology of Education at the University of Glasgow in the School of Education, College of Social Sciences. Professor Arday has also held the position of Associate Professor in Sociology at Durham University in the Department of Sociology and Deputy Executive Dean for People and Culture in the Faculty of Social Science and Health. He is a Visiting Professor at The Ohio State University in the Office of Diversity and Inclusion and an Honorary Professor at Durham University in the Department of Sociology. Jason holds other Visiting Professorships at University of Glasgow and Nelson Mandela University. He is a Trustee of the Runnymede Trust, the UK's leading Race Equality Thinktank and the British Sociological Association (BSA). In Nov 2023, he was named the 4th most influential person with a disability in the UK on the Shaw Trust Disability Powerlist 100.

Nira Yuval-Davis (University of East London, UK)

"Belonging, bordering and contemporary necropolitics"

We are living at a time in which the Durkheiman pre-contractual contract, so essential for the possibility of trusting any social and political solidarity, is highly damaged. The double crisis of governability and governmentality of neo-liberal globalisation has brought with it the rise of different kinds of identity politics, both on the Right and on the Left, as defensive strategies.

In this presentation I shall discuss some of the manifestations of these strategies and their effects on contemporary politics of belonging. I shall focus on the role of everyday bordering in these strategies and the growing necropolitics – the dehumanization of 'the Other' and their entitlement to life – as one of their outcomes.

Biography

Nira Yuval-Davis is Professor Emeritus, Honorary Director of the Research Centre on Migration, Refugees and Belonging (CMRB) at the University of East London. A diasporic Israeli socialist feminist, Nira has been active in different forums against racism and sexism in Israel and other settler colonial societies as well as in the UK and Europe. Among other activities she has been the President of the Research Committee 05 (on Racism, Nationalism, Indigeneity and Ethnic Relations) of the International Sociological Association, founder member of Women Against Fundamentalism, the international research network on Women in Militarized Conflict Zones and Social Scientists Against the Hostile Environment.

Nira Yuval-Davis has won the 2018 International Sociological Association Distinguished Award for Excellence in Research and Practice. The article she has written with G. Wemyss and K. Cassidy on 'Everyday Bordering, Belonging and the Reorientation of British Immigration Legislation', Sociology, 52(2), has won the 2019 Sage Sociology Award for Excellence and Innovation.

Among her books Woman-Nation-State, 1989, Racialized Boundaries, 1992, Unsettling Settler Societies, 1995, Gender and Nation,1997, The Warning Signs of Fundamentalism, 2004, The Politics of Belonging: Intersectional Contestations, 2011, Women Against Fundamentalism, 2014 and Bordering, 2019. She is currently developing her recent article in Sociology on Antisemitism as Racism into a book. Her works have been translated into more than ten languages.

12

Plenary 3

Transformation

30 Aug 2024 | 18:00 | Casa da Música

With: **Michael Biggs and Jana Hainsworth**
Chair: **Gary Pollock**
Michael Biggs (University of Oxford, UK)

"How critical social theory has transformed institutions and culture"

In the last ten years, Western societies have experienced a significant transformation in their institutions and culture, with increasing emphases on race, gender, and sexuality. This transformation has many potential causes, such as the rise of digital social media. My aim is to evaluate the impact of academic theories developed in the 1980s, such as queer theory and critical race theory. Can we view such theories as self-reinforcing prophecy? I will draw on the literature on the performativity of economics, which argues that economic theories construct as well as describe their object. A case study will illustrate how Judith Butler's conception of gender impacted the operation of English prisons in the 2010s.

Biography

Michael Biggs is Associate Professor of Sociology at the University of Oxford and Fellow of St Cross College. His primary research focuses on social movements and political sociology. In the area of sex and gender, he has published on various subjects. One is on the evidence for puberty suppression in children experiencing gender dysphoria. He has acted as an expert witness in legal cases in England, Australia, and the United States. Another subject is the influence of queer theory on prison policy. Most recently he discovered serious errors in the gender-identity question used by the 2021 Census of England and Wales.

Jana Hainsworth (Independent Consultant)

"Science, Politics and Activism: Together advancing children's rights and well-being across Europe"

When and why did the European Union start to champion children's rights? What and who influences policy making and politicians at EU level? What is the current state-of-play post-European Parliament elections June 2024? What does the future hold for collaboration between research, civil society and politics to protect and promote a rights-based approach to social progress and investment in children and families across Europe?

This presentation draws on the speakers' experience leading a European NGO advocating for the rights and well-being across Europe from 2006-2022. It traces the steps that led to the adoption of a European Strategy on the Rights of the Child and the European Child Guarantee by European leaders in 2021. It maps the dynamics of EU influence over time, exploring the relationship between research, evidence and activism and some of the tensions therein.

Between 6-9 June 2024, around 400 million Europeans can vote for their representatives to the European Parliament. The results will determine who leads the EU institutions and their political priorities for the next 5 years. The presentation will reflect on the outcomes and the risks and opportunities for academia and civil society working to advance children's rights and well-being across Europe.

Biography

Jana Hainsworth is an expert in EU social policy and children's rights. She has over 25 years' experience working at EU level, influencing policy and helping organisations to communicate and implement those policies at national level.

From 2006 to 2022 she was Secretary General of Eurochild, a network of organisations promoting the rights and well-being of children across Europe. She helped design advocacy campaigns on early childhood development and deinstitutionalisation. During her leadership, Eurochild influenced several EU policy milestones, notably the EU Strategy on the Rights of the Child and the European Child Guarantee.

From 2015-2019 she was elected President of Social Platform bringing together 45 civil society networks advocating for a stronger social Europe. In 2017 she led Social Platform's delegation to the Gothenburg Summit where Heads of State signed the European Pillar of Social Rights. The 'Social Pillar' remains the North Star of EU social policy today.

Jana is an independent consultant since March 2023. She works at the intersection of private philanthropy, civil society and the EU. Her mission is to help social change advocates more effectively harness EU policies and funding.

SP01 | "Building Open Science Together: Transformative Concepts and Practices"

28 Aug 2024 | 9:00-10:30 | FC4.0.41 (Faculty of Science – Venue C)

With: **Nick Lindsay and Elena Giglia**
Organisation and chairs: **Lígia Ferro (ESA President 2021-24)**

Different European agencies and countries have been reinforcing the open access policies at the level of research funding, which has contributed to a spirit that open access to publish and read, thus to production and access of scientific knowledge, is a basic right of citizens and the optimal strategy to pursue in the upcoming years. Universities and research centres are increasingly publicly committed to open access. Several sociology, social sciences and humanities journals have been shifting to open access lately and there is a wide understanding that the community as a whole should work together to contribute to this process.

Open access has been a subject of intensive discussion within the ESA for the last few years. The ESA envisions access to knowledge as a human right and as a means to pursue social justice. Open access allows for research and innovation improvement while it can also contribute to decision-making at different societal levels and build better societies. Inspired by MIT's excellence, upon witnessing its investments in successfully pursuing Open Access and after getting to know the MIT Shift + Open Initiative), the ESA Executive Committee decided to go fully open access with its journals in partnership with the MIT Press.

So far, debates about open science have focused mainly on access to knowledge by the readers. Nonetheless, there are also unequal funding and publishing opportunities, and it is vital to ensure access to research excellence, regardless of any submitters' characteristics: their economic resources, territorial location, gender, ethnic, sexual orientation, or age. The open-access model allows to guarantee equal access for both authors and readers while siding libraries' pursuit of affordable knowledge diffusion. In this sense, investing in open access should be a real priority for sociologists and social scientists in general as it will improve public engagement.

At this session, the speakers will bring transformative concepts and practices to engage the scientific community in this collective and essential task: building open science together.

Nick Lindsay (MIT Press, Director of Journals and Open Access)

Access to Science and Scholarship, Key Questions About the Future of Research Publishing

In November of 2023, members of the MIT faculty and staff at MIT Press release a report entitled, Access to Science and Scholarship, Key Questions About the Future of Research Publishing. The report lays out a research agenda for the future of scientific publishing and suggests many questions that need to be answered in order to create and protect a robust and equitable publishing ecosystem. This talk will expand on several topics related to the report, including peer review, open access, open science practices, and open infrastructure to support the publishing enterprise.

Biography

Nick Lindsay has worked for The MIT Press since 2008 where he leads both the journals division and the Press' open access efforts. He's focused on developing new titles and business models to support the Press and has worked extensively with scholarly societies, university departments, and others on innovative journal projects, including Rapid Reviews: Infectious Diseases. Before MIT, Nick worked at the University of California Press in their journals group.

Elena Giglia (University of Turin)

Why do we need Open Science

Open Science is often perceived as the umpteenth administrative burden, or something imposed by European rules in research programs. Actually, Open Science is a powerful tool to get a research process which is more efficient, as every component is ready to be reused and build upon, and more respondent to societal needs, as built in dialogue and co-creation with society. In this way, Open Science can work as a corrective in the current scholarly communication system which is plagued by retractions and scientific misconduct induced by the hypercompetitive evaluation criteria in place. Open Science is functional to research integrity as the entire research workflow is transparent, allowing for checks and reproducibility. Sensitive and personal data are considered the logic "as open as possible, as closed as necessary" and are enabled by the FAIR principles (Findable, Accessible, Interoperable, Reusable). In the end, Open Science can be both boosted by and act as an enabler of the ongoing reform of the research assessment framework under the COARA initiative.

Biography

PhD, Masters' Degree in Librarianship and master's degree in public Institutions Management, is Head of the Open Science Unit at the University of Turin. She was a member (2019-2020) of the Committee on Open Science at the Ministry for University and Research (MUR), in charge of drafting the National Plan Open Science. She actively collaborates with ICDI – Italian Computer and Data Infrastructure Competence centre on Open Science, EOSC and FAIR data,

14

organizing the Open Science café and collaborating with the editorial board of open-science.it. She is the delegate of OPERAS, the Research Infrastructure for Open Science in the Social Sciences and the Humanities, in the EOSC Association, where she is a member of the Task Force Researchers Engagement and Adoption. Since 2017, she has been a partner in 8 EU-funded projects. She has been part of the European Open Science network for many years, attending national and international conferences, and writing and lecturing on Open Access and Open Science. She never stopped learning and attends training courses and workshops.

She takes part as invited expert in several EU Workshops on Open Access and Open Science. She coordinated (2019-2021) the CO-OPERAS Implementation Network in GO FAIR and represents Italy in the OPERAS research infrastructure Executive Assembly. She serves in several Scientific Committees and Advisory boards. She served as one of the Italian National Open Access Desk-NOADs for OpenAIRE. She has edited since 2010 the web portal OA@UniTO, www.oa.unito.it.

SP02 | "Culture and Education for Transforming Societies"

28 Aug 2024 | 9:00-10:30 | FC4.0.40 (Faculty of Science – Venue C)

With: **Isabel Menezes and Pedro Abrantes**
Organisation: **Local Organising Committee: João Teixeira Lopes (University of Porto), Carla Malafaia (University of Porto) and Sílvia Silva (Centre for Social Studies of the University of Coimbra)**
Chairs: **Carla Malafaia and Sílvia Silva**

The sociological perspective places education and culture as the bases for action and democracy. Assuming that education and culture intersect and accumulate in the promotion of both transformative public policies and grassroot communitarian practices, this semi-plenary intends to reflect on the state of the art of this intersection, opening up avenues for shaping the future. To do this, it will look at education and culture in terms of their intrinsic values and outside economic instrumentality, with which they establish non-subalternate connections. Culture and education must forge alternative economic logics, giving them their social roots, criticising their abstract nature and contesting their detachment from social processes and practices. Current times of socio-political turmoil strongly call for efforts to imagine new cultural toolkits and educational bonds that can enact collectiveness and be sustained by transgressive modes of meaning-making and knowledge production.

In this way, the logics of education and culture will contribute to a plural perspective on social phenomena, focusing on the forms of socialisation, the conditions of communication, and the possibility of acquiring dispositions and skills not limited to reproducing business as usual. At the education-culture intersection, we can find the foundations for a new social contract based on autonomous, responsible and supportive individuation, on exchange and interculturality, relational and critical subjectification, and a shared sense of societal transformations outside of one-dimensional, top-down, authoritarian and bureaucratic logics.

Speakers
Isabel Menezes (PhD, Full Professor, Centre for Research and Intervention in Education (CIIE-FPCE.UP), University of Porto)

On (political) emotions and education in contemporary democracies

There has been a 'rediscovery of passion' (Marcus, 1991) in politics, even if not without ambivalence. For some, the growing emotionality in politics would be related to the rise of (mostly right-wing) populism, with strong connections between anger, fear, and authoritarianism – following Le Bon's (1895) cautionary notes of the 'exaggeration of the sentiments and its risks for political principled reasoning. For others, emotions are an inevitable part of political participation, and the lack of a 'public culture of emotion' (Nussbaum, 2013) that celebrates the love for pluralism and radical equality is one of the contemporary dangers for the survival of democracies. I will depart from recognizing the transversality of emotions and relationality in political phenomena across time and space, and how denying it is a basis, now as in the past, for excluding a significant part of political actors, including children and young people. Then, I will explore how spaces for collectiveness and pluralism, such as schools, can engage emotions, reflexivity, and participation as essential for generating more complex, collaborative, and creative ways of relating with the political.

Biography

Isabel Menezes has a degree and a PhD in Psychology and a habitation in Education Sciences from the University of Porto, where she is a Professor in the Department of Education Sciences. Her research deals with the civic and political participation of children, young people and adults, with a particular interest in groups at risk of exclusion. The main goal is to explore if and how formal and non-formal education (including artistic) experiences can generate more complex ways of relationship with the political. She coordinated several funded inter/national research projects and is currently the Director of the CIIE – Centre for Research and Intervention in Education.

16

Pedro Abrantes (Universidade Aberta, Centro de Estudos Globais and ISCTE-IUL, Centro de Investigação e Estudos de Sociologia)

Education and Social Classes in Europe: tensions, trust and transformation

This intervention will discuss recent trends and some current prospects regarding the relation between education and social classes, in Europe. Education is often referred either as a central leverage of transformation, trust and social mobility or an arena of (class/ethnic) tensions and inequality reproduction.

Based on recent research on this topic, as well as an analysis of comparative data, this session aims to provide an overview on how education has contributed to social mobility/reproduction in Europe, during the last 50 years, comparing different countries and generations. Acknowledging the relevance of the socioeconomic indexes and the racial categories, this analysis sustains the enduring relevance of the concept of social class to understand domination, distinction and closure strategies, as well as democratization, mobility and usurpation movements. Trust is here conceived as a key element to avoid tensions, highly dependent on the consistency of public policies to promote Constitutional rights and people's aspirations.

After, we aim to reflect upon two ongoing processes – the increase of international schools and the "full-time

education" policies – as "case studies" to contribute for the discussion on how the current (social) tensions between social classes are transforming the (primary and secondary) education systems in Europe. Such relation between (private) distinction and (public) democratization movements is paramount to forge the future of our societies.

Biography

Pedro Abrantes is Professor at Universidade Aberta and at Iscte-University Institute of Lisbon. He holds a bachelor's degree (2002) and a PhD (2007) in Sociology, focusing his work on education, socialization, social inequalities, and life pathways. Member of the Portuguese Sociological Association, where he coordinated the Sociology of Education section (2009-13), and currently coordinates the Classes and Inequalities section. He developed research for some years in Mexico and collaborates regularly with international agencies on education development. From 2016 to 2022, he worked for the Portuguese educational administration, as Minister's advisor and deputy director of the statistics department. Among dozens of titles, he published "Socialization and inequality" (Current Sociology), "Gendering social mobility: a comparative perspective on the nexus of education and class in Europe" (Gender and Education), "Full-time Schools in Portugal" (Journal of New Approaches in Educational Research), "Analysing biographies in transnational educational spaces" (Globalisation, Societies and Education).

17

SP03 | "From the Risk Society to Surveillance Capitalism and Authoritarian Modernity: Theorising Contemporary Society"

28 Aug 2024 | 9:00-10:30 | LC.001 (Faculty of Arts and Humanities – Venue L)

With: **Sylvia Walby and Christian Fuchs**
Organised by RN18 Sociology of Communications and Media Research and RN29 Social Theory
Coordinators and Chairs: **Thomas Allmer (University of Paderborn), Paško Bilić (Institute for Development and International Relations, Croatia), Mikael Carleheden, (University of Copenhagen) and Frank Welz (University of Innsbruck)**

This semi-plenary will ask in which society we live, how it is best termed and how it is best theorised. Back in the 1980s and 1990s, some sociologists claimed that we live in a risk society (Ulrich Beck and Anthony Giddens) or a network society (Manuel Castells). While millions have been hit hard by the financial crisis, austerity cuts and the rise of precarious working and living conditions around the globe, the reference to capitalism has come back to the sociological agenda. Concepts such as capital in the twenty-first century (Thomas Piketty), digital capitalism and surveillance capitalism (Shoshana Zuboff) have been made popular recently. Currently, there is a debate on how far we still live in a neoliberal or rather a post-neoliberal world order. Nancy Fraser and Wolfgang Streeck both suggest that we live – in reference to Antonio Gramsci – in an interregnum, where the old neoliberal order is coming to an end and the new system cannot yet be born. Regarding the overall conference theme, the task will be analysing tensions in contemporary society, characterising the spreading of trust and discussing sociology's role in societal transformation:

1. Theorising tension: More specifically, to study the tensions and contradictions between the haves and have-nots along class, racism and gender relations in contemporary Europe and beyond.

2. Theorising trust: In particular, to develop an understanding of how trust, solidarity and democracy are shaped in the twenty-first century.

3. Theorising transformation: In detail, to investigate the broader political realities and potentials in terms of transforming modern society to a more equal and just society.

The semi-plenary wants to debate these questions and tasks with international experts in the field.

Speakers
Sylvia Walby (Professor, School of Law and Social Sciences, Royal Holloway, University of London)

Theorising Contemporary Society: From Risk Society to Authoritarianism

Rebuilding the concept of society to address the turn in modernity towards authoritarianism is the aim of this paper. I address the tensions generated by intersecting regimes of inequality, and the role of crises in societal transformation. I rework the concept of society, using complex systems theory. I argue for the inclusion of violence alongside economy, polity, and civil society; and the inclusion of gender regimes and coloniality alongside capitalism. Without including violence, gender, and coloniality, it is hard to theorise the turn to authoritarianism. The concept of modernisation is pluralised into multiple varieties: authoritarianism is distinguished from neoliberalism (Streeck, Fraser, Bruff) and fascism (Mason, Robertson), as well as social democracy. The analysis of change, using complexity theory, includes crisis, tipping points and path dependency. I draw on classical (Durkheim, Weber, Marx, Du Bois, Gilman), recent (Giddens, Beck, Tilly, Mies), and contemporary (Go, Bhambra, Scott) sociology. I address societal transformation in modernity/ies (Eisenstadt, Giddens, Beck), including globalisation (Castells, Wallerstein, Chase-Dunn), (post) colonialism (Du Bois, Go), and gender transformations (Fraser, Gottfried, Shire). The substantive focus is the (re) turn to authoritarianism, linked to de-democratisation and declines in trust (Lombardo, V-Dem, Verloo) and to crises (Gramsci) of finance (Minsky, Piketty), war (Mann), and climate (Urry). Yet, these crises can be resolved in other ways. I develop the concept of society, deploy complex systems theory, include gender regimes and coloniality, and identify the importance of violence, to analyse the return to authoritarianism and alternative trajectories.

Biography

Sylvia Walby is a Professor in the School of Law and Social Sciences, Royal Holloway, University of London. She holds the Alexander von Humboldt Foundation Anneliese Maier Research Award and is Visiting Professor, University of Duisburg-Essen. She is a Fellow of the British Academy, and a Fellow of the Academy of Social Sciences. Sylvia was the founding President of the European Sociological Association. She is founding Co-President of the International Sociological Association's Thematic Group on Violence and Society and was President of ISA's Research Committee 02 on Economy and Society. She was Chair of the Sociology sub-panel for REF2021. Sylvia held the UNESCO Chair in Gender Research at Lancaster University. Books include Crisis (Polity 2015), Globalization and Inequalities: Complexity and Contested Modernities (Sage 2009), and The Concept and Measurement of Violence against Women and Men (Bristol 2017). Her next book is Trafficking Chains: Modern Slavery in Society (Bristol 2024).

18

Christian Fuchs, Professor, Department of Media Studies, Paderborn University

Critical Theory Foundations of Digital Capitalism: A Critical Political Economy Perspective

The overall task of this paper is to outline some foundations of a critical theory of digital capitalism. The approach of the Critique of Political Economy is taken as the starting point for theorising (digital) capitalism.

First, the paper discusses selected classical definitions of capitalism. Theories of digital capitalism must build on definitions and theories of capitalism. If capitalism is a societal formation and not only an economic order, but the analysis of capitalism is also the analysis of economic exploitation and non-economic domination phenomena and their interaction. Theories of digital capitalism should also address the question of how class, racism, and patriarchy are related in the context of digitalisation. Second, the author introduces a notion of digital capitalism that is based on Marx's approach of the Critique of Political Economy. Third, the paper engages with one influential contemporary approach to theorising capitalism, Nancy Fraser's Cannibal Capitalism. The author discusses what we can learn from Fraser's approach to theorising digital capitalism. Fourth, the author discusses existing understandings of digital capitalism that can be found in the academic literature. These definitions are compared to the understanding advanced in this article. Fifth, the paper discusses the relationship of the notion of digital capitalism from a Critical Political Economy perspective in comparison to the notions of the network society/informational capitalism (Manuel Castells), surveillance capitalism (Shoshana Zuboff), and platform capitalism (Nick Srnicek). Sixth, the paper reflects on the relationship between digital capitalism and violence as we live in a (digital) age where a new World War is all but uncertain. Finally, some conclusions are drawn.

Biography

Christian Fuchs is a critical theorist. He is co-editor of the journal tripleC: Communication, Capitalism and Critique and a professor at Paderborn University.

SP04 | "Decolonizing youth mobility: beyond the normative and Eurocentric youth/mobility nexus"

28 Aug 2024 | 9:00-10:30 | FC1.0.03 (Faculty of Science – Venue C)

With: **Shannon Philip and Aleksandra Grzymała-Kazłowska**

Organised by RN30 Youth and Generation and RN35 Sociology of Migration
Coordinators and Chairs: **Michela Franceschelli (University College London, UK) and Ilenya Camozzi (University of Milano-Bicocca, Italy)**

The recent growing interest in the forms of mobility/migration of the younger generations as an entry point for studying their transition processes to adulthood lies at the heart of this joint reflection between RN 30 and RN 35.

In the early 2000s, the announcement of a 'mobility turn' in the social sciences (Urry 2002) offered an opportunity to re-conceptualise youth transitions as 'mobile' and so mobility as a new marker of adulthood. Today global transformations such the climate crisis or the pandemic are inevitably reshuffling the configurations and features of both human mobility and life course transitions. Yet, the 'mobility turn' only partially addresses these new tensions and the inequalities entailed by increasingly diverse flows of moving people.

With this proposal, we aim to open a dialogue and reflect on the inter-connected risks of normalising various forms of movement under one category anchored in an idealised view of youth and restricted to a privileged segment of subjects. These include the risk of neglecting of gender and structural inequalities (Philip, 2022; Nayak 2026), immobility (Cairns and Clemente 2023), the experiences of minoritised youth (Frisina and Hawthorne 2018), the role of whiteness in shaping migration and adaptation journeys (Morosanu et al 2019), the risk of polarising the actors involved in the movement: labour migrants versus mobile high-skills actors (Faist 2002) and of not problematising notions of identity and integration (Grzymala-Kazlowska 2016).

Finally, with decolonising youth mobility, we seek to challenge normative notions about the youth/mobility nexus entangled in the Western-centric gaze (Boatcă 2016) lurking behind the mobility turn.

Speakers
Shannon Philip (Sociology, Associate Professor of Sociology, Faculty of Social Science, School of Social Work, University of East Anglia)

Caught-In-Between: Decolonising Young Men's Mobility and Immobility in Neoliberal India and South Africa

Youth mobilities have often been imagined in linear and normative ways within mainstream 'youth sociology'. However, in various post-colonial global contexts like Brazil, Egypt, India or South Africa, deeply embedded colonial legacies, intersecting with dynamics of deep racial and class inequality, as well as rapid neoliberal transformations and consumer cultures, have opened important questions around the idea of 'youth' and their 'mobility'. From a gendered perspective, the lives of young men offer an interesting vantage point to explore how patriarchal obligations, male privilege, as well as men's vulnerabilities and anxieties, shape their mobility as well as their immobility.

In this paper, using qualitative and ethnographic data from longitudinal fieldwork with young men aged between 18 – 29 from New Delhi and Johannesburg, I argue that young men are 'caught-in-between' various gendered dynamics of mobility and immobility. Critically understanding this in betweenness of young men, makes two primary contributions: 1) It challenges the normative and often heteropatriarchal ideas of young men's mobilities and 2) It provides empirical evidence to think beyond Western-centric approaches to life-courses whilst contributing further to the research and political aims of Global Sociologies and Connected Sociologies.

Biography

Shannon Philip is a Lecturer (Assistant Professor) in Sociology at the University of East Anglia and a Research Associate at the University of Johannesburg. He recently published his first monograph with Cambridge University Press entitled Becoming Young Men in a New India: Masculinities, Gender Relations and Violence in the Postcolony (2022). His current research comparatively explores youth, masculinities, sexualities, urban transformations, and gender relations in South Africa and India.

Aleksandra Grzymała-Kazłowska (University of Warsaw)

Mobility, anchoring and inequality. Looking at the youth/mobility nexus from the processes of adaptation and settling

The talk will argue for the need to rethink established concepts such as identity and integration to capture multidimensionality and complexities of processes of adaptation

20

and settling in the context of youth mobility. To untangle the youth/mobility nexus, contemporary fluidities, complexities, diversities and inequalities must be brought to the fore, so the previous notions should be reconceptualized or new tools developed in our analyses. After the critical assessment of the existing conceptualizations in migration studies concerning migrants' adjustment and functioning, the paper will discuss the opportunities and challenges in employing the concept of anchoring, which links the notions of adaptation, identity, and settling while highlighting the issues of safety and stability. Anchoring will be presented as a potential alternative lens to the notion of integration, offering a more multidimensional and dynamic perspective to better understand the experience of adaptation and settling among today's migrants in complex, diverse, fluid and divided societies, particularly in the current time of tensions, conflicts and uncertainties. It allows for capturing transnational processes, uneven and relational character of settling and changes in anchoring – its flexibility and reversibility, including the processes of un-anchoring or re-anchoring. Analytically and empirically distinguished anchors provide a useful tool for analysis. Anchoring acknowledges, on the one hand, human agency and the cognitive and emotional aspects of establishing footholds and, on the other hand, inequalities and structural constraints in establishing a sense of stability and safety. It may enable us to see how individuals' positionality influences both their levels of exposure to risks and uncertainties as well as capacities for agency, ability to deal with challenges and make use of opportunities.

Biography

Aleksandra Grzymala-Kazlowska (PhD Hab.) is a Professor at the University of Warsaw in the Faculty of Sociology and the Centre of Migration Research. Professor Grzymala-Kazlowska is the Editor-in-Chief of the Central and Eastern European Migration Review. She is a sociologist with a background in psychology and anthropology and an interest in social policy, conducting cross-disciplinary research focused on different dimensions and implications of migration and diversity related to adaptation, identity, discourses, inequalities, and inclusion. Her recent book "Rethinking Settlement and Integration. Migrants' Anchoring in an Age of Insecurity" was published by the Manchester University Press in 2020.

21

SP05 | "Knowledge and the Planet – how can we transform environmental governance?"

28 Aug 2024 | 9:00-10:30 | LC.0.02 (Faculty of Arts and Humanities – Venue L)

With: **Karin Bäckstrand and Florian Rabitz**
Organised by RN32 Political Sociology and RN12 Environment and Society
Coordinators and Chairs: **Louisa Parks (University of Trento), Ebru Özturk (Mid Sweden University), Audrone Telesiene (Kaunas University of Technology) and Çigdem Adem (Ankara Rivers Study Group, Turkey**

Controversies and tensions over the integration of different types of knowledge in decision-making are at the forefront of many public debates, and environmental decision-making is no exception. This semi-plenary hosts experts on different aspects of knowledge politics who will discuss the different tensions at play, as well as the potential of plural approaches to knowledge in the transformation of environmental politics. The role of Enlightenment-method scientific knowledge in the construction of global environmental problems like climate change and biodiversity loss is well known, yet tensions remain in the construction of global framings of issues with complex and inevitably local impacts, as well as in the failure of this type of scientific knowledge alone to drive effective governance. At the same time, regulatory interventions on high-risk environmental technologies are increasingly proposed as a way of avoiding slippery slopes towards their deployment. This creates a complex decision environment as regulators and wider public's demand information that can only be provided through research activities that could initiate path dependencies. The role of traditional ecological knowledge has also come to the fore as holding potential answers for effective governance, yet here too effective spaces for meaningful engagement with such knowledge and its holders is a source of tension, with serious issues about how to design such spaces given longstanding trust issues. The speakers will discuss the intricacies of these tensions; point to whether and, if so, how, knowledge plurality could come about to transform environmental governance; and discuss the extent to which research governance is becoming an integral aspect of contemporary environmental governance.

Speakers
Karin Bäckstrand (University of Stockholm, London School of Economics)

The Politics and Governance of Decarbonization. The Interplay Between State and Non-state Actors in Sweden

How and under what conditions can states – in collaboration with societal actors –steer and govern to accelerate the large-scale transformation that is needed to reduce greenhouse gas emissions in line with the goals of the Paris Agreement? This intervention presents novel theoretical findings and empirical insights on how the state governs through collaborative climate governance, which is a mode of governance that aims to foster cooperation, deliberation and consensus between state and non-state actors. The focus is on interplay between the state and non-state actors in Sweden, which announced its goal to become the world's first fossil-free welfare state at the United Nations climate summit in Paris in 2015. What is role of the state in collaborative governance as well as the mix between hard (regulation) and soft modes of governance (orchestration) to achieve decarbonization in after the adoption of the 2017 Climate Policy Framework and in the context of the European Green Deal and EU's Fit for 55 packages? Highlighting state-led transformation I critically examine Sweden's progress towards its overarching goal to become the first fossil-free welfare state in the world by 2045. I investigate Sweden's national strategies and governance modes to achieve decarbonization and overcome carbon lock-ins through institutional, economic, technological and behavioral transformation. Sweden's path to decarbonization – like many other countries – resembles more of an incremental transition limited to certain sectors rather than the wholesale transformation toward achieving a fossil-free society.

Biography

Karin Bäckstrand is a Professor in Environmental Social Science in the Department of Political Science at Stockholm University, Visiting Professor at London School of Economics and Political Science and senior research at the Institute for Future Studies. She is a former member of the Swedish Climate Policy Council. Her research revolves around global environmental politics, the democratic legitimacy of global governance and the role of state and non-state actors in climate governance.

22

Florian Rabitz (chief researcher in the Research Group Civil Society and Sustainability at Kaunas University of Technology, Lithuania)

Paradoxes of precaution: The Institutional Lock-in of Technological Risks

Global politics today confronts a vast variety of regulatory challenges across diverse technological fields, from biotechnology over energy technologies up to digitalization and artificial intelligence. The typical global response to the emergence of potential technological risks is the formation of various types of assessment processes which, in turn, are expected to enable high-quality regulatory decision-making further down the road. Increasingly, there are concerns that this may result in slippery-slope effects: the institutionalization of assessment processes can create multiple drivers of path dependence that might lead to the deployment of high-risk technologies, even where their risks turn out to outweigh their benefits. I discuss the conditions under which institutionalized assessment processes can lead to the lock-in of technological risks that would otherwise be avoidable. I also discuss institutional design options for avoiding institutional lock-in. Throughout, I will be illustrating the theoretical argument by drawing on contemporary debates on climate modification, large-scale genetic engineering and Artificial Intelligence. The broader message is that international processes for generating knowledge on technological risks can be risky in themselves, thus requiring careful and reflective institutional design.

Biography

Florian Rabitz is a chief researcher in the Research Group Civil Society and Sustainability at Kaunas University of Technology. He holds a PhD in political science from the Free University of Brussels (VUB) and has previously taught at the Institute of International Relations of the University of São Paulo. His work explores questions of institutional adaptiveness and effectiveness regarding technological challenges and opportunities in the global politics of environmental sustainability. He is the author of Transformative Novel Technologies and Global Environmental Governance (Cambridge University 2023) and The Global Governance of Genetic Resources: Institutional Change and Structural Constraints (Routledge 2017).

23

SP06 | "Advancing Public Sociology in dealing with stakeholders and policy makers on social issues: challenges and perspectives in Europe"

28 Aug 2024 | 9:00-10:30 | LC.2.00 (Faculty of Arts and Humanities – Venue L)

With: **Esther Oliver and Joana Almeida**
Organised by RN16 Sociology of Health and Medicine
Coordinators and Chairs: **Guido Giarelli (University 'Magna Graecia', Italy) and Sandra Racionero-Plaza (University of Barcelona, Spain)**

The title of the next ESA conference speaks of tension, trust, and transformation, brought by diversity of experiences of current times. Old inequalities persist, manifest in new forms, while novel problems emerge together with new tensions. Sociological work can play a key role in shedding new light on old and new social problems, and to provide sociologically informed inspirations that enlighten transformation. This semi plenary session will star 2 speakers presenting sociological research that is excellent illustration of how sociology can have a transformative impact in different social spheres, such as climate change, gender violence, labour exclusion, etc., touching on those topics as questions of public health concern. The semi plenary session will show that the social sciences can enrich health and medicine for a greater impact, and vice versa, but this occurs when these disciplines exchange not only between themselves but also with diverse stakeholders, policy makers and general citizenry. The presentations will combine novel social sciences analyses of most pressing social problems during and after the pandemic together with how such analyses have informed policies and interventions that have contributed to the building and maintenance of trust. Likewise, the two presentations will share information on how such sociological work has had impact in society, so that our commitment and desire as sociologists to improve society has come true in those examples. By sharing such theoretical and empirical investigations, this semi plenary session will contribute to advance public sociology by means of inspiring with what is already out there.

Speakers
Esther Oliver (University of Barcelona, Spain)

Heath consequences of Isolated Gender Violence. A sociological analysis with crucial social impact

Gender Violence (GV) is a major problem in current societies and its impact on health is widely researched. However, there is a lack of scientific evidence regarding the impact on the health of Isolating Gender Violence (IGV), which is the violence perpetrated against those who support victims of gender violence, and the results from such support. The aim of individuals engaged in IGV is to isolate victims of gender violence and dissuade them from reporting or seeking assistance.

Research has already shown that overcoming IGV is central to eliminating gender violence, informing policies as when the Catalan Parliament approved by unanimity, in December 2020, the creation of a new juridical figure and legal victim that never existed in the world before: victims of IGV.

This paper provides evidence on the health consequences of IGV from a qualitative research study, which analysed, in a group of advocates for victims of GV in Spanish universities, whether and how the experience of IGV they had experienced deteriorated their physical and mental health. This novel analysis provides key sociological knowledge to overcome barriers in the fight against gender violence, because identifying the health consequences of IGV and informing policies to improve the protection of those who support victims of GV, can contribute to reducing their fear of reprisal for their support, and it is a key aspect towards the elimination of any form of gender violence in society. The findings can also help sociologists and health professionals to better respond to IGV survivors' needs.

Biography

Dr. Esther Oliver is an Associate Professor at the Department of Sociology of the University of Barcelona and affiliated to the CREA, Community of Research on Excellence for All. Her research focuses on preventive socialization on gender violence. She has been the principal researcher of the national RTD project named "The mirage of upward mobility" and has participated in several RTD Spanish projects in this area. Her work has been published in indexed journals in Web of Science or Scopus such as Humanities and Social Sciences Communications, Research Evaluation, International Journal of Qualitative Methods, Qualitative Inquiry or PLoS ONE, among other scientific journals

Joana Almeida (University of Bedfordshire, UK)

The Transformative Impact of Sociology on Precarious Employment and Working Conditions of Long-term Personal Care Workers

While demand for long-term personal care (LTPC) for the elderly and people with disabilities and chronic conditions is growing across the European Union (EU), formal LTPC work is also underpaid and undervalued. According to a recent Eurofound report (2020), formal LTPC workers working in residential, community or home care receive well below average in most EU countries, with Portugal offering the lowest wages among EU countries. There is also a growing shortage and high turnover of LTPC workers, who are predominantly female and low educated. By focusing on the Portuguese case, the proposed semi-plenary explores the transformative impact of sociology in addressing and mitigating labour exclusion and precarity experienced by LTPC workers, mainly those working in community–care and social support services, a segment of the workforce often overlooked. It seeks to raise awareness of the systemic challenges and barriers that perpetuate inequality and inefficiency within the LTPC work and workforce, and contribute to their precarious employment and working conditions, including low wages, insufficient training and funding, limited career development opportunities, and high turnover. By increasing awareness and visibility of LTPC work and workforce, sociology has also the power to challenge and reshape prevailing norms, public and governmental attitudes and perceptions, and advocate for interventions and policies that address the precarity experienced by these workers, particularly after the Covid-19 pandemic, leading to more equitable and dignified employment.

Biography

Dr Joana Almeida is a health sociologist and Senior Lecturer in Applied Social Studies (Health and Social Care) at the School of Applied Social Sciences, University of Bedfordshire, United Kingdom. Joana earned a PhD in Health Sociology from Royal Holloway, University of London in 2012, a master's degree in communication, Culture and Information Technologies from ISCTE – University Institute of Lisbon in 2004, and a BSc in Sociology from the University of Coimbra in 1997. In 2013/14 Joana was also a Mildred Blaxter postdoctoral research fellow from the Foundation for the Sociology of Health and Illness, UK. Joana has expertise/research interests in the dynamics of professional work, complementary and alternative therapies, the social determinants of health/health inequalities, addictive behaviours with a focus on prescription drugs, and qualitative research methods. Joana is the Vice-President of the ISA RC15 – Sociology of Health.

SP07 | "Digital Data-Driven Technologies meet Sociology"

28 Aug 2024 | 9:00-10:30 | FC1.0.07 (Faculty of Science – Venue C)

With: **Tommaso Venturini and David Dueñas**
Organized by the International Committee for the Digital ERA
Coordinators: **Lígia Ferro (ESA President 2021-24) and Nathalie Lewis (Université du Québec à Rimouski, Canada)**
Chairs: **Bernadette Brereton (Chair of the Council of Research Networks) and Nathalie Lewis (Université du Québec à Rimouski, Canada)**

The objective of this semi-plenary is to discuss the possible establishment of an International Committee on Digital Data-Driven Technologies (ICD3). Created under the auspices of the European Sociological Association (ESA), the Association internationale des sociologues de langue française (AISLF), the Association internationale de sociologie (ISA) and the Arab Council for the Social Sciences (ACSS), the committee would serve as a platform to promote collaboration and share sociological reflections about the transformations brought about by data-intensive infrastructures and computational techniques.

It would offer a venue where diverse traditions from across the social sciences (and possibly beyond them) can meet to consider the tensions generated by digital technologies, the asymmetries that they create or reinforce, and the ethical problems and political challenges that they raise. It would help reunite sociological research and distill it in formats that, while preserving diversity and internal debate, can be more easily appropriated by decision-makers and the public.

After decades during which digital innovations have been welcomed with general optimism, the last few years have witnessed growing concern and increasing distrust about these technologies. The ICD3 would offer an occasion for social scientists to offer their viewpoints on these tensions and their help in addressing them. Yet, its exact nature, its precise objectives, its "rules of engagement", and the expected outcome of its work remain to be defined. This semi-plenary is an occasion to collectively brainstorm about them.

Speakers

Tommaso Venturini (Medialab, University of Geneva and Center for Internet and Society, CNRS)

The Wind has Changed

Something has changed in the way we think of data and digital technologies. Since the dawn of the Internet and maybe since the advent of computers, digital technologies have been met with great expectations and general optimism. While many did worry about possible misuses of digital technologies, few considered the increase in data and computational power as a societal problem and even fewer demanded regulations to restrain it.

The mood, however, has changed. At some point, or rather at many points in the last few years, the relentless digitalization and datafication of society has started to be perceived as a problem. A series of scandals about micro-targeting in political and commercial marketing, the increasingly oligopolistic structures of digital infrastructure, new privacy regulations in Europe and elsewhere, the implosion of many crypto currencies, the startling power of generative AIs, and many other small and big events have opened deep cracks in our digital optimism. While all these events have roots that extend far back in the history of digital technologies, their accumulation has somewhat abruptly brought our societies to realize that the development of data and computational infrastructures is as much a social as a technological issue.

In this talk, I will consider this change in our technical imaginary and the way in which it offers to social sciences new opportunities and new responsibilities to contribute to the development of digital technologies.

Biography

Tommaso Venturini (tommasoventurini.it) is associate professor at the Medialab of the University of Geneva, researcher at the CNRS Centre for Internet and Society, and founder of the Public Data Lab. He has been advanced research fellow at INRIA and "digital methods lecturer" at King's College London. From 2009 to 2015, he coordinated the research of the médialab of Sciences Po Paris. His research focuses on digital methods, controversy mapping, online attention economy and Internet subcultures at the intersection between STS and media studies.

David Dueñas Cid (Department in Management in Networked and Digital Societies, Kozminski University ul. Jagiellońska 57/59, 03-301 Warsaw (Poland))

"Trust, distrust and data-driven technologies: Is the digital changing the way we trust?"

Globalisation and digitalisation have unleashed a crisis of trust, as traditional institutional and interpersonal logics are not attuned to deal with the risks introduced by the prevalence of digital technologies (Bodó, 2021, p. 2668). Besides assuming the renewed notoriety of the concept of trust, this presentation aims to put in context the discussion on whether the use of digital technologies is renewing the notion and functioning of trust and distrust. The second is often defined as an opposite to trust in a somehow simplistic manner. This presentation will provide a definition of both concepts and their interrelation, an overview of its use in current literature and a reflection on the suitability of current definitions of trust and distrust when applied to the implementation of current data-driven technologies.

Biography

David Dueñas Cid is an Associate Professor in Digital Sociology and e-Governance. He serves as President at the Thematic Group on Digital Sociology at the International Sociological Association.

SP08 | "Far Right-Wing Populism in Current Democracies: Habits, Emotions, and Gender Performances"

29 Aug 2024 | 9:00-10:30 | LC.0.02 (Faculty of Arts and Humanities – Venue L)

With: **Ov Cristian Norocel**
Organisation: **RN20 and RN32**
Coordinators and Chairs: **Ulrike T. Kissmann (University of Kassel, Germany) and Carlo Berti (Rovira i Virgili University, Spain)**

Many democracies are currently facing the rise of far right-wing populism such as was seen in the election of Donald Trump as president of the US. The success in elections coincides with the resurgence of xenophobia, racism, antisemitism, sexism and anti-queerness. The majority of sociological studies focuses on conscious attitudes, pointing out the connections between populism and the resentments towards migrants, black people and other ethnic or religious groups, as well as the distrust towards institutional politics and economic fears. However, such studies assume that the attitudes in question are reflexively available to the full extent to the participants and that they can easily be retrieved through questionnaires. The taken-for-granted assumptions that feed conscious attitudes are seldom empirically analysed. However, an increasing number of studies moves beyond the analysis of conscious attitudes and investigates instead less-than-conscious habits, emotions as well as gendered performances in populism. Shannon Sullivan's work was dedicated to the analysis of unconscious habits and current publications such as, for example, Carolyn Pedwell emphasizes the relevance of routines in nowadays societies. The aim of the semi-plenary is to discuss present theoretical and methodological approaches that enable the analysis of far right-wing populism, paying particular attention as to how less-than-conscious habits, emotions, and gendered performances can be theoretically framed and empirically analysed. The contribution of quantitative, qualitative as well as mixed method methodologies will be equally considered. Early career scholars are particularly encouraged to apply.

Speaker
Ov Cristian Norocel (Lund University, Sweden)

Performing Hate as Harmless Banter – Communicating Far-Right Metapolitics, One Political Cartoon at a Time

This contribution brings novel insights and argues that the hateful opinions (be them racism, xenophobia, sexism, anti-LGBTIQ as well as anti-poor stances) that underpin the far-right ideological universe reach out to larger audiences though their discursive packaging as allegedly harmless banter. It presents a qualitative analysis of controversial political cartoons drawn by a controversial USA-based cartoonist posted on X (formerly Twitter) within the last year. Of interest here are those cartoons that envisage a common transnational far-right endeavour, focusing on the elections the Netherlands, Argentina, EU, and USA. The analysis highlights the importance of an intersectional analysis of emotions (attentive to imbrications of gender and sexuality, race, religion, and social class) in the communication of far-right politics, and points out two crucial aspects. First, it concerns the medium of communication, whereby the quasi-ubiquitousness of social platforms – driven among others, by and through emotional messaging, personal choice, and personalised experiences – makes them ideal communication channels. Here, political cartoons serve as seemingly humorous takes on political events, spreading widely otherwise controversial political concepts. Not totally concealed or denied, hateful opinions are rather performed through these so that to allow them a wider circulation. Second, it concerns the far-right agenda beyond politics (thus meta-politics) to achieve a shift in generally held opinions, which are deemed socially acceptable on matters of social and cultural diversity, gender, and sexual equality. This agenda is pursued by various entities across the globe: radical-right populist parties and their leaders contesting parliamentary elections (e.g. the Party for Freedom and Geert Wilders in the Netherlands); radical-right candidates leading former mainstream parties (Donald Trump); or more diffuse extreme right entities (the Alt-Right in the USA).

Biography

Ov Cristian Norocel is Associate Professor and Senior Lecturer in Gender Studies, at Lund University (Sweden). He is Doctor of Social Science in Political Science from the University of Helsinki (Finland). Norocel applies an intersectional lens to issues of far-right political communication and anti-gender mobilization. He examines these phenomena in a comparative perspective in Europe (focusing on Sweden, Finland, Hungary, and Romania). In his latest projects, he deploys in a syncretic manner critical discourse studies, digital ethnography, and critical big data analysis to map out far right metapolitics, as well as anti-gender politics.

SP09 | "Contribution of the ESA to the European Sociology and European Society" – Celebrations of the 30th ESA Anniversary

29 Aug 2024 | 9:00-10:30 | FC4.0.41 (Faculty of Science – Venue C)

With: **Martin Kohli, Carmen Leccardi, Marta Soler, Sylvia Walby and Frank Welz**
Organisation: **ESA Executive Committee and ESA Past Presidents**
Chair: **Lígia Ferro (ESA President 2021-24)**

The European Sociological Association was officially established in 1994 and it is celebrating its 30th anniversary at the ESA Porto Conference. This session is organised by the ESA Executive Committee and the ESA Past Presidents and will include testimonies of the challenges and opportunities encountered all over the last decades in building the sociological community and giving positive contributions to the diverse and complex social problems faced by European societies.

Speakers

Martin Kohli was born in 1942 in Solothurn (Switzerland), and studied at the Universities of Geneva, Cologne, and Bern, where he obtained his doctorate. After a few years at the Ministry of Education of the Canton of Zurich and as Assistant Professor at the University of Constance (completed by his "habilitation") he went to the Free University of Berlin in 1977 as Professor of Sociology. In Berlin he initiated and directed the Research Group on Aging and the Life Course (Forschungsgruppe Altern und Lebenslauf, FALL). He is a member of the Berlin-Brandenburg Academy of Sciences and the Austrian Academy of Sciences, and from 1997-99 served as President of the European Sociological Association (ESA). From 2004-2012 he held the Chair of Sociology at the EUI.

Since 2012, Kohli is Emeritus Professor at the EUI and Distinguished Bremen Professor at the Bremen International Graduate School of Social Sciences (BIGSSS). He has been a member or Fellow of the Institute for Advanced Study (Princeton), at the Collegium Budapest, and at the Hanse Institute for Advanced Study (Delmenhorst/Bremen). He has also been a Visiting Professor at Harvard University, Stanford University, Columbia University, the University of North Carolina, and the University of California, Berkeley.

Carmen Leccardi is Professor Emerita, Sociology of Culture, at the Department of Sociology and Social Research, University of Milan-Bicocca. Here she has been Director of the PhD program in Applied Sociology and Methodology of Social Research. Vice Rector for equal opportunities (2012-2013), she was Director of the 'Gender Cultures' Inter-university Research Centre (2013-20). From 2013 to 2015 she was President of the European Sociological Association.

Has researched extensively in the field of social time, youth, gender and generations, cultural models and processes of cultural and social change. From a methodological point, she is interested in qualitative research methods, in particular hermeneutical approaches. Her last book (2023) is Exploring New Temporal Horizons, Bristol University Press (with P. Jedlowski and A. Cavalli).

Leccardi have conducted theoretical/empirical research (at both European and national level) in the following areas: youth cultures and inter-generational comparisons, biographical constructions, gender differences, sociological study of time, changes in cultural models, qualitative research methods. The last conference she organized is the 12th Conference of the European Sociological Association "Differences, Inequalities, and Sociological Imagination", Prague, 25-28 August 2015). She has published widely on cultural changes, young women's cultures, youth and its cultural practices (with specific attention to the changing life course perspective) and temporal orientations.

Marta Soler-Gallart is Full Professor and Chair of the Department of Sociology at the University of Barcelona and Vice-president of the International Sociological Association. She is currently Democracy Visiting Senior Faculty Fellow at the Harvard Kennedy School (Ash Center for Democratic Governance and Innovation 2023-24). She has been President of the European Sociological Association (2019-2021) and Editor in Chief of the journal "International Sociology" (2015-2022). She has been at the Governing Board of the European Alliance for Social Sciences and Humanities (EASSH, 2016-2019). She was the first researcher in the social sciences to be at the ORCID Board of Directors (2014-2016).

Soler-Gallart is Director of CREA (Community of Research on Excellence for All), where her research focuses on dialogic democracy to address social inequalities. She was the Main Researcher of the H2020 Project "SOLIDUS" on the analysis of solidarity acts with social impact during the crisis in Europe. Besides, she has been the Knowledge Management Coordinator of the FP7 Project "IMPACT-EV" on evaluation of scientific, political and social impact from research. She recently published the book "Achieving Social Impact. Sociology in the public sphere" (Springer). She is among the ten first researchers worldwide in the categories of social impact and gender violence in Google Scholar.

Sylvia Walby is Professor at Royal Holloway, University of London, and holds the Anneliese Maier Award from the Humboldt Foundation. She chaired the Steering Committee setting up the European Sociological Association, 1992-5, and was elected founding President of the European Sociological Association, 1995-7. She was co-founder of the International Sociological Association's Thematic Group 11 on Violence and Society, 2018-2023, and the Working Group 11 on Violence and Society (2023-27). Walby was elected Fellow of the British Academy in 2022, elected Fellow of the Academy of Social Sciences in 2007 and awarded an OBE for services to equality and diversity in 2008. She was the founding chairholder of the UNESCO Chair for Gender Research, 2008-2019. She chaired the Sociology Sub-Panel in REF2021. She was awarded an Honorary Doctorate from Queen's University Belfast in 2017. Walby's research is focused on rebuilding the theory and concept of society to take account of gender as a regime of inequality and violence as an institutional domain (Globalization

28

and Inequalities: Complexity and Contested Modernities, Sage 2009), the better to understand contemporary social change and the possibilities of alternatives (Crisis, Polity 2015). She theorises gender regimes of inequality (Theorizing Patriarchy, Blackwell 1990) and projects attempting its transformation (The Future of Feminism Polity 2011; Gender Transformations, Routledge 1997). She is developing the methodology to better count violence, especially to reduce the underestimation of its scale and consequences against women and minorities (The Concept and Measurement of Violence against Women and Men Policy, 2017) and to inform the development a theory of change of violence, and the theory of society.

Frank Welz has been teaching sociology at the Innsbruck School of Social and Political Sciences since 2006. He was a Research Fellow at the International Institute for the Sociology of Law, Onati, Spain, at the Centre for Interdisciplinary Research (ZiF) at Bielefeld University, Germany, and at the Department of Sociology of the University of Cambridge, UK. He served as the 11th President of the European Sociological Association (ESA) in 2015-2017 and as a member of the Executive Committee and vice-president of the ESA from 2011 to 2015. He has further been a Governing Board member of the European Alliance for the Social Sciences and Humanities (EASSH) and a Founding Member of the Initiative for Science in Europe (ISE). He coordinated ESA's Social Theory Research Network (RN29) 2007 to 2011, and he also served as Vice-President of the Austrian Sociological Association.

Recently, Welz has been publishing on sociological theory, sociology of culture, particularly law, and the history of sociology. His initiatives at Freiburg have been awarded with several prizes, among others e.g. the State's Excellence in Teaching Award 1999, the Heilmann Prize for the 'virtual' seminar series "LEC" Freiburg-JNU New Delhi (2000) and the BMW Group Award (Munich 2005) and Stifterverband/ DAAD's quality label "Top 10 International Master's degree courses made in Germany" (2006) for the GSP.

SP10 | Tensions and Transformations in European citizenship and identity. Can we trust an inclusive future?

29 Aug 2024 | 9:00-10:30 | FC1.0.03 (Faculty of Science – Venue C)

With: **Manuela Boatcă and Annalisa Pelizza**
Organisation: **Council of National Associations**
Chair: **Maria Carmela Agodi (University of Naples Federico II)**

The focus of this SP are current tensions in European self-representation, involving the presence and fluxes of multiple ethnicities, languages, histories. While coloniality, as a phenomenon that started with the European colonial expansion, continues to characterize global asymmetries and epistemologies today, we can also observe counter currents, resistances, appropriations, and the emergence of new hegemonies. Re-discovering European internal diversity as a sociological and historical reality would be a contribution to deconstructing the future of our continent as depicted by new and old nationalistic and post-colonialist scenarios.

Speakers

Manuela Boatcă, Albert-Ludwigs-Universität Freiburg

Romani Europeans and the Challenge of Unthinkable Histories

Present in Europe for centuries, but still not considered of Europe or addressed as Europeans, the Roma are not part of Europe's reckoning with either racism or enslavement. Such reckoning routinely restricts European racism temporally to the Holocaust, conflating racism with antisemitism; and relegates enslavement spatially to Africa and the Americas, equating enslavement with the transatlantic trade. The Roma falls through these temporal and spatial cracks in Europe's current politics of memory. I trace this structural oblivion to an Occidentalist imaginary that equates Europeanness with whiteness and that has historically produced unequal Europes in the South and East of the continent to which non-white and other non-conforming populations, histories, and events can routinely be relegated. Drawing on Michel Rolph Trouillot's analysis of the Haitian Revolution as an "unthinkable history" made by enslaved Black people, I argue that European politics of memory will remain incomplete as long as the history and the present of anti-Roma racism, the legacies of Romani enslavement, and the implications of such histories for the (im)possibility of constructing an identity as Romani Europeans are deemed unthinkable in an Occidentalist white Europe.

Biography

Manuela Boatcă is a professor at the Institute of Sociology and Head of School of the Global Studies Program at the University of Freiburg, Germany. She was Visiting Professor at IUPERJ, Rio de Janeiro in 2007/08 and Professor of Sociology of Global Inequalities at the Latin American Institute of the Freie Universität Berlin from 2012 to 2015. She has published widely on world-systems analysis, decolonial perspectives on global inequalities, gender and citizenship in modernity/coloniality, and the geopolitics of knowledge in Eastern Europe, Latin America, and the Caribbean. She is the author of Global Inequalities Beyond Occidentalism, Routledge, 2016 and co-editor of Decolonizing European Sociology. In 2018 she was awarded an ACLS collaborative fellowship alongside literary scholar Anca Parvulescu (Washington University in St. Louis, USA), for a comparative project on inter-imperiality in Transylvania. The resulting co-authored book, Creolizing the Modern. Transylvania Across Empires, Cornell University Press, 2022, also translated in German, and in Romanian, has received Honourable mention for the 2022 George Blazyca Prize in East European Studies from the British Association for Slavonic and East European Studies (Basees) and the 2023 René Wellek Prize for best monograph from the American Comparative Literature Association (ACLA).

Annalisa Pelizza, University of Bologna and Aarhus University

Processing Alterity, Shaping the European Order

This lecture introduces the concept of "alterity processing" to account for the simultaneous enactment of individual "Others" and emergent European orders mediated by data infrastructures for migration management. Alterity processing refers to data infrastructures, knowledge practices and bureaucratic procedures through which populations unknown to European actors are translated into "European-legible" identities.

Drawing upon a Science and Technology Studies perspective, the lecture provides empirical evidence and theoretical reflections on the co-production of migrant people and Europe as a polity through the digitization of registration and identification of third-country nationals. It shows how different registration and identification procedures compete to legitimize different chains of actors, data, and metadata as more authoritative than others. Competing procedures have governance implications, as well, with institutional boundaries shifting de facto, if not de jure. In this tension, it is not only the individual Other that is enacted but also specific bureaucratic orders cutting across old and new European actors and distinctive understandings of "Europe." The lecture draws upon data collected in the context of the "Processing Citizenship" project (ERC StG No 714463, https://processingcitizenship.eu/).

Biography

Annalisa Pelizza is Professor of Science and Technology Studies at the University of Bologna and at the University of Aarhus (Denmark), Department of Digital Design and

Information Studies. Her research and teaching interests span: Governance of and by technology; Sociotechnical aspects of data infrastructures, including ontologies and interoperability; The long-term relationships between modern polities and infrastructures for populations and territory management; Social informatics and its methods. Prof. Pelizza has been the recipient of excellence science grants, including the Processing Citizenship research project funded by the European Research Council and Marie Skłodowska-Curie Actions. She is member of the Editorial Board of Science, Technology and Human Values, of Tecnoscienza and vice president of STS Italia. She was elected member of the EASST Council (2019-2022). She acts as reviewer for science agencies and journals in STS, information systems, governance. She held visiting fellowships in U.S., Germany, France and the Netherlands.

SP01 | "Building Open Science Together: Transformative Concepts and Practices"

SP11 | Academic Freedom in Times of Division

29 Aug 2024 | 9:00-10:30 | LC.0.01 (Faculty of Arts and Humanities – Venue L)

With: **Judit Takács and Geoffrey Pleyers**
Organisation: **Lígia Ferro, Gary Pollock, Teresa Sordé, Maria Carmela Agodi, Bernadette Brereton, Kaja Gadowska and Tiziana Nazio (ESA Executive Committee)**
Coordinators: **Kaja Gadowska, Nilay Çabuk Kaya, Krešimir Žažar, Tiziana Nazio, Maggie O'Neill, Ana-Cristina Santos**
Chair: **Kaja Gadowska**

This semi-plenary will consider academic freedom through the prism of personal experience in Hungary, Belarus, Turkey, and beyond. Academic freedom is central to the very idea of the university and crucial to discussions regarding Tension, Trust and Transformation.

There is currently a global tendency towards division, compartmentalization, and the resulting polarization. Critical for scholars is the freedom to choose research and teaching topics. Yet, increasingly, certain subjects are sidestepped due to (explicit or implicit) injunctions powered by financial pressures. Agents of influence are persuasive sociopolitical ideologies, ruling political systems, (in)formal social organizations, public/private sponsors of research, and so on. The effects of such tensions are especially apparent at state universities where approvals and funding for curricula, research projects, information resources, equipment, etc. are determined (more or less) by the government as well as special interest groups. Constraints on the subject matter of scientific inquiry severely undermine the conception of learning and education as an autonomous activity, rather leading towards the emergence of an "academia on demand" model.

Around the world, authoritarian political movements constrict the rights of academia to freely conduct inquiries, teach, and express views inconsistent with or challenging a government's ideological line. Constants are efforts to supress discourses questioning existent power structures and to undercut financial support for uncomfortable issues. This may lead to the distortion of research and misrepresentation of outcomes by way of supporting one ideology over another. Ultimately, aware of incentives and sanctions, scholars may increasingly choose self-censorship.

Speakers

Judit Takács (Centre for Social Sciences, Hungarian Academy of Sciences)

Self-censorship: Between academic freedom and exile

During the last decade Hungary has faced increasing concerns regarding not only the state of democratic institutions, media freedom, and civil liberties but also academic freedom. Changes in the governance of Hungarian universities, the closure of the Central European University in Budapest, the forced restructuring of the Hungarian Academy of Sciences and its network of research institutes are among the key issues we can consider.

According to the EP Academic Freedom Monitor 2023, in Hungary the level of academic freedom "is low compared not just to all other EU Member States, but also globally (the bottom 20-30% of countries worldwide)". Thus, my home country can offer an extremely rich research field for scholars interested in academic freedom related issues. However, it is not always easy to cope with such richness, especially while living inside the research lab (it is a bit as if Alfred Jarry's play King Ubu is no longer an absurd spectacle but has become part of everyday life).

In my talk I will focus on the following questions: What is the measurement of (self)censorship? How free are we academically and otherwise to act as responsible scholars? How free are we to conduct research of our choice in limited and limiting social contexts?

Biography

Judit Takács is a Research Professor at the Centre for Social Sciences, a Centre of Excellence of the Hungarian Academy of Sciences. Her main research interests cover family practices, childlessness, caring masculinities, the social history of homosexuality, homophobia and genderphobia; while also having extensive research experience in HIV/AIDS prevention, community engagement in the context of public health preparedness, and measuring social attitudes. She completed an M.A. in Social Sciences at the University of Amsterdam, holds a Ph.D. in sociology, a Diploma Habilitationis, and a Doctor of Science title. Her recent publications include a co-edited volume on Paradoxical Right-Wing Sexual Politics in Europe, thematic issues on Gender Studies in Exile and Fragile Pronatalism; a book chapter on How to Conserve Kertbeny's Grave? A Case of Post-Communist Queer Necrophilia, and a co-authored article on Resisting Genderphobia in Hungary

Geoffrey Pleyers (ISA and Catholic University of Louvain, Belgium)

Sociologists at risk. Academic freedom in times of rising authoritarianism

The ISA is alarmed by the backlash against social sciences, and the rise of threats against academic freedom. The rise of authoritarian leaders, far-right movements and their stances during the COVID-19 pandemic have fuelled a backlash against science. All scientific disciplines are concerned. However, due to the nature of the discipline, the critical outlook on social facts and their commitment to democracy, sociologists are more frequently threatened. They pay a high price, mostly in authoritarian countries and in countries where reactionary leaders are on the rise, but also in countries long considered among the most solid Western democracies. The war in Gaza has added fuel to the fire. To forestall further catastrophic loss of life, well-informed and

nuanced debate and a historicized and sociological understanding of the ongoing war and atrocities are required. At this critical juncture, the ISA and the international community of sociologists cannot stand idly by as spaces of public and academic debate shrink and are increasingly policed. Protecting and promoting academic freedom and supporting our colleagues who are victims of repression and threats has become an intrinsic part of global sociology. It is a core duty of the ISA and a shared responsibility for all scholar associations in sociology and social sciences. To be up to this historic task, we need to foster new collaborations among sociological associations and mobilize the international academic community in new ways.

Biography

Geoffrey Pleyers is the current President of the International Sociological Association. He is a FNRS Professor of Sociology at the Catholic University of Louvain (Belgium) and holds a doctorate in sociology from the Ecole des Hautes Etudes en Sciences Sociales (Paris, 2006). His research focuses on social movements, global studies, youth, religion and Latin America. He is the author of "Alter-Globalization. Becoming Actors in the Global Age" (Polity, 2011). His latest books "Social Movements and Politics in the Pandemic" (edited with B. Bringel, Bristol University Press, 2022).

SP12 | "Energy Transition in the City: Socio-technical Challenges and policy implications"

29 Aug 2024 | 9:00-10:30 | LC.2.00 (Faculty of Arts and Humanities – Venue L)

With: **Harald Roracher and Catherine Butler**
Organisation: **RN37 Urban Sociology and RN12 Environment and Society**
Coordinators and Chairs: **Gabriele Manella (Università di Bologna, Italy) and Natalia Magnani (Università di Trento, Italy)**

Cities occupy only 4% of the EU area, but 75% of EU residents live there. Moreover, cities globally consume over 65% of energy and they cause over 70% of CO2 emissions (European Union, EU Mission: Climate-Neutral and Smart Cities, 2022).

If they are the main determinants of climate change, they can also be the main contexts for creating solutions (Harriet Bulkeley, Cities and Climate Change, 2013). The concentration of people, industrial and cultural activities can make them laboratories of innovation (UNHABITAT, Global Report on Human Settlements, 2011), for efficiency and adaptation strategies to reduce climate change vulnerability. Cities are also important to achieve climate neutrality by 2050, as foreseen by the ambitious EU Green Deal program. Moreover, the EU has also foreseen some Missions in the Horizon Europe 2021-2027 program to produce tangible results already by 2030 in 100 cities, through the combination of research and innovation in new forms of participatory governance and collaboration.

Despite this awareness, many problems make this goal very complicated to achieve. In a context of energy crisis affected by the war between Russia and Ukraine, growing inequalities in access to energy are developing in the urban areas, which are combined with a crisis of trust in the public and private actors who manage its supply and a lack of citizen engagement in the ecological transition.

On this background the session we propose intends to combine two strands of sociological research, namely research on the environmental issue and research on the urban question, focusing on the energy theme and moving from the keywords (Tension, Trust, Transformation) of the ESA conference in Porto.

Speakers

Harald Roracher (Linköping University, SWE, Department of Thematic Studies, Tema T – Technology and Social Change)

Beyond urban experiments: governance innovations for accelerating urban energy transitions

Pilot projects, experiments, or living labs have increasingly become key tools for governing transformative change in general, and urban energy transitions in particular. Books such as "The Experimental City" (Evans et al., 2016) give witness of these shifts in urban governance in times of multiple crises and grand societal challenges. The idea is to test alternative socio-technical configurations in real-life settings, use them for learning how to do things differently and eventually scale them up to the whole city and beyond. In practice these projects and experiments are ridden by many problems which limit their contribution to urban transitions – they may be isolated from each other, no systematic learning is taking place, they are 'projectified' with a focus on short-term outcomes, they are highly situated and contextualised, or they may be captured by incumbent actors. In this talk I will critically analyse some examples of urban experimentation such as the development of positive energy districts or urban smart grid experiments as part of Swedish energy transition efforts. In a further step I will discuss different attempts of governance innovations beyond pilot projects which aim to achieve some level of systemic integration through transformative portfolios, system demonstrators, reflexive monitoring or alternative strategies of scaling.

Biography

Harald Rohracher is Professor of Technology and Social Change at Linköping University, Department of Thematic Studies, since 2012. He has a background in sociology as well as science, technology and innovation studies. He has been co-founder and director of the Inter-University Research Centre for Technology, Work and Culture (IFZ), Graz, Austria (1999-2007), Joseph A. Schumpeter Fellow at Harvard University (2009-10) and Simon Visiting Professor at Manchester University (2013). From 2014-2023 he has been Associate Editor of the journal 'Environmental Innovation and Societal Transitions'. In his research he is interested in the governance of socio-technical change, societal transformations towards greater sustainability as well as urban and regional low-carbon transitions.

Catherine Butler (University of Exeter, Geography Department UK)

Energy poverty and sustainable transitions in the city

Within energy research and policy, there is an often-cited tension between the need to address energy poverty and

34

the requirements for sustainable transitions. For this talk, I draw on my research examining experiences of energy poverty and transition in UK cities to critically engage with this framing of these dual issues. While much energy research has focused on either energy poverty or energy transitions, in this analysis I examine the intersections to reveal the ways that transitions can be addressed at the dynamics underlying and constituting energy poverty in the city. In this I pursue three different points of departure. The first places inequalities at the heart of debates about the advancing energy intensity of contemporary societies, examining the long run processes of governance that have constituted both energy dependencies and deprivation. The second looks how socio-technical interventions in communities vulnerable to energy poverty have done little to transition homes and mobilities in directions that support sustainability and improve wellbeing, with consequences for relations of trust in transition processes. The third examines how locally based organisations work to navigate the fault lines of distrust and disenfranchisement in such communities to build toward transformations that reduce energy poverty along with wider inequities and offer routes to environmental sustainability. With this third point of departure, I end on a hopeful examination of the ways that those working within these challenging contexts have moved forward and of what could engender greater longevity, stability, and reach of such activities to create sustainable equitable cities.

Biography

Catherine Butler is Associate Professor in Human Geography within the Environment and Sustainability Research group at University of Exeter. Her research examines processes of societal transitions required to address environmental challenges and linked issues of equity, justice, and wellbeing. Prof Butler has published widely in this area (> 50 journal articles) including her recent book (Palgrave Macmillan, 2022) which brought focus on issues of inequality by looking at how sustainable transitions might also address energy poverty in the UK. She has coordinated >16 funded research projects and is the University of Exeter lead for a new AHRC project examining retrofit of homes in UK cities. She is Chair of the Royal Geographical Society Energy Geographies Research Group, formerly Convenor of the British Sociological Association Climate Change study group, and associate editor for the journals Environmental Research Letters: Climate Change, Frontiers in Climate, and GEO: Geography and Environment.

SP13 | "Considering Humanism and Post-Humanism in Sociology. Lessons from within Critical Sexuality Studies"

29 Aug 2024 | 9:00-10:30 | FC1.0.07 (Faculty of Science – Venue C)

With: **Pam Alldred and David Alderson**
Organisation: **RN23 Sexuality**
Coordinators and Chairs: **Christian Klesse (Manchester Metropolitan University) and Isabel Crowhurst (University of Essex, UK)**

With the death of Prof Ken Plummer (4 April 1946 – 4. November 2022), the sociological community lost an innovative voice on sociological theory (symbolic interactionism, pragmatism, deviance, narrative sociology), sexuality and the body (LGBTQI+ studies, aging and illness) and methodology (life stories, documents of life). Over the last decades, Plummer systematically elaborated an approach he called critical humanism (Plummer, 2001, 2018, 2021). Plummer asserted the prime significance of embodied human experience and agency. He proposed critical humanism as a normative stance for an ethical publicly engaged sociology and – as the founding editor of the leading journal Sexualities – critical sexuality studies. This commitment put him at odds with key developments in critical sexuality studies and gender studies, which took inspiration from poststructuralist perspectives that solidified around queer theory (Alderson 2016, 2017). Ken Plummer (2013) saw the queer turn as indicative of a wider shift to post-humanist sexuality studies. In recent years, propelled by debates around new materialism we have seen an intensified outpouring of post humanist work in sexuality studies (Fox and Alldred 2013, 2017). Like Plummer's critical humanism, post humanist work in gender and sexuality studies postures and self-represents as a pointedly ethical framework (Braidotti 2013). This panel stages a constructive dialogue between humanist and post-humanist positions in sexuality and gender studies. Dialogue across different positions has also been a key concern of Plummer's idea of a politically engaged sociology. This renders such a panel an apt way to memorise the passing away of one of the most prolific European humanist sociologists.

Speakers

Pam Alldred (Nottingham Trent University, UK)

What Can We Say About the Sexuality of the Posthuman?

Humanism held the hand of the civil rights movement and the democratising, anti-war and egalitarian struggles of the 1960s and 70s. In Anglo-American cultures this left the sense of humanism as 'the good guy', especially in the psy-disciplines, where Carl Rogers epitomised the best of liberal humanism in bequeathing us Unconditional Positive Regard. But while there were revolutionary currents flowing, the revolution was not complete. As Weeks (1986) explained, identity politics were necessary to the Gay and Women's Liberation Movements, but not sufficient. As Braidotti (2013) showed, the model human turned out to be white, male, straight and able-bodied. Even where identity was plural, understandings of diversity were limited to 'shades' of the subject, with some seen as further from the Enlightenment model, or as burdened by additive subordinated identities. As Lorde (1984) showed, humanism needs to capture how gender is diffracted through race, and sexualities through racialised genders. This meant that further imperialist damage has been waged by societies believing that they had made a humanist turn. Posthuman feminisms, particularly Braidotti (1994; 2013; 2021), are a radical effort to question these remaining normativities in humanism. I will describe what I think this posthuman 'turn' offers the study of sexualities, drawing on concepts in my work such as the sexualities-assemblage and gender-related violence. Posthumanism is not a substitute for humanism's ethics of inclusion, but a necessary corrective to its certainty. I will query the title's 'sexuality of the posthuman', and sketch the posthuman promise of plural, emergent, undecidable sexualities.

Biography

Pam Alldred is Professor of Youth and Community Studies, in the Department of Social Work, Care and Community, at Nottingham Trent University, UK, and research sexualities, sexualities education, consent, gender and sexual violence, parenting and inequalities interventions. She has led large EU-funded projects on gender-related violence and sexual violence and is co-editor of the Handbook of Youth Work Practice (Sage, 2018), and with Nick Fox co-author of Sociology and the New Materialism (Sage, 2017) and is currently editing a Sociology of Sexualities Research Handbook for Edward Elgar.

David Alderson (University of Manchester, UK)

Liberation, Chemsex and the Posthuman

This paper considers the phenomenon of chemsex among gay men in relation to debates central to claims about our posthuman condition, especially the potential for freedom, the possibility (and desirability) of autonomy and the technological determination and transformation of our understanding of each. It will discuss the way chemsex is represented in critical chemsex studies, public health discourse and cultural representation, focusing on identity politics, history and temporality, as well as the marketized dissolution and reconfiguration of private/public distinctions. The framework for the discussion will be a cultural materialist one, indebted principally to the work of Alan Sinfield, but it will also draw critically on a Marcusean framework that relates sexual possibilities to the dominant reality principle. It will therefore offer a different kind of humanistic

36

perspective from that of Ken Plummer, while paying tribute to his achievement.

Biography

David Alderson is Professor of Literary and Cultural Studies at the University of Manchester. He has written extensively about gender, sexuality and the neoliberal transition, and is the author of Sex, Needs and Queer Culture (Zed, 2016), as well as co-editor, with Robert Spencer, of For Humanism (Pluto, 2017). He is currently researching a project on cultural representation and the political economy of the family.

37

SP14 | Sociology in Action: Co-creating Integration Solutions with Migrant and Refugee Children in Europe

30 Aug 2024 | 9:00-10:30 | FC4.0.41 (Faculty of Science – Venue C)

With: **Adnan Abdul Ghani and Mateja Sedma**
Organisation: **Teresa Sordé and Gary Pollock (Chairs of the Conference)**

Migration, mobility, and forced displacement, with a special emphasis on the experiences and impacts on children, are integral elements that have shaped for decades European societies. This session will revolve around the need to generate knowledge by considering the views, experiences, knowledge, and insights of refugee and migrant families and children on social inclusion. Drawing on European research results, personal experiences, and extensive work from the grassroots up to the EU level, a discussion around effective strategies to embrace meaningful co-creation processes that define new responses in dialogue with, and not aside from, refugee and migrant families and children will be held. Effective practices that foster empowerment, emotional well-being, and social belonging among migrant and refugee children, as well as the tailored support systems in facilitating the inclusion and empowerment of adults and youth will be presented.

Speakers

Adnan Abdul Ghani (Member of EU Commission Expert Group on migration, asylum, and integration)

Empowering Resilience: Advancing Psychosocial Support and inclusion for Refugees and Migrants in Europe.

Reception of migrants and refugees in Europe presents unique opportunities and challenges for host societies. This presentation will delve into the empowerment and psychosocial support strategies implemented to enhance the well-being and resilience of these vulnerable populations. Drawing on the experience with Save the Children and the European Commission Expert Group of the views of migrants on asylum migration and integration, we will explore effective practices that foster empowerment, emotional well-being, and social belonging among migrant and refugees. The discussion will include case studies and evidence-based approaches. Additionally, some personal insights from a refugee journey highlighting the importance of tailored support systems in facilitating the inclusion and empowerment of adults, youth and children. This session aims to provide valuable insights and practical recommendations for better inclusion strategies in our European societies.

Biography

Adnan Abdul Ghani is project Manager and a Migration thematic expert in Save The Children Sweden where he developed Re-Act Model for refugee's empowerment, self-organization, and strategic cooperation. As a refugee from Syria, he started a movement to train refugees to lead community, the movement has spread to other parts in Europe. – Thematic adviser for Region Västra Götaland, Sweden for the regional development strategy 2020 to 2030. – Member of EU Commission Expert Group on migration, asylum, and integration.

Mateja Sedmak (Institute for Social Sciences at the Science and Research Centre Koper, Slovenia)

Child-Centred Approach to Migrant Children's Integration

The presentation will critically discuss the integration of migrant children in educational settings in the European context. From the prevailing adult-centred perspective (of educators, researchers and policy makers), successful integration is perceived as migrant children adopting the local language and cultural values, achieving academic success, progressing to the next grade, avoiding dropping out of school and eventually finding a job. Furthermore, integration often assumes integration into an imaginary homogeneous national culture. We will critically reflect on these traditional notions basing on a child-centred approach that recognises (migrant) children as active participants. With child centred approach we shift the focus from an adult-centred perspective to children's experiences of migration and integration, viewing them as experts, skilled communicators, rights-holders and meaning-makers (Clark and Moss, 2005; Fattore, Mason and Warson, 2007). What integration is from a child-centred perspective does not necessarily coincide with adult-centred perspective. This is illustrated using data collected as part of the MiCREATE – Migrant Children and Communities in a Transforming Europe Horizon 2020 project in eight European countries (UK, Slovenia, France, Poland, Austria, Denmark, Spain, Greece) and Turkey in 2019-2022 through comparative multi-method research.

Biography

Mateja Sedmak, PhD in Sociology, is Principal Research Associate and the Head of the Institute for Social Sciences at the Science and Research Centre Koper, Slovenia. Her research interests include ethnic and intercultural studies, migration and integration, management of cultural diversity, and topics in sociology of everyday life and sociology of the family. She is vice president and the Head of the Section for Intercultural Studies at Slovenian Sociological Association. She is the editor of the journal Annales – Series Historia et Sociologia (SI) and member of the editorial boards of: Social Science Discussions (SI), Italian Sociological Review (IT) and Demography (SR). She has been the leader of many national and international projects, including the MiCREATE project – Migrant Children and Communities and A Transforming Europe, funded by the Research and Innovation Grant Scheme, Horizon 2020 program.

SP15 | Harassment in Institutions and Society

30 Aug 2024 | 9:00-10:30 | LC.0.01 (Faculty of Arts and Humanities – Venue L)

With: **Ana Bull, Anneleen De Cuyper and Sarah Van de Velde**
Organisation: **RN33 Women's and Gender Studies**
Coordinators and Chairs: **Elisabetta Ruspini (University of Milano-Bicocca, Italy) and Ana Vidu (University of Deusto, Spain)**

Harassment is still a severe problem in different spheres of society, affecting people, especially women, of all cultures, races, ages, religions, social classes, and socioeconomic backgrounds. Research has also shown that the most vulnerable people, such as LGTBIQ+ communities, are potentially at a higher risk of being harassed, bullied, or discriminated against.

Harassment can take many forms and can take place in many situations. Victims of harassment suffer significant physical or psychological problems such as depression, anxiety, sleep disorders, family tensions. Employees who experience sexual harassment can suffer significant effects, including low self-esteem, low job satisfaction, job burnout, isolation. Harassment produces high individual and social costs: its impact on women, families, vulnerable communities, institutions, organizations and policies requires greater attention.

Harassment is already on the agenda of most world-known companies, top universities, non – governmental organizations and social policies. However, sexual, domestic, workplace and online harassment must be specifically addressed by scholars aligned with the perspective of women's and gender studies. Effective action to address harassment and its multiple expressions in various forms and contexts require a broad and diverse view that pays attention to the close connection between harassment and gender systems. To this end, the intersectional feminist perspective and the gender – sensitive lens are valuable keys to understanding and responding to the phenomenon.

Based on these premises, the current call aims to discuss harassment and its link with gender norms, gender power relations, gender stereotypes, and other forms of discrimination, e.g., the maternal wall. What contribution can the intersectional approach and gender perspective make to understanding the causes that generate harassment? What actions should be implemented in institutions to prevent and respond to this problem? How are support networks built to overcome isolation toward those who choose to speak up? Are there generational differences when it comes to sexual, domestic, workplace and online harassment?

Speaker
Ana Bull (University of New York)

Navigating Feminist Debates On Due Process For Addressing Gender-Based Violence And Harassment Within Organisations: Findings From A Qualitative Study Of Survivors' Reporting Experiences Within UK Higher Education

Increased public and media attention is currently being paid to how workplaces and education institutions are addressing gender-based violence and harassment (GBVH). Scholarly and activist debates on this issue are divided. On one hand, some argue that survivor-centered, feminist forms of 'due process' should be adopted within institutions and therefore, feminists should work to improve formal reporting processes within institutions for GBVH. On the other hand, others argue that institutions where violence and harassment occur must be inherently discriminatory – across gender, class, race, disability, and/or caste lines – and therefore cannot adequately manage reports of these issues. This position can lead survivors to take steps such as naming those responsible for harassment. Alongside this, many activists and scholars are advocating transformative justice solutions that entirely bypass existing institutional processes.

Despite these febrile debates, research literature on complaints, grievance and disciplinary processes for addressing sexual harassment within workplaces and education institutions remains limited. This paper addresses these debates using qualitative interview data from twenty-seven students and staff who reported GBVH their higher education institution in the UK between 2016-21. Building on Sara Ahmed's work on 'complaint', the paper takes the perspective of an 'institutional mechanic' (Ahmed, 2021) to explore why and how reporting processes for GBVH are often unsatisfactory for reporting parties. The paper also interrogates debates around informal versus formal processes, exploring whether more formality in institutional processes in this area is likely to be more helpful for survivors who need to report GBVH.

Biography

Anna Bull is a Senior Lecturer in Education and Social Justice at the University of York, and co-director of *The 1752 Group*, a research and campaigning organisation working to address staff sexual misconduct in higher education. As well as multiple academic and public-facing publications on sexual misconduct in HE, Anna was an academic advisor to the National Union of Students for their report *Power in the Academy: staff sexual misconduct in UK higher education.* She sits on national advisory boards to address gender-based violence in higher education in the UK and Ireland, and co-authored The 1752 Group and McAllister Olivarius' *Sector Guidance to address staff sexual misconduct in UK higher education.* She has also conducted research into inequalities in classical music education and industry and sexual harassment in the film and television industry.

Anneleen De Cuyper (University of Antwerp)

Reporting Sexual Harassment in Higher Education: A Case Study of a Belgian University

The university setting is often characterised by a steep hierarchy, power imbalances and professional dependency. This makes it challenging for people who have experienced sexual harassment at university to file an internal, formal complaint. This study wishes to analyse the reporting procedures at the University of Antwerp: How do people decide whether to report sexual harassment? If one does report, what is the outcome? Who falls through the cracks of these internal procedures and how? Do significant differences exist in reporting behaviour and outcome between groups with distinct socio-demographic and/or professional characteristics? To answer these research questions, the Belgian sample of the Uni4Equity questionnaire dataset on sexual harassment in higher education will be analysed using regression methods. This data will be complemented by in-depth interviews with various university stakeholders (e.g. policy makers, leadership, staff and students). Preliminary results reveal respondents expect to not contact specific university services due to: A lack of information about their setup (62,5%), confidentiality and anonymity concerns (34,6%) and preferring to seek help from family, friends and/or partner (29%). Interestingly, of the 9,1% who actually has been confronted with sexual harassment at the University of Antwerp, close to no one filed a formal complaint. Reasons included being concerned about not being believed by the university, that nothing would happen, and the reporting procedure being too difficult. These first results indicate a lack of knowledge and trust in university reporting services. However, additional research will provide more extensive data on the reporting procedures and decision-making processes involved.

Biography

Anneleen De Cuyper is a researcher at the Sociology department of the University of Antwerp. Her research focuses on sexual harassment in higher education. More specifically, she aims to get a better understanding of the reporting behaviour of people who have experienced sexual harassment and the decision-making process of university members tasked with handling sexual harassment reports. Throughout her study, she combines quantitative and qualitative data collected for the Uni4Equity project. This is an international cooperation between several European higher education institutions, including the University of Antwerp, focused on preventing and identifying online and offline sexual harassment in higher education. Before her start at the University of Antwerp, she obtained master's degrees in Organisational Psychology (Ghent University), Management (Lund University) and Conflict and Development studies (Ghent University), enabling her to approach topics from various theoretical perspectives.

Sarah Van de Velde (University of Antwerp)

Biography

Sarah Van de Velde is a Professor of Medical Sociology at the University of Antwerp, Belgium. She is a leading researcher in the field of social disparities in SRH and mental health, as well as access to healthcare. Her SRH research topics include abortion, female genital mutilation/cutting, contraception, and sexual harassment. She employs both quantitative and qualitative research methods and has extensive expertise in developing (multi-country) surveys. She is the Vice-President of the European Society for Health and Medical Sociology, co-chair of the scientific board of The Social Study, board member of VLIR-UOS, and editorial board member of BMC Reproductive Health. She teaches several courses in the fields of Medical Sociology, Social Inequality, and Family Sociology.

SP16 | Homelessness and Housing distress in Europe

30 Aug 2024 | 9:00-10:30 | LC.0.02 (Faculty of Arts and Humanities – Venue L)

With: **Eoin O'Sullivan and Luís Mendes**
Organisation: **RN27 Southern European Societies and RN37 Urban Sociology**
Coordinators and Chairs: **Teresa Consoli (University of Catania, Italy), Inês Vieira (Lusófona University, Portugal) and Gabriele Manella (University of Bologna, Italy)**

The European Commission has defined homelessness as "situations of living in temporary, insecure or poor-quality housing". It clearly is a wide definition, which includes people who sleep on the streets, in the cars, in tents and/or in shelters. Covid-19 pandemics dramatically affected this part of population, but several data show that housing distress started even before: homelessness in EU countries had a 70% increase in the last ten years, and around 700,000 people are estimated to be homeless on a given night.

A report from FEANTSA (European Federation of National Organisations Working with the Homeless) pointed out that many people are "increasingly marginalised by a private rental market that feeds off a systematic lack of affordable housing": not only the migrants but also women and young people are at risk, showing new areas of social tensions and the urgency to rethink homelessness as a wider and increasing phenomenon.

If the trend has emerged throughout Europe, Finland seems the only country that has been able to reduce homelessness significantly: – 19% between 2009 and 2017 and finally declared to have ended homelessness through a long-term orchestrated housing-led political strategy.

Our proposal moves from these considerations and focuses on two questions:

• Which methods and approaches can be used to analyse the conditions of homeless people but also the ones of people at risk of becoming homeless? Which policies and data collection on the phenomenon of homelessness can be strategic in the transformation of the welfare system and the public debate on housing?

• What is happening in the European countries and, specifically in southern European cities to tackle (or worsen) this situation?

This challenge clearly requires new welfare organizations as well as the sharing of data and methods. We boost the specificity of sociological approaches on homelessness and housing but also strongly encourage an interdisciplinary public debate on both issues.

Speakers

Eoin O'Sullivan (Professor in Social Policy, Trinity College of Dublin, Ireland)

Effective Systems to End Homelessness in Europe

The objective of this paper is to provide a conceptual framework to understand the dynamics of homelessness, drawing on key lessons from research, and how these lessons can inform, through mutual learning and collaboration, the configuration of practices and policies in devising effective systems to end homelessness in Europe. Social science research has clearly demonstrated that the experience of homelessness is a dynamic process and that those who experience homelessness are not randomly distributed across the population but are part of a larger population of disadvantaged households, for whom housing precarity and insecurity is omnipresent. Given this understanding of homelessness, effective systems to end homelessness must orientate towards changing the "homelessness system" (that is the assemblage of services and policies that respond to those experiencing homelessness) rather than "changing people". This is driven by an evidence-based understanding that homelessness is solvable, when the appropriate policies and practices are in place, rather than an unresolvable "wicked problem" as sometime portrayed. The objective of effective homelessness systems should be to prevent entries to homelessness in the first instance. For those that do experience homelessness, the objective should be to provide appropriate temporary accommodation to prevent literal homelessness, and to minimize the duration of stay in such accommodation by rapidly exiting households to secure affordable housing, with support if required. This will reduce the likelihood of a further experience of homelessness, allowing for the reduction of costly emergency accommodation and the alleviation of the individual trauma associated with a spell of homelessness.

Biography

Eoin O'Sullivan is a Fellow of Trinity College Dublin, Senior Dean and Professor in Social Policy in the School of Social Work and Social Policy, Trinity College Dublin. He is a member of the European Observatory on Homelessness since 1992, and editor of the European Journal of Homelessness since 2009. Recent books include Ending Homelessness? The Contrasting Experiences of Denmark, Finland, and Ireland (2020), Reimagining Homelessness (2020) and his co-authored book Decades in the Making: The Roots of the Homelessness Crisis in Ireland will be published in early 2024.

Luís Mendes (CEG, IGOT-UL, Lisbon, Portugal)

Housing crisis: main drivers and the question of homelessness

Undoubtedly, one of the problems that mark the current situation in Europe, Portugal and Lisbon, still in the 21st century, is the growing difficulty of the population in accessing

41

the Right to Housing, a corollary of a structural crisis in the sector that has been going on for decades, intrinsic to the very functioning of the economic and social mode of production of the contemporary society, and which was particularly acute after the capitalist crisis of 2008-2009 and with the pandemic crisis of 2020-2022 and now resurfaces with the inflationary crisis. The purpose of this presentation is to analyse the main drivers of the contemporary housing crisis, mainly: touristification, neoliberal urban policies, and financialization of housing and rental market. We will also analyse the impact of this crisis on the galloping expansion of homelessness, which in the last half decade alone in Portugal increased by 78% reaching 11,000 people and in Europe the number reached 900,000 people. The presentation will conclude with an apology for the general principles and specific measures for an effective and consequent Public Housing Policy in the path of universal realization of the inalienable and unconditional Right to Housing in national territory and Europe.

Biography

Geographer. Guest Lecturer and Permanent Researcher at the Institute of Geography and Spatial Planning of the University of Lisbon (IGOT-UL). He is a technical and scientific consultant in public and private institutions, as well as national and international projects. Author of more than 250 titles: papers, presentations, book chapters, books, technical opinions and reports, in addition to publications on gentrification, housing and urban regeneration. His work has been recognized and cited in the national and international media where he has a frequent presence. He has also worked in the last 25 years as a board member in several civic associations and 7 years as activist in the social movement Morar em Lisboa.

SP17 | The relevance of teaching social theory today

30 Aug 2024 | 9:00-10:30 | LC.2.00 (Faculty of Arts and Humanities – Venue L)

With: **Ramon Flecha and Hubert Knoblauch**
Organisation: **RN10 Sociology of Education and RN29 Social Theory**
Coordinators and Chairs: **Adriana Aubert (University of Barcelona, Spain) and Mikael Carleheden (University of Copenhagen, Denmark)**

For the first time the European Commission has set its research priorities with a social dimension focusing on the Sustainable Development Goals of the United Nations. Therefore, research in all sciences today must have this social dimension which makes crucial the inclusion of social theory in social research and teaching of professionals as sociologists, educators, social workers, economists or lawyers even more relevant.

Learning social theory today means having better access to the best scientific knowledge available to understand current "tensions", and to understand the transformation towards a more democratic, just, egalitarian and sustainable society.

The session proposed responds to the ESA's approach of revitalising citizens' trust in science, and science cannot be understood without social theory. We contribute to the creation and maintenance of "trust" in institutions and key individuals such as scientists and politicians. Finally, we aim to shed light onto the teaching of social theory for future social science professionals who will have a key role on the processes of social "transformation" and thus on the achievement of social improvements. Social sciences offer to a world of uncertainties, conflicts and persistent crises, key elements of analysis and, importantly, the possibility to identify and analyse actions already reversing them.

Speakers

Ramon Flecha (Emeritus Professor, University of Barcelona)

The impact of teaching dialogic elaborations of social theories

Now more than ever, without social theory, science cannot be understood. The current priority of social impact and co-creation (in research and in society) has created the best scenario in history to improve sociology and its contribution to the improvement of society. Sociologists have co-led the elaboration of this priority that is transforming all sciences and their relations with citizens. Today, the dimension of social impact is an increasing requirement. New legislation is being approved, for instance by the EC, to make compulsory for companies reports of their social impact. Citizens are claiming to participate in the assessment of the social impact of companies, governments and academia, including sociological theory and sociology of education.

Scientists from physics, neuroscience, mathematics and other areas are asking sociologists to develop the social impact dimension of their studies. They discover now their need for social theories able to contribute to their dialogue with society and the improvement of their social impact. Never, Nobel prizes of different sciences have been so motivated by sociology, and concretely by those social theories that make them able to improve their dialogue with citizens. Dialogic sociology is not one more theory different or competitive with other social theories, but the relevant orientation of recent elaborations of diverse social theories. Students are receiving with enthusiasm those elaborations and the clear transformations of society they are generating.

Biography

Prof. Flecha is the highest ranked scientist worldwide in the category "Social Impact" (Google Scholar) and the 7th in the category of "Sociological Theory", Emeritus Professor at the University of Barcelona and Doctor Honoris Causa from Vest University of Timişoara. His recent book "The Dialogic Society" (2022) is published in English, Spanish, Basque, Chinese, Catalan and Portuguese. In his book "Contemporary Social Theory" (2003) with a preface by U. Beck, he already discussed the importance of the dialogic society in social theory. He was the Chair of the Expert Group from all scientific fields to develop Horizon Europe's social impact and co-creation criteria.

Hubert Knoblauch (Technische Universität Berlin)

43

The 'Institutionalization of Permanent Reflection'. Sociological Theory and Societies in Transformation

In the last decades, sociology has in fact got in dialogue with many partners. Having been confronted with the demand for interdisciplinary and the "mode 2" transdisciplinarity, it has opened also for participating in public discourses as a primary goal and, after its extension to a "global sociology", lastly, for postcolonial critique of its Western perspectivity. As important as the instrumentalization of sociological knowledge to various social actors has been for sociology as a profession, it not only made it increasingly difficult to teach "Sociological Theory" as a somehow bounded field of knowledge; in addition, it has led to some confusion about the discipline itself, to severe tensions and even schisms even in Sociology between different "paradigms". As a result, the role of Sociological Theory at Sociological Institutes, at universities and in Academia in general seems to have waned in many national and international academic systems.

There is no doubt that Sociology as pluralistic and highly differentiated body of knowledge does need to go in dialogue with as many social actors as possible, yet because of that, to be a trusted, respected actor, sociology needs to communicate internally about its own subject matter to maintain a disciplinary identity. This holds particularly

for the current transformation of societies, the tensions involved with that as well as the crisis of scientific expertise (i.e. what we called the refiguration of societies). As a discipline which is studying society as well as the role of knowledge and the sciences in society, sociology needs to be able to reflect in its own terms about societies, about its empirical observations as well as its own changing role in science and society. These terms are provided by, reflected and corrected by the institutionalized field of "Sociological Theory" which, I argue, constitutes a unique and, because of its reflection, trustful perspective relevant also for students in an age of digitally mediated, algorithmic and artificial machines of sense-making.

Biography

I am Chair for General Sociology/ Theory of Modern Societies and Co-Speaker of the Collaborative Research Center "Refiguration of Space" funded by the German Science Foundation (DFG) at the Technical University of Berlin's Institute of Sociology. I have been teaching Sociological Theory for 20 years and doing research in the Sociology of Knowledge, Culture, Religion, Communication, Methodology and, of course, Social Theory. Based on a wide range of empirical studies with different methods and methodologies, I have been trying to contribute to develop further the Social Constructivist Theory into what is now Communicative Constructivism. Latest publications: The Communicative Construction of Reality. London/New York: Routledge 2022; with Michaela Pfadenhauer: Construction versus Realism? The Unrealized Potential of Communicative Constructivism, in: Sociologica V. 17, No.1, 119-136 (2023) *https://doi.org/10.6092/issn.1971-8853/16725*

SP18 | Social conflicts at work and around work: challenging inequalities and redefining boundaries

30 Aug 2024 | 9:00-10:30 | FC1.0.03 (Faculty of Science – Venue C)

With: **Michele Lamont and Donatella Della Porta**
Organisation: **RN17 Work, Employment and Industrial Relations and RN25 Social Movements**
Coordinators and Chairs: **Guglielmo Meardi (Scuola Normale Superiore), Valeria Pulignano (KU Leuven) and Elena Pavan (University of Trento)**

The challenges posed by the Covid-19 pandemic and post pandemic, combined with changing technology, demographic trends, armed conflicts and concerns about energy and the environment, have brought about a resurgence of social conflicts both at work and about the boundaries of work. On one side the re-emergence of inflation has given new centrality to wage issues, with waves of strikes and policy developments, for example on minimum wages. On the other the idea of work itself has been newly problematized. The reported emergence of labour shortages questions the future of labour supply, i.e. the availability of people for paid employment, in the way it has been known and largely taken for granted so far. The balance between work and life, the relationship between home and workplace, the distinction between employment, self-employment and other forms of activity appears much less clear cut than they have long assumed to be.

The semi-plenary proposes to reflect both theoretically and empirically about the social turbulences and the emergence of new forms of conflict from below at work – i.e., regarding wages and working conditions – and about work – i.e., the importance of work as a sense of identity and value for citizens and people alike – in the post-pandemic world. Issues like the 'great resignation', falling labour supply, new forms of labour power in politics and the workplace, and the redefinition of care work between market, household and society are important examples of topical societal concerns that require such reflection.

RN17 is well placed to propose evidence-based and theoretically informed reflections that directly address the ESA Conference's theme of 'tension, trust and transformation' on a key social setting (work) and on very topical developments.

The proposed Semi-Plenary will consist of presentations on the social conflicts at (and about) work, and their antecedents and societal challenges for trust and social cohesion. The specific issues on which contributions will be called for from among the several colleagues working on this topic is:

• Social conflict at work on wages and on restructuring, new actors and new forms of mobilisation

• Social conflict on work-life balance, on remote work, and on technological change such as digitalization and Artificial Intelligence
• Social conflict on working time and on the duration of the working life (e.g., pensions, parental and care leaves)
• Social conflicts on care work, on its redefinition as key work and on its distribution between genders and between state, family and market
• Social conflicts on the redefinition of employment, e.g., in the platform economy, freelancing, and new grey zones between employment and self-employment

Speakers

Michele Lamont (Professor of Sociology and of African and African American Studies)

Seeing Others: How to Redefine Worth in a Divided World

Growing inequality and the decline of the American dream are marked by a mental health crisis across all social classes in the United States. I consider what alternative hopes are taking shape based on interviews with 80 Gen Zs and 185 agents of change who are producing new narratives in entertainment, comedy, advocacy, art, impact investing, and other fields of activity. They are offering alternatives to neoliberal scripts of self by producing narratives that emphasize inclusion, authenticity, and sustainability. They contribute to social movements that aim to extend recognition to the largest numbers, even in a context where political backlashes are multiplying. These transformations point to how to broaden cultural citizenship, not only in the United States but in other societies.

Biography

Michèle Lamont is an influential cultural sociologist who studies boundaries and inequality, she has tackled topics such as dignity, respect, stigma, racism, class and racial boundaries, and how we evaluate social worth across societies. Her most recent book is Seeing Others: How to Redefine Worth in a Divided World (Penguin 2023). Lamont's a leader in the study of culture and inequality in the United States and beyond, helping to redefine the field of sociology as we know it today. Her many awards include the C. Wright Mills Award for The Dignity of Working Men, the 2014 Guttenberg Award, the 2017 Erasmus Prize, and honorary doctorates from six countries. She served as President of the American Sociological Association in 2016, was a Carnegie Fellow in 2021-2022, co-chaired the advisory board to the 2022 United Nations Human Development Report, and was inducted into the American Academy of Arts and Sciences in 2023.

Donatella Della Porta (Scuola Normale Superiore, Florence)

Labour conflicts in post-pandemic times: a social movement perspective

Pandemic times can be defined as emergency-driven critical junctures, having produced sudden breaks in routine and calls for deep transformation. Eventful protests were triggered during the pandemic, as it exacerbated intersectional inequalities, making their killing effects more visible. In the field of labour, mobilization addressed the very definition of essential works, the health conditions at work, the impact of precarity in and beyond job conditions, but also the suspension of some unions and workers' rights. As health rights became a bridging frame, conceptions of care and caring classes come to the fore. Building upon a social movement perspective, the paper will discuss if and how the opportunities opened by the critical juncture, but also it is challenges resonated in the mobilization around work issues, affecting repertoires of action, organizational networks and collective framing.

Biography

Donatella Della Porta is professor of political science at Scuola Normale Superiore in Florence, where she also leads the Center on Social Movement Studies (Cosmos). She is the author or editor of over 90 books and 150 journal articles on topics including social movements, political violence, terrorism, corruption, the police and protest policing. She has recently published "Regressive Movements in Times of Emergency: The Protests Against Anti-Contagion Measures and Vaccination During the Covid-19 Pandemic" (Oxford University Press, 2023) and, with Riccardo Emilio Chesta and Lorenzo Cini, "Labour Conflicts in the Digital Age. A Comparative Perspective" (Britsol University Press, 2022).

SP19 | Just Transition after Cop28. Closer or farther from environmental justice?

30 Aug 2024 | 9:00-10:30 | FC4.0.40 (Faculty of Science – Venue C)

With: **Patricia Vieira and Gerard Mullally**
Organisations: **Communications Committee and The European Sociologist**
Discussants: **Aleksandra Wagner (Jagiellonian University Krakow) and Pia Laborgne (Karlsruhe Institute of Technology)**
Chair: **Luigi Pellizzoni (ESA Vice-Presidetnt)**

The idea of environmental justice began to develop as local protests exposure to toxic waste and other environmental degradation and health risks unfairly affecting socially disadvantaged and discriminated people. It quickly escalated to social mobilizations claiming the need to address environmental issues and social inequalities and injustices at once, as intimately connected within and across nations. Joan Martinez-Alier, Ramachandra Guha, Donna Haraway and many others contrasted views of ecological problems as a matter of conservation or growing technical efficiency with a view of them as primarily a matter of moving away from exploitative thrusts and finding ways of living and prospering together, humans and nonhumans. The rise of climate change as the epitome and synthesis of ecological problems led to a reframing of environmental justice as a question of just transition in the first place.

The division that has emerged at the recent COP28 climate change negotiations in Dubai is not simply between the good and the bad, between supporters and opponents of the need to move away from fossil fuels, but between those for whom the transition is financially viable (Europe and North America in particular) or dramatically imperative (such as island nations from the Pacific and the Caribbean), and those for whom a sudden phasing out of fossil fuels is tantamount to a climate disaster and, moreover, raises the risk of renewed forms of ('green') colonialism, based on technological dependence on rich countries.

If timing and modalities of the transition are issues that have long been addressed in the Just Transition framework, are we facing a new phase in the global ecological conflict? What scenarios for transition do the agreement for an exit from fossil fuels by 2050 open? Are we getting closer or farther from environmental justice?

Speakers

Patricia Vieira (Centre for Social Studies, University of Coimbra, Portugal)

Environmental Justice and More than Human Rights: A View from the Amazon

In this talk, I reflect upon the issue of environmental justice from the perspective of Amazonian communities that include both human and more than human beings. I discuss key features of Amazonian thought and the way it envisions a collaborative, symbiotic relationship between human and more than human sentient, intelligent beings as a significant contribution to current debates on climate change and environmental degradation. I then analyse the emergence of so-called "rights of nature" in Amazonian countries such as Ecuador, Bolivia and Colombia and analyse the ties between Indigenous knowledge and the legal framework of environmental rights. I finally reflect on whether and how the COP negotiations, and their current state, affect the legal and political case for indigenous rights and approach to environmental justice.

Biography

Patricia Vieira is Research Professor at the Centre for Social Studies (CES) of the University of Coimbra in Portugal. Her fields of expertise are Latin American and Iberian Literature and Cinema, Utopian Studies and the Environmental Humanities. Her most recent book is States of Grace: Utopia in Brazilian Culture (SUNY UP, 2018) and her most recent co-edited book is The Mind of Plants: Narratives of Vegetal Intelligence (Synergetic, 2021). She is currently heading a European Research Council funded project titled ECO – Animals and Plants in Cultural Productions about the Amazon River Basin and co-coordinating a Gerda Henkel Foundation funded project titled Resilient Forest Cities: Utopia and Development in the Modern Amazon. Gerard Mullally (University College Cork, Ireland)

Hope for future(s): How soon is now?

Prior to embarking for CoP 28 in Dubai, Mary Robinson (former President of Ireland and former UN High Commissioner for Human Rights), Chair of the Elders, addressed the Sustainable Futures Forum in University College Cork. Her theme proved apocryphal to eventual outcomes, lauding progress on "loss and damage" she later lamented that "transparency, equity and climate justice have been undermined by misleading language, false solutions and game-playing".

Despite the relationship between cognate fields of justice, social justice, environmental justice, energy justice, climate justice and Just Transitions there is still considerable divergence regarding their intersections, practices,

47

and theorisations. Just Transitions has tended to focus on extractive industries like mining but has recently expanded to include a focus on agriculture which has generated significant and powerful counter-movements (Stark et al.).

Recognising the value of transdisciplinary research, we need to (re-)consider questions of ethics, politics, and engaging publics in realising possible and desirable futures. Beyond environmental sociology (Abram et al., Aldoff and Neckel, Altstaedt, Delanty, Goldman, Strydom) there is a growing sense that we need to embrace futures that reimagine the sociological imagination and social imaginaries in the new times of the Anthropocene, theoretically, critically, and imaginatively! (Adam, Sarren et al.)

Biography

Gerard Mullally is a lecturer in Sociology in the School of Society, Politics and Ethics at University College, Cork. He lectures in the Sociology of the Environment and the Sociology of Community and is Co-director of the post-graduate programme of the Sociology of Sustainability and Global Challenges and the award-winning University Wide Module: Sustainability. Gerard is co-editor of Transdisciplinary Perspectives on Transitions to Sustainability and Metaphor, Sustainability, Transformation: Transdisciplinary Perspectives (Routledge).

MD01 | The future of the Evolving Landscape of Survey Research: Theoretical and Practical Implications in the Age of AI

28 Aug 2024 | 13:00-14:00 | FC4.0.40 (Faculty of Science – Venue C)

Organisers and Chairs: **Gary Pollock and Teresa Sordé (Conference Co-chairs)**

This session delves into the dynamic and complex world of survey research, with a particular focus on the European context. It brings together different perspectives that explore both the promise and challenges of contemporary survey research practices. The evolution of survey research, from traditional methods to the incorporation of administrative data and AI will be examined, with its theoretical and practical implications of these developments, discussing the potential of longitudinal data, the role of AI, and the impact of selection biases in data harvesting. An on-the-ground view of conducting large-scale survey research in Europe will be offered by discussing the experiences of leading participation in major surveys, paying special attention to the challenges encountered, from securing funding to ensuring response quality, and calls for united efforts to address these issues. The session aims to foster a critical and constructive discussion on the future of survey research, exploring how we can navigate its evolving landscape to continue producing robust, valuable and excellent insights into our societies.

Speakers

Tiziana Nazio (Turin University)

From survey research to administrative data and AI: theoretical and practical implications

Great investments in data infrastructures and swift distribution have promoted an increase in high-quality survey-based research. Meanwhile, longitudinal surveys have gained relevance as valuable data sources for social scientists to produce stronger empirical evidence in support of theory-driven research. Longitudinal data allowed an increasing refinement of modelling that accounts for the dynamism and complexity of human lives, for the time ordering of events, for time-varying characteristics, and for interdependencies between individuals and life-domains. Large-scale survey projects like national panel data and comparative efforts in the last decades have vastly increased the reach and robustness of results afforded by social scientists, fostering knowledge and helping policymakers. More recently, the use of administrative data for research and their linkage with surveys has fostered even more high-quality, crucial sources of empirical data. Increased data availability, modelling development and comparative designs fostered studying not only probability, timing, sequence, and order of events but also how individuals' behaviour is situated within cultural, institutional and relational contexts of opportunities and constraints. Most recently, Artificial Intelligence (AI) modelling has entered research practices and analyses, with consequences that are yet to be fully understood. I will discuss my experience in using data for research and teaching and the scope for maintaining comparative data collection efforts. I will also critically reflect on the promises and limits of AI with respect to the advancement of the field and the selection biases in data harvesting. I will conclude by discussing the implications for the validity and pace of theoretically informed research.

Biography

Tiziana Nazio is an Associate Professor at Turin University, a Fellow at Collegio Carlo Alberto and a former Marie Skłodowska-Curie Research Fellow at the Berlin Social Science Center (WZB). After her PhD in Bielefeld (2004), she worked at the Centre for Demographic Studies and Pompeu Fabra University (Barcelona, 2003-05) and at the University of Oxford and Nuffield College (2005-08). Her research examines individuals' life courses, emphasizing the role of social background, employment, social interactions, and institutional settings. She works at the intersection of sociology, demography, and social stratification. Her research has been funded by ECSR, FP7 and H2020. She has published in prominent journals like European Sociological Review, European Journal of Population, Work, Employment and Society, Demographic Research, and International Migration Review. She was an associate Board member of Work, Employment and Society 2017-2019.

49

Sigrún Ólafsdóttir (University of Iceland)

The challenges and promise of survey research in Europe

European researchers have united in groundbreaking work of collecting large-scale survey research in Europe and around the world. These include the European Social Survey (ESS), European Values Study (EVS) and the International Social Survey Programme (ISSP). These studies have represented the state-of-the-art in survey research for decades with their careful theoretical, conceptual, cultural and methodological co-ordination. As a result, they have provided European researchers and policymakers with invaluable insights into key societal issues and challenges for the past forty decades. However, recent decades have witnessed increasing challenges to such efforts, including difficulties in securing funding, lowering response rates, especially for certain population, and difficulties guaranteeing the quality of our survey responses. In this talk, I will briefly discuss my experience in leading Iceland´s participation in the ESS (since 2018), EVS (since 2017) and ISSP (since 2009) with a focus on the challenges we have encountered as well as the value that is associated with understanding public views and experiences in Iceland in a comparative perspective. I will then discuss on the major challenges of continuing participation in such cross-national efforts within and across nations. Finally, I turn attention to recent challenges survey researchers face, including how recent developments regarding AI may threaten survey research. Overall, I argue that while survey research currently faces difficult challenges, the promise of such work is still significant and call on survey researchers across national boundaries to unite to work toward creative solutions to continue high quality surveys in Europe.

Biography

Sigrún Ólafsdóttir is a professor of sociology at the University of Iceland. She obtained her PhD at Indiana University (2007) and was faculty at Boston University until 2016. Her research interests lie at the intersection of medical, political and cultural sociology. She has published on, among other things, health inequalities, public attitudes toward inequalities and stigma of mental illness. Much of her work relies on cross-national survey work. She has led Iceland´s participation in the European Social Survey since 2018, the European Values Study since 2017 and the International Social Survey Programme since 2009. Her has published in some of the most prominent sociological journals, including American Journal of Sociology, European Sociological Review, and Journal of Health and Social Behavior. Her research has been funded by the Icelandic Research Fund, the U.S. National Science Foundation and U.S. National Institutes of Health. She was a co-editor of Acta Sociologica from 2018-2022.

MD02 | City of Porto

28 Aug 2024 | 13:00-14:00 | LC.0.01 (Faculty of Arts and Humanities – Venue L)

Chairs: **Lígia Ferro (ESA President 2021-24) and Paulo Peixoto (LOC Chair)**

In recent years, Porto has undergone a remarkable transformation, establishing itself as a vibrant and dynamic city of culture. This change is visible not only in the diverse cultural programme, but also in the growth of independent cultural programming, the countless cultural events and the high-quality cultural facilities that enrich the city.

Porto's cultural programme reflects its rich historical heritage and its openness to the new and the innovative. From music, theatre, dance and film festivals to contemporary art exhibitions, the city offers a variety of events that appeal to locals and international visitors alike. Renowned institutions such as the Casa da Música, the Serralves Museum of Contemporary Art and the São João National Theatre are just a few examples of how Porto has invested in cultural venues that are true icons of the city.

Independent cultural programming has also flourished, with countless local collectives and artists developing innovative projects that challenge conventions and offer new perspectives. Venues such as Maus Hábitos, Mira Forum and Mala Voadora are examples of how independent culture contributes to Porto's diversity and cultural richness. These spaces promote bold and experimental programming, providing a platform for emerging artists and establishing a constant dialogue with the community.

Speakers

Virgílio Borges Pereira (Faculty of Arts and Humanities of the University of Porto)

Renewing sociological research on the city of Porto with Bourdieu

Although it is not always seen as a reference programme for the development of sociological research on the city, Bourdieu's sociological work can be mobilised for the development of innovative research on the relationship between space and society, helping to renew and reinvent the research agendas devoted to it. In fact, from a relatively early stage, Bourdieu was able to integrate into his research, in an original way and using different methodological strategies, a systematic concern with understanding the relationship that social agents establish with physical space. Whether in his Algerian phase, in his work on the French countryside, or in his established research on social classes, the understanding of positions in social space and their respective inscriptions in physical space has operational and heuristic contours. For more than three decades, the city of Porto, in north-western Portugal, has been studied under the theoretical, methodological and technical implications of Bourdieu's research programme, contributing to a renewal of the sociological view of the city. I will try to show how, in the city of Porto, sociability, inequality, housing policy, territorial valorisation and stigmatisation gain a more evident sociological

coherence when they are conceived and analysed in the light of Bourdieu's concepts and his research on the relationship between social space and physical space.

Biography

Virgílio Borges Pereira is Full Professor of Sociology at the Department of Sociology of the Faculty of Arts of the University of Porto, where he has taught since 1994, and a researcher at the Institute of Sociology of the University of Porto. Since 2003, he has collaborated with the Faculty of Architecture of the same university. He specialises in the sociology of social classes and symbolization, paying attention to the legacy of Pierre Bourdieu's work. Taking the city of Porto and the regions of the Ave and Sousa valleys as a reference, he has privileged the construction of social spaces, spaces of lifestyles and representations, and the analysis of their relations with physical space. Combining sociological and historical approaches, he has studied dominant social groups, intellectuals, institutions and relations with less privileged groups. Housing policy and activity in the construction industry have also been areas of research.

Vânia Rodrigues (University of Coimbra)

Porto: challenges and shortcomings of a budding cultural ecosystem

In little more than a decade, Porto has tried to revamp its arts and culture ecosystem: it reopened the main city theatre and one of its historic cinemas, renewed the municipal galleries and some of the museums, reinstated and promoted flagship curatorial programmes with international reach, established new dedicated funding mechanisms for artistic creation, internationalization, artistic residencies and visual art spaces. These changes were spearheaded by the city hall, and heavily marketed as part of a neoliberal political project to make Porto 'attractive' and 'cosmopolitan' – a bittersweet concurrence which cultural agents have been hesitant to disentangle. The institutional strategies accompanying this overhaul have been far less innovative, resorting to age-old cultural management models of centralized bureaucracy and strong hierarchy, thus pointing to an arts management ethos that is more compliant than transformative. Combining recent research on changing organisational structures in the arts with reflective notes from first-hand experience as a theatre manager and programmer in the city, this intervention muses on the conditions for institutional experimentation and democratic co-existence.

Biography

Vânia Rodrigues worked as an arts manager for several cultural organisations before transitioning to a research career. Currently, she is an Integrated Researcher at CEIS20 – Center for Interdisciplinary Studies at the University of Coimbra, where she leads the exploratory project GREENARTS (FCT). She founded and coordinates the RandD platform Modes of Production – Performing Arts in Transition, the Post-Graduate Diploma in Arts Management and Sustainability and is the Principal Investigator of the exploratory project GREENARTS (FCT) – three initiatives dedicated to reflection on the ethical, political and practical challenges raised by the context of ecological emergency.

MD03 | How to get your paper published?

28 Aug 2024 | 13:00-14:00 | FC4.0.41 (Faculty of Science – Venue C)

Chair: **Michalis Lianos (ESA Executive Committee)**

This session is dedicated to helping interested colleagues to better understand various aspects of the process of academic publication, namely,

1. Selecting the journals to submit to.

2. Writing with a specific journal in mind.

3. Cover letter/note to the editor(s).

4. "Behind the scenes" process: desk rejection, reviewer selection, double-blind reviewing…

5. Dealing with reviewers' comments.

6. Dealing with rejection and considering resubmission to another journal.

Speakers

Paul Blokker is professor in political sociology, University of Bologna. He has been one of the editors of the European Journal of Cultural and Political Sociology since 2020.

Veikko Eranti is assistant professor of urban sociology at university of Helsinki. His work situates at the intersection of political and urban sociology. Drawing from pragmatist and cultural theory, he is interested in questions of urban conflict, participation in land use, and questions of general sociology. He has been one of the editors-in-chief of the European Journal of Cultural and Political Sociology since 2020.

Patrick Präg is one of the Editors in Chief of "European Societies". He works as an associate professor of sociology at the École nationale de la statistique et de l'administration économique (ENSAE) in Paris.

52

MD04 | Consumption, social class, and environmentalism: from tensions to transformations

28 Aug 2024 | 13:00-14:00 | B2.12 (Faculty of Architecture – Venue A)

Organisation: **RN5, Sociology of consumption, and RN12 Environment and Society**
Coordinators and Chairs: **Marlyne Sahakian (University of Geneva, Switzerland) and Audrone Telesiene (Kaunas University of Technology, Lithuania)**

Imagining transformations to more sustainable societies in the future requires grappling with tensions and conflicts in the present. This special session considers the ways in which power plays out at different scales, from private consumption to public action, from communal living to market-based solutions. The two panellists engage with questions of social and environmental justice and will be brought into dialogue around their recently published books. Author of Recycling Class: The Contradictions of Inclusion in Urban Sustainability (MIT Press 2024), Manisha Anantharaman links middle-class, sustainable consumption with the environmental labour of the working poor to offer a situated and intersectional analysis of the class, gender and caste politics of urban sustainability in India. Her talk will discuss the class and caste tensions that emerge when diverse social groups come together to solve urban environmental problems and discuss under what conditions transformative cross-coalitions can emerge. In dialogue with Anantharaman is Arve Hansen, author of Consumption and Vietnam's New Middle Classes: Societal Transformations and Everyday Life (Palgrave, 2022). He will discuss the changing consumption patterns of Asia's new middle classes, focusing on the relationship between everyday life, capitalist transformations, and social and environmental sustainability. He will pay particular attention to questions of agency and power in relation to the conditioning effects of political-economic processes. The semi plenary will be moderated by the Chairs of RN5 and RN12, who will prepare an engaging discussion between the authors and with the audience, gleaning insights on how to support more just transformations.

Speakers

Manisha Anantharaman's (Centre for the Sociology of Organisations, Sciences Po) research examines how economic and political ideologies, socio-cultural identities, and inequalities affect how ecological transitions are conceptualized and enacted at multiple scales: from the household to the city to the transnational milieu. Applying ethnographic and community-engaged methodologies, she studies everyday sustainability practices and political mobilizations in relation to each other. As a critical scholar, she pays specific attention to how "environmental" initiatives—be it municipal recycling schemes, green space development, or global circular economy transition plans—reinforce or contest intersectional manifestations of race, class, gender, and caste-based inequality. Her publications include a co-edited volume "The Circular Economy and the Global South" (Routledge, UK, 2019), and a book "Recycling Class: The contradictions of inclusion in urban sustainability" (MIT Press, 2024). Her current research projects include a US National Science Foundation and Belmont Forum funded project studying Digitalization and Sustainable Consumption and a collaborative project on pro-poor circular economies. Beyond research, Manisha Anantharaman is an Associate Fellow at the Royal Institute of International Affairs Chatham House's Environment and Society Program, through which she serves as an expert consultant for organizations such as the UN Environment Program.

Arve Hansen (Centre for Development and the Environment, University of Oslo) is Senior Researcher at the University of Oslo's Center for Development and the Environment. With a PhD in Human Geography obtained in 2016, his academic interests encompass a range of topics including consumption and sustainability, development in emerging economies, and the dynamics of the new middle classes in Asia. His recent research has been particularly focused on food and meat consumption, , with a specific emphasis on Vietnam. Additionally, he leads SUM's research group on sustainable consumption and energy equity and co-directs the Norwegian Network for Asian Studies. He has co-edited various books, including Consumption, Sustainability and Everyday Life (Palgrave Macmillan: 2023), with Kenneth Bo Nielsen; and Changing Meat Cultures: Food Practices, Global Capitalism, and the Consumption of Animals (Rowman and Littlefield Publishers: 2021), with Karen Lykke Syse. His monograph, Consumption and Vietnam's New Middle Classes: Societal Transformations and Everyday Life (Palgrave Macmillan: 2022) studies the dramatic changes in consumption patterns in Vietnam over the past decades, combining a focus on everyday practices and societal transformations.

53

MD05 | European Research Opportunities

28 Aug 2024 | 13:00-14:00 | LC.0.02 (Faculty of Arts and Humanities – Venue L)

Chair: **Anna Burger**

Learning by doing, improving by sharing

In addition to scientific knowledge and a good publication history, other skills are required to write a successful research project. From the EU to other international opportunities, both public and private, finding and then accessing funding opportunities means developing skills and abilities.

The presentation is dedicated to sharing more than 20 years of experience as a project evaluator and successful project author. The talk will focus on sharing the way to develop a possible successful project (both RIA and IA) considering different funding opportunities ranging from EU (HE, ERC, MCS) to private funders (e.g. family, bank and corporate foundations). Starting with some ideas on how to review calls and funding opportunities, to key tips on how to get good/awarded projects off the ground, the aim is to develop (or improve) a way to translate scientific expertise, networks and methodological advice into funding opportunities.

Roberta Ricucci is Full Professor of Sociology of Migration and Sociology of Islam at the University of Turin. She deals with migration processes, researching the paths of integration of young protagonists, religious dynamics in the diaspora and practices and policies for dealing with cultural diversity in local contexts and was consulted as an expert on these topics in the definition of the Global Compact documents on migration and asylum at the UN. She coordinated and coordinates a number of international and national research projects (funded by international and EU funders, as Templeton Foundation in the US, Conicet in Latin America, EU with its several opportunities) on integration dynamics and processes, with a focus on the youth component and the transformation of religious identities in migration: recently, she has been the PI of the Horizon 2020 project KIDS4ALLL – Key Inclusive Development Strategies for Life-LongLearning, leading a consortium of 15 institutes spanning from Europe and Asia, which has been recognized as 'successful' by the European Commission.

Valeria Pulignano will share her experience as the PI of an ERC AdG RESPecTMe, which aimed at theorizing and measuring precarity at the continuum between paid and unpaid work in creative work, care work, and platform work. The results of this research have been published in several international peer reviewed journals, for example: Human Relations; Work, Employment and Society; Research in the Sociology of Work; Industrial and Labor Relations Review; the European Journal of Industrial Relations; the Cambridge Journal of Economics, and several others. Her forthcoming book 'The Politics of Unpaid Labour: How Can Unpaid Labour Help to Address Inequality in Precarious Work' (Oxford University Press) theorizes the class-based inequalities stemming from the precarious employment and life conditions in contemporary labour markets in Europe.

Valeria Pulignano is Professor of Sociology, with expertise on work, employment (industrial) relations and labour markets and Francqui Research Professor of Sociology at the Centre for Sociological Research at KU Leuven. He holds a Ph.D. in Sociology and a scholarly background in socio-economic studies. She is PI of the ERC AdG RESPecTMe and Coordinator of the RN17 Work, Employment and Industrial Relations at the European Sociological Association (ESA) and researcher at the Inter-University Research Centre on Globalization and Work (CRIMT), research fellow at Warwick University (UK) and LISER, Luxemburg. She is Editor of Work, Employment and Society, Associate Editor of the Journal of Industrial Relations, and former Chief-editor of Work, Employment and Organizations (Frontiers). Valeria's research lies in work, employment (industrial) relations and labor markets, their changing nature and implications for voice at work and inequality as differences in wages, working conditions, job quality, precarity and wellbeing across different sectors and national settings. She is Winner of the James G. Scoville Award 2015 from LERA, and she holds a Chair Jacques Leclerq at UCL. She has a forthcoming book with OUP on The Politics of Unpaid Labour. How Can Unpaid Labour Help to Address inequality in Precarious Work. Among her recent books Shifting Solidarities. (2020, Palgrave-MacMillan) with I. Van Hoyweghen and G. Meyers; Reconstructing Solidarity (2018, Oxford University Press) with V. Doellgast and N. Lillie.

54

MD06 | How artificial intelligence realigns sociological research

28 Aug 2024 | 13:00-14:00 | LC.2.00 (Faculty of Arts and Humanities – Venue L)

Organisation: **RN20 (Qualitative sociology), RN21 (Quantitative methods) and RN24 (Science and Technology)**
Chairs: **Silvia Cataldi (University La Sapienza, Roma, Italy), Fabrizio Martire (University La Sapienza, Roma, Italy) and Heta Tarkkala, University of Helsinki, Finland**

Sociological research is transforming. The diffusion of digital technologies changes how societies work and how we can study them. Artificial intelligence plays a prominent and heavily debated role in this transformation – creating promises for new societal potentials as well as fears of being controlled and exploited. As a result, the digital transformation brings about social tensions and tests our trust in societal structures and technologies. This semi-plenary session helps sociologists assess the social effects of artificial technologies and the resulting changes in sociological research. Dan Kotliar discusses how artificial intelligence changes societies. He views the effects of artificial intelligence as cultural phenomena, on which he critically reflects in a country-sensitive perspective. He shows how artificial intelligence creates new social institutions and practices, e.g., in the fields of surveillance and the relationship to one's own body. Afterwards, he discusses the ethical implications of these changes. Next, Kathrin Komp-Leukkunen reflects on how ChatGPT may change sociological research methods. ChatGPT is a rapidly developing generative artificial intelligence chatbot which can produce, e.g., text and computer code according to natural language instructions of the user. As such, it can be used to analyse texts in a qualitative way, and to support statistical data analyses. Komp-Leukkunen explores when it assists sociological methods, and when it hinders them.

Speakers

Dan M Kotliar is a lecturer (Assistant Professor) at the Department of Sociology, University of Haifa. His areas of interest include critical algorithm studies, sociology of knowledge, STS, and sociology of emotions. Kotliar's work has been published in Theory and Society, New Media and Society, Science, Technology and Human Values, among others. His more recent research projects include algorithmic production in Israel and Silicon Valley, Israeli surveillance firms, emerging data infrastructures, and the ties between AI, science, and start-up culture.

Kathrin Komp-Leukkunen (PhD, prof., LUT University, Finland) **is** Professor in social sustainability and welfare policies. Research focussed on work and retirement, social sustainability, population ageing, digitalization, welfare policies, and research methods. Formerly Marie Curie fellow, treasurer of the European Sociological Association, and chair of the Research Network on Ageing in Europe. Expert assignments to, e.g., the European Commission, Council of Europe, Bank of Finland, and Governments of Finland and Romania. Certified project manager. Executive education.

MD07 | Addressing equality, diversity and inclusion (EDI) issues in sociology: reflections from practitioners

30 Aug 2024 | 13:00-14:00 | FC1.0.05 (Faculty of Science – Venue C)

Organisation and Chair: **Chiara Cocco**

In this interactive workshop, we will introduce our research in the EDI Caucus (EDICa) – a UKRI-funded project (with support from the British Academy) focusing on creating equitable and inclusive careers across the research and innovation sector in the UK. EDICa's research is conducted across three workstreams: the career lifecycle; the research process; and the organisation of work. Across the work of the caucus, we have identified recurring themes, including bias in the peer review process, bullying and harassment in research workplaces intersecting with established issues such as ableism, gender and racial discrimination. We acknowledge that EDI issues are understood in different ways across countries and disciplines and seek to discuss how EDI translates internationally and how issues are researched, experienced and performed in other institutions across Europe.

In this workshop, we encourage you to apply the sociological lens to sociology itself as a place of work and to sociologists who research sociology as a discipline. Specifically, we invite you to reflect on your role as manager, supervisor, colleague, and educator. Drawing from the themes identified in our studies, we encourage sociologists to reflect on the dynamics of their work, relationships and interactions with an EDI agenda in mind. The questions we will ask in this interactive workshop include: what is it like to work in sociology, what are the EDI barriers, what are the challenges that different identities experience, and what are the EDI priorities for European sociology?

In other words, this will be an opportunity for sociologists operating across Europe and beyond to come together and reflect on how we can transform sociology to be more equitable.

Speakers

Chiara Cocco holds an MSc in Cultural Resource Management from Heriot-Watt University, and she has recently submitted her PhD thesis on performance and experience in the Festival of Sant'Efisio in Sardinia, her home country. Chiara has been engaging with EDI issues for over a decade, as she worked in schools supporting disabled and d/Deaf students. She holds 3rd level certificates both in Italian Sign Language (LIS) and British Sign Language (BSL). She is currently a Postdoctoral Research Associate in the UKRI funded Equality, Diversity and Inclusion Caucus (EDICa) at Heriot-Watt University. Her role in the caucus is to explore the relationships between life events and career, by focusing on menstrual health and (peri)menopause in the workplace. Her main concern is to address barriers to inclusion, development, and progression for those who experience problematic menstruation and (peri)menopause in research and innovation careers. Her research interests and expertise also lie in ethnographic methods, particularly autoethnography. Her own experience as a menstruating researcher with caring responsibilities informs her current work with EDICa and drives her commitment to improve inclusion and enable fulfilling and accessible careers for all.

MD08 | Casualisation, Precarity and Career in Higher Education

30 Aug 2024 | 13:00-14:00 | LC.0.01 (Faculty of Arts and Humanities – Venue L)

Organisation: **Postgraduate Committee of the ESA Executive Committee and The European Sociologist**
Chair: **Maggie O'Neill (University College Cork)**

This lunch time special was sparked by an online seminar we held in September 2023 that was organised in collaboration with postgraduate scholars. What is clear from the seminar and our subsequent discussions (including a special issue of the European Sociologist on this issue) is how complex, multi-dimensional, and multi-layered a phenomenon the precarity of early career scholars is. How far-reaching are the social repercussions casualisation and precarity produces and how it reshapes universities. At the centre of the lunch time special is a commitment to facilitating space for dialogue and research on casualisation, precarity and career in Higher Education especially about how we might contribute in concrete ways to address these deeply problematic neo-liberal tendencies in Higher Education.

Speakers

Experience of an academic research career and its uncertainty

Despite efforts to encourage women's participation in science, their underrepresentation in academia persists. This manuscript presents a woman's personal journey in academia, revealing the challenges she encountered. Originating from an immigrant background, the author faced lower expectations from pursuing higher education. Despite these barriers, she pursued an academic career, then navigating issues such as academic hierarchy, structural power dynamics, and the law of silence. Furthermore, the manuscript discusses ongoing uncertainties even after obtaining prestigious grants and addresses reasons why academia might be an uncomfortable environment for women. This analysis underscores the obstacles obstructing women's advancement in academia and underlines the urgent need for this situation to change for many women and girls dreaming of an academic career.

Ana Vidu is a Marie Sklodowska-Curie postdoctoral fellow at the University of California, Berkeley and the University of Deusto. She is member of the ESA Executive Committee and co-coordinator of the RN33. Ana is chair of the Gender Committee of the Horizon Europe project "SCIREARLY" and was chair of the DEI Committee of the Berkeley Postdoc Association. She leads the "UniswithHeart" research project on solidarity networks to improve prevention, action and support mechanisms against sexual harassment in academia. She defended the first doctoral dissertation on sexual harassment in universities in Spain and co-founded the first support network in the country, – today called "MeToo Universidad"-, recognized as Good Practice by the Spanish Government. Her work on gender violence, sexual consent, and isolating gender violence has been published in many peer-reviewed scientific articles, more than a hundred conferences and invited talks, and is widely present in national and international media.

Gender and Precarious Careers in Academia

This contribution aims to analyse how the principal transformations of the higher education sector, including globalisation, marketisation and neoliberalism, affect the relationships between gender inequalities and precariousness among early-career researchers. To discuss different perspectives on academic careers, the dynamics distinguishing three distinct levels of analysis will be examined, focusing on institutional, organisational and subjective levels. Particular attention will be paid to the general process of precarisation within higher education, and its connections with gender differences in academia. In the conclusion, the need to develop alternative policies and practices will be discussed, with the aim to resist and challenge the rules of neoliberal academia and to counter the reproduction of gender inequalities.

Annalisa Murgia is Associate Professor in Sociology at the Department of Social and Political Sciences of the University of Milan, where she is also the Scientific Coordinator of the research centre GENDERS. She is the Principal Investigator of the ERC project SHARE – 'Seizing the Hybrid Areas of work by Representing Self-Employment' (2017-2024). In 2014-2016, she co-coordinated the European FP7 project GARCIA – 'Gendering the Academy and Research: Combating career Instability and Asymmetries' at the University of Trento. Her main research interests lie in qualitative sociological and ethnographic studies, with a focus on precarious labour and its implications for workers' agency, emerging forms of collective organising, and the social construction of gender in organisations. Her work appears in such outlets as Organization, Research in the Sociology of Organizations, Gender, Work and Organization, Qualitative Research in Organizations and Management, Work, Employment and Society, as well as in edited scholarly books.

MD09 | LGBTQI+ Tensions and Transformations

30 Aug 2024 | 13:00-14:00 | FC1.0.03 (Faculty of Science – Venue C)

Chair: **Ana-Cristina Santos (Centre for Social Studies, Portugal)**

LGBTQI+ issues have been at the forefront of positive changes and backlash in recent times, signalling tensions that call for a serious sociological examination. In this session, we draw our attention to movement, travel and mobility from a queer perspective. In particular, the speakers explore the intersectional, nuanced and complex challenges that the study of LGBTQI+ issues offer, cherishing the potential of theoretical and empirical insights with scientific as well as political impact on everyday life.

Speakers

Transformations and Tensions of Queer Family Migrations

Queer families increasingly use the transformations of various countries' family and immigration regimes to have their families recognized, protected or reunified. For example, same-sex couples may migrate together, choosing a country recognizing same-sex partnership or marriage and/or providing legal pathways to parenthood and protection of LGBTQI+ parenting rights. Or LGBTQI+ residents of such countries may sponsor their partners' spousal visas or apply for family reunification programs. Furthermore, LGBTQI+ people also increasingly use transnational strategies to sidestep some countries' restrictions, such as travelling temporarily to third countries to access ART or surrogacy process, and then returning to their countries to regulate their family status and rights. These developments, however, are also fraught with many tensions. At the level of countries' family and immigration regimes, for example, they increasingly expose inequalities and hierarchies inscribed in these systems, as individuals' access to both family and immigration rights are not only negotiated within heteronormative frameworks, but also structured across classed, gendered and racialized lines. At the level of queer families as well, international migrations and transnational strategies of familyhood are often complicated matters involving, for instance, multiple migrations or prolonged legal and administrative struggles. These often carry heavy emotional and mental health burdens for queer families themselves, as individuals may be faced with personal losses or compromises in return for family recognition, protection or reunification. The topics above are just beginning to be investigated in the sexualities and migrations research, but these emerging studies already clearly demonstrate transformations and tensions of queer family migrations.

Tanja Vuckovic Juros received her PhD in Sociology from Indiana University Bloomington. She is a Marie Skłodowska-Curie Actions (MSCA) post-doctoral research fellow at the Department of Sociology at the Faculty of Humanities and Social Sciences at the University of Zagreb, where she is finalizing a project on how citizens interpret anti-gender messages in Croatia and Belgium. Her research has been funded by the Croatian (Doctoral Fellowship) and the US National Science Foundations (Doctoral Dissertation Improvement Grant), as well as by the European Commission's Marie Skłodowska-Curie actions (two Individual/Postodoctoral Fellowships). This research is situated mostly at the intersections of cultural and political sociology, with a deep interest in families and sexualities. Her recent articles appear in Sexualities, Gender, Place and Culture, and Journal of Family Issues. She is currently a member of the board of the Research Network Sexuality of the European Sociological Association, as well as a member of a COST action LGBTI+ Social and Economic (in)equalities.

Sexualities and the labour of mobilities production: queer transport as a site of tension and transformation

Despite the proliferation of work on the sexual and queer politics of movement across a range of disciplines across the social sciences, transport has rarely received the explicit critical attention that it deserves given its significance within queer lives. Recently there has been a growth in work examining LGBTQ+ people's experiences accessing and using public transport, but the paper argues that there is scope for a more expansive examination of the broader relationships between sexualities, transport and mobilities. Accordingly, this paper examines the study of these relationships in broad interdisciplinary context. In doing so, it highlights the often-neglected role of LGBTQ+ workers within the transport sector as producers as opposed to consumers of mobility. Moreover, an important theme within this work is on transport as a key site of queer labour solidarity and activism. The paper argues that this foregrounding of queer working-class experience within studies of transport can complement existing research on queer mobilities which has hitherto tended to focus on LGBTQ+ people as consumers of mobility. In forging a research agenda for a queer politics of transport, I suggest that work on queer labour activism within the transport sector can contribute towards a centring of labour and labour politics within geographical and other understandings of queer mobility. Moreover, I argue that it can also help to re-centre class and labour politics as key sites of tension, struggle and transformation within sexualities studies more widely.

Jon Binnie is Reader in Human Geography at Manchester Metropolitan University in the United Kingdom. His research interests focus on the LGBTQ+ politics in an urban, transnational and European context; transnational LGBTQ+ activism and queer film festivals. He is the author of The Globalization of Sexuality (Sage); co-author of The Sexual Citizen: Queer Politics and Beyond (Polity) and Pleasure Zones: Bodies, Spaces, Cities and co-editor of Cosmopolitan Urbanism (Routledge). His work has also been published in journals including Environment and Planning D: Society and Space; European Journal of Women's Studies; Gender, Place and Culture; International Journal of Urban and Regional Research; Journal of Ethnic and Migration Studies; Progress in Human Geography; Sociology; The Sociological Review and Urban Studies.

MD10 | The Role of Social Sciences in Shaping Research and Policy Frameworks

30 Aug 2024 | 13:00-14:00 | LC.0.02 (Faculty of Arts and Humanities – Venue L)

Organisers and Chais: **Teresa Sordé (Conference Co-chair) and Lígia Ferro (ESA President 2021-24)**

This midday session will explore the critical role of social sciences in influencing European research funding and policy-making processes through the presentation of two examples. The European Alliance for Social Sciences and Humanities (EASSH) has been instrumental in advocating for dedicated research funding for these disciplines, ensuring that European scholars continue to excel globally. Simultaneously, the session will address the challenges and opportunities of evidence-informed policymaking across Europe. It will highlight the efforts of the Spanish grassroots association "Ciencia en el Parlamento" in expanding the science-for-policy ecosystem. The discussion will focus on engaging society in the creation of mechanisms that integrate scientific evidence into policymaking, emphasizing the relevance of science for policy to all citizens. The session aims to underscore the collaborative efforts and the crucial role sociologists and the broader social sciences play in ensuring that scientific input in policymaking is inclusive and serves the broader public interest.

Speakers

EASSH Commitment in reshaping SandT narrative to include SSH research

The European Commission is at the early stages of formulating the successor programme to Horizon Europe [1] – European Framework Programme 10 (FP10). Negotiations over the programme and the size of the FP10 budget will start in 2025. The academic and research community is not a passive recipient of the outcome of this process, but as a key stakeholder is increasingly an interested and active participant. The largest Alliance for Social Sciences and Humanities in Europe (EASSH) has now been active for over five years to ensure a dedicated space in the research funding for these disciplines where European scholars have consistently delivered in terms of quality at global scale. The talk will provide some practical examples of how the Alliance is engaging at political levels in the shaping of the new framework programme.

[1] In December 2023 the European Commission assembled an independent adviser group for the EU's next research programme, officially launching the drafting process for Framework Programme 10.

Gabi Lombardo (PhD) is Director of the European Alliance for SSH one of the largest advocacy and science policy organizations in Europe and advocates for an evidence-based approach to policymaking, and researchers' inclusion in funding design. High-level experience in strategic and 'foresight' planning in international organisations like LSE, ERC and Science Europe. She's an evaluator for SSH and ethics for the EU, WB, COST. Gabi received the Young Academy of Europe Prize in 2018.

Ciencia en el Parlamento as Catalyst for Widening the Science-for-Policy Ecosystem: In the Service of Society

Evidence-informed policymaking is widely discussed across Europe, aiming to enhance decision-making processes and develop public policies that better serve citizens. However, the challenge lies in creating structures and mechanisms that facilitate the integration of scientific evidence into policymaking. Furthermore, it is crucial to ensure that these processes genuinely benefit society. This raises important questions for sociologists: What role does Sociology, and the broader Social Sciences play in ensuring that science truly serves society?

In this session, we will explore the efforts of the Spanish grassroots association "Ciencia en el Parlamento" as a catalyst for expanding the science-for-policy ecosystem. We will discuss how to engage society in informing the creation of these mechanisms and emphasize the importance of demonstrating that science for policy is relevant not only to policymakers and scientists but to all citizens. Through this presentation, we aim to highlight the collaborative efforts and the crucial role sociologists can play in ensuring that scientific input in policymaking is inclusive and serves the broader public interest.

Emilia Aiello-Cabrera is Ramon and Cajal research fellow (2023) at the Department of Sociology at the Universidada Autónoma de Madrid (UAM), and member of the interdisciplinary Community of Research on Excellence for All (CREA). Between 2019-2022 she was EU Marie Sklodowska-Curie Fellow at Harvard Kennedy School of Government (Ash Center) and Universitat Autònoma de Barcelona (UAB, Sociology Department). Emilia's research interests are focused on how the most vulnerable social groups organize at the grassroots level to overcome inequalities. Currently, she is the principal investigator of the #FriendsMatter project. Friendship Networks of Immigrant and Ethnic Minority Women that Are Conducive to Social Integration (PID2022-140540OA-I00), funded by the Spanish National RandD Plan of the Ministry of Science and Innovation. Her works have been published in journals such as International Sociology, Plos One, Evidence and Policy, Qualitative Inquiry, among other. Editorial Board member of the journal Humanities and Social Sciences Communications, of the Springer-Nature group, in the Sociology section (2023, to date). Outside the academic field, she is vice president of the Science in Parliament association, and member of the Board of Directors of the Drom Kotar Mestipen Roma Association of Women.

MD11 | Is there a European Health and Medical Sociology? An international survey on sociological associations in Europe

30 Aug 2024 | 13:00-14:00 | FC4.0.40 (Faculty of Science – Venue C)

Organisation and Chair: **Guido Giarelli (RN16 Coordinator)**

The paper presents the main results of a cross-sectional survey on the development of the health and medical sociology associations in Europe over the past few decades conducted between May and August 2023 by a joint group of the ESA RN16 Sociology of Health and Medicine and of the European Society for Health and Medical Sociology (ESHMS).

After identifying the challenges faced by the sub-discipline such as generational changes and criticism of "parochialism", it aims to identify and characterize both Health and Medical Sociology formal national associations and informal groups in Europe. Employing a macro-regional approach and thematic content analysis, the results reported show the current status of European Health and Medical Sociology, characterised by varying degrees of institutionalisation and professionalisation across macro-regions. The interdisciplinary orientations and the attempts to engage with professional and public spheres of most of these associations are also discussed, thus providing a comprehensive overview of the field's development and future perspectives in Europe.

Speakers

Guido Giarelli (ESA's RN16 Coordinator) is a Ph.D. at University College London is full professor of General Sociology at the University 'Magna Græcia' of Catanzaro (Italy). He was a founder and first president (2002-2005) of the Società Italiana di Sociologia della Salute (S.I.S.S.); secretary (2005-2008) and then member (2008-2011 and 2017-2020) and coordinator (2020-2023) of the board of the Section of Sociologia della salute e della medicina of the Associazione Italiana di Sociologia (AIS); member of the board (2004-2006) and then elected president (2006-2010) of the European Society for Health and Medical Sociology (ESHMS); member of the Board (2010-2014) and then vice-president (2014-2018) of the Research Committee 15 (Sociology of Health) of the International Sociological Association (ISA); and he is currently coordinator of the board of the Research Network 16 – Sociology of Health and Medicine of the European Sociological Association (ESA).

He has been research associate of the Institute of African Studies of the University of Nairobi, adjunct associate professor of the School of Health Sciences of the Oakland University of Rochester (Michigan), visiting scholar at the New York Academy of Medicine and at Harvard Medical School of Boston, visiting professor at the University of Oviedo (Spain), at the Escola de Saúde Pública do Ceará di Fortaleza (Brasil), at the Centre for Sociological Theory and Research on Health Division and Population Health of University College London, at the University of Coimbra, at the University of Lisbon, at the Panteion University of Social and Political Sciences of Athens and at the Miguel Hernandez University of Alicante. His main research interests are in the Sociology of health and medicine, comparative health systems, self-help and civil society in health care reforms, non-conventional medicines and integrated medicine, illness narratives, ageing and life course.

Dino Numerato (RN16 board and Charles University Prague) is Associate Professor and Vice-Director for Research at the Institute of Sociological Studies at the Faculty of Social Sciences, Charles University in Prague (Czech Republic). He is also the Co-Principal Investigator of the Czech National Institute for Research on Socioeconomic Impacts of Diseases and Systemic Risks (SYRI). His research interests focus on the sociology of health and medicine (healthcare professionalism, vaccine hesitancy, patient and public involvement, health and communication) and the sociology of sport (sport governance, football fandom and activism, sport and corruption). His work has been recently published also in Social Science and Medicine, Sociology of Health and Illness, Health Sociology Review, Qualitative Health Research, Human Vaccines and Immunotherapeutics, Sociology of Sport Journal, Governance or VOLUNTAS. He serves as ESA RN 16 Sociology of Health and Medicine Board Member (Midterm Conference Chair).

MD12 | Midday Special on the ESA Best Article Awards and ESA Young Scholar Award*

30 Aug 2024 | 13:00-14:00 | FC4.0.41 (Faculty of Science – Venue C)

Organisation: **Krešimir Žažar and Michalis Lianos on behalf of the Awards Selection Committee**
Chair: **Krešimir Žažar**

After its inception at the 15th ESA Barcelona Conference in 2021, this is the second edition of both: ESA Best Article Awards and ESA Young Scholar Award. Whereas the former refers to best articles published in the two ESA's journals European Societies and European Journal of Cultural and Political SocioloMDgy in the 3 preceding years (2021-2023), Young Scholar Award is assigned to the best yet unpublished paper stemming from a Ph.D. dissertation defended in the same time framework. In this very special session, winners within the 3 denoted categories will present their valuable works, while also vibrant responses from the audience is expected, as best articles will certainly ignite vivid discussion.

*The winners will be announced during this session

RN01 | Ageing in Europe
RN01 | T01_01: Ageing in Place

Aging Together, Living Individually: A Case Study on Aging in Place

Shlomit Manor

Western Galilee college, Israel

Contemporary trends indicate a growing preference among individuals to age within their own homes, in familiar surroundings where they have lived most of their lives. This preference has led to the concept of 'aging in place'. However, 'place' encompasses not just the physical home but also the neighborhood, environment, and community. Consequently, the role of a supportive community becomes particularly significant, and even more so for older adults living alone.

The current study focuses on three newly formed communities, established four years ago in Harish, Israel. The aim was to understand what community and communal living mean from the perspective of the older people living there. The study also examines how community members, who were strangers before moving in, experience community life and whether a community made up only of older people meets their diverse needs and expectations.

The research was conducted qualitatively through in-depth interviews with members of these communities. The most notable finding revealed ambivalence and mixed feelings regarding the meaning of living in the community, particularly concerning the community's ability to alleviate loneliness and act as a substitute for family. The findings highlight the complexity and challenges associated with community life in old age. While the community model in Harish is not perfect, it meets several basic needs, such as social interaction, balance between community involvement and maintaining individual privacy and autonomy.

In summary, aging in place offers manifold benefits and significantly contributes to the well-being of the older adults. However, an exclusively positive portrayal of this phenomenon is reductive and potentially misleading. Aging in place is accompanied by inherent challenges, underscoring its status as a multifaceted and multidimensional reality.

The Contextual Pre-conditions For Ageing In Place: A Multidimensional And Comparative Perspective

Marco Arlotti, Micol Bronzini, Giovanna De Santis

Marche Polytechnic University, Italy

The experience of ageing in place cannot be taken for granted: not only is it not possible for everyone, but it may not even be necessarily a positive experience.

Specific contextual pre-conditions may strongly shape and mediate the relations between ageing in place and older people's quality of life. Successful ageing in place relies on the accessibility of appropriate housing, living in a safe neighborhood, and the possibility of social interaction. When older people are affected by functional limitations, the availability of care services or support provided by informal caregivers may also be crucial. However, such contextual pre-conditions, and their interdependencies, are highly differentiated in Europe, shaping diverse ageing in place experiences. To understand the different configurations of pre-conditions in which ageing in place is embedded in Europe, the paper focuses on two central contextual dimensions: the structure of care and housing systems.

Drawing on two previously uncombined research strands, we present a preliminary typology of integrated long-term care and housing systems in Europe through a quantitative analysis of secondary data retrieved from Eurostat and OECD. The first step of the analysis involved selecting relevant indicators for each of the two separate domains, capturing the current diverse features of national long-term care and housing systems. Subsequently, a cluster analysis was performed using data from 24 European countries to identify distinct types. The resulting typology aims to deepen our understanding of specific contextual preconditions that may significantly shape ageing in place experiences and quality of life for older individuals.

Ageing In Place And Meals On Wheels: Insights From Southern Switzerland

David Maciariello, Laurie Corna, Stefano Cavalli

University of Applied Sciences & Arts of Southern Switzerland (SUPSI), Centre of Competence on Ageing, Switzerland

Facilitating 'ageing in place' is an oft-cited policy goal in ageing societies, as it aims to reduce or delay institutional care costs while also meeting the desire of many older people to age at home. Achieving this requires an inter-sectoral approach, including networks of informal care and formal community-based long-term care. The aim of our paper is to assess how one community-based service, Meals on Wheels, supports older people in Southern Switzerland to continue to live at home.

62

We conducted a mixed-methods study with current users of the service and their informal caregivers between April and June 2023. A paper-based or online questionnaire was first completed by a total of 806 users (mean age=83) and 557 informal caregivers, followed by semi-structured interviews (28 users, 22 informal caregivers). Three-fourths of the users perceived the service as highly beneficial for facilitating ageing in place, with women, high-intensity users and those in poorer health more likely to affirm its value. Imagining a hypothetical scenario without the service, strategies for coping with its absence ranged from preparing one's own meals (24%) and reliance on family members (20%) to contemplating having to leave their home (9%) or general uncertainty regarding how they would manage (13%).

Our findings offer valuable insights into the perceived benefits of Meals on Wheels for ageing in place. Considering growing pressures on systems of informal and formal long-term care due population ageing, the value of such services for facilitating ageing at home must be recognized, and their resources protected.

Ageing in Place in Post-pandemic Societies: Qualitative Longitudinal Study in ten small towns of Northern Italy

Francesco Diodati, Simone Carlo

Catholic University of the Sacred Heart of Milan, Italy

In many European Countries, 'ageing in place' is widely accepted as the most sustainable model to foster in the context of population ageing and shrinking welfare states. In this view, gerontologists promote the spread of Information and Communication Technologies (ICT) among older adults to enhance ageing in place and active ageing. Indeed, the pandemic has deeply accelerated the digitization of social interactions, welfare services, and economic activities. Many scholars have advocated for more qualitative research on the way older adults relate to ICTS within specific social-cultural contexts and living environments. Recent studies have also underlined that the contemporary digital acceleration risks increasing the digital divide rather than reducing it.

This paper aims to discuss the extent to which ageing in place can effectively help elderly people adapt to the challenges of post-pandemic societies. This contribution presents the preliminary results of the fourth wave of the longitudinal qualitative research that investigates older people's experience of the pandemic in ten Italian small towns of the first COVID-19 'Red Zone' in Europe – 'ILQA_19'.

In this setting, we register the presence of strong family obligations to care for and generational control over older adults. On one side, older people without digital skills can rely on close family networks. On the other side, however, some interlocutors complain about losing their independence due to the digitalisation of services.

We will also underline how, in the absence of public support, in Italian small towns digitalization has a negative impact on frail older people without social support networks.

RN01 | T01_02: End of Life and the Oldest Old

Doing Death: Relational Agency And Interdependency

Bernhard Weicht

University of Innsbruck, Austria

The legal possibilities of euthanasia and assisted suicide have fundamentally altered our understanding of one of the most crucial transitions of existence – the one from life to death. Having been understood previously as the "ultimate humiliation of reason and control" (Bauman), over the last years the imaginations of what constitutes a dignified death have gained additional momentum by the possibilities of choice and control over the end of life. Various countries have seen debates on euthanasia and assisted dying taking up the ideals of choice and control to combat challenges and fears associated with the latest life stages. In sociological understanding, these developments have often been described as logical continuations of the normativity of autonomous and independent agency into very old age. Similarly, critics of liberalisation attempts have warned from a wrong idealisation of autonomy and control. However, both analyses seem to be limited by its own theoretical starting point: the centrality and primacy of the autonomous individual.

Drawing on a discourse analysis of several examples from European public debates on euthanasia regulations, I investigate the underlying conceptualisations of agency and the individual subject. Rather than understanding the wish for assisted dying as emblematic for individual agency, I demonstrate the strongly relational nature of the conceptualising of this (final) transition. Using a relational ontological theoretical perspective, I explore the different ways in which old age in euthanasia policy proposals is characterised by relationality and relationships. This perspective may counterbalance a theoretically one-sided analysis that inevitably reads the debates on assisted suicide as prolongation of societal individualisation processes. Doing euthanasia is a relational process that cannot be limited to individual agency, control and autonomy.

Exploring The Gap: Care Needs, Preferences, And Actual Support For Oldest Of Oldest People In A Nordic Welfare State

Jiby Mathew Puthenparambil

University of Jyväskylä, Finland

Social care services for older people in Finland has been in a state of flux for quite a while. The policy of promoting ageing in place, supporting older people to continue living in their own homes, has been presented as a key to reducing

63

welfare expenditure in ageing societies. Additionally, the promotion of marketisation of care and support for refamilisation has been used to justify reducing publicly funded universal services. This study examines older people's care needs and preferences in a Nordic welfare state. The question asked here is what kind of social care needs older people have and how these care needs are covered (e.g., public, private, informal source of support) in the last decade. Do older people's actual sources of support differ from their care preferences, and has there any change in the actual support and their preferences for care in the last decade? This study employs quantitative data gathered from older people aged 80 and above who lived at regular home in Finland during 2010 and 2020 in two cities, Tampere and Jyväskylä. According to preliminary results, approximately 71-80% of participants reported having at least one practical care need, while 14-16% reported having at least one personal care requirement. Compared to earlier surveys, the 2020 data indicates an increase in older people receiving informal care support, primarily from their children, while public support has decreased. There is a discrepancy between the preference for and actual utilization of public care provision, particularly in practical care services. Contrastingly, informal care support aligns closely with both preference and reality. The perceived entitlement to public care services is diminishing among older people in Finland.

Older Adults' Attitudes Towards Using Euthanasia At The End-Of Life: Cancer Versus Parkinson's Disease

Rinat Lifshitz[1], Sara Carmel[2], Yaacov Bachner[2]

1The Max Stern Academic College of Emek Yezreel, Israel.; 2Ben Gurion University of the Negev, Israel

There is a paucity of studies that compare attitudes towards Euthanasia (EUT) in

different illnesses. This study assesses older adults' attitudes towards Euthanasia at

the end-of life in cancer versus Parkinson's disease.

A total of 501 individuals aged 75 and above participated in the study. Attitudes towards EUT were measured using vignettes which described metastatic cancer and advanced stage of Parkinson's disease. The questionnaire also included measures of past experience, self-efficacy, will to live, satisfaction with life, will to prolong life, fear of death and dying, social support and background characteristics.

A more positive attitude towards EUT was found for cancer than for Parkinson's disease. Being a woman, higher education, lower religiosity level, and higher levels of fear of death and dying and self-efficacy manifested more positive attitudes towards EUT for both end-of life conditions.

These findings shed light on older adults' attitudes towards EUT in different illnesses.

The Temporalities of Being 'Exceptionally Old' – Doing Age and Doing Future in the Lives of Centenarians

Vera Gallistl, Katrin Lehner, Viktoria Greber

Karl Landsteiner University of Health Sciences, Austria

In many European countries, adults with an age over 100 years are the fastest growing population group. Existing research has explored the lives of centenarians mainly from a psychological or public health perspective, arguing that centenarians are prototypes for healthy, successful, and exceptional ageing (Borras et al. 2020; Araujo et al. 2016; Motta et al. 2005; Santos-Lozano et al. 2016). From a sociological perspective, centenarians offer unique insights into the social practices of age differentiation, particularly as individuals move from being perceived as "old" to being perceived as "exceptionally old".

This paper uses the everyday experiences of centenarians as a starting point to explore how age, as a social category of difference, is established as individuals reach an age of 100 years. Drawing on practice theories as well as new materialist ageing research (Gallistl & Wanka, 2023), we frame centenarianism as a material-discursive practice of creating age-boundaries. We explore these through 12 interviews with centenarians and 12 interviews with other actors close to our primary interview partners. Data was analyzed using situational analysis (Clarke 2012) and boundary-making analysis (Höppner et al. 2024).

Results uncover the co-constitutive relationship between age-boundaries and diverse temporalities: While the centenarian's social network considers the past as most impactful in defining age-boundaries between centenarians and non-centenarians, centenarians themselves exhibit practices that cater to the future rather than to the past. These future practices we uncover in the lives of centenarians highlight the role of diverse and contested futures in the social construction of ageing.

RN01 | T01_03: Digital Technologies and Ageing (I)

Digital Literacy Among Older Women Who Transform Their Communities.

Mimar Ramis-Salas, Lidia Bordanoba

UNIVERSITY OF BARCELONA, Spain

Many older women are excluded from digital learning opportunities (UNESCO, 2019). To contribute to the generation of knowledge that can overcome this expression of inequality the R+D+i project ALLWOMEN. The Empowerment of All Women through Adult Education for a Sustainable Development, has delved into the analysis of the actions in adult learning and education that are contributing to the empowerment of women in a situation of greater vulnerability. Through the development of different case studies, the project is providing evidence of the actions that have a greater social impact focusing on the identification of the characteristics that make these actions replicable and transferable to other contexts, thus enabling a more active and fair ageing process for women from vulnerable backgrounds. The present paper introduces evidence of a case study on the social impact of actions in digital literacy on older women based on the use of smartphones, implemented by an adult education federation in Barcelona. This case study delved on the reflections and evidence provided by the realization of three daily life stories and a communicative discussion group with women who are participating in these actions, and an interview with one of the educators. The main results show that older women with a low level of ICT skills can develop a successful digital literacy process with different positive consequences for them and their close communities, with an impact on their wellbeing.

COVID-19, Older Adults' Digital Experiences, and Representations of Ageing: a Qualitative Longitudinal Case Study in Italy

Giulia Melis

University of Milan-Bicocca, Italy

As world population is progressively ageing, a greater attention is paid to the role of older individuals in contemporary societies. However, although the need to promote an active ageing framework to maintain social inclusion, a multifaceted generalization still portrays older adults either as indispensable contributors to social sustainability or as a vulnerable category. The spread of digital technologies constitutes a key area of ageist exclusion, posing new challenges in terms of access and support.

COVID-19 prompted an intensification of this phenomenon: while institutions implemented social distancing measures, their justifications often perpetuated an ageist portray of older individuals; moreover, the forced digitalization of society, not accompanied by a proper support, might have contributed to older adults' internalization of ageist discourses.

The research here discussed, ILQA-19, is an ongoing longitudinal qualitative case study, initiated in 2020, which focuses on older adults aged 65-80 residing in ten villages in Italy which constituted the first Red Zone in Europe. It explores everyday life transformations, older adults' well-being, personal and social resources, and the role of ICTs in adapting to a post-pandemic society.

Drawing on the analysis of the initial waves, this contribution will focus on two main aspects: older adults' reframing of old age due to the pandemic experience, and the intricate relationship between these narratives and digital practices. In conclusion, this study aims to contribute to the active ageing debate, shedding light on the nuanced challenges faced by older individuals in the context of ageism, digital exclusion, and the profound impact of the COVID-19 pandemic.

Artificial Intelligence and the recurring Narrative of the 'Vulnerable Old' – A Systematic Literature Review

Katrin Lehner

Karl Landsteiner University of Health Sciences, Austria

65

With demographic change, a shortage of care personnel and the associated problematization of age(ing), care facilities increasingly rely on innovative technology, such as artificial intelligence (AI), to reduce burden on care staff and increase 'vulnerable' care recipients' safety (Neven & Peine 2017). From a sociological perspective, it is noteworthy that 'vulnerability' is a recurring theme in the scientific discourse on AI, especially when the technology is implemented on older adults. While the inherent (socio-technical) agism and age-bias of technology development is widely discussed in sociological ageing research (Neves et al. 2023; Chu et al. 2022; Stypinska 2022), thorough investigations of the seemingly established connection of old age and vulnerability in the context of AI are yet to be made.

This article makes a novel contribution by critically examining scientific publications, asking how age and vulnerability are constituted in discourses around AI. To explore this a systematic literature review was conducted by searching the database 'Scopus' for peer-reviewed articles and reviews that reported on old age, AI and vulnerability in their abstract and were published between 2018 and 2024.

Findings highlight a co-constitution of ageing as vulnerable mainly through technology development and application. Also, they reveal why this constitution is reasonable, especially for engineering: Focusing on old people as vulnerable justifies and necessitates new technological developments (Neven & Peine 2017). This is further emphasized by beneficial aspects of AI as the discourse's main focus, while heterogeneous perspectives and needs of older people are hardly considered. These findings illustrate an understanding of

vulnerability in old age that is characterized as a construct of inequalities and power relations.

As a first year PhD student at the University of Vienna I am concerning myself with bias of algorithms in long-term care. The ESA PhD Summer School would give me the opportunity to refine the above paper, exchange experiences and connect with peers. As I have not participated in an ESA Summer School before, I would be pleased about a positive response.

Ageing Societies in the "Era of Games" – Challenges and Opportunities

Damian Gałuszka

AGH University of Krakow, Poland

The increasing prevalence of digital games among older adults, termed "silver gamers," presents a unique opportunity to explore the potential benefits and challenges of this emerging practice. This presentation will delve into the socio-cultural factors – starting from reflections on the unstoppable (?) megatrends of demographic ageing, digitization, and the ludification of culture – driving the adoption of digital gaming among older adults and critically examine its implications for active and successful ageing.

Silver gaming, under certain conditions, can foster cognitive stimulation, physical activity, and social engagement, potentially contributing to fulfilling and engaged later life. However, potential drawbacks such as excessive screen time and social isolation require careful consideration. The presentation will introduce the "developmentally beneficial gaming scheme" as a framework for maximizing the positive aspects of silver gaming while mitigating potential risks. The presentation draws upon a combination of existing research and the author's own qualitative investigations: (1) on online forums for mature gamers using virtual ethnography methods, and (2) interviews with Polish silver gamers aged 58 and above.

The overarching goal of the presentation is to enhance understanding of the role of digital games in the lives of older adults and underscore the need for further research and development in this area. With the growing popularity of silver gaming, social scientists can play a crucial role in shaping a more positive and beneficial landscape for older citizens who have to function in what Frans Mäyrä described as a "ludic society" or "the era of games" (2017).

Mäyrä, F. (2017). Pokémon GO: Entering the Ludic Society. Mobile Media & Communication, 5(1), 47-50. https://doi.org/10.1177/2050157916678270.

RN01 | T02_01: Ageing and the Social Context

Exploring Meaning-making Around Civic Engagement Among Older Migrants: A Qualitative Study In Four European Countries

Karima Chacur[1], Sandra Torres[2], Pernilla Ågård[2], Emilia Häkkinen[3], Bas Dikmans[4], Toon Vercauteren[4], Rodrigo Serrat[1], Fredrica Nyqvist[3]

1University of Barcelona, Spain; 2Uppsala University, Sweden; 3Åbo Akademi University, Finland; 4Vrije Universiteit Brussel, Belgium

Research on migrants' civic engagement has tended to solely rely on academic definitions of this term instead of exploring how migrants themselves make sense of civic engagement in general or their own engagement in particular. This presentation taps into both of these knowledge gaps by bringing attention to the meaning-making that older migrants engaged on when asked about their civic engagement.

Conducted as part of a European research project (CIVEX), which investigates the exclusion of older people's civic engagement, this presentation departs from a project that brings attention to the civic engagement of potentially marginalized groups of older people. Sixty migrants aged 60 or over, who migrated during adulthood, were interviewed. They were asked about their involvement in various civic engagement activities, and their own meaning-making as far as this engagement is concerned.

The findings suggest that while some of their meaning-making aligns with the scholarly literature (e.g., volunteering, participation in associations), most of it is actually broader. For the participants civic engagement extends beyond traditional definitions, containing aspects such as contributing to society, being a law-abiding citizen, contributing to the bettering of other people and/or surroundings, among others.

The findings challenge conventional academic definitions of civic engagement by exposing alternative meanings attributed to the concept. As such, they offer a theorizing ground from which researchers of civic engagement, in social gerontology and in migration studies could expand their own scholarly imagination about how themselves make sense of civic engagement, and how research on this topic could be further developed.

66

Co-creation Sessions As An Example Of A Participatory Approach For Identifying Views Of Older Citizens About the Quality of Life in Their Cities

Milena Maj[1], Natalia Nowak-Krygowska[1], Aleksandra Trybalska[1], Loredana Ivan[3], Zsuzsu Tavy[2], Jan Kazak[4], Joost van Hoof[2], Jolanta Perek-Białas[1]

1Jagiellonian University, Poland; 2The Hague University of Applied Sciences, The Netherlands; 3The National University of Political Studies and Public Administration, Romania; 4Wrocław University of Environmental and Life Sciences, Poland

Population ageing and urbanization are the two dominant forces shaping the social and economic life of today, especially in thinking about the future of sustainable cities, inclusive for all ages. Therefore, the challenge is to prepare for these changes in such a way that current and future generations of older people can benefit from age-friendly strategies in cities (van Hoof et al. 2018). While ageing in place, defined as the ability of older people to live safely, independently, and comfortably in their own homes and communities, has become a priority policy agenda in many countries (WHO 2015) there are still many aspects not well explored with the active participation of older citizens.

The presentation aims to take a closer look at the co-creation process with older people focusing on their quality of life in cities concerning WHO's domains in four European cities, like Kraków, Wrocław, Bucarest, and the Hague.

We draw our analysis based on the qualitative component of a larger international study City and Co project funded by ENUTC (2021/03/Y/HS6/00213). We have in total four cities with about 30 participants over the age of 65 years who participated in repeated co-creation sessions.

Preliminary findings show similarities and differences in the perception of quality of life by older people from individual cities and the types of issues they would like to report through an online tool developed under the project. The co-creation sessions appeared to be a useful method of gaining in-depth insight and iterative cooperation with participants.

Social Participation, Education and Healthy Ageing in Italy

Paolo Pasetti[1], Loris Vergolini[1,2]

1University of Bologna, Italy; 2FBK-IRVAPP

The aim of this paper is to analyse the relationship between education and social participation among elderly people in Italy. We consider social participation as one of the possible dimensions of successful ageing. More precisely, under the umbrella of social participation we analyse three sub-dimensions: political participation, voluntary activities, and social connectedness. The analytical strategy plans to compare the social participation of elderly people with different levels of education. Indeed, the level of education can be related to social participation in at least two ways. Firstly, education could lead to the acquisition of certain lifestyles and cultural tastes that lead individuals to conduct a more active social life. Secondly, social participation is a costly activity and people have to invest time and/or money to play an active role in community life. Therefore, education could have an indirect impact through the attainment of remunerative occupation. Another aspect to consider is the state of health: education can have an impact on the health status of elderly people through the two channels described above, which in turn affects social participation. Using ISTAT (Italian National Statistical Institute) data (Aspects of daily life) from 2013 to 2021, we estimate a first model to identify the effect of education on social participation and then conduct a mediation analysis to understand how much of the total effect of education passes through health status.

RN01 | T02_02: Digital Technologies and Ageing 2

Digital Ageing: A Comparative Study of Elderly Perspectives on Technology Before and After the Pandemic

Claudio Melchior

University of Udine, Italy

The process of digitalization and an ageing population are two phenomena that characterize the dynamics of contemporary Western societies. The literature on the digital grey divide highlights how the elderly population often has low digital literacy and poor use of technology, which exposes them to risks of exclusion. Hence the importance of measuring the phenomenon and its dynamics, to be able to intervene with specific projects in order to improve the digital skills of the elderly population, thus fostering inclusion and active ageing processes.

Our quantitative survey compares data from 1,381 questionnaires collected in northern Italy in 2019 and 2022 (before and after the Covid-19 pandemic) to investigate 1) transformations in the frequency of use of digital devices; 2) comfort in use (and subsequent estimation of digital literacy) and 3) opinions and motivations related to technology and digital education by the Italian over-60s.

The effects of the Covid-19 pandemic, and the related push for digitalization, appear in our data, especially in terms of an increase in the frequency of use of digital technology devices by the elderly (anyway, still low in absolute numbers). However, this increased frequency is not matched by an improvement in comfort and ease of use, suggesting that this dynamic has not been accompanied by an improvement in digital literacy or a willingness to improve in this direction. All this in a context in which the opinion and motivation of the elderly toward the digital world appears to have worsened rather than improved as a result of the pandemic emergency.

Exploring Heterogeneity in Digital Skills and Training Needs among Older Adults in Switzerland

Lisa Katharina Kortmann, Sarah Speck, Miriam Wallimann

OST – Ostschweizer Fachhochschule, Switzerland

Population ageing and digitalization represent two prominent contemporary mega trends. The pervasive integration of digital technologies into both daily life and professional spheres underscores the increasing importance of digital skills. Although research on the digital skills of older adults is rapidly advancing, existing studies indicate a "grey divide" concerning access to, utilization of, and competencies related to digital technologies. Digital divides are also found for gender and educational level. However, the prevalent use of a dichotomous categorization for digital competencies overlooks distinct skill levels and domains of digital skills.

This study aims to address this gap by providing a nuanced exploration of sociodemographic differences among individuals aged 50 and above in Switzerland, specifically focusing on various domains of digital skills and related training needs. Our primary objective is to investigate age, gender, and educational disparities across seven different digital skill domains and associated training needs. We seek to understand whether these potential differences exhibit variability between skill domains and training needs.

Our research employs survey data representative of the Swiss population aged 50+ (n=400) from the year 2021, supplemented by an ongoing online survey conducted from 2022onwards. We anticipate identifying general age, gender, and educational differences, with variations dependent on the specific digital skill domain. The findings of our study hold significant implications for policymakers and practitioners, enabling them to tailor targeted interventions aimed at enhancing digital skills and fostering digital participation among older individuals.

Balancing Acts: Exploring Older Adults' Relationship with Digital Technologies in Aging Belgium

Nelly Geerts

Vrije University Brussel, Belgium

It has long been known that digital technology can positively impact the physical and mental health of older people. However, older adults are often less accepting and more distrustful of these technologies. This paper, informed by 96 interviews with older adults, both Internet users and non-users, explores the motivations older adults have for their acceptance or resistance to digital technologies. My study finds that older adults interact with technology in complex ways that go beyond simply identifying the positives and the negatives. Individuals may vary in their idiosyncratic reasons for embracing a particular technology, while they simultaneously have different motivations for opposing the same technology. For older adults, the decision to engage with technology often resembles a delicate balancing act, where personal, interpersonal, and societal factors all play an influential and sometimes contradictory role. The paper shows that older adults are not merely uninformed bystanders or passive victims of digital inequalities, but rather active agents who make decisions rooted in their lifelong experiences and the current realities of aging. Drawing on these findings, I argue that current digital inclusion efforts are overly focused on boosting acceptance among older adults. Achieving uniformity across generations is a goal that seems unlikely to be achieved. More emphasis is needed on embracing digital diversity, which refers to the various ways different demographic groups use and experience digital technologies.

68

A Longitudinal Analysis of Older Adults' Internet Use and Health Outcomes Amidst the COVID-19 Pandemic

Noemi Novello[1], Alessandra Gaia[2], David Consolazio[1]

1Università di Milano-Bicocca, Italy; 2University College London

This paper investigates the relationship between pre-pandemic digital literacy, as measured by internet usage, and the subsequent health outcomes – both in terms of physical and mental health – of older adults during the COVID-19 pandemic. The central research question guiding this study is: Did older adults with higher levels of ICT use before the COVID-19 pandemic experience better physical and mental health outcomes during the pandemic?

The hypothesis posits that, although overall physical and mental health may have declined for the majority of older adults during the pandemic, those who were digitally adept may have exhibited better health outcomes due to improved access to medical care facilitated by technology.

To address this research question, we utilize data from the Survey of Health, Ageing and Retirement in Europe (SHARE) and employ longitudinal statistical analyses, incorporating a regression discontinuity design and a model with random effects. This approach allows us to discern the impact of pre-pandemic internet usage on mental and physical health outcomes (self-reported) during the pandemic.

The paper contributes to the broader understanding of the intersection between digital literacy, health, and crisis management among older populations. By employing rigorous statistical methods, we aim to uncover nuanced insights into the potential protective effects of digital literacy on the well-being of older individuals during times of crisis, such as the COVID-19 pandemic. The findings have implications for public health policies and interventions aimed at supporting older adults in navigating health challenges, especially in the context of increased reliance on digital technologies for healthcare delivery.

RN01 | T02_03: Work, Retirement and Ageing 1

Importance of Work-Related Factors for Labour Market Participation After Retirement

Anu Polvinen, Sanna Tenhunen

Finnish Centre for Pension, Finland

Today's retirees are healthier than ever before, and many continue to work after old-age retirement. Working in retirement is often occassional and part-time, but it has many benefits for individuals and society. The aim of this study was to examine whether pre-retirement work-related factors are associated with work in retirement among those who have retired from paid work to an old-age pension.

Finnish survey data from 2022 (response rate = 68%), supplemented by register data, included 3,056 retired persons aged 63-70 who retired from paid work with an old-age pension between 2019-2021. Logistic regression analysis was used to estimate ORs and 95% CIs for working in retirement.

The results showed that a third of old-age pensioners had worked after retirement. Those who had been employed were often in good health and capable of working. Many pre-retirement work factors were associated with working in retirement. Experiencing work as an important part of life and receiving positive support at work had a positive effect on older workers' willingness to continue working after retirement. Those retired people who found the demands of work too strenuous were less likely to have worked in retirement. Higher occupational status was also associated with working in retirement.

The study indicates that good health, favourable working conditions, and positive work experiences, increase pensioners' interest in working alongside their pension.

Retirement and Cognitive Abilities – Evidence from Germany

Annette Trahms[1], Laura Romeu Gordo[2]

1Institute for Employment Research (IAB), Nuremberg; 2German Centre of Gerontology (DZA), Berlin

Due to the consequences of demographic change, the prolongation of older people's participation in the labor market is a recurring topic of public debate. The focus of our analysis is the contribution of prolonged labor force participation to the preservation of cognitive abilities, which at the same time is important for active aging.

In the present paper, we investigate how labormarket participation at older ages affects cognitive performance. Specifically, we investigate how retirement and retirement timing affect mathematical and reading competence. For this analysis, we use a data basis unique to Germany – the

69

National Educational Panel Study (NEPS). NEPS includes very comprehensive tests on mathematical and reading abilities, observed in 2011 and 2017.

Under using a difference-in-difference propensity score matching approach our results show that retirement is associated with a decline in reading and mathematical competencies. In addition a late retirement has a more negative effect on reading competencies than on mathematical competencies.

Timing Of Retirement From Work And Changes In Quality Of Life

Liisa-Maria Palomäki

Finnish Centre for Pensions, Finland

Postponing retirement is a central goal of pension policy, and our research evaluates the individual outcomes related to quality of life to this end. We explore how timing of retirement from work is associated with changes in overall QoL by paying attention into retirement at general retirement age (on time) versus postponing (later) retirement. We further analyze and how this is associated with changes in the satisfaction with the amount of leisure time and social relationships, self-rated health, perception of coping and income adequacy.

Analysis is based on the "From Work to Retirement" survey, collected in 2022 in Finland. The sample (n=3 378) includes Finnish pensioners, who were employed before retirement and started to receive old-age pension between 2019–2021. Analysis is based on retrospective questions on QoL before retirement and currently.

Results with FE regression models show that before retirement, quality of life was lowest among on-time retirees and highest among the longest postponers. After retirement, quality of life of on-time retirees increased and was at the level of average, while the quality of life of longest postponers remained basically unchanged. Much of the increase in QoL of on time retirees was explained with increases in the satisfaction with the amount of leisure time and feeling of coping. Overall, retirement timing seems to work as means of balancing overall quality of life. Results increase knowledge on individual's retirement timing and adds to the discussion over policy target of prolonging working lives and wellbeing in older age.

An Agent-Based Approach to Age Management and Retirement Behaviours: From Exclusive Human Resource Investments to Social Inequality?

Konrad Turek[1], Shaoni Wang[2], Wander Jager[2]

1Tilburg University, The Netherlands; 2Groningen University, The Netherlands

Recent developments in computer simulations, such as Agent-Based Modelling (ABM), offer novel ways to study organisational dynamics and employment relations from a complex-system perspective. This approach allows insights into bottom-up, complex and dynamic relationships, such as those between older workers, employers and the organisational environment.

In this project, we are connecting older workers with their organisations to study how different organisational settings (e.g., policies), employer approaches (e.g., mental models), and social norms (e.g., retirement norms) affect work and retirement at older ages. Drawing upon a multilevel organisational theory, employer decision-making theories, and organisational inequality paradigm, this study aims to understand better the mechanisms behind beneficial and harmful workplace practices and their wider impact on labour markets and social inequalities. In particular, we focus on human capital investment strategies (e.g., inclusive and exclusive) and their consequences for older workers' retirement behaviours. We hypothesise that exclusive approaches (e.g., supporting only talented workers) can lock specific groups in disadvantaged career paths, counteracting ageing policies and contributing to inequality in the ability to work longer.

For this, we designed an ABM simulation model for human capital investment mechanisms, using external data for empirical calibration (to reflect real-life settings better). An additional experimental (vignette) survey verifies simulation results about employers' decision-making. In the presentation, we discuss the key findings related to the role of within-organisation processes for retirement behaviours and macro-level patterns. We also reflect on the potential of computational simulations for ageing studies.

70

RN01 | T03_01: Generations and Ageing

Framing the Climate Crisis as a Generational Matter

Merve Tuncer

Örebro University, Sweden

This study investigates how climate crises is discussed in relation to generations and how discourses of solidarity, blame and ressentiment are constructed in current climate movements. On one hand, older populations, more specifically the so-called baby boomers are being targeted and often scape-goated as a generation that has wasteful and reckless consumption habits and indifference to nature by younger generations. On the other, Greta Thunberg's school strike for climate, and the movements inspired from her protest as well as independent and scattered movements around Europe and North America are shown as the new face of climate movements. Younger generations are portrayed as the 'solution' or 'rescuers' in the media against the older generations. Thus, the question of 'who to blame?' becomes entangled with intergenerational conflict. Replacing the class discourse with generational discourse blurs the lines of power relations between disadvantaged and privileged groups and carries the danger of reducing the climate injustice to a generational issue. It also overlooks the intergenerational solidarity that is already prevalent in many climate movements.

Generational Divides in Poland. Exploring Sites of Intergenerational Ambivalence Outside Family Environment

Magdalena Romanowska

SWPS University of Social Sciences and Humanities, Poland

The paper addresses the topic of intergenerational relationships among individuals from different age cohorts within the context of social polarization linked to the ageing society in Poland. Polarization along the lines of age, encompasses phenomena such as deficiencies in cooperation between young people and seniors, linked to rapid social change (Lowenstein 2007). Polarization in Poland has become a part of the political game through emphasis on opposing values of different generations (Cześnik, Zagórski 2022).

In this paper, the focus is on two selected areas of intergenerational conflicts and ambivalence. First, the tensions manifested in the perceived electoral advantage of older individuals as those who vote for changes that exclusively benefit their age group are discussed. Secondly, the differences in proficiency towards using new technologies are explored, as younger individuals demonstrate greater aptness in this area.

The basis of the analysis concerns material gathered through the individual in-depth interviews conducted in Warsaw in 2023 with young individuals (16-20) and seniors (68-80). The generational approach adopted for the purposes of this presentation (Mannheim 1970) aims to present the narratives of both cohorts in the context of – on the one hand – the perception of potential intergenerational conflicts, and on the other hand, the potential and foundations for building intergenerational solidarity.

In the process of data analysis, the concept of generational ambivalence (Lüscher & Pillemer 1998) was centralized, as this category allowed us to capture contradictions in relationships between members of different generations and their manifestations in interactions. During the presentation, it will be shown how the concept of ambivalence can be applied to foster a better understanding of intergenerational relationships outside the family environment in Poland and beyond.

Exploring Intergenerational Communication through Arts-Based Collaborations among Youth and Older Adults

Seran Demiral

Istanbul Arel University, Turkiye

This study aims to foster various ways of intergenerational communication to transcend biases against older adults and marginalizing perceptions of aging. As a researcher who usually works with children and young people, I have been focusing on the capabilities of youth within a human capability approach, addressing their marginalized status in society. Technological competency and the inclination to learn new developments in digital technologies can provide advantageous positions for younger generations in changing societal settings. On the other hand, due to the same core, older adults may face even more difficulty in the face of upcoming circumstances. Hence, this study has emerged to build new bridges between generations with an awareness and understanding of perceptions of ageing.

Through interviewing a group of university students actively participating in artistic and performative activities and discussing the elder members in their families, this preliminary research aims to understand their perspectives on older people in their social networks. Additionally, it seeks to reveal how their reciprocal communication differs with the introduction of new technologies. Secondly, by conducting an intergenerational theater workshop, the interactions between youth and older adults will be observed. The potential collaboration between the participants of the study will be facilitated through arts-based methods, aiming to enhance intergenerational understanding among the study participants.

Continuity and Change in Intergenerational Care during Times of Crises: Insights from the SHARE Corona Survey

Mihaela Haragus, Paul-Teodor Haragus

Babes-Bolyai University, Romania

Recognizing that individuals play a crucial role in supporting their aging parents, especially in countries with limited welfare systems, we delve into how this support adapts during times of heightened vulnerability, such as the recent COVID-19 pandemic.

The frequency and intensity of support vary by individual's resources for intergenerational solidarity, by the needs arising from their parents' health, financial or emotional challenges, as well as by family and cultural-contextual structures. Utilizing data from the 2020 and 2021 waves of the SHARE Corona Survey, we analyze how the pandemic has redefined intergenerational support towards the elderly. Our focus is on understanding which forms of support persisted, which were disrupted, the changes in support intensity, and how socioeconomic status influenced these dynamics under the new pandemic conditions.

Our sample includes eight countries recently added to the SHARE project, offering a diverse cultural and geographical perspective: Lithuania and Latvia (Baltic), Romania, Bulgaria, and Slovakia (Central and Eastern Europe), Malta and Cyprus (Southern Europe), and Finland (Northern Europe). In our analysis, we control for individual and family-level characteristics and draw comparisons across different welfare and intergenerational solidarity regimes.

Preliminary findings indicate that during the initial lockdown, older adults experiencing some form of deprivation—material or social—were less likely to maintain contact (direct or electronic) with their adult children and were also less likely to receive increased support. This study sheds light on the evolving nature of intergenerational care in times of crisis, highlighting the complex interplay of individual, familial, and societal factors.

RN01 | T03_02: Work, Retirement and Ageing 2

Ageism in Employment: A Framed Field Experimental Approach

Kari Kristinsson

University of Iceland, Iceland

With life expectancy growing, ageism has received increasing interest from researchers and the general public. This is understandable, as ageism can have many serious financial and health consequences for the victims of such discrimination. In this study we focus on ageism in the employment context by examining whether older applicants are evaluated differently than younger applicants and whether recruiters have negative intentions towards hiring older workers. We use a framed field experimental design that has recruiters with hiring experience as participants. Using this research design, we are also able to study the various recruiter traits and how these are related to ageism. Our results show that recruiters have less intention to hire older applicants compared to younger applicants. The results also show that older applicants are evaluated lower on physical fitness, health and attractiveness compared with younger applicants. Lastly, young, and less experienced recruiters showed more signs of ageism, whereas more experience recruiters and older recruiters showed no difference in intention to hire older or younger applicants. Implications for organizations are discussed, underscoring the need to train recruiters as well as implementing action focused on reducing ageism in hiring.

Age-friendly Workplaces – a Management Training Model

Anne Inga Hilsen

Fafo Institute for Labour and Social Research, Norway

A sustainable society is dependent on high labour market participation, and across Europe there is a growing worry about an ageing workforce. Demographic change and the ageing population puts stress on workplaces to initiate age-friendly HRM-policies to keep their older workers engaged and motivated to work longer. One challenge is how managers can support their employees in prolonging careers?

In this paper we will explore a management training model to support this aim. The empirical data is from a large Norwegian financial institution and is based on background documentation and notes from multistep group interviews with two groups of managers. Between the first and second round of interviews the managers participated in a training day organized and run by Centre for Senior Policy, a national Norwegian "resource centre dedicated to the stimulation and development of policies concerning older workers in the workplace" (https:/seniorpolitikk.no, 2024).

The first stage of group interviews engaged managers in discussions on what challenges they experienced concerning the older workforce and what they expected from the training day. Second stage group interviews asked about what they had learned and how/if new knowledge had changed practice.

The outcome of the process was increased knowledge and raised consciousness about the situation for older workers in the organization. In addition, the combination of multi-stage group interviews and training day gave the added value of offering managers an opportunity to reflect together and explore possible initiatives across the different departments in the organization.

Beyond Numbers: Exploring Ageism and Retention Challenges for Poland's Aging Workforce

Maria Varlamova[1], Katri Keskinen[2], Jolanta Perek-Białas[1]

1Institute of Sociology, Jagiellonian University, Poland; 2Faculty of Social Sciences, Tampere University

Contemporary labour markets are under constant pressures and changes. Among these challenges is the retention of older workforce as a response to rapid population ageing. Delving into the experiences of older workers (aged 50+) in Poland, this study examines age management practices from workers' perspective. By moving beyond the quantitative data previously gathered from employers, this research illuminates the lived experiences of extended working life from the workers' viewpoint.

The research methodology employs in-depth remote interviews to explore the narratives of older workers across various industries. These interviews focus on understanding the workers' firsthand experiences with stereotypes, prejudice, and discrimination in the workplace. Special attention is given to age management practices within organizations and how they affect the day-to-day experiences of these employees. The study also investigates the impact of the COVID-19 pandemic on the work life of older individuals, examining any shifts in employment patterns, workplace dynamics, or attitudes towards older employees during and after the pandemic.

The findings of this research contribute to the ongoing dialogue on ageism in the workplace, specifically in the context of an aging population and evolving labor market dynamics. By capturing the voices of older workers, the study provides critical insights into effective age management practices and highlights areas where improvements are needed. The ultimate goal is to inform and guide policymakers and corporate leaders in developing strategies that not only retain but also empower and respect the older workforce, ensuring their valuable contribution to the economy and society.

The Consequences of Young People's Labour Market Uncertainty for Future Pension Savings

Dirk Hofaecker

University of Duisburg-Essen, Germany

Following the gradual shift from primarily public to multi-pillar pensions systems, young people in European countries are increasingly expected to supplement contributions to public pension schemes with own private savings to ensure a decent standard of living for their later life. At the same time, however, many young people in Europe increasingly face difficulties in entering the labour market or finding a stable, permanent and decently-paid job. For young Europeans, the increasing expectation to make savings for older age thus is accompanied by a decreasing ability to make such savings within specific parts of the population. Yet, until now, only little research has explicitly analysed this "long-term link" between current youth labour market uncertainty and future pension outcomes.

Drawing back to findings from two recent EU-funded projects (EXECPT, YOUNG-IN) and using evidence from a recent edited volume based on this research (Hofäcker, D. and Kuitto, K. (eds.) "Youth Employment Insecurity and Pension Adequacy"), the presentation first will outline current trends in unemployment and atypical employment among youth today. In a stylized way, it will then discuss how such labour market uncertainties are treated in contemporary public and private pension systems and which risks such insecure employment patterns entail for savings behaviour and pension accrual.

Building on this, the presentation will finally develop recommendations on how public policies can mediate the detrimental effect of insecure employment on future pensions savings. In particular, it will discuss possible strategies in social as well as labour market policies.

The Imaginaries Behind Logics of Care. Insight from Ethnographic Inquiries of Long-stay Institutions Dealing with Dementia

Alexandre Lambelet, Benjamin Tremblay, Fabienne Malbois

University of Applied Sciences and Arts Western Switzerland (HES-SO | HETSL), Switzerland

The care of older people with severe dementia living in long-stay institutions took a decisive turn in the 1990s, with the development of « person-centred approaches » (Kitwood, 1988). Moving away from a biomedical vision, in which people suffering from dementia are seen as diseased and invalids, these approaches look at dependency through the prism of a relational conception of autonomy, and aim to provide individualised care. Valuing dementia people as individuals, such approaches explicitly project a moral horizon. The aim is to provide the care that will enable residents, despite their impairments, to fulfil their potential as « persons » and to be recognised and recognisable as members of the human community. That being said, these new « logics of care » (Mol, 2008) involved different representations of what a human being is, called « implicit anthropologies » by Rigaud (1998). In other words, a certain way of imagining what a person is made up of is embedded in such innovative caring. On the basis of two ethnographic inquiries covering a total of 7 care homes in French-speaking Switzerland between 2018 and 2024, this paper will highlight, on the basis of the empirical material collected (mainly interviews and observations), two anthropologies underlying this new caring. More specifically, the paper will show that (i) these two anthropologies imply specific ways of articulating the two central dimensions of body and mind, (ii) and set up forms of life, which people with dementia are invited to inhabit, that have their own consistency.

Discussing Deficiencies in Older People Care: Supervisors' Responses to Care Workers Raising Concerns About Their Work Practices in Care Homes

Vilhelmiina Lehto-Niskala

University of Helsinki, Finland

Ageing societies are facing an increasing need for professional care workers who take care of the oldest old. Care work in older people care can be physically and emotionally burdensome. Support from their supervisor is an important factor in contributing to workers' professional self-esteem, well-being and reducing their likelihood of deciding to leave their jobs. To improve the quality of care and the workers' working conditions it is important that the care workers feel able to speak up. The aim of this study is to examine care home supervisors' discursive strategies when responding to care workers' concerns regarding their work practices.

The data consists of six performance appraisal interviews and 13 other workplace meetings in four care homes in Finland. The method of analysis is discourse analysis with emphasis on supervisors' discursive strategies.

Care home supervisors responded to care workers' concerns using six discursive strategies: encouraging, activating, directing, reconciling, taking responsibility, and justifying. Supervisors could use several discursive strategies in one discussion and thus construct different, sometimes overlapping, positions for themselves.

Supervisors need to ensure that care workers feel safe to voice their concerns. Supervisor's use of language in these situations plays a major role. This study provides new knowledge about micro-level workplace interactions in care homes and helps to identify supervisors' different strategies in responding to care workers' work-related concerns. These can have impact on the care workers' work-related well-being and the quality of the care provided in older people care services.

Robot Literacy of Fourth Agers in Care Homes – an Institutional Ethnography

Heli Valokivi

University of Jyväskylä, Finland

Digital technologies play a central role in the everyday life, well-being, learning, and societal participation of individuals throughout lifespan. However, to use the increasing amount of information disseminated through digital technologies, citizens need media literacies (MLs), that is, competencies in accessing, analyzing, evaluating, communicating, and creating messages in a variety of contexts. Older people may lack adequate MLs to support their everyday life, well-being, lifelong learning, and participation in society. Therefore, special efforts should be made to ensure that the older population is adequately equipped with MLs.

This project will focus on robot literacy (RL), a subset of ML, in care homes for older adults, homes of fourth agers. Robots are becoming more popular in both domestic and institutional contexts. Robots can function as providers of information and services, which require people to have RL, that is, competences to understand and interact with robots. We ask, what kinds of robot literacies and support needs are reported in care homes. The research will apply institutional ethnography (IE) and participatory action research (PAR) in care homes with older adults and care professionals. The communal, collaborative, and situated nature of MLs will be emphasized. The reason for studying care homes is that, since aging in place is highlighted in the care of older adults, care homes are seen as the final

74

housing destination and homes of fourth agers. Care homes are highly invisible to the public.

The Transformation of Knowledge Related to Long-term Care: Implications for Transiting Change and Trust-building.

Uzuri Castelo Moñux[1], Maider Larrañaga Egilegor[2], Lorena Gil de Montes Etxaide[3]

1University of the Basque Country, Spain; 2University of the Basque Country, Spain; 3University of the Basque Country, Spain

The actual systemic crisis manifests the profound changes which are taking place in contemporary long-term care systems, leading to new care modalities in society. Through 26 interviews conducted with caregivers, family members, and older adults with care needs, this communication presents the study that aims to make visible the transformation in the conceptions of care in the Basque Country (north of Spain). The results revealed the socio-cognitive tensions and transformations experienced by the actors, through three main processes (Jovchelovitch & Priego-Hernández, 2015). The first process shows the displacement of familialist ideas in favor of individualization; the second, the contextual validation of the institutionalization and outsourcing of care; the third, the hybridization of ideas that lead to new care modalities, such as professionalization and personalization. The relevance of a dynamic and situated approach to the theory of social representations, and its contribution to the analysis of new knowledge disseminated in a changing cultural and organizational context are discussed. The potential of the findings for promoting collective trust in care provision are also examined, considering the actor´s diverse dialogues and positions.

Caring for Older Parents in Norway – How Does it Affect Labor Market Participation?

Heidi Gautun[1], Christopher Bratt[2]

1Norwegian Social research NOVA Oslo Metropolitan University; 2Department of Psychology, Inland Norway University of Applied Sciences

Introduction: As the population ages, younger generations will increasingly be called upon to provide informal care to their aging parents. To prepare for this development, it is essential to understand how employees combine the dual responsibilities of work and caring for aging parents. Methods: By analyzing data collected in Norway in 2022 from a nationally representative sample of 6052 respondents, aged 35 to 67, we investigated how caring for older parents affects labor market participation and work absence. We provide descriptive statistics and conduct analyses with structural equation modeling

Results: The analyses indicated that caregiving had no substantial impact on overall participation in the workforce. However, employees did use work absences to assist their parents. We differentiate between using holidays, compensatory time, and three types of formal leave: paid, unpaid, and sick leave. More than a third of the formal leave was taken as sick leave. Women were moderately more likely to use work absence to care for their parents. Conclusions: We conclude that caring for old parents has little effect on work participation and attribute the favorable situation in Norway to its comprehensive public elderly care system. However, a contributing factor is Norway's generous sick leave policy. Although intended for use when employees are sick themselves, sick leave is used to provide care to old parents. Sick leave seems to act as a safety valve. To mitigate the effects on work participation, welfare states may create conditions that allow employees to combine work and care without resorting to unauthorized sick leave. A solution could be to extend the existing support scheme for employees with young children to those providing care for their aging parents.

Combining Informal Care for the Aged with Employment – Not Only a Double Burden.

Vera Charlotte Dötig[1], Karl Krajic[2]

1Forba, Austria; 2University of Vienna

Informal care is the dominant model of care for the aged in most European countries. Welfare state concepts for the aged are mostly based on the assumption that care for aged is a family duty. But informal care brings along several risks

75

to receive several "penalties" (Yeandle): Economic losses, social exclusion and losses of mental and physical health. Several of these losses are related to decisions to reduce or quit employment – a reaction that welfare state policies so far do not try to counteract.

Concerning health effects, combining employment and informal care seems to be considered a double burden situation with giving up one half as a plausible relief. So far there is very little systematic knowledge about practices at the workplaces and especially about the perception of specific health risks and chances in this context.

The presentation proposed comes out of the context of the project Combining Employment with Care for the Aged – COMBECA. This is a cross-national, multi-perspective study in Austria and Switzerland on the relevance, practices and effects of combining in the workplace context.

Focus of the analysis will be the perceived health risks of carers, but also positive health opportunities in 14 companies and the perceived welfare state support for combining employment and care. The paper utilizes a multi-dimensional health concept, including perspectives on physical, mental and also social health by Pelikan (2007, 2009).

First results indicate that certain practices of carers and management seem promising to manage stress and help employees in retaining positive effects of inclusion in working life. Analyses also indicate that welfare state practices could be improved to increase chances of positive health outcomes.

Pathways in Caregiving: Strategies of Employed Informal Caregivers to Reconcile Paid Work and Family Care in Familialist Welfare State

Tjaša Potočnik[1], Maša Filipovič Hrast[2]

1University of Ljubljana, Faculty of Social Sciences, Slovenia; 2University of Ljubljana, Faculty of Social Sciences, Slovenia

Informal care plays a pivotal role in sustaining long-term care systems throughout Europe, particularly in familialist care systems like Slovenia's, where strong social norms emphasize family care for elderly relatives, and legal obligations support care from adult children to their parents (Saraceno 2016; Filipovič Hrast, Hlebec & Rakar 2020). However, with the increasing demand for elderly care and rising of the retirement age, the number of informal caregivers balancing paid work and family caregiving is growing (Pickard et al. 2015). This paper focuses on pathways to care (the freedom of choice in becoming a caregiver) and pathways through care (the capabilities of caregivers to reconcile paid work and caregiving) in Slovenia. Pathways, in this context, refer to the dynamic course of processes within broader family constellations, connecting family caregiving in later life with events and processes in earlier life stages, relationships with others (e.g., siblings, family members), and contextual factors such as public policies and cultural norms (Rodrigues et al, 2022). Special attention will be given to understanding how local welfare systems,

gender, and socioeconomic status shape the choices and capabilities of employed family caregivers. The analysis draws on the Slovenian portion of data collected as part of the Det_Caremix project, specifically in-depth interviews with 47 working caregivers in Slovenia engaged in mixed care arrangements. The paper employs reflexive thematic analysis (Braun and Clarke, 2018) to identify various pathways in caregiving and their impact on caregivers' freedom of choice and capabilities to balance paid work and family care.

Transforming Care: Social Practices in Companies to Combine Employment and care for older Relatives. An international Comparison between Switzerland and Austria

Thomas Geisen[1], Karl Krajic[2]

1University of Applied Sciences and Arts Northwestern Switzerland, Switzerland; 2Working Life Research Center, Vienna, Austria

Due to demographic change, aging workforces, and shortages of labour force, employers are seeking to strengthen retention activities. This includes activities to improve possibilities to combine employment and care for older relatives. The position of employees with care obligations has also been strengthened by recent welfare policies. Switzerland, a "non-familiarized welfare state" (Esping-Anderson) and Austria, a "familiarized welfare state" have implemented measures to support employees with care obligations. So far, there is little knowledge on the impact of these changes in everyday work life. Before this background and within a comparative, international study, company case studies in both countries analysed social practices that have been developed to combine employment and care for older relatives.

In Switzerland (n=9) and Austria (n=6) company case-studies were conducted in a mixed method design. In each organization qualitative, guided interviews were conducted (n=7 per company) and analysed according to Grounded Theory (Charmaz). Additionally, an online questionnaire was offered to the employees to find out how many workers are combining employment and care, and what stresses and strains are resulting from that situation. The research was funded by the Swiss National Research Foundation (SNF) and the Austrian Science Fund (FWF) from 2020-2024.

The case studies show that the companies emphasise that care for older relatives is a single-case-issue which cannot be solved by standardized general measures or packages. In those organizations that were aware and sufficiently interested in the issue, procedural practices are the dominant feature – in Switzerland as well as in Austria – based on the key-category "negotiating employment and care obligations". Welfare state legislation and services seem relevant to reduce the workload and stress for informal carers.

RN01 | T04_02: Health and Ageing in Social Context

An Investigation of the Causal Association Between Social Participation and Health Outcomes in Later Life: findings from a Nationally Representative Sample Using Marginal Structural Models

Shunqi Zhang

The University of Manchester, United Kingdom

This paper draws on Bourdieu's capital-based theory (economic, social and cultural capital to examine the effects of social participation on depressive symptoms and cognitive function in later life. Social participation is the key variable of interest, operationalised in terms of types of social networks, including informal and formal social networks. Based on data from four waves of the China Health and Retirement Longitudinal Study (CHARLS) over 7 years (2011-2018), we use marginal structural models (MSMs) with stabilised Inverse Probability of Treatment Weights (IPTWs) to estimate the causal effect of different types of social participation on mental and cognitive outcomes. Missing data is imputed by Predictive mean matching (PMM). E-value is used to assess how sensitive the results are.

After controlling for economic and cultural capital and a set of demographic and health variables, the results show that two measures of social capital, interaction with friends and caring for a sick adult have strong associations with lower risk of depressive symptoms. Similarly, we find social participation was generally associated with better cognitive function across waves. The findings of this paper have the potential to enhance the usefulness of Bourdieu's forms of capital in explaining the production of practices of social participation and their effects on health, as well as contributing to a further understanding of social stratification in later life.

Living Alone, Poor Social Support And Loneliness: An Analysis Of Their Association With The Health Of Older Adults

Stefano Cereghetti, Anna Maria Brambilla, David Maciariello, Elia R.G. Pusterla, Stefano Cavalli

University of Applied Sciences and Arts of Southern Switzerland, Switzerland

Living alone, lacking social support, and suffering from loneliness have been shown to have significant negative consequences on the health of older adults. Nevertheless, our understanding of their combined influence is still limited. In this study, we aim to investigate the interplay of these three factors and their potential association with health outcomes. To achieve this objective, we employ data from a sample of older individuals aged 65 and more included in wave 7 (2022) of the Swiss Health Survey, a repeated cross-sectional study conducted every five years in Switzerland. We perform multinomial logistic regression models to assess the relationship between combinations of solo dwelling, poor social support (Oslo Social Support Scale) and feelings of loneliness (direct question), and various health-related measures, including but not limited to, self-rated health, mental health (e.g., depression, anxiety), activities of daily living, sleep health, presence of chronic ailments and frequency of medical visits. We hypothesise that individuals exposed to more factors will demonstrate a stronger correlation with adverse health outcomes than those with fewer exposures. Furthermore, we anticipate that the link between factors and health issues might not completely coincide. Our results will shed light on the possible cumulative impact on health of the most common forms of exclusion from social relations. In so doing, they will offer evidence of the intricate interplay of social factors in the health of older adults.

The Role Of Physical Exercise In Combating Loneliness Among The Elderly

Rafaella Fernanda Lauria de Souza, Rui Manuel Garcia

University of Porto, Portugal

The definition of aging is quite complex due to its multifactorial nature, however, it can be understood as a set of changes that occur gradually, progressively and irreversibly, causing a series of changes, including motor, sensory, psychic and social. With the reform, transformations can be observed in practical terms, in which the elderly have their routine taken away, also taking away social relationships built at work. In this way, the elderly are excluded from the social environment, which can lead to loneliness. In order to combat it, physical exercise is seen as a tool for this, as elderly people have the opportunity to develop new social ties, improving aspects directly related to the problem. The main objective of this study is to understand, from the perspective of the elderly, the effect that physical exercise has in the context of loneliness. The present study has a qualitative approach, with its data collection instrument being a semi-structured interview, constructed in three blocks of questions (indicators of loneliness, physical exercise and the impact of physical exercise on loneliness), and its data processing based on content analysis. 22 elderly people participating in a project from the Faculty of Sports of the University of Porto were interviewed. According to the reports collected, it was possible to observe that performing physical exercise was able to change the state of loneliness, especially in elderly people with many indicators, as it was able to offer elderly people a new look at their reality, making them socially active once again. It is concluded that physical exercise is capable of effectively combating loneliness among the elderly.

77

Not All Bad News: Early and Late Life Social Determinants of Physical Limitations Trajectories Across Different Cohorts from Portugal, Estonia and Slovenia

Daniela Craveiro

ICS, Universidade de Lisboa, Portugal

Research on age trajectories of physical limitations provides valuable insights. Understanding the average trend in the number of physical limitations in a given population provides valuable information for healthcare needs, social policy development, and even personal health management. It is well established in the literature the role of social circumstances on health and ageing. Less often, research captures the dynamic nature of these associations. Understanding how younger cohorts differ from older cohorts will generate a clearer picture of how the ageing process is changing in a given context, allowing a better calibration of policy intervention and priorities. This paper tries to contribute to the gap using data from the SHARE survey to compare functional limitation trajectories based on early and late life social determinants across generations in Estonia, Portugal, and Slovenia. Trajectories for physical limitations are modelled using ageing vector models. The estimated parameters are then used to derive cohort trends, which are adjusted by incorporating early, adulthood, and later-life social determinants of health, along with controls. This approach allows for the estimation of cohort trends while accounting for different sets of determinants. Results suggest that younger cohorts are undergoing a relatively more accelerated ageing process, characterized by an earlier onset of health limitations in the three countries. Cohort differences are wider when controlling for the effects of health behaviors suggesting they are mitigating the disadvantage of the younger cohort. Data seem to indicate that health behaviours even late in life are a crucial entry policy point to ensure better prospects for physical ageing trajectories and compensate for the potential increase of health hazards experienced in younger cohorts.

RN01 | T04_03: Ageing and Social Networks

How to Increase Trust in Institutions and Co-design Innovative Transformation for Increased Safety of Older Adults Living with Dementia? The Role of Social Workers in Interprofessional Collaboration Before, During and After a Missing Episode of Persons Living with Dementia in Risk of Disappearances.

Maria Wolmesjö

University of Borås, Sweden

78

Aim of paper is to present results from an ongoing research project on increased safety for people living with dementia/cognitive impairments in risk of risk of wandering away, disappear and go missing.

Project purpose was to identify "best practices" of a missing episode from the perspective of persons living with dementia, their relatives, eldercare workers and the Police and to initiate and develop routines, training and collaboration initiatives to prevent or hinder a new missing episode. The project was developed in close collaboration between municipal eldercare, the Swedish Police and Swedish Dementia Centre for a Dementia Friendly Society and researchers from different disciplines to improve efforts before, during, and after a missing episode of persons living with dementia, their relatives, professionals and volunteers involved in the missing process.

Methods used are 1) Knowledge overview – of statistics, steering documents & guidelines, 2) Case studies and individual interviews with persons living with dementia and their relatives 3) Interviews – with "experts" to identify crucial factors in finding a missing person living with dementia, 4) focus group – and individual interviews on experiences of effective co-operation in the disappearance and search for a person with dementia and 5) development, implementation and evaluation of a document "My life story/Historia Vitae – for increased safety in the event of missing episodes".

Preliminary results point out there is a lack of shared information and knowledge on "the others" possibilities and obligations, legislation and routines. Social support and technical devises are available but often unknown by relatives. Social workers have an important role to increase trust in institutions and co-design innovative transformation of missing process in collaboration with persons living with dementia, relatives and Police.

Why is Psychological Wellbeing Associated with the Composition of Older Adult's Care Network: An Application of the Self-Determination Theory

Joukje C. Swinkels, Jens Abbing, Marjolein Broese van Groenou

Vrije Universiteit Amsterdam, Netherlands, The

Objectives: Older care recipients differ in types of care used: some receive mostly partner or other types of informal care, whereas others use mostly formal or privately paid care. This may add to differences in psychological wellbeing. Applying Self-Determination Theory (SDT) to the care context, we hypothesize that care networks types differ in the extent that they foster feelings of relatedness, autonomy and competence , resulting in different levels of psychological well-being.

Methods: Data are from ten observations of the Longitudinal Aging Study Amsterdam (N= 18,434 observations from 4,837 older Dutch adults, from 1992 until 2022). Care network types are created a priori composed of (mainly) partner, informal, formal or privately paid care. Mixed-model regression analysis of depressive symptoms as measure of well-being is applied on care network type and loneliness (indicator of relatedness), mastery (autonomy) and care sufficiency (competence). Hybrid models disentangle between and within subjects effects.

Results: Receiving care from a partner care network contributes the most to psychological wellbeing. Those with a formal care network type are worse off. Loneliness and care sufficiency partly explain these differences. Results of between and within effects are comparable.

Conclusion: The findings support that applying SDT concepts of basic needs helps to understand how care from different care networktypes impact psychological wellbeing.

The Role of Social Network Characteristics in Long-term-care Networks Among Older Adults in The Netherlands

Jens Abbing, Joukje Swinkels, Marjolein Broese van Groenou

Vrije Universiteit Amsterdam, Netherlands, The

The increasing demand for long-term care among European societies calls for a better understanding of how older adults build long-term care (LTC) networks consisting of informal and formal caregivers. Having supportive family members and friends is generally associated with receiving informal care, yet how different characteristics of individuals' social networks relate to LTC networks is not fully understood. Therefore, this study investigated how the size, composition and relationship quality of individuals' social network influences what type of LTC network they have. Data was used from the Longitudinal Aging Study Amsterdam that measured LTC use and social network characteristics of older adults (55 plus) in three-year intervals from 1992 to 2022. The sample contained 18252 complete observations from 4859 participants. Using multilevel latent class analysis, co-residing, children, distant family, non-kin, formal and privately paid LTC networks were identified. Cluster-robust multinomial logistic regression analyses revealed that network size, composition and quality all were associated with membership in different LTC networks. In particular, having partners and children living in proximity contributed to an informal LTC network. If these were not available, other family members and non-kin can act as substitutes. The impact of relationship quality was limited, which suggests that older adults may refrain from using the full potential of their social network to build informal care networks, maybe because they prefer not to involve relatives or non-kin into caregiving or prefer formal or privately paid care.

Social Integration And Well-being In Later Life Across Europe

Alina Schmitz[1], Michal Levinsky[2], Martina Brandt[1], Melanie Wagner[3], Ella Cohn-Schwartz[4]

1TU Dortmund University, Germany; 2Hebrew University of Jerusalem; 3SHARE Berlin Institute; 4Ben-Gurion University of the Negev

Background

Countries across Europe are facing challenges associated with increasing life expectancy, such as enabling social integration and high well-being until old age. So far, few studies have investigated the patterns of social integration and later life well-being from a country comparative perspective.

Data and Methods

Based on data from the Survey of Health, Ageing and Retirement in Europe (SHARE), we rely on a comprehensive index of social integration (Berkman & Syme 1997, Am J Epidemiol 109: 186-204). Our study examines the following questions: (i) Does the social integration of older adults differ across Europe? (ii) Which population groups are more likely to lack social integration, and (iii) how is social integration associated to various dimensions of well-being?

Results

More than 40 percent of older Europeans achieve low social integration scores. Low social integration is highly prevalent in Southern and Eastern Europe. Especially men, individuals with a low socioeconomic status and those affected by health limitations bear an increased risk. From a longitudinal perspective, higher levels of social integration are related to better well-being outcomes, including reduced depressive symptoms, a higher quality of life and overall life satisfaction, better self-rated health and less mobility limitations.

Discussion

Low social integration is a risk factor for low mental and physical well-being and might rein-force pre-existing inequalities in the well-being of ageing populations. In further analyses, we will examine contextual factors that explain the cross-country differences in social inte-gration.

79

RN01 | T05_01: Ageing in Rural and Urban Contexts

Formal and Informal Support for Older Adults Living in Rural Areas: Insights from Poland

Ilona Matysiak, Jowita Bartczak

Maria Grzegorzewska University, Poland

Given the scarcity of literature and research on ageing in place in rural Poland as well as other countries, the main aim of this paper is to explore experiences of older adults living in the Polish countryside, and how their needs and expectations are addressed at the local level. The main research question is whether small rural communities can provide their older residents with opportunities to age well and in what way. The main focus is on analyzing various types of formal and informal support available in the community, and how these correspond with what older adults need. The primary source of data for this paper is 20 in-depth interviews conducted in 2023 in a rural commune of northern Poland, which is an area affected by unemployment and poverty. Half of the interviewees were older adults aged 65 and up living in the commune's various villages. They were diversified in terms of age, education level, health, and a general life situation. The remaining 10 interviewees were local stakeholders including local authorities' representatives and other local leadership members competent in the topic. The results confirm the importance of informal support provided by family and neighbors, which is often taken for granted. The outcomes show a division between active older adults effectively using local opportunities and those who are excluded due to their health, immobility or social, as well as spatial isolation. These results inform future efforts for creating age-friendly environments in rural areas.

Experience of Rurality and Perceptions of Quality of Life in Aging: What community social support systems?

Hermínia Gonçalves[1], Teresa Sequeira[2]

1Universidade de Trás os Montes e Alto Douro & Centro de Estudos Transdisciplinares para o Desenvolvimento; 2Universidade de Trás os Montes e Alto Douro & Centro de Estudos Transdisciplinares para o Desenvolvimento

Objectives: To understand the importance of the rural environment factor in older people's perceptions of quality of life (QoL), explaining interactions with visions of access to health services and social support, and with expectations of access to support systems for ageing in rural communities.

Methodology: An experiential model inspired by symbolic interactionism, immersion and action research was adopted. Case study in the municipality of Vila Marim, located in the northern interior of Portugal. In methodological terms, the case study articulated the qualitative method and the ethnographic method, whose design can also rely on the results of a more comprehensive quantitative investigation carried out in the same parish (Sequeira, et.al, 2023). We carried out semi-structured interviews with forty-six elderly people spread over the 7 villages of the parish. And we proceeded to the observation of rural daily life, which was later systematised through categorial and discourse analysis.

Results: The results show how rural experiences in particular partially explain the quality of life of rural older people. The perception of quality of life is influenced by the way each individual experiences ageing, by biological, social, economic and cultural conditions. There are ambivalences marked by feelings of loneliness and scarce social support, which are stronger in isolated and mountainous areas, challenging local actors to innovate support mechanisms and strengthen access functionality.

Ageing at the Edge of Europe – A Case Study from Madeira

Petra Žišt

INRCA IRCCS Italy

This paper will examine different experiences of ageing in Portuguese island of Madeira in the Atlantic Ocean. Traditionally island of emigration and in jargon a place for "newlyweds and nearly-deads", in pandemic and post-pandemic times attracted many new people from EU, UK, USA and beyond to live and/or work on the island remotely, which was supported by some incentives of the local government and promotion of the island as welcome place for 'digital nomads' as well as wealthier older adults. Older adults and retirees from continental Europe and beyond choose Madeira as their retirement place for various reasons such as moderate climate, beautiful landscapes, friendliness of locals and with increasing inflation they still can live more affordable lifestyles while saving on heating etc. However, practices and experiences of aging as a local or as an immigrant are different concerning lifestyle, family support, networks, wealth, health, and wellbeing. Differences are reflected in transformations, tensions and trust on the island that this paper aims to examine. How those tensions are played out through policies, health and design around aging in place and assistive technologies? Marketing of products is more often targeting richer foreigners, but how about ageing experiences of the locals? How do they experience place, identity and attachments differently will be analysed through interdisciplinary perspectives of environmental gerontology, sociology and anthropology. What are social and cultural aspects of aging on the island for people with different life courses and 'insideness' (Rowles 1983)?

Caring Communities as Spaces of Engagement. Research Evidence from Rural and Urban Hungary

Dóra Gábriel

HUN-REN Centre for Economic and Regional Studies, Hungary

Care marketization tendencies are manifested in a slightly different way in Hungary than in Western European countries, partly due to the shortcomings of state regulation. The Hungarian eldercare sector has been facing several challenges: in terms of funding, workforce, decent working conditions of the workers, regulation of the market, and the lack of central intention to improve the standards of the provision. However, caring communities might have a special role in localities regardless of the access to care provision. While community-based initiatives have not yet spread in the country, there are some good practices of age-friendly communities. The presentation is based on empirical research conducted between March – November 2023 in Hungary. The observation took place in an economically deprived county, both in small villages, and in the county seat. The paper seeks answers to the following questions. Based on the empirical results: What are the roots, requirements and driving forces of developing an age-friendly community; How do caring communities contribute to the quality of life of older adults in rural and urban settings; What suggestions can be offered to local municipalities in order to develop community-based innovations both in towns and villages? Results show that municipal practices, civil initiatives, and local identity are important factors in enhancing engagement in the community. While older adults take part in organizing themselves both in rural and urban environment, differences can be observed regarding the institutional background and commitment towards their communities.

RN01 | T05_02: Home Care

The Logic of 'Home Care Time'

Håkan Jönson, Glenn Möllergren, Tove Harnett

University of Lund, Sweden

The study investigates temporal aspects of home care in Sweden, as experienced and interpreted by older care users. The data consists of 34 qualitative interviews with 36 care users aged between 68 and 96 – 22 women and 14 men – in southern Sweden and 15 observations of home care provision. By focusing on care users' recalibration of time and events, the analysis identifies a form of interpreted experience – here termed 'home care time' – that comprises two governing sublogics – care users understanding of themselves as part of the home care organisation, and care users' empathetic understanding for care staff – where each sublogic evolved from several approaches where care users expressed time empathy, tried to increase time efficiency, or adapted to other care users. Some care users described attempts to take control and influence temporal aspects. Such attempts resulted in adjustments to services at the individual care user's request, but they were also associated with the risk of conflict between care users and care workers. The study addresses the gap in the literature, which mostly studies and theorises care from a care provider perspective. The logic of home care time identified in the study can explain why older people may say they are satisfied with services though poorly performed due to time shortages. This explanation is a corrective to ageist stereotypes that portray older care users as docile and grateful.

Individual, Household and Contextual Characteristics Linked to the Selection of Home Care Strategies for Older Dependents

Pedro Gallo, Albert Julia, Sandra Escapa, Marga Mari-Klose

University of Barcelona, Spain

Care strategies for older dependents are determined not only by individual or network characteristics but also by contextual factors. We aim to determine whether the individual, household and urban (neighbourhood) characteristics are linked to the use of family care (informal), public services or private care at home (formal). We applied logistic regression analysis to data from the Survey on Care Strategies for Older Dependents 2023 (DEPCURA-BCN project). The sample was composed of 1,600 older people (65+ years old) living at home (no care institutions). The sample is representative of dependent older people in Barcelona (Spain). Our results suggest that differences in urban socioeconomic contexts determine some inequalities. The type of neighbourhood is relevant in explaining the home care older dependents receive, especially in private (paid)

81

care. In high socioeconomic level neighbourhoods, dependents are more likely to use private services, even after controlling for household income and other individual and household characteristics. Dependent women show a higher probability of using paid services. Both the number of people living in the household and income are the main factors associated with family care. The higher the household size and/or household income, the higher the probability of receiving family care. On the contrary, the lower the household size and/or income level, the higher the probability of using public care services. Understanding the factors that determine the use of public care services, private care services or family caregiving is increasingly relevant due to the increase in the number of dependent older people.

Dealing With Ageing Challenges: housing conditions and residential mobility of Italian older adults

Giovanna De Santis[1], Tiziana Nazio[2,3], Micol Bronzini[1,4]

1Università Politecnica delle Marche, Italy; 2Università del Piemonte Orientale, Italy; 3Università degli Studi di Torino, Italy; 4Università degli Studi di Firenze, Italy

Housing provision and adequacy pose unique challenges along the ageing process, especially when ageing in place becomes a policy goal. Individuals are differently equipped to deal with challenges regarding housing quality and the capacity to adjust to their changing needs in later life. Drawing on housing inequalities literature, we analyse the living conditions and housing adjustments in later life using data from the first retrospective wave of ITA.LI survey, a representative household panel of the Italian population. First, we describe the housing conditions of older adults (60+) living in private households, focusing on the characteristics of their spatial context (dwelling, location) and their family configuration (their household members). Then, we examine residential mobility patterns in later life and their association with individuals' characteristics. Results show that factors such as living in non-owned housing and residing in rural areas are associated with a higher likelihood of relocation, along with partnership dissolution and retirement. Additionally, higher educational attainment is associated with a greater probability of relocating. We discuss these results in light of the capacity to adjust one's own housing conditions to changing needs along with the ageing process.

You Could Use a Cup of Coffee! Recipients in the Home Care Sector in French-speaking Belgium

Nathalie Burnay[1,2], Amélie Pierre[1]

1University of Namur, Belgium; 2UCLouvain

For some years now, Belgium has been developing policies to keep elderly people at home. The authorities have made efforts to support the home care sector in a strong welfare state tradition. Public or semi-public structures (subsidised by the region) have been able to develop around a very broad and open concept of home care. People in need can use this sector, with the costs being covered partly by the beneficiaries themselves (depending on their means), but mainly by the public authorities.

From a theoretical perspective resulting from critical gerontology, the aim of our contribution is to understand the itineraries and experiences of home care recipients. As a first step, it aims to show to which extent the pathways of dependency that require recourse to assistance are crossed by gendered logics. In a second phase, a typology of the experiences of the assistance relationship will be developed to complete the analysis by crossing the dimensions of gender and social class. Sharing a cup of coffee with home care professionals is not neutral and can be interpreted from an intersectional perspective.

This contribution is based on a double quantitative (a survey of recipients with over 2600 responses) and qualitative survey of recipients of home care in French-speaking Belgium (20 in-depth interviews with recipients).

RN01 | T05_03: Work, Retirement and Ageing 3

Stuck Between Unemployment and Retirement: Negotiations of Age and Duty to Work in Early Exit Decisions

Katri Keskinen

Tampere University, Finland

Alongside extending working lives agenda, there is a growing need to better understand why and how a number of workers choose to exit the labour market early. Grounded in discursive gerontology, this presentation delves into the underlying norms and patterns that guide retirement behaviour near retirement age and inform us the right time to do things. Using qualitative longitudinal interview data from recently dismissed workers near-retirement age in Finland, this study explores how individuals choosing early exit position themselves between unemployment and retirement by drawing on age specific discourses. Findings show that being under the old-age pensions age, individuals feel morally accountable to explain their exit behaviour against the extending working lives agenda and duty to work. Although individuals were eligible for early exit, they did not see themselves as retired, but stuck in a limbo between unemployment and retirement, where exit was seen as the least problematic option for their age. Retirement then, could only be achieved by reaching the retirement age, and early exit was merely seen as a waiting room for the time being. This shows that age and age specific discourses play great roles in retirement decisions and exit negotiations. In addition, the results indicate that extending working lives agenda has succeeded in its efforts to create moral accountability for individuals unwilling or unable to continue working longer.

Changes in Social Fabric upon Retirement Transition

Minna Riikka Tuominen[1], Hans Hämäläinen[1,2], Antti Tanskanen[1,2], Markus Jokela[3], Mirkka Danielsbacka[1,2]

1University of Turku, Finland; 2The Population Research Institute; 3University of Helsinki, Finland

In the workplace, individuals forge connections that often develop into enduring bonds. While previous research notes the impact of retirement on social life, ambiguity persists regarding the nature and direction of these changes.

Our study investigates retirement's impact on close social networks and social participation in organized group activities. We explore interactions between retirement and gender, partnership status, or region of residence. Additionally, we examine how reasons for retirement may elucidate changes in social interaction.

The research used fixed-effects estimates based on data from the fourth and sixth survey rounds of the SHARE-dataset. In the initial time point, our analytical dataset comprised, depending on the outcome variable between 6,118-12,922 respondents from 14 European countries.

Our results reveal subtle changes in both close social networks and social participation, relating to size, composition, and frequency of contact. The most consistent change, evident across sub-groups, is a decline in the presence of colleagues in close social networks. Conversely, great stability is observed in the proportion of relatives and friends, as well as satisfaction levels with the close network, highlighting the resilience of these relationships amid life transitions. Additionally, most sub-groups displayed heightened social participation when retired. However, men and individuals living in Southern and Eastern Europe exclusively exhibited a loss in relationships without compensatory developments. In contrast, partnered individuals experienced growth in both close networks and social participation.

Our research enhances comprehension of dynamics altered by retirement transition.

The Role Of Health In Retirement Planning Towards Extended Working Lives

Rachel Louise Crossdale, Nehle Magdalene Penning

The University of Sheffield, United Kingdom

Decades of research have shown that health is a key determinant of labour force participation in later life. As the ageing global population necessitates extended working lives (EWLs) for broader economic sustainability, the importance of the older population for the labour market is emphasised. Understanding the role of health and health inequality across the life course is crucial for impactful policy development to protect the health of the older workforce and encourage participation in EWLs.

Using 100 interviews on risks and turning points in working life with older workers in Germany, Poland, Sweden, and the UK, this research explores the role of health as a barrier and facilitator of EWLs across the working life course. Drawing on policy and literature to contextualise our findings, this research reveals the role of health in retirement planning, including assumptions about health decline, impact on work, and the importance of partner's health. Health as a 'push and pull' factor is also explored, with good health both fostering labour market engagement and encouraging early retirement, while physical and mental health can be both positively and negatively impacted by work. Inequalities by sector of employment, gender, and education level are also explored, with all four countries facing a 'double bind' whereby the most vulnerable must work longer for financial security but are limited by poor health.

For future older populations to be healthier and more productive the current treatment-based European model of health care needs to be challenged with preventative policy interventions throughout the life course.

83

Regulating Ageing: Ageing Workforce Management through Collective Bargaining in Italy and the Netherlands

Luigi Burroni, Giulia Cavallini, Dario Raspanti, Annalisa Tonarelli

University of Florence, Italy

Workforce ageing is one of the most critical challenges in contemporary economies. The work experience of workers over 50 has specific characteristics that may make the work less sustainable from different points of view. Our analysis focuses on the role of sectoral collective bargaining in supporting age management, i.e., human resource management policies with age-related issues as their primary concern. Our analysis focuses on the role of sectoral collective bargaining in supporting age management. We adopt a comparative research design by focusing on two Western European countries. We conducted a content analysis of Italy and the Netherlands' most representative sectoral collective agreements. We code all the voluntaristic provisions regulating specific dimensions of employee relations. The codes were grouped as representing an example of age management policy or targeting women, young, foreign, or fragile employees to weigh social partners' awareness of age management compared to other groups. We then conduct a netnography on social partners' communication on the most common social media (Facebook) to examine the prevailing meanings attached to older workers' and social partners' approaches to deal with the process of workforce ageing. We find that Dutch collective agreements specifically target older workers with several dedicated provisions, while Italian collective agreements neglect age management apart from a few exceptions focusing on early retirement. We assume that Italian unions perceive older workers as soon-to-be-retired. Unions focus on retirement-related services instead of collective representation on 'proactive measures' due to membership strategies. Indeed, pensioners unions have a pivotal role in Italian unionism compared with the Netherlands since retirees account for half of confederal union members.

RN01 | T06_01: Communities, Ageing and Ageing Communities

Ageing and activism: Co-creating spatial justice in Naturally Occurring Retirement Communities in Manchester, UK.

Niamh Katie Kavanagh[1], Mark Hammond[2]

1University of Manchester, United Kingdom; 2Manchester School of Architecture, United Kingdom

Unjust geographies and power structures shape the ageing experience of many older communities in cities (Buffel et al., 2024). This paper explores how local activism led by older people can provide opportunities to affect positive change in response to inequalities in rapidly changing urban environments. In the context of inner-city Manchester (UK) that is affected by deprivation and gentrification, we focus on initiatives of older activist tenants that live in a high-rise social housing tower and their collective efforts to co-create a Naturally Occurring Retirement Community (NORC) as a response to the challenges of ageing experienced in the block and neighbourhood. Originating in North America, NORCs are an alternative model to specialist housing for older people living in cities, where integrated services of support are clustered around the existing accommodation older people live, facilitating ageing in place. However, little is known about how NORCs can be developed in diverse, international contexts, or the ability of NORCs to address issues of spatial injustice or marginalisation. From insight gained through a co-production methodology, we explore how precarity creates multiple barriers to co-developing the NORC in marginalised communities, but also how activism provides opportunities for older tenants to generate resources and a sense of belonging. We argue that the NORC model's focus on place-based initiatives that prioritises older tenants' voices is an appropriate mechanism for more activist approaches supporting ageing in place, grounded in the view that tenants have the right to determine what ageing well means for themselves and their community.

The Self-managed Collaborative Housing (Cohousing): Singularities, Limitations, And Demands In The Spanish Case

Noelia Teijeiro Cal

Universidad de A coruña, Spain

The objective of this communication is to analyse the expansion of collaborative housing for the elderly in Spain as a new space for the provision of care. This modality of

84

coexistence has re-emerged in Europe in the 21st century as an alternative for those elderly people who do not want to face their old age stage and the possible care that entails, neither institutionally nor isolated in their homes under single-family supervision, or through the acquisition in the market of a paid worker.

Through a qualitative methodology, based on an ethnographic work of case studies and in which the active participation of the people interviewed in the course of the investigation has been promoted (under the so-called paradigm of co-creation), this study analyses comparative ways several collaborative coexistence initiatives in different territories of Spain, thus giving strength to the spatial context in which they develop, as an explanatory dimension of their emergence. In this sense, the values that have set them in motion, their operation, relations with the surrounding public and private powers, and the possibilities of becoming public provision providers are studied. The theoretical approach is built through the feminist framework of care in the community and the common to find out the transformative potential of these initiatives in the field of democratisation of care.

Ensuring Age-friendly Communities: An Explorative Research Study On Kiyota's Ibasho Concept

Sarah Speck, Samira Hüsler, Rhea Braunwalder

University of Applied Sciences of Eastern Switzerland (OST)

The current demographic transition to aged societies affects most of the world's societies and brings a range of challenges. Several aspects of life such as housing, financial situation or health-related issues urgently need to be addressed, rediscussed and reshaped. So, how can we ensure age-friendly communities? The Ibasho concept of Kiyota*, based on co-creation approaches, develops and creates (caring) communities directly with older adults that socially integrate and value older people. It refers to a place where one feels accepted and valued and feels a sense of belonging. Ibasho is implemented successfully in Japan, Nepal, and the Philippines. However, such concepts hardly have been researched and verified to date.

This applied research study aims to fill this gap by qualitatively exploring already implemented Ibasho. Extracting from empirical findings, the aim is to bring Ibasho to Switzerland and implement the concept in collaboration with a local project partner, involving older adults. Among others, we want to investigate how the concept works and what needs to be considered and culturally adapted when implementing it.

This paper is a reflexive review of Kiyota's Ibasho approach compared to (emerging) caring community approaches tailored to the specific group of older adults. It sets the outline for upcoming field research to explore in-depth the impacts of Ibasho on older people's well-being and their lives, and the use for creating age-friendly communities. We assume that participation of older adults in Ibasho will improve their daily life, their mental health and helps to strengthen social relations.

Theorizing Loneliness in Later Life – a Micro, Meso and Macro Perspective

Fredrica Nyqvist[1], Laura Coll Planas[2], Joanna McHugh Power[3]

1Faculty of Education and Welfare Studies, Åbo Akademi University, Vaasa, Finland; 2Research group on Methodology, Methods, Models and Outcomes of Health and Social Sciences (M3O), University of Vic-Central University of Catalonia (UVic-UCC), Vic, Spain; 3Department of Psychology, Maynooth University, Kildare, Republic of Ireland

The aim of this theoretical paper is to chart theories of loneliness relevant for older adults through micro, meso, and macro-level perspectives and discuss to what extent they are complementary. Loneliness has been addressed across various disciplines, including psychology, public health, and social policy, all of which are explored in this paper. On the micro-level, intraindividual factors such as biological, developmental, cognitive, personality factors, and existence contribute to the understanding of loneliness among older adults. For instance, attachment theory purports to account for later-life loneliness. Moving to the meso-level, interpersonal networks and relationships play a crucial role in shaping the experiences of loneliness in later life. For example, the Convoy model and the Theory of Socioemotional Selectivity provide frameworks for examining the dynamics of social connections, emphasizing the impact of close relationships, social support and the reciprocity of interactions on loneliness outcomes for older adults. At the macro or societal level, structural and cultural factors come into focus. Welfare institutional arrangement, culturally-determined relationship expectations, socioeconomic disparities, and ageist attitudes within communities contribute to loneliness among older adults. Understanding the influences on loneliness from the micro-level to broader contextual factors is essential for developing comprehensive intervention strategies and informing policies. By synthesizing micro, meso, and macro perspectives, this theoretical study offers a holistic understanding of loneliness in older adults. Recognizing the interconnectedness of individual, interpersonal, and societal factors provides an urgently needed foundation to address the complex nature of loneliness in later life.

Unveiling Queer Aging Realities: Preliminary Findings from "Imagining Queer Aging Futures"

Joanna Mizielińska[1], Agata Stasińska[2], Linn Sandberg[3], Rebeca Põldsam[4]

1Collegium Civitas, Poland; 2Collegium Civitas, Poland; 3Sodertorn University; 4University of Tartu

The international project, "Imagining Queer Aging Futures," (PI: Linn Sandberg, Co-Is: Joanna Mizielińska, Agata Stasińska, Rebecca Põldsam) delves into the nuanced experiences of LGBTQ+ individuals aged 50+ in Poland, Estonia, and Sweden. The Baltic Sea region, facing one of Europe's swiftest ageing populations, represents a vital yet underexplored terrain for ageing research. Within this demographic landscape, the experiences of sexual and gender minorities, grappling with persistent discrimination and stigma, remain conspicuously overlooked. Previous studies, predominantly situated in Anglo-American contexts, underscore the vulnerabilities confronting ageing LGBTQ+ individuals. However, these vulnerabilities are intricately linked to the unique sociocultural contexts of the region, marked by variations in eldercare provisions, civil rights, and attitudes towards minorities.

This project aims to bridge the gap in knowledge by focusing on the ageing trajectories of LGBTQ+ individuals aged 50 and older in Poland, Estonia, and Sweden. Participants are encouraged to articulate their visions of liveable later lives by employing a qualitative mixed-methods approach—encompassing focus groups, individual interviews, and innovative visualisation methods. The study seeks to unravel the everyday practices and adaptive strategies LGBTQ seniors employ as they navigate ageing.

Drawing upon our preliminary findings, this presentation offers early insights gleaned from workshops and interviews with LGBTQ+ 50+ informants in Poland. Our discussion extends to methodological intricacies and recruitment challenges encountered in diverse Baltic Sea localities where the study is conducted. Inspired by queer and ageing methodologies, alongside the principles of public sociology, our study aims to contribute valuable perspectives on the needs and aspirations of ageing LGBTQ individuals in the Baltic Sea region, thereby informing strategies to enhance their wellbeing.

Dealing with Diversity: Views of Native-Dutch Urban-dwelling Older Adults on Neighborhood Characteristics for Well-being

Max Bloem, Jane Murray Cramm, Anna Petra Nieboer

Erasmus University Rotterdam, Erasmus School of Health Policy and Management, Netherlands, The

As many cities in Western countries undergo profound demographic transformations, the impact of superdiversity on the well-being of native populations, particularly older adults, remains underexplored. This study employs Q-methodology to unveil three distinct viewpoints among native-Dutch urban-dwelling older adults (>65 years) regarding neighborhood characteristics crucial for well-being. Analyzing responses from 28 participants revealed diverse perspectives represented by the viewpoints "well-equipped and connected," "afraid and frail," and "green and clean." Notably, the findings underscore the heterogeneity of older adults' viewpoints and emphasize the pervasive influence of neighborhood ethnic diversity. While participants did not overtly express a preference for homogeneity, discussions frequently centered on immigrants, linking their presence to various issues and highlighting cultural differences. The preservation of Dutch identity in the neighborhood emerged as a recurring concern. These findings stress the necessity for policymakers and scientists to recognize the diversity within this aging population, especially as aging in place gains prominence. The study underscores the nuanced relationship between neighborhood ethnic composition and well-being, urging a comprehensive consideration of ethnic diversity in future research, local policymaking, and urban planning.

RN01 | T06_03: Family and Ageing

Understanding Unmet Care Needs in Dyads: Spousal Characteristics, Gender, and Unmet Care Needs among Older Adults in England

Jingwen Zhang[1], Matt Bennett[2], Yanan Zhang[3]

1University of Sheffield, United Kingdom; 2University of Birmingham, United Kingdom; 3University of Oxford, United Kingdom

With the rapid population ageing and declining state-funded formal care, understanding the extent and causes of unmet needs for social care across different groups of older people becomes critical to both policy and practice in England. Although spouses are often heavily involved in care arrangements for people in need, most studies have focused on individual-level determinants of unmet care needs and few studies examine unmet care needs considering the interpersonal context. This study adopts a dyadic perspective, investigating how the risk of experiencing subjective and objective unmet care needs relates to spouses' socioeconomic characteristics, health, and caregiving behaviours; and gender differences in these relationships. Drawing on data from the English Longitudinal Study of Ageing, we matched older people with information on their care needs and spouses using random effect modelling to account for the longitudinal nature of the data. The results show that older people whose spouses had more ADL difficulties or chronic conditions were more likely to experience objective and subjective unmet needs. The association between spouses' employment status and objective unmet care needs was gendered, with wives' engagement in paid work significantly associated with their husbands' higher risk of experiencing unmet needs. In caregiving couples, female care recipients had a greater risk of objective unmet needs when their spousal caregivers did not receive assistance. However, the relationship is reversed for male care recipients. The findings provide important insights into how European social care systems can be transformed to ensure the equitable distribution of care resources.

The Ageing of Divorce: Exploring the Causes and Consequences of Late Divorce

Marcos A Bote, Aurora Gómez Garrido

University of Murcia, Spain

During the decades following the implementation of the Divorce Law in 1981, statistics recorded a significant increase in the total number of divorces in Spain, and since 2006, this increase has stagnated. However, available data show that the number of divorces in people over 60 years of age is increasing at the same time as the number of divorces in younger population groups (under 50 years of age) is decreasing.The general objective of this thesis is to study the phenomenon of divorce in the Spanish population over 60 years of age, analysing its characteristics, causes and consequences. To achieve this, a mixed methodology is being used, combining different qualitative and quantitative methods. On the one hand, a quantitative methodology is being used based on a statistical analysis of various secondary sources containing data on divorce in the national and international contexts. In addition, an analysis of primary data obtained from a survey designed to ascertain the perception of the target population on variables of interest to the study will be carried out, which will facilitate the analysis of the social perception of the Spanish population towards divorce from the age of 60 onwards.

Preliminary results of the study show the multidimensionality of the phenomenon of divorce in general, but with some particular features in the older population and with large gender differences. Specifically, higher educational level, economic resources, and unstable marital biography increase the probability of divorce in older people.

Widows: How Can We Learn From Their Experience And What Can We Learn About It?

Ana Rita Brás

Faculdade de Economia/ Centro de Estudos Sociais da Universidade de Coimbra, Portugal

This communication relates to the findings of a PhD research on female widowhood within the Portuguese context, where demographic and cultural factors make widowhood predominantly female, particularly in advanced age groups. As female widowhood is a complex phenomenon full of specificities regarding several dimensions of life, its analysis must be grounded on knowledge relating to social structures but also on the link between widowhood and other experiences – such as ageing – that both shape and are shaped by widowhood. It is a subjective experience that must be analysed in the light of other individual categories, as well as a process that is shaped by social and historical factors that interfere with the way it is personally experienced.

The weight of widowhood among the 65-plus population led to the conduction of interviews with widows from this age group, allowing us to explore the specificities of the older population in relation to female widowhood. To understand the experience of these women it is necessary to understand the positions they hold and the roles they play in society, as well as in the private, family and conjugal spheres – before and after ageing and the death of their partner.

Based on these widows' narratives, it is possible to say that the reality of older women is diverse and complex and that there is a clear need for an in-depth study about their place in society, framed by the country's social structures and linked to the social roles attributed to them.

Intergenerational Relations in Migrant and Non-migrant Families with Parents Aged 50 and Above – an International Comparison of Frequency of Contact

Claudia Vogel, Aviad Tur-Sinai, Harald Künemund

Neubrandenburg University of Applied Sciences, Germany

Frequency of contact is at the heart of intergenerational relations within families, this holds for all families independent of migration status. We investigate the frequency of contact with parents as well as with adult children of adults aged 50 and above among the migrant and non-migrant families throughout Europe, analysing data from wave 7, wave 8 and the COVID-19 wave of the Survey of Health, Ageing and Retirement in Europe (SHARE). In addition, we compare frequency of contact with parents and children during the COVID-19 pandemic with patterns observed before, assuming a decrease in frequencies of contact and an even stronger decrease among the migrant population.

While the frequency of contact is very high among parents with a majority reporting daily contact with adult children and also high among children aged 50 and above with a majority reporting contact with parents at least several times a week, results reveal that migrants aged 50 and above have slightly less frequent contact with their parents and more frequent contact with their children than the non-migrant population in Europe. As the groups did not change the frequency of contact behaviour during the pandemic, differences between the migrant and the non-migrant populations remained stable over time, a result of an increase in usage of video calls, messenger apps and the like. COVID-19 has challenged intergenerational relations, this holds for migrant and non-migrant families alike, but did not stop familial generations to communicate with adjusted means to keep contact.

RN01 | T07_01: Migration and Ageing

The Effect of Transnational Ageing and Volunteering on Social Trust

Ferhan Saniye Palaz

Istanbul University – Cerrahpasa, Turkiye

Social trust is an element of social capital embedded within relations with strangers, reflecting the expectation of another's trustworthiness based on personal experience. Volunteering is often believed to build trust among fellow members of society by nurturing what Putnam calls bridging social capital.

This study aims to examine potential predictors of social trust, in terms of migration background (natives, the first and second-generation migrants), discrimination experience (age, nationality, ethnicity, race or colour), sociodemographic factors, and volunteering among 50+ population in addition to four country categories based on Active Ageing Index (AAI) 2018 scores. Data of 11 European countries with similar migration histories (n = 15045) from the European Social Survey wave 10 is used.

According to the final model of the hierarchical linear regression results (Durbin Watson= 1.976, VIF<10, adjusted R square = .142), the beta coefficients are high for, higher level of education, good health, and difficulty in perceived income. Among all variables considered, volunteering emerges as an important factor associated with social trust, even after controlling for other predictors.

Overall, our results suggest that residing in a European country that values active ageing, having higher socioeconomic resources and better health, and not experiencing discrimination by nationality or age positively effect social trust. Among the individuals in 50+ population, volunteering and age also demonstrate a positive effect. Based on our analysis, there is no significant effect of migration background and citizenship.

Civic engagement in later life is crucial for social inclusion. Further studies with a broader range of activities (e.g. active membership in associations) and categorising migrants by origin country can significantly contribute to our understanding.

The Quest For Security – Multiple Motivations For International Retirement Migration To Hungary

Ágnes Erőss[1], Dóra Gábriel[2], Monika Mária Váradi[2], Julianna Kohut-Ferki[1]

1HUN-REN CSFK Geographical Institute; 2HUN-REN Centre for Economic and Regional Studies

The paper is based on 40 semi-structured interviews conducted in multiple locations in peripheral municipalities in

88

Hungary between March 2022 and November 2023 with older adults who migrated to Hungary, either from Western Europe or from Ukraine. The research employs the theoretical framework of international retirement migration while broadening the geographical scope of related research. Our contribution explores the multiple motivations and compares the strategies of older migrants from the East and West. The research delivers new data on a topic that has been overlooked in post-socialist countries such as Hungary and explores the peculiarities of the narratives of older adult migrants. Our data draws on the understanding of geographical arbitrage described by Haynes (2014) as „enable individuals to take advantage of historical structures of global inequality in order to offset the loss of financial security or to enhance material lifestyles in retirement." (Hayes, Matthew, 2014, p. 14). Based on the interviews, we could identify similar – mainly economic – motivations for migration. Our paper demonstrates how structural constraints and uneven development determine and reproduce existing hierarchies within the region in the case of older adult migration. Noteworthy is that that sense of security (with altering meaning) appeared as a narrative strategy in both groups, partly to conceal the economic reasons. Western European older migrants list ideological reasons for moving to Hungary, which they describe as secure and traditional. Migrants from Ukraine – overwhelmingly ethnic Hungarians – additionally point out their sense of belonging to the motherland.

The Role of Family in the Decision-Making of Elderly Japanese Women to Stay in Germany

Hikari Beck, Dženeta Karabegović

Paris Lodron University of Salzburg, Austria

Germany is currently a home to about 2.7 million migrants of various ethnic groups and the proportion of elderly population with a migrant background is projected to increase sharply in the future years. Three categories of migration—labor migrants, retirement migrants, and return of labor migrants—are documented by previous research on elderly migrants in Europe. Less research exists on elderly migrants with German partners and their decision-making processes regarding life after retirement. This qualitative study delves into the decision-making processes of elderly female Japanese migrants in Germany, the largest destination country for Japanese migrants in the EU. The number of Japanese women living abroad has steadily increased over the last two decades, bringing them a new challenge: how best to age. How do they determine where to spend their final years? What kinds of influences play a role? The study is based on eight semi-structured interviews and one expert interview with a Japanese support organization for elderly migrants in Germany. Thematic analysis was conducted to discern common patterns and uncover new insights in the data. The findings highlight that a good relationship with a German partner and family plays a significant role for female Japanese migrants to decide to stay in Germany. This is reinforced when they are embedded in their local German communities. The analysis also emphasizes the

role of language (communication competence) as another important element in the decision to (not) relocate. Ultimately, the research contributes to scholarly inquiry about migrants agency with a focus on retired migrants.

Experiences of Mobility Among Retirees Leaving Italy: Between New Cultural Models and Forms of Precariousness

Alice Lomonaco, Marco Alberio

University of Bologna, Italy

This paper aims to discuss the construction of new identities and cultural scripts linked to the ageing process. In a context where mobility and ageing have often been seen as opposites, what we see today with demographic and cultural transformations are other scenarios, including Italian seniors undergoing migration processes, as other european cases as the one of north europe (Sardinha et al., 2015, King et al., 2021, Gehring, 2019). Therefore, this study aims to discuss the migration preferences and motivations of Italian pensioners, their migration paths and the repercussions these processes have on integration and the perception of age discrimination. In addition, this work sought to understand how migration experiences redefine or help shape new meanings of ageing, those experienced outside the country of origin. The methodology chosen for this work was qualitative, through direct observation and semi-structured interviews with pensioners who had migrated to other countries (EU and non-EU). Some preliminary results will be presented from interviews (40) conducted in Portugal and Tunisia, which show how the migration process of Italian retirees challenges social definitions of age and life stages in different contexts. Furthermore, some preliminary results show that many interviewees report an improvement in their social conditions and lifestyles (especially those associated with physical activities and a good diet) that can be linked to the idea of active ageing.

RN01 | T07_02: Norms, Values and Images in Ageing

Ageing Bodies in the Culture of Cosmetic Surgeries: The Margins of Research Regarding Old Age and the Medicalisation of Beauty in Poland

Mariola Marta Bieńko/Greczyn

University of Warsaw/Institute of Applied Social Sciences, Poland

As societies age, the perception of the ageing body as the 'rejected body' – and of old bodies as 'problem bodies' – intensifies. The presentation focuses on the concept of the biosocial ageing body, analysing the ways in which older men and women construct themselves through cosmetic surgery and non-surgical procedures adhering to imposed beauty norms. The presentation is an attempt at reflection on older adults' beauty practices as a form of oppression, i.e. the disciplining of "vulnerable old bodies", and a dimension of choice, i.e. – a reflexive way for older men and women to manage their ageing.

The important part of this presentation involves the results of two research projects: 1) individual semi-structured interviews with 84 women and 74 men between the ages of 50 and 89 from Polish cities and the rural communities, 2) an exploratory qualitative study based on individual in-depth interviews with three plastic surgeons. The first study investigates how gender and age are manifested in perceptions of the role of one's own body and the degree of satisfaction with one's own physicality. The statements from plastic surgeons broaden the knowledge on the older individuals' attitudes to, and experiences of, aesthetic anti-ageing surgeries and technologies as well as the relationship between these practices and their well-being. The results of the studies suggest that it is possible to theorise about cosmetic surgery without constructing older men and women who engage in its discourses and practices as 'cultural dupes'. They can also engage in beauty practices as aesthetic entrepreneurs

Ageing Bodies In The Urban Space

Magda Bolzoni[1], Valeria Cappellato[2], Eugenia Mercuri[3]

1Politecnico di Torino, Italy; 2Università di Torino, Italy; 3Università del Piemonte Orientale, Italy

Discourses on active and successful ageing are based on neo-liberal economic ideology and, in focusing on individual responsibility for one's state of well-being, blame those who are unwilling or unable to conform to the ideal model of the active elderly person with an able body (Rubinstein and de Medeiros 2015; Stephens 2017).

Efforts to separate the ageing body from 'youthfulness' can also be read from a spatial perspective that distinguishes public and accessible space for active older people with a performing body, from a private – and institutionalised – one in which declining bodies are confined, whether these spaces are people's homes or residential facilities.

Elaborating on a qualitative research carried out with 17 individuals aged 65 or over and 18 key informants working in services for the ageing population in a Northern Italian metropolitan city, the contribution aims at reflecting on the relationship of older adults with their space of living, looking especially at the interrelations between the transformations of the urban space – at the neighborhood, block and house level – and the sense of belonging related to the concept of 'ageing in place'. The analysis shows that the city struggles to include ageing bodies, especially if the ageing process is not 'active' or 'successful', which can bring to a progressive social and spatial exclusion of older adults, up to the institutionalisation or the confinement in the private space of unfit bodies. Furthermore, it sheds light on the strategies that older adults put into play to make sense of such transformations in their daily routines.

Understanding and Centering 'Old Age' Normative Markers in Baltic States

Apolonijus Žilys

Vytautas Magnus university, Lithuania

90

The research field of life course predominantly focus on the demographic life events which are more related to transition from adolescence to adulthood, as it is significant point in time when individuals start or able to start their self-independent life. An in-depth understanding of life events of younger age is important as it provides with the understanding about wide range of macro societal and demographic changes in late modernity societies. However, the 'old age' is usually left as the last marker of post-adulthood sequence in life course trajectory.. The presentation aims to look what is the situation regarding the ageing visions in contemporary Estonia, Latvia, and Lithuania by showcasing the most prominent/dominant images of life events in each country.

European social survey round 9 data of module "Timing of Life" provides us a comparative possibilities to look at the different ageing visions based on various definitions of ageing across Baltic states by basing on the concepts and insights of F. Billari, G. Hagestad, A. Liefbroer, and others. The presentation aims to reveal how Estonians, Latvians and Lithuanians tend to distance 'old age' stage to the person who would be considered as entered the age of 'adulthood' and reached the 'middle age'; how wide is the differentiation between the definition of 'old age' marker and ideal age of retirement and the other normative deadlines to perform certain roles (i.e., to live with parents, become parent, have a job, etc.). Lastly, we would consider if these demarcations are related to certain value orientations by looking at S. Schwartz Human scale as covariates.

Perceptions of Elder Mistreatment: A Mapping Review of Existing Academic Research

Regina Gerlich

University of Stuttgart, Germany

"Elder mistreatment" (EM) encompasses problematic, transgressive behaviour towards older people. This includes physical, psychological, financial, and sexual abuse, and neglect. Since the mid-1980s, this topic has also been researched in the context of lay perception. What is meant by EM? How congruent are the definitions of the population (and subpopulations) with those of science and politics? These and similar questions are addressed in the 65 articles compiled for this mapping review. However, the mapping review is less concerned with answering these substantive questions than with providing an overview of the research context and attempting to answer the following questions:

In which countries is this topic primarily researched? Which (sub)populations have been researched using which methods in order to record their perception of EM? Which types of EM have been at the centre of this research? In which years does this research occur? Are there any other peculiarities in these publications? Are there "trend topics" in certain years or countries?

This rather explorative approach serves as a kind of preliminary work to present the knowledge and gaps on the topic of perception of EM, so that my doctoral thesis can be conclusively linked to it. Therefore, there is no theoretical framework for this part.

A mapping review includes a systematic literature search with defined search terms and clear inclusion and exclusion criteria. This resulted in a corpus of 65 scientific articles published in the period from 1991 to 2022, to which the application of exploratory mapping refers. The results are presented descriptively.

So far there are no overview articles on this topic, so this will be my contribution.

RN01 | T07_03: Discourses of Ageing

Foucault Care Of The Self And The Status Of Old Age

Christopher John Gilleard

University College London, United Kingdom

This paper draws attention to Foucault's 1981/82 lecture series on The Hermeneutics of the Self . These contain the only direct reference Foucault ever made to the topic of old age. In them, he observes how, in the first and second centuries of the Common Era, Greco-Roman philosophy shifted its emphasis from 'knowing thyself' to 'becoming one's self'. While these writers saw the practice of the arts of living as desirable at every stage of life, they considered them most effectively cultivated in later life, when the individual is least constrained by the subjectifications imposed by the world. Their focus upon the 'arts of living' was later replaced by what Foucault considered a 'rules of living' approach, evident in the early Christian church teachings, and later by the institutions of the state. Foucault's endorsement of the art of living in later life can in turn be contrasted with other modern thinkers who have perpetuated such 'rules of living' approaches. Set against Foucault's support for an aesthetics of lifestyle, writers working largely within an ageing studies/gerontology framework have advocated what might be called a public health endorsed agenda to age actively or successfully or have prescribed other morally desirable pathways for older people to develop integrity, self-realisation and/or bodily transcendence. Foucault's advocacy of an art of living in later life has been neglected by those using his work to emphasise the governance, rather than the freedoms of old age. Drawing attention to these overlooked lectures may help re-balance this view

Ageism and Age Logics in Social Policy and Social Work

Tove Harnett, Håkan Jönson

Lund University, Sweden

Age serves as a prevalent criterion in social policy, social work, and various human services. The inherent disparities associated with age often obscure the identification and interrogation of ageism. Conversely, some scholars posit that ageism, as a label for age-related differences, has become excessively encompassing. Moreover, instances exist where vulnerable individuals derive benefits from arrangements that may be characterized as ageist. This presentation endeavors to introduce the concept of age logics, an alternative and complementary framework. Age logics denote culturally embedded age-related reasoning employed to elucidate or rationalize specific societal arrangements.

To scrutinize the use of age logics in social work, this study draws upon data derived from investigations into 'wet' care facilities catering to older individuals grappling with

91

substance dependence and complex needs. The analysis discerns four distinct age logics associating chronological age with its connotations: (a) A logic of changeability, positing that individuals with an extensive history of substance misuse in their later years are uanble to change. (b) A logic of lifestyle, demarcating the active nature of the young from the sedentary disposition ascribed to the old within an institution for those over 50. (c) A logic of function, characterizing residents as prematurely aging, their bodies deemed worn out and thus necessitating elderly care. (d) A logic of administrative fit, where the alignment between a resident's chronological age and existing age limits justifies their placement. In the presentation we will discuss the potential use of age logics in research and practice.

Digital Inclusion and Ageism in Narratives of Age and Technology

Cora van Leeuwen[1,2]

1imec-SMIT, Vrije Universiteit Brussels, Belgium;
2University of the Western Cape, South Africa

Accessing government services, shopping, maintaining social connections, most of these activities have transitioned partially or completely to a digital format. This has influenced a transformation of the life world of older adults, in which the ability to work with digital technology has become essential for full and complete participation in society. The influence of digital technology use on the construction of the ageing identity has received relatively little attention, especially when it is viewed from the perspective of the digital included older adult. Therefore, it is necessary to investigate how older adults use their digital technology to make sense of their ageing process.

A thematic analysis of 37 semi-structured interviews with Belgian older users found that they use digital inclusion tropes as a narrative device in their construction of their ageing experience. It shows that digital technology skills can be used to construct and transform their understanding of their life world. The sense-making itself often involves positioning their place within a digital society in opposition to those without digital skills. This results in a unique new form of ageism aimed towards those not skilled in digital technology use. The implication here is that digital technology and older adults create a new social ageing world that is only accessible for those with the correct skills. The influence of digital technology on ageing and especially on the social world of ageing needs to be better understood to ensure that no one is left behind.

A Problem of Gendered Injustice? Objective and Subjective Poverty Among Older Women and Men Across European Welfare Regimes

Camilla Härtull, Mikael Nygård

Åbo Akademi University, Finland

Using European Social Survey data, we study the prevalence of objective and subjective poverty among older women and men (60+ years) in 21 European countries. Objective poverty refers to whether one's disposable income falls below the poverty line whereas subjective poverty relates to the capacity to make ends meet. We analyze gender differences in these two dimensions of poverty and the role of gender as an explanation to these phenomena while controlling for other individual-level variables as well as the role of welfare state regimes. We find that older women are more exposed to objective poverty than men, and that female gender remains strongly and positively correlated with this kind of poverty even when controlling for other variables. Other individual-level variables, such as partnership, paid work and education curbs objective poverty, while the type of welfare regime does not matter. As to subjective poverty, on the other hand, there is no significant association with female gender, nor with the type of welfare regime, while individual-level variables such as subjective health, partnership, and paid work are negatively correlated with this dimension of poverty. Subjective poverty is somewhat more influenced by contextual factors than objective poverty although the type of welfare state regime is not significantly associated with subjective or objective poverty. Gendered poverty among today's older populations in Europe requires public attention as it not only may affect the overall well-being of older women but also becomes increasingly important due to the expected predominance of females in the aging demographic.

Are People with Higher Pensions Happier Than Others? The Link Between Life Courses, Pension Entitlements, and Well-being in Germany

Christin Czaplicki, Thorsten Heien

German Federal Pension Insurance, Germany

Life course trajectories have become increasingly important for retirement and pensions as recent reforms have strengthened the link between lifetime employment and old-age provision, introduced measures to lengthen working lives and increased the role of private supplementary

pensions. At the same time, life courses are increasingly fragmented due to diversified and discontinuous employment, family dynamics and migration. These developments raise concerns about the adequacy of pensions as well as socioeconomic and gender inequalities in old-age income, not only for current but also for future retirees. The connection between income and life courses has been examined many times from a structural perspective. However, how socioeconomic situation is assessed from an individual perspective is rather unclear.

Against this, using survey and administrative data of the German study on "Life courses and old-age provision" (LeA) for people aged 40 to 59, we analyze the interplay of (non-)employment biographies, old-age provision, and subjective well-being for various domains (health, work, income, housing). To examine what raises or lowers satisfaction, we consider – in addition to comprehensive life course information (e.g., full-time/part-time work, domestic work, unemployment) – different aspects of old-age provision: 1) the type of statutory, occupational, and private pension scheme, 2) the mix of different schemes (e.g., statutory pension insurance, civil servants and farmers pensions), and 3) the accumulated amount of pension entitlements. Finally, we include indicators of the actual socio¬economic position and further socio¬demographic variables (e.g., age, sex, partnership, parenthood, health, housing, region) to control for other effects in our multivariate models.

The Health And Social Care Divide in Sweden's 1992 ÄDEL-reform

Anton Petersson

Lund University, Sweden

In many national contexts there has been talk of a divide between health and social care (Glasby, 2003; Kröger, 2011). This divide is particularly evident in institutionalised care for the elderly. This practice can sometimes fall under the category of health care, addressing the medical needs of the elderly, or in other cases be characterised as a social service. In some welfare systems, this fluidity can have profound effects on the financing and charging of these services.

In Sweden, legislation implemented in 1992 decided that all former long-term hospitals should be converted into homes for the elderly. Administrative responsibility for these services was transferred from the health service to the social services. Doctors could no longer be employed in these homes. On 1 January 1992, 44,990 nurses and nursing assistants changed employers overnight (Landstingsförbundet, 1993). They no longer provided medical care for the elderly in the country's long-term care hospitals. Instead, their professions became part of the social services and they suddenly found themselves working in specialised homes for the elderly. Through the magic of a parliamentary vote, the same grey concrete complexes that had once been long-term care hospitals were transformed into homes for the elderly.

My dissertation aims to describe and understand this reform and to place it in a broader sociological context. What happens to a welfare service when it is decided that it will change from medicine to social care? For the ESA conference, I will be submitting a draft paper that focuses on deconstructing the argumentation and constructed rationale for the reform.

Does Caregiving Add To Already Existing Disadvantages?

Marco Albertini, Francesca Zanasi

University of Bologna, Italy

In ageing societies, the increasing quota of older and frail individuals creates unprecedented needs for care. Governments face the economic challenge of long-term care (LTC) policies that support older people with limitations in everyday activities.

All over Europe, care responsibilities for older individuals fall on the shoulders of family members, particularly partners and children, usually wives and daughters and daughters-in-law. The care load can negatively affect various outcomes, mainly psychological and physical health. Nonetheless, the socio-economic characteristics of informal caregivers remain overlooked by research.

In the present study, we aim to uncover socio-economic differences (regarding education, income, and wealth) in the probability of providing informal caregiving to older parents (and parents-in-law) in Europe, using the Survey of Health, Aging and Retirement in Europe (SHARE, 2004-2020).

Preliminary results indicate that there is a positive gradient between women's/households' socio-economic status and providing support to parents(in-laws); educational level appears to be the dimension along which differences in care provision emerge the most. Such provision is at low-intensity levels, and it may be offered as a complement to formal services that high socio-economic status individuals can afford to purchase on the market. A lower commitment to older parents(in-law) can be experienced as less burdensome and be offered at the daughters' (in-laws) discretion. However, it emerges clearly that low-income groups compensate for lack of resources with co-residence with older parents, allegedly as a strategy to care for them.

Do Age Gaps Between Political Leaders and the Public Reduce Support for Democracy among the Young?

Scott Williamson, Luca Bellodi, Alonso Amarales

Oxford University, United Kingdom

Some recent research suggests that younger people may be less committed to democratic governance than older people. Why would the young support democracy less? In this paper, we propose that age differentials between political leaders and the general public may cultivate perceptions among younger generations that the political system is unresponsive to their preferences, leading to a perception of inefficacy in democratic representation. We test this argument in three ways. First, we use data from the World Values Survey to analyze whether younger people are particularly less likely to support democracy when the age gap between political leaders and the public is larger in their respective countries. Second, drawing on original survey data from Italy, South Korea, and the United States, we investigate whether dissatisfaction with democracy is more prevalent among younger individuals who perceive personal age-related disadvantages. Third, we use a survey experiment in the aforementioned three countries to assess whether priming the age gap with political leaders diminishes satisfaction with democracy among younger individuals. This research contributes to understanding popular support for democracy across age cohorts at a moment when popular politics is contributing to democratic backsliding in several countries.

Empowering the Future: Social Investment Strategies for Active Ageing in Lithuania

Violeta Vilkoityte

Lithuanian Centre for Social Sciences Institute of Sociology, Lithuania

The study is based on the understanding that the aging population has significant implications for the welfare states, many of them exceeded their capacity to meet welfare commitments. Social investment strategies could respond to a radically changed economic and social demographic order by providing individuals with the resources and skills they need to succeed in a rapidly changing world, it can help older people to stay active and avoid early retirement as well. Even though the social investment perspective has been discussed for the past decades, in current literature there is still a void of empirical evidence to explain how social investment affects older adults. Most empirical attempts to assess the impact of social investment focus on objective material socioeconomic conditions such as employment and poverty among working-age groups.

This study aims to examine the results of social investment for active aging. Within the social investment framework, there are three main policy functions of the modern welfare state; stock, flow, and buffer policies (Hemerijck 2015; 2017). The active aging model is based on the Health, Lifelong Learning, Participation, and Security pillars (Zaidi, 2015; Rojo-Perez et al., 2022).

To investigate the research question, Secondary quantitative data analysis was performed of the Survey of Health, Ageing and Retirement in Europe (SHARE) wave 8 (Lithuania N = 1437). In the analytical phase, quantitative Principal Component Analysis and Cluster Analysis (SPSS 26). The results reveal different active aging profiles (low activity; moderate activity; balanced activity; and high activity). The first two profiles are characterized by bad aging conditions such as bad health, a large share of social benefits in income, and insufficient social investment interventions. The last two profiles are described by better conditions and confirm the positive impact of the social investment.

Social investment strategies could play a crucial role in creating an environment that supports active aging by addressing various aspects of an older individual's life, including health, education, employment, and social inclusion. These strategies aim to maximize the potential of older individuals and enable them to lead fulfilling and active lives as they age.

94

Silver Awareness Sustainability: Towards the Construction of a Checklist for Sustainable Development in an Aging Society

Sara Nanetti, Piermarco Aroldi, Simone Carlo, Francesco Diodati

Catholic University of the Sacred Heart, Italy

The aging of the population poses significant social, economic, and ecological challenges that require the identification of factors capable of improving the well-being of the entire population from a perspective of generational, environmental, and consumption sustainability. The 2030 Agenda has established clear goals for Global Sustainable Development, considering generational differences.

Within the context of the Age-it project, which explores the consequences and challenges of aging, this contribution investigates key indicators supporting the awareness of the older population on sustainable development. The qualitative research, based on the consensus method using the Delphi tool, initially identified the main indicators found in literature, policy briefs, and national and international reports aimed at supporting the well-being and awareness of the older population in relation to sustainable social development.

Based on the collected data, the main areas of interest and indicators were formulated for the construction of a

checklist on Sustainable Development for the older population, termed "Silver awareness sustainability" (SAS). Both the areas and indicators were discussed by a group of 20 experts, including professionals, academics, healthcare professionals, representatives of political, associative, and volunteer groups. The objective was to define a tool that is: comprehensive, encompassing all relevant aspects in defining sustainable development for the older population, clear in the definition of its components, and immediately usable by policymakers, analysts, and interest groups. This contribution aims to present the initial results of the research, illustrating the outcomes of the participatory reflection on the definition of areas and indicators of the checklist.

Aging and Sustainable Tourism: a New Model of Tourist Coexistence

David Rodríguez guillén[1], Juan antonio Clemente soler[2], Juan carlos Solano lucas[3]

1University of Murcia, Spain; 2University of Murcia, Spain; 3University of Murcia, Spain

Aging population can be considered both a success of public health policies and of socioeconomic development. But aging also constitutes a challenge for society, since the phenomenon of aging forces societies to change and adapt in order to improve the health and functional capacity of older people as well as their participation in society (World Health Organization, 2018).

Although aging is the result of human progress in terms of healthcare, quality of life and well-being, it also poses challenges in areas such as health, financial security and social inclusion of the elderly.

In this context, sustainable tourism can play a key role, since it can help to face the social isolation that an important part or the elderly are facing. By participating in tourist activities, old people can have the opportunity to interact with people with different ages and backgrounds.

This research aims to address a new concept of tourism model, in which sustainable tourism together with aging can merge into an alliance that can face a series of social and environmental challenges.

Through an active participation of old adults in experiences of sustainable tourism, we can foresee a new model of coexistence. The aim of this model is to achieve a balance between cultural and environmental preservation, social inclusion and the empowerment of the elderly.

In order, to do so we will develop a theoretical framework using the documentary analysis. On a second stage, we will study several cases of sustainable touristic experiences of old people. Finally, we will carry an analysis of those experiences with the use of a comparative analysis methodology.

RN01 | T09_01: Informal Care and Ageing 2

Resources Of Family Carers Of Elderly Relatives In COVID-19

Anett Maria Leleszi-Tróbert[1,3], Marton Bagyura[2,1,3], Zsuzsa Széman[1,3]

1Semmelweis University, Hungary; 2Centre for Social Sciences; 3Hungarian Academy of Sciences – Post-Covid Research Grant

In ageing societies, the provision of elderly-care is an increasing challenge. The role of family carers is increasing as care systems become overburdened. Our online questionnaire survey (n=1004) of family caregivers of elderly relatives during the first wave of COVID-19 in 2020 was primarily designed to investigate the burden on family caregivers in Hungary. The other main focus of the research was the impact of caregiving burden on professional work, and therefore we analyzed the relationship between caregiving and burnout. The third dimension of our research is the impact of the pandemic situation on the caregiving process. In 2022, the research was extended: firstly, the online family carer questionnaire survey was extended and repeated with a larger sample (n=1760), secondly, in-depth interviews with family carers were conducted (n=20) and focus group interviews with employers were carried out (15 interviews with a total of 90 participants).

In our presentation, we will publish the findings related to the resources of family caregivers: respondents reported an increase in their existing burden related to the pandemic situation and faced several specific challenges. The increase in caregiving burden also had a negative impact on the subjective experience of the caregiver role. The presentation will describe the additional burdens experienced by family caregivers during COVID-19, what family caregivers drew strength from to carry the increased burdens, and what they needed to cope with the difficulties.

Our findings can provide important guidelines for supporting family carers, especially in coping with specific situations.

Social Heterogeneity in the Effect of Informal Caregiving for Older Individuals on Social Withdrawal

Francesca Zanasi, Marco Albertini

University of Bologna, Italy

All over Europe, care responsibilities for older individuals fall on the shoulders of family members, particularly partners (usually wives) – with negative consequences on a range of outcomes, including psychological and physical health, loneliness, and social isolation. Among these consequences, and a key factor in leading to other negative outcomes, is the phenomenon known as 'social withdrawal':

95

a withdrawal from social activities and relationships they previously enjoyed, following the time priority required by caregiving. Despite the extensive study of the caregiver burden, the socio-economic heterogeneity of its effects remains under-researched. Not all caregivers are equal, and we may expect the consequences of the care burden to be moderated by key individual/household characteristics connected with social stratification – such as education, income, wealth, and social class. In the present study, we aim to uncover socioeconomic differences in the probability and severity of social withdrawal among European informal caregivers using the Survey of Health, Aging, and Retirement in Europe (SHARE, 2004-2020). Operationally, we leverage health shocks experienced by the partner, such as heart attacks, strokes, and hip fractures, to estimate the effect of starting informal caregiving on reducing or stopping tout court to attend a range of social activities and meetings with close friends and relatives. We expect the effect to be stronger for more disadvantaged individuals, with limited possibilities to 'buy time for themselves' by purchasing services on the market. Preliminary, descriptive results confirm a strong social withdrawal effect of caregiving, even though it appears evenly distributed across the social strata. In conclusion, the present study advances our understanding of informal caregiving's multifaceted and heterogeneous consequences.

International Recommendations vs. Unequal Local Implementation of Policies to Support Informal Care of Frail Older People: Results from a National Programme for coordinating multi-level strategies in Italy

Cristina Calvi[1], Federico Sofritti[2], Georgia Casanova[2], Giovanni Lamura[2]

1University of Eastern Piedmont, Italy / INRCA IRCCS – National Institute of Health and Science on Ageing,Italy; 2INRCA IRCCS – National Institute of Health and Science on Ageing,Italy

A national three-year participatory multi-level programme to promote more comprehensive policies to support informal carers of older people with long-term care (LTC) needs is being implemented since summer 2022 in Italy. The Italian context is characterised by a regionalisation of care competencies that leads to strong regional inequalities and some resistance by regional authorities to State interference. The dramatic impact of the pandemic has radically questioned the validity of this approach, and an advanced proposal to reform the system is currently under discussion by the Parliament. This paper provides a state of art of Italy's regional policies for informal carers of dependent older people with LTC needs, via a secondary data analysis, expert interviews and a bottom-up consultation of main stakeholders involved in the current design of the nation-wide LTC reform. These policies will be analysed in the light of the main European recommendations on this topic. Starting from an analysis of regional differences in informal care policies (considering both dedicated laws and laws that indirectly deal with informal carers), key elements will be identified and compared with what main international recommendations provide for. Strengths and weaknesses of Italian policies will then be highlighted, in order to indicate the gaps on which regional authorities should work to improve supports for informal carers and to increase the overall quality of informal care, also combating policy inequalities in different areas of the country.

European Policies for Supporting Caregivers of Older Adults with Long Term Care Needs: A Mixed-Methods Systematic Review

Marco Albertini, Eva Bei, Federico Toth

University of Bologna, Italy

Background: In an era marked by the imperative to restrain costs within health and social care services throughout Europe, informal caregivers of older adults assume a pivotal role as primary providers of long-term care. Informal caregiving, however, often requires those who provide care to acquire information and skills; moreover, providing long-term care to family members may have significative negative effects on care providers' health. Nevertheless, there remains a shortage in mapping the various social policies pertaining to both direct and indirect support for informal carers across the various EU member states.

Objective: This mixed-method systematic review synthesizes data on care policies related to diverse support forms implemented across EU countries to assist caregivers.

Methods: A comprehensive search strategy was conducted in three electronic databases and grey literature to minimise publication bias.

Results: Preliminary findings of studies published between 2010 and 2023 indicate that various forms and levels of support have been introduced or reformed over the past 13 years across EU countries to support caregivers. Despite the challenges posed by population ageing, there is significant policy development disparity among EU members, with some countries to have established mechanisms aside financial assistance to support carers, while others to only now starting to express interest in developing such services. Financial support, primarily through cash-for-care schemes, emerges as the predominant form of assistance, followed by respite care, while other policies in terms of training and mental health services exhibit a notably lower level of development within the EU social policy landscape.

96

RN01 | T09_02: Experiences of Ageing

Age Self-identification: Reconstruction of Older People's Ideas About Age and Social Status

Irina Petukhova[1], Irina Grigoryeva[2]

1Sociological Institute, Federal Center of Theoretical and Applied Sociology, Russian Academy of Sciences, St. Petersburg, Russia, Russian Federation; 2Institute of Sociological Institute, Federal Center of Theoretical and Applied Sociology, Russian Academy of Sciences, St. Petersburg, Russia

Our paper is devoted to a preliminary analysis of how older people construct their ideas about old age and social status. We draw on the results of semi-structured interviews with people over 60 years of age (N=34). Preliminary results of our study indicate that elders have not developed a common understanding of the chronological boundaries of elderly and old age. In the assessments of our informants, the "beginning" of old age and old age is not associated with the moment the right to receive an old-age pension arises. In general, in their answers, our informants referred to discussions in the media about age limits and made attempts to "attribute" themselves to certain social groups. Also, from the point of view of our informants, the media has a responsibility to shape the image of an elderly person. It is emphasized that today the media show the image of an ugly old age: poor and sick. This significantly affects social status in old age and the (not) desire to identify with this socio-age group.

Older People Living With Early-Onset Motor Disability: Do They Perceive Themselves As Aging Successfully?

Josep Fabà[1], Feliciano Villar[1], Clicia Jatahy[2], Karima Chacur[1], Montserrat Celdrán[1]

1Universitat de Barcelona, Spain; 2Universitat Internacional de València, Spain

Some approaches to successful aging (e.g., Rowe & Kahn, 1998) tend to set high standards to define certain ways of aging as 'successful', which may alienate some collectives, such as older people living with disability, from that process. The objective of this study is to explore what definition of successful aging older people living with disability have, and to what extent they perceive themselves as aging successfully. We interviewed 30 people aged 60 years or older (19 women, 11 men) living with motor disabilities for at least 25 years. Their definitions of successful aging contrast to the academic ones. They were focused on sustaining agency and assuring that their main life priorities were still accessible. The importance of relational and contextual

(e.g., physical context, policies, social attitudes) aspects for successful aging were also highlighted. In participants' responses we found some adaptative mechanisms in which they ground their agency, such as reappraising priorities and expectations, selecting and designing accessible close living contexts or optimizing remaining capabilities. Such strategies are interpreted using adaptation theories. To conclude, most older people living with disabilities, despite recognizing their additional barriers and lower resources, perceive themselves as aging successfully, underlining psychological, relational and contextual aspects in that process.

"You're Only as Old as You Feel": The Role of Personality and Social Networks for the Subjective Experience of Ageing in Europe

Bettina Isengard, Ronny König

University of Zurich, Switzerland

Although aging is a natural phenomenon, people perceive and experience this process considerably differently. The subjective age, indicating how old individuals feel themselves, has been highlighted as an important predictor of physical and psychological well-being in various research across different disciplines. However, besides socio-demographics it is mainly unclear which circumstances affect that some individuals feel younger than their chronological age and vice versa. Therefore, this study shed some insights in this phenomenon by investigating whether and how a discrepancy between subjective and objective age varies by individual, familial and contextual characteristics. Moreover, we contribute to the existing research and focus on the role of personality traits and individual social network, namely their composition and interaction, to analyse more detailed the patterns for the subjective experience of ageing.

The analyses are based on representative data for 28 countries from the Survey of Health, Ageing and Retirement in Europe (SHARE). The data – conducted in the second year of the COVID-19 pandemic (summer 2021) – are based on over 38,000 respondents aged 50+ and indicate that the majority of Europeans feel subjectively younger than their chronological age. On average, participants rated their subjective age approximately five years younger than they actually are. However, feeling younger but also older does not depend on socio-demographics only. In this vein, our multivariate analyses found, in addition to country-specific differences and pandemic-related circumstances, that a mismatch between subjective and objective age varies significantly by personal traits and is in turn affected – albeit different – by the availability of and the interaction with various types of social network members (e.g., children, parents, relatives, and friends).

97

Voiceless Older People: Source Analysis of News Reporting on Older People's Problems in National Quality Newspaper Through Five Parliamentary Election Years (2004-2018)

Otto Gerdina, Sinja Coz

University of Ljubljana, Slovenia

In democratic societies the media serves as a key platform for public discussion for opinion formation and decision making. This function becomes particularly important during parliamentary elections, which decide who will address and tackle the challenges that the population ageing is linked to. While many authors have researched media representations of old age in newspapers, the literature on who is constructing news reporting on older people's problems is scarce. Source selection is important for the journalist's construction of related social problems because sources shape, structure, (re)interpret information and determine meaning.

We were interested in knowing who constructs older people's problems in newspaper reporting. We conducted a study in the Slovene national daily quality newspaper Delo, focusing on five sequential parliamentary election years between 2004 and 2018. Following a systemic selection process of news articles retrieved from Delo's internal electronic archive, we identified 124 newspaper articles reporting specifically on the older people's problems. We conducted a content analysis using a taxonomy model of news sources to identify source voicing older people's problems.

We found that older people rarely get to voice their problems or comment on issues directly affecting them rather the news coverage on older people's problems is predominantly constructed by elites. Particularly underrepresented are older women's voices, which can indicate the double jeopardy of older women. As newspapers are one of the key infrastructures for enabling political recognition, there is an untapped potential in news reporting on age-related problems for fostering older people's civic inclusion during parliamentary election years.

RN02 | T01_01: Gender in Art Practices and Music

"Blend" in Trans* Choral Musicking

Holly Patch

TU Dortmund University, Germany

This talk investigates what it means to "blend" in a trans* chorus, specifically following the gendered implications of this choral sound ideal. Drawing from ethnographic research conducted with the Trans Chorus of Los Angeles (TCLA), one of the largest and longest running outwardly trans*-identified choruses, I argue that, even in a chorus that prioritizes empowerment and celebrates diversity, blend is a technology that regulates bodies, selves, belonging, and exclusion. The first section of the talk will illuminate the structural component of this regulation: traditional choral performance practices where visual uniformity (arrangement of bodies and performance attire) underpins the perception of one collective voice also often regulate gender, for example. The second section closely examines the singers' perspectives and experiences singing within their voice sections in the TCLA and in other ensembles to show how the singers concomitantly use the notion of blending as a descriptor for how they relate to others in their voice sections and as a chorus in terms of sound, and to qualify gendered belonging and visibility. By focusing on what blending means to them, the chapter also sheds light on liberatory moments for the singers enacted by their choral singing practice. Finally, I address the limits and possibilities of blend in the case of trans* choral musicking, focusing specifically on social attunement and representation.

Is It Not for Fun? Work And Gender in The Jazz Scene

Rebeca Munoz-Garcia

Universidad Carlos III de Madrid, Spain

Work is a dynamic and complex concept that has extensively been explored in Sociology as a field of knowledge. It is probably more complex to define when we refer to it as artistic profession, especially when the intent is to understand professional trajectories and social interaction dynamics which are part of the music scenes. Specifically, insecurity and job intermittency are characteristics of artistic work (Menger, 2011, 2016), but if we exclusively observe jazz professional practices, we can confirm that many of those present specific characteristics. The main aim of this contribution is to reflect on those characteristics to show how gender and professional practices interact with each other in the current jazz scenes. Those interactions make the definition of work not only more complex from a sociological point of view, but they also bring professional and personal experiences to light that must be analyzed from a gender perspective. Is the way of facing the risk and uncertainty inherent to artistic professions particularly determining women's professional trajectories in the jazz scene? Based on 42 in-depth interviews, this communication analyzes how women find relevant difficulties when developing professional practices in jazz. In short, this communication highlights that gender experiences must be considered to understand the artistic work development in the music scenes. Only embracing an inclusive and holistic perspective we could address present and future tensions, truths, and transformations that shake artistic work professions.

Socially Engaged Art between Radical Democracy, Statement Markets and Cancel Wars

Karen van den Berg

Zeppelin Universität, Germany

"Socially Engaged Art Between Radical Democracy, Statement Markets And Cancel Wars"
My contribution examines the role of socially engaged art projects in our current struggle for a new world directedness – epistemically, geo-politically and somatically. For a long time socially engaged art projects operated with an aesthetic of the provisional. They relied on Deleuzian "becoming", insisted on the intelligence of the many, pursued practices of solidarity and promoted care work. These presiding conditions have always had a certain proximity to a symbolic statement market. However, it is precisely this market that seems to contaminate more and more recent projects. A new logic of indignation, guilt and collective judgement is leading increasingly to withdrawal, de-platforming and jeopardising solidarity-based work. As such, this presentation presents projects that promote radical democracy, relevant to our times. Radical democracy assumes that social dissent, which has always existed, cannot be resolved. Therefore, one of the tasks of socially engaged art, in times of violent social upheaval, is to create new spaces for dialogue, provide infrastructures that make dissent visible, and its conditions bearable and liveable. Using the example of three projects in Germany, the Netherlands and the UK, I will show which strategies institutions have developed for this. The presentation is based on interviews and field studies.

"It's Supposed to be Anti-all of the Bullsh*t That Happens Outside": Challenging Sexual Harassment and Inequality in Australian Music Scenes.

Freya Langley

Griffith University, Australia

In Australian music scenes, and indeed music scenes globally, women and gender-diverse people are critically underrepresented both on and off stage, and this is inextricably linked to broader societal patterns of patriarchal subordination and domination. Despite the promise of social belonging, resistance and alterity to the mainstream, there are clear inequalities within music scenes which limit women and gender-diverse peoples' participation. In Australia, women and gender-diverse people experience high rates of sexual harassment and violence in music scenes. The Australian music scene in 2024 does not appear much different to what Sara Cohen (1997) described of the Liverpool music scene over 25 years ago: men continue to dominate the relationships, activities, and networks within the scene, and this dominance alone works to exclude women and gender-diverse people from full participation, creative expression, representation, and safety.

However, music scenes are also significant spaces for forging and affirming identities and opportunities for cultural change and resistance. Recent grassroots developments in Australia highlight the transformative potential of music scenes. Women and gender-diverse participants in these scenes are increasingly challenging the structures that marginalise them through DIY and grassroots initiatives (such as the de-legitimation of male-dominated performance line-ups, statements of inclusion and action plans for patron safety at venues and events).

As Australian music scenes reckon with their #MeToo moment, it is important to consider the systemic barriers women and gender-diverse people face in order to forge a way forward. Drawing on ethnographic observations and interviews with women and gender-diverse participants in Australian dance and rock scenes, I will explore the ways women and gender-diverse people creatively challenge sexual harassment and inequality to transform these spaces.

RN02 | T01_02: Audiences and Consumption

Music Festivals, Organisational Artefacts Of Control And The Audience's Trust

Marcin Poprawski

Humak University of Applied Sciences, Helsinki, Finland

The aim of this research paper is to explore the theme of music festivals during and immediately after the pandemic period from the perspective of the concept of organizational symbolism (Strati 1998, 1999), with a particular focus on organizational artefacts (Gagliardi 1990, Strati 1998, Royer 2020) that served both to exercise power and control and to facilitate the trust and shared values of festival audiences. The empirical part of the material was collected during the qualitative research through over 50 individual in-depth interviews with two groups of respondents: the organisers and participants of 7 music festivals, and the experts of the festival scene.

This paper essentially concerns the festival as an organisational format and object of "planning" treated as a clear example of organisational symbolism. Of additional significance here are the circumstances of the COVID-19 crisis, which gave "planning" with its organisational heroism, the status of an even more complex and symbolically relevant activity.

The results of the research showed that the 'organisational artefacts' identifiable within a festival allow organisers to control the situation during concerts. This is exemplified by a wristband that identifies a person as being entitled to enter the festival grounds. However, this marking of the wrist of a festival participant also has other, symbolic meanings for the person wearing it. Artefacts, in material terms they enable, facilitate, or hinder organisational activities. On the other hand, artefacts influence our perception of reality, to the extent that they subtly shape cultural beliefs, norms, and values. Artefacts materialise the bond and trust between the audience and the festival.

Shifting Perspectives on Audiences through the Observation of Practices in Cultural Interstices.

Elisa Ullauri Llore

Aix-Marseille Université, France

By turning "audiences" in culture into a social fact, our approach reexamines the concept of "non-audiences". Through the observation of cultural and leisure practices of local audiences occurring in the spatial and symbolic interstices, this presentation aims to reflect on how this extensive regime of diverted uses shapes hybrid spaces and border audiences.

100

Can we speak of audiences for contemporary art when neighbors visit a contemporary art place for a neighborhood gathering? Or audiences for the Archives when they attend a Scape-Game?

By shifting the boundaries of categories used to define audiences and non-audiences in culture, using theoretical tools from the fields of cultural sociology, art, and reception, drawing on frameworks like Bourdieu's and considering indicators of cultural eclecticism, omnivorousness (Peterson, 1992), cultural rights, or recent categories such as "not yet public" (Girel, 2023), we propose to examine the broad spectrum of "non-publics" (Jacobi and Jason Luckerhoff, 2012).

To do this, we utilize the results of an audience survey conducted during the first edition of the "Biennale de la Joliette," led by the parliament, composed of around twenty cultural structures and community stakeholders, including residents and merchants who were entrusted with part of the programming. The event aimed to revitalize the social fabric of a neighborhood grappling with significant socioterritorial challenges. The urban redevelopment project of Euroméditerranée, envisioned this area as a cultural and commercial hub for the city, but cultural participation remains very limited.

By intersecting three relational dimensions—artistic competence, habitat activism, cultural rights—we identify three layers: parliament, neighbor programmers, and audiences. Thus, we propose to delve into the machinery of weak, discreet, or distracted uses of art and territorially embedded cultural offerings.

Performing Musical Multiculturalism: A Case Study of the Rap Duo Karpe's Impact on the Norwegian Civil Sphere

Ingebjørg Sofie Larsen

Norwegian Academy of Music, Norway

Alexander's Civil Sphere Theory (CST) conceptualises values of common humanity in modern democracies and how the inclusion of out-groups can be achieved. The Norwegian rap duo Karpe, comprising the rappers Magdi and Chirag, has endeavoured to broaden "Norwegian-ness" to include more mixed and multicultural identities over the past two decades. This article argues that Karpe's album "Omar Sheriff" (2022) pushed the Norwegian civil sphere in a more multicultural direction through a specific kind of audience fusion, comprising emotional identification and symbolic extension. This process depended on 1) the duo's position as national icons, 2) how intellectuals and critics (with and without minority backgrounds) negotiated this position and 3) Karpe's artistic and social performance on "Omar Sheriff".

The argument is grounded in a qualitative analysis of two datasets. The first includes all articles about Karpe and/or "Omar Sheriff" published in Norwegian legacy media between Jan 2022 and April 2022 (n = 92), supplemented by selected social media discussions on "Omar Sheriff" from

the same period. The second dataset comprises Karpe's artistic work, specifically "Omar Sheriff" and its associated discourse, encompassing press releases, a documentary, and selected award speeches.

A narrative analysis inspired by Alexander (2006) is employed to map the civil sphere discourse, and a performance analysis inspired by musicological methods from Auslander (2021) and McCormick (2006) is employed to examine Karpe's social and artistic performance. Beyond its empirical contribution to Norway, this study offers insights into the potential impact of music on national civil spheres, bridging sociological and musicological methodologies.

Towards A Comprehensive Understanding: Mapping Concepts of Audience Experiences and Engagement in the Cultural and Creative Experience Sectors

Eirini Tsitse, Izabela Derda, Ellen Loots, Susanne Janssen

Erasmus University of Rotterdam, Netherlands, The

This paper conducts a comprehensive mapping of the concepts of audience experiences and visitor engagement within the cultural and creative sectors and industries (CCSIs), focusing specifically on the experience sectors as categorized by NESTA (Flew, 2012). Employing a systematic literature review, this research aims to delve into the evolution of concepts relevant to audience experiences which is particularly crucial especially in the context of emerging technological applications. As cultural participation has been a predominant research topic in audience studies during the last decade, ranking as the 3rd most popular theme based on of arts marketing articles in 2007-2016 (Walmsley, 2019a), little attention has been given to phenomenological research necessitating a comprehensive mapping and understanding of the topic and related concepts.

In response to the call for "defragmentation" of phenomenological studies advocated by scholars like Martin Barker and Kristy Sedgman (Walmsley, 2019b), this systematic review endeavors to synthesize the (co-)evolution and empirical dimensions of concepts. Moreover, recognizing the heightened expectations for personalized and controllable art experiences by audiences/visitors (Kemp and Poole, 2016; Novak-Leonard and Brown, 2011), the paper delves into multiple concepts linked to the term "experience" as it becomes evident that various sectors use the term differently while it consists of the main intangible output within the context of the creative experience sectors. Unraveling the distinct opportunities and limitations inherent in each concept becomes pivotal for adapting to the evolving cultural consumer expectations and aims to provide valuable insights to both researchers and practitioners in the field.

The Sociology of Art-based Research Methods: Music As a Tool to Include Underage Migrants in Europe.

Alix Didier Sarrouy

Universidade Nova de Lisboa, Portugal

The Sociology of the Arts has mainly based its research on two methodological paths: history-based sociology (White & White 1965; Moulin, 1967); ethnography and contemporary document analysis-based sociology (Becker, 2010; Faulkner & Fred, 2017; Hennion, 2015; Menger, 2002). The discipline has more recently been influenced by art-based research methods (Leavy, 2019; Pink, 2015), in which the processes and results of artistic productions are being used as research tools to approach the complexities of the interactions between all the involved actors at micro and macro-levels (Sarrouy, 2022).

Based on a research project titled "YouSound – Music education as an inclusive tool for underage refugees in Europe" (2022-23), in which I have been the Principal Researcher (www.yousound.eu), I will analyse some of the possibilities and complexities when using art-based research methods in the specific context of young asylum seekers in two music programs: the Swedish Dream Orchestra (Gothenburg); the El Sistema Greece (Athens). Daily music learning and playing have served as research contexts, in which the relationships built around musical instruments, repertoires, classes, and concert settings reveal the nature of the social interactions between all the social actors, including the powerful macro and invisible ones (i.e. the State; national and international laws).

Finally, I will analyse some of the assets and risks (namely ethical) when applying art-based research methods in studying the use of music education for the social inclusion of migrant youth in Europe (Lenette, 2019; Mienczakowski, 2018; Nunn, 2020; Vougioukalou et al., 2019).

Visual Art And Practices Of Creative Subversion In The Public Sphere

Lia Luchetti

University of Rome III, Italy

Recent research has highlighted the performative nature of the arts and the social and cognitive effects of the arts for the identity formation, the body representation, the social transformation (Hennion, Grenier 2000; Tota, De Feo 2020) and the power of the arts on social structures (Gaupp et al. 2022) and in educational settings (Tota, De Feo 2022). Different forms of art, such as visual art on which this paper aims to focus, can become resources that people use in everyday life for constructing meanings and shaping social experience (DeNora 2011). Emphasis will be on "artivism",

i.e. the use of art to mobilise people and to express demands for social justice in the public sphere (Danko 2018; Trione 2022). Within this framework, this paper aims to explore the ways in which art – as arts-in-action (DeNora, Ansdell 2017) – can affect the public discourse. The focus will be on the relationship between artistic practices realised in the context of culture jamming and brandalism (Allgajer 2020; Lekakis 2017) and social imaginaries, with regard to the components involved in the processes of signification. Starting from this approach and using the methodology of qualitative interviews with Italian subvertising activists, we will discuss the capacities of artistic practices to turn into symbolic devices capable of challenging, for example, ethnic and gender stereotypical representations (Tota et al., 2023) and contributing to articulate concepts such as democracy, equality and social inclusion in the public discourse.

The art museums and expectations of Gen Z

Przemyslaw Kisiel[1], Elżbieta Nieroba[2]

1Krakow University of Economics, Poland; 2University of Opole, Poland

The art museums are institutions that are undergoing a profound transformation. They are being transformed from institutions based on the concept of the object-centred museum into institutions based on the concept of the client-centred and/or community-centred museum (Gurian 2010). This direction of change is the result of a fundamental reflection on the social functions of the museum and the nature of the relationship with the social environment and the need to implementation of accessibility policies.

102

However, these activities aren't fully satisfactory. It is worth noting that art museums enjoy very little interest from generation Z, who are an important segment of the cultural public, because they will determine the situation of museum institutions in the future. Hence, it seems that art museums should better prepare themselves for the expectations of this audience segment.

The aim of my speech is the presentation of the results of a qualitative study conducted among representatives of generation Z in Krakow and Opole (in Poland). The issues of this study focused on the way in which representatives of generation Z perceive the offer of art museum institutions and on the identification of directions for desirable changes that could make these institutions more permanent and attractive to them. Conclusions formulated based on the study allow us to identify areas and directions of change, and their implementation in the museum environment may encourage representatives of this generation to take a greater interest in the offer of art museums.

Perspectives On The Impact Of Artistic Interventions. Observations From Fieldwork Within A German Activist Choir And Orchestra

Laura Karoline Rogalski

Freie Universität Berlin, Germany

103

The article examines the perspectives on the impact of artistic interventions within the practices of artistic-activist collectives. Drawing on fieldwork conducted with the German activist collective Lebenslaute that integrates civil disobedience and classical music, the study explores the contested notions of impact, embedded in internal and external legitimization and poetic and political programmatics, of a specific intervention – the blockade of a military air base while performing music.

Guiding the analysis is the research question: How do distinct expectations regarding the impact of artistic interventions manifest within the Lebenslaute collective's practices, and how do these expectations relate to explicit and implicit ideas about art's societal function? The theoretical framework adopts a practice-theoretical understanding of society, wherein societal structures materialize as meaningful interpretative patterns and implicit knowledge within cultural practices. The investigation of art activist practices yields insights into renegotiations of the relationship of art and politics, since ideas about art and its societal role are part of artistic-activist practice as implicit knowledge, while the practices at the same time performatively alter cultural structures, in this case the relationship of art and politics.

Methodically, a combination of ethnography, predominantly participant observation, and situational analysis is employed. The latter, as a form of grounded theory, seeks to generate theory from empirical research. For this reason, no predefined hypotheses are formulated. Preliminary findings indicate impact to be a strongly contested concept within the group, manifesting itself among two main axes of conflict: aesthetics vs. politics, and (prefigurative) practice vs. goals. Motives behind the groups activities are subtly inscribed into the group's practice rather than openly discussed.

This research addresses a gap in theory and art sociology, where emphasis on reception dominates the study of the relationship between art and politics, and questions of impact are not a major concept of interest. As aesthetic and creative practices are becoming increasingly ubiquitous in late capitalist society, the need to legitimize arts as politically relevant grows. This study aims to capture these shifts at the level of concrete practices.

Note: I have not participated in an ESA Summer School before.

RN02 | T02_01: Inclusion, Diversity and Participation (II)

From Intensity to Social Engagement. Sociology of the Arts and Refugee Involvement in Participatory Art

Prokopios Orfanos[1,2]

1University of Athens, Greece; 2Association of Greek Sociologists-Thessaloniki Branch

In the present study, we will trace the trajectories of creators who participated in the Blind Platform artistic project (2016). The main purpose of the artistic action was to intervene in refugee crisis and to creatively empower a group of refugees who were accommodated at Eleonas Camp (Athens). In the beginning, a cross-cultural, multidisciplinary residency for refugee, local and international artists was created (Volanakis, 2016). Following the residency, a sustainable supportive network was grown.

A qualitative survey was developed and in-depth interviews were conducted with 3 refugees and 4 local artists (2021-2). Interviewees' social and cultural background was investigated and also their trajectories in education, employment, and participation in organizations or collective bodies were traced. Their interaction and cooperation in the art residency was examined (expectation, participation, possible outcome). Participants described their route in the project as a passage from tension to collaboration and engagement.

The research project was enriched by sociological and art theory approaches to art producers (Bourdieu, 1993 & 1996; Becker, 1982; Elias, 1993; Heinich, 2004), collaboration/ participation (Becker, 1974; Sennett 2012; Goffman, 1972; Dezeuze 2010; Bishop, 2012), and the concept of the stranger (Simmel; 1908, Wood; 1934, Park; 1928, Schutz; 1944, Bauman; 2016).

The qualitative research followed the approach of Discursive Psychology through the ten stages in the analysis of discourse (Potter & Wetherell, 1987; Phillips & Jorgensen, 2009). In data analysis, we used shift of pronouns and interpretive repertoires, to elaborate the participators' narrations.

Illustrating Dissent: Visual Analysis of 2013 Gezi Protests

Selen Sarıkaya Eren

Scuola Normale Superiore, Italy

One of the results of the amplified visuality of social movements in the last decade has been the increased use of illustration as protest art. Illustration has been an understudied genre both in art history and social sciences despite its commonness. The recent literature shows that such graphic protest art can undercover motivations, identities, emotions, and cognitive experiences in social movement research. The 2013 Gezi Protests in Turkey was one of the first events in the country's history where protestors individually created illustrations and shared them on social media as a way of showing support. Although these illustrations have not been ignored by scholars, they have not been the focus of a systematic analysis either.

This paper will analyze the visual expression of the 2013 Gezi Protests in the illustrations, focusing on the creation process, the protestor figures and visual narrative. It will employ an innovative and interdisciplinary methodology called three-step visual analysis. The undertheorized category of illustration will be discussed and conceptualized with the introduction of nascent Illustration Studies. The paper aims to contribute to the visual analyses of social movements by analyzing the highly visual case of Gezi; to further develop the newly emerging three-step methodology by introducing conceptualization and insights from the Illustration scholarship; and to contribute to the wider discussion regarding the art of social movements in Turkey.

Semanitcs of Participation in Art – How Participatory Art Protects Employ Diffeernt Modes of Collectivity for Social Critique

Alice Neusiedler

Copenhagen Business School, Denmark

Participatory art practices have become increasingly popular to foster social change by involving those actors, who's situation they attempt to change, empathizing art's potential to disrupt habits of perception and the potential to reimagine social orders. However, the inclusive potential of such projects has been contested, and participatory projects have been criticized for exploiting participants and diminishing artistic potential for change when they give up artistic autonomy from other fields, studies in other fields – form social work to organization studies – placed much. Both, hope and critique, have convincing arguments. Yet, we still know little about different semantics of participation at play and the mode of social critique.

To explore this tension of hope and critique in participatory art projects, I investigate which narratives of collectivity and related modes of social critique contemporary participatory art projects discursively employ. Acknowledging the performative character of visuals to (re-)produce "cultural ideas of difference" (Swan 2010, 83), I draw on visual data from 84 participatory art projects, such as official project pictures, projects description on artists websites, and online reviews of art projects, which I analyze with Visual Situational Analysis (Clarke 2006) and with the analytical lens of Reckwitz' (2020) concept of singularity.

I show that contemporary participatory art projects lean on four main semantics: (1) Sharing competences; (2) Providing infrastructures; (3) forming environmental actors; and (4) Forming new collective bodies. I will argue how each of these semantics relates to different narratives of social critique and modes of organizing these semantics engage with.

Sensory Approaches, Arts and Sociology: a Path to Inclusivity

Karla Berrens

University of Barcelona, Spain

The intersection between art and sociology is particularly interesting in the methodology. As Back and Puwar note (2012), the methodological boundaries between disciplines are eroding. Aural sociology is well established in Canada and the UK, in Spain it is seen as a venture into the Arts instead of a hybrid approach between Sociology and Art. Hybrid methodologies combine aural, sensory and/or corporeal methods, emotional cartographies, focus groups, interviews and more traditional qualitative methods. Combining Sociological with Artistic methods can enable a methodological ecology that visibilises social transformations processes from a perspective rooted in the diversity of bodies and ways of inhabiting.

This article, reviews sensory approaches and artistic aural methodologies arguing how artistic aural methodologies are key tools to warrant an equitable research process including and visualising the variety of social realities and participation of social actors. Integrating the Arts in Sociology is to highlight a focus on participation. It enables diversity and diversely functional individuals and their relationships to social life to be made visible and play an active part of the research from process to results. This coporeal approach can make research more accessible to several collectives with diverse functionality and, as such, it is an equitable and inclusive path to social research. Hence it's a path to inclusivity and social transformation. This article concludes with an argument for the inclusion of sensory and artistic practices in our sociological research to be active contributors in social equity and represent society inclusively.

RN02 | T02_02: Inclusion, Diversity and Participation (III)

Live Fast, Die Old. Experiences of Ageing in DIY Creative-Music Scenes

Paula Guerra

University of Porto, Portugal

Globally, over the last decade, a broader cultural fabric has gained traction, with a DIY ethos that has been a source of new forms of (artistic) music scenes and their derivatives: video, street art, design, and illustration. The fact that the producers of these scenes have not just grown up with punk or indie rock but have grown older with it has challenged conventional readings of youth culture, which has become more focused on lifestyle. The participation of older generations goes beyond the delay of youth transitions; it doesn't reflect a refusal of adult obligations, nor is it confined to emergent adulthood. Several producers have continuously participated in punk, rap, EDM, indie-rock, and other cultural scenes well into their forties and beyond. These encompass not only producers (i.e., artists), but also a range of different activities related to the cultural and creative ecosystem, whose DIY musical scenes have been the leitmotiv: design, illustration, journalism, digital arts, and management. The fundamental aim here is to systematise the lifestyles in these composite cultural scenes poured into cultural/creative experiences translated into the body, fashion, and style; mirrored in family relationships, parenting, gender; experienced in careers; and materialised in practices, discourses and patrimonial and mnemonic objects. The methodological basis of this chapter is centered on the data analysis of 15 in-depth interviews with key actors of the scene over 50 years old conducted between 2018 and 2022 in Portugal and Brazill.

105

'Cultural Ecosystem' As Tool For Researching Alternative Cultures – Potentials, Limits And The Question Of 'Another Black Box'

Robin Kuchar

Leuphana University Lüneburg, Germany

Since the beginning of the 2010s, the notion of cultural fields as ecosystems has been increasingly gaining popularity – especially in terms of cultural policy and creative industries analyses (Holden 2015), but as well within research on urban (live) music cultures (Behr et al. 2016; v.d. Hoeven et al. 2020). While cultural ecosystems so far have primarily been understood as an integrative perspective for identifying beneficial factors and to emphasize aspects of social and cultural value creation, at the level of a more detailed theoretical understanding, the concept still appears little elaborated and 'black boxed'.

In order to initiate a more theory-based discourse, this paper critically discusses opportunities and possible ways of how cultural ecosystem might be a valuable approach to further conceptualize alternative cultural production and in which way the historical use of ecological language in social science and humanities might be helpful for this. Against the backdrop of growing complexity and multi-layered facets and spaces within the spheres of cultural production and distribution, the conceptual base of 'cultural ecosystem' will be further traced by also taking a closer look at its current weaknesses and blind spots.

As an exemplifying case of applying 'ecosystem' and alternative cultural production, the relationship of 'music scene' and 'cultural ecosystem' will be explored by questioning different aspects of compability and combinability. In which way the scene perspective might be a valuable approach to further conceptualize music ecosystems? Can scenes be considered as more or less self-reliant entities or 'biotopes' within a greater 'music ecosystem'?

Audience Development as a Resilience Strategy for Arts Organizations: Talks Before and After an Arts Event

Rūta Muktupāvela, Anda Laķe

The Latvian Academy of Culture, Latvia

The approach of developing the audience of art organisations acquires special importance in the context of financial, security, and the COVID-19-caused crisis. Data from monitoring of cultural consumption in Latvia show that pre-pandemic art consumption behaviour patterns are renewed only for a small segment of the active consumption audience. In our research audience development solutions are viewed as part of the resilience strategy of arts organisations, which is aimed at creating new relationship models with the audience. The 2022 audience research revealed that the period of restrictions on in-person events created not only "longing" for art events and excellence in artists' performances, but also deepened the sense of solidarity and empathy between artists and the audience, which was strengthened by negative emotional experiences.

We put forward two research questions: 1) check whether performing arts organizations, when developing strategies for the resilience, use new forms of dialogue between organisations, artists, and the audience; 2) based on case studies of theatre organisations, analyse pre – and post-performance talks as a tool for reducing mutual emotional, cognitive, physical, and status barriers, and for expanding the range of the audience. The theoretical basis of the study is the analysis of types of resilience strategies (Woodley et al. (2018), Frigotto et al. (2021), Nieuwborg et al. (2023)), where special attention is paid to transformational changes in the relationship between art organisations and the audience. Qualitative research design – case studies, analysing the experiences of state and privately funded theatres – is used in the empirical part. Reflexive in-depth interviews (N12) with audience representatives and artists, as well as participant observation of "before" and "after" conversations, were used as data collection methods.

"We want to improve upon the culture that's been built": The Transformative Potential of Scene-based Initiatives for Equity, Diversity, Inclusion, and Safety in Live Music Spaces

Freya Langley, Benjamin Green

Griffith University, Australia

In popular music, it is common to conceive of aesthetic innovation as originating at the 'grassroots' level of local scenes, and then filtering upward to the industry. What about social innovation?

Music industry leaders have increasingly recognised and committed to addressing chronic inequalities based on gender, race, indigeneity, sexuality, and disability. However, much of this is yet to translate into action. The recent (and longer) history of scene-based cultural change may offer leadership from the bottom at a critical juncture for equality, diversity, and inclusion in Australian music. Recent developments in small-scale, DIY/DIO and underground/alternative live music spaces in Australia highlight the transformative potential of these spaces. These developments include: gender and racially diverse event programming; acknowledgment of and engagement with local First Nations communities; statements of inclusion and action plans for patron safety at venues and events; staged and sliding-scale pricing, including waivers for particular groups; and exclusive events and spaces. These initiatives range from informal to formal, and from symbolic to material.

Drawing from the presenters' adjacent, ongoing ethnographic research in Australian music scenes, this paper details observations and interviews with participants – including patrons, musicians, event promoters and venue operators in dance and rock scenes – about the above changes. We consider sources of motivation and information; outcomes, experiences, and feedback; challenges, limitations, and lessons. We seek to gain a better understanding of cultural change in action, as well as considering how such change may or may not succeed, endure, and filter upwards in music industries.

What About the Arts? Exploratory Results on Private Support for the Arts and Corporate Social Responsibility in Portugal

Inês Arinto, Helena Santos, Ana Isabel Couto

Faculty of Economics, University of Porto, Portugal

In contemporary times, especially in Europe, a widespread narrative about the need to increase the private support for the arts has gained visibility and even some commonality. This is not only a result of cultural policies retrenchment (the welfare state in general) under neoliberalism and the various economic and social crisis. That narrative has been generated around the idea that the private support for the arts should be more than just a complement of the state: as the arts are, in general, considered part of our collective benefits (common good), some collective responsibility for their existence and sustainability is acknowledged. Additionally, widening the support for the arts to private companies would be, in this sense, a demonstration of those benefits, or, in other words, a contribution to the positive value of the arts and the artists, as well as a means to accomplish their social responsibility.

Nevertheless, private support for the arts is far from going towards being a generalised practice (or should we say, 'a generalised intention', instead?), especially outside the legitimated field, i.e., the publicly supported arts (including the public sector of arts production). Beyond this well-known and longstanding situation, research is still scarce to understand the reasons behind it.

We developed an exploratory research aiming to contribute to the understanding of why the arts remain so distant from the contemporary practices and discourses of corporate social responsibility.* We will present our main results, based on a sample of different artistic organisations and private companies that were interviewed.

* Arinto, I.L.A.L.B (2023). What about Arts? Private Support and Corporate Social Responsibility, Master in Management, University of Porto, Faculty of Economics, av. at https://hdl.handle.net/10216/155881.

What is Alternative Film Exhibition and What it Does? A Statistical Analysis of the Portuguese Case Between 2007 and 2022

Marta Miranda[1], Helena Santos[2], Luís Delfim Santos[2]

1Faculty of Engineering of the University of Porto, Portugal; 2Faculty of Economics of the University of Porto, Portugal

Film exhibition is the most fragile segment of the cinema industry circuit. It is highly dependent on market forces, which is not new and has been complicated by the development of streaming platforms, eventually compromising the accessibility of alternative cinema, as well as theatrical screenings. The pandemic brought new challenges into this scenario, putting pressure on alternative exhibitors (mainly film societies) to programme and attract audiences. They are essential in providing diversity in supply, screening national and non-national films that otherwise would not meet the potential audiences.

We have been investigating NCE as part of public policies for film exhibition in Europe (Santos & Miranda, 2023)*. A statistical analysis of selected results of the database of the Portuguese Institute of Cinema and Audiovisual, between 2007 and 2022, will be presented, focusing on a set of variables that will allow significant insights on the exhibition practices at the local levels, as well as their evolution over time. We will analyse the main aspects of the subfield's performance, identifying several of its driving factors. The effects of the pandemic will be highlighted.

* Santos, H. & Miranda, M. (2023). Disentangling economics and culture in European policies for cinema: what can we learn from Portugal and non-commercial exhibition?, International Journal of Cultural Policy, 29:6, 733-751, DOI: 10.1080/10286632.2022.2109628.

A "Connected Lives" Perspective On Art and Money : The Case of Istanbul's Art World

Eda Ozturk

Université Paris Cité

This research aims to analyze the complex intertwinements and mutual transformations of the art and market worlds, characterized by presumed disparities in their value systems and operational mechanisms, by focusing on Istanbul's art world. The artistic field in Istanbul has been transformed and restructured by the neoliberal economic policies that have prevailed in Turkey since the 1980s. With the state's withdrawal from the areas of culture and art, new economic actors have become effective and visible in the production, the distribution and appreciation of contemporary art in particular. The artistic field cannot be solely reduced to the "external" struggle among various actors for dominance as described by Pierre Bourdieu. It also has an internal

107

dynamic structure that is shaped and transformed by the interactions, both conciliatory and conflicting, among the network of actors. We asked in which contexts the intertwining of these two worlds leads to tensions, as well as in which contexts these tensions dissipate and the two worlds are reconciled by the artists. In this regard, Viviana Zelizer's ''connected lives'' perspective will enable us to fully grasp and understand the dynamics of the transformation of the art world and the economic world in the context of Istanbul. We will conduct exploratory research by carrying out semi-structured in-depth interviews with the economic actors, the artists who have been supported by those actors and the curators as intermediaries.

Success in the Field of Art – a Relational Survey of Craftspeople and Designers Socioeconomic Positions

Sebastian Diemer Mørk

Roskilde University, Denmark

This paper will examine the socioeconomic positions and conditions for craftspeople and designers in Denmark (Baldin & Bille, 2021; Bille et al., 2017; Peters & Roose, 2022). Craftspeople and designers are cultural producers who produce artefacts which have the potential to become art if they are consecrated in the field of art (Alexander, 2018; Rössel & Weingartner, 2015). Because of the precarious position of both the artisans and their work, this paper will examine how the relational position in the field of art affects the acceptance of artefacts as art (Heinich, 1996). The paper builds on a survey of 3.561 correspondents supplemented by register-data. By mapping the field of craftspeople and designers, using multiple correspondence analysis (Le Roux & Rouanet, 2010), this paper examines their working conditions as well as how they perceive their own position in the field of cultural producers (Abbing, 2002; Bourdieu, 1996; Menger, 1999). The paper is also interested in the distinctions within the field between different disciplines (Luckman, 2020). The paper finds that the field is highly stratified with a creative elite, who excel at creating and selling their work as art, as well as receiving state grants. The majority of the field is made up of struggling artists who rely on working grants and jobs not involving their own practice. Unlike other artistic fields, this field is also occupied by artisans who distance themselves from artistic qualities and instead attribute value to their craftsmanship (Becker, 1978; Sennett, 2008).

RN02 | T03_01: Theorizing the Arts

Alternative Perspectives On The Social Organization Of Art

Volker Kirchberg[1], Tasos Zembylas[2]

1Leuphana University of Lueneburg, Germany; 2University of Music and Performing Arts, Vienna, Austria.

From the 1970's onwards, a vital sociological interest on arts and culture has been raised. One can speculate about the multiple reasons for this renewed interest in the sociology of arts but what is commendable is the diversity and plurality of the variety of theoretical perspectives that all have tried to answer one central question. How do contemporary societies organize various artistic activities from production to distribution to consumption, including valuation and archiving? Putting the focus on "how" implies references to formation and institutionalization but also to transformations and unforeseen and unintended ruptures. This question explains why the sociology of arts, and especially theories of the social organization of arts, are closely connected to general social theories. This insight has motivated us to analyze and compare the shaping and reception of seven particular sociological perspectives on the social organization of arts. These perspectives are the interactionist approach of art worlds, the structural field theory, the systems theory of arts, the production of culture perspective, neo-institutionalism, cultural institution studies (inspired by practice-theory and pragmatist approaches), and sociological network theory. What do they have in common, where do they deviate from each other? All these approaches depart from an anti-essentialist understanding of arts and apply contextual and relational thinking. They have emerged from very different theoretical foundations and scholarly contexts. Our analysis and comparison will not be evaluative – creating a ranking of theories – but epistemological, which presupposes an appreciation of each distinct perspective aiming to advance the understanding of theory building and theoretical innovation in arts sociology and in general social theory.

For a Sociology of Aesthetics in the Contemporary Art World

Guillaume Sirois

Université de Montréal, Canada

Most sociological studies on visual contemporary art are conducted at the infrastructural level (institutional formations, power dynamics, career trajectories, etc.), consciously avoiding deep discussions on works of art and aesthetic considerations. Such orientation can be explained historically, as the sociology of art first needed to distinguish itself from other disciplines, mainly art history, which typically concentrates on the artwork as its primary object. This paper follows recent academic literature (Highmore, 2019)

108

that calls for a reconsideration of this division, or even an "aesthetic turn" (Olcese & Savage, 2015) to open a new space for the sociology of arts and culture. This perspective invites to study the "social life of objects", and more specifically, its aesthetic dimension as a central component of its production and reception. I argue in this paper that the perspective is particularly fruitful in the case of contemporary visual art. All too often, contemporary art is accepted as a given category by sociologists studying this world, therefore reconducting a form of exceptionalism that is prominent in this social formation. By contrast, an examination of the category, based on aesthetic considerations, would open a space to probe how creative processes are influenced by discussions with various players (Becker, et.al., 2006) and ultimately curbed by aesthetic expectations dictated by the demand (Witkin, 2005). As contemporary art has become increasingly global, it may also bring a new perspective of understanding to the local/global dynamics at play in this world, as local practices are inevitably influenced by international aesthetic standards.

Studying Cultural And Artistic Production Through Infrastructuring: A Conceptual Exploration

Marthe Nehl

Lund University, Sweden

Witnessing the omnipresence of the notion of infrastructure across disciplines, this paper sets out explore its current use and future potential for the study of arts and cultural production. A tentative literature overview shows a tendency that infrastructure in arts and culture (and cultural policy) accounts primarily for buildings and to some extent, digital platforms, but is limited to being a 'material' object of study. The infrastructural turn though, and with it the suggestion to think through infrastructure as a verb, opens to explore the social in relation to the material and entangled complexity through which the crucial question of the possibility of cultural production may be posed. Thinking in terms of infrastructure (i.e. asking for the systems and operations that are generative for the phenomena under study) allows us to study cultural and social phenomena systematically as achieved and not as given." (Meyer, 2023, p. 49). Scholars in cultural organization have pointed out, that cultural production always also organizes, or in other words, it involves the arranging of people and objects in space and time, always generating knowledge, building relations, and sometimes opening possibilities for future production. The analytical concept of infrastructure promises to be more agency-inclined and time-sensitive than 'structure', but more structured than ecological perspectives and more directed than networks. Whether and how working with infrastructuring as analytical approach helps to address phenomena like precarity as one consequence of longstanding hierarchies and inequalities remains to be explored.

The Art World and the Art Dimension

Katalin Soós[1], Rita Kéri[2]

1ELTE, Hungary; 2independent

Involvement in the visual arts has many faces in the contemporary scene. There are diverse roles and strategies available to the professional and a range of social functions involved.

The authors – practitioners themselves – conduct their field study in the cities of Budapest, Hungary and Barcelona, Spain, and pitch the findings against a constantly shaping theoretic framework developed by them throughout these years.

In the present paper, we bring insights from the respective art scenes about the changing dynamics of mainstreaming, periphery and marginalisation within the art world, and the fluid borders between the art world and lay audiences in light of the multifaceted strategies.

The goal of the present investigation is to test candidates for a theoretic framework that can embrace these diverse phenomena as a unified dimension within society: what would be the elements of such a framework, how it could be explanatory for past and present transformations in the social world in relation to phenomena of art, and how it could speak to the current situation in a meaningful way.

We will highlight tendencies synthesized from an ongoing longitudinal interview study to present the approach we propose in action.

109

RN02 | T03_02: Anti-racism, post – and de-colonial perspectives

Understanding the Values of Equality, Diversity, and Inclusion in British Arts Organisations

Victoria D. Alexander

Goldsmiths, University of London, United Kingdom

This paper draws insights from two case studies of arts organisations – Gasworks in London and the Nottingham Contemporary in Nottingham, England – which have been particularly active in promoting the values of 'equality, diversity, and inclusion' (EDI). The presentation covers some important initiatives undertaken by these organisations to provide context, and then turns to questions of how arts organisations understand 'EDI', how arts organisations evaluate the initiatives they undertake relative to such values, and the implications of these findings for publicly funded arts organisations.

In the United Kingdom, organisations funded by Arts Council England must attend to EDI issues as a condition of funding. The research, therefore, asks specifically how arts organisations understand EDI, both in general but also relative to public funding. Further, the study investigates how these organisations evaluated their EDI activities. The study finds that there are externally driven, internally focused, and co-created forms of evaluation in both organisations. Tensions emerge across evaluation systems. The paper considers the implications of these findings for cultural policy and for evolving understandings of equality, diversity, and inclusion.

Rubiane Maia's deriva [drift] between the body-territory in the Global South

Sofia Sousa, Paula Guerra

University of Porto, Portugal

This proposal intends to present a visual and content analysis of the art project entitled Divisa, by Brazilian artist Rubiane Maia. Focussing on this artistic creation and drawing on the renewal of contemporary creative experiences in the Global South, our main objective is to demonstrate interconnected aspects of this innovative/creative project, such as the accentuation of symbolic and historical-social landmarks that, in turn, restrict a territorial drift. Thus, the concepts of border and 'crossings' are mirrored, represented, and contested by the artist in states such as Espírito Santo and Minas Gerais, in Brazil. In addition to reflecting on these concepts, we also intend to establish theoretical-artistic connections with notions such as body-territory, displacement, and art-place, as well as with the concepts of resistance and memory, taking as our starting point a process of re-signifying the lived experiences of connection between the human body and the body-territory.

Towards a Conceptual Framework of Cultural Justice – A Normative Turn in the Sociology of Arts Inequalities

Tal Feder, Emil Israel

Technion, Israel

In the field of sociology, cultural inequalities have been thoroughly examined using descriptive and explanatory frameworks. However, these inequalities have seldom been analyzed within a normative context. This paper introduces a theoretical framework for studying justice in the field of art and culture engagement, which we term "cultural justice." Focusing on the arts-related aesthetic domain, we consider three forms of cultural engagement: consumption, creation, and education and develop the notion of cultural justice as an expression of social justice characterized by the unique ways art is embedded in the cultural dimensions of social life. The proposed framework builds upon two theories of justice. Sen and Nussbaum's capabilities approach highlights the observable and hidden dimensions of cultural engagement, focusing on people's actions and the conditions that facilitate or restrict them. Fraser's dual perspectivism approach complements the capabilities approach by differentiating between tangible and intangible levels of justice related to cultural engagement. Combining both approaches, we construct a holistic model of justice for the culture and art domains and demonstrate its application in the context of cultural consumption.

Creative Spaces as Sites of Radical Possibility for Re-imagining Policing

Rachel Lewis, Jacqueline Hodgson

University of Warwick, United Kingdom

In this paper, we explore the possibilities afforded by arts and creative spaces as sites of radical possibility for a re-articulation of policing, in its broadest sense. In doing so, we draw on our extensive body of empirical work exploring policing through creative practice. As part of this research, we partnered in 2022 with the Coventry Belgrade Theatre, first to commission and share a new play drawing on the themes of our critical evaluation of the West Midlands Police partnership with the Coventry UK City of Culture. And, most recently, to co-construct a project with several schools which offers a space for pupils to explore their own experiences and understandings of policing – both by the police as a force, and by other state and non-state actors. In this paper, we draw on insights from the 'affective turn' across diverse sociological and legal fields (e.g. Fortier 2016; Zembylas 2021; and Bergman Blix and Wettergren, 2018) to centre emotion in our analysis, asking how these creative spaces might operate as sites of affective power

110

within and through which those involved might begin to 'think otherwise' (Carlen, 2017). In doing so, we consider the generative possibilities within these spaces to disrupt existing power dynamics and to contest and rearticulate policing, community, safety, and care.

RN02 | T03_03: Critiques and Disruptions of Power in the Arts

Critiques and Disruptions of Power in the Arts – Transnational Co-Creation and Collaboration as democratic practice

Nicola Scherer[1], Özlem Canyürek[2], Lisa Gaupp[3], Meike Lettau[4]

1University of Applied Sciences Niederrhein, Germany; 2Freelancer; 3University of Musik and Performing Arts Vienna, Austria; 4ZU Zeppelin Univerity, Germany

The contemporary time can be described as time of multi crisis. Issues of sustainability, political insecure times and global pandemic. The insecurity of possible futures worries a whole generation and evolve in right wing movements and (re-)building walls all around the world, as Wendy Brown described in "Walled States, Waning Sovereignty". At the same time, however, we are witnessing growing solidarities that stand against these drastic and widening inequalities, from small-scale neighbourhood projects to, on a global scale, the Black Lives Matter and the #MeToo movements. The acceptance of cultural organizations is also further called into question by decolonial perspectives, which expose the persistence of neocolonial and Eurocentric power relations in culture. The presentaion intends to take these developments as a starting point for collective engagement with the pressing questions they entail. The presentation will be committed to both voicing critiques of power in the field of arts and culture as well as to discussing "ways to do it otherwise" based on transcultural co-creation groups while understanding processes of power and inequality as inherently interwoven. Four project examples of "ways to do it otherwise" will be given and analyzed. For example the ITI Academy, which is an exchange and qualification programme for emerging transnational working artists and curators consisting of various formats. All these "how to do it differently" projects provide interesting results which lay bare the intervened lines between cultural, political and social background of the individual participants and co-creation and collaboration as democratic practice.

Cultural Activism and Eurocentric Power Relations in Cultural Diplomacy

Meike Lettau

Zeppelin University, Germany

The presentation analyses solidarities, disruptions and hegemonic structures between cultural activism and Eurocentric

111

power relations played out in cultural diplomacy. It investigates existing narratives and places the neo-colonial top-down policies of international funding organisations, such as the Goethe-Institut, in critical contrast to the self-positioning of cultural activists from the so-called partner countries which are often working based on self-generated structures and methods. By using examples from Egypt, Lebanon and Tunisia the presentation discusses the topics of the ESA conference – tension, trust and transformation – as well as current challenges of transcultural cooperation between Europe and the WANA region (West Asia-North Africa).

Starting from the position of a cultural activist arguing "The funders need us, we do it anyway", the presentation investigates shifting narratives in cultural diplomacy in the framework of democratization as well as re-democratisation processes. These processes are considered as part of a decolonial and power-critical approach, which is fundamental for democratic change as a bottom-up process starting from civil society.

The research is part of the project 'Tawasol – Cultural Production and Policy Network' (https://www.zu.de/lehrstuehle/cultural-media-policy-studies/news/tawasol-network.php) which investigates socio-political dimensions of artistic formats between the WANA region and Germany. Artists and cultural activists have contributed to democratisation processes in many countries of the WANA region, created forms of exchange and dialogue, and thus have a relevant effect on shaping society through artistic production and international cultural collaboration.

Challenging Powerful Institutions in the Cultural Field

Lisa Gaupp

mdw-University of Music and Performing Arts Vienna, Austria

It is now commonly acknowledged that we live in times in which radical global inequalities continue unabated. Also in the cultural field, the structural divide along lines of discrimination, sexism, racism, classism, ableism etc. has become even stronger and more evident. At the same time, however, we are witnessing growing solidarities that stand against these drastic and widening inequalities, from small-scale neighbourhood projects to, on a global scale, the Black Lives Matter and the #MeToo movements.

The planned paper presentation intends to take these developments as a starting point for engaging with the pressing questions they entail. It will be sketched how power laden social and cultural institutions govern how things are handled in the cultural field and which strategies of solidarity challenge such hegemonic institutions in the arts. The discussion will be committed to both voicing critiques of power in the field of arts and culture as well as to problematizing "ways to do it otherwise" while understanding processes of power and inequality as inherently interwoven. In a sociological understanding with a praxeological reading, institutions are understood as symbolic orders and practices that form a framework for how people communicate and interact with one another linked to and based upon

certain individually assigned cultural meanings. It will be shown how, if a cultural institution is imposed on someone else from a more powerful position, this can, for example, lead to or justify discrimination, ideologies and inequities. In parallel, unlearning powerful cultural institutions can be a way of not only voicing critique but also of challenging unequal power relations in the cultural field.

112

RN02 | T04_01: Carreers and labour conflicts in the arts

Facing multiple crisis: Employment precarity and coping strategies of Performing Arts and Entertainment professionals in Greece

Christina Karakioulafi[1], Aspasia {Sissie} Theodosiou[2], Chara Kokkinou[1]

1Department of Sociology, University of Crete;
2Department of Music Studies, University of Ioannina

In the Greek context, as in other countries, creative sectors are among the most affected by the pandemic crisis, bringing to the surface structural problems that these sectors have long been facing. In Southern European countries such as Greece, which have experienced almost a decade of the aftermath of the financial crisis and austerity policies, creative workers seem to be living in a state of continuous crisis. Drawing from the first results of a nationally funded research program (Hellenic Foundation for Research and Innovation-HFRI) on "Labour Precarity and Social Cohesion: The Case of the Cultural & Creative Industries (CCIs)" the proposed paper focuses on the core CCI of Performing Arts and Entertainment – an industry that encompasses a complete and multifaceted ecosystem of cultural and creative professions. Based on the findings from qualitative research through an array of research methods (ethnography, focus groups, and semi-structured interviews) and the analysis of institutional changes/reforms (desk research) during the multi-crises especially on employees/workers' collective protection the paper will examine: a) the ways employment in the Performing Arts and Entertainment sectors and professions are (re)shaped within 'crisis-scapes' and the main parameters affecting employment and working conditions whilst also accelerating precarization b) the strategies of individual workers and collective organisations (unions, emerging grassroots practices etc.) to resist/respond to the predicaments of the Performing Arts and Entertainment sectors and to tackle precarity and exclusion c) the obstacles and challenges of the institutional attempts to (re) regulate the highly unregulated labour markets of the Performing Arts and Entertainment sectors. Emphasis is given on core professions within the Performing Arts and Entertainment sectors, such as actors/actresses, musicians, and dancers.

Innovation and Adaptation: Contemporary Street Art in Contemporary Social Crises

Anna Garbaruk

European University at Saint Petersburg, Russia

This study focuses on street artists, their creativity and their innovative strategies for adapting to evolving social landscapes, including legislative amendments and sociocultural shifts. The study aims to explore the ways street artists solve problems and bring new elements to the city's art scene.

The central research question concerns the techniques and methods used by street artists to adapt to social changes, including the introduction of new regulations and increased penalties for unauthorized art. On the one hand, the study focuses on the specific methods that artists use to adapt to legislative changes. On the other hand, it explores the impact of the working environment on street artists, especially in the context of immigration or relocation. The empirical field includes street artists from Russia, as well as curators, researchers and gallery workers who directly interact with the artists.

The study contributes to a deeper understanding of how street artists are embedded in sociocultural dynamics from a cultural and social perspective. The presentation will highlight insights gleaned from interviews with street artists and exhibition curators, and offer a unique perspective on the adaptive strategies used by artists who began making street art before 2018, engaged in significant unauthorized work, and continue to shape the evolving landscape of urban art.

Music Careers And Cultural Policies. Considerations Based On The Independent Music Scenes Of Lisbon and Porto

Ana Sofia Oliveira

Iscte – University Institute of Lisbon, Portugal

Music and, more broadly, culture have become part of the political agenda. In different contexts and on different scales (international, national, and local), it is common for political discourse to associate them with creativity, urban development, and tourism. Multiple social actors recognise the importance of culture and music for the regeneration and revitalisation of urban areas, for improving the quality of life and promoting the well-being of populations, and for the social and economic development of local communities. Based on this framework, this communication focuses on the Portuguese case, analysing the independent music scenes in Lisbon and Porto. We seek to understand the place of culture, and specifically music, within the framework of local cultural policies and how these are related to the development of musical careers. To this end, we analysed data collected through 80 interviews with different

113

actors in the music world and political players in the cultural sphere. Our analysis suggests that although the importance of (independent) music for cities is recognised, its translation into cultural policies is questioned or several shortcomings are pointed out. These are essentially anchored in the lack of knowledge about the independent music sphere and the working conditions of musicians and others involved in the music world.

RN02 | T04_02: Careers and labour conflicts in the arts II

Culture, Commerce and Crowdfunding: Artists' Experiences of Crowdfunding and Surviving the Covid-19 Crisis in Japan

Takao Terui

Xi'an Jiatong Liverpool University, Japan

Recently, cultural crowdfunding came to be spotlighted as an emerging funding instrument to collect micro-donations from supporters more efficiently. However, research on cultural crowdfunding remains limited. This paper aims to make an original contribution by studying the impacts of cultural crowdfunding in Japan and the voices of performing artists and representatives of cultural organisations. In exploring the recent trends of cultural crowdfunding in Japan, this paper applies mixed methodologies, including interviews with artists and members of cultural organisations, document analysis covering national newspapers, art magazines and public documents, observation of symposia and online events and a questionnaire on performing artists. To examine the artists' attitudes and approaches to cultural crowdfunding, this paper employs theories of justifications proposed by Boltanski and Thévenot, specifically contrasting values of the inspired world and market world. Drawing on the research on cultural crowdfunding in Japan, this paper broadens the understanding of artists' policy and the roles of public aids for the culture in the post-pandemic society. This paper significantly contributes to the scholarship of the sociology of the arts and creative industries by bringing two new perspectives. First, this paper broadens our understanding of crowdfunding in the creative industries by investigating artists who are severely critical or intentionally distance themselves from the practice of crowdfunding. Second, this paper is the first academic writing featuring cultural crowdfunding in the Japanese context. This exploration of the development of the creative industries in Japan has demonstrated how locally structured beliefs and policies can activate or hinder crowdfunding in the cultural sector.

114

Different Career Trajectories in Different National Contexts

Andrea Csaszni Rygh

University of Stavanger, Norway

How are we to understand different artistic career trajectories? While previous research on artistic careers has mostly been oriented towards reasons for entering an artistic career and presenting individualized explanations for enduring precarity as an artist, less attention has been given to the role of social communities for artists' choices and experiences of exiting or staying in the art world over time.

There has also been little research comparing artists' careers in different national contexts. This paper is oriented towards understanding how artists in two different national contexts, Hungary and Norway, understand their artistic career trajectory and artistic identity in relation to aspects such as precarity and social communities. The data consist of 40 life story interviews, 20 from each country, with visual artists who have committed to an artistic identity through arts education and in professional life. In terms of comparing national contexts special emphasis is put on how different degrees of economic precarity in the two countries affect career choices and possibilities, but also how such difference may influence artists' sense of what is required to assert to an artistic identity. The analysis focus on the social world of the artists, their own descriptions and understandings of their career paths, choices, and what the idea of social communities means to them.

Negotiation and Recreation in the Careers of "Folk" Musicians in Portugal in the 21st Century: The Case of Medieval Fairs and Historical Recreation Events

Pedro Belchior Nunes

INET-md, NOVA-FCSH, Portugal

In this paper I will address the practices and values of musicians within the particular universe of rural folk music, taking as a case study their involvement in historical recreation events in 21st century Portugal. I will address this topic based on a set of semi-directed interviews, carried out with musicians within this universe as well as onsite observation. Theoretically I sustain my approach on a critical and sustained dialogue with the notions of artistic worlds (Becker, 1982) and DIY music production modes, proposed by several authors over the last twenty years (Bennett 2018, Guerra 2018, Haenfler 2018, Haynes & Marshall 2018, Tarassi 2018, Threadgold 2018, Schmidt 2019, Jones 2021). I start from the previously claimed assumption (Nunes 2023) that folk musicians opt, out of necessity rather than ideological imperatives, for DIY modes of musical production, but without fully adhering to a corresponding ethos and maintaining institutional connections through state support and organizations such as city halls. I will argue that the idea of musician independence commonly advocated in studies on DIY music production modes is constantly negotiated by folk musicians since the constraints of the subfield in which they operate force them to navigate between institutional commitments and, at least partial, control of the means of production. We invoke historical recreation events with a particular focus on medieval fairs as a case study that highlights a negotiation stance, involving moments of commitment and resistance on the part of musicians, in relation to the event producers and the public's expectations.

Sociology of Music and Qualitative Methods in Contemporary Perspective

Barbara Jabłońska

JAGIELLONIAN UNIVERSITY, Poland

People's musical practices are an exciting and important area of sociological reflection. So how can we study them, especially in the context of the changing nature of social reality, new technologies, globalization, and the mediatization of society? The paper aims to present selected methodological perspectives and qualitative research methods in the field of studying people's musical life. Therefore, the subject of consideration will be a review of the most important qualitative research methods concerning the research field of the sociology of music. First, the so-called sociological-auditory approach will be discussed (see Jabłońska 2016). Next, research methods such as observation (including online observation) will be characterized. Emphasis will also be placed on qualitative analysis of musical discourse and discourse on music, including in particular critical discourse analysis. The issues of narrative analysis and multimodal analysis in research on people's musical lives will also be discussed, especially in the context of online discussions (Internet forums, social networks). Multimodality will be shown here as a combination of audial, visual, and linguistic modes. Musical netnography and the study of musical-discursive narratives will be characterized. The whole discussion will be guided by Christopher Snow's assumption, according to which music is a process and something that is produced in interpersonal relationships.

Finally, the question will be posed about the future of research methods in sociology, especially in the context of hybrid music practices, artificial intelligence, and multimedia communication, in which the diversity of communication intertwines.

115

RN02 | T04_03: Creativity and its discontents

Doing Creativity – in the Field of STEM

Anna-Kathrin Wimmer, Yves Jeanrenaud

Ludwig-Maximilians-Universität München (LMU Munich), Germany

Creativity is commonly associated with the arts as a means of self-expression. However, it has become crucial in many other areas. The ideal of creativity has permeated the dominant sectors of postmodern culture and their working practices as a dispositive. In STEM, creativity is recognised as a key factor for innovative solutions and technological advances in our increasingly sustainable and complex world. It is a key skill for future engineers to navigate complex tasks and problems. But beyond technical innovation, the individual's creative impulse lies in the quality of connecting to the self. The joy of creative doing leads to a sense of an autonomous, self-efficient individual. Experiencing one's own creativity can enhance self-efficacy. The result is greater motivation and thus greater interest in the subject. Thus, this can lead to a clearer sense of purpose and belonging. The aim is to highlight perceptions of creativity as an important determinant. Encouraging positive experiences of creativity could support sustainable labour market integration and future career success, by leading to higher levels of job satisfaction and commitment as well as self-awareness. Accordingly, this research focuses on exploring different manifestations, perceptions and meanings of creativity and its inherent consequences in STEM. To gain further empirical insights, data from a mixed-methods study is collected using narrative interviews of students and employees, as well as a questionnaire with young professionals of mechanical and plant engineering. The aim is understanding the stimuli of creativity, as well as its framing, conceptualisation and negotiation as a social, cultural and historical phenomenon within the field.

Innovations in contemporary art, from Becker to Baudrillard

Lorenzo Pardi

Gabriele d'Annunzio University, Chieti – Pescara

Based on Howard S. Becker's Art Worlds (1982), this proposal aims to analyze the transformative role of artistic innovation within street art. The central research question seeks to understand how artists operating on the fringes of the art scene contribute to the modification or creation of new aesthetic worlds, specifically examining the interplay between institutional structures, grassroots expressions, and the assimilation of new artistic forms.

The ability of these artists, including Bansky and Shepard Fairey, to modify or even create a new aesthetic world is related to the figures involved in the institutional and production chain. In this sense, Becker's work is expanded with a reference to Jean Baudrillard's text, The Symbolic Exchange and Death (1976), in which the author argues that the aesthetic system tends towards 'indefinite reproduction' and the incorporation of new artistic forms from grassroots origins

Our research employs a comparative analysis between two distinct forms of street art expressions: the grassroots-driven graffiti and murals versus municipally initiated 'City Walls.' We aim to elucidate the radical need for affirmation that arises from below in the former, in contrast to the top-down approach in the latter. Through an examination of works, such as Banksy's "Love is in the bin," a transposition of "Girl with Balloon", we unravel the transformative processes at play, transcending the original street context.

The main results of our study reveal a nuanced understanding of how street art innovators navigate the tension between institutional structures and grassroots expressions, shaping contemporary aesthetic preferences. By establishing an opportunity to link Baudrillard's insights and Becker's sociological framework, in a broader context of sociology of art applied to new forms of creative enterprise.

We're all Alone In This Together: Grime Music As Theoretical Toolkit for Navigating Elite Spaces As A Working-Class Student

Éireann Attridge

University of Cambridge, United Kingdom

My love for Grime and UK rap, along with my dedication to access and widening participation, appeared to find a perfect union when artists Stormzy and AJ Tracey created scholarships to support Black students at the Universities of Oxford and Cambridge. However, this music and educational work had already been perfectly paired in my mind throughout my time navigating these elite institutions as they guided me and enabled me to make sense of what was going on around and within me. This presentation reflects on how my personal journey through academia, as a mixed-Black woman from a working-class background, intersects with key themes in Grime and UK Rap. Considering the discography of artists such as Little Simz, Dave and Stormzy, I outline how themes from the genre have guided and comforted me as I navigate the elite and exclusionary space of academia. Key experiences such as disillusionment and disappointment, navigating a split habitus are explored alongside lyrical analysis. Furthermore, drawing from bell hooks' concept of 'Theory as Liberatory Practice', I find that the accessibility and relatability of Grime and UK Rap resonates with me far more than any traditional academic theory. It is this genre, with its working-class history and the experience of artists, that has provided me with the greatest comfort.

Eco-Visions and Mental Landscapes: On the impact of Visual Pollution

Anna Lisa Tota

University Rome III, Italy

In the last decades many scholars have focused on the idea of different kinds of mental landscapes (Appadurai 1990), or "mindscapes", underlying the interconnection between mind and external space (Lingiardi, 2017). As a matter of fact, landscape visions become psychic images and, as such, they end up influencing the very maps of our mind. Following the idea of "eco-words" and "eco-thoughts" (Tota, 2023) it is here proposed to consider the concept of "eco-visions" and the corresponding idea of "visual pollution", applied to our social imaginary and to the impacts of visual arts on the shared representations. Eco-visions can be defined as "actualised images", nourishing and defensive texts, which we decide to take with us to be better equipped in everyday life. Eco-vision is an act of subjective freedom, not an act of public censorship. However, in its completely subjective nature, this concept can evolve and become consciously intersubjective. We need new forms of social narration that are able to regenerate reality for us through our daily experiences. Eco-visions are therefore embodied images, because they can neither ignore nor do without the situated gaze that produces them. Eco-visions presuppose the eye of the subject who looks, but more than the eye they presuppose the gaze, that is, the act of viewing of the eye that takes place thanks to all the values thought by that subject and which support her ability and her specific way of seeing. Eco-visions are the opposite of polluting images, they require citizens to take responsibility and develop awareness. Referring to several examples this contribution aims at documenting the usefulness of this concept for empirical research.

Ecological Emergency And Cultural Policies In Portuguese Performing Arts: Tension And Opportunity.

Vânia Rodrigues, António Ventura

CEIS20 – Centre for Interdisciplinary Studies of the University of Coimbra, Portugal

Climate emergency is an inescapable contemporary collective challenge of a colossal dimension. Following incessant calls from the international scientific community, governments and organisations of all sectors are progressively incorporating environmental issues into their strategies and decisions – the arts and culture being no exception. Admittedly, in this quest towards the 'green transition', the arts have so far mostly been challenged to raise awareness around the severity of the ecological crisis, given their ability to offer narratives which "make complex relationships (…) understandable" (Skolczylas, 2021:6). But the time for raising awareness seems to be running out, and there's a clear push towards decision-making: environment and sustainability-related issues are already affecting artistic and curatorial decisions, as well as challenging production, touring and management models. What role is reserved for cultural policy in this rapidly changing context? This paper explores the results of a pioneering nation-wide survey, in which 140 Portuguese performing arts practitioners claim that the connection between the ecological emergency and cultural policymaking is both urgent and legitimate (Rodrigues, Oliveira and Ventura, 2023). The survey covers a broad range of respondents, from theatre to contemporary circus, from venue-based arts organisations to project-based/ independent collectives spread across the country.

Insofar the arts are generative of and impacted by societal transformations, and vice versa, and given the topicality of the issue, the dataset at the basis of this paper carries public policy interest at European level. At the same time, it constitutes a relevant starting point to discuss the conjunction of cultural policies and the ecological emergency, a juncture, we argue, appears as a site of tension, ambiguity, contradiction, and opportunity.

Reimagining Social Media Platforms through Art: The Case of MyceliumMinds Performance

Antonietta De Feo

Università Roma Tre, Italy

Recently, many artists have focused their works on the opaque and controlling nature of the machine learning mechanisms that govern social media platforms. In particular, they have introduced a critical thinking about the assemblage of human and non-human, imagining a more sustainable ecology of platforms (Tota et al. 2023). In this regard, the paper analyses Matteo Domenichetti's artistic project, called MyceliumMinds, curated by Milovan Farronato and presented in January 2022 at the "Casa degli artisti" in Milan. Inspired by the studies on the Wood Wide Web, and in particular by the work of Anna Lowenhaupt Tsing – The Mushroom at the End of the World: On the Possibility of Life in Capitalist Ruins – Domenichetti created a long-term artistic performance, which translates the connective tissue of the "mycelium" within Instagram to make it a collaborative space sheltered from the algorithmic logic.

Within a research agenda focused on the structuring – rather than structured – properties of art (Acord, DeNora 2008; Tota, De Feo 2022), the paper presents the first results of an ongoing ethnographic research focused on the enactment of MyceliumMinds. The aim is to document the transformative action of Art with respect to the dominant usage practices of social media platforms.

Unleashing Playback Theatre's Transformative Power on Climate Change

Roberta Roberto[1], Aurore Jeanne Stanislava Dudka[2]

1ENEA; 2University of Trento

While efforts to engage citizens in climate change have predominantly emphasized technological and economic perspectives, the outcomes of these conventional approaches remain a subject of debate. Considering this, we propose a shift towards emphasizing the role of art, particularly through Playback Theatre, an interactive form of improvisational theatre in which audience members tell stories from their lives and watch them enacted on the spot. It is used in a wide variety of contexts to foster social dialogue, conflict resolution, team building and much more, and emerges as a promising tool for raising awareness about climate change by directly engaging its audiences, evoking deep emotional responses, inspiring action and encouraging reflection on established practices. However, it is essential to acknowledge that addressing climate change is a complex endeavour, and integrating Playback Theatre into this context presents its own set of challenges which need to be addressed to foster its potential.

To fill this gap, we adopt a qualitative approach by leading qualitative interviews with playback theatre companies working on climate issues in different countries (N=15). Our research aims to provide insights into the evolving role of Playback Theatre in addressing climate change, explore how this process differs from experiences with other social themes especially examining audiences interactions. Our results show that climate change poses specific challenges, while innovative approaches to communicating with the public have very high potential. Ultimately, our study identifies and shares best practices that can serve as valuable models for organisations wishing to address similar issues to replicate.

RN02 | T05_02: Arts educations and arts in education

Spatial Divisions of Labor. The Case of Education in European Art Institutions

Joana Monbaron

University of Coimbra, Centre for Social Studies, Portugal

Peripherality and marginality are persistent characteristics of the physical spaces dedicated to education in art museums and galleries. Bearing in mind that the built environment is a facilitative milieu in which relations are formed, and that the museum field is an embodiment of a particular social world with complex underlying organizing principles, what does the physical relegation of the spaces assigned to educational work tell us about the specificities of art museums' internal organization, but also about the kind of relationships with the public this organization implies? Drawing on the critical knowledge produced by museum and gallery educators across Europe, who, observing empirically that they were overwhelmingly women, historicized and analyzed their field of practice by introducing a perspective drawn from feminist epistemologies, this paper takes a feminist critical spatial approach to analyze the organization of labor in the art museum and its hierarchy structured in a patriarchal way. Considering the social relations of gender as a significant axis in the formation of spatial structures of production/reproduction, it is argued that the physical peripheralization of education work in the museum can be seen as a spatial enunciation of a gender division of labor that can be recontextualized within broader processes of labor division, which reflects the structural inequalities of race, class and gender that persist among European cultural institutions.

The article develops via institutional ethnographic practice a nuanced approach to explaining the interplay of gender, race, class, and space that shape social inequality in art institutions. Through in-depth interviews with art museum workers and participant observations, with a particular focus on people's everyday working lives, this empirical analysis is therefore devoted to exploring and explicating the social and spatial relations that organize experiences in art institutional settings. Since embodied knowledge – or ways of knowing, doing, and being – are internalized through processes of socialization, particular attention is given to embodied experience in practice as a primary source to study the naturalization of constructed patterns of professional behavior in the art museum environment, often presented as a neutral space in which power relations are normalized and pacified.

From Art to Art with a Shine of Science; Transformations in Visual Art Educations in Light of Becker

Målfrid Irene Hagen

Independent researcher (Retired professor/associated), Norway

In this paper I look at the transformations in higher art educations during the last 2-3 decades, when many art educations in the West were included in the university sector, and consequences of this. In their epilogue to the German artist Hans Haackes book; Framing and being framed from 1975; Becker and his colleague John Walton concludes that although several artists may work in a similar way as researchers, it is a big difference between art and science. Art belongs to another sphere, that give meaning to art. One of the consequences of the transformations, is the so-called Research based art. In her essay, Information overload from 2023, the art historian Claire Bishop says that the presence of Research based art is almost mandatory in any serious exhibition: Postcards, faxes and e-mail printouts in a vitrine, rows of leaflets, graphs and charts, tables filled with documents and texts. She claims this development is inseparable from the rise of doctoral programs for artists in the West, specifically in Europe, from the 1990s. Although many artworks may resemble research, they often appear as one single step in a research process, without any conclusion on the problem they claim to research. Instead, they may appear only with a shine of science. Considering Becker, I analyze some recent curricula for higher art educations in Norway, to reveal how other disciplines than art seems prioritized on the cost of art subjects, which also may contribute to give art educations only a shine of science.

Participatory Culture: Case of Youth Engagement in Museum Activities

Baiba Tjarve, Laura Brutāne, Lote Katrīna Cērpa

Latvian Academy of Culture, Latvia

The concept of cultural participation is no longer limited to individuals attending events and consuming cultural products. Researcher Henry Jenkins has highlighted the concept of participatory culture, emphasizing community involvement as a means of creation (Jenkins, 2009). The participation of individuals in the production of artistic and cultural work enhances the social capital of individuals (Bourdieu, 1986) and improves the subjective well-being, quality of life, physical, mental health, social inclusion and integration of communities in general (Martinez, 2022; Jenkins, 2009). The authors aim to identify the benefits and challenges of youth cultural participation. To achieve this, authors will focus on the example of Eduards Veidenbaums Memorial Museum 'Kalāči' (Latvia), which has actively engaged young people in the creation of its exhibitions and events throughout the period of the last two years. The authors will analyze data collected during July and August 2023. The fieldwork involved conducting three in-depth interviews with museum representatives and using timeline mapping as one of the participatory research data collection methods – twelve young people (aged 14-19) visualized their journey starting from their first involvement in museum activities, discussed it in more detail during the peer to peer interviews. The interviews were analyzed using qualitative content analysis, with a focus on both positive and negative aspects of the youth's experiences. As it is witnessed by young people, the involvement in museum activities has a positive impact on their quality of life, mental health, well-being, contributing to their exploration of identity and self-discovery.

Perception of Art Production Process by Performers with Disabilities in an Inclusive Museum

Ekaterina M. Dolgova

National Research University Higher School of Economics (HSE University, Moscow), Russian Federation

According to the recently adopted by International Council of Museums (ICOM) definition of the museum, its traditional role has transformed together with societal transformations and relies on such values as "accessible and inclusive," "museums foster diversity," and "sustainability" that help to build trust between different actors. It is a new trend in cultural policy worldwide.

Participatory Culture is becoming one of the main approaches to the museum practices, which creates conditions for activism and futher possibilities for people with disabilities in the museum – from visitors to cultural mediators and guides. This is suggested by experience of Moscow performance art institutions where disabled people participate as direct art producers, blind and deaf guides, etc. (the State Tretyakov Gallery, the Garage Museum of Modern Art and others).

Though the concept of an inclusive museum creates conditions for participatory practices implementation, its social and psychological consequences create additional risks for the disabled people. The conducted research was to establish how people with sensory disabilities perceive their position as art producers in museums based on 30 interviews with inclusion experts, blind and deaf employees of Moscow museums. Their professional roles were classified into a museum accessibility expert, a professional museum employee, a representative of the community of their disability.

It was also observed that inclusive activities do not always overcome the difficulties, moreover, lead to voluntary precarious employment as project work is widespread in museums, which deprives social guarantees, though they are perceived by people with disabilities as a blessing. Finally, their employment contributes to new sociological understanding of inclusion in museums, promoting new professional areas and standards for both employees of cultural institutions and arts managers.

RN02 | T06_01: Art Fields

Building Reputations Through The Founding Of Private Art Museums

Andrea Friedmann Rozenbaum

University of Amsterdam, Netherlands, The

Since the year 2000, there has been a worldwide boom in private museums for contemporary art. These institutions are typically founded by economic elite members, who expand their visibility, becoming key players in the art field and potentially increasing their power as taste-makers and gatekeepers. This phenomenon of private museums has, however, been under-investigated, and the focus on how founders navigate the art field has received little attention. Considering the importance of investigating the power dynamics in the art field, this paper examines how museum founders' reputations are constructed through the narratives of art actors. Drawing from participant observation and interviews conducted with curators, gallerists, dealers, critics, collectors, scholars, artists, and museum directors and owners composing the Brazilian art world, I explore how these actors recognise the founders. Although private museums can be framed as cultural philanthropic projects aiming to make art more accessible, critics argue that such generosity also favours its founders. Many art actors express their gratitude and admiration for the outcomes of what the founders created. However, they also critically state that founders aim to increase their prestige in the art field and as economic elite members. Brazilian museum owners are criticised in many ways: as unknowledgeable art collectors, as nouveaux-riches social climbers, as self-interest capitalists with hidden business agendas, and as ego-centred super-rich. Contrasting with other studies, in the Brazilian art field, the visibility enhancement of museum founders does not always increase their prestige but can end up damaging their reputations. These entangled narratives signal the complexity and nuances involved in analysing the benefits private museums can confer on their owners, stressing that prestige enhancement should not be taken for granted.

Advertising On Modern And Contemporary Art: On The Privatization Of Culture And Art Museums

Sara Raquel de Andrade Silva

University of Amsterdam, Netherlands, The

During the past decades, the art world has been experiencing a growing private initiative interference (Alexander 2018; Brown 2019; Durand 2000; Hagood 2016; Quemin 2020; Wu 1998). Connected with the withdrawal of public funding that followed the rise of neoliberal governments, private support for the arts became a global trend (Martorella 1996; Wu 2003), and researchers have been pointing out the marketization and/or privatization of culture as the most striking outcome (Victoria D. Alexander 1996; Victoria D Alexander 1996; Schwaiger, Sarstedt, and Taylor 2010; Sepúlveda Dos Santos 2001; Wu 1998, 1998). Although there is consensus on the impact of these changes in art museums, studies investigating how private influence affects aesthetics and curatorial choices in art museums are still sparse. Offering a perspective on the micro-sociological level, this paper aims to understand the extension of private actors' interference in art museum decisions through in-depth interviews with curators, directors, and managers of seven major Brazilian modern and contemporary art institutions. The results showed that censorship restrictions on curatorial choices do exist but are frowned upon and not common. However, the planning of exhibitions and other activities by art institutions is strongly influenced by private sponsors, and curators are often required to consider private interests when elaborating on upcoming exhibitions. From the data collected, the study concludes that art museums' decisions are not only impacted by sponsors, as well as acting as an advertising agency for sponsoring companies.

Artists in Exile in the European Cultural Scene: Transformation of Positionality, Betrayal of Institutional Trust, and Rising Tensions

Varvara Kobyshcha

University of Helsinki, Finland

"The Long Summer of Migration" of 2015 and the mid-2010s more broadly enriched the European cultural scene with artists from various countries of the Global South that experienced wars and repressions. Despite the rapid decrease of European institutions' interests in a particular group of "artists in exile" (usually, following the 3-year project funding cycle), the following political developments across the globe have led to the constant increase of forced and political migration among the artists and to various degrees pushed the European state and independent cultural institutions to incorporate "artists in exile" category in their agendas and infrastructures. More than 8 years have passed, which is the period long enough to apply for citizenship. These artists have gone through different stages in their relations with/within the European art field and cultural-political sphere more generally, their practical understanding of their own positionality and, in some cases, legal status have changed. I will trace how the artists' positionality has transformed and how their presence has transformed the European/national art fields. I will specifically focus on the initial trust in the European cultural system they had, and how sometimes (yet systematically) it was betrayed not only by the migration bureaucracy but by the "leftish" and "progressive" representatives of European culture. I will also cover the rising tensions surrounding the "antisemitism" controversies and censorship that lead to further transformations.

The paper is based on the ongoing comparative qualitative PhD research about visual artists with exile experience who

120

relocated from countries in the Middle East to Germany or Finland and the network of supporting actors and institutions emerging around them.

Literary Field as a Three-Dimensional Social Setting: Insights from the Serbian Literary Field

Milica Resanović

University of Belgrade, Serbia

The paper explores the dynamics of constructing and deconstructing literary prestige, specifically examining how actors in the Serbian literary field evaluate modes of consecration. Through a detailed examination of discourses surrounding the NIN Award, the most prestigious Serbian literary award, this study investigates the criteria upon which literary field actors evaluate this award and its jury, as well as the strategies by which they seek to confirm or challenge the award's legitimacy. This study relies on qualitative data collected from semi-structured interviews with Serbian writers, and publishers, and media articles. Evaluation practices are analyzed and operationalized from the perspective of Bourdieu's theory of the field (Bourdieu, 1992), supplemented by insights from the sociology of valuation and evaluation (Beljean, Chong, Lamont, 2015). This research enriches discussions within Bourdieusian sociology regarding variations in field properties (Krasue, 2017). It highlights differences in the structure of symbolic oppositions compared to the original theoretical model. Besides the well-known dividing lines between restricted production and mass production, and new arrivals and established avant-garde in the subfield of restricted production, in this case, the literary field structuring is strongly influenced by the great dividing line in Serbian society between the "nationalist/patriotic" block on one hand and the "antinationalist" block on the other hand. Consequently, it shows that the relative autonomy of the literary field in Serbia is disturbed because of the weakness of its capacities to organize specific activities according to its own specific categories of judgment.

RN02 | T06_02: Embodied, distributed and extended artistic practices

The Digital Turn In the Arts: Ethnographies of Artistic Practice

Dafne Muntanyola-Saura[1], Gloria Romanello[2], Marc Barbeta[3]

1Universitat Autònoma de Barcelona; 2Universitat Autònoma de Barcelona; 3Universitat Autònoma de Barcelona

The digital turn in the arts has resulted in the progressive substitution in academia and within the professional market of analog tools with digital ones. And the ways of working creatively have been transformed. How do professional artists project, build and imagine all along this changing pathway? The general objective of the project is to identify the changes caused by the digital turn in the artistic practice of established professionals. Our theoretical position integrates interdisciplinary contributions and defines artistic practice as a socially constructed habitus, a socio-cognitive process of a distributed, multimodal and embodied nature. Methodologically, we compare the discourse and practices of photographers, architects, film editors, designers, choreographers and musical composers, recognized in their field and linked to artistic schools, from two different generations, one educated analogically, the other digitally. Our hypothesis is that digitalization shapes the communicative modalities and epistemic objects of the artistic process, thus modifying the conceptualization, execution and evaluation phases. While the ethnographic filming and observation with field notes of their creative process focus on the reconstruction of the workflow, the interviews and focus groups go beyond the technical-functional changes to understand what new meanings emerge. Initial results show how the digital turn constitutes a process of institutionalization of new social practices. Artistic practice is an observable process of symbiotic gestures with the environment, bodily movements that make sense in relation to the spatial structure of the world, shared vocabularies and metaphors in conversation.

Being Perfectly Imperfect: Parallels Between the Contemporary Circus Artist's Embodiment and the Westernized Wabi Sabi Concept

Renida Baltrušaitytė

Vytautas Magnus University, Lithuania

This presentation will be a sociological outlook of interconnections among existing beliefs in the contemporary circus field and the new trend of Westernized Wabi Sabi ideas.

Wabi Sabi is a Japanese concept that, despite lacking a universal definition, comprises three principles: nothing is perfect, nothing is finished and nothing lasts forever (Suzuki, 2021:16). In 2018 an adapted version of Wabi Sabi started to become trendier in the Western world (Łaziuk, 2020:100-102) and this Westernized concept accidentally starts to have parallels with how contemporary circus artists experience their embodiment.

The research showed that contemporary circus artists are constantly trying to focus more on what a body can do and how it can do it instead of body appearance, they accept that bodies are not perfect and share an understanding of the importance of embracing this imperfection. Moreover, contemporary circus artists have in mind constant bodily changes and reflect them correspondingly by developing positive relationships with their bodies.

The State of Fine Art within the Era of Artificial Intelligence (AI): Experimental Study of Attributed Agency and Aesthetic Evaluation Shaping Factors

Alexandra Alekseeva[1,2]

1University of Vienna, Austria; 2Higher School of Economics, Moscow, Russia

The integration of Artificial Intelligence (AI) in art creation has sparked concerns within the art world regarding its impact on traditional artistic processes and appreciation. This study examines how AI's role as a creator affects the notions of artistic agency and art appreciation. It investigates the explicit and implicit factors that shape aesthetic evaluation and attributed agency in fine art, focusing on artworks created by human and AI artists. The study utilizes a mixed experimental design with 902 Russian-speaking participants, employing vignettes that include visual and textual components. The results reveal that human-created and presented as human-created artworks receive higher aesthetic evaluations compared to AI-created ones and those which are presented as AI-created. Additionally, participants attribute lower agency to AI-created and named as AI-created artworks, while the highest rates of agency attribution were assigned to artworks presented as created by male artists. Participants tend to assign higher aesthetic appreciation to landscape paintings than to portraits and abstractions, while the highest rates of agency attribution related to portraits. The study also identifies covariates such as trust in AI technology, awareness of AI, anthropomorphism, engagement in the art scene, subjective income, and mother's/caretaker's employment position positively correlated with aesthetic evaluation and attributed agency. The study emphasizes the importance of both implicit and explicit factors in shaping aesthetic evaluation and agency attribution, highlights the impact of textual component on participants' judgments, and contributes to the sociological implications of AI's involvement in the art domain.

Beyond Human Limits: The Impact of Artificial Intelligence on Contemporary Art Practice

Yuyan Li

Goldsmiths, University of London, United Kingdom

In the current era of rapid technological development, Artificial Intelligence (AI) has become a disruptive force in all aspects of human life. This paper examines the impact of AI on contemporary art practice, discussing in depth how, in the age of AI, the virtual and symbolic mimicry of human social relations is slowly coming to the fore, individual and collective memories will be blurred, and a new conflict between artistic creation and the current social context will arise. The study analyses the impact of increasingly pervasive artificial intelligence on the evolution of the role of the human artist. It also examines the impact of AI in liberating artistic productivity and the moral and ethical issues of AI in artistic creation. By synthesizing existing cases and studies, the thesis aims to delve deeper into how artistic expression and creation will be reconfigured under the widespread adoption of AI. The study explores the impact of AI creativity on the boundaries of human artistic expression while proposing reflections on the nature of art itself and the conflicting issues facing contemporary artistic practice.

RN02 | T07_01: Arts in the city

Emerging Cultural Spaces and Theatre on the New Stages in Ankara

Özlem Alioğlu Türker

Ankara University, Turkiye

In recent years, middle-class neighborhoods of Ankara have become home to a variety of new small businesses, including third wave coffee shops, art houses, artisan workshop studios, and "stages" for theatre plays and other performances. These emerging spaces redefine residential neighborhoods and the artistic and cultural spaces at the same time.

Similar to the way third wave coffee houses challenged earlier versions of coffee shops, these new artistic and cultural spaces establish themselves with a cozy and participative ambiance in contrast to the high-ceilinged, flamboyant art galleries. Theatre performances are integral to these newly flourishing, mostly multi-functional spaces. In Ankara, a city known for its theatre culture, the traditional theatre scene consists primarily of state-funded national theatre and a few private theatres owned mainly by renowned actors/actresses.

Theatre, being both an artistic and architectural form, is closely tied to physical space. Following H. S. Becker's well-regarded approach "art as a collective activity," both the creation process and performances are profoundly influenced. Consequently, a new theatre practice is likely to emerge as a result of the urban transformation described above. This paper aims to examine the theatre entities, performances, and spaces that are emerging on these new "stages" and explore the potential for novel theatrical experiences.

The research methodology involves in-depth interviews with the owners/directors of theatre entities and on-site observations of relevant activities and spaces. By doing so, this study seeks to contribute to our understanding of the evolving landscape of theatre in urban environments and the possibilities it presents for unique and transformative theatrical experiences.

Producing Affect: Theorising Collective Emotion Across Physical and Virtual Music Spaces

Beate Peter[1], Steve Taylor[2]

1University of Groningen, Netherlands, The; 2Manchester Metropolitan University, UK

In popular music studies, space has historically been linked to a geographical place and is all too often conceptualised exclusively in its physical form, underestimating the role of space in creating collective emotion. We contend that applying a more nuanced sense of what constitutes space, based on Henri Lefevbre's theorising about the urban, will help to restore space to its constituent role in generating collectively-experienced affect. In particular, we propose approaching an understanding of the relationship between music, space, technology, shared experience and affect through the lens of Lefebvre's tripartite vision of space as perceived, conceived and lived (l'espace perçu, conçu, vécu). Understanding space as socially produced, rather than just physically constituted, will also help us in speaking about virtual and concrete spaces in, as it were, the same breath.

Considering the online/offline nexus allows us to link an individual's irrepressible desire for affect to the facilitation of social experiences through, and within, particular spaces, whilst also assessing to what extent the generation of affect has been restored by the recuperation of physical music spaces.

Using a specific cultural venue as a case study, the authors discuss how and why shared affective experiences work in certain spaces (but not in others). Moreover, they argue that these affective spaces provide a counter-experience to increasing societal alienation, to what Lefebvre himself described as "the disaffection of fundamental desires".

Sicily Land-Lab: Future Architectures In The Place Of History

Pier Paolo Zampieri

University of Messina, Italy

Stripped of all embellishments, architecture is the "function plus sign," the "settlement plus landscape"; a distinctly anthropological faculty that hierarchizes the world by projecting values into space through the medium of art. It is a field of sensitivity to the desires and conflicts of an era, capable of generating complex social feedback. In this perspective, Sicily appears as a profoundly oxymoronic region caught between the rich reservoir of classical architectures and the cement universalism of the second half of the 20th century.

The paper will attempt to interpret Sicily as an enormous land-laboratory that, in the second half of the 20th century, tried to escape the dichotomy of nostalgia versus novelty, producing, in terms of quantity and scale, a large number of sites where art and architecture were invested with salvific characteristics. The famous and gigantic interventions in Gibellina Nuova and Gibellina Vecchia (Burri's Grande Cretto), or the more recent cases of Fiumara d'Arte and Farm Cultural Park, will be juxtaposed with the phenomenon of architectural and numerical excess of Sicilian outsider and Babel-like works—fantastic artifacts where it is difficult not to read, alongside the creators' distinctly personal mythologies, a dialogue both archetypal and avant-garde with the powerful landscape contexts in which they are immersed. All the mentioned episodes will be conceptually grouped in a hypothetical Petit Tour, where the theme is no longer the nostalgia for the classical but a significant archaeology of imagined futures following the collapse of modernist optimism.

123

Cultural Production and Technologies of Evaluation. A Comparative Analysis of Architectural and Design Production in Barcelona

Matias I. Zarlenga[1], Ariadna Peralta Llado[2], Glòria Guirao Soro[3]

1University of Barcelona, CONICET and University of Tres de Febrero, Argentine Republic; 2University of Barcelona; 3University of Barcelona

The paper presents preliminary results from the UNCHARTED project, "Understanding, Capturing, and Fostering the Societal Value of Culture," funded by the European Union's Horizon 2020 research and innovation programme. The primary objectives of UNCHARTED are to develop a comprehensive vision of the societal value of culture in Europe and to create a roadmap for cultural policy actions that supports the diversity of cultural values. We understand that the plurality of the values of culture in Europe is only possible if we consider the multiplicity of agents who participate in valuation processes and the diversity of evaluative practices in which they engage. This presentation examines how evaluation technologies are utilized in specific cultural production cases in Barcelona, adopting a pragmatic sociological perspective. The cases analysed correspond to architectural and design productions in the framework of public competitions (a project for the reconversion of a former industrial site into a factory for artistic creation and a Christmas luminaire for the city) and for conventional clients (production of lamps). The architectural and design productions selected represent functional cultural productions developed by low-complexity professional firms, where a craft production model prevails. Drawing on semi-structured interviews and document analysis, this presentation explores the evaluation technologies applied in the pre-production, production, and post-production phases of design and architecture projects. Additionally, this presentation observes how specific evaluations are enacted, encoded and stabilised through a complex interplay of actors, evaluative practices, evaluative reframing, objectivations and tensions.

RN02 | T07_02: Evaluation, valuation and hierarchies

Regimes of Evaluation in the Cultural Sphere

Arturo Rodriguez Morato, Matías I. Zarlenga

Universitat de Barcelona, Spain

Within the framework of the H2020 research project UNCHARTED, which studies the societal value of culture in Europe from a pragmatic perspective (Lamont, 2012; Heinich, 2020), we explore the plurality of values emerging in cultural practices, examining actors, evaluative practices, and values across different cultural domains (in the cultural participation field, in cultural production and heritage management, in cultural administration, and in cultural information). In this paper, we analyse the organized ways of making (e)valuations by actors in these different sectors of the cultural sphere. Based on empirical evidence gathered from interviews, document analysis, and observations of 18 case studies from different European countries (Portugal, Spain, Italy, Norway, France, and the United Kingdom), the paper examines the evaluative tools used by social actors in these domains, the emerging tensions, and their resolution forms. On that base, we define their characteristic regimes of (e)valuation: Grammars (in the case of the cultural participation field), Technologies (in cultural production and heritage management), Methodologies (in cultural administration), and Systems (in cultural information institutions). Furthermore, the paper explores the connections between these different regimes of (e)valuation and discusses their tendency to hybridisation.

Inverted Dependency: How Organisational Sense-making Enables Procedural Reinforcement of Hierarchies in Ireland's Visual Art Infrastructures

Michael Anthony McLoughlin

Technical University of the Shannon, Ireland

Visual art infrastructures in Ireland are primarily built around a state funding procedural hierarchy. Within this structure arts organisations are mostly funded by state funding, or are civic institutions with costs salaries, etc., coming from directly from the exchequer. The artist has very little hand in the management, planning or implementation of programme, in either scenario. While the artist's work is central to an organisation's public presentation of its purpose and the means through which the organisation makes sense of that purpose, the infrastructures are built on perceived dependency by artists procedurally, and a power dynamic that enables that hierarchy to perpetuate.

This anomaly became most evident during Covid19 restrictions as the assemblage of procedural supports didn't exist.

In this article paper, I will compare two post-Covid19 restriction examples of this hierarchy as manifest through the procedural actions of two arts infrastructures in Ireland. I will use an ethnomethodological approach to examining both situations and their implication. The first procedural action involves the cancellation of a group exhibition, Beyond the Studio in March 2023 at dlrLexicon gallery, in Dublin. The second involves the pay to speak "speed curating" events organised by Visual Artists Ireland. As an artist working in Ireland for over 25 years, I have the unique adequacy (Garfinkel, 2002) to be able to identify the sociological facts within two vastly different situations. As such, I focus on organisation sense-making in relation to these actions, and how they aim to create orderliness within a visual art infrastructure.

Teacher's And Leaders' Views Of Arts And Knowledge Within Schools Of Music And Performing Arts.

Rut Jorunn Rønning

Norwegian Academy of Music, Norway

This qualitative study delves into how teachers across various artistic disciplines and leaders at public Schools of Music and Performing Arts (SMPA) in Norway express their views of arts and knowledge. Fourteen municipal SMPA schools are involved in the research.

Theorists such as Boltanski & Thèvenot emphasize actors' capacity for independent reflection, irrespective of structures and power dynamics. Boltanski & Thèvenot have developed a set of orders of worth, categorized through principles of valuation, regimes of justification, and evaluation tests, encompassing categories like artistic, projective, market, domestic, civic, etc. The analysis aims to understand the actors' views of arts and knowledge according to various orders of worth. Some of these orders of worth can be perceived as conflicting, such as artistic versus domestic, projective versus civic, artistic versus civic, and market versus artistic. Sometimes, more than two orders of worth are competing and negotiating. Some findings also demonstrate different arguments due to different orders of worth between teachers and leaders. This can lead to conflicts and debates and illustrate an unclear status of how the SMPA can be understood by other actors such as pupils, parents, guardians, society, public policy, etc.

The central research question driving this study is how the teacher's and leaders' views of arts and knowledge influence the SMPA.

This paper is a part of the Ph.D. project titled "The School of Music and Performing Arts: an arts-based and knowledge-based institution?". This project aims to identify and analyze the unique characteristics of SMPA as an institution, considering the perspectives of three crucial stakeholders: public policy, teachers, and leadership within SMPA.

Negotiating Between Intrinsic And Instrumental EvaluationS Of Socially Engaged Art

Gráinne Coughlan

TU Dublin, Ireland

When we speak of 'evaluating' socially engaged art it often elicits a strong reaction from artists and art workers. Indeed, it is frequently conflated with bureaucratic requirements, tighter top-down control, and encouraging a homogeneity of art practice. Such feelings of suspicion often derive from an underlying fear arts instrumentalisation by funders, government, or institutions, in which socially engaged art is considered a tool to address a plethora of social issues, such as poverty, social cohesion, and lack of investment. That said advocates of socially engaged art also often underscore its transformative potential and positive contribution to society. For example. following art critic Francois Mattaraso to disregard instrumentality entirely is disingenuous and may amount to no more than an attempt by "artworld" insiders to maintain a power of validation to defend their own tastes against critique. Moreover, while art organisations turn towards impact-based evaluation methodologies, empirical research conducted with a set of Irish socially engaged artists revealed intuition, and ad hoc approaches as artists main approach to evaluation. To resist these binary positions often engendered by instrumental and intrinsic Norbert Elias's theories of involvement and detachment provide a unique way to assess and navigate the interplay between instrumental and intrinsic values as a relational rather than oppositional. This paper argues thinking about evaluation through this lens shifts evaluation's purpose away from predetermined, and often idealized notions of success based on outcome to a tool for learning about the processes that characterize the practice from which better systems of support, development and solidarity may be built.

Promoting 'The Nordic' through Soft Power: Strategic Narratives in the Nordic Council Prizes Award Ceremonies (1962-2012)

Henrik Fürst[1], Johanna Pettersson Fürst[2]

1Stockholm University, Sweden; 2Uppsala University, Sweden

In the context of recent global geopolitical shifts marked by populism and democratic setbacks, the Nordic Council has emerged as a noteworthy player, leveraging soft power through cultural diplomacy to foster collaboration among Nordic states. While lagging behind the EU and NATO in hard power, the Nordic Council has gained acclaim for its cultural awards in literature, music, film, and environmental achievements. This presentation delves into the strategic use of narration in the Nordic Council's award ceremonies to promote unity and establish the Nordic region as an identity community. The study examines digitized archival material spanning 50 years, from 1962 to 2012, analyzing speeches at award ceremonies to reveal how Nordic identity is constructed through aestheticization. The region is portrayed ambivalently—both as an imaginative haven of wonder and as one addressing historical failures. These awards not only acknowledge individual artistic excellence but also articulate historical frames of Nordic political cooperation. The study contends that this strategic narrative serves as a soft power tool, enrolling new actors in the Nordic political project and framing "Norden" as a cohesive community with shared values. By shedding light on the significance of awards in shaping Nordic collective identity, this study highlights their role in navigating challenges posed by the evolving global geopolitical landscape. The Nordic Council's ability to craft compelling narratives emerges as crucial to its power and legitimacy, offering insights into the dynamics of cultural diplomacy amidst geopolitical changes.

Chinese Response to Top Gun – New Geopolitical Visions and Cultural Reflections in High Profile Feature Film

Aleksandra Biernacka

Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland

Released in 2023 "Born to Fly", the Chinese blockbuster featuring air force pilots and their missions, has been produced by the Chinese major film studios and directed by military affiliated director Liu Xiaoshi in a bid to present alternative vision of geopolitical relations in the South China Sea basin. For years the place of the rising political and military tensions in the region, the South China Sea is perceived as a potential point of conflict between China and Taiwan and the Philippines supported by the US. Decision of the Chinese government to promote its goals through the means of feature film, copying and modifying the US born successful narrative of the "Top Gun" and "Top Gun: Maverick" might be a sign of foregoing transformation of thinking about means of rivalry, engaging artistic tools of shaping the soft power.

In addition to delineating geopolitical official goals and points of view, the "Born to Fly" takes the "Top Gun"-inspired narrative and transforms it in accordance with the Chinese storytelling characteristics: the relation of the hero to the world and people around him, editing sequences, and dramaturgy are molded into a model resembling Chinese popular fictions of recent years.

The comparative content analysis of the "Born to Fly" and "Top Gun" and "Top Gun: Maverick" presents the discursive differences and points of reference between the analyzed cases that set a stage for a new area of international communication between governments and cultures.

The Power of Arts in Transnational Dialogues: Exploring Cinematic Perspectives on Turkish-German Relations

Deniz Güneş Yardımcı

Istanbul Bilgi University, Turkiye

This paper is based on first findings of our ongoing DAAD-TÜBITAK-funded bilateral project 'Distant Neighbors: Exploring Political Narratives and Visual Culture in Turkish-German Relations' that aims at challenging the dominant narrative among contemporary prevailing scholarly debates on Turkish-German relations that mainly focus on political elites and decision-making processes on the diplomatic level of high politics (e.g. Arısan-Eralp et al. 2022; Aydın-Düzgit and Tocci 2015; Turhan 2019). From such a point of view, for example in the research fields of European Union studies and foreign policy analysis (e.g. Reiners and Turhan 2021; Tekin and Schönlau 2022) scholars often diagnose a growing distant and pragmatic relationship between Germany and Turkey due to an alienation in the European integration process and the strategic game between both countries around geopolitical concerns, the EU-Turkey deal on refugees and currently the Israel-Gaza war. Following this focus of analysis, the relationship is characterized as a transformation from a befriended to a rather pragmatic mode of cooperation.

By broadening the empirical scope from political elites to the art scene and cultural actors (filmmakers, novelists, musicians, artists etc.) from both countries in their European and transnational context, we argue that these actors, have developed and established practices and creative techniques in transnational cooperation and thereby overcome the nationalist-driven narratives of a distant relationship. Given both countries' growing ties in light of the 1960s labor migration from Turkey to Germany, today's postmigrant

126

and culturally diverse societies gave birth to a vivid transnational cultural scene. This paper investigates the influence of cinema in shaping present-day Turkish-German relations.

Video Games as a Tool for Creating "Good Citizens": Content Analysis of Media Representations

Egor Novgorodov

National Research University Higher School of Economics, Russian Federation

This paper looks at videogames as a field of electronic arts within the theoretical framework of Michel Foucault's biopolitics, juxtaposing the roles of video games in constructing subjectivity in different political contexts. The theme stems from the fact that while European and American video game projects increasingly feature elements of DEI, some non-Western regimes have also recently turned to the video game industry to advance their own narratives. Although the paper briefly examines the practices of different non-democratic regimes, the main focus is on the Russian context. A number of video game titles were announced there, suggesting the promotion of the values of patriotism, traditional family and a healthy lifestyle – which implies the possibility of using this art form for biopolitical framing.

The paper turns to an analysis of how video games are represented in the media – it is based on Stuart Hall's theory of representation and includes content analysis of popular Russian newspapers for 2022-2023. This analysis demonstrates that generally video games are presented in a negative way (they lead to dissociation, provoke violence, etc.), but in parallel there is a narrative of "import substitution" – the creation of "other games" that promote the values of the government. These findings are analyzed through the prism of the Foucault's concept of governmentality.

Therefore, this study gives explorative insight into how video games can be used to influence subjectivity and promote certain contextual narratives (thus creating "good citizens") – not only for DEI, but also for an authoritarian agenda.

The Impact of the COVID-19 Pandemic on Performing Practices of Professional Artists in Austria

Olga Kolokytha[1], Raffaela Gmeiner[2]

1University for Continuing Education Krems, Austria;
2University for Music and the Performing Arts Vienna

One of the changes the COVID-19 pandemic brought to the cultural sector was the shift to the digital and in the case of music, online concerts and initiatives that allowed artists to have more digital presence during lockdowns. As this "onlineification" took place in a short amount of time, however, there was not enough time for policy considerations or for estimations on the mid – and long-term impact of those initiatives for artistic production.

Our proposal focuses on Austria; it identifies the music landscape during the pandemic and discusses trends and developments to artistic practices and working cultures as a result of the pandemic. Our data collection method consists of semi-structured interviews with professional, self-entrepreneur musicians from different genres such as classical, jazz and pop, active in organising and/or participating in online events that were instigated by the COVID-19 pandemic.

We research the impact of the digital presence of musicians and in what way it affects artistic practices. We identify professional musicians' new artistic forms and co-creative processes, new working practices and new ways of income generation in a digital environment, and highlight restrictions and limitations to artistic work in a digital ecosystem. We also look into the new reality and discuss the vulnerability of labour conditions and the direct and indirect consequences on creative performers, and the impact of the new developments on the precarious working conditions of musicians in Austria.

Zooming into the literary trajectories: Three Ideal-Typical European Cases

Lía Margarita Durán Mogollón

Universität Siegen, Germany

Sociologists of translation and scholars of cultural globalisation have unveiled structural and symbolic mechanisms at play in the processes of literary translation: geopolitical factors, cultural policies, accumulated symbolic capital, pop culture and even news cycles have been said to influence translation flows. In this vein, researchers agree that translation flows are uneven and tend to follow a core – periphery structure that places English as the sole hyper-central language from which most translations are made, a few other languages in the distant semi-centre and the rest

127

of languages in the periphery. Based on the analysis of 60 semi-structured interviews with literary actors in Europe (authors, publishers, agents, translators, representatives of cultural centres, experts, etc.) this paper explores the nuance behind these structures by zooming into three ideal-typical translation trajectories; from the hyper-centre to the peripheries, from the peripheries to the hyper-centre, and from the periphery to the periphery. By doing so, this analysis exposes the particularities of such translation trajectories like the kinds of actors, discourses, institutions, instances of consecration and expectations involved in each one of them. Additionally, this work seeks to contribute to a more nuanced understanding of these structural positions; how are cultural policies, cultural proximity and media cycles affecting these flows? How are these structural inequalities shaping the perception and strategies of literary actors?

This paper is based on the research done as part of the EuroLit Project between 2022 and 2023.

"We Persist, Therefore We Have Hope": Collective Social Trauma And Communal Resilience Of Hongkongers Through Their Art Since 2019

Mandy Lee, Nicholas Johnson, Balazs Apor

Trinity College Dublin, Ireland

We are a group of Trinity academics coming together across the humanities and health sciences who organised an exhibition showcasing art by members of the Hong Kong pro-democracy movement, to explore themes of collective social trauma and communal resilience. Art has become one of the few avenues still open to the Hongkonger community to express dissent, and it is also a key medium by which members of a community, beset by mental health challenges following political repression, may find solace and support from one another. Communally shared art is crucial to maintaining community resilience in the face of acute regime pressures. Viewing protest art as a "repertoire of contention", we explore questions of trauma, resilience, solidarity, and resistance, and how these inform Hongkongers' emerging identity as a distinct ethnic community. Designed in consultation with members of the Hong Kong community, and bringing together transdisciplinary perspectives across narrative medicine, resistance studies and creative arts practice, our exhibition and discussion panel event was followed by in-depth interviews with the Hongkonger artists that explored their views and experiences regarding their art and activism, especially given their positionality as members of a diasporic Hongkonger community based in Europe and elsewhere where they made use of their freedom of expression to "voice out" for Hong Kong. We performed thematic analysis on these artists' interviews with the aim of generating a "transcultural understanding of resilience" (Meili et al, 2020: 332) and also to explore how art could represent a form of cultural resistance against transnational repression.

Music And Trauma On The Relationship Between Music And Cultural Remembrance

Magnus Ring

Lund University, Sweden

This paper address the role of music in relation to what here is defined as cultural trauma.

The text takes its starting point in Jeremy Eichler's (2023) project on the music of remembrance, in which he shows how music bears witness to history and carries the memory

of the past, using the cases of composers that lived through the 2nd WW and the Holocaust, the paper establishes a case of how music may work as a cultural memory carrying forward the meaning of a more or less distant past. As cultural trauma may persist over generations (e.g., the Holocaust or slavery) the living memory of these events fades, which leads to questions regarding how these memories still may persists and be addressed through cultural means of various kinds. The role of different forms of memorialization here becomes central. These events are not only memorialized in various institutional forms such as museums and/or monuments, but also by other means such as literature and the arts. The paper elaborate Eicher's sample of classic music by looking at cases of more recent forms of musical expressions that also relates to a troublesome and traumatic collective past. Using the theory of cultural trauma (e.g., Alexander 2004, Eyerman et.al 2011 2023) and a range of exemplary musical expressions as cases, the paper shows how various generations may find their own forms and expressions in respect to how to deal with the cultural memory of a common traumatic past.

Reception of Unofficial Russian Art (1957-1991) in France, Germany and the United States: A Comparative Analysis

Vera Guseynova

EHESS, France

This research explores how post-war Soviet underground art from Moscow has come to be recognized and legitimated in France, Germany and the United States since 1957 until 1991. The process of valorization is analyzed by examining the role of networks of different actors (collectors, gallerists, critics, etc.) involved in the transfer and promotion of such art. Using the notion of the "cultural intermediaries", I show how the contribution of various actors are crucial to how artists' careers develop and to how they are placed in the art market. As part of the analysis, I investigate the reception of unofficial Soviet-era art in the western press and critical space by drawing on Bourdieu's theory of artistic meaning [Bourdieu, 1992]. Artistic meaning is created by the narratives produced about works of art by critics through the use of particular language and categories, as well as the position taking in the field, and studying such language allows us to trace the transformation of aesthetic judgment since the 1960s in the West, as well as the parallel formation of art-criticism as a distinct autonomous field in Russia itself. Exploring the work of critics therefore helps us to understand the transformation of aesthetic judgment about and aesthetic value attributed to unofficial art. Drawing on the intersection of qualitative and quantitative methods of sociology, I propose to answer the question of how the label of "dissident" Soviet art was shaped through its reception in Germany, France, and the United States.

How Narratives Construct Symbolic Capital In Cultural Fields

Tommie Soro

Technological University Dublin, Ireland

Bourdieusian field analysis has provided a wealth of insight into the reproduction and transformation of hierarchies in cultural and occupational fields. Largely overlooked in this literature, however, is the role discourse plays in such reproduction and transformation. Indeed, the need for Bourdieusian sociology to better account for the roles discourse plays in cultural fields has been widely noted. Equally, discourse analysis has long called for the integration of field theory to better account for the context of discourse production. Recent research is addressing these needs by developing transdisciplinary approaches that bring Bourdieusian field analysis into conversation with discourse analysis. This paper makes two contributions to this research agenda. Firstly, it illustrates a novel theoretical and methodological approach to analysing relationships between nomos and field position on the one hand, and online genres, narratives, and performative statements on the other. Secondly, it empirically demonstrates how the symbolic capital of avant garde musicians is constructed through storytelling, genre-mixing, rhetorical devices, and performative utterances, and how this construction is bound to the nomos of the music field and the different positions of musicians within it. The empirical findings of this paper thereby shed new light on the online reputational economies of cultural fields, which appear increasingly important but remain largely understudied, while its novel approach contributes to a research agenda that aims to enhance both cultural sociology and discourse analysis.

RN03 | Biographical Perspectives on European Societies

RN03 | T01: Advances in Biographical Research

Biographical Dimensions of the New Social Architectures: Theoretical Reflections on Biographical Research for Post Pandemic Times

Maggie Oneill[1], Lyudmila Nurse[2]

1University College Cork, Ireland; 2oxford-xxi.org

What are the challenges for theorising, experiencing and doing biographical research in post-Pandemic time, a time which was characterised by social, physical/material distancing, isolation and for some, and ruptures to the biographical trajectory? Physical distancing altered and narrowed the nature of space/time of social interactions; it brought billions of people to interact via screens while some people re-connected, with nature and the natural world. What specific biographical research methods can inform a sense of our past, present and possible futures, their inter implications and their interconnections; the social conditions, social relations, social landscapes and their relevance; and the participatory and policy-oriented possibilities of biographical research, especially in these challenging times? (Nurse, O'Neill and Moran editors, 2024)

In this presentation we focus on theorising, experiencing and imagining the relationships between biographical research, space and time in Pandemic times by revisiting biographical theories in relation to the reconfiguring of temporalities/ time and the meanings of 'future' (Nurse, O'Neill et al 2020, O'Neill and Nurse, 2024). We provide examples from the development of Walking Interview Biographical Method (WIBM) (O'Neill and Roberts, 2019) which demonstrate the benefits of the WIBM as the creative combination of sensory experiences of storytelling with sensory immediacy of the visual/performative experience of walking, that opens up a discursive space, where embodied knowledge and experience are shared (O'Neill and Nurse, 2024).

Founding ruptures. Reading life stories in the perspective of Michel de Certeau

Davide Lampugnani, Monica Martinelli

Università Cattolica del Sacro Cuore, Italy

In the last decades, biographical research has gained increasing relevance and visibility in social sciences. Starting from different themes, many scholars have proposed and explored new perspectives, concepts, and research methods (Breckner & Massari, 2019). In particular, wide focus has been given to the relationship between individual biography and social change. Within this field, the contribution aims to analyze the concept of "founding rupture" ("rupture instauratrice") as proposed by Michel de Certeau in his works (de Certeau, 1987; de Certeau, 1994). By identifying four key dimensions (rupture of history; opening of possibilities; plural authorities; risk practice), biography could be read as an individual and social trajectory caught in the middle of a tension between continuity and change. The paper concludes by adopting the concept to analyze two life stories (Berteaux, 1981) marked by biographical crisis and radical changes enabled by the unexpected encounter with African street children: the first life story is that of the founder of Koinonia Community in Nairobi, Kenya; the second life story is that of the human rights activists and founder of Gandhi Charity NGO.

Exploring the Identity Transformation of Central European Cities over the Last Hundred Years. Poznań in the Memoirs of its Inhabitants

Jacek Kubera

Adam Mickiewicz University, Poznań, Poland

The paper presents the results of the quasi-panel biographical research conducted four times among the inhabitants of Poznań. The memoir competitions in the series "What was and is the city of Poznań for you?" were organised in 1928 (by Florian Znaniecki, creator of the inspired memoirs method), 1964, 1994 and 2021.

This series of competitions is an essential element of the Polish tradition of biographical research as it allows us to study the many transformations experienced by Central European societies and the inhabitants of cities such as Poznań. These included processes such as border shifts, mass migrations, demographic changes, tensions between ethnic and national minorities, industrialisation, modification in the urban structure, systemic political changes, and (especially nowadays) accelerated globalisation, environmental and urban movements, political polarisation, effects of the Covid-19 pandemic. The competitions were organised comparably, similar methodological assumptions were adopted, and the core of detailed questions was preserved in the competition announcements.

The biographical material collected at different stages of the development of Polish society provides insight, as if through a lens, into the evolution of the city's social system and the nature of the residents' relationship to the city in the context of the many identifications and processes taking place over almost a century. Based on the analysis of a sample of memoirs from these four competitions, the paper provides information about the internal diversity and transformation of the Central European urban identity. It also contains a methodological proposal for researching urban identity transformation from both synchronic and diachronic perspectives. The paper is the result of research activity Reg. No: 2022/06/X/HS6/00538 financed by the National Science Centre, Poland.

Between Forgetting and Remembering, What Are the Dialectics of Constructing One's Biography?

Catherine Négroni

Universite de Lille CLERSE, France

This paper will look at how Covid has changed our lives and our relationship with ourselves. A form of preoccupation with the self (Foucault, 2001), a preoccupation with care that was already present a little before Covid, has become more evident. Our aim here is to explore the relationship with the self and the way in which we tell and explore our biography through reminiscence and oblivion.

The life course is inscribed in precise socio-historical contexts, which typifies a singular journey (Elder, 1974) in the sense that it then becomes the witness to this intersection between global movements, local contexts and individual trajectories (Négroni, 2022). The prism through which we will view it here is that of the bifurcation, of the event, through the inaugural event (Kaufman, 2004) (Leclerc-Olive, 1997) that creates irreversibility (Grossetti, 2006). Based on the narratives of authors who are involved in a form of biographization of their careers, my aim is to look at and think about how "forgetting and remembering" are summoned up, and how this interferes with biography and in biographies. We draw on a number of authors who have worked and written about their own biographies (Edouard Louis, Annie Ernaux, Christine Detrez), in order to question the telling of the event, between reminiscence and oblivion in life courses, why forget, why remember ? What work is involved in this dialectic ?.

RN03 | T02: Biographical research in Portugal

Multi-perspective Biographical Research: Truth, Agency and Ethics

Ana Caetano

Iscte-Instituto Universitário de Lisboa, Portugal

This paper presents a reflection on transversal issues related to biographical research, namely concerning the idea of truth in studying lives, the agency of the participants in the research process and the research confidentiality related ethics. The discussion is anchored in the deconstruction of three critiques that were made to a biographical research project that used a multi-perspective approach, i.e., that analysed the biography of a person using first-person accounts, but also third-party testimonies. The first critique focused on the fact that the methodological design implied a quest for the truth of what a life is. The second expressed concerns over forcing others to talk about close people's lives. And the third was an accusation of not protecting the participants' right to privacy. The response given to these critiques is, in fact, a great opportunity to reflect on what a (multi-perspective) biographical research is, its potentialities and challenges, namely (i) the flexibilization of the notion of truth and the existence of multiple truths in biographical accounts, (ii) the capacity that participants (should) have to manage their involvement in the research, accepting challenges and establishing boundaries to protect themselves and others, and (iii) the concern to do no harm, by ensuring the participants' privacy, regardless of the research design. It is argued that, ultimately, the scientific scope and value of the research about people's lives will be defined not merely by the challenges and risks involved, but mainly by the actual research practices and strategies developed and put into practice to act upon them.

131

Understanding Social Inequalities And Territories Through Life Stories: Reflections On The Biographical Approach And Its Contributions To Sociological Knowledge In The Portuguese Context

Catarina Figueiredo, Leonor Medon, João Teixeira Lopes

University of Porto, Portugal

The Nucleus of the 'Museu da Pessoa' (People's Museum) of the Institute of Sociology, based in Porto, Portugal, was created in 2023 with the aim of building a digital archive of qualitative data to collect and disseminate life stories, in the form of oral testimonies, from a diversity of social actors, spread across the national territory and facing

different inequalities or vulnerabilities. With the interest of deepening the structuring processes of social inequalities and their territorial inscriptions and simultaneously valuing qualitative methodologies, particularly, life stories, the Nucleus intends to promote scientific research and future community and social intervention.

Considering the experiences from the previous and current initiatives developed within this Nucleus, this presentation aims to reflect on their contributions to further sociological knowledge, as well as on the potentialities and challenges associated with the biographical approach involved. Located in different social-territorial contexts in the northern region of Portugal, these initiatives focus on different social issues and promote analyses on the different forms of contemporary inequality, within the portuguese context. They also bring up the discussion about the relationship between academia and society, since life stories have the ability to mediate the communication between these two spheres, promoting closer ties between them and a broader awareness on the links between our daily lives and the social inequalities and challenges that structure contemporary societies.

Emotional Dimensions of Migration: A Biographical Approach

Liliana Azevedo

Iscte – Lisbon University Institute & University of Neuchâtel, Portugal

Drawing on two sociological studies on migration that use biographical interviews, I reflect on the emotional costs and effects of (return) migration for both (elderly) parents and their (adult) children, at the present time and throughout their lives. Between 2018 and 2022, I carried out ethnographic research with Portuguese migrants who returned when they reached retirement. Since 2023, I have been carrying out an exploratory research with the descendants who stayed in Switzerland. The comparison of empirical biographical data from both studies reveals the individual and intergenerational expectations and tensions that can arise around return, transnational care, and transnational family life. Emotions are constantly present in migrants and their descendants' life course and life stories, in their words, in their tone of voice, in their non-verbal language: worry, anxiety, sadness, frustration, patience, longing, relief, joy, hope, trust, obligation, among other emotions. (Return) migration is an emotional journey for both those who leave and those who stay. However, despite emotion is an important topic for migration research, it has attracted little attention from migration scholars, and it is still an emergent field (Boccagni & Baldassar, 2015). I argue that biographical research is a useful and appropriate methodological approach for exploring the intersection of these two fields of sociology: emotions and migration.

The Intersection Between Biographies: The Case Of Mother-Sibling-Biographical Disruption' When A Child In The Family Suffers From A Life-limiting Illness

Ana Patrícia Hilário, Fábio Rafael Augusto

Instituto de Ciências Sociais da Universidade de Lisboa, Portugal

Drawing from a qualitative study of the experience of mothers and siblings of children with a life-limiting illness in Portugal, this communication intends to present novel and important insights on how the biographies of relatives intersect during the child end-of-life trajectory. This interconnectedness has not been explored in detail regarding the experience of life-limiting illness in childhood. In-depth interviews were carried out with 5 mothers and 2 siblings. Five siblings were also interviewed using the draw, write and tell technique. The findings show that mothers and siblings had to redefine themselves: they both had to change their personal plans and rethink their biographies. We argue that the concept of 'mother-sibling-biographical disruption' should be applied to describe this experience. Building on the presented results, this communication seeks to enrich the field of biographical research.

RN03 | T03: Forgetting and Remembering

Forgotten Inequality: autobiographical remembrance by professors from east Germany

Laura Behrmann[1], Markus Gamper[2], Haag Hanna[3]

1Bergische Universität Wuppertal, Germany; 2University of Cologne, Germany; 3gFFZ – das Gender – und Frauenforschungszentrum der Hessischen Hochschulen

Being from East Germany continues to lead to social disadvantages in German society as a whole. Many East Germans still face devaluation, discrimination and marginalization and are disadvantaged in their access to valuable goods and positions due to their origin. The fact that the origin "East" is a determinant of social inequality in contemporary society is often forgotten in academic and public debate. Inequality research tends to focus on "West German" challenges, such as gender equality, ethnic origin and, in recent years, more often on questions of class. We analyze logics of displacement based on the autobiographical narratives of successful scientists–professors–from various disciplines and three generations born around 1940, 1960, and 1980.

This presentation aims to make social disadvantage visible through the group of professors and to discuss this in a social comparison, in the system transformation and between the generations. For this purpose, a theoretical and historical framework will be set and those with experience will speak for themselves, who have autobiographically written about their individual experiences on the way to a prestigious professorship with high status. Different birth cohorts (from 1941-1982) and their experiences in the respective educational and social system, as well as different disciplinary affiliations, will be presented. We would like to deepen this specific interplay of personal experience and social space of experience by first opening our eyes to the social space of experience. At the same time, the "invention of the West" will be deconstructed with the help of the autobiographies of East German professors. Subsequently, East German professors will have their say, which will be analyzed and discussed again from different perspectives at the end.

Remembering Mass Rapes Through Biographical Material of Victims During WWII.

Tinka Schubert

Institut für Praxisforschung und Projektberatung, Germany

At the end of WWII 1.9 million women and girls were raped in Berlin and Eastern Territories by soldiers of the Red Army, excluding victims in the territories of today's Czech Republic, Slovakia, Hungary and Austria. Yet, German, Polish, Yugoslavian, Hungarian, Austrian and even Soviet and Jewish women had become victims. During Soviet occupation women and men spoke openly about the problem of rape and mechanisms to address some of the consequences (pregnancy and venereal diseases). Especially testimonies of victims evidence the collective humiliation perpetrated, but also strategies to protect each other from harm. As soon as a certain normality was established and the GDR was founded, women had to pretend they had been spared to avoid social exclusion. The lack of acknowledgement and the inexistent access to justice reinforces the silence and stigma related to rape. Even in 2010, Hedgepeth and Saidel were criticised for bringing shame to the survivors of the Holocaust by transmitting the notion that Jewish women had suffered rape. Yet, considering the will of victims through their testimonies to make their experiences heard and the recurrence of this problem from other war zones, I analyze the biographical testimonies from these victims using the perspective of the bystander intervention prevention strategy. This analysis provides examples of how to successfully tackle VAW in the most adverse circumstances. Showcasing that men and women had certain agency to act to prevent or support women contributes to the understanding of what can be done today in cases of largescale rape.

Organizing Plurality. A Question on Remembering/Forgetting of Selves, Gender and in Narrative Interviewing

Folke Brodersen

CAU Kiel, Germany

133

'Organizing Plurality' focusses the depathological self-organisation of 'Plural Systems' – this self-designation describes the experience of having more than one identity. What used to be dealt with in terms of 'multiple identity disorder' has been reinterpreted in the last five years. Systems distance themselves from a genesis, which has usually been attributed to traumatic events, and emphasise the functionality of multiple identities.

The ability to manage multiplicity and dissent from the norm of singularity poses questions on 'remembering' and 'forgetting' in three ways:

(1) The form and structure of identity. The talk traces, how identities are differentiated from one another and placed in relation to others by remembering them. For example, the concepts of 'fronting' and 'host' provide information about the organisational effort required to ensure that a – more or less – distinguishable identity is present.

(2) Dimensions of socio-structural inequality and how these are made relevant. Systems negotiate gendered and sexualised positions, attribute them differently to identities and remember and shape a body as (un)fitting. The talk then poses the question how 'race' and 'class' are not marked as significant.

(3) Method of interviewing and interview research. Narrative analysis assumes, i.a., that a statement at the beginning of an interview can be connected with subsequent

content. These connections are called into question if the positioning of independent identities, forgetting memories and experiences is taken seriously. The talk therefor asks, how change in biographies must be considered.

The talk is based on a double empiricism of empirical subjectivation connecting therapeutic and self-help literature with self-positionings based on interviews. Thereby the talk criticises existing concepts of identity, rooted in singularity and continuity.

RN03 | T04: Compassion and Suffering

Embodied Representations of Suffering. Stories of Care to Family Members with Mental Distress Unveiled With Body Mapping

Micol Pizzolati

Università di Bergamo, Italy

In light of the crucially important and yet understudied dynamics of family grief, my research aims to explore the lived experiences of people whose close family members going through mental disorder treatments.

I approach the study of this complex issue through body mapping, a visual, narrative, and participatory method in which participants are considered knowledgeable, reflexive individuals who can better articulate their complex life journeys when painting and drawing their bodies and social circumstances.

Participants which experiences of care that spanned lengths of time from 20 to 50 years engaged in multimodal and sensory workshop-based storytelling: they were asked to trace a life-size body outline and decorate it with images, fabrics, and drawings for recounting their lived experiences of care.

The body mapping storytelling disclosed evocative images of intertwined anguishes. A thematic analysis cross-referencing visual and narrative data reveals that caring relations are underpinned by complex moralities, forms of obligation, contrasting feelings as well as the social judgement and isolation that circulate around suffering and care.

The research process opens thus a rare window into nuanced and multiple aspects of participants' lived experiences, the meanings thereof, and how these meanings are impacted by affective and social contexts.

My work contributes to scholarship that approaches suffering as an affective assemblage of bodies, discourses, practices, and performances whose complex relationality seeks to challenge the split between the mind and the body.

134

In (Biographical) Limbo: Ways and Limits of Articulating Past Individual but Ongoing Collective Experiences of Violence

Verena Muckermann

Ruhr-University Bochum, Germany

While there is already extensive literature on approaches to transitional justice for dealing with violent pasts, even in this established academic field, contributions from diasporas are generally underrepresented. Moreover, all these approaches require – by definition – an end to violence.

Yet, for the increasing group of internationally displaced persons of protracted conflicts, this end is often unforeseeable, which requires new strategies to articulate and acknowledge their suffering than already discussed in discourses on remembering and forgetting.

Based on ethnographic research as well as narrative interviews with Syrian refugees in Germany, the doctoral project asks how refugees articulate past individual, but ongoing collective experiences of violence in the context of massive state violence in Syria. It focuses on people who fled the direct threat of violence since 2011, but who remain displaced from their homes for (at least) as long as the violence continues. They find themselves in a complex position between the individual challenges of finding their way in a new country, dealing with past violence they suffered themselves, and the ongoing concern for those remaining exposed to violence in Syria. This, as an ongoing phenomenon, is hard to integrate into biographical narrations.

The data shows that – when narrating their experiences in this limbo-state between past individual and current collective experiences of violence – exiled Syrians position themselves dynamically in a temporal (past – present – future) and geographical dimension (Syria – flight – Germany), as well as between individual and collective interpretations of their experiences (myself – family/friends – population). Therewith, my paper sheds light on the (narrative) tools people employ to make sense of their experiences in these limbo states, which currently shape their biographies as well as (future) collective narrations.

Based on my research, I argue that it is one of the crucial aspects of our time to make academic efforts to build bridges to these communities in limbo. This includes listening to people's attempts to articulate their (ongoing) experiences, meeting mistrust with honest compassion and interest, as well as representing the narrated tensions, frustrations and inconsistencies that accompany being caught up in limbo.

Social Suffering, 'Lifeworlds' And Agency Of Social Assistance Beneficiaries In Luxembourg

Roland Maas[1,2,3,4]

1Luxembour Institute For Socio-Economic Research; 2Université Savoie-Mont-Blanc; 3Université du Luxembourg; 4FNR – Luxembourg National Research Fund

The fight against the growing at-risk-of-poverty and socially excluded populations in the EU Member States is being led by social investment policies aimed at fostering social inclusion through active labour market policies. Within this framework, this ongoing PhD project explores the impact of recent reforms to Luxembourg's guaranteed minimum income scheme, emphasizing activation towards the labor market. This research contributes to a better understanding of social suffering that 'activated' welfare recipients experience in their daily lives and how it affects their social inclusion process. Based on observations made in previous research, we assume that social suffering is a significant underlying component of the social exclusion process and presents a substantial challenge for populations receiving social assistance in order to reintegrate into the labour market and be socially included.

The aim of the study is twofold: First, we provide a comprehensive analysis of the origins of social suffering throughout participants' 'life' course, examining turning points whether linked to structural or individual causes, and their effects on life phase transitions.

Second, we investigate how social suffering affects the agency of the target population regarding the challenges they face in their "Lebenswelt" and the strategies they develop to articulate structural constraints and individual action.

The methodology uses qualitative research methodologies, which focus on the individuals' subjective points of view for explaining social phenomena. Data is collected through narrative interviews based on life course research as well as document research to contextualize information.

"My Life on the German-Polish Border" – Narratives of Everyday Life in Divided Towns in the Diaries of Their Inhabitants

Natalia Niedźwiecka-Iwańczak

University of Wrocław, Poland

135

The paper presents the results of research using the biographical method – an analysis of 14 diaries submitted to a memoir competition for residents of Polish border towns (Zgorzelec, Gubin and Słubice), organised as part of a research project. The analysis will focus on the following questions: How did the narrators experience and practice the border? How do they remember and narrate changes in their everyday functioning in different areas (work, leisure, contacts with people from the German side of the river) in view of the changing permeability of the border in relation to its transformation in different periods?

Zgorzelec, Gubin and Słubice were created after the Second World War as a result of the demarcation of the German-Polish border on the Oder and Neisse rivers and the separation of the previously existing German towns. The state border, whose permeability has changed over time, provides an important context for the functioning of communities in its immediate vicinity. In recent decades, the EU's border regions have moved towards social and institutional integration, creating spaces with multiple functional links. An important break in this process was brought about by the COVID-19 pandemic and decisions by central authorities to restrict or close down cross-border movement. These events have been described as a turn towards re-bordering (Wille 2020, Klatt 2020, Jańczak 2020). Restrictions on cross-border mobility have had a strong impact on the lives of border residents in the EU and have been interpreted locally as a failure of the centre to take into account the needs and interests of the periphery. Analysis of personal documents will provide an insight into the world of experiences of border residents.

RN03 | T05: Migration and Forced Migration in Europe

Two Young Immigrants Determined to Succeed Academically and Professionally: Ali in Germany and Aya in France.

Catherine Delcroix

Université de Strasbourg, France

Here we compare two migration journeys, the ones of Ali and Aya. Ali is a young Syrian from Alep whose middle-class parents helped at age 14 to flee with his brothers their country in the midst of civil war. They reached Turkey in 2011 and tried to resettle there, living from menial jobs. But Ali wanted to get higher education. He left Turkey and he ended up in a village in Germany. He decided to learn German through Internet, and moved to a large city where he succeeded in finishing secondary schooling ; and working at nights, finally got accepted at age 22 in a technical University.

Aya is a girl who lived in Tunisia. Her father is a fisherman with irregular income. Aya was concentrating on studying but she was forced to work in a fish cannery for very little pay. In 2021, she convinced her father to accept a smuggler proposition to take him, Aya and her brother aged 10. They reached Lampedusa then Paris. Her father went back to Tunisia. Her brother was entrusted to a French public institution but not her, at 18. But a French family offered to take care of her. She continud with her school career and could two years later enroll on a technical University. We will show how case studies open the door to obtaining knowledge of lived experience and provide what can be referred to as validation from within the case itself.

Transcending Faith: Value Transmission And Transformation In Evangelical Russian-German Families

Rebekka Hahn

Bielefeld University, Germany

The restructuring of relationships and embedded concepts of a good life and self during adolescence necessitates biographical work, explored in this study within the domains of family, migration, and religion. Adopting a generational perspective (Halbwachs 1985), the study investigates the relevance of remembering and forgetting, as well as suffering and compassion, in the adolescent transmission and transformation of values within evangelical Russian-German families.

Historically, self-perceptions and external perceptions as ethnic Germans have often motivated and facilitated the migration of Russian-German families from countries of the former Soviet Union to Germany. However, within evangelical Russian-German communities, educational paths, family structures, and gender roles often diverge from mainstream cultural ideals (Panagiotidis 2021). Now, how does the younger, German-born generation reconcile their concepts of life and self with the cultural heritage of their families while also navigating the options and expectations of a predominantly secular society?

Biographical interviews conducted with young women from evangelical Russian-German families (Demmer/Hahn 2020) reveal modern ideals of autonomy and authenticity (Taylor 1989) as a reference point for both the transmission and the transformation of communal values.

Biographical tension surrounding belonging and identity emerges in two distinct scenarios: Firstly, when interviewees sense alignment between parental and communal attitudes perceived as outdated or restrictive (Hahn/Demmer 2022). Secondly, when interviewees sense alignment between parental and societal attitudes, where continuous self-improvement becomes a promise and prerequisite for belonging and recognition. In both scenarios, the interviews prompt a focused analysis of how suffering and compassion (or their absence) relate to the interviewees' personal faith. This aspect is explored in the proposed contribution.

Shared Spaces, Shared Stories: Autobiographical Narratives of Dublin and Munich-Based Hosts of Ukrainian Refugees

136

Daniel Guigui

University College Dublin, Ireland

In 2023, the United Nations High Commissioner for Refugees reported that a staggering 117.2 million people were forcefully displaced. Of these, around six million are estimated to have fled the ongoing Russo-Ukrainian war into the European Union. Although there has been a growing body of research on migration and the socio-political impacts of large-scale displacements, there is a notable gap in understanding why people in metropolitan cities with highly competitive housing markets choose to share their accommodations with refugees. The existing literature mainly focuses on government policies and macrolevel social impacts, overlooking the personal motivations and material conditions that drive such decisions. Therefore, this research project aims to fill this gap by answering the question, "What conditions reflected in the autobiographies of Dublin and Munich-based hosts of Ukrainians explain the practice of sharing accommodation?" seeking to explore how individual life courses contribute to the practice of home-sharing with displaced individuals. The study's theoretical framework is based on empirical forms of everyday cosmopolitanism, emphasising the importance of a cosmopolitan ethics of sharing. The Biographic Narrative Interpretive Method, developed by Tome Wengraf, was chosen because it empowers participants to share their stories while providing a robust methodological framework for case-by-case and cross-country comparisons. The findings of this research are expected to provide valuable information

on the determinants of biographical narratives that lead to the manifestation of cosmopolitan outlooks, practices, identities, and ethics of sharing. By providing a nuanced understanding of how personal narratives can inform and enhance strategies to manage housing challenges in the wake of large-scale migrations, this research will contribute to a more comprehensive understanding of the practice of home sharing. Therefore, the results of this study are potentially interesting for academic researchers in empirical cosmopolitanism and policymakers seeking to foster and harness the positive effects of the cosmopolitan ethics of sharing to alleviate the bottlenecks in housing provision caused by unexpected migrations. Ultimately, this will ensure that our rapidly growing cities are welcoming to all.

I have not joined an ESA Summer School before.

Tensions and Paradoxes of Compassion and Trust at the European Borders. The Case of Activists Providing Help on Polish-Belarusian Border

Agnieszka Golczyńska-Grondas, Katarzyna Waniek

University of Lodz, Poland

The paper will grasp the paradoxes of providing assistance in the situation of the ongoing humanitarian crisis on the Polish-Belarusian border since the second half of 2021. It is about huge numbers of people from the Middle East and Africa seeking a safe shelter in Europe, but nomadic for weeks in the forests and swamps between Poland and Belarus. Drawing on personal documents (quasi-biographical interviews published in the press and books, but also autobiographical accounts in the social media), we will discuss the tension between the moral imperative to give aid vis-a-vis big European politics and a callous state. Preliminary analyses of the empirical material show a huge biographical costs borne by those who provide help including family life, work commitment, social life, but also an enormous psychological burden. The latter is associated not only with the sharing in the immense physical and mental suffering of people fleeing wars, persecution or poverty while caught in a trap of a cynical political game between Putin and the "fortress Europe", but also with the extreme indifference of Polish and European society as well as burdening public discourse presenting refugees as not-quite human, as criminals threatening state security or arrogant swindlers intending to abuse social system. This image radiates to the helpers, who are seen as gullible people seduced by "sad stories", or as traitors collaborating with enemies to destroy the "we"-community.

RN03 | T06: Biographical Research of Pandemic and Post-COVID Societies

The Role of Biographical Resources in Shaping Coping Strategies of Polish Doctors in the Pandemic Crisis

Jacek Burski

University of Wrocław, Poland

The proposed paper aims to analyze the role of biographical resources in shaping the coping strategies employed by Polish doctors during the institutional crisis triggered by the COVID-19 pandemic. Specifically, the study focuses on doctors in Poland who can be classified as frontline healthcare workers – those who worked in designated COVID-19 wards established in Polish hospitals following the pandemic outbreak. This particular segment of the healthcare system experienced significant challenges including changes in the labor process. The healthcare workers faced increased work intensity, organizational restructuring, revised schedules, altered tasks and responsibilities, heightened health risks, changes in compensation, disrupted work-life balance, and more.

The emerging research question is what ways of dealing with the mentioned problems were established by medical doctors on the collective and individual levels?

The proposed hypothesis is that individuals facing the COVID-19 pandemic crisis in the workplace utilize opportunity structures (Roberts, 2009) and draw upon "biographical resources" (Liebermann, 2012) which concern the totality of biographical experiences that can foster resilience, support life strategies, and provide additional assets to protect against consequences of crises one would experience during life.

The paper is based on the projects: „COV-WORK: Socio-economic consciousness, work experiences and coping strategies of Poles in the context of the post-pandemic crisis" which focuses on the consequences of the COVID-19 pandemic to the world of work, and "Residents in Crises. Biographical Dimension of Becoming Physician in the Polish Healthcare System" which covers the biographical experience of young Polish doctors.

The empirical material consists of the data extracted from 40 biographical narrative interviews conducted with medical doctors, nurses, paramedics, and non-medical personnel according to Fritz Schütze's methodology principles.

Return to Work

Veronika Sofia Schmid

Ludwig-Maximilians-Universität München, Germany

Why do people return to work? From this question as a starting point, the contribution turns to the empirical phenomena

137

of returning to work and, as part of the results of the underlying research, the role agency plays in the process and beyond.

The centrepiece of the qualitative PhD study is interviews with former drug addicts, who have or have had to deal with returning to work as a possible option. They all have successfully completed a therapeutical programme to address their addiction. This critical biographical event is occasionally termed a `rebirth` or `reinvention of the self` and marks the radical experience of completely losing one´s own ability to act.

How do potential re-entrants to the labour market attain agency? Returning to work is an issue the interviewees have to deal with as part of their struggle to regain agency. Does the process of returning to work itself foster or impede opportunities for action?

In order to answer these questions, the paper analyses the empirical material, guided interviews with narrative elements, using Grounded Theory according to Strauss and Corbin. The findings might be structured along the conference themes, tension, trust and transformation.

Tension evolves between the capacity to act and the desire to act. It also arises out of the experience of the total incapacity to act and the handling of the new possibilities. A crisis of trust can be stated for some of the material. It correlates with different feelings and conditions of being in the world with others. Remarkably, anger is only expressed by interviewees who are socially embedded in some way.

Transformation takes place in form of a transformation of the self through narration. Agency and the self as an acting subject are constructed by narration, far beyond its actual capacity. In the course of this, the anticipated ideal working subject provided an important point of reference for positioning oneself.

Narratives of Imprisonment: Suffering and Adaptation from the Pandemic Onwards

Alessandro Maculan

University of Padua, Italy

This contribution will focus on narratives of imprisonment drawing on qualitative data collected through semi-structured interviews with a sample of 26 male detained individuals in a Northern Italy's prison. Since the earliest qualitative studies conducted in the prison context in the last century, imprisonment has been described as an experience characterized by several sufferings, what have been called by Gresham M. Sykes (1958) "the pains of imprisonment". Over the decades, these sufferings have partly changed form (just as the penal and penitentiary institution has changed), maintaining, however, their intensity intact. With the recent pandemic crisis, however, the pain of imprisonment has been further exacerbated. With this presentation I intend to shed light on the stories of people deprived of freedom, exploring their experiences which are characterized by profound suffering and – especially during the pandemic and its subsequent management – a strong and deep sense of societal and institutional abandonment.

These biographical stories of detention reveal a widespread request for recognition of one's prison experiences (characterized not only by deprivation but also uncertainty, precariousness, and unsafety in overcrowded, unhealthy, and violent places), as well as an assumption of responsibility towards the penitentiary world which increasingly ends up being forgotten by society. From the interviewees' narratives, the strategies they have implemented to cope with the complex daily challenges inherent in detention will also be highlighted. Not only individual but also group strategies, where various forms of peer support and solidarity take on new contours from time to time.

Lights and Shadows of Educational Trajectories of Young Migrants in Pandemic Times: Navigating Educational Inequities through Biographical Perspectives

Amalia Creus[1], Ines Martins Macedo[2], Adriana Ornellas[3]

1Universitat Oberta de Catalunya, Spain; 2Universitat Oberta de Catalunya, Spain; 3Universitat Oberta de Catalunya, Spain

138

This proposal presents partial results of an international research project funded by the Spencer Foundation which explores educational inequities affecting racialised and minoritised migrants worldwide in the context of COVID-19. Based on a transnational case study developed in five countries (Brazil, Malta, Spain, the United States of America, and Uruguay) the research aims to analyze systemic and emergent post-pandemic inequities that impact the education of migrants within and across countries, building a complex vision of how these inequities intersect with race, gender, ethnicity, social class, and legal status. The research follows a biographical and narrative approach, based on deep interviews and focus groups, aiming to capture the nuances and textures of the pandemic as a 'lived experience'. The paper focuses on the Spanish case, which takes place in a vocational training school on the outskirts of Barcelona, which welcomes students who have dropped out of compulsory education. School dropout is a complex social phenomenon which impacts the lives of thousands of young people in Europe and particularly Spain, as one of the European countries with the highest rate of youth leaving school before completing compulsory education. Emerging results are now allowing us to analyze, from a biographical perspective, how young migrants make sense of truncated school careers in the regular educational system, unraveling the lights and shadows of their educational trajectories, that are often nonlinear, full of twists and turns, fueled by a context of exclusion, stigmatization, demotivation and disaffection towards educational institutions.

RN03 | T07: Biographies and Identities

Auto\Biographcial Stories of Social Class: Seaside Holidays, Education and Work

John Goodwin

University of Leicester, United Kingdom

As a sociologist inspired by C Wright Mills and his concern for the intersections of history and biography, core to my practice is working with respondents' biographical accounts. These are usually offered through stories and anecdotes curated, crafted, and honed throughout the person's life. These stories have been amended, embellished, edited and refined, but all point to private troubles, public issues, and the narrative arc of history. By exploring these stories, we gain insights into the problems of our time alongside biographical continuities and changes. My own autobiographical stories offer the same insights and have been a valuable tool for orienting my sociology approach. Born in a working-class mining town in the North of England, growing up during the 1970s and trying to enter work at the height of Thatcherism, deindustrialisation entirely shaped my early life. Stories from this time have helped me understand my troubles, the value of family and community, and what it was like to be on the receiving end of ill-considered education practices. In this paper, I explore these issues and the accompanying intersections of history and biography via three autoethnographic stories of social class: Visiting the Seaside, Learning to Read and Socks on the Sofa. These are mundane stories of the 'everyday' and the 'ordinary' but also point to the complex biography of working-class lives.

Biographical Approach In Studying Industrial Heritage

Maruta Pranka[1], Ginta Elksne[1], Maija Krūmiņa[1], Iliana Veinberga[2]

1Institute of Philosophy and Sociology, University of Latvia; 2Riga Porcelain Museum

In Latvia, various forms of testimony from the second half of the 20th century started to disappear, whether they were personal stories or tangible artifacts. However, in recent years, the industrial legacy of Latvia's Soviet era has drawn more attention, involving documenting recollections of the past of various industries.

The report aims to demonstrate the potential of the biographical approach in the study of industrial heritage by conducting walk-and-talk interviews with former workers of Riga Porcelain Factory in its old buildings and territories to investigate.

In Latvia, porcelain production commenced in the mid-1800s and gained cultural significance in the 20th century, contributing to the development of a distinct national style. However, mass production of porcelain in Latvia has ceased since the closure of industrial firms caused both by the collapse of the USSR, followed by changes in raw material and outlet markets, and by wider processes of deindustrialization worldwide.

As the context of interviews significantly influences their content, the research approach emphasizes the connection between interviewees' statements and the interview locations. The study collects diverse information about individuals' ties to specific places, the impact of social and political changes, and relationships within the local community. This technique has proven effective in activating memory processes and documenting remaining details related to the industrial legacy. The interviews primarily focus on life and work stories, including relationships among coworkers, as well as features of the manufacturing facility and its surroundings.

Afro-poles. Culture in the making

Piotr Szenajch

University of Łódź, Poland

For more than a decade now, a generation of Poles born into families of African immigrants from the communist and early transformation era has been entering adulthood. They grew up in Poland and were educated in Polish schools, Polish is their first language and they are saturated with Polish culture. Despite this, their countrymen on the street regularly address them in English, compliment them on their use of Polish, and at times vulgarly send them back 'to where they came from'. In a seemingly mono-ethnic and mono-cultural country until recently, the appearance of Afro-Poles remains a stigma of otherness and foreignness, carried with them constantly.

However, contemporary Poles of African descent – as reported in the press and as my first interviews show – not only consider themselves Polish but want to change Polish

139

culture and society, based on their and their families' difficult experiences. They have started NGO's, organized large-scale media actions, intercultural workshops and street protests, as well as addressed petitions. They have written memoirs, novels and essays about their condition. In recent years, at least five theatre plays, several books, a major contemporary art exhibition and a research group at an important art institution were devoted to the Black experience.

Within the scope of the study, I am trying to address issues of race and racism in the Polish context through a multi-layered description of the experience of being a Pole of African descent, including aspects such as social and cultural mobility, activism and cultural production. The study is based on auto-biographical narrative interviews, complemented by a photographic interview. The paper will be a mid-fieldwork work-in-progress presentation on the most recent findings.

RN03 | T08: Creative Applications of Biographical Methods

Biographical Perspectives on Public Anti-racist Mobilities

Outi Eline Kähäri

University of Oulu, Finland

Podcasts have recently drawn attention among researchers who study anti-racist media activism. An increasing number of podcasts connecting to the issues of racism have become a part of the digital activism formed in both national and transnational antiracist networks. These networks have accelerated intersectional discussions on gender, race, citizenship and migration often poorly represented in the mainstream media.

Youth and young adults experience everyday racism often in the form of mundane othering during their life course at schools, universities, and other educational institutions as well as in their transition to working life. In podcasts, discussants talk openly about their experiences, thoughts and feelings related to racism with persons who are 'like them' or are known to be their 'allies' in their anti-racist work. However, podcasting seems to mediate also through diverse socio-cultural boundaries because of its 'hyper-intimacy' and the feeling of closeness between the discussants and the audience.

By using the methods of podcast ethnography, I explore how young adults make everyday racism visible in podcasts produced in Finland. The study shows that many podcast producers and their guests employed biographical perspectives in making everyday racism understandable. In the analysed podcast episodes (N=18), discussants shared intimate individual, collective and vicarious stories on racism and they used affective autobiographical and collective memories to activate the listener's empathy on anti-racist practice. By comprehending the biographical meaning of racism, the empathic listener began to both cognitively and affectively conceive racism as a long-term personal life experience and collective social phenomenon.

The Formalization Of Informal Mechanisms To Support Survivors In Academia: The Case Of The CARE Centers

Ana Vidu[1,2]

1University of Deusto, Spain; 2University of California, Berkeley

Scientific literature has already shown – to address GBV – the importance of solidarity networks and of protecting both direct victims and those who protect victims of

140

gender-based violence; whom, if this protection also lacks for them, may become victims of Isolating Gender Violence (IGV). Within this context and aligned with the EU-funded Marie Sklodowska-Curie research project "UniswithHeart", which examines the different support mechanisms universities employ to assist survivors of sexual harassment and GBV, this paper's scope covers formal and informal mechanisms, including support networks, analysing how the latter deal with possible resistance in the academic context. The methodology included the analysis of 9 US universities and organizations, conducting 67 in-depth interviews and focus groups; and attending 6 support group sessions. Drawing on this, the paper shows the model of the CARE Centers, present within the University of California System, with more emphasis on the University of California, Berkeley. Our findings suggest that these advocacy Centers, named PATH to CARE at UC Berkeley, are confidential resources and highlighted as a mechanism that started as informal and became formalized by the university, recognizing their need and importance. The CARE Centers remained student-informed, offering survivors the protection and support they need. All the analysed biographical narratives, and people participating in the support groups, have improved their stories thanks to these Centers. Their efforts are addressed to transform the campus environment by caring for their most vulnerable community while being a model for other universities regarding survivors' support. Also, to successfully protect survivors in academia, tackling the connection between solidarity networks and IGV becomes crucial for survivors to break their silence and keep forward, continuing their personal and professional paths.

Transformative Trajectories: Navigating Multi-Crisis Challenges in Post-Pandemic Developing Societies

Marta Eichsteller

Univeristy College Dublin, Ireland

In the aftermath of the COVID-19 pandemic, particularly in Africa, developing societies grapple with unprecedented challenges, necessitating profound transformations for inclusive, sustainable, and economic development. This presentation leverages extensive data from the SIDA-funded NEXUS project, focusing on joint policy-making in low and middle-income countries. Guided by the theory of change, our theoretical framework highlights the complexities of navigating post-pandemic transformations.

This paper explores developing countries' challenges, especially amid demands for low-carbon, climate-resilient economies. The analysis encompasses multiple crises, including unstable governance, conflict, post-pandemic poverty surges, and the escalating impact of climate change. Based on qualitative comparative analyses of life history interviews conducted in seven African countries between 2019-2024, the study aims to unravel the intricate interplay of individual values, choices, and institutional arrangements.

Key findings emphasise the inseparable link between environmental sustainability, economic transformation, and social inclusion for developing societies to thrive. The study underscores the pivotal role of social institutions, such as communities and local networks, acting as both hindrances and catalysts for economic transformation and effective coping strategies in the face of climate shocks.

Crucially, the research identifies social inclusion, particularly in education for both genders, as a promising avenue for concurrently fostering economic transformation and environmental sustainability. The analysis suggests that investing in education, breaking gender barriers, and empowering communities are integral to sustainable poverty escapes. As we navigate post-pandemic transformations in developing societies, this research provides valuable insights for policymakers, practitioners, and scholars, allowing us to forge pathways towards a more resilient, inclusive, and sustainable future.

Transforming the Life Story: the New Empirical Model of Biographical Learning

Katarína Rozvadská[1], Saeid Aminjafari[2]

1Masaryk University, Czech Republic; 2Stockholm University, Sweden

The concept of biographical learning postulates learning from individuals' own life stories, which is particularly important to evidence in turbulent times. From the start, biographical learning was closely related to biographical research methods but is also connected to a particular educational practice of autobiographical storytelling. The research gap in biographical learning knowledge is no clear understanding of the internal processes that occur when an individual engages in biographical learning.

The study presupposes the process of making sense of biographical experiences can be evidenced through storytelling during the research interview. Data was collected through 29 biographical narrative interviews with adult learners in Czech higher education and analysed through different means of narrative analysis. The abductive synthesis of the results enabled the creation of the graphic model of the process of biographical learning.

The analysis showed that through storytelling, connections between experiences are created in three possible ways: learning by analogy, learning by audit, and learning by authority. Through the empirical model, it was discovered that identity is the guiding element for the selection, transformation, and integration of experiences. Identity is thus a condition and outcome of biographical learning.

Biographical learning is evidenced by creating meaningful connections between biographical experiences stored in the memory. The consequence of the process of biographical learning is the constant construction and reconstruction of one's biography and identity. Understanding these processes more fully can help to shed light on the mechanisms behind biographical learning and how it can be effectively facilitated in various settings.

Ethical Reflexivity in Participatory Research with Children

Anne Carolina Ramos[2], Andrea Riepl[1], Luiza Vafina[1], Nina Bingham[1], Yara Küng[3], Julia Steiner[1], Alexandra Roggensinger[1]

1University of Zurich, Switzerland; 2University of Fribourg, Switzerland; 3University of Bern, Switzerland

Doing participatory research with children entails various ethical challenges regarding power relations between adults and children in the field. The location where the research takes place, the consent and presence of parents and gatekeepers, the dynamics of the interviews, and the methods used can promote or limit children's participation. In this presentation, we discuss these ethical aspects using the example of our research experience in the project "WoKidS – Children's Well-Being in German-Speaking Switzerland (2021-2024)", in which children aged eight to 14 are participating. The presentation is based on an ethical reflexivity approach, in which different researchers involved in the field reflect on their research practice with children. First, we highlight the importance of informing children and gatekeepers about the research prior to data collection. To ensure that they are broadly informed, we developed a booklet for children and consent forms for parents and legal guardians. The consent forms are written in twelve different languages to include families from various migration backgrounds. Secondly, on the example of our project, we discuss different opportunities and levels of children's participation in the research. Lastly, we draw attention to the issues of privacy, sensitivity, and autonomy after the data collection. Here we address how we handled privacy and sensitive topics during and after the interviews and the children's right not to answer questions.

Navigating the Challenges of Implementing Children's Participation Rights in Policymaking: The Case Study of Chile

Paulina Loreto Jara-Osorio

Loughborough University, United Kingdom

The UNCRC participation rights application has encountered significant challenges. Its elements of emancipation, contradicting a paternalistic and adult-centric system, and the power families have over children, have been an important contest. Implementing participation rights confronts theoretical objections and practical challenges.

A significative case study is Chile, which has been facing a process of socio-political, economic, and cultural transformation, and has embarked towards a constitutional change in which childhood is identified as an area of social demands. There is a debate over the position that children and adolescents should have in Chilean society, especially around the idea of being social subjects and protagonists of the processes in which they are subjects of intervention.

This qualitative research examines whether it is necessary to incorporate childhood participation in public policymaking in Chile and the consequences of this aim for childhood, policymaking, and social programs. The Mosaic Approach, coupled with semi-structured interviews, played a pivotal role in unveiling and juxtaposing the perspectives of children, adolescents, Chilean practitioners, experts, and policymakers.

The nature of childhood participation in public policies should consider intergenerational practices as the public sphere arena is a territory of all the social actors who are involved in the participative experience of children and young people. Also, the redistribution of power is essential for this, being necessary to consider the political factor, and understanding that political participation is the exercise of Human Rights. The exercise of children's participation rights evokes the necessity of participating in the development of their own country.

The Role of Digital Tools in Increasing Trust and Enhancing Dialogue in Research Work with Young People with Migrant Backgrounds

Sara Amadasi

Università di Modena e Reggio Emilia, Italy

Although children and adolescents are often experienced and at ease regarding the use of digital technology, there seems to be a lack of works that explore the potential of digital tools in promoting the participation of children and how these tools can be included in the context of field research to increase trust and, consequently, dialogue. This lack is even more evident when it concerns research experiences that involve children and teenagers with migrant backgrounds.

This paper presents some data collected within a research project with unaccompanied minors and a group of teenagers with migrant origins.

The study aimed to investigate how young people construct their sense of belonging through the selection, within their mobile phones, of pictures of places that are important to them. Participants were then asked to choose a story linked to those pictures and to record it, with a personal selection of music tracks, to create a podcast to be shared with the group of young people involved in the research. The research was conducted in Italy and digital tools were adopted to facilitate dialogue and increase trust during the research process.

Data show that the use of digital tools can enhance the epistemic authority of children and teenagers, with relevant

142

effects on dialogic dynamics which are based on trust, with the consequence of fostering young people's possibilities to tell stories about themselves and places that are important in their lives.

"Childhood and Digital Storytelling From Television to the Internet"

Angelo Romeo

Guglielmo Marconi University of Rome, Italy

Childhood with digital changes has undergone notable transformations, which have redefined times and places of coexistence between parents and children and has also led to a significant change in media storytelling, that is of the way in which children are narrated within the media and how they themselves become consumers of the media themselves. Through an analysis of cartoons, especially Italian ones, but also known in other European countries, with a reading that passes from traditional to digital media, (from the 80s to today) it is possible to understand the change in childhood from a media point of view , taking up the concept of "Cultural Reproduction" to which W. Corsaro's sociology of childhood and contemporary theorists refers, it is possible to underline the way in which children become protagonists of the media scene and of consumption choices, not only of cartoons but also of recreational products, meeting places, which directly influence the social practices of the family. This analysis highlights new forms of storytelling, which undermine the communication models of television, which does not die, but becomes less and less attractive for children, who are more digitally expert than their family members.

RN04 | T01_02: Research Processes and Artistic Doing

Children's Participation in the Transformation of Common Spaces: a Participatory Process in a Deprived Community from Children's Perspectives

Gabriela Trevisan, Mariana Carvalho

ProChild CoLAB, Portugal

Children's participation in public spaces has been widely discusses in the Sociology of Childhood, particularly by its valuable contributions to communtity well-being and benefitial aspects of intergenerational experiences. Moreover, children's perspectives are also seen as valuable for designing action in community and local projects as a condition for social change (Johnson, 2020). As several authors have also suggested (Percy-Smith, 2010; Trevisan, 2023; Sarmento, 2023, amongst others) local and proximal settings present themselves as more effective for children's effective participation rather than formal structures are capable of, most of the times. The experience we bring is a result of a participatory process of children and young people's participation (aged 6-16 years old) in a deprived neighbourhood of the North of Portugal where, for 3 years, mapping exercises, community meetings, exibitions, public discussions and presentations and actions of spatial recognition were built also with the larger community members. Dyagnosing the public space of the neighbourhood, identifying needs and wishes, projecting children's imagination as a transformative and revealving force, it was possible to create a "script" that comprises the idea of community well-being from children's unique perspectives. The results show a multi generational view that children are capable of producing on public space. A particular graphic and visual language was created with children in order to recognise children's actions and project products, namely, pamphlets and 3 dimensions of visual registration of public space: photo, drawing and writting. The main of the process will be discussed.

143

Can Childhood Studies Be More Awesome? Some Notes On The Practicalities Of Awe As A Conceptual Tool In Studying Children's Agency And Engagement With The World

Aleksandra Zalewska-Królak[1], Maja Brzozowska-Brywczyńska[2]

1University of Warsaw, Poland; 2Adam Mickiewicz University, Poznań, Poland

Looking at the agentic child of childhood studies (and given its conceptual ambivalence), especially in the context of their lived citizenship and social/political participation in the world constantly reshaped by transformations, flooded with tensions, and lacking trust, including trust in the future, it is hard not to notice that to fully grasp the specificity of children's engagement, its potential, and its limitations, one must take into account—probably more explicitly than ever before—what we call its affective landscape.

To somehow chart this landscape, we used the concept of awe that, alongside wonder, imminently conjures childhood experiences, but is rarely featured in sociological analyses of children's emotions, especially in the context of their agency. As awe implies both self-diminishment and increased connectedness with other people; we see it as a useful lens to study children's formative relationships with the world and a useful conceptual bridge between affect and action. To better understand the complexities of awe and its interpretations, we conducted a literature review of childhood studies research from the last two decades, exploring the concepts of awe, wonder, and amazement, but also mindfulness, empathy, connectedness with nature, and biophilia. We created a practical definition of awe that focuses on its prosocial aspect and investigates its analytical potential in understanding young people's actions and engagements in a world filled with uncertainty, loss, and grief.

Our conceptual endeavours are both an invitation to further exploring these possibilities in various social contexts and a disclosure of the idea of constructive hope that stems from love grounded in wonder and awe as the foundation for children's agentic involvement with the world.

Children's Political and Aesthetic Enactment: Learning from Frequencies, a Global Archive of School Student Canvases

Deborah Jane Crook

University of Central Lancashire, United Kingdom

Frequencies is a long-term international project led by Turner-prize-winning artist Oscar Murillo that has enabled children to make their marks on canvases fixed to desks in classrooms across the world. Since 2013, students in 350 schools in 30 countries have participated, producing over 40,000 canvases. Undirected mark-making can provide a new lens for reflection that disrupts dominant patterns of knowledge construction. How children expressed their being whilst at school was explored through a research study that examined a sample of the canvases from 12 varying geographical and cultural contexts. The stages of analysis challenged developmentalist conceptualisation of children's art as the expression of evolving self-awareness and ignorant of subject matter, with little value in itself. Instead, I contend that children's representations of their surroundings, and the universality of scribbled symbols, demonstrate a sophisticated sense of human symbiosis with the world. Images of celebration, of war, and belief, enabled children to express communicative competences and emotional capabilities that they are not supposed to have at school, revealing their self-awareness and understanding of their selves in relation to the perceived world around them. There is further tension between the natural and manufactured, through representation of the colonisation of minority world ideas, with brands and media appropriations littered throughout the canvases. And yet there is hope as children resist the heteronomy evoked by school, by changing the rules of child art towards political and aesthetic enactment that suggests the 'product' of their endeavours is just as important as the mark making process itself.

"I Had my Older Brother…": Constructions of Childhood and Youth in University Students' Life Stories

144

Anne-Sofie Nyström

Uppsala University, Sweden

The presentation aligns with existing scholarship on constructions of age, childhoods, 'becoming', and children's agency in life stories. Positioned within the broader landscape of life story research, this analysis seeks bring forward constructions of age within university students' narratives. In the paper, findings from a larger project about under-represented students' trajectories into university physics programs are presented, focusing the life stories of 21 university physicists through a narrative analysis. The data was developed through loosely structured timeline interviews, during the dialogue and construction of a timeline different aspects of the interviewees' lives were made meaningful, intelligible, and used to position them.

The paper places a significant emphasis on the portrayal of childhoods and the agency of children within their trajectories. Previous research has often explored scientists' life histories, emphasizing pivotal moments and influences that shape their academic identities. However, this study extends beyond these frameworks by drawing attention to the construction of age (and its intersections) and the agency of children, particularly within the context of science narratives. By highlighting the role of peers, including siblings and friends, the research explores understandings of

the influences of childhood relationships for facilitating and hindering science interest and science identities. The paper contributes by offering insights into how the agency of children, as portrayed in physics students' narratives, shapes their 'becoming' as adults and scientists. In such, it seeks to advance our understanding of the multifaceted dynamics involved in the construction of age, childhood and youth.

RN04 | T02_01: Intersectionality and Difference

Looking Beyond Policy: A Critical Analysis Of Children's Work At The Agbogbloshie Scrapyard In Ghana

Joyce Serwaa Oppong

University of Edinburgh, United Kingdom

The debates about children's paid and unpaid labour services in both the public and domestic domain are well-documented. In this paper, I draw on empirical research to explore the lived experiences of children working as electronic waste recyclers at the Agbogbloshie scrapyard in Ghana. My research questions address agency and children's work, the social construction of childhood and children's work and stakeholders' perception of children's work in the setting.

Undertaking ethnographic research, I observed and interviewed child workers who were street children and children living with their families or carers in the urban slums of Sodom and Gomorrah in Ghana. In addition, I interviewed adult workers at the scrapyard and government and non-governmental organisation officials.

The findings revealed the tension between policy and culture as children's work in the e-waste industry is considered child labour but the children were allowed to work due to constructs about childhood and work in the setting. I identified the transformative impact of children's work on their lives and their families. Children who lived independently took care of their basic needs and education without adult support. In a setting where social intervention policies are bedevilled with challenges, children's paid and unpaid work supports family income and ensures social cohesion. Through work, children are socialised to express reciprocity and obligation, acquire strong work ethics and become responsible members of the community. However, while children's work was beneficial, the children experienced abuse, economic exploitation and state-produced harm owing to policies that do not acknowledge children's work and hence do not offer protection which deepened their plight.

In summary, ignoring the cultural, contextual and situational differences when implementing policies could impact children's well-being.

Who Is Afraid of the Queer Child? Constructions of Childhood and Gender in the Public Discourse on Drag Queen Readings for Children.

Jana Miktas

University of Vienna, Austria

The study of public debates on gender and trans issues focuses primarily on anti-gender movements. Despite the central focus on children in the discourse – for example through "early sexualisation" or "indoctrination" – a thorough analysis from a childhood studies perspective has so far been lacking.

Based on the public controversies about drag queen readings for children in Vienna in the spring of 2023, I focus on the entanglement of childhood and gender as contested concepts and ask about the discursive constructions of childhood and their relation to gender.

The data basis for the study are press statements and social media postings of central discourse producers (actors from civil society and political actors from the Vienna City Council) as well as the reporting in Austrian newspapers around the drag queen readings for children in the spring of 2023.

Using the methodological approach of situation analysis, all the discursive positions on the child and childhood and gender were reconstructed. In doing so, I show, first, the heterogeneity and complexity of the constructions, second, marginalised and not taken positions and, third, positions for and against drag queen reading for children.

Based on this analysis, heterogeneous constructions of the child and childhood in relation to gender become visible, which, alongside protection and innocence, also produce notions of autonomy and danger, thus echoing established and historically rooted images of the child (Smith 2012; Walton 2021). Further, the study highlights clear differences in the construction by supporters and critics of drag queen readings for children, but also shows overlaps in some positions.

Tracing Transformative Trajectories: The Diverse Impacts of COVID-19 on Child and Adolescent Well-Being in Germany

Sophia Chabursky, Christine Entleitner-Phleps, Inga Simm, Alexandra Langmeyer

German Youth Institute, Germany

The COVID-19 pandemic has notably impacted children and adolescents' mental health, significantly increasing stress, anxiety, and depression (Miao et al. 2023; Ravens-Sieberer et al. 2023). Studies highlight that children from families with lower socio-economic status or single-parent households are disproportionately affected (Ng & Ng, 2022; Ravens-Sieberer et al. 2023). This underscores the need for

146

detailed, longitudinal studies to track changes in well-being and identify long-term trends.

Our study aims to examine longitudinal well-being trajectories among children and adolescents during the COVID-19 pandemic and identify key factors influencing these trajectories, particularly among vulnerable groups.

We use Latent Growth Mixture Modeling on data from the representative large-scale panel "Growing up in Germany", starting in 2019. This approach analyzes the evolving patterns in the well-being of children and adolescents throughout the pandemic. We measure well-being using the Strengths and Difficulties Questionnaire (SDQ) scores, reported by primary caregivers of children aged 4 to 17 years. The SDQ, a brief behavioral screening tool, effectively captures the multifaceted aspects of psychological health. Our sample includes 1,846 participants, spanning critical developmental stages and offering insights into the pandemic's varied effects across different age groups.

Preliminary analyses reveal significant variations in SDQ scores, highlighting the pandemic's uneven impact. Factors such as material deprivation and family climate emerge as significant influencers of children's well-being. With the latest 2023 data, we continue to analyze distinct trajectories between different age groups, enhancing our understanding of these complex dynamics even after the pandemic.

This study charts diverse mental health trajectories and contributes to understanding how global crises like the COVID-19 pandemic can drive transformative changes in societal structures and individual experiences.

Young People's Attitudes To Wearing Masks During The COVID-19 Pandemic: Exploring Rights And Responsibilities

Colin Leonard

Queens University Belfast, United Kingdom

Colin Leonard – Queen's University Belfast

This paper explores the extent to which young people (age 14-18) considered the COVID-19 pandemic in moral terms and how they viewed compliance around regulations and requirements to wear face coverings in varying settings. The research uses the work of Goffman as a theoretical framework for exploring the extent to which young people position themselves in relation to morality. Morality is intimately connected to rights and responsibilities and the balance between the two is fraught with ambiguities and contradictions. The research is based on responses to a written exercise whereby young people were asked to reflect on whether they had a responsibility to wear a mask or a right not to wear a mask. 270 young people from 7 schools in Northern Ireland took part in the research. Analysis of the data indicates that young people divided responsibilities into three types: personal responsibility, social responsibility and collective responsibility. The paper will illuminate attitudes to these constructions of responsibility and how they equate with opinions related to the right not to wear a mask.

RN04 | T03: International Justice: Processes in Research

Ethical Tensions When Undertaking Co-produced Research With Children: Questions Of Intergenerational, Epistemic Justice?

Kay Tisdall[1], Patricio Cuevas-Parra[1], Marlies Kustatscher[1], Vicky Lafantaisie[5], Christina McMellon[1], Carol Robinson[2], Monica Ruiz-Casares[6], Aurelia Di Santo[3], Nicole D'souza[4], Laura Wright[1]

1Childhood & Youth Studies, University of Edinburgh, United Kingdom; 2University of Strathclyde, United Kindgdom; 3Toronto Metropolitan University, Canada; 4Dalla Lana School of Public Health, University of Toronto/ McGill University Canada; 5Université du Québec en Outaouais, Canada; 6Toronto Metropolitan University/ McGill University Canada

Children are increasingly involved in social research, not only as research participants, but in co-producing the research from research design to knowledge exchange. These developments have challenged our current academic ethical policies and systems, which have too often blocked, hampered or delayed such research rather than enhanced it. These tensions raise questions about intergenerational, epistemic justice: to what extent are children recognised and supported as knowledge producers? The presentation draws on a range of collaborative research projects involving children in co-produced research, to discuss three testing issues. First, if children are involved in data generation and analysis, how should their moral rights to authorship be recognised? The defaults of many ethical policies are that children should be anonymised as a protective measure when involved in social research. Second, there are legal concerns, ethical constraints and sometimes prohibitions about children's images being used publicly, and even more so online and in social media. This perpetuates the invisibility of children in social research but (again) is often argued as a protective measure, especially recognising the replicability, longevity and power of visual images online. Third, if adult researchers are economically or otherwise supported to contribute to social research, how should children's contributions be similarly recognised? Ethical policies differ substantially on whether and how children should be compensated or acknowledged for their research contributions. The presentation seeks to explore various perspectives, values, and principles that can address such issues and contribute to achieving epistemic justice in co-produced research with children.

147

Children's Participation Inside Shelters Between Multiple Tensions: An Analysis Through Modes Of Action

Daniel Pascal Stoecklin, André Cardozo Sarli

University of Geneva, Switzerland

This paper stems from a nationwide research with children in streets situations in Brazil, who are placed in institutional care (colloquially known as shelters). In our field, we visited 10 institutions in 5 major cities in all regions of the country and spoke with over 50 teenagers and 20 staff. We shed light on their participatory capability, defined as "the capacity of the child to effectively participate in the definition and fulfilment of choices that affect his/her own life" (Stoecklin & Bonvin, 2014, p. 66). Their participatory capacity lies in opportunities that they are more or less able to build by relying on institutional structures.

We focus on their participation from a frame of children's rights, which we argue are mediated by transactional horizons – "symbolic landscapes channeling social interactions" (activities, relations, values, motivations and images of self) (Stoecklin, 2021) – which allow actors to negotiate the institutional order that constitutes their daily environment. We observed three distinct types of participation: adaptative, cooperative and innovative (conflict-free or confrontational). By focusing on the underlying modes of action that mediate the effectivity of children's rights, we identified tensions between, on one side, the dominating entrepreneurial mode of action, triggered by neoliberal discourse focused on achievements and metrics and often reflected in the requirements of donors and public power, and, on the other side, the needs reflected in the in-betweenness of shelters from the modes of actions prevalent in the teenagers' discourse, especially relationships (need for trust) and images of self (need for transformations).

The Case for Intergenerational Alliances For Social Change

Jo Moran-Ellis

University of Sussex, United Kingdom

The Sociology of Childhood has much to offer by way of challenges to existing social orders which support structural inequalities. In recent years there has been a growing recognition that generational relationships are significant in social orderings. Recent climate activism has positioned the generational order as (potentially at least) problematic when it comes to bringing about social change. In this paper I argue that whilst this can be the case, effective positive social change needs to embrace the possibilities that intergenerational alliances could open up. However, such alliances require methodological support and a clear theoretical foundation to support their capacities. I examine the theoretical starting points for generational structures, and then develop an alternative way of thinking about the constellation of agency, structure, and relationality around

axes of age and generation. Following on from this, the aim will be to show how a methodology (empirical and practical) of building mutual understanding and shared insights can foster powerful alliances which holistically address key areas of social change and social justice. The role of trust will be core to this argument, as will questions of mutual and competing interests.

Learning From Intergenerational Research Embedded In Mountain Epistemes

Vicky Johnson

Centre for Living Sustainability, University of the Highlands and Islands, United Kingdom

Mountain epistemes require interdisciplinary and structural exploration of community intergenerational agency across different geographies. Mountain spaces demonstrate precarity and are perceived as liminal and marginal. This paper will explain how mountainscapes are being understood through partnership research focusing on traditional and contemporary cultural-ecological and intergenerational community knowledges and experiences in changing environmental and political contexts, and in the recovery from the covid pandemic. Using an intergenerational research approach rooted in changescape analysis, the multidisciplinary research teams in Scotland, and international partners, will develop spaces and mechanisms to surface voices that are marginalised in mainstream political processes. Child and youth agency will be supported to ensure that there are creative and participatory spaces and processes to ensure their meaningful engagement throughout the research. Intergenerational exploration of lived experience will not only inform insights into survival strategies across generations in communities but will also underpin a comparative analysis of community knowledges across geographies. The multimethod social research is embedded in historicity, ethnographic interviewing and observation, and creative and participatory strategies, sensitive to insectionalities, including age and gender. The partnerships across the Highlands and Islands of Scotland and internationally, including in the United States and South Africa, will develop insights on how to implement community-informed, place-based, and intergenerationally sensitive governance systems in mountainscapes. Learnings can in turn serve as exemplars for embedding intergenerational justice in development processes in rural and remote communities.

RN04 | T04_01: Intergenerational Justice in Care and Education

Social Consequences of Early Learning in Danish Early Childhood Education and Care Institutions

Karen Ida Dannesboe

Aarhus University, Denmark

This paper explores transformations of children's everyday lives in Danish early childhood education and care (ECEC) institutions due to an increased focus on early learning. Since the 1990s, promoting early learning has been a key objective in Danish ECEC sector, reshaping the Danish social pedagogy tradition characterised by a child-centred approach with a strong focus on children's play and social relations (Gulløv 2012, Karila 2012, Kjørholt 2013). Various policy initiatives and legislative frameworks have promoted a greater focus on educational content within Danish ECEC (Bach et al. 2020, Dannesboe & Kjær 2021, Dannesboe et al. 2021). Today, ECEC institutions are required to support learning environments and create learning opportunities for all children (Juhl 2018). The aim of this paper is to investigate the consequences of the increased learning agenda for dominant ideals of early childhood and children's everyday lives and social relationships ECEC. How are social dynamics and divisions among young children conditioned by the institutional (learning)environment and everyday rhythms ECEC? The paper present preliminary findings from an ethnographic study of 3-5 year old children's social engagements in Danish ECEC institutions. To address, how children's complex social lives unfold in dynamic exchange with local learning contexts and the pedagogical, social and material landscape of ECEC, I draw on childhood studies emphasising the entanglements of children's practices and social-material environments (e.g. Spyrou 2018, Alasuutari et al. 2021, Rautio & Stenvall 2019). The paper will provide knowledge on changing conditions for young children's lives in institutionalised contexts and early childhood.

Trusting Young Children's Knowledges and Agency: Early Childhood Education, COVID-19 and the Challenge to Developmentalist and Neoliberal Childhood Discourses

Marlies Kustatscher, Juliet Hancock, Gillean McCluskey, Annie Taylor, Kay Tisdall

University of Edinburgh, United Kingdom

Early childhood education has exemplified competing discourses about childhood: the continuing emphasis on developmental ideas; a site of economic investment within neoliberal politics; and as a potential space for respecting, supporting and fulfilling children's human rights. The tensions between these discourses came to the fore during the COVID-19 pandemic, its accompanying policy responses and subsequent retrenchments.

We draw on a comprehensive review of the literature – carried out for the Scottish COVID-19 Inquiry – on the impact of the COVID-19 pandemic, and the policy responses to it, on the education of children under five in Scotland. It details how these impacts have been experienced differently by young children who face disadvantages based on socio-economic exclusion, disability, race/ethnicity, and other intersecting inequalities, and adds to wider evidence on how COVID-19 has exposed and exacerbated such structural inequalities.

This presentation discusses how the COVID-19 pandemic, and policy responses to it, have shaped meta-narratives around early childhood in favour of a return to reinforcing developmentalist, neoliberal discourses. This is exemplified, for example, in increased standardised testing and milestone-tracking and the sidelining of play in favour of more structured, adult-led pedagogies. There is a tendency to shift towards individualist lenses (e.g., exemplified in constructions of some children as 'vulnerable') and neglecting complex and nuanced systemic issues. We highlight early childhood education as a politicised space, illustrative of other arenas of childhood, with the potential to transform children's lives by trusting their knowledges and agency.

149

An Exploratory Study on Young Carers in China: Conceptualising Childhood for Children Who Care

Kefan Xue

University of Oxford, United Kingdom

Many children provide care to parents and/or other family members who have illnesses or disabilities. These young carers are present in every country. Studies worldwide show that caring responsibilities hugely impact young carers' livelihoods and future opportunities. In contrast, young carers in China have yet to be recognised, with scant statistics or academic research on this topic. It means that this group of children currently goes unnoticed by society and thus receives little support. This exploratory study aims to understand the lives and needs of children who care through the lens of intersectionality. It also intends to conceptualise childhood and caregiving in the Chinese sociocultural context. The fieldwork has been carried out in rural and urban research sites of a southeast coastal city in mainland China. 30 young carer families have participated in this study, including 30 young carers aged 12 to 17 years old, and 30 care recipients or other family members. Other participants include 12 professionals and eight school staff members. In total, 80 semi-structured interviews have been conducted. I also carried out participant observations with the young carer families and questionnaires with the children, to explore the nature and extent of their caring and how caring impacts different aspects of their lives. Findings show a series of 'push and pull' factors that put children

into a caregiving situation; however, being a young carer is not a choice. When their experiences conflict with an idealised normal childhood, these children try to negotiate with themselves, their families and societies.

Preschool Tactics for Claiming Space for Daily Outdoor Activities in Dense Urban Environments

Katarina Gustafson[1], Danielle Ekman Ladru[2]

1Uppsala University, Sweden; 2Stockholm Universtiy, Sweden

In the Nordic countries, childhoods are intimately related to nature and being outdoors. However, urban densification has resulted in shrinking outdoor spaces for play and recreation, including fewer and smaller preschool yards, with consequences of tension and competition between different interests and urban users. Based on mobile ethnography (Cresswell 2012), this presentation focuses on how inner-city preschools in Stockholm without their own preschool yards or with just a small enclosure, organise and perform everyday outdoor activities in a dense urban environment.

Together with theories of children's collective agency (Corsaro 2018), space as co-produced and negotiated (Massey 2005), mobility as interdependent and more-than-human (Cortéz Morales 2021; Ekman Ladru & Gustafson 2020), we draw on De Certeau's theorization of the practices of everyday life (1984) in order to understand the preschool groups' spatial and mobility practices. The analyzes shows how young children and preschool groups engage in tactical manoeuvres of i) using local knowledge and protecting secret places ii) making space for play and learning on the move and iii) creating 'institutional privacy' in public parks. Hereby, signalling ownership of the space through the 'doing of preschool' and temporarily turning the space into a preschool space. This brings to the fore questions of parks as public goods and who has access to these and who not. When authorities do not take responsibility for the provision of preschool yards and spacious enough urban parks and other green and open spaces, preschool groups are left to compete with each other about the space on an everyday basis.

RN04 | T04_02: Places and Spaces: Marginalisation, Diversity and

How to Guarantee Change in Child Poverty in Europe: Redressing Silent Marginalisation with Children, Communities and Bourdieu

Cath Larkins[1], Abel Beremenyi[2], Alastair Roy[1]

1University of Central Lancashire, United Kingdom; 2University of Barcelona, Spain

There is a diversity of experience within Roma communities and for children who experience alternative care, but consistently care experienced children and a proportion of young Roma are living in the some of the most marginalised conditions in Europe. This manifests, for example, in poor housing, education, health and environments. The EU has targeted policy to redress some of these inequalities, through the European Child Guarantee. However, many of the contributing conditions are entrenched. This paper reflects on short-term cocreated community projects that aimed to promote children's rights to participation, forms of action for change, on these issues. Through these cocreated community interventions, in five countries, children and adult revealed barriers and facilitators to trust and transformation. They also provided guidance to the European Union on effective strategies for redressing inequalities. Through participatory and rapid evaluation, we researched the perspectives, silences and actions of some of the adults and children involved. Participants cocreated a set of indicators related to the education, leisure, healthcare and housing aspects of the Child Guarantee. These highlight barriers related to social networks, social provision, cultural capital, self-perception and professional understanding. The absence of social provision and the restricted nature of established mechanisms for children's involvement in public-decision making, resulted in a lack of trusting relationships being established through which transformational change can be pursued. We suggest a Bourdieusian lens as a starting point for exploring these dynamics, because it enables resistance to the ways in which, in some dominant discourse, Roma and care experienced children are held responsible for their own marginalisation.

Leisure Worlds of Children and Young People in a Diverse Society: Opportunities for Participation Between Different Origins and Socio-spatial Segregation

Till Stefes

Ruhr Universität Bochum, Germany

How children and young people spend their time beyond adult supervision in familial and formal educational contexts plays a pivotal role in social integration and development of social relationships. "Leisure Worlds" aims to scrutinize the varying leisure experiences of young people (9-17 years) against the backdrop of social disparities and socio-spatial segregation.

Individual free time schedules depend not only on personal inclinations and interests but are largely determined by socioeconomic background and socio-spatial factors such as place of residence and location of the attended school. Young people from disadvantaged households often have fewer opportunities to actively participate simply due to lack of accessibility and potentially lower quality of private (home, own room) and public spaces (malls, recreational spaces) available to them.

This might pose additional challenges for young immigrants, who often struggle with poverty and lack of participation already. Hence, there is a research gap with regard to leisure time in the diverse society. The share of migrants and refugees is larger among youths than in older generations and currently growing, while regions of origin of immigrants have become much more pluralistic. Which activities or spaces are relevant for processes of social integration and the development of social relationships? How do they differ between young people with refugee experience, with and without a history of migration? These questions are addressed using multivariate analyses based on standardised survey studies conducted between 2019 to 2023 in Germany. Results show different patterns in leisure time activities and available spaces between these three groups.

A Critical Approach to Adultism Exercised by Volunteers Working with Children in Istanbul

Ayse Yilmaz[1], Seran Demiral[2]

1Bahcesehir University, Turkiye; 2Istanbul Arel University, Turkiye

This research delves into the changing dynamics of generational encounters within the context of a civil society organization's two-decade project. In our research, we contributed to this longstanding project that organizes cultural visits to historical, artistic and touristic places in Istanbul by aiming to build a space where volunteer adults can interact with children. Engaging 35 children aged 10-14, we utilized participatory and arts-based research techniques in six meetings and visits across Istanbul. After these visits, both adults and children gather for "enhancement activities" in schools to solidify acquired knowledge. Our role was not only researching with children but also to ethnographically explore generational relationships in order to enhance this adult-centered project.

Responding to coordinators' requests, we utilized participatory methods more, prioritizing child engagement and fostering reciprocal relationships between adults and children. A critical examination of the research reveals instances where adults inadvertently exercise adultism despite the participatory focus. Limitations in the genuine influence of children's perspectives, especially within the facilitator role of adults, underscore the need to scrutinize adult involvement for a more balanced power dynamic. This study, centered on generational relations, contributes to understanding the interplay between children and adults in participatory settings. Advocating for a reevaluation of power dynamics to foster equitable interactions, the research addresses the challenges of adultism and provides valuable insights for refining methodologies in collaborative endeavors between children and adults.

When Children Get Things Wrong and Why This Really Matters: Fallibility, Voice and Childhood Studies

Phil Mizen

Aston University, United Kingdom

Gathering children's testimonies is rightly a sine qua none of childhood studies and among its greatest achievements. Children's accounts reshape narratives about childhood and challenge orthodox discourses of developmental and cognitive incompetence. Yet, recently questions have been asked about what these testimonies can tell us, specifically through the interpretative focus on children's voices as mediated sources of knowledge. Examining the constructedness of children's voices is of course essential, but in this paper I pursue this critical engagement further by centring the fallibility of children's understandings. I do this by drawing upon my experience of long-term research with street and working children in Accra, Ghana, conducted with my collaborator and friend, Yaw Ofosu-Kusi, and our collection of testimonies that include questionable statements and understandings. Here, I consider these in terms of children self-consciously misrepresenting their lives and the possession of sincerely held beliefs that cannot be true. Rather than reproducing alienated accounts of children's incompetence, my focus on fallibility facilitates closer participation in and understanding of children's lives and cultures. More fundamentally still, I assert that fallibility as a core realist proposition raises profound questions about voice and childhood studies more generally. Specifically, to accept children's missteps and misunderstandings is to provide good reason for accepting that children's worlds are not simply social constructions: worlds that exist only in terms of how they have been constructed by children and researchers. To get things wrong suggests the existence of childhoods beyond how both children and we as researchers define them.

Trusting Children? One Case Analysis About Migrant Children's Participation in Policy Lab Meetings

Claudio Baraldi

Università di Modena e Reggio Emilia, Italy

Multistakeholder Policy Labs are initiatives promoted by the European Parliament to improve citizens' participation in the elaboration of policies on specific themes, through the collaboration of citizens, specialized stakeholders and decision-makers. During Policy Lab meetings, coordinated by at least two facilitators, plenaries and small group workshops alternate to elaborate proposals about possible policies on the chosen theme. This presentation concerns a European project in which Policy Labs were implemented in six cities with the aim of supporting migrants' participation in local policies. The Belgian city of Mechelen decided to support migrant children's integration in the local school system. Thus, a few migrant children, adult migrants, several stakeholders working in education services and some policy officers and policymakers participated in the Policy Lab meetings. One specific facilitator supported children's active participation. This presentation is based on video-recordings of these meetings and aims to show if and how children's agency was supported and trust in children's agency was visible. The presentation shows several problems in constructing a trusting relation between adults and children, and in supporting children's contribution to new policies. In particular, the presentation shows three problems in facilitating children's agency: (1) differentiation between small group workshops in which children actively participated and other small group workshops in which children were only theme of adults' narratives; (2) reproduction of separation between adults' participation and children's participation during the plenaries, in which children's participation was marginal; (3) the adult-centred way in which children's agency was facilitated in small group workshops.

Building Trust In The New School: Rural-Urban Migrant Children's Experiences Of Friendship And Inclusion

Boyang Yin

University of Sheffield, United Kingdom

In the last decades, the deep-rooted economic rural/urban dichotomy in China has driven large-scale rural residents to migrate to urban areas in seek of better jobs and life opportunities, therefore most of their children have to migrate to the cities with their parents. In recent years, with the increasingly disproportionately distributed educational resources between rural and urban schools, compared with being the 'by-products', children are becoming the main driven force for millions of migrant families. However, the education-driven migration are only more common for the 'rural middle class'. Based on a 5-month ethnography in a primary school containing both migrant and non-migrant children in China, this qualitative research employed observation, interviews with parents, teachers, and children, and art-based method (children's drawing) to explore children's voices and experiences of migration. The study has found that, the 'change of class' that brought by migration contributed as key source for migrant children's feelings about migration. However, categories influencing children's experiences of inclusion, trust and tensions with peers intersected and reinforced each other thus spurring transformative social justice and migration-related difference and discrimination is more politically constructed rather than a natural given and reifies, for example, patriarchy and capitalism.

152

Moreover, the feelings of exclusion can also be influenced by the curriculum shift in recent years from characterized of 'urban value' to the emphasizes of agricultural knowledge. The study has also found that migrant children's experiences of inclusion and exclusion can also be shaped by 'whose knowledge is important' in education system.

The Silent Rights Of Children. What Type Of Reception And Protection Of Unaccompanied Foreign Minors?

Deborah De Felice

University of Catania, Italy

Child migration is likely to increase in both scale and salience as the mobility of young people grows for different reasons: a result of more affordable travel, climate change, growing technology mediated connectivity, increasing global inequality in the distribution of opportunity, security and access to employment, and the diffusion of a global cultural commons. In recent years, the reception and protection of unaccompanied foreign minors have represented one of the most critical issues for the European Union.

The approach to the phenomenon of unaccompanied foreign minors has always been characterized by interventions which oscillate between protection (of their rights) and control (of migratory flows), between inclusion and exclusion processes in states in which they arrive, etc.

The literature is quite in agreement in arguing that migration policy tends towards closure, and migration laws hurt migrants and refugees. On the other hand, what little insists on are the consequences of our legal system on the life of the host populations in terms of the "development" of their capacity to welcome. The rhetoric about children's rights is stuffed with "high" notions and principles referring to their well-being (widely understood) as a primary concern. Yet, we witness violations of their rights. The issue should be studied by looking at these violations as the result of the combination of the regulatory reception system and the lack of recognition and exercise of a "common responsibility" that the functioning of this system has produced over the long term.

Transformative Sense of Home by Children: From Family House to One's Home

Cléolia Sabot

University of Lausanne, Switzerland

By focusing on children's experience and expertise, this paper sheds light on how lone parenthood provides children with opportunities to exercise their agency over the place(s) in which they live.

The article draws in data from a longitudinal study, which followed 23 families in the swiss French-speaking area (5 waves). 23 children and youngsters aged 9 to 23 years old were interviewed twice, about their experience in lone parenthood families, using a Mosaich approach (Clark, 2004).

Studying the experiences of children in lone parent families constitutes a paradigmatic example of children's practices for transforming space or their relationship to space. Their living environment may in fact be subject to common or unexpected transformations, due to custody agreements or organizational contingencies, as well as their relation to different spaces of their own. This family configuration enables them to participate in the transformation of their "sense of home" (Boccagni, & Duyvendak, 2020).

Results demonstrate that their sense of home is not confined to the residential space of the custodial parent, but extends into various places. While sometimes managing some tensions at home, they cope with constraints and create their own sense of home – sometimes in their bedroom or by transforming public spaces into intimate places. A whole continuum is then created, differentiating home from house. This paper also includes the investigation of how they define and delimit it, how they act in and on space, using a variety of ingenious tactics.

This line allows us to examine children's ability to exercise their agency, to transform and appropriate space, allowing them to create new spaces for trust and safety (Hilppö, Lipponen, Kumpulainen, Virlander, 2015).

Divorcescapes: Family Conflicts and Children's Lived Spaces

Hanne Warming, Sarah Alminde

Roskilde Universty

In this paper, we present an analysis from a project focusing on the entanglements of the practice in the family law system and children's everyday life in conflictual family law cases. We base our analysis in third wave childhood sociology, and zoom in on the social-spatial dimensions of children's everyday life, exploring children's lived spaces. We take departure in, what emerges as important for the children,

153

exploring how this is (not) reflected in the child conversation, the notes and the decisions. Inspired by the concepts of carescapes (Bowlby 2012) and foodscapes (Brembeck et al. 2013), we suggest (and further develop) a new concept of "divorcescapes" to address the mundane spatial contexts of children's life with divorced parents. Moreover, we draw on Barad's agential realism and Ahmed's theorization of emotions as socio-spatial phenomena, especially her concepts of sticky and circulating emotions.

The empirical basis of our analysis consist of 100 anonymous case notes, and 25 Family Law cases, where vi have observed the child conversation, and interviewed the children and the parents.

Based on the analysis, we argue that the spaces and relations that are essential to the child, only to a limited degree is acknowledged by the professionals as well as the parents. Further, we point to, that the image of what it means to be competent for a child in a conversation, as well as discourses around divorce, results in othering of the child and sticky emotions of shame and powerlessness.

Children's Ideas and Interpretations of Family Normality in the Context of Transnational Families

Katarzyna Jendrzey

University of Duisburg-Essen, Germany

Transnational families face inner-family and social tensions. On the one hand, they navigate the challenges of (re)organizing themselves across borders and adapting to new situations. This can lead to questions about the negotiation processes within families regarding gender and generational orders. On the other hand, these families challenge societal norms of what constitutes a 'good' family, which often prioritizes parental, and especially maternal, presence.

The children are caught between two opposing sides. However, their perspective on the transnational arrangement remains largely unknown.

In my presentation I will illustrate the experiences of children whose parents migrate temporarily and of children who do not have such experiences. I will analyze how they position themselves in/within transnational family arrangements and to what extent they advocate for their own interests. In addition, I will examine the extent to which the transnational arrangement is an issue among peers. And finally, I will explore how they interpret the transnational arrangement: As a deviation or as a legitimate form of family life in times of change. The data is based on group discussions with 12 – to 14-year-olds in Poland. They were collected as part of the German-Polish research project 'Growing up in transnational families: children's perspectives on a good childhood'.

The Transformation and Trust of Argentinian Youngers in Healthy Relationships and Intergenerational Dialogues and Their Life Projects

Patricia Alejandra Rodriguez Aguirre[1], Cecilia Barni[2]

1Universidad Siglo 21, Argentine Republic; 2Universidad Austral, Argentine Republic

This ongoing research, which aims to study the transformation and trust of Argentinian youngers, especially in healthy relationships and intergenerational dialogues among friends, adults, parents.

It is focused on changes in behaviours and family life, that youth experienced during and after the COVID-19 pandemic. Life Attitude is the construct in which life projects develop (Barni, 2021), based on the existential certainty that life has a purpose, that people find meaning in a variety of sources, such as interpersonal relationships, personal accomplishments, recreational matters and purposes (Reker, 2007).

This qualitative study shows biographical life stories (Perelló, 2009); interviews were administered to 20 young people living in the Global South (Twum-Danso et al. 2019), focus groups were conducted with games specifically designed for the age of the emerging adults –18 to 21– (Barrera-Herrera y Vinet, 2017), in order to find if young people living in rural areas –belonging to other ethnicities– have greater inequalities than the ones living in urban areas (Malinoski in Zaragoza, 2010).

Both instruments were recorded, digitalized and analysed in order to listen to their voices, and to detect if they had been listened to (Spyrou, 2015); if there had been behaviour changes due to compulsory confinement, if their capacity for personal decisions had been changed (Pérez-del-Aguila, et al. 2023); if their autonomy had increased (Stoecklin et al. 2023); if adult dialogue and containment were important (Wyness, 2013); if family life had been affected (Pinto Santos & Diaz Carreño, 2015); if learning skills helped to deploy their life projects.

Child Protection Social Work in an Open Environment in France

Akiko Awa

Ritsumeikan, Japan

AEMO (Aide Educative en Milieu Ouvert), a judicially mandated educative support in an open environment, is a measure for children at risk in France. It covers 1% of the minor population to prevent them from danger. It aims to promote development and well-being by addressing specific educational needs. AEMO is often carried out by specialized educator, which is one of national qualification of social worker.

In sociology, there was work of Donzelot or Foucault about social control, forced norm from upper class population, and later, study about care (Gilligan) or social isolation and social bond (Hirschi). My study was about to know what AEMO social work is. In this study I tried to know the reasons for the risk, the child's family and environmental background, the practices of professionals, and the risk potential towards the child in a period of 2 years. The study was conducted through participant observation for one month in one of Paris's AEMO structures, every 6 months for 2 years. The subject of analysis included 37 families. Most of the families received this measure when school professionals observed concerning issues regarding the child and were unable to resolve the situation.

I observed that AEMO social work aimed to help the family concretely to improve child surrounding situation and to decrease the risk. Even though it has a nature of social control, in practice, value of « Interests of the child » was found in socialwork, and it is possible that this is a strategy that has emerged from social workers' practical knowledge to build better relationships with parents and to work for better development of a child.

The Loss Of Trust In Institutional Support For Children With Down Syndrome: Parental Experiences In Germany

Hannah Kroell

University of Kassel, Germany

This work challenges social psychological and (special) education research which has long attributed parental stress in families with disabled children solely to the child's disability. Rather than placing the child as the cause of difficulties in family life and parent-child relationships, this work draws on insights from neo-institutionalism and normalism theory to lie the focus on the social context. Thereby, the importance of a supportive institutional system for families with disabled children is emphasized. Employing Grounded Theory methodology, this research explores the interactions between parents of children with Down syndrome and the institutions to which they turn for support. Using narrative in-depth interviews, German parents of individuals with Down syndrome were asked about their experiences with society's treatment of themselves and their disabled child. The parents' narrations focused on the influence of institutions during childhood, especially the medical field, disability services, and the (special) education system. The findings reveal a paradox: organizations and institutional actors, perceived as supportive, disappoint this expectation of support and are closely associated with strains on parents and a loss of trust in society's support system. Both parental distress and a loss of trust stem from institutional strategies that denormalize and pathologize individuals with Down syndrome, marginalizing them in German society. These findings highlight the importance of supportive social institutions in the lives of parents and their disabled children and underline the importance of needs-based and respectful assistance to (re-)enable trust in social support systems.

Exploring Children's Roles in Religious Transformation: insights from First Communion preparation courses

Claudia Andreatta

IUSVE – Istituto Universitario Salesiano Venezia, Italy

Traditionally, sociological attention to the religious lives of children – especially in Italy – has been scarce. However, a better knowledge of children's religiosity can have important consequences to understand religious transformation in the transition to pre-adolescence and adolescence itself. Moreover, it is crucial to give voice to children in order to describe the processes of re-interpretation and individualization of religious practice, which usually occur in the context of religious socialization such as families and peer cultures. This can help to comprehend what lies behind the increasing loss of centrality of religion in daily life and the changing perception of the Catholic Church, especially among young people.

The research aims to explore this topic and intend to enable children as actors in the studies of religious practices as well. The results of actively listening to children will also be presented as a driver to understand the participation of families in the Christian community, offering new opportunities for dialogue and mutual understanding. The research presents the results from a participant observation conducted in two parishes in Venice during children's First Communion preparation courses. Not only the process of individualization of belief became evident already in children, but also it was important to recognise that children have reinterpreted the traditions of Christian rituals, the way of considering the sacraments, in the way they pray, their commitment to Christian values and beliefs. Lastly questioning and doubting some mysteries of the Gospel

155

they heard, children influenced a lot the way adults reflect on their religious experience and on their values.

Systematic Review of Extracurricular Activities of Children Living in Foster Families

Zsófia Miklódi-Simon, Tímea Szűcs

University of Debrecen, Hungary

Students in foster care face school challenges for which school personnel are not always adequately prepared. Children living with foster parents have social, emotional, behavioral, and learning needs that differ from their peers in the primary family. As a result, these students are more likely to miss school, and there is a greater likelihood that they will require special educational methods. It is crucial for schools to adapt to the unique needs of students in foster families, as this influences the success of the school (Scherr, 2014; Zetlin et al., 2004; Fredricks & Eccles, 2006).

Extracurricular activities can provide an opportunity for foster children as compensatory factors. However, if children frequently change their place of residence or if their relationships deteriorate, extracurricular activities may not always be effective in compensating for disadvantages. Structured leisure activities and regularity are important in the lives of children facing changes and can contribute to their resilience.

In our study, we conducted a systematic literature review, applying the PRISMA guidelines and criteria. We present the unique situation of foster families and the positive effects of extracurricular activities on children's development. Following our literature analysis, we conducted a qualitative semi-structured questionnaire survey to explore agreements or differences with what was found in the literature. Our results confirmed that the specified compensatory factors are indeed present in the lives of children living in foster families who participate in extracurricular activities.

Collaborative Research Methods and Best Practice with Children and Young People: A Systematic Review of Reviews

Rebecca Nowland[1], Laura Robertson[2], Nicola Farrelly[1], Ali Roy[1], Darren Sharpe[3], Nora Morocza[3], Sarah Tatham[1], Charlotte Ennis[1], Cath Larkins[1]

1University of Central Lancashire, United Kingdom; 2Poverty Alliance, United Kingdon; 3University of East London, United Kingdom

Children and young people are key collaborators in research. They can guide the focus and conduct every part of the process, and their contribution improves research quality and insights. To cocreate resources that could guide ongoing research by UK and international networks of children and young people, we conducted a systematic review of peer research with and by children and young people aged 5-25 years, published in English since 2000. A review steering group, involving experienced young researchers, study partners and advisors (including academics, and policy actors) took part in a week-long civic hackathon, to generate a definition of 'peer research' and inform the search strategy, inclusion and exclusion criteria and framework for synthesis. This paper reports the findings of one element of this study – the review of reviews.

We conducted a two-fold analysis of all systematic and scoping reviews of peer research. A narrative synthesis drew together theoretical principles and approaches to peer research (including power, inclusivity, ethics, safeguarding, learning, methods, and impact). A thematic analysis, using the co-produced framework, identified: 1) cushions (strategies for support that promote confidence to do/ not do peer research); 2) collaborations (relationships and powers through which research is conducted); 3) credibility (approaches to enhancing the capacity of peer research to convince relevant audiences); and 4) change (mechanisms through which peer research is mobilised for social change). Our findings synthesise guidance from children, young people and academics and can be used to reveal the tensions and help strengthen the transformative potential of peer research.

156

Class Analysis, Social Inequality, Child Poverty-Social Analysis And Transformative Socio-Political Strategies In Late Capitalism

Heinz Suenker

University of Wuppertal, Germany

Based on a materialist class analysis (mediating the work of Sennett/Cobb on „hidden injuries of class" from the 1970s with the contemporary studies of Vester and Savage centred around „class based milieus") the paper analyses different dimensions of social inequality in late capitalism with a special emphasis on child poverty. Child poverty with its disadvantaging and disempowering elements is discussed in the context of the new sociology of childhood and its emphasis on social competences and agency of children.

Against these manifold backgrounds, the paper develops two transformative socio-political strategies. Firstly, in the context of a welfare state approach, aiming at ameliorating the effects of poverty in the lives of children with the help of tax policies (following Picketty). Secondly, a revolutionary strategy to counter the structural conditions that produce poverty and social inequality based on overcoming the capitalist mode of societalisation in the interest of all children (following ideas from Marx, Engels, Adorno and Wright).

Children's Participation in Child Labour Policies: Unpacking Definitions and Exploring Conflicting Discourses

Rossana Perez-del-Aguila

The Open University, United Kingdom

Theoretical advancements in Childhood studies have played a significant role in shaping our understanding childhood and children's rights over that past thirty years. There has been an increased focus on children's voice, participation, and agency in the academic literature and policy and practice initiatives. This paper aims to provide a nuanced understanding of these complex concepts in the context of child labour policies.

Despite the implementation of the United Nations Convention of the Rights of the Child, there has been limited evidence of children's active involvement in decision making processes. The issue of children's work and labour is particularly contentious when it comes to exploring the nature of working children's participation in the development and implementation of policies that affect them. This paper examines the tensions between the policy discourse of the International Labour Office (ILO) and the discourse of working children's movement discourse from the Global South, using examples from published research.

The definitions of 'child labour' and 'child work' are unpacked highlighting the interconnection with children's agency. Conflicting discourses arise due to different conceptions of childhood. The article argues that the child labour policy arena has yet to fully recognise childhood as a socio-cultural-historical phenomenon and children's agency as relational, intergenerational, and interdependent.

To address these issues, it is crucial to develop an awareness of childhood diversity across societies as a key principle underlying international norms. This article aims to contribute to the ongoing debate surrounding children's agency in child labour policies and advocate for a more inclusive and holistic approach.

Listening to Children Related to Early Childhood Education Policy

Maarit Alasuutari[1], Heli Muhonen[2]

1University of Jyväskylä, Finland; 2University of Jyväskylä, Finland

Following the United Nations Convention on the Rights of the Child, children's participation is a statutory requirement of Finnish early childhood education and care (ECEC). Consequently, children's views are studied in the monitoring and evaluation of the national two-year pre-primary education experiment in 2021–2024 that concerns about 35,000 five-year-old children in Finland. As part of the monitoring and evaluation, 105 children participated in a data collection informed by the Mosaic approach. The children took photographs of/in ECEC to respond to four questions: 1) what do they like most in ECEC, 2) what do they like least in ECEC, 3) what would they like to change in ECEC, and 4) what have they learned in ECEC. Then they discussed the photographs in small groups led by early childhood education teachers. The study considers the challenges and possibilities of studying young children's viewpoints on policy-related issues. More precisely, it first examines the interaction between teachers and children in small groups to illuminate how the teachers invite children to describe their views and ideas and how the interaction is constructed when children's expressions become restricted. The analysis of the interactions is based on discursive psychology. Second, the study considers the overall process of addressing children's views in the monitoring and evaluation of the two-year pre-primary education experiment by applying the Lundy model. The research is funded by the Ministry of Education and Culture.

RN04 | T08: Intra and Intergenerational Relations III

Using Visual Methods to Explore the Lived Experiences of Long-term Care leavers in Latvia

Ilze Trapenciere[1], Sigita Snikere[1], Zoe Kessler[2]

1University of Latvia/Riga Stradins University, Latvia;
2Salem University, USA

Over the past twenty years research on children in long-term social care perpetuated negative stereotypes and marginalization of children who have experienced long-term social care. This contributes to negative outcomes of care graduates. They experience more difficulties gaining employment, housing, further education, and youth clubs. Those youth are seen as replicating the social cycles of their parents and grandparents (Trapenciere, 2015, Zumente-Steela, 2019).

The visual methods are employed after studying care leavers with focus group discussions (FGD) and life history interviews. Throughout interviews and FGD multiple stories were told by participants on their status as a care leaver. Constructing a study by using the visual methods (mapping and photo voice) offered the young people an opportunity to be empowered to express their lived experiences and show who they truly are through a strengths-based modality (Wang & Burris, 1997) and is the motivating force behind this research.

Since some researchers have often used methods of research that make marginalized groups passive participants as opposed to active participants this research has sought to use mapping and photo voice method, which creates an environment where participants are co-researchers because they draw maps, take photos, and interpret their meaning for the researchers. This differs fundamentally from traditional research where the power lies with the researcher.

The knowledge from this research project will contribute to a new understanding of care leavers in Latvia and Eastern Europe.

Giving silence a voice: children sexual abuse in the Portuguese Catholic Church, 1950-2022

Ana Nunes De Almeida, Vasco Ramos

Institute of Social Sciences, Portugal

Over the last two decades, several studies have examined the extent and expression of child sexual abuse (CSA) in religious institutions. In 2021, following new Vatican guidelines and intense public pressure, the Portuguese Episcopal Conference commissioned a study on CSA in Portugal by members of the Portuguese Catholic Church (PCC) and others associated with it (from 1950 to 2022). Our study draws on a web-based survey and a respondent driven sample. The questionnaire included categorical questions about victims, abusers, types of abuse, and open-ended questions. We characterized victims and abusers and developed a social cartography of abuse using Correspondence Analysis. Victims' narratives are also part of the model of analysis. We validated 512 of CSA by members of the PCC. Boys were more frequently abused (57.2% vs. 42.2%); male abusers predominate (96.7%); most victims were abused more than once (57%); the average age of victims when the first abuse occurred was 11.2 years. More invasive forms of abuse predominate (80% manipulation of sexual organs or penetration; only 20% had no body touching). There are patterns of abuse, and space plays a pivotal role in understanding the forms that CSA takes within Catholic environments. The richness of individual narratives was an unexpected outcome that enables us to better understand the organizational and symbolical power structures in which abuse takes place. Given the characteristics of our sample, these cases are the tip of the iceberg, with CSA within the PCC likely involved thousands of children. Further research should strive to consider victims' narratives.

Surv Child: Children Living with Gender-based Violence. Community Action to Foster Resilience

Cristina Sánchez-Miret, Roger Campdepadrós-Cullell, Albert Sabater-Coll

University of Girona, Spain

In accordance with a 2019 survey conducted in Spain, 1,678,959 minors reside in households where women are subjected to gender violence. Of these minors, 89.6% have witnessed such violence, while 51.7% have directly experienced it. These encounters significantly impact individuals' development, both mentally and physically (Fraga, Amorim & Soares, 2022). Notably, we have identified a dearth of literature capturing narratives from adults who have navigated paths divergent from the violence they observed or experienced during their childhoods (Beetham, 2022). Furthermore, there is a lack of indicators assessing recovery from gender violence within the familial context.

In response to these gaps, we present 'Surv_Child: Children living with gender-based violence – Community action to foster resilience,' funded by the Spanish National Research Plan. This project employs mixed methods and posits the hypothesis that informal support networks can aid these minors in cultivating positive coping mechanisms, subsequently enhancing their overall well-being, a finding consistent with our prior research (author, 2019-2022; author et al., 2021). Our aim is to identify elements that have enabled individuals to break the cycle of gender violence in their relationships, promoting constructive confrontation instead. This, in turn, contributes to interrupting the intergenerational transmission of gender violence.

Anticipated outcomes will inform community stakeholders, as well as professionals in education, health, and social services, facilitating the development of effective

158

interventions. These interventions will empower minors to cope positively with violence, thereby enhancing their quality of life and potentially reducing gender violence in the future.

'A Slap is Not a Beating'. Normalizing Corporal Punishment on Children in Poland.

Emilia Sieczka, Antonina Dębska

Polish Academy of Sciences, Poland

'A slap is not a beating' is a pertinent phrase from a conservative discourse that shows how civilizing and de-civilizing processes are dialectically intertwined. On the one hand, the sensitivity standards toward children were risen to the point that brutality against them is denounced as both shameful and unlawful. On the other hand, the innocent 'slap' is still considered as a last resort to impose parental authority through physical domination, supposedly the only form of persuading intelligible to those less competent socially and linguistically.

The reactive character of normalizing domestic violence by the Right will be illustrated by a Polish case. We will analyse the discourse defending the slaps as non-violence, during the process of outlawing corporal punishments on children between 2005-10, including parliamentary works on the reform of the family code, public consultations and mobilization in media. We will present dynamic and rationales behind nationalist (de)civilizing offensive normalizing violence against children as being a part of traditional upbringing that needs to be reinstituted. In order to explain such a sentimental come back to the 'glorious past', we will integrate two processual theories of Pierre Bourdieu and Norbert Elias. The political mobilization in restituting older norms informally, non-publicly will be discussed as a Don Quixote effect, a discrepancy between the changes in law and national habitus.

Being Black in a White Vessel: Exploring Trusts and Tensions of Un/belonging in Lived Experiences of Children and Young Persons with Albinism

Elita Chamdimba

University of Strathclyde, United Kingdom

Background: Sense of belonging is based on social connections, safety, and participation. However, for children and young persons with albinism (CYPWA), belonging is complicated by stigmatization and discrimination because of skin colourism. Albinism, often categorised as a disability, is a biological condition which produces paucity of pigment causing Persons with Albinism (PWA) to have pale white hair, skin and eyes (Inena et al., 2020). This significantly marginalised minority group makes up only 1 in 20,000 people.

The absent voices of CYPWA in sociological research is a major gap. This study amplifies CYPWA's voices to explore tensions and trusts to belonging. Although situated in Southern Africa, this study connects to Europe through colonial legacies which shape trusts and tensions. Therefore, the study pursues a decolonial agenda to unpacking and understanding belonging.

Main research question: what are lived experiences of children and young persons with albinism in Malawi and what factors enable and/or hinder belonging?

The theoretical framework embeds intersectionality (Crenshaw, 1989; 1991; 2013) into the socioecological model (Bronfenbrenner, 1979) and centres disability as key concept intersecting with various factors within CYPWA's multi-layered systems.

Original contribution: unlike some feminist intersectionality scholars who have underscored gender at the expense of disability, this study's contribution is a theoretical framework that centres disability within intersectionality.

Methodology: Qualitative study applying participatory approaches was informed by an advisory group of PWA (n=3) from March – June 2023 in Malawi. Participants included 44 CYPWA aged 3-23 years old. Methods involved drawing, poetic inquiry, focus group discussions (n=9) and interviews (n=39). Transcripts, drawings and poetry were analysed thematically (Clarke & Beale, 2018).

Findings & conclusions: CYPWA experienced belonging with family at the microsystem. Intersections of disability with location, age and gender complicated tensions and trusts of belonging in school settings where disabilities associated with albinism were less accommodated in rural schools. Bullying and lack of inclusive teaching practices for CYPWA's visual impairments, derogatory labelling, exclusionary social attitudes and harmful beliefs were experienced at meso-systems. CYPWA negotiated belonging in these spaces by demonstrating resilience when rejecting negative social labels and showed agency by accessing social capital through peer support groups.

RN05 | Sociology of Consumption
RN05 | T01_01: Economics of consumption 1

Embodiment and Consumption. Habitus, subjectivity, and commercialization

Roberta Sassatelli

University of bologna, Department of History and Cultures, Italy

In this paper I discuss the intersection between the sociology of the body and embodiment and the sociology of consumption and consumer practices. The body has been branded by Baudrillard as the "fined object of consumption". The paper therefore considers first the historical development of consumer culture in Western societies and how it revolved around a particular form of materialism, combining asceticism and hedonism, and heightening not only the pleasures of imagination but also, especially with the XX Century, the role of the refinement of the senses and the body. It therefore explores how an emphasis on the positive, expansive control of the body married with commercialization and gave way to a cornucopia of market-mediated practices and objects for the care, maintenance, and transformation of the body. The body becomes a plastic object in consumer culture, and as such is fundamental for the growth of the market, married as it is to the possibilities of expanding desire and attaching it to both individualized practices and commercially mediated forms of sociability. However, embodiment remains a largely unreflexive process, and bodily habitus works intersectionally as a fundamental point of departure for the realization of commercially induced body projects. The paper therefore explores how we can conceptualize the encounter between the pressure to reflexively manage one's own body, the workings of habitus and the influence of commercial culture and commercial institution. Embodied subjectivity, commercial institutions, and intersectional habitus are three heterogeneous but intertwined levels through which we can systematize our understanding of the workings of the body in contemporary consumer culture.

Shaping a Not-to-Buy Consumption Enjoyment: The Formation of Wandering Masses in State-owned Department Stores in Socialist China

HE SUN

The Hong Kong Polytechnic University, Hong Kong S.A.R. (China)

Since the founding of the People's Republic of China, the scarcity of commodities worsened inevitably due to the embargo during the Cold War and the dissolution of production ties with the Soviet Union. In this context, consumption in socialist era was inhibited under a revolutionary and production-focused discourse aimed at accumulating state capital. Most researchers point out that a deferred enjoyment was expected with a promise of an ideal Communist vision by the party-state, while it overlooked the "residue" of consumption beyond mere ownership of commodities.

Notably, activities like shopping remain significant for leisure both in urban and rural regions. Among commercial organizations, department stores held a particular fascination in socialist China. Driven by ambitious goals, new state-owned department stores in the mid 1950s proliferated across China, aiming to involve all citizens in the advancing blueprint of New China.

Separate from the general populace (qun zhong), "the wandering mass" (guang zhong) positioned on a spectrum between detached flâneur and the alienated shoppers enchanted by the capitalist urban world, lingered in the spaces of the new state-owned department stores, and interacted among and with other groups and commodities.

Through a comprehensive analysis of various visual and textual sources, I argue that the wandering masses are strategically portrayed as the main subject rather than a component of various objects. This approach allowed the socialist country's new masters to derive multiple enjoyments in contrast to their capitalist counterparts, intentionally downplaying consumption as only a small fraction of this activity. While predicting the arrival of the great abundance of commodities remains challenging, the envisioned enjoyment of the wandering masses suggests a socialist version of present goodness devoid of consumerism.

Reconstructing Made in Italy: by Chinese or with Chinese

Yintan Fan

University of Essex, United Kingdom

Chinese entrepreneurship and investment outside China's mainland are a growing global phenomenon, the migrant entrepreneurs have converted Prato into a fast fashion manufacturing centre and one of the largest wholesale networks in Europe. Yet comparatively little is known about the subjectivities, business habits, transnational affinities and identities of Chinese merchants and traders who work either for short or long periods in Europe. Made in Italy by

160

Chinese gradually becomes an unsustainable strategy for fashion industry development due to industrial transformation and social tension. The national brand "Made in Italy" can be regarded as social capital which needs collaboration from both locals and migrants. Social capital behind the slogan should be restructured and reconsidered more broadly. Through semi-structured interviews and grey literature in Prato, the article aims to find sustainable approaches to the fashion industry development from different actors and concludes four possible development paths. Therefore, Social capital should be shared not only inside the migrant community but also needs to expand to the local society to formulate a wider and stabler social cohesion against crisis and challenges. Made in Italy with Chinese seems a better solution to maintain sustainable entrepreneurship.

RN05 | T01_02: Food consumption 1: Meat 1

"Never Without Meat" – Perspectives On Sustainable Food Consumption Based On The Results Of A Consumer Survey

Luca Kristóf, Boldizsár Megyesi

Centre for Social Sciences, Hungary

In our research, we mapped the knowledge, attitudes and practices of the Hungarian population regarding sustainable food consumption based on the data of a nationally representative survey conducted in spring 2023. Research on sustainable food consumption is of growing importance in the context of the ecological crisis. A key question of our research is how consumers' willingness to consume sustainably is influenced by their social status, their attitudes toward environmental values and climate change, their knowledge on sustainable consumption and the cultural and political discourse around sustainable consumption.

Sustainable food consumption can be motivated by both social and functional values. A particularly interesting social factor in the motivation for sustainable consumption is the 'conspicuous conservation' effect. Through this effect, consumers can signal both their ethicality and their social status.

In our presentation, we aim to present a path analysis and a typology of attitudes and practices related to sustainable food consumption, grouping consumers according to the importance they attach to different sustainability-related attributes of food and the sustainable food consumption practices they have implemented or plan to implement. The resulting groups are then analysed not only in terms of their socio-demographic characteristics and social status, but also in terms of their motivations for sustainable consumption: climate change perception, environmental attitudes, and knowledge about sustainability practices are included as variables explaining group membership, as well as the propensity to engage in conspicuous consumption. Our aim is to gain a more nuanced understanding of how to motivate Hungarian consumers to more sustainable food consumption.

(M)eating Out? Understanding Tensions Between The Established Practice Of Eating Out And Changing Discourses On Meat And Plant-Based Consumption

Yolie J.E. Michielsen[1], Hilje M. van der Horst[1], Hester C. Dibbits[2]

1Wageningen Univerisity & Research, The Netherlands; 2Reinwardt Academy, Amsterdam

Due to the environmental impacts of meat, one of the major challenges of current times is a societal transition towards more plant-based consumption (i.e., a protein transition). Chefs are seen as promising change agents in such a transition because they can create innovative and delicious plant-based meals. However, chefs' agency is limited due to the nature of the established practice of eating out and its diverse carriers, such as restaurant diners. This paper aims to understand the tensions between the established practice of eating out and changing discourses on meat and plant-based consumption. Using Elizabeth Shove's concept of 'infusing', the paper examines how such discourses infuse this meat-heavy practice and more specifically, how the intertwinement between discursive and routinized elements in the practice of eating out either supports or hinders meat reduction. Drawing from 23 semi-structured interviews with executive head chefs of French/Western restaurants in the Netherlands, preliminary findings reveal how discourse on plant-based consumption infuses the practice of eating out in several ways, such as through an increasing number of clients requesting vegetarian and vegan dishes, internationally renowned chefs in the culinary field going plant-based, and coordination between head chefs and more plant-based oriented apprentices in an increasingly horizontal kitchen hierarchy. Next to such seeds of change, we also identified forms of resistance. Serving and eating animal products in restaurants is normatively acceptable and expectable, as exemplified by the high percentage of meat dishes sold, the fear of bankruptcy after cutting meat off the menu, and the persistent intertwined symbolic statutes of animal products and eating out. Taken together, the embedment of ideas about meat and plant-based consumption into the practice of eating out both facilitates and complicates meat reduction in restaurants. This paper contributes to the literature on social practices in transition and specifically builds on scholarship on the scarcely studied link between discursive and routinized elements in practice. Moreover, it delves deeper into the underexplored territory of the practice of eating out in the context of the protein transition from the perspective of chefs. Hereby I confirm I have never joined an ESA Summer School before.

Chicken and Care: Socio-Material Arrangements of Carelessness in Food Systems

Mike Foden[1], Lydia Martens[2]

1University of Bristol, United Kingdom; 2Keele University, United Kingdom

Since the 1950s, there has been a tenfold increase in the production of chicken as food for human and pet populations, making it one of the most normalised and widely consumed of protein-rich foodstuffs around the globe. The past sixty years have seen dramatic changes in the growth rate and body shape of broiler chicken, and the animal in question and the consumption of its flesh have become thoroughly reliant on human-designed technological interventions and infrastructures. The normalisation of chicken as food raises profound ethical considerations as to the quality of its short life span, the hidden environmental costs of industrial-scale poultry production and chicken consumption, and the highly volatile nature of the 'chicken-flesh-microbiome' that carries health risks and consequences for human consumers. These ethical considerations map onto different registers of care:

1. Care for human health and justice

2. Care for animal welfare

3. Care for the environment

162

We draw on theoretical insights from work by Susan Leigh Star, Maria Puig de la Bellacasa, and Annemarie Mol, to explore how the socio-material arrangements of the chicken food system organises registers of care by rendering some more significant and visible than others. The presentation offers a contribution to the well-known problematic of the disconnection of consumers from specific food ethics and debate about how to make food systems more environmentally and animal friendly.

Towards Sustainable Levels of Meat Consumption: Factors and Support Strategies Across Social Groups and Classes

Thea Xenia Wiesli

University of Innsbruck, Austria

Global meat consumption has risen significantly in recent decades and is projected to continue growing, causing substantial environmental, climate, and justice challenges. According to the Intergovernmental Panel on Climate Change and the United Nations, a minimum 50% reduction in global red meat consumption will be necessary to establish a sustainable, healthy and equitable global food system. A reduction in average meat consumption is particularly required in the Global North and, thus, in high-income countries. Inhabitants of these countries consume two-and-a-half times more than inhabitants of low-income countries in the Global South. However, societies are not uniform and

consist of several socio-economic groups and social classes with different capacities to transform their diets towards healthy and sustainable nutrition. To effectively and specifically support different social groups and classes in reducing unsustainable amounts of meat consumption, science practice and policy actors need to understand the influencing factors for their specific diet decisions.

The research I aim to present identifies these factors influencing meat consumption among various socio-economic groups and social classes in high-income countries and develops support strategies. I will present the results of a critical literature review on the influencing factors and the hypotheses containing support actions to reduce meat consumption. Moreover, I will give the first insights into a factorial survey testing influencing factors among social groups and classes by an experimental design. The results will provide urgently needed knowledge into consumer behaviour for the scientific community and practice and policy actors outside academia to support consumers by informing actions for sustainable and just food transformation.

RN05 | T01_03: Energy consumption 1: Justice

Exploring Energy Justice In Mumbai's Electricity Provision Systems

Sharayu Shejale

University of Geneva, Switzerland

In this paper, I aim to examine electricity provision and governance in the urban Global South, using the case of the megacity of Mumbai, India. Based on exploratory fieldwork, including document analysis of reports and policy documents, and semi-structured interviews with 'energy experts' (NGOs, policy advisors and electricity distribution company representatives) (n=10), I present a regime level analysis of energy governance in the city. Patterns of energy consumption are highly variegated across urban residents, depending on class, gender, location, and even electricity service providers, among other factors. The politics of energy provision thus becomes important to uncover to understand its effect on consumption by different urban residents. Through semi-structured interviews, I examine how 'energy experts' tackle questions of such differentiated provisioning and the issues of justice, gender, class and subsequent wellbeing. Analysis of policy documents and official reports further supplement this, along with providing context and historical development of electricity provisioning in Mumbai. Moreover, framing energy provisioning around questions of sustainable consumption, wellbeing, and justice is not common in formal policy documentation. Thus, engaging with insights from such key experts may provide novel perspectives for all parties.

163

Consuming Water: Motivations, Obstacles, and Promotion of Sustainable Consumption Practices Among the Youth Population in the Marche Region

Lorenzo Giannini, Ivana Matteucci, Mario Corsi

University of Urbino, Italy

The intervention presents the progress of a research whose objective is to address the motivations, resistances, and obstacles in the adoption of sustainable water consumption practices, especially among young generations.

This research centers on safety and trust as pivotal variables in everyday water consumption practices.

From a cultural perspective within the study of alimentary consumption, the variables of safety and trust, along with the crisis of the latter in the risk society (Beck 1992; Douglas 1966, 1973; Fischler 1988; Giddens 1990; Luhmann 1979; Salvatore and Sassatelli 2004), constitute a focal point. Within water

consumption, these variables emerge as primary impediments to the transition towards more sustainable practices and habits.

This topic holds particular significance in the Italian context, given our country's leading position in Europe (second globally) for bottled water consumption. The lack of trust in public institutions and the perception of tap water insecurity are considered fundamental factors contributing to this phenomenon. The theme of safety, specifically in relation to water as the quintessential natural resource, brings individuals into direct contact with a nature whose hazards must be managed, even culturally (Bartoletti and Cecchelin, Wilk 2002; 2006).

This research employs a mixed-methods approach, combining both quantitative and qualitative methodologies, with a specific focus on the youth population as potential catalysts for cultural changes associated with an emerging environmental consciousness and post-materialistic values.

The study aims to inform the development and assessment of social communication initiatives and policies by public institutions, specifically tailored to promote sustainable behaviors. This involves strategic interventions designed to establish supportive contexts for the widespread adoption of these behaviors, encompassing technological advancements, institutional frameworks, services, and incentivizing measures.

Power to the People: The Incentives and Obstacles of Consumer Participation in the Energy Transition

Ilona Maria Kousa

University of Helsinki, Finland

The energy transition from fossil-based to renewable energy sources is a critical concern from both European and global perspectives. This transition is deeply intertwined with major crises confronting the world today, including climate change, environmental degradation, and geopolitical conflicts.

In the face of these significant shifts, ordinary individuals are not just adapting; they are driving change, influencing policy through civic action, and affecting markets with their purchasing decisions. However, it's important to recognize that not everyone has equal opportunities to participate, often due to disparities in resources. This research aims to explore the incentives and obstacles consumers encounter in the energy transition and to contextualize these within the broader, sometimes polarized discussions by examining the interactions between consumers, energy sector stakeholders, and policymakers.

I will employ several methodological approaches, integrating quantitative data from stakeholder surveys with qualitative insights from social media discussions. I will use both traditional statistical analysis and innovative AI-based methods to provide a comprehensive understanding of the collected data. This research will contribute to academic discourse on how consumers engage in the energy debate and the methods available for studying it, and offer insights for policymakers and energy sector stakeholders seeking

to facilitate the energy transition effectively and equitably. Moreover, the importance of this subject extends to its direct impact on every consumer, reflected in energy costs and accessibility, as well as environmental and geopolitical repercussions. A key objective of this research is to amplify the perspective of the average consumer, ensuring their voice is heard in a dialogue historically dominated by political and industrial powers.

Building a "diverse economy" through the Renewable Energy Communities. Framing a new movement and reframing a public policy in Italy.

Ignazio Terrana, Marco Binotto

La Sapienza, University of Rome, Italy

The paper describes the connection that is developing in Italy between the solidarity economy networks and the emerging experiences of Renewable Energy Communities (RECs). RECs are a model of distributed production of energy that allows different subjects to come together to produce and share renewables. The solidarity economy networks are a social movement born as a phenomenon of consumer activism from the GAS experience ("Gruppi d'Acquisto Solidale", solidarity purchasing groups), founded on the shared purchase of essential goods in the early 1990s and slowly evolved towards the construction of "alternative economic systems."

Through changes in purchasing practices, political consumerism advocates for processes of social transformation (Boström, Micheletti 2019). Thus, a change in lifestyle becomes the initial step in fostering "diverse economies" (Gibson-Graham 1996; Gibson-Graham, Dombroski 2020). Often, food offers itself as a first step: as a daily necessity, it offers the aspect of individual consumption to be modified to build everyday activism eventually evolving into alternative food networks, true Sustainable Community Movement Organizations (SCMOs) (Forno, Graziano 2019). Rarely do these experiences focus on utilities, such as energy consumption.

The interest in this experience lies in two tensions, two conceptual redefinitions: a) the intention to operate a different framing of the experience of food activism and b) the attempt to reframe a European energy public policy to radicalize an energy transition that might reproduce the top-down logic of traditional energy systems and promote an individualized consumer-activism, detached from a systemic vision.

164

RN05 | T02_01: Economics of consumption 2: Inequalities

Transitions in Tension: Understanding Sustainability Engagements across Socio-economic Backgrounds in Norway

Ulrikke Wethal[1], Arve Hansen[1], Sara Heidenreich[2], Cornelius Heyse[2], Robert Næss[2], Gisle Solbu[2]

1Centre for development, University of Oslo, Norway; 2Department of Interdisciplinary Studies of Culture, Norwegian University of Science and Technology

How to change unsustainable lifestyles and consumption patterns in affluent societies is at the heart of global climate and environmental challenges. While many consumption domains are increasingly contested and debated, little progress is made in tackling overconsumption. Furthermore, while there is a pressing need for rapid sustainability transformations, it is also increasingly acknowledged that transformative change needs to be fair and inclusive. In this paper, we seek to understand the complex relations and dynamics between sustainability transitions, social organization and inequalities by examining how households across socio-economic backgrounds in Norway perform 'sustainability' in everyday life. We employ a practice theoretical lens to address the factors that co-shape different households' agency, ability, and forms of engagement in transition processes, and thus how inequality becomes expressed in sustainability transitions at the household level. In the analysis, we demonstrate how particular forms of (visible) sustainability engagements (electrification, technological upgrading, circularity) which are often associated with higher-income households are considered more socially desirable, publicly valued and politically supported, while others are made invisible in the popular public and political discourse (e.g. austerity measures associated with low-income households). We argue that in order to avoid reinforcing social inequalities and tensions, there is a need to develop policy measures that also meet the needs of invisible sustainability performers and pursue ways of valuing a broader diversity of sustainability engagements. The analysis is based on extensive qualitative interview data (n120) from four different research projects studying consumption and sustainability within low-, middle – and high-income groups in Norway.

To Spend and to Afford: Theorising the Economic Practices of Discount Consumption

Jonas Bååth[1,2], Christian Fuentes[3]

1Department of People and Society, Swedish University of Agricultural Sciences, Sweden; 2Circle – Centre for Innovation Research, Lund University, Sweden; 3Department of Service Studies, Lund University, Sweden

As consumption often takes place on markets, money has an integral role in making it happen. Recent hikes in costs of living have also demonstrated the relevance of prices for shopping and other consumption practices. In addition, retail outlets actively use pricing as marketing to guide or control customers towards the purchase of certain offers—performatively organising, rather than adjusting to, supply and demand. Nevertheless, the sociology of consumption has largely omitted how consumers use and consider money and economic value, spare the recent interest in credit consumption. Economic sociology has, in turn, studied the forces of economic institutions and knowledge at length yet engaged sparsely with the practices of (private) consumption. The paper engages with the topic of discount consumption – the marketing, purchase, and use of offers with reduced prices – to investigate the potential of economic-sociological theory for the sociology of consumption. Using discount consumption as an entry-point, it engages with the questions: how do consumers and retailers use discount prices and thereby organise discount consumption?

To address this question, we focus on spending, the use of money in practices of consumption, and affording, the contextual cognitive, social, and practical configurations involved in allocating money to different forms of spending. Our analysis traces these concepts presence (and absence) in extant sociology of consumption and economic sociology. By combining these strands of research, we theorise how spending and affording works, how these practices shape and get shaped by the organisation of discount consumption (both in retail and in the lives of people who practices it), and trace further avenues for engaging with economy as culture and practice in the sociology of consumption.

165

Shades of Poverty: Tensions Between Objective and Lived Poverty

Zuzana Chytková, Alžběta Wolfová

University of Economics in Prague, Czech Republic

Prevailing notions of poverty line arise from theoretical viewpoints in the various forms of „minimum income standards" and „reference budgets" (Deeming 2020). In practice, they often do not match the actual lived experience of the people, which is necesarily also defined by the subjective definition of the „decent household budget", and more importantly, by tthe regional characteristics of their site of residence. In this paper, we set out to map poverty's diverse landscapes from the point of view of those navigating its complex terrain in unequal spatial conditions.

Our study is part of a larger research project, which seeks to integrate the theoretical definitions of poverty with quantitative measures and qualitative understanding of what such definitions mean in the lived experience of people in varying regions. In particular, we present the findings of the qualitative part of the research. Within this part of the research, we have selected regions in the Czech Republic, which we identified as at risk of deprivation by the selected quantitative measures. In these regions, we carry out participant observations, a series of in-depth interviews with key gatekeepers and stakeholders (e.g. pediatricians, school directors) and in selected households identified as vulnerable.

By analyzing accounts of people facing varying challenges regarding their subjective perception and preferences and objective (sociodemographic) status in regions with specific limits of social infrastructure, we compare consumption strategies and resources relied upon across a spectrum of deprivation levels, revealing poverty to be a spatially diverse, nuanced continuum rather than a monolithic state.

"The Freedom to Extend Purchasing Power: Who Uses Unsecured Credit and Loans in Norway, and for Whom Does This Develop into Problematic Debt?"

Markus Lynum

SIFO, Oslo Metropolitan, Norway

In this paper I examine who uses unsecured credit and loans in Norway, and for whom it turns into problematic levels of debt by analyzing data from the Norwegian debt-registry. Since the 1990's social inequality has increased, while consumers also have gained a newfound freedom to quickly extend their purchasing power through the use of unsecured loan and credit products. Consumers are incentivized to make use of loans and credit products in order to access market welfare and bankroll consumption, and behave like market actors when dealing with their own finances. For some, access to unsecured credit is a good that allows for more economic flexibility while it for others turns into problematic debt – that may cascade into severe payment problems. As problematic levels of unsecured debt are frequently seen as individual outcomes from market processes that come about due to frivolous consumption, it is important to examine how the risk of overextending one's borrowing capacity is distributed in Norwegian society. As unsecured loan and credit don't come with a requirement of the borrowing party providing security, it's an accessible form of financing that is readily available to both the well-to-do and for the disadvantaged. Through examining trajectories leading to consumers racking up problematic debt-levels, I hope to further our understanding of the potential role unsecured credit and loans play for the production and reproduction of social inequality in contemporary Norwegian society.

RN05 | T02_02: Food consumption 2: Meat 2

The Social Conditions Of Macro-Algae Consumption In France: A Review »

Calixte Engelberg

EHESS, Institut Lyfe

The sustainability of food diets has become a topical question with the growing emphasis of diets' role in carbon footprint (Chai et al., 2019; Wolfson et al., 2022). Food practices have been evolving for decades, from the rise of alternative diets in the West, to the growing organic food offer. Recently, foods such as insects, legumes or our research object, macro-algae (such as kombu or nori) are being introduced in diets as a source of non-animal protein (Embling et al., 2022; Shanti et al., 2023). Algae can be an answer to a concern for sustainable consumption as it has many nutrients and grows in salted water. It is scarcely consumed as a sea vegetable in France (Lesueur & Comparini, 2015) but may be the object of a growing interest as a novel food. Our primary hypothesis is that after a change in food practices, we will be now observing a change in the households' food repertoires, linked to a probable sustainable engagement (Alagarsamy, et al., 2021; Boström & Klintman, 2009). This review aims to examinate this hypothesis but also to highlight which theoretical approaches are used by authors in social sciences to report those changes in consumption. As the survey is still in progress, the results are limited for the moment, but we can already note that practice theories are much used to analyse sustainable consumption and changing individual behaviour (House, 2018). Anthropological concepts like "invisible foodscapes" (O'Connor, 2013) will also be explored as they suit particularly this research.

Who Do We Talk About When We Talk About flexitarians

Morten Wendler[1], Johannes Volden[2], Øyvind Sundet[2]

1University of Copenhagen, Denmark; 2University of Oslo, Norway

Many studies have investigated vegetarians and vegans in different ways, e.g. focusing on their values, motivations, identities, challenges, and everyday food practices. A recent trend is to study so-called flexitarians, which usually is used to group together consumers who don't completely avoid meat, but who reduce their meat consumption to some degree. However, the term flexitarianism tends to be ill-defined and is used in widely different ways. In consequence there is no apparent scientific consensus on who counts as flexitarians and for the same reason nor on how widespread the phenomenon is. This also means that consumers who don't self-identify as flexitarians and/or have

166

high levels of meat consumption are still sometimes viewed as flexitarians in empirical studies, which means studies risk overestimating how widespread meat-reduction is among consumers. In the current article we aim to contribute to scientific understandings of meat reduction among consumers by challenging the utility of the term flexitarian itself, and by questioning the existence of "flexitarians" as a coherent consumer group. By drawing on empirical examples from both a Danish and a Norwegian research project on consumers who have reduced, or are in the process of reducing, their meat consumption, we illustrate how meat reduction in everyday life is approached and organized in fundamentally different ways meat reducing by consumers. We discuss the implications of the results for food studies as well as policies aiming to normalize less meat intense diets.

"The Sustainable Food of Future: Cultured Meat Coverage in the Italian Newspaper, 2004-2023"

Andrea Rubin, Michele Bonazzi, Giulia Banfi

University of Ferrara, Italy

Food production and consumption have been identified as some of the most significant contributors to the current environmental crisis. Meat consumption was associated with higher risks for environmental sustainability. The actual level of meat consumption is associated with several problems linked to production and consumption systems that may increase in public health domains. This is an important topic, which urges the media to pay attention and public opinion. Thus, it becomes particularly relevant to understand how the theme of food innovation is configured in medial arenas. This article reports on a content analysis of the emerging issue of "cultured meat" coverage by the leading Italian newspaper, Il Corriere della Sera, over a period of twenty years. Hence, it becomes crucial to comprehend how the concept of "cultured meat" is framed within media spaces, also in connection with the consumption of food. Results show an expansion of coverage over time, although it was increasingly "controversed". The typical "cultured meat" news can be described as dealing with two main frames: on one side, the lab-grow meat presented as an expression of the food innovation process, the food future, and its compatibility with new consumption trends. On the other side, "cultured meat" is associated with potential risks for farmers and national culinary heritage. In order to extend the scope of the research, a comparison with similar studies in other countries is also presented. Our contribution can provide important insights to shed light on a relevant subject in the contemporary media landscape, with potential implications for future consumer choices. It will be important to develop and articulate these findings in terms of future national surveys and international comparisons.

Consuming Seaweeds: In The Laboratory And Beyond

Annabell Merkel

Lund University, Sweden

Based on fieldwork in a sensory science laboratory in Sweden, this paper brings the social aspects of conducting an analytical sensory panel together with consumers' understandings of the everyday consumption context and existing practices. As part of an interdisciplinary project investigating seaweed as a new food in a Swedish context, this paper explores how seaweed as a new resource is made edible and how its taste is negotiated. The aim is to understand how expert consumers' everyday life practices and ideas about seaweed consumption resonate with sensory perceptions and experiences they have produced in a laboratory.

What kind of sensory perceptions and experiences are produced and how are they negotiated?

How do the professional tasters understand and relate to eating seaweed in their everyday life?

How do the sensory perceptions and experiences resonate with the experts' everyday habits?

Theoretically the study draws on diverse perspectives from the sociology of consumption, social science studies on sensory science, as well as literature from social and cultural geography. Through the concepts edibility and taste, I explore how a new resource becomes edible, tasty food.

Observations and open expert conversations during two training sessions and one testing day of an analytical sensory panel have been conducted. After the sensory testing of different seaweed species, in-depth interviews with the professional panelists took place. The semi-structured interviews evolved around different parts of the food consumption cycle, such as acquisition of ingredients, cooking and eating. Qualitative aspects of conducting the analytical sensory panel are analyzed, and everyday life practices and ideas of panelists about seaweed consumption are investigated.

The study is currently ongoing. Drawing on concepts, such as edibility and taste, conceptualizations of resources "becoming", as well as an interdisciplinary research approach, it is expected to contribute to sociological studies through exploring new ways of directly connecting laboratory evaluations and everyday life through the research participants and consumed food. Moreover, by understanding the social processes that are involved in a new food becoming edible, the findings might support establishing seaweed in a new market and aid a transition towards a more sustainable, plant-based diet.

RN05 | T02_03: Energy consumption 2: Crisis

"Finally Someone Talks About Energy" – Various Forms of Sufficiency in Everyday Life During the Energy Crisis

Senja Laakso

Tampere University, Finland

While the energy crisis in Europe in 2022 was in many was an unwanted event causing inequality and deprivation among households, it also caused an unprecedented acceleration in the energy transition towards renewable energy production and a significant reduction in energy demand. This study focuses on the latter and asks how the energy consumption in everyday life changed during the crisis, what forms of sufficiency could be identified in household practices, and whether and how the households linked their practices and their role as consumers to the broader dynamics in the energy system and energy transition.

The data consists of in-depth interviews with 39 households across Finland, conducted in early 2023. The interviews focused on changes in routines due to energy crisis and reflections of 'enoughness' in mundane energy use. The households represented various situations in life and housing arrangements.

The preliminary findings of the study show how people changed their everyday practices in various ways to keep heating and other energy use at minimum. However, the reasons varied from being forced to save energy due to high energy costs, to general interest of trying new things and technologies, and to solidarity towards others and "being a good citizen". Many respondents also felt as having had a role in mitigating the energy crisis due to changes in consumption patterns in homes. In the presentation, we discuss these various forms of, and reasons for, energy saving in homes and the ways they relate to energy sufficiency and energy transition.

The 'Capacity To Act' Gap : Why Are Certain Motivated Households Unable to Implement Household Sufficiency Measures in an Energy Crisis?

Marlyne Sahakian[1], Alice Guilbert[1], Eivind Hjort Matthiasen[2], Arve Hansen[2], Senja Laakso[3], Przemysław Pluciński[4], Line Valdorf Madsen[5], Kirsten Gram-Hanssen[5]

1Sociology department and Institute of environmental governance, University of Geneva; 2Department of Sociology and Human Geography, University of Oslo; 3Faculty of Management and Business, Tampere University; 4Faculty of Sociology, Adam Mickiewicz University, Poznan; 5Department of the Built Environment, Aalborg University Copenhagen

In winter 2022-2023, countries across Europe were bracing for an 'energy crisis'. For the first time since the 1970s, certain governments took action by inciting energy users, including citizens, to reduce their energy consumption. A building performance gap exists between the expected energy efficiency of a building, and the actual energy that is consumed by users (Gram-Hanssen and Georg 2017). When it comes to users, it has long been established that there can be a gap between people's values and actions (Blake 1999). In a study across five countries (Denmark, Finland, Norway, Poland and Switzerland), we draw on qualitative data to assess how households – representative of diverse socio-economic groups – coped with the alleged 'energy crisis'. Although many people were able to reduce their energy usage, we uncovered a 'capacity to act' gap among a select group: even when people wanted to reduce their energy usage in the home, their capacity to engage in sufficiency practices was to varying degrees hindered by several factors including a) material and technical barriers, making it all but impossible to act upon certain energy systems and technologies; b) power dynamics, mostly owner-tenant relations, whereby owners lack incentives to render buildings more efficient, c) the significant role of intermediaries, such as heat experts or building managers, who add complexity to the coordination of any energy reduction measures, and d) the correlation between socio-economic background, care responsibilities, and access to time and energy efficiency/sufficiency measures. The analysis compares differences between the countries and contests the idea that information or better attitudes are lacking when it comes to bringing about change, which must be understood in relation to practices and power dynamics.

168

Sufficiency and New Meanings: Changes in Energy Practices During Times of Crisis

Line Valdorff Madsen, Kirsten Gram-Hanssen, Anders Rhiger Hansen, Rikke Skovgaard Nielsen

Aalborg University, Denmark

The recent energy crisis in Europe during 2022/2023 led to changes in energy practices. In this paper, we raise the question to what extent these changes included aspects of sufficiency.

In Denmark, media discourse along with rising energy prices and political debate spurred awareness of energy consumption among Danish households with a focus on reducing household consumption out of public spirit, sustainability or economic necessity. We explore how households' energy practices were affected by the energy crisis and how meanings connected to practices possibly changed. The paper builds primarily on 30 in-depth qualitative household interviews conducted during the Winter of 2022/23, supplemented by a survey with Danish households conducted in the same period. This gives a broader view on Danish households' responses to the energy crisis, showing that many Danes made changes to several types of household practices including both heat and electricity consumption.

The paper delves into the changing meanings of energy practices during times of crisis and disruption of everyday routines, dealing with the research questions: how do meanings connected to practices reshape due to the energy crisis, for example how do feelings of shame, distress, restraint, or content and perceptions of citizenship and sustainability affect energy practices in households? And how might these changed meanings in practices signify a focus on sufficiency in energy practices? Thus, the paper investigates different insights into sufficiency paths directed from a so-called crisis intervening in everyday life from a household perspective.

What Energy Crisis Revealed from Households' Demand Flexibility

Kaisa Matschoss[1], Jenny Rinkinen[2], Senja Laakso[3]

1University of Helsinki, Finland, Finland; 2LUT University, Finland; 3University of Tampere, Finland

Europe faced an energy crisis in 2022 as a consequence of the Russian war in Ukraine. Households were expected to show solidarity and reduce and shift their energy use throughout Europe. Some were struck by quickly rising energy prices that threatened the economic survival of many households. Relying on a social practice theoretical approach, our research empirically examines the experiences of households across Finland during the energy-crisis-winter of 2022-2023. Based on focus group and individual interview data with altogether 83 participants we examine in particular how households engaged in time-shifting their energy use. What motivated households to shift energy use? How did households manage to do this? What did they do differently and did they need to install new technologies or develop new capabilities? We find three motivations to engage in activities to time-shift energy use: own economic benefit to avoid large energy bills, influencing the overall energy price (societal benefit), ensuring the availability of energy to all (saving and shifting for the benefit of the society as well) and avoiding power cuts. Households engaged in a variety of practices to reduce and time-shift energy use such as reducing indoor temperature, taking less hot baths, using electric sauna less, engaging more with wood-heating with electric radiators out of use altogether, washing dishes and laundry during the night-time, etc. We discuss the potential in households for increasing flexibility in overall energy use and whether some new practices are likely to stay (such as following apps and accepting stock-priced electricity contracts).

RN05 | T03_01: Digital consumption 1: Platforms and youth

Digital Agency and Vulnerability: A Study on Young Adult Consumers in Personalised Advertising Ecosystems

Mikko Laamanen, Arne Dulsrud, Dag Slettemeås, Erlend Kok

Consumption Research Norway, Oslo Metropolitan University, Norway

Personalised, behaviour data-driven, programmatic advertising is global market practice and a complex privacy issue that impacts consumers in their everyday lives. This chapter examines young adult consumers' experiences of digital agency and vulnerability in relation to the personalised advertising they encounter in digital spaces, particularly in social media. In a two-part qualitative study, we analysed these understandings and experiences from the point of view of 1) actors from the Norwegian media and advertising industry, as well as interest organisations and market regulators, and 2) Norwegian consumers with special categories of personal data, such as health, sexual orientation, ethnic background and political activity. We conclude that for both advertising market actors and the consumers they (try to) reach, it is difficult to identify alternatives to profiling based on personal data and behaviour, but that the vulnerabilities that this creates, impacts all consumers more universally.

Cultural Spaces, Places And The Digitalisation Of Consumption

Konstantinos Theodoridis

Panteion University of Social and Political Sciences, Greece

For a long time consumption of the city has been at the centre of attention in sociological and urban studies. The focus on urban experience has increased significantly in recent years due to the emergence of new smart technologies and social media from a range of different disciplines such as urban planning, sustainability and urban policy making. Despite recent research on the social and spatial impact of digital technologies, little attention has been paid to young people's engagement with cultural spaces as an experiential realm. As Miles (2021: 117) suggests "the experience society has created spaces and places for consumption in which the potential for control, magnified by the access to our information that the world of consumption has, is magnified". This paper investigates how the increasing impact of social media affects the process of producing and consuming cultural spaces in relation to youth identity development. More specifically, it focuses on the ways consumption of cultural spaces relates to the everyday challenges and tensions that young people have to deal with. Drawing

on data collected during the multi-method research project LOCUS: sociaL media, yOuth and Consumption of cUltural Spaces that is funded by the H.F.R.I. (Hellenic Foundation for Research & Innovation), this paper explores the effects of the digitalisation of consumption in the ways new forms of digitally mediated experiences of physical and social location are produced. Based on this, the research engages critically with the ideological implications of the digitalisation of consumption and the transformation of consumer culture.

Citizen-Prosumers' Participation Within the Digital Transition. Hybrid Reality and Public Services

Laura Tirabassi, Piergiorgio Degli Esposti

University of Bologna, Italy

The migration of public services to the digital platform has the potential to improve citizens' lives by offering faster, more efficient, transparent and participatory services according to those principles and power dynamics governing the digital environment in which individuals, citizens and consumers all fit into the definition of prosumers. The processes of bureaucratic rationalisation, standardization, the implementation of intelligent systems, and the effect of a hybrid space on the vital worlds, represent the assumptions on which the theoretical framework of the present research is built. The study intends to explore how the implementation of a bureaucratic model dictated by the criteria of the digital platform can ensure accessibility, inclusion and equity for citizens in the sphere of public administration (PA). To this extent, Ritzer's Integrated Sociological Paradigm will be implemented, supported by the theoretical framework of the Actor Network Theory, and Digital Humanities.

The context of the investigation is the Italian PA in the city of Rimini. Data on the digitalization projects active in the area are gathered and analysed combining quantitative and qualitative approaches.

The work intends to propose, in parallel with a critical sociological approach on digital participation in the public sphere, a perspective able to account for concrete horizons in the definition of a fair digitalization of PA with the main objective to provide services for all citizens, regardless of their socio-economic conditions or digital literacy, thus in view of mitigating the digital divide and reduce digital exclusion.

How Social Media Mechanisms Influence on Young People's (Un) Sustainable Consumption Practices

Clara Julia Reich[1], Jesse Tuominen[2], Mikko Laamanen[1], Terhi-Anna Wilska[3], Dale Southerton[4]

1SIFO | OsloMet; 2University of Jyväskylä School of Business and Economics; 3University of Jyväskylä Faculty of Humanities and Social Sciences; 4University of Bristol

The digital environment is an important part of young people's everyday lives and exerts influence to their consumption practices. Over the past decades, social media platforms have become multi-sided marketplaces; platforms use a variety of mechanisms to target users with data-based algorithmic profiling that leads to behaviour-based advertising, influencer and native advertising.

These mechanisms can encourage young people to engage in more or less (un)sustainable consumption practices. Considering the calls for more sustainable lifestyles and the mounting pressures to address the enabling and barrier-creating mechanisms to sustainable consumption, there is a need for a comprehensive overview of this topic. Our paper addresses the question of how social media mechanisms influence young people's (un)sustainable consumption practices.

The article develops a systematic literature review on the existing research on the impact of social media on (un)sustainable consumption with the aim of providing an overview and consolidation of existing knowledge and identify research trajectories for a future agenda. We focus on young consumers given their prevalent use of social media and the fit of these tools to their everyday practices and consumer identities and adopted lifestyles. The findings not only highlight the dynamics of the amassing discussion in the juncture of digital technology and the sociology of consumption but engenders relevance for policymakers working on questions regarding young people, digitalization, consumption, and sustainability.

RN05 | T03_02: Food consumption 3: Meat 3

Different Practices in Meat Reduction: The Significance of Meaningful Understandings and Social Environment

Alicia Dunker

University of Hamburg, Germany

Despite the rising awareness of the unsustainability of meat consumption, people seeking to reduce their meat intake still lead a niche existence in prevailing meat-centric societies. In order to better understand this minority, I examined the nuances of meat reduction within a Social Practice Theories (SPT) framework. By exploring the elements of routine, meaningful understandings, competence, social environment, communication and effects of media reports, I looked for differences between self-identified vegetarians and flexitarians as well as for subgroups beyond diet-labelling. Relying on data from a cross-sectional survey carried out in 2018 in Hamburg, Germany, bivariate analyses (N=323) show that self-identified vegetarians exhibit a stronger commitment to animal welfare and sustainability and are more integrated into like-minded social circles than flexitarians. Results from a Latent Class Analysis suggest two distinct groups among all meat reducers, characterized even stronger by their level of commitment and engagement. Vegetarians were more likely to fall within the highly involved group. The findings suggest that meat reduction is not merely a linear decrease in meat consumption but also especially involves the adoption of meaningful understandings and social connections, and show that these come combined. This contributes to a more comprehensive understanding of meat reduction, adds to SPT, and implies the importance of fostering supportive environments for sustainable dietary transitions.

Consumers Are Conservative, Meat-loving And Hard To Change – The Imagined Consumers As Presented By Plant-based Food Companies

Mette Weinreich Hansen

University of Copenhagen, Denmark

Based an assumption that the socio-technical imaginaries presented by companies will influence real life through chosen technologies and chosen product ranges available on the market, this presentation will discuss the potential for plant-based transitions seen through lens of companies' expectation to the market and their presentation of 'the consumers'. Based on a qualitative study from 2023 with

171

participation from plant-based food processing companies, the findings raises questions on the wider consequences of the imagined consumer presented by companies.

When looking into the imagined consumer presented by the companies a pattern emerges. Consumers are by companies mainly presented as traditional, price-oriented, meat loving and non-ideological. Only a small niche group of consumers is seen as more value-driven and they are not in focus for many companies. Companies working from this consumer imaginary, expecting most people to be unwilling to change their habits, risk to be stuck in certain production rationalities where meat imitations, lacking product innovation, modest market expectations and a low sense of responsibility for pushing the existing market structures are dominant. Consequently, the plant-based transition of food practices may be slowed down, not only because changing habits and routines are difficult but also because companies themselves limit the availability of plant-based quality products due to their low expectations to 'the consumers'. This imagined consumer is challenged by consumer research showing e.g. a much more dynamic and negotiated approach towards meat reduction, which will be discussed as well.

Tracing a 'Plant-Based' Backlash? Practices, Political Economy, and the Contestation of Dietary Transitions

Jonathan D Beacham, David M Evans

University of Bristol, United Kingdom

Amidst growing calls for the urgent need to transition away from 'Western' diets – characterised by high levels of meat and dairy consumption – on both environmental sustainability and public health grounds, consumption scholars have contributed to a groundswell of interest in potential dietary shifts. Drawing principally on theories of social practice to articulate these transitions, particular attention has been paid to the reconfiguration of everyday purchasing, cooking and eating practices towards 'plant-based' diets, denoting a significant (if not necessarily total) divestment away from animal-derived foods. However, these transitions are not unidirectional or delivered via consensus. Building on and developing existing contributions, this paper traces the contours of an emergent backlash against plant-based diets. Noting a palpable and growing problematisation of plant-based – variously on the grounds of nutritional (particularly micronutrient) deficiencies, concerns around the health effects of 'ultra-processed' foods, as well as the unintended consequences of a shift away from pastoral agriculture – we argue that greater emphasis within consumption scholarship ought to be paid to broader 'landscape' processes and practices of contestation. Connecting to and highlighting the resonance with debates in the political economy of agri-food and innovation studies, this paper argues that contestations around dietary transitions are exemplary in illuminating the need to better account for questions around power, normativity and the politics of knowledge in consumption scholarship. To conclude, we suggest some productive directions for further research, outlining some theoretical resources to better understand

and make sense of increasingly contested terrains of consumption in and beyond diets alone.

"I Aim to Choose the Plant-based Option, if it is Not Too Bean Heavy" – Identifying Normalities of Eating in Written Accounts

Roosa Luukkanen, Mari Niva, Taru Lindblom, Johanna Mäkelä

University of Helsinki, Finland

Sustainability transformation requires changes in all spheres of production and consumption, and food is one of the most important areas in this enormous effort. More sustainable, plant-based products need to be developed to replace foods that are most problematic from the point of view of ecological and nutritional sustainability. However, consumer practices change slowly, and the new products do not easily become part of everyday routines, unless the practices are perceived expectable and acceptable, and thus 'normal'. Nevertheless, history shows that what is seen as 'normal' changes over time, not the least in context of food. This study looks at understandings of 'normal' eating in written accounts depicting eating during one April Friday. The data was collected in April 2023 in collaboration with the Finnish Literature Society SKS, the University of Helsinki, the Rural Culture Foundation, and the Forum for Culture and Religion. The data set includes 428 written accounts by Finnish participants describing a single 'Food Day' including nuanced descriptions of the foods that were favored and avoided, and reflections on food and eating in general. The aim of the study is to identify how expectable and acceptable foods and practices of eating are conceptualized in these written accounts and the meanings ascribed to plant-based foods in these practices. In other words, the goal is to examine how plant-based foods fit into the understandings of 'normal' eating, and how 'normal' is maintained and challenged in everyday life.

Gendered Video Game Consumption: The Role of Consumption in Shaping Gender Identities among Young Norwegian Players

Kamilla Knutsen Steinnes

Consumption Research Norway, Oslo Metropolitan University

Playing online games is a highly gendered consumption activity, which is especially pronounced among Norwegian children and youth. Young male gamers in Norway spend both more time and money on video games compared to their female counterparts. In the literature, female gamers are understudied, objectified, and harassed, while male gamers tend to be stigmatized through unfavorable stereotypes. Moreover, consumption patterns in games are relatively under-researched, despite the established role of consumption in peer belonging and gender identity construction. Through 41 play-along interviews with children and youth aged 10-24 years, this article seeks to understand how the role of a gamer is enacted through gendered consumption. By drawing on identities and roles as theoretical tools, the findings suggest that players simultaneously accept and reject the socialized and gendered gamer role. Gendered consumption preferences allow for different ways of enacting gender, and game design contributes to shaping such preferences. Girls face challenges to belong as gamers and tend to conceal their gender identity due to harassment and exclusion, and actively seek out safe spaces. The findings are discussed in terms of how gendered consumption influences membership in the gaming culture and encourages the promotion of inclusion in game design and gaming platforms.

Digital Distinction: Strategies of Legitimizing Instagram Use in São Paulo Restaurants

Camila Crumo

Universidade de São Paulo, Brazil

This study delved into the digital transformation of restaurants in São Paulo, Brazil, employing Pierre Bourdieu's field theory. The analysis encompassed eight restaurants, with four distinguished in national reviews and four boasting a significant Instagram following. Data collection involved mystery visits to each establishment and a digital ethnography analysis of their Instagram profiles. The research explored the social distinction strategies employed by each restaurant to legitimate their Instagram presence without compromising their position in the gastronomic field and to seamlessly convey elements traditionally experienced in person onto the platform.

Within the gastronomic subfield governed by cultural production norms, restaurants accrue prestige through peer recognition, demonstrating minimal interest in public acclaim. Consequently, Instagram, as a vast social media, is perceived by gastronomic agents as potentially "vulgarizing." To counteract these negative effects, acclaimed restaurants typically adopt digital distinction strategies rooted in aesthetic and moral considerations, such as the mobilization of ecological and social repertoires. In contrast, restaurants famous on the platform tend to more flexibly align with trends dictated by Instagram.

In conclusion, this research observed that critically acclaimed restaurants often replicate and deepen haute cuisine repertoires on Instagram, thereby extending the intellectual experience beyond their physical space. For these establishments, Instagram serves a complementary role. Restaurants with substantial followings strike a balance between platform trends and essential gastronomic themes in their posts, tempering their message to resonate with their consumer base. In essence, Instagram plays a pivotal role for these restaurants, becoming an integral part of the product they offer.

Gaming Trajectories, Life Trajectories: How Video Gaming of People of Different Social Class Change or Not in Transition to Young Adulthood

173

Xiaobin Zhou, Paula Saukko, Adrian Leguina

Loughborough University, United Kingdom

There is established research on gender and race-based differences in video gaming, but social class is rarely discussed. Based on qualitative interviews with UK gamers (aged 18-35) of different social classes (n=39), we suggest that gaming trajectories and life trajectories of working-class and middle-class gamers diverge in the transition from adolescence to young adulthood. Both working-class and middle-class participants reminisced that they spent considerable time gaming daily with real-life and/or online friends as adolescents. As the middle-class and upwardly mobile gamers moved onto university, the games they played, time spent gaming and the friends they played with changed, contributing to a more self-controlled and discerning habitus. The life situation of working-class young adults did not change, and they continued playing more, similar games with the same friends. Differences in gaming frequency in the transition were corroborated by quantitative analysis of secondary data. Drawing on Bourdieusian conceptual framework, we offer original insights on how subtle changes affecting video gaming, such as the adoption of personalised tastes, time pressures and new social circles, transform young people's habitus with repercussions to their social mobility.

Exploring the Contradictions and Tensions of Feminist Consumption: Subscription Memberships, Alternative Funding Models, and Patreon

Carys Hill

University of Warwick, United Kingdom

Subscription-based platforms like Patreon and Substack, where audiences can be charged a monthly subscription fee in exchange for paywalled content and services, are quickly growing in popularity among content creators and others working in the digital sphere. While the motivations behind this shift vary, they often relate to a critique of and frustration with dominant digital income streams, including the challenges of navigating visibility, precarity and labour. However, subscriptions also develop audiences into paying consumers, and this gives rise to several tensions. In this paper, I reflect on findings from interviews and workshops with feminist individuals providing subscriptions as a way of building community and sustaining feminist work, and those paying for them. What emerges is that subscriptions ostensibly provide a form of care and support among otherwise uncaring funding models, but at the same time generate powerful tensions between building forms of voluntary, participatory communities, and the kinds of relationships that emerge. Namely, participants felt they were owed a service, 'buying' their way out of mainstream social media but also opting out, through paying for a service, of the labour that is required to build a community resource and space – consumer demands and expectations which ultimately reproduce the forms of precarity, scrutiny, and uncertainty subscription providers seek to escape. Building on scholarship which explores the relationship between entrepreneurialism, consumption, community and care more broadly, participants' experiences offer a compelling example of the effects of monetisation and consumption within feminist spaces and the inherent contradictions and tensions that emerge.

RN05 | T03_04: Energy consumption 3: Class

Unpacking The Eco-habitus In a Norwegian Context: Nuancing Cultural Distinctions in Energy Practice

Eivind Hjort Matthiasen

University of Oslo, Norway

Studies have found the cultural upper class in contemporary societies distinguish themselves through strategies of environmental and sustainability awareness – described as having an 'eco-habitus' (Carfagna et al., 2014). This indicates 'eco-habitus' is classed, with lower classes often feeling a sensation of powerlessness as to influencing their surrounding environment (Kennedy and Givens, 2019). Through an analysis of 37 interviews with informants from different classes in Oslo, Norway, this paper studies their orientation towards environmental values with regards to their performance of energy practices. Norway is a key case, as egalitarian sentiments in conjunction with unique energy characteristics, such as a fully electrified household sector and a renewable energy mix, provides a context of low social stratification and an energy transition that is well underway. Due to these contextual factors, previous research has found a lack of environmental awareness with regards to energy consumption in Scandinavian countries (Winther and Bell, 2018). In this research, I suggest that the general energy system context is key for understanding the social stratification of energy practices, as are local material conditions (e.g. types of home people live in) for influencing expressions of 'eco-habitus'. I question the power of distinction that cultural capital holds in this, and other, energy systems. Nuancing previous research on eco-habitus, the findings contribute to a deeper conceptual understanding of habitus and its outcomes on sustainable practices, as well new insight into class distinctions regarding environmental consciousness.

174

Water-Energy-Food (WEF) Nexus at Home: a Case Study from a Municipality in Portugal

Monica Truninger[1], Luis Dias[2], Ana Vales[2], João Graça[3], Luisa Schmidt[1], Julia Seixas[2]

1Instituto de Ciências Sociais, University of Lisbon, Portugal; 2NOVA School of Science and Technology, NOVA University Lisbon, Portugal; 3Faculty of Arts, University of Groningen, The Netherlands

The transition toward sustainable urban water, energy, and food systems (WEF) requires a comprehensive approach combining both technological solutions and socio-cultural dimensions of home resource consumption. Drawing on

results from the CitySelfy project, this paper aims to understand consumer attitudes and reported practices related to WEF systems in a Portuguese municipality. Additionally, it examines consumers' willingness to adopt alternative products and technologies with a WEF focus.

In 2022, a questionnaire was administered to 605 residents of Cascais municipality, near Lisbon, to understand socio-economic profiles and preferences regarding local water, energy, and food systems.

To gauge pro-environmental behaviour, we adapted the Pro-Environmental Behaviour Scale (Brick, Sherman, and Kim 2017) exclusively to WEF-related questions, enabling us to capture frequencies of environmental practices linked to energy, water, and food. Using a Principal Component Analysis (PCA), our results revealed that respondents were simultaneously concerned about conserving water and energy in their daily household practices, while issues related to food showed less integration with water and energy. The PCA on willingness-to-adopt questions for WEF resources indicated that respondents expressing the highest willingness for each set (water, energy, or food) were less likely to adopt measures in the other two sets. This suggests that consumers' declared practices and expectations do not display an integrated perspective on WEF systems, and it is uncommon for them to combine pro-environmental practices across all three systems in daily life. This highlights the need to grasp the dynamics of practice in everyday life where demand for resource use is configured (Foden et. al, 2018). This understanding is essential for developing interventions that promote an integrative approach to sustainable urban resource management.

Cutting the Air with a Knife: Energy Consumption, Class Boundaries and Suburban Atmospheres

Dana Kaplan[1], Miri Lavi-Neeman[2], Victor Chernov[3]

1The Open University of Israel; 2Arava Institute for Environmental Studies, Israel; 3Braude College of Engineering, Karmiel, Israel

In the context of climate change, studies on ordinary consumption and the procurement of energy have shown how differential access to energy fosters climate-resilience inequalities. Research into energy precarity shows that marginalized communities are often forced to use polluting energy, unlike middle-class populations, who may choose otherwise. Although wood-smoke pollution has been linked to various public-health risks, it remains a popular form of domestic heating, worldwide. In Israel/Palestine, a region known for its limited natural sources and uneven energy distribution, a substantial share of both lower and middle-class households uses wood-burning for domestic heating, albeit for different reasons and in different settings. Taking energy consumption as a contested social terrain whereby conflicting political-economic pressures, national-environmental imaginaries and class boundaries articulates, this paper asks, first, how energy consumption delineates symbolic class boundaries in suburban areas,

and secondly, how it produces mistrust and contentious relationships between residents. Based on interviews with residents and digital ethnography of suburban social media sites, we describe how the consumption of specialty wood and well-made fireplaces placed in well-designed homes, is not only formulated in terms of environmental consumer rights, but it also produces middle-class domesticity and gender propriety. At the same time, the involuntary consumption of middle-class waste, in the form of smoke and pollution by the neighbors of these stove users, create suburban atmospheres of mistrust, potentially also risking not only the middle-class branding of these locales but also notions of the good life itself.

Energy Saving In Low-income Households: Charity Or Political Environmentalism?

Felicitas Riedel, Kathia Serrano-Velarde, Britta Hedderich

Ruprecht-Karls-University Heidelberg, Germany

Energy consumption and its carbon footprint are known to increase with household income. Nevertheless, it is low-income households that are being encouraged to save energy by a German energy-saving-program as part of the National Climate Initiative. This approach is not only ecologically ineffective but also morally problematic from a climate justice perspective. Then again, low-income households benefit most financially from energy savings, as they spend a disproportionately large share of their income on household energy. Thus, such programs are confronted with normative dilemmas since saving energy may serve multiple purposes – charity and sustainability.

The paper studies the implementation of the so called "Energy-saving-check" in Germany. To reduce CO_2 emissions, it advises low-income households on sustainable energy consumption through peer-to-peer counselling. Funded by the Federal Ministry for the Environment and operated jointly by energy agencies and the welfare organization Caritas, the program trains long-term unemployed people to coach social welfare recipients on energy saving in their homes. Since 2009, the 150 sites of the program have coached 412,000 households nationwide. It claims to have saved 720.000 tons CO_2.

Using qualitative evidence from semi-structured interviews with politicians, local coordinators, and participants (N = 43) and ethnographic observations of household coaching and the training of the peers, we provide systematic sociological insights into the changing normative ascriptions attached to energy saving among vulnerable groups. Especially, we will show how environmental goals at the political level got decoupled from the local practice of the household coaching, which is strongly embedded in a value framework of charity and social counselling. Thus, we contribute to the ongoing debate on sustainable energy consumption and climate justice.

RN05 | T04_01: Digital consumption 2: Food platforms

Food And Sustainability: How Digital Platforms Are Trying To Reduce Food Waste

Ariela Mortara[1], Geraldina Roberti[2]

1IULM University, Italy; 2Sapienza University of Rome

Food waste plays an important role in the discourse on food sustainability with implications for the environment, the economy and social well-being.

Today, the scale of food waste is staggering, with billions of tonnes discarded each year worldwide. In Italy, according to a recent study, the cost of food waste will reach €9 billion in 2023 (Waste Watcher 2023), confirming that the country is still far from the goal of reducing food waste by 50% by 2030, as set out in the UN's 2030 Agenda for Sustainable Development. According to many researchers, consumers are one of the biggest sources of food waste in developed countries.

Government policies and regulations play a crucial role in promoting sustainable practices and minimizing food waste. In addition, addressing this issue includes raising awareness among individuals, households and businesses about the importance of reducing waste, adopting sustainable practices throughout the food supply chain, and implementing effective food recovery systems. These systems can include initiatives such as food rescue programmes and anti-food waste platforms such as Too Good To Go, Olio, NoFood Waste, FreshSurety, Nowaste, Nosh, Kitchen.

The paper discusses the different ways in which some of these platforms, operating in different contexts (business-to-business, business-to-consumer or peer-to-peer), can raise awareness, facilitate food redistribution and encourage responsible consumption, all with the aim of building a more sustainable and efficient food system.

Waste Watcher 2023, Osservatorio internazionale su cibo e sostenibilità – ITALIA, https://www.confcommercio.it/documents/20126/3920989/Waste+Watcher+Italia+2023.pdf/3ed10f67-6623-2802-9d4e-2c8df-0fa7110?t=1675261641974

The Social Meaning of Pulses in Media Recipe Presentations: A Qualitative Analysis based on Cookbooks and Instagram posts

Catherina Jansen, Tonia Ruppenthal, Jana Rückert-John

Fulda University of Applied Sciences, Germany

A transformation of food-systems for the health of people and the planet requires a significant reduction in the consumption of animal-based food. Pulses could play an important role here as climate-friendly, resource-saving protein alternatives. However, the consumption of pulses in Europe falls far short of the recommendations for a sustainable diet. Possible barriers to consume pulses are related to digestive problems, a lack of knowledge about how to prepare them and their culinary image as „poor people´s food". Nevertheless, public awareness for sustainable nutrition increases. This leads to following questions: to what extent (and how) the social perception and meaning of pulses and the associated practices are changing and which milieu – and target group-specific differences can be identified.

To address these questions, we conduct a qualitative analysis of two media formats that are assumed to represent contemporary food-related values and practices and be discursively involved in their constitution and confirmation. Selected media are current best-selling German cookbooks (n=46) and social media posts, more precisely, recipes published on Instagram by popular German food influencers (n=19).

The results indicate that pulses play a marginal role in media aimed at more traditional milieus and (meat-oriented) eating styles, especially as a mere additional ingredient in simple everyday dishes. In contrast, pulses are associated with explicit meaning and value in media aimed at health and sustainability-oriented audiences. However, in this context, pulses are not primarily valued for their culinary properties, but above all for their nutritional and health-promoting benefits. In this way, pulses appear as a symbol of sustainable, health-conscious and enlightened consumption. This reveals a change in social meaning that appears to be the opposite of that of meat.

Digital Entrepreneurship on Social Eating Platforms

Cecilia Manzo

Università Cattolica del Sacro Cuore, Italy

In recent years, social media and digital platforms have given rise to new forms of entrepreneurship, aiming to turn an amateur activity into a profession. An interesting case study is that of social eating platforms.

Social eating platforms are created to intermediate traditional forms of consumption (such as sharing a meal among friends) through digital. The technological infrastructure

has enabled to create new social bonds between strangers who meet to share a meal made by an amateur chef. It is built on relationships that develop within a peer community based on a strong experiential dimension.

After the pandemic, there has been a transformation of the model proposed by the owner companies (whether intentional or not), which outlines the transition towards work platforms dedicated to professionals.

The different business model of these platforms signifies a shift from a reciprocity-based regulation model to a market exchange model. Host profiles (chefs) are characterized by the presence of professionals who invest time and financial resources in establishing their activity on the platform. Based on these observations, the research aims to investigate how platforms give rise to new forms of "bottom-up" entrepreneurship. The questions to be addressed include: How do social eating platforms enable people's entrepreneurs in the digital economy? What is the quality of the work they create? What are the characteristics of this form of entrepreneurship? Additionally, the territorial dimension of the phenomenon will be explored: How does the phenomenon embedded in different regions?

The study is based on mapping social eating platforms in Italy, the analysis of chef profiles, and semi-structured interviews with platform managers and chefs.

The FoodMAPP Project: Exploring Possibilities of Promoting Local Food Distribution and Provision Through Digital Tools.

Maxime Michaud, Fairley Le Moal

Institut Lyfe Research and Innovation Center, France

FoodMapp is a European funded applied research project aiming at promoting short food supply chains through the development of a digital platform. The results presented here come from the qualitative part of this study, based on an investigation with consumers and stakeholders across five countries (Austria, Belgium, France, Spain, England). Five focus groups were led with consumers in each country and 50 interviews conducted with stakeholders across the different countries. The data was analysed according to a thematical analysis approach. Key drivers and barriers toward the adoption of digital solutions for improving short food supply chain and provisioning were identified. The results also provided insight into the multidimensional and heterogeneous definition of what "short supply chain" or "local food" mean for the different stakeholders. This definition helps understand, in particular, why both stakeholders and consumers perceive many barriers to the use of digital tools in the consumption of sustainable food, especially because digital tools are perceived as being somewhat an antithesis to local food provisioning and waste reduction practices. This research also has theoretical implications in studies of consumption as it allows to investigate the balance between cultural and social differences in European consumers and stakeholders' habits.

RN05 | T04_02: Imaginaries of consumption

The Utopia of Frugality. Imaginaries of Sustainable Consumption

Nina Heidenstrøm, Audun Kjus, Harald Throne-Holst, Atle Wehn Hegnes

Oslo Metropolitan University, Norway

Imagine that you are transported thirty years into the future. What does it look like? How do people live? What do you fear and hope for in the future? 137 Norwegian citizens answered these questions in an online qualitative questionnaire. Their responses take the shape of stories, imaginaries, of the future, that also consider aspects of consumption. More precisely, aspects of sustainable consumption because almost all the stories we collected revolved around man-made climate change, even though the respondents were not asked directly about it. When the respondents write about their own lives in the future, they do so in terms of virtues and vices as responses to the consequences of climate change. By means of narrative analysis, we examine how one virtue – frugality – is offered as an ideal for consumption both in micro-narratives of individual lives and in the macro-narrative level of the rules, ideals, and organisation of future society. The stories depict the frugal society of the future as going forward by going backwards to the consumption practices of previous generations. This frugality can be seen as an operationalisation of sustainability that translate into concrete actions the individual can take in their daily life. First and foremost, a frugal lifestyle entails engaging less with mass consumption and achieve a sense of freedom through self-production of food and clothing as a new mode of modernity.

177

Consumption, Mediatization and the "Long Tail" of Memory and Imaginaries

Silvia Leonzi, Giovanni Ciofalo, Lorenzo Ugolini, Fabio Ciammella

Sapienza University of Rome, Italy

The paper aims to reflect on the capability of media fruition to activate specific forms of sharing and participation in a scenario characterized by deep mediatization and full hybridization. In the current media environment transmedia narratives tend to expand horizontally through the process of spreadability, thus fueling the sedimentation of contents and symbols, that become a starting point for users to negotiate shared meanings, activating co-creative practices traceable to prosumption logics (Ritzer, Degli Esposti 2020). Nonetheless, this same process appears to lack in the capability to create a common shared intra-generational and inter-generational memory and imaginary, as was once the

case, generating a grey zone where social tensions could expand (Leonzi, Ugolini 2023).

To deeper analyse this scenario, the paper aims to investigate the ways in which specific transmedia narratives manage to create relations of meaning with users even when the latter have not directly accessed the texts. A survey and several in-depth interviews were conducted to identify whether and how media consumption still represents a possibility of dialogue within social groups, or on the contrary a new field of division, tension and mistrust.

The first results of the research show that a model of approaching cultural objects, products and consumption seems to be taking shape that is increasingly disconnected from the roots of narratives and, as a paradoxical consequence, increasingly linked to their representations, deprived of meaning. A mass imaginary that evolves in a mass of imaginaries, linked together in a "long tail" of volatile consumption (Anderson 2006; Tosca 2023), which contrasts the reaffirmation of a shared memory and a shared imagination capable of generating dialogue.

Sociology Consumption And Social Change

Alan Warde

university of manchester, United Kingdom

This paper addresses some central theoretical and methodological issues in the explanation of changes in consumption patterns. It takes the case of eating practices as illustration to examine conceptual apparatuses for dealing with processes of reproduction and transformation of habits. It focuses on ways to relate socio-cultural processes like informalisation, commodification and aestheticization to change and stability in aggregate behaviour. It explores how data, methods, analytic procedures and interpretive framings can best be combined to give defensible and distinctive sociological explanations of collective action. It asks, inter alia, whether it is plausible to offer characterisations of national culinary cultures and evaluates methodological procedures suitable for depicting their trajectories. It reflects on dilemmas arising from my recent attempts to explain patterns of domestic eating and dining out.

Futures Literacy: Norwegian Imaginaries Of Food And Clothing Consumption

Lisbeth Løvbak Berg[1], Atle Wehn Hegnes[1], Justyna Jakubiec[2]

1Consumption Research Norway SIFO, Oslo Metropolitan University, Norway; 2Utrecht University, the Netherlands

UNESCO has championed futures literacy since 2012, highlighting its importance in the context of imagining alternative futures and directing change towards desirable futures. It follows that futures literacy allows people to actively engage with the plurality of images of the future and relate them to their own choices and ideas of (un)desirable futures. While this includes understanding the role of the future also in people's everyday consumption practices, which inevitably play a major role in the green transition, efforts are largely focused on policy planning, business innovation and higher education. We, therefore, ask what level of futures literacy Norwegian stakeholders exhibit related to food and clothing consumption. Based on stories collected from 137 Norwegian consumers, advertisements, and business strategy and policy documents, we highlight the different stakeholders' narratives of food and clothing consumption to compare their engagement with present imaginaries of future consumption. We find that businesses and policymakers display a higher level of future literacy than consumers. In general, the narratives of food consumption are richer and more well-developed than those of clothing consumption: business and policy documents' narratives of sustainable clothing futures are limited to the repeating narrative of 'repair, reuse, recycle', whereas food consumption narratives range from self-sufficiency to alternative protein sources. The latter suggests a higher level of future literacy, which may reflect a more mature discussion of food futures: adversely, the lack of attention to alternative forms of clothing consumption decreases the likelihood of a larger transformation of clothing consumption patterns.

178

RN05 | T04_03: Panel on Food, inequalities, and social stratification

"Analysing Social Inequality Within a Social Practice Theoretical Perspective. Reflections From a Study of Food Practices Among Underprivileged Danish Households"

Lotte Holm, Kia Ditlevsen, Bente Halkier

University of Copenhagen, Denmark

In the project 'Proper' food under economic constraints' we conducted an interview based qualitative exploration of food practices in underprivileged Danish households. Links between food practices and lower dietary health, and relations between social norms and societal food discourses were in focus. The project was theoretically inspired by Social Practice Theories (SPT) as introduced by Warde to the field of consumption (2005) and to food and eating (2016). SPT is generally strong in analyzing social dynamics involved in mundane practices. However, social inequality and social hierarchy has largely been an absent theme which is only beginning to be addressed in SPT food research. In this paper, we highlight main empirical results and present conceptual reflections.

Our results report how specific bundles of practices in daily lives link to less healthy diets in underprivileged households, and how performance of food practice in constraining conditions are gendered. Further, we take up Walker's (2013) suggestion to address social inequality by relating Amarta Sen's capability approach to SPT. We focus on capacities and accomplishments and explore whether a social interactionist approach to accounting may deepen our understanding of normativity in underprivileged households.

The empirical study is based on 30 qualitative interviews with Danish men and women with low income and short education.

A Middle-brow Taste? Ultraprocessed Food Consumption, Eating Practices and Class in France

Marie Plessz, Séverine Gojard

INRAE, France

Ultraprocessed foods (containing ingredients not used in domestic cooking) are widely used but subject to negative moral judgements. The main explanation for their widespread use has been that they are convenient. This paper shows that UPF consumption expresses distinct tastes, that are most often found in the middle classes. We base our work here on the sociology of taste, on a practice-based approach to food consumption, and on the latest (2017) French Household Budget Survey. Regressions show how the share of UPF in food purchases varies according to class, food practices, and the various segments of the food market (types of restaurants, types of shops) for eating at home or away from home. UPF constituted 34% of the food budget for at home consumption. We found that UPF budget share is highest in households with intermediate levels of income and education, and convenience in food practices only partly accounts for variations in UPF consumption. The persistent association of UPF consumption with income and education, and the analysis of market segments for eating out and grocery shopping indicate that purchasing more UPF is associated with positive engagements with the conventional food market. The literature on the social stratification of taste has laid much emphasis on what differentiates the tastes of the lower and upper classes. Our research investigates tastes specific to the middle classes, and expands the category of middlebrow taste, both empirically and theoretically.

Between surplus and support: A comparison of Greater Manchester and Kyoto charitable food provision fields

Filippo Oncini[1], Hein Mallee[2], Nami Hamamoto[3]

1Maastricht University, The Netherlands; 2Kyoto Prefectural University, Japan; 3Kyoto University, Japan

Literature to date has increased our understanding of charitable systems of food provision and its complex dynamics with food waste and surplus, although there is still a lack of attention to food charities' relationships of conflict and interdependence, their shared understanding, boundaries, social positioning, and power relationships. Strategic action field (SAF) theory has been successfully used to analyze several nonprofit organization NPO arenas and proved to be a particularly useful approach to improve our understanding of the charitable food provision (CFP) field, and more generally of transitions towards more sustainable and just food consumption and provision systems. Additionally, the structured approach of Strategic Action Field (SAF) theory makes possible to compare CFP fields in different countries. Building on the case studies of Greater Manchester and Kyoto, this paper uses SAF theory to investigate the Japanese CFP field and to identify the main differences and similarities with the UK CFP field. The data is based on several semi-structured interviews with food charities directors, spokespersons and stakeholders based in Kyoto (15) and Greater Manchester (42). In both cases, data were enriched with visits during food distribution events, information and documents collected on the organizations' websites, and Factiva references trends. Similar interviews guidelines were used in both countries, and the interview transcripts were coded and analysed in Nvivo to identify differences and similarities following SAF's theory building blocks: field emergence, shared understandings and practices, the broader field environment, and the effect of Covid-19 as an exogenous shock.

179

Going Forward Or Going Backward: Using Securitization Theory To Understand Policy Implications For Food Access And The New Concept Of Nutrition Security.

Wesley Dean[1], Cassandra Johnson[2]

1University of Copenhagen, Denmark; 2Texas s<tate University, United States of America

Food security "exists when all people, at all times, have physical and economic access to sufficient safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life (FAO 1996)." It is the predominant concept that frames policies that address systems of food provisioning by governments and charitable organizations at multiple levels and across contexts. Recent work in the US seeks to reframe these policy solutions with an updated concept, nutrition security that explicitly addresses structural inequities. Securitization theory (Wæver 1995) examines the securitization of policy solutions as a speech act which constrains solutions. Prior applications examined how issues of national security and environmental crises primarily focus on defense of the state. The historical context for US framing food access in nationalistic terms has been shown to have roots in militarization (Levenstein 2003) and food security policy is currently tied to the promotion of American agriculture. Our case study uses securitization theory and a discursive analysis of the historical framing of policy solutions to explore three research questions: 1) How has the concept of food security developed in the US as a solution that links challenges to household food acquisition to questions of national security through policies implemented by the US Department of Agriculture? 2) How have competing conceptual frameworks (food sovereignty and food justice) been expunged from the security frame? and 3) What are the implications of transitioning to an official policy frame of nutrition security for equity and justice?

RN05 | T05_01: Digital consumption 3: Data entanglements

The Human-algorithmic Entanglement in the News Realm

Piergiorgio Degli Esposti[1], Laura Tirabassi[2]

1Universita' di Bologna, Italy; 2Universita' di Bologna, Italy

News evolution is increasingly driven by technology, favoring fast, automated, and accessible content. This shift raises concerns about the de-professionalization and societal value of journalists, as AI influences news production. Our study examines AI's impact on Italian journalism, using Ritzer's Integrated Sociological Paradigm to analyze the balance between rapid, AI-driven news and a slower, more humanized approach.

Prosumers, who both produce and consume news, are reshaping media. Their active role challenges traditional journalism, accelerating information flow. Within that frame the slow news vs fast news approach is reshaping the way information is produced and consumed, leading our attention to the cultural lag, where societal norms struggle to keep pace with technological changes in news dissemination.

Furthermore, prosumers are central to the concept of creative destruction in media, driving innovation but also raising concerns about the quality and trustworthiness of news. Our study aims to unravel these complex dynamics, spotlighting how the news landscape is evolving in an era marked by AI and proactive consumers, a battlefield between human-centered journalism and machine efficiency.

Creepy or Curios? Affective Responses to Digital Voice Assistants 'Acting Out'

Helene Fiane Teigen

Oslo Metropolitan University, Norway

Digital voice assistants such as Google Home, Apple's Siri, and Amazon's Alexa are popular features of connected homes. They are used for various tasks such as relaying news, weather forecasts, and controlling other smart home devices (i.e. lights and heaters). They consist of a material "body" and a human-like voice that people interact with activated by a code phrase. However, it is commonly known that these devices may activate accidentally without the code word. How do people react to this malfunction and what does it mean for their sense of home to have a human-mimicking presence that sometimes acts outside of their control?

In this paper, I will explore how people talk about – and with – their digital voice assistants and how this is affected by

180

the assistants 'acting out', by which I refer to the assistants operating outside of people's expectations and control.

The paper draws on qualitative interviews with ten people living with digital voice assistants, including images of how their assistants are physically placed within their homes, as well as researcher notes from the interviews. Combining a socio-material framework with the notion of affect, this paper discusses the tensions between the seamless ideal of smart home technology and the messiness of reality, and as such contributes to illuminating the transformation of the home from a closed and private space to a connected node in a larger digital ecosystem.

Consumed by Data: Reconnecting Consumers With Their Personal Data Through Data Domestication

Dag Slettemeås, Helene Teigen, Henry Mainsah

OsloMet, Norway

This paper addresses the escalating tracking, monitoring and commodification of consumer data. Both individual and 'behavioural surplus' data (Zuboff 2019) are in high demand for marketing purposes, leaving consumers vulnerable to privacy erosion, manipulation and discrimination, challenging their agency, autonomy and life quality (Puntoni et al. 2021). The paper combines insights from two recent research projects (employing group interviews); one focusing on consumer perceptions of digital market surveillance (dataveillance), and one on sensitive data used for targeting consumers with 'intimate' SoMe-ads. Preliminary analysis suggests that the 'weak' relation between consumers and their data is a major obstacle for constructing and maintaining privacy-protective strategies. Personal data are considered abstract, immaterial and intangible by consumers, who struggle to conceptualize what data can be considered personal, intimate or sensitive. Weak data relations seem to be exacerbated by a sense of 'loss of control' over personal data flows, leading to privacy apathy or digital resignation (Draper & Turow 2019). At the same time, tracking and exchange of data for services appears to be the accepted state of affairs, and consumers enjoy relevant targeted marketing. This ambivalence generates apparently paradoxical positions and emotions among consumers. The paper concludes that a central challenge will be to reconnect consumers with their own data. Here we suggest the concept of 'data domestication' (cf. Flintham et al. 2019), making data visible and tangible through visualization techniques, and through experiencing data in practice. In this way personal data can be 'tamed', demystified and tangible, potentially strengthening consumer privacy protection strategies. We will combine technology paradox concepts (Mick & Fournier 1998) with theories of domestication (Silverstone et al. 1992, Helle-Valle & Slettemeås 2008) for this purpose

Consuming Convenience: The Case of Voice Assistants in the Smart Home

Niklas Strüver

University of Siegen, Germany

This presentation examines the field of smart home technology, focusing on the role of voice assistants, exemplified by Amazon's Alexa, in facilitating the consumption of artificial intelligence (AI) and smart devices. The integration of voice assistants into everyday life not only simplifies the use of smart home technology but also alters the consumption of digital convenience technologies. Central to this investigation is the concept of 'convenience' (Shove 2003; West 2022) as a driving force behind the adoption of AI and smart devices in domestic settings, as the imaginaries around it justify these technologies.

I view these devices not merely as tools, but active agents as an extension of a big tech company in shaping consumption patterns. The study argues that Alexa, by making the smart home more accessible, facilitates the consumption of technologies such as artificial intelligence and smart devices, in the users' pursuit of convenience. This analysis is achieved by looking at various qualitative empirical materials (such as interviews, or media – and standard-analysis) gathered during my PhD project that works on Alexa.

Finally, the future trajectory of smart home technologies and voice assistants in the light of the rise of ChatGPT and similar services should be considered. The field of digital consumer technologies has been disrupted multiple times in the last few years and seeks to re-align itself. This process has an impact on imaginaries and consumers and their devices that (in some cases) have become essential for daily lives.

Shove, E. (2003). Comfort, cleanliness and convenience: The social organization of normality.

West, E. (2022). Buy now: How Amazon branded convenience and normalized monopoly.

Italians' Food Consumption and Environmental Sustainability Beyond the Pandemic Covid-19

Roberta Bartoletti, Paola Parmiggiani

University of Bologna, Italy

The Covid-19 pandemic disrupted the normality of everyday life throughout the world and affected consumption practices, radically during the first Italian lockdown (March-May 2020) and in a softer way in the following months. Consumers have been forced to abandon, modify or replace some of their previous practices, and some of them have also learned and adapted to new practices, such as home cooking, which became even more common and popular among Italian families during the two months of the first lockdown. We wonder whether there are some permanent changes in the consumption practices of Italian families, what are the reasons for these changes and whether these changes are oriented towards a more sustainable society.

We intend to present some results of a qualitative research based on 30 in-depth interviews with Italian households carried out between May and July 2021 – at least one year after the end of the first lockdown – in the macro-territorial areas of the North (Emilia Romagna), Centre (Marche), South and Islands (Sardinia) of Italy.

In our presentation, we focus on the social and environmental sustainability of domestic food consumption practices. Our research questions are How do consumers engage with environmental issues in their everyday lives? What changes, if any, have occurred as a result of the Covid-19 pandemic? The research shows that daily waste management and attitudes towards food waste are the areas where Italian consumers are most concerned about environmental sustainability, albeit mainly indirectly and not always consciously.

The Evolving Significance of Food Origin Label, between Sustainable Eating and Security Claims. A Study on Italian Consumer Trust amid Crisis.

Maria Giovanna Onorati[1], Sarah Siciliano[2]

1University of Gastronomic Sciences of Pollenzo, Italy; 2Salento University, Italy

The intervention presents the outcomes of an interdisciplinary study engaging five Italian universities, focusing on the escalating importance of food origin label for contemporary Italian consumers and its implications in terms of eroding consumer trust amid the prolonged crisis. Despite economic challenges, the origin of food remains a paramount concern for Italian consumers, wielding a substantial influence on their purchasing decisions. Notably, the food origin label has transformed into a symbolic construct, encapsulating omnivore dilemmas intensified by persistent uncertainty, reflecting an escalating distrust toward the global landscape and supranational systems. Through a blend of qualitative and quantitative research conducted on a representative sample of the Italian population, this study delves into the cultural narratives underpinning geographical indications of food products, their impact on consumer values and meanings – often resulting in a polarization between security and 'green', or the overlapping of 'authentic' and 'sustainable' – and their integration into daily consumption practices. It will ultimately offer insights into the emerging contradictory axiology and tense social dynamics shaping food-related practices during times of crisis.

Between Production and Consumption: The Transformative Potential of Food Engagement and Foodie Culture in Contemporary Poland

Agata Bachórz

University of Gdańsk, Poland

182

A tradition of examining the multifaceted role of food in late modern societies positions it, among others, not only as pragmatic sustenance but also as a form of leisure and cultural engagement. Scholars have conceptualized this engagement as craft consumption (Campbell 2005) or productive leisure (de Solier 2013), thereby blurring boundaries between consumption and production, as well as between the material and the intangible. They view engagement with food as making consumption more meaningful by, for example, including productive and creative dimension or accumulating cultural capital.

In this presentation, I aim to explore the transformative potential of engagement with food, focusing on: 1) individual biographies (advocating for shaping them around empowerment and self-realization); 2) new work ethics (mitigating alienation); 3) interpersonal relations (that should be based on energetic exchange and resonance, as articulated by Hartmut Rosa). To discuss these dimensions, I will draw upon material from various qualitative, individual or team research projects in which I participated. They were devoted to the following topics: 1) everyday food practices, 2) career shifts from white-collar professions to passion-oriented manual work in food industry, 3) reinterpretation of Polish cuisine and the gastronomic field to align with the cosmopolitan foodie scene, and 4) cultural participation and cultural institutions. All the research that I aim to summarize was situated in Poland, primarily within urban environments, spanning the last decade. Through a re-analysis of different projects, my goal is to contribute to the ongoing discussion on the potentials and challenges of foodie culture, particularly in its Polish manifestation.

Switching to Dairy Alternatives or Executing a More Profound Shift: Finnish Consumers Navigating between Different Pathways to Ecological Sustainability

Sami Koponen, Taru Lindblom, Mari Niva

University of Helsinki, Finland

Many sociological studies on food consumption have underscored the important role of meat and dairy product alternatives (i.e., products that have been developed to imitate meat and dairy products in appearance, taste, or structure) in the mitigation of current environmental problems. It has been suggested that such products successfully support the transition towards plant-based diets since they allow consumers to mostly maintain their deeply rooted ways of cooking and enjoying food. However, recent research has raised more critical viewpoints on the role of meat and dairy alternatives in sustainable food transitions. They have been criticised, for example, in the context of 'Big Veganism'. It has also been argued that by imitating meat and dairy products, the alternatives may reinforce the normality of animal-based eating and delegitimise the consumption of other non-animal foods. There is a clear need for more empirical studies exploring the promise and challenge of meat and dairy alternatives. This paper aims to critically explore and discuss the options of 1) switching to meat/dairy alternatives and 2) executing a more profound shift in food consumption practices. More precisely, drawing on 30 thematic interviews with Finnish consumers representing various social backgrounds, we examine the ways in which consumers navigate between the options of replacing dairy products with plant-based alternatives and developing ways of eating that are less focused on both dairy and 'dairy-like' products. We are interested in their current food performances as well as how they envision the future of Finnish food culture in terms of these options.

RN05 | T05_03: Sustainable consumption 1

Navigating Towards a Sustainable Future: Investigating Festivals' Impact on Sustainable Consumption and Local Identity

Katalin Formadi

University of Pannonia, Hungary

Festivals are an excellent example of how boundaries can be crossed, bringing people from different regions and cultures to celebrate, and fostering cross-cultural interactions and diverse consumption experiences. Festivals offer a platform to promote and embrace sustainable practices, benefiting both local communities and broader societies. This abstract explores the role of festivals in promoting sustainability, assessing their efforts in this. It explores the sustainable consumption patterns and attitudes of festival visitors, presenting a typology of festival attendees based on their sustainability engagement.

A comprehensive three-year-long questionnaire survey, conducted at festivals in the Veszprem-Balaton region, yielding more than 1100 responses, shedding light on the geographical and socio-cultural dynamics of festival attendance. The findings indicate an increasing environmental consciousness among festival participants, who willingly adopt sustainable practices like recycling, reducing waste, and energy conservation. However, there is still room for improvement, particularly in the areas of food waste reduction and carbon footprint reduction.

This research highlights the role of stakeholders in promoting sustainable consumption and tailor their sustainability efforts to better meet the needs of festivalgoers. In conclusion, festivals have the potential to bring together diverse backgrounds and create a sense of community around shared values and interests. In conclusion, festivals have the potential to be catalyst for sustainability, with festival visitors, including locals acting as essential allies in advancing positive changes towards a more sustainable future.

What Kind Of Resources For The Engagement Of Consumers In The Circular Economy?

Laurence Godin

Université Laval, Canada

This presentation looks at the integration of the circular economy's principles into everyday life. More specifically, it looks at how everyday objects – clothing, furniture, toys, small appliances, etc. – fall into disuse, circulate and are reappropriated by households; in other words, how they gain a second life. It is based on a series of semi-directed

183

interviews conducted in Quebec City, Canada with participants engaged in this process as consumers, retailers or as members of community groups such as Repair Cafés or the zero waste movement.

Two main conclusions emerge from these interviews. First, engaging in the buying, selling, finding or donating of used objects, as well as repairing or transforming them, requires the investment of significant resources including time, skills and transportation. For this reason, today, engaging as a consumer in the circular economy remains more of a hobby or a passion than a set of practices that could easily be upscaled.

Another important observation is the importance of social networks – Facebook in particular – for every player involved, notably through classified ads or communications more generally. Indeed, the algorithm that determines the visibility of ads and publications plays a fundamental role determining if and how objects circulate between households, and the way this set of practices plays out. Taken together, these elements point to the necessity of designing infrastructures that would make engaging in the circular economy accessible to every consumer, without relying on the investment of significant resources by each and everyone of them.

on shared and normalized practices contains the risk of flattening social and cultural differences. Moreover, the notion of ecological habitus directs attention to the cultural dimensions of sustainable consumption. We underscore the need to enrich practice theoretical approaches with perspectives that highlight the relational and embodied nature of sustainable consumption practices to better understand social variations and inequalities.

On Embodiment and the Ecological Habitus. An Empirical Exploration of Social Class Dynamics in Sustainable Consumption Practices

184

Robbe Geerts, Frédéric Vandermoere, Stijn Oosterlynck

University of Antwerp, Belgium

Following the practical turn, research on sustainable consumption has emphasized ordinary, inconspicuous consumption and the role of materiality. Studies, for instance, highlight the role of freezers, washing machines, and central heating in explaining escalating consumer demands. However, this has been at the expense of addressing social variation and inequality. Utilizing qualitative in-depth interviews, this contribution explores social class dynamics in sustainable consumption practices. In particular, we employ a Bourdieusian perspective, which has often been overlooked. Through the notion of ecological habitus, we underscore that sustainable consumption is not solely externalized in material artifacts, but also embodied through one's social history and class conditions. Two key findings emerge from our study. First, despite the emphasis on everyday life within practice theory, it has gone underacknowledged that people from different social classes inhibit vastly different everyday life-worlds. For example, (operational) central heating is not self-evident among people in poverty. Second, such differences can translate into diverging environmentally relevant systems of dispositions. Findings, for instance, reveal an ecological habitus that focusses on scarcity among people in poverty, or show contradictions between elite and middle-class tastes (e.g., traveling, second homes, swimming pools, old-timers) and sustainability objectives. In conclusion, the focus of practice theory

RN05 | T05_04: Cultural consumption 2

Sensory Sensibilities: Rituals of Purification and Risks of Ethical Pollution in Speciality Coffee

Ian Woodward, Anuja Anil Pradhan

University of Southern Denmark, Denmark

In this study, we explore how sensory skills are constructed, practiced, and reflected upon in the speciality coffee industry. Based upon a case study analysis of a speciality coffee roaster in Copenhagen, Denmark, we focus on taste languages and tasting rituals and analyse the narratives and practices of how connoisseurs like baristas, owners, and roasters interpret and negotiate meanings around 'good coffee' through the refinement and reverence of sensory skills. Our ethnographic data – including interviews, observations, and follow-alongs – reveals a foundational narrative regarding the desire to purify the sensory coffee experience. This purification involves refining ritual sensing practices around tasting and describing the coffee, but also involves narrating contradictions and tensions that originate outside the material entanglements of a cup of coffee. Connoisseur consumption is a practice where taste is 'learned' through consumption and reflection. While tasting coffee, connoisseurs engage with sensory 'science' and 'protocols' in order to connect embodied sensations with abstract ideas about flavour. However, our informants also encounter significant contradictions whilst learning to taste which spill outside strict containers of physical taste. Through finding sensations and tastes in coffee, they also give voice to the political and ethical tensions of promoting a form of connoisseurship that valorizes aesthetic purity, whilst simultaneously claiming to lobby for 'poor' farmers in coffee-producing nations. We explore these sensory tensions that arise from informants' reflexivities. Our analysis has implications for sensory approaches, omnivore orientations, and sociological studies of taste as skill.

Authenticity as the Aesthetic Regime of Late Modern Capitalism: Insights from the Hipster Economy

Alessandro Gerosa

University of Birmingham, United Kingdom

Artisanal products have regained their popularity in the 21st-century post-industrial society. This phenomenon is being led by the urban 'hipster economy', particularly in the food and beverage sector, as highlighted by Ocejo (2017). Chris Land (2018) coined the term 'neo-craft' to describe this movement, which combines traditional craft with innovative and skilful production of high-quality products. Despite the symbolic and material allure of neo-craft work for middle-class individuals (Gandini and Gerosa, 2023), this revival cannot be comprehended without considering long-term taste transformations. In turn, these transformations allow the development of a framework capable of theorizing the role of taste in capitalist transformations.

This presentation builds upon the theoretical contributions included in 'The Hipster Economy' (Gerosa, 2024), based on a corpus of 40 semi-structured interviews with neo-craft entrepreneurs in Milan. The presentation will illustrate how the 'Hipster Economy' ubiquitous in the cities of the West – and beyond – epitomizes a 'hip aesthetic regime of consumption' founded on authenticity and a 'neo-craft' economic imaginary of consumption, typical of post-Fordist Late Modern Capitalism. Through this illustration, it will discuss the complex relationship between aesthetic regimes of consumption operating at the structural level of the economy and economic imaginaries of consumption operating at the meso-level. The main argument is to illuminate how taste is a pivotal dimension contributing to the structuration and development of capitalist configurations, despite its historical overlook in favour of regimes of accumulation and modes of regulation.

Accumulation of Cultural Capital: Longitudinal Study of Cultural Space of 2015-16 Cohort of University Students

Ondřej Špaček

185

Charles University, Czech Republic

The study of cultural stratification assumes that some differences in consumption patterns and cultural tastes are not merely outcomes of social inequalities but their integral parts. This argument rests on the assumption that these differences have qualities of (cultural) capital. Therefore, we could identify the processes of its accumulation and convertibility (Savage et al., 2005). However, existing research often relies on cross-sectional data collection, limiting its capacity to address these questions. The accumulation and convertibility facets of cultural capital require a longitudinal perspective on cultural consumption, taste differences and social class. This paper will aim to bridge this gap by utilizing data from a longitudinal study of the 2015-16 cohort of Charles University students, initially surveyed in 2017 and subsequently followed up in 2024. The focus will be on tracing the accumulation of cultural capital by mapping changes in positions in the space of cultural consumption and taste. It will explore different trajectories in various study fields in tertiary education, as well as examine capital accumulation in the context of the family of origin. The paper will also explore methodological issues of longitudinal analysis of cultural space, considering shifting relations of meaning, positions and understandings of cultural goods and practices by employing statistical instruments of MCA (see, e.g. Plessz et al. 2022).

Body Modification: An Ethnographic Approach to Tattoo Practices

Paula Varela-Fernández

University of A Coruña, Spain

The body can be perceived as a cultural fact, since the relationship with the body reflects the way in which social relations are organised. The convergence of capitalist consumption dynamics and the new era of communication has significantly influenced bodily practices. Thus, within the Western collective imagination, bodily expression is revealed as a flexible strategy for the materialisation of identity and connection to systems of common meanings. The present work explores this conception of the body as a place of cultural transmission, ideological manifestation and symbolic representation. The central object of investigation, body modification, is analysed as a total social fact that groups different practices and disciplines extended in time and space. According to the fundamental categories of sociological research, body modification practices will be approached through a qualitative methodology based on ethnographic fieldwork, in-depth interviews and focus groups with tattooists and tattooed people. Autoethnography and photographic recording are contemplated as ways to thoroughly investigate the intersubjective and situated construction of knowledge. The observation of the spaces where tattoo practices are professionally developed enables to understand the communicative action and the sensory load that accompany the consumption of body modification. Therefore, the frameworks of meaning that delimit and characterise the object of study are evaluated, examining the forms of consumption of body modification and the transculturation processes that affect its rituality. Consequently, this study aspires to delve into the Western (re)interpretation of body marking as a mechanism in the fetish machinery of today's consumer society.

RN05 | T06_01: Sustainable consumption 2: Waste

Consuming the waste

Marco Hohmann

Universität Hamburg, Germany

A colorful patchwork of nylon fabrics, oversized, "unisex" and "unique". And a price tag of 265,00 €. The rain-jacket's label explains that the garment is made out of 100 percent up-cycled waste material from broken tents that the manufacturer has "harvested" on festival grounds and therefore "saved" it "from destruction" in the incinerator.

Since the early 2000s, the term "upcycling" has become established for these and similar products. While the recycling of waste historically originated from an "economy of makeshifts" (Hufton) born out of poverty and associated with dirt and shame, it has undergone a fundamental shift in meaning over the last 20 years and is today being appropriated by a startup economy of change makers. Upcycling has become one of the emblems of a Green Economy of consumer products. In 2019, the Cambridge Dictionary named upcycling the word of the year.

From a sociological point of view, however, upcycling is a culturally and historicallly highly complex process of a material, symbolic and economic transformation of values that I empirically reconstruct in my follow-the-waste-approach. In my ethnographic field research I accompanied upcycling startups as they tracked down, collected, sorted and cleaned waste materials. I visited urban mines, places of value transformation and spoke to the actors who turn waste into wants, i.e. specific commodities with culturally and economically distinctive values.

In my contribution, I develop a sociological typology for this transformation of values and show in what way upcycling products can be understood as a material representation of typical late-modern regimes of value and their respective cultural patterns of valuation and devaluation, as well as for new categories of social classification and ecological distinction.

From Acquisition to Decay: Thinking the Dimensions of Consumption Through a More-than-human Lens

Taru Lehtokunnas

Tampere University, Finland

Alan Warde has famously defined three different dimensions of consumption: acquisition, appropriation and appreciation. Later, David Evans suggested three counterparts to these dimensions, that are devaluation, divestment and disposal. In this paper, I suggest the dimension of decay as one more additional aspect of the process of consumption. With decay, I refer to the process in which materials break down and in which both human and non-human actors

participate. The paper draws from ethnographic fieldwork at two Finnish biogas plants, home visits in households that compost biowaste, and expert interviews with people who work with black soldier fly maggots that eat organic waste. I focus especially on the different transformations and circulations that the process of decay creates. In some cases, these transformations produce new products, such as compost soil or fertilisers, that can be, again, acquired. However, some unwanted circles, such as microplastics in compost soil, are also part of these circulations. When discussing the dimension of decay as part of the process of consumption, this paper pays special attention to three different issues: the afterlife of waste after the practices of disposal, multispecies relations in consumption practices, and matter as an active participant in the organisation of everyday practices. By doing so, it offers a critique of the anthropocentric notion of sustainable consumption in the context of current sustainability visions, such as the circular economy.

Waste and Care – Socio-material Relationships with Food Packaging in Private Homes

Elisabeth Süßbauer

Technische Universität Berlin, Germany

In a common understanding waste is regarded as superfluous, invisible or annoying threatening the social order. From a new materialistic perspective, however, waste is entangled in relationships of care and trust in manifold ways. The example of takeaway food packaging is used to explore and exemplify human and non-human relations with waste in Western societies. To this end, we conducted go-along and object interviews in the homes of people in Neukölln, a diverse district of Berlin, Germany. In addition, the participants were given a daily task for five weeks on the subject of reusable takeaway packaging, which they documented in an app with videos, photos and short texts. Finally, they participated in a shared group discussion. To counteract a bias of participants towards high education and income levels and to reflect the diversity of the district, we worked together with a local association that gave us access to people with a Turkish and Arabic migration background and provided translation work and assistance throughout the survey. Results show that waste is integrated into three partly competing socio-material assemblages and actively co-constitutes the specific relationships therein: first, (gendered) consumption work in the household under the conditions of time squeeze, second, subjectivation and identity formation in the context of green consumption and third, group affiliations and demarcations through the handling of waste. With this, the paper pleas for a more integrative politics of care that unveils the consumption work related to waste as well as its role for identity constructions.

All this Junk: Object Relations in Pursuits for Self-provisioning

Jenny Rinkinen, Johanna Hohenthal, Hannele Toivonen, Pasi Heikkurinen

LUT University, Finland

Self-provisioning of food and energy has been proposed as a path towards a socially and ecologically sustainable life. It has been seen to reduce the environmental load and emissions, as well as reduce dependence on the import of raw materials and products, for example from ecologically vulnerable and conflict areas. In this paper, we examine self-provisioning in terms of the materiality, particularly junk, that is often associated with it. We draw on a case study of Finnish self-provisioning community and reflect the prevalence of junk in self-provisioning pursuits against the ideal of minimalism in sustainable consumption discourse. When viewed in this way, multifaceted object-world and regimes of value and potential appear and give nuance to the understanding of social practices and object relations. Treating self-provisioning as a form of sufficiency, we also add to the discussion on sustainable commodity relations in a sufficient economy.

187

RN05 | T06_02: Food consumption 5: Alternative models

Locally Grown Consumers: Understanding the Socio-material Cultivation of Alternative Food Consumers

Christian Fuentes[1], Jonas Bååth[2], Emmelina Eriksson[1]

1Lund University, Sweden; 2Swedish University of Agricultural Sciences

One of the central issues discussed in relation to alternative food networks (AFN) is the recruitment of new consumers. Not only does the recruitment of new members influence the scaling possibilities of alternative food networks (AFN), AFN generally also struggle to broaden their consumer base beyond the urban middle-class. Addressing these issues, this paper aims to empirically explore and conceptualize the processes by which AFN consumers are recruited and constructed as actors. Combining theories of practice and economic sociology, we investigate how AFN consumers are configured into a specific type of actor – alternative food consumers – and what consequences this process of actor-making has for AFNs viability. Our paper draws on an ethnographically inspired study of REKO rings in Sweden – a network of local food markets enabled via Facebook groups and intended to interconnect local food producers and consumers. The analysis shows how these consumers are cultivated to become actors with specific agentic capacities through process of moralization (learning why to engage in AFN consumer practices), skilling (developing the competences to perform AFN consumer practices) and equipping (acquiring the tools and accessing the necessary infrastructure to perform AFN practices). Moreover, while these processes are generalizable to multiple AFN settings, the specific composition of actors and their agentic capacities vary across sites (REKO-ring market sites) and across categories of consumers (e.g. age, class, financial situation). The AFN consumers, it seems, are always locally grown. We end the paper by discussing what our findings imply for the scaling of AFNs and efforts to make these food networks more inclusive.

Impacting conventional foodways: diverse scaling strategies in Alternative Food Networks

Francesca Forno[1], Michela Giovannini[1], Ewa Kopczyńska[2]

1University of Trento; 2Jagiellonian University, Krakow

Alternative Food Networks (AFNs) have been analyzed for their capacity of fostering sustainability and generating social change. The latter derives from their ability of sustaining collective action and of altering practices enacted in the everyday life. Being value-oriented collectives, AFNs develop practical and critical response to weaknesses of unsustainable food system.

Based on five living labs with AFNs in different European countries, this study aims at unfolding the main scaling strategies adopted to impact on the sustainability of the local food systems. We analyze how the context shapes (it is shaped) the activities of AFNs, how they exploit opportunities and deal with hurdles deriving from their embeddedness in different social and economic fabrics. We claim that despite usually operating at the margins of the mainstream food system, AFNs develop unique and diverse scaling strategies to make an impact on conventional foodways. Analyzing these strategies, it is possible to understand the dynamics of sustainable transitions of food systems on different levels. With the analysis of social embeddedness and power positions of AFNs as political actors, we also highlight how different conceptions of food democracy emerge.

188

Give me a Living Lab and I Will Raise the Food System: How Participatory Transformation Models Implement Food Democracy

Ewa Kopczyńska

Jagiellonian University, Poland

The paper discusses the challenges of transforming food systems by applying Living Lab (LL) approach. Participatory models of designing food policies are today recommended and widely practiced as effective and sustainable tools to face challenges of food system: health-related, environmental, social etc.

I apply actor network theory perspective to understand the dynamics of LLs impact on consumption cultures. I build on Latourian concept of laboratory and his analysis of Louis Pasteur inventing cure for anthrax disease. Then I argue that LLs transform food systems by providing the model of social order, decision making and cultural patterns rather than just developing innovative product or solution to specific problem.

In Pasteur's case the transformation of animal production has been possible due to a few steps: capturing interest, transferring farm to laboratory, controlling the disease by changing the relations between humans and microbes, and

again, transferring the lab to external worlds of animal production. In case of LL these translations are based on identifying public health and environmental interests related to food consumption, indicating the factors and stakeholders being part of the situation, developing food-related interventions, and then transferring the process to external social worlds.

Applying Latourian model helps to understand the role of sociological perspective in food systems' transformation and to identify the paths of potential LL's impact on consumption. What is transformed in LL are social and beyond-social relations, power positions, communication practices, know-hows, food practice arrangements. From this perspective LLs scaling problem can be framed here as "living-labisation" of social worlds. The question arises of what kind of food democracy is promoted by LLs and other participatory models.

RN05 | T06_03: Sustainable consumption 3

Pleasure Or Virtue? Conceptions Of Wellbeing And Ethical Consumption

Jörg Rössel[1], Makiko Hashinaga[2], Schenk Patrick[3]

1University of Zurich, Switzerland; 2Sapporo Gakuin University, Japan; 3University of Lucerne, Switzerland

Ethical consumption is regarded as a step towards a more sustainable, just, and mindful society. It means that individuals express moral, political or environmental values with their purchase decisions. Research has identified various factors, such as convenience or social norms, as determinants of ethical consumption. A few studies have shown the role of subjective wellbeing as a motivating goal. However, these studies did not differentiate between various conceptions of happiness. To address this gap, we investigate hedonic and eudaimonic wellbeing as motivations for ethical consumption. While hedonic orientations see pleasure as the source of wellbeing, eudaimonia represents an orientation towards the pursuit of a virtuous life.

H1: The stronger the hedonic orientation, the more frequent ethical consumption.

H2: The stronger the eudaimonic orientation, the more frequent ethical consumption.

We measured various types of ethical consumption behaviors (fair trade, local, vegetarian, etc.) and orientations towards hedonic/eudaimonic wellbeing, using a validated two-factor scale (all Cronbach's alpha > 0.7) based on an online survey of representative samples in Switzerland and Japan (n=2012). We used multivariate regression for the analysis.

Preliminary results confirm the hypotheses: Hedonic and eudaimonic orientations are positively correlated with various types of ethical consumption. This is more pronounced among Japanese than Swiss respondents.

The study shows that ethical consumption is motivated by hedonic and eudaimonic conceptions of subjective wellbeing in different cultural contexts. Ethical consumption contributes to a more sustainable, just and mindful society while also providing a means for consumers to pursue a virtuous and happy life.

Exploring Norwegian Men's Understanding And Use Of Disposable Gloves

Atle Wehn Hegnes

OsloMet, Norway

The pandemic contributed to heightened use of disposable products, notably face masks and disposable gloves (DGs). While serving as a protective barrier against health hazards,

189

these products also pose significant environmental risks due to their resource-intensive production and waste generation. This exploratory study delves into the adoption of DGs beyond healthcare, probing their use and significance in the daily lives of urban Norwegian men, particularly in hygiene, leisure, and childcare. Employing social practice theory (SPT), the research examines how the integration of DGs into everyday practices transforms these activities. I focus on the journey of DGs from professional health settings to the realm of consumer life, investigating the underlying reasons and ways Norwegian men incorporate DGs into various practices. The study draws on the concepts of Shove et al. (2012) and Warde (2016) to understand the dynamics of evolving practices and the role of new materials like DGs in these transformations. The methodology encompasses interviews with Norwegian men (N=10), complemented by historical sources. The findings highlight that DGs are increasingly becoming integral to diverse practices. However, the reasons for using DGs vary across contexts. The integration of DGs in specific practices depends on their interrelations with other activities and the orchestration of various practice elements. Conclusively, the study sheds light on the complexities of changing material-practice entanglements and offers insights for developing sustainable hand hygiene practices. The results also contribute to advancing practice theory by illustrating the multifaceted nature of social change in the context of everyday material usage.

Everyday (un)sustainability and environmental concerns in Rotterdam South

Janna Michael[1], Amanda Brandellero[2]

1Erasmus University Rotterdam, Netherlands, The; 2Erasmus University Rotterdam, Netherlands, The

In this presentation we are interrogating the concepts 'sustainability' and Huddart's (2022) concept 'Eco-types' or 'eco–social relationships' to explore their applicability within the context of a superdiverse neighbourhood with high levels of socio-economic inequality in Rotterdam. Our citizen-science research is grounded in the daily lives and consumption of inhabitants in Rotterdam South and explores what meaning climate change and (un)sustainability take in this context and within a social – strata traditionally underrepresented in both research and policymaking. Thereby it enables us to reflect on the implications for our New European Bauhaus project Cultuur&Campus Putselaan, a hub of arts, research, learning and community. The New European Bauhaus initiative is supposed to connect 'the European Green Deal to our daily lives and living spaces. It calls on all Europeans to imagine and build together a sustainable and inclusive future that is beautiful for our eyes, minds, and souls' (European Union, 2024). Drawing on our participatory research, we then reflect on the implications that our findings have for a successful translation of the European Green Deal into the daily lives of Rotterdamers.

How Individuals Make Sense of their Climate Impacts in the Aapitalocene: Mixed Methods Insights from Calculating Carbon Footprints

Tullia Jack[1], Jonas Bååth[2], Jukka Taneli Heinonen[3], Kirsten Gram-Hanssen[4]

1Lund University, Sweden; 2Swedish University of Agricultural Sciences, Sweden; 3University of Iceland, Iceland; 4Aalborg University, Denmark

Many people want to play their part to tackle climate change, but often do not know where to start. Carbon Footprint (CF) Calculators pose potential for helping individuals situate themselves in climate impacting systems of which they are a part. However, little is currently known about whether and how individuals who complete CF calculators understand their CF in the context of climate change. This article explores how people make sense of their CFs and locate themselves in the capitalocene. It draws on theories of social practices, environmental ethics, valuation, and knowledge-use to analyse data from 500+ Danes who completed a CF calculator (https://carbonfootprint.hi.is) and interviews with 30 Danes who were asked to complete the CF calculator. In this article, we describe how Danes' CFs are impacted, looking at how survey respondents rate importance of mitigating climate change, importance of personal actions, and importance of public steering, as well as disposable income, living space, and family type. We also show how interviewees reflect over their consumption activities and possibilities. Those with high income nearly always had high CF but felt like they had little agency to change the system and rather justified their high-emitting practices such as flying, while those with low CF felt they had more agency in the system. The results show that high-CF individuals resist voluntary reduction of their emissions despite the presence of environmental ethics. Thus, we conclude that systemic solutions have the foremost capacity to reduce carbon emissions.

RN05 | T06_04: Cultural consumption 3

Studying Cultural Status Through Materialist Methods. Practical Considerations About Methodological Balance in Consumption Research.

Thomas A.M. Skelly

University of Copenhagen, Denmark

How can consumption research account for the symbolic aspects of consumption while not losing methodological inventions represented by the material turn? Proponents of the material turn have highlighted culturalist blind spots in ignoring practical consciousness and embodied relations to commodities, and the mobility of consumers and consumption. Combinations of different methods and the use of non-static methods have been suggested to overcome these limitations. The contention is that methodological plurality and flexibility can achieve an empirical balance between the tacit and discursive dimensions of consumption (Halkier, 2017). Yet few studies in consumption research have shared how they have attempted to achieve this balance. In this paper, I share practical considerations about attending to the tacit and discursive dimensions of consumption through the application of mobile methods and the use of counting in qualitative methods. The considerations stem from an ongoing empirical research project about the cultural status ascribed to meat in the West. The paper contributes with methodological judgements of the potentials and pitfalls when using mobile methods to examine symbolic aspects of consumption.

Cultural Consumption, Social Capital, and Network Closure: A Cross-sectional Study

Michał Cebula, Aneta Uss-Lik, Aleksandra Drabina-Różewicz

University of Wrocław, Poland

Tastes can be used as both a bridge to other groups and to construct a fence around one's own group. Following this line of reasoning, the aim of the presentation is to answer two research questions: 1) To what extent are individuals' styles of cultural participation associated with access to social capital measures (volume, range and average status of social contacts – derived from the position generator tool)?; 2) To what extent are these styles associated with network closure, that is, the predominance of social contacts with one social class? The possibilities of survey data conducted on a representative sample of a single urban population aged 18-75 (N = 1010) in Poland are exploited. The results show that participation in highbrow culture (the "highbrow style") is a more relevant predictor of access to higher prestige contacts than participation in popular culture (the "popular style"). Both styles are related with the general volume of contacts and the heterogeneity of social resources. Moreover, the analysis indicates that the structure of social capital (i.e., the proportion of contacts with upper-, middle-, and lower-class members) is connected with pursuing different cultural profiles. The effect of network closure is stronger for highbrow style than for any other style. The results are interpreted in terms of social closure and the role that culture plays in monopolising access to social resources and maintaining social boundaries.

Cultural Participation and Cultural Preferences: Decomposing Genetic and Environmental Contributions Using German Twin Data

Dave Benjamin Balzer, Marie Schlosser

Johannes Gutenberg University Mainz, Germany

Besides current endowments with individual resources, socialization influences during childhood and adolescence, are key in explaining inequalities in cultural participation, with the parental home playing the most prominent role. In sociological studies on cultural participation, genetic factors are rarely discussed. Rather, it is assumed that family influences are predominantly a result of socialization. However, from a causal analytical perspective, it can be argued that genetic factors introduce a potential confounding as they influence both the parental characteristics (e.g., education, cultural participation) as well as their offspring's cultural outcomes. Neglecting genetics may therefore lead to "omitted variable bias", overestimating of the effect of parental socialization.

By utilizing a genetically informed design, it is possible to separate the environmental (primarily the parental home) from genetic contributions to determine their relative importance. The German TwinLife study provides a comprehensive database containing extensive information on the cultural behavior of monozygotic ("identical") and same-sex dizygotic ("fraternal") twin pairs and their family members. We perform decomposition analyses for cultural preferences and activities in various domains. The starting point is the ACE model, which are widely used in genetic epidemiology and behavioral genetics. It utilizes the information that monozygotic twins share 100% of their genetic composition, while dizygotic twins share on average 50% of their genes. By comparing twins with different zygosity, it is possible to identify different variance components and thus distinguish between heritability (A), shared environments (C) and unshared environments (E). The models' assumptions are tested in extended models. For example, we correct for "assortative mating" and investigate "unequal environments". Finally, we discuss how the results of decompositional analyses relate to causal analytic questions interested in estimating effects of treatments.

191

RN05 | T07_01: Clothing consumption 1: Fashion

Gender Dynamics in Clothing Consumption: Examining the Inflow and Outflow of Clothing from a Practice Oriented Perspective

Vilde Haugrønning

OsloMet, Norway

The present-day consumption of clothing is marked by excessive production and consumption, leading to issues of water scarcity, microplastic pollution, chemical contamination, CO2 emissions, and textile waste. In order to mitigate the environmental impact of clothing, there is an urgent need to examine the factors influencing the high volume of garments in wardrobes.

This study explores the influence of gender and age on clothing consumption based on a qualitative and quantitative wardrobe study of 15 households in Norway from a practice oriented perspective. Each household had a man and a woman living together as partners to enable a gendered comparison between couples that take part in many of the same practices and share the everyday life. In the wardrobe study, the participants conducted a counting exercise of all the garments they owned, including underwear, socks and accessories. Following this, each participant was asked to register all inflow and outflow of clothing for 6 months.

The analysis focus on the turnover rate of clothing and employs Evan's (2019) six moments of consumption that focus on processes of acquiring and disposing in relation to practices. Preliminary findings show that female participants acquired a higher quantity of clothing compared to male participants. However, age also play a significant role in determining the turnover rate of clothing. The study highlights the social mechanisms and gender dynamics that shape clothing consumption patterns and challenges the prevailing studies on clothing and fashion that often overlook the nuanced practices and actions that influence clothing volumes.

Why should we Care? The Political and Transformative Dimensions of Italian Fashion

Ludovica Carini

Università Cattolica del Sacro Cuore di Milano, Italy

Western societies have long been going through a transformation in political participation, which is expressed through consumer choices. The citizen-consumer enacts what Michele Micheletti calls political consumerism, visible in cultural and creative industries, where the symbolic value of objects transcends functional aspects to encompass individual expression.

Fashion consumption, specifically, represents a dynamic and influential medium through which individuals and societies express values, beliefs, and aspirations, and the fashion industry emerges as a domain where the cultivation of potentially divergent imaginaries and social structures occurs. It mirrors the sensitivities and encapsulates the composition of the target population.

The Italian scenario, where fashion narrates Italian identity and the allure of the Made in Italy, becomes a particularly intriguing field of exploration when examining populations marked by social fragility, marginalization, or under-representation, which are increasingly vocal in their demands for recognition and inclusion.

Employing a qualitative methodology, this contribution aims to unveil micro-experiences whose products and business model challenge the uneven distribution of influence, control, and authority within the fashion industry, addressing issues of exploitation in the supply chain, lack of diversity in representation, and the environmental impact of mass production. It highlights virtuous experiences – including sartorial social cooperatives, Afro-descendant brands, and adaptive fashion projects – which disseminate ethical practices, sustainability, and inclusivity. The shift towards more responsible, ethical, and sustainable practices highlights an emerging dimension of care within fashion. Brands and consumers alike are recognizing the importance of caring for the environment, workers, communities, and the overall well-being of the fashion industry.

192

Based on Practice Theory: Exploring Valuation Construction within the Charity Shop

Jiangyi Hong

the University of Edinburgh, United Kingdom

With the second-hand market's rapid development, second-hand clothing has gained particular attention. In second-hand consumption studies, consumer motivations are regarded as a major component. However, few studies mentioned how these motivations are constructed or justified. In response to the current situation, this study has analysed how valuation is constructed in the consumption of second-hand clothes, based on social practice theory (SPT). In SPT, practicing valuation is "in itself what creates value, both by making sense of the objects and by investing time and energy in them". Thus, SPT is a relevant framework for study and enables people to gain insight into how consumers and sellers work together to create a meaning system for second-hand fashion, thereby promoting sustainable consumption behaviour. The study employs semi-structured interviews and documentary analysis as research methods. Semi-structured interviews allow for a detailed exploration of their corresponding practical awareness, daily life needs, individual fashion, etc. Additionally, analysis of market and government documents aims to reach the prospect of exploring historical developments and generalities, which are difficult to obtain from consumers. Research

shows that the valuation of second-hand clothes is no longer simply an economic process, in which the construction of second-hand consumer value is influenced not only by individual choices or motivations, but also by the norms surrounding consumption and by the influence of society. This study extends the examination of valuation creation from the production-consumption to daily practices. Drawing on the sociology perspective, the operational logic of value creation is conceptualised in a practice: it defines the elements of practice, their role in the valuation creation process and their interdependence. Valuation creation is socially constructed and influenced by consumers and the social environment, which guides consumers to engage in practices (including the use of products).

Overall, second-hand consumption is full of experiences of a social nature, in which consumers with their own interests, motivations and goals. By interpreting consumers, charity shops and governments as co-creators of value, this study aims to explore how interpretations of what is deemed "value" drive the social practice of second-hand consumption.

I have not previously participated in ESA Summer School.

Fashionably Caring for the Planet: How US Vogue Responds to the Tensions from an Ethics of Care for the Environment and (Re)constructs Gendered Notions of 'The Consumer'.

Chloe Dawson

Keele University, United Kingdom

This paper explores how the women's fashion magazine, US Vogue, responds to the tensions raised by wider environmental activism and politics in the 21st century. The work offers current data on gendered constructions of 'the consumer' and how ethical/sustainable consumer practices are imagined in the magazine. Empirically, this work investigates how an ethics of care operates alongside postfeminist sensibilities that promote women's 'empowerment' through consumer capitalism and emphasise values of individualism, entrepreneurialism, and neoliberalism (Gill, 2019). The paper investigates how the magazine propels the projects of fashionable consumer capitalism (that encourages obsoletion) alongside environmental critiques. Vogue responds by constructing feminine subjecthoods that combine fashionable consumer capitalist values with a 'sustainable' ethics of care. This includes the 'eco-chic celebrity', a figure that provides 'authenticity' for brands (Welch, 2020) and boosts their reputation as a 'caring' individual. Vogue also includes youth indigenous climate activist women to construct a figure who cares for the environment with narratives of hope through consumerism. Despite the women's environmental activism, the magazine emphasises their commitment to consumer capitalist 'solutions'. The findings show how Vogue responds to these tensions by 'distancing' and 'othering' the impacts of Western consumerism, viewing ecological issues as something bound by nation,

class, and ethnicity rather than interdependent. The source of 'sustainable' fashion shifts from political issues towards capitalist and scientific innovation for 'the consumer'. The celebrity figures do not challenge consumer capitalist values or anthropocentric thinking, despite the inclusion of indigenous voices. Rather than decolonising the magazine, the indigenous women are used as opportunities for the cultural omnivore. Overall, this work explores the recent gendered constructions of 'the consumer' under tensions from wider environmental ethics of care.

RN05 | T07_02: Food consumption 6: Critical perspectives

Mapping Class Belongings in Food, Eating and Moral Boundaries

Kia Ditlevsen

University, Denmark

Eating is a shared human practice and, at the same time, a highly distinctive practice by which class belongings are revealed and reaffirmed (Bourdieu 2004; Prieur et al., 2008). What one eats, the way one eats, one's taste and habits are embodied expressions of class belongings. Food consumption as well as the symbolic and cultural value of foods are dynamic and changes over time (Bourdieu 1998; Flemmen et al. 2018). New trends may be incorporated in the lifestyles of some classes, but not necessarily in all.

In this presentation, I will share results from a qualitative investigation of current cultural expressions of class in food and eating in Denmark. Results will address: What is good taste? What is bad taste? Which moralities are present – and among whom? Are differences class based, or based on other factors in the current Danish welfare state?

The research project has mapped distinctive features of food and eating among people from different social classes in Denmark and is based on 60 individual interviews with participants from four different social classes (the underprivileged class; the less privileged class; the cultural fraction of the privileged class; the economic fraction of the privileged class).

"Alternative" Food Consumption, Sustainability and the Body: Investigating Different Narratives of Care, Political Tensions, Spaces of Transformation

Alice Dal Gobbo

University of Trento, Italy

Health is intimately tied to eating across cultures and history but has acquired special prominence in Western countries' public and expert discourses, and everyday understandings of nutrition. The body has become a nodal point of food concerns: enhanced or protected via nutrients, endangered by contaminants, fat or lean. Health concerns are beginning to overlap with ecological ones: healthy diets are increasingly identified with sustainable diets. Yet, this convergence should be critically assessed rather than taken for granted. Especially feminist and intersectional food studies are evidencing the gendered, classed, and raced power relations that subtend the adoption of healthy and sustainable diets, which might perpetuate, rather than challenge, inequalities and injustices in access to food. My proposal is that "embodied materialism" might be useful for bringing to this debate a focus on the way capitalist arrangements of production and reproduction inform daily food practices, in relation to the ecosystems in which they are embedded. Drawing on 45 interviews carried out in Milan (Italy) in the context of a study on the platformisation of alternative food consumption, my presentation considers three ways in which the health–sustainability nexus is articulated in daily life: 1) an individualistic and socially-functional preoccupation of choice and self care; 2) a logic of care for proximate others, which nevertheless often reproduces unequal gender and class positions; 3) collective engagement in alternative food networks and the politicization of the body, where health becomes a field of more-than-human struggle. I propose that the latter case is most able to promote socio-ecological transformation, as it pushes subjects to collectively support existence through transformative practices, within the recognition of both human and ecological limits, fragility, interdependence.

Vegan Parenting, Negotiating Forms of Knowledge and Objects of Care

Hilje van der Horst

Wageningen University, Netherlands, The

Vegan parenting is a controversial practice and is currently not recommended by official dietary guidelines in the Netherland. However, due to concerns about animal welfare and the sustainability impacts of animal products, an increasing number of parents are choosing to raise their children on a vegan diet. Although there is a significant amount of research on veganism, there is little research on vegan parenting. This study examines vegan parenting in the Netherlands in light of concerns about nutritional deficiencies

194

raised by healthcare professionals and the growing consensus on the need to reduce animal product consumption due to environmental concerns. Using a critical care ethics perspective, which acknowledges that care can have multiple and conflicting objects, this paper explores how different objects of care and sources of knowledge are integrated into the practice of vegan parenting. Interviews with 17 vegan parents revealed diverse strategies for integrating multiple objects of care, including animals, the environment, vegan identity, children's health, and children's social welfare. The analysis consisted of reflexive thematic analysis. Three levels of parental strictness emerged, influenced by parental care priorities and children's ages. The analysis underscores the active role parents play in seeking, evaluating, and integrating knowledge from various sources. The text outlines a typical trajectory of knowledge formation in vegan parenting, highlighting the interplay between care and knowledge acquisition. This research contributes to understanding vegan parenting dynamics, ethics of care, and the relationship between care and knowledge.

Guilt And Beyond: A Class Cultural Analysis Of Evolving Emotional Responses To Maternal Foodwork.

Irmak Karademir

Oxford Brookes University, United Kingdom

Based on a longitudinal and ethnographic study, this research examines how women

experience the emotional aspects of their maternal foodwork in England across social classes. Maternal foodwork is frequently linked to guilt and anxiety due to intense gendered and class-related ideals of proper feeding within the context of responsibilising discourses. This paper contributes to the literature by introducing a temporal perspective, exploring how emotions beyond anxiety transform as caregiving arrangements evolve over time. The findings suggest that middle-class mothers, benefiting from the ability to circumvent stigma and navigate surveillance, adopt a downscaling strategy to counter maternal guilt. Working – class mothers, however, develop practical resilience as their foodwork matures, helping them manage ongoing exposure to institutional surveillance and feelings of inadequacy. The study thus underscores women's capacity to cultivate agentic responses, albeit within the boundaries of their class habitus, crafting pockets of resistance against intensive feeding ideals.

Life-course Transitions as Moments for Fostering Sustainable Consumption: Exploring activity connections and their coordination within and between everyday practices

Amanda Krog Juvik[1], Dale Southerton[2]

1University of Copenhagen, Denmark; 2Bristol University, UK

Life-course transitions (major life-events, such as becoming a parent and moving home) have been identified as moments of opportunity to redirect human activities in more sustainable directions. Habit discontinuity, the theory that automated human actions can be re-set at moments of individual change, are prominent within such claims, and numerous intervention studies seeking to nudge automaticity into reflexivity have been trialled with mixed empirical results. Theories of practice, by contrast, consider habits (and routines) as observations of the stable organisation, and continuously reproduced performances, of social practices. Studies framed within this perspective reveal that life-course transitions are often multiple and intersecting (e.g. people often move home, change jobs, or have children simultaneously), that experiences vary across social groups, and that the material settings in which practices are performed are critical components of change. Focusing on mobility and food practices, interviews conducted with Danish households before and after moving home analysed changes in the connections between everyday practices. Schatzki's (2019) concepts of activity events and chains are applied to examine the different ways in which activities of food and mobility are connected, coordinated, and performed. Our findings demonstrate that re-configured material arrangements (of infrastructures, local services, and homes) created diverse challenges for activity event coordination. General patterns of mobility and food practices were not radically changed during home transitions, but dynamic forms of coordination within activity chains were necessary to hold those practices stable. We argue that it is in context of activity event coordination that moments of life-course transition may offer scope for systemic shifts toward less resource-intensive consumption.

195

Exploring the Nexus of Consumer Policy and Environmental Sustainability: A Scoping Review

Marthe Hårvik Austgulen, Nina Vatvedt Heidenstrøm, Live Standal Bøyum

Oslo Metropolitan University, Norway

Sustainable consumption has gained global attention, particularly in the context of environmental agendas like the European Green Deal. While consumer policy plays a pivotal role in the envisioned green transition, concerns have been raised about its efficacy and alignment with sustainability goals. Some argue that there is a need for a comprehensive reevaluation of consumer policy. However, the research on the nexus of consumer policy and environmental sustainability is fragmented. This is also the case for sustainable consumption as a policy area as a plethora of policy instruments relate to consumption in different ways, and they can be adopted at different levels.

This research provides a scoping review of the global literature on the role of consumer policy, and the consumer policy toolbox, in the green transition. The key aim of the review is to map the available evidence by factors such as (but not limited to) the consumer policy tools examined, how consumer policy is defined, policy recommendations, theoretical perspectives, geographic location, and scientific disciplines. This mapping aims to identify the volume, nature and characteristics of the extant research as well as unexplored gaps, offering crucial insights for policymakers and facilitating informed decision-making in future policy development.

We extract relevant articles from Scopus, Web of Science, EconLit and PsycINFO databases published from January 1990 to December 2023 and conduct a scoping review following the PRISMA-ScR guidelines. We anticipate presenting further results at the conference.

On The Relationship Between Sociology And Intervention Research – Strange Bedfellows Or Possible Cooperation?

Thomas Bøker Lund, Morten Wendler Jørgensen, Mette Weinreich Hansen

University of Copenhagen, Denmark

Much of the current research on the sustainable transformation of society investigates the impact on consumption practices following diverse kinds of interventions (information provision, nudges, etc.). In the social sciences, this kind of research is predominantly carried out by economists and psychologists and is for the most part quantitative in nature. To many sociologists, especially those that are inspired by the practice turn, the philosophical assumptions underlying such research will appear incompatible with their assumptions and preferred research methodology.

However, in this presentation, (i) it is argued that practice-oriented sociology potentially can play an important role in intervention research if sociological practitioners are ready to take a more pragmatic approach. It is also shown (ii) that intervention research currently is undergoing self-critique where a "heterogeneity revolution" is called for. It is argued that this self-critique presents an opportunity where the discipline's methodological conventions can be partially challenged and influenced by sociological theory and methodology. It will then (iii) be discussed what actions (in terms of, e.g., methodology and data sharing/transparency) that sociologists on their part will need to take (or at least consider) if they want to push intervention research in a more sociologically relevant direction. Finally, (iv) to illustrate the points, we present an ongoing research project aimed at promoting a plant-based transition. The research features an intervention, and we show how we plan to include practice-oriented method/theory in the research.

Consumption and Disruption at the Nexus of Practices: A Longitudinal Experiential Analysis

Arve Hansen[1], Mary Greene[2], Sigrid Wertheim-Heck[2], Ulrikke Wethal[1]

1Centre for Development and the Environment, University of Oslo; 2Environmental Policy Group, Wageningen University

196

Understanding how and why everyday practices with significant resource implications change is a question of critical relevance for sustainability transformations. Over the past decades, social practice theories have emerged as a dominant heuristic framework in sociological research on consumption and sustainability. Practice focused research has significantly advanced our understanding of the contextual dynamics and socially embedded dynamics of consumption in everyday life. However, as of yet longitudinal experiential insights into dynamics of practice transformation have been limited. Longer term analysis of practices have largely remained at the scale of the history of practices themselves, with a consequence that the situated everyday dynamics of practices over longer time periods have been overlooked. Furthermore, despite a recent shift towards understanding transformation through interconnected practices, critical gaps persist in understanding how dynamics at the nexus of practices shape everyday life over time.

In response to these challenges, our paper pioneers a 'nexus of practice' approach to examining longitudinal dynamics in everyday consumption. Focusing on major societal disruption as a prism through which to scrutinise these extended dynamics we draw upon unique longitudinal qualitative data co-created with householders in Oslo, Dublin and Hanoi. This data collected a two critical moments – during the first Covid-19 lockdowns (2020) and in the aftermath (2022) – offers a rare insight into the evolving landscape of everyday food and mobility practices at the nexus of practices. Our analysis is threefold: we explore the evolution of these practice domains, examine dynamics of continuity and change at the nexus of practices, and investigate the intersections of agency and structure, including the influence of reflexivity, broader political economy and systems of provision.

RN05 | T08_01: Clothing consumption 2: Identity

Social Practices and Identity-Work: Life Course Changes as Drivers for Textile Disposal

Anna Schytte Sigaard

Oslo Metropolitan University, Norway

In this contribution, the complex interconnections between social practices and textile consumption are explored. Based on wardrobe interviews in 28 Norwegian households, investigation is carried out of the influence of two major life course changes, cohabitation, and parenthood, on disposal of clothing and other textile items. In the transition from living alone to cohabitation, it is found that the disposal of clothing and textiles emerges not only as a functional act but as a symbolic act of divestment. Spatially and temporally separated practices, such as pre-move closet purges and post-move decoration, underscore the profound identity-work involved in this transition where discarded items come to symbolize remnants of single life. Parenthood introduces a challenging balance between environmentally conscious practices and time constraints, unveiling compromises made in sustainable practices amidst the demands of parenting. The disposal of impractical gifts and inherited baby clothes reflects the negotiation of a new parental identity. In this contribution, the importance of individual reflexivity in the negotiation of identities during major life transitions is emphasized. Thereby, it contributes to expanding the understanding of clothing and textile consumption as both routinized and mundane practices at the same time as involving intentional and reflexive discursive activities.

Ryousangata Revolution: Challenging Western Grammars of Fashion through Non-Western Modernities

Shuan Lin[1], Nikita Makarchev[2]

1University College London, United Kingdom; 2Ohio State University, United States

How does the Ryousangata fashion phenomenon in Tokyo challenge the traditional Western grammars of fashion? Existing studies in this area have adopted Western-centric frameworks where authenticity is typically considered a defining element. Moreover, they have used ad hoc methodological techniques with minimum quantitative elements. Accordingly, this paper strives to improve the status quo. First, it draws on the concept of non-Western modernities to guide its analysis and demonstrate how Ryousangata does not align with Western expectation. Second, it implements a comprehensive original survey, informed by qualitative interviews, of young adults in Japan who engage with the Ryousangata fashion phenomenon. Subsequently,

the results indicate that the absence of authenticity is a defining characteristic of Ryousangata. As a consequence, Ryousangata represents a shift towards a more fluid-and dynamic understanding of style, where reinterpretation, hybridization, and imitation are valued as legitimate forms of creative expression. These results, then, emphasize the relevance of non-Western modernity theory in understanding and interpreting fashion dynamics. Furthermore, they deepen our insight into the complexity of global modernity and contribute to broader conversations about the role of imitation in expressing cultural identity.

The Ambivalence Of Fashion And The "Competency" Of The Consumer: A Study Of The Consumer Repertoires Of The Greek Middle Class

Dimitris Lallas

International Hellenic University, Greece

Drawing on the research findings of a qualitative sociological study on middle-class consumption and consumerism in Greece before, during and after the financial crisis (2009/2010-2018), we present the ambivalent and ambiguous attitudes of middle-class subjects towards fashion. Through the investigation of the repertoires of consumer action and discourse, we show that subjects' relationship with fashion is characterized both by individualized "conformity" to fashion trends and by "active" appropriation of consumer, new and fashionable objects. By understanding fashion and the relation of subjects to it in the context of late, fluid modernity, we highlight the "competency" of the (Greek middle-class) consumer as an organizing principle of consumer practices.

RN05 | T08_02: Food consumption 7: Stability and shifts

Food and Friendships Among Young People from Low-income and Affluent Households

Silje Elisabeth Skuland, Ola Røed Bilgrei

Oslo Metropolitan University, Norway

Young people in low-income households are often associated with poor dietary habits by consuming more fast food, sweets, salty snacks and sugary beverages than their more affluent peers. Research has found that exposure to food environments, where foods high in fat, sugar or salt are marketized and suppled at a low cost. Prior research has found that young people in their early teenage years negotiate agency and family food values when purchasing and eating unhealthy foods. However, more research is needed to understand what young people do when they eat outside of home. This paper aims to explore eating practices outside home among young people from an affluent and a disadvantage area of Oslo, Norway. A total of 40 adolescents aged 10-13 years was interviewed at home about food, eating and food purchasing practices at school, at home and outside home. Most of the young interviewees ate out with their friends to some extent either they ate sweets, crisps or larger meals such as fast food. Interesting, sharing food was more common among the young people living in disadvantage area, than in the affluent area. While the supply of unhealthy foods varied little in the two areas, hanging out mostly at home meant eating under parental influence in the affluent area. In the disadvantage area, spending time in youth club, the library or at the mall meant sharing foods 'suitable' for friends. While eating out in early teenage life may be at odds with dietary discourse, food sharing forged closer bonds to friends, trust, reciprocity and feelings of belonging.

Ecological Risk And Trust-Building: Green Food Consumption In China

Franziska Marliese Fröhlich

Max Planck Institute for the History of Science, Germany

Chinese consumers have little faith in the food available in Chinese markets. Frequent food safety scandals have hardened their suspicions. Among consumers' top concerns are pollution-related food safety issues, such as pesticide and fertiliser contamination. In the midst of what has been labelled a 'crisis of trust,' they are seeking their own strategies to reduce the risks in their food bowls.

My paper addresses trust-building strategies in the face of ecological risks by analysing discourses about ecological forms of food consumption. Specifically, in my paper, I look at consumer guidebooks, lifestyle magazine articles and advertisements of food producers, in order to show how they depict ecological risks in the food system, the emerging food safety concerns and their implications for people's everyday eating. I juxtapose the discourses present in these texts with the official government narrative on eco-civilization and food safety to draw out their diverging ideas about food and trust.

What emerges from this analysis, is, on the one hand, a government that seeks to build trust through farmgate-to-plate transparency, social co-governance and harshly punishing wrongdoers, while deflecting attention from its own failures. On the other hand, the authoritarian context shrinks the space for the articulation of alternative models of trust-building and fosters consumer behaviours that attest to an intense lack of trust and that may even be corrosive to trust-building. In conclusion, this paper shows how China's authoritarianism profoundly shapes the possibility for trust-building in China.

Challenging the Place of Meat within the Christmas Meal: Lessons Learned from Ritual Intervention

Nemo Koning[1], Hilje van der Horst[1], Mijs Besseling[2], Hester Dibbits[2], Mirella Klomp[3]

1Wageningen University & Research, Netherlands, The; 2Reinwardt Academy, Amsterdam University of the Arts; 3Protestant Theological University

Despite it being associated with grave issues concerning the environment, public health and animal welfare, the over-consumption of meat continues unabated in high-income countries. The tension that follows from an unyielding appetite for meat on the one hand and expanding knowledge about its negative impact on the other has been called the "meat paradox". Explanations, as well as interventions to resolve this paradox, so far have been based mainly on behavioristic accounts that fail to address the social and ritual practices that meat-eating is bound up with. Sociocultural intervention strategies remain largely unexplored, despite multiple authors mentioning their potentiality. The aim of this article is to examine different strategies to intervene in festive meals, making use of social practice theory and ritual studies, and explore how such ritual interventions can help to reduce meat consumption. We specifically look at the Dutch Christmas meal, working together with different cohorts of participants. In a 'Field Lab', we asked participants to imagine intervention into their Christmas meal aimed at bringing down meat consumption. In a parallel 'Living Lab', we asked students to keep a logbook on their individual Christmas meals while instigating particular tweaks. We conclude by discussing challenges related to ritual intervention, the obstinacy of the festive meal, as well its susceptibility to change.

Emergence Of Social Commerce And Change Of Agri-food System In Vietnam

Shozo Sakata[1,2], Fumie Takanashi[3]

1Institute of Developing Economies, Japan External Trade Organization, Japan; 2International Institute of Social Studies, Erasmus University, the Netherlands; 3Tokyo University of Agriculture

A widely observed phenomenon in developing countries, particularly in Asia, includes the expansion of food sales via "social commerce," in which various foods are sold through social media platforms such as Facebook. Social commerce has gained widespread acceptance, especially among young and affluent urban consumers.

This study takes social commerce of "safe" and "clean" food in Vietnam as a case study. Social commerce has emerged in the process of Vietnam's "compressed modernization," in which food systems have not transformed in sequences from traditional, modern to late modern. The expansion of social commerce has coincided with the expansion of supermarkets and multinational e-commerce platforms since the mid-2010s. The social commerce of "safe" and "clean" food has emerged as a new form of "alternative" food system, but in different forms than that in Western societies, as consumers are willing to pay to avoid health risks, but are not necessarily averse to the modern food system per se.

Based on qualitative research with social commerce retailers, the study explores how trust on food can be built. Despite the fact that social media platforms can technically disseminate information to a wide range of consumers, social commerce retailers tend to target a smaller number of loyal customers who purchase socially-endorsed products. Rather than subjective information on foods conveyed through mobile phones, trust in products seems to be tied to trust in information sources. The increased social connectivity between producers, retailers, and consumers brought about by mobile phones seems to be the basis of trust.

Sufficiency-Oriented Lifestyle in Urban China? Understanding Satisfiers, Needs and Wellbeing

Mallory Xinyu Zhan

Sciences Po Paris, France

Changes in carbon-intensive consumption patterns and consumerist lifestyles are indispensable components of climate actions globally. It is estimated that the top 10% consuming households worldwide have contributed almost half of global emissions, with a third of such households live in emerging economies such as China and India (Chancel and Piketty, 2015). In China, rising consumption has been critical for meeting fundamental human needs and improving quality of life for the people. Nevertheless, current per capita trade-adjusted CO_2 emissions in China have reached a level comparable to those of many advanced economies, with the rich contributing a significant share (IEA, 2023). As China continues to grow into an upper-middle-income country, it is critical to reflect upon ways to reduce excessive consumption among its affluent urban populations, towards delivering well-being for all within planetary boundaries. Through partnership with local environmental groups in Chinese cities, this research engages with ordinary Chinese citizen-consumers in a series of participatory workshops to examine the relations between consumption and need fulfilment. Building on recent theoretical advancement on consumption corridors (Sahakian et al., 2021) and need-based theories of wellbeing (Di Giulio and Defila, 2021), this project seeks to understand whether and how wellbeing can be achieved through sustainable, and especially voluntary reduction in carbon-intensive consumption practices. This presentation introduces preliminary findings from the workshops and ethnography work conducted in spring 2024, shedding light on how sufficiency-oriented lifestyles can be better supported in China.

Challenging assumptions about sustainability practices of migrants from the Global South to the Global North

Tally Katz-Gerro[1,2], Sherilyn MacGregor[2]

1University of Haifa, Israel; 2University of Manchester, UK

This paper looks at household sustainability practices and the way these are shaped by social difference, in particular migration background. We draw on research on environmental practices and attitudes and household sustainability from a South-North migration lens. We examine demographic and cultural factors that shape individuals' sustainability practices in the private sphere with specific

attention to a sample of people who have moved from the Global South (GS) to Manchester, UK. We question assumptions that immigrants from GS countries are difficult to engage when it comes to environmental issues and need to be educated about household sustainability.

We study the household as a meso-level unit of analysis, linking it with a focus on the intersections of race/ethnicity, migration, and culture. Data collection involved a survey conducted in 2022 in Manchester. We recruited, via snowball sampling, 530 survey respondents. The survey included questions on frequency of performing a set of household practices regarded as sustainable or pro-environmental in the literature, as well as questions on participants' socio-economic status, housing tenure, size/composition of household, length of time in the UK, and migration trajectory.

Findings form multivariate models predicting a series of sustainability practices indicate that: First, there is no significant difference between UK born and non-UK born respondents in frequency of engagement in sustainable practices; second, time living in Manchester or being born outside the UK does not correlate with sustainable practices. Third, sociodemographic variables do a much better job explaining sustainability engagement of non-UK born respondents.

Empirical Traces of Sustainable Consumption Among Secondary School Students

Isabel Silva Cruz[1], Luís M. Afonso[2]

1ESA member, Portugal; 2School of Engineering, Polytechnic of Porto, Portugal. ISRC

The finiteness of resources, environmental preservation, and the notion that it's possible to live better by consuming less lie at the core of the concept of sustainable consumption. These issues have been increasingly capturing the interest of young individuals and appear to resonate within their system of dispositions and preferences (Lahire, 2004).

The data collected by this study (N=280) suggests that individuals who adopt one sustainable consumption value often tend to encompass a range of examined values. This categorization separates students into two groups: those who internalize sustainable consumption values and those who do not. Moreover, the findings propose the identification of three distinct clusters of consumption values that delineate different chronologies: recycling, "Bio" products and energy issues; and repair, reuse, and sharing, characteristic of the circular economy (zero waste) and contemporary collaborative consumption ("using" prevails over "owning").

Despite its weaker correlations with other sustainable consumption values and most practices, "waste recycling" remains pivotal. It notably lacks significant associations except for "purchasing 'Bio' products" and "using alternative energies". Nevertheless, waste recycling has established itself as a well-embraced and universally recognized value in sustainable consumption practices.

The data also underscores disparities between sustainable consumption values and practices, emphasizing the predominance of values over actions. Specifically, "reuse" correlates with all values except "waste recycling." Additionally, a moderate correlation (rho=0.441) exists between the sustainable consumption value of "sharing" and its practice, indicating a reciprocal relationship: individuals advocating "sharing" are more likely to actively engage in it, suggesting mutual influence.

In essence, data seems to align with practice theory, prioritizing context over individual choices, offering a theoretical framework that better explains behavior change towards sustainability.

Ethical Consumption and Consumer Virtue: Insights from Iran

Sara Karimzadeh

Örebro University, Sweden

This study, by delving into ethical consumption in Iran, aspires to broaden our understanding of how ethical consumption is actualized differently within different societal structures. Ethical consumption involves adopting practices that seek to safeguard both society and the environment. Various forms of this phenomenon, most notably in the form of consumption refinement, have gained popularity in Western Europe and North America. However, our understanding of how ethical consumption is defined and practiced in non-Western cultures and social structures still requires further development. To address this gap, the study will focus on the following questions: what are the societal capacities within the studied context to promote ethically-oriented consumption practices? and what are the obstacles to their development?; Is there a unique form or definition of 'ethical consumption' that emerges specifically from the collective life experiences, traditions, rituals, and culture of the studied context? Data was generated from 19 semi-structured interviews with consumers in Iran. Data analysis indicates that Iranian individuals have particular attitudes regarding ethical consumption that originate from their given societal framework. These attitudes are manifested in different consumption stages. In the pre-consumption stage, Fairtrade and boycotting practices will be discussed. In the consumption stage, ethical considerations will be explored through the lens of 'heif,' a deep-rooted tradition in that culture that considers taking good care of things a virtue. In the post-consumption stage, ethical considerations will be explored through the common practice of 'ehsan kardan,' a practice that did not originate from environmental concerns, but its effects may be viewed as environmentally friendly.

RN05 | T08_04: Sustainable consumption 6: Mobility

Shared Mobility As a Way to Sustainable Mobility? Results from a Digital Ethnography.

Mirijam Mock

Vienna University of Economics and Business, Austria

Many Western consumption patterns are highly unsustainable, posing a significant challenge to global efforts to respect planetary boundaries. This is particularly evident in the field of mobility, where emissions from this sector continue to rise instead of decreasing. Digitally mediated shared mobility is presented as an alternative to the escalating emissions from private car use, with practitioners and scholars attributing it high transformative potential. However, a closer examination reveals significant environmental variations among diverse shared mobility practices.

Problematically, the most widespread form of shared mobility, namely business-to-consumer free-floating carsharing, hardly replaces any private cars. This study empirically examines why certain shared mobility forms gain traction while others falter. Employing an ethnographic approach, I conducted 22 digital mobility diaries in Austria. Twenty-two respondents documented their mobility practices over three weeks, highlighting their experiences with various shared mobility options and private car ownership by uploading pictures, videos, and text notes on a dedicated smartphone application.

Preliminary findings suggest that shared mobility can fulfil users' needs without car ownership, but it comes with challenges, especially for families. Respondents frequently navigate a range of mobility options and adjust their routines to accommodate low-carbon practices. This contrasts with private car users who encounter fewer obstacles due to infrastructure tailored to their convenience. This leads to the conclusion that, in addition to improving shared mobility practices, deprivileging private car travel is necessary for the proliferation of shared mobility.

Interventions to Promote Sustainable Private Transport – Document Analysis of Norwegian Policy Strategies

Live Bøyum

SIFO, OsloMet, Norway

There is an urgent call for a transformative shift in consumption patterns, particularly regarding daily mobility. The pervasive reliance on private cars for personal mobility presents a significant challenge due to its deeply ingrained nature in people's lives (Camilleri et al., 2022). Despite numerous attempts, successfully reducing emissions from private transport remains a significant challenge, underscoring the limitations of current policy measures in catalyzing a transition towards more sustainable mobility. As a result, new theoretical perspectives such as social practice theory are emerging to enhance our understanding of high carbon mobile lives and explore pathways towards sustainable mobility.

From a social practice perspective, transport practices are seen as interconnected with other social practices, seamlessly incorporated into daily routines (Spurling et al., 2013). In this context, transport practices are seen as a product of other practices (Cass & Faulconbridge, 2016). Consequently, understanding transport practices and the associated consumption is paramount for crafting effective climate policies to foster sustainable mobility patterns.

This paper scrutinizes the extent to which policy measures for sustainable private transport incorporate a social practice perspective. We conduct a comparative analysis of policy documents from three Norwegian cities, investigating their car usage trends and policy measures. We then discuss the effectiveness of these policy measures in promoting sustainable private transport. Based on the analysis, we suggest improvements to current policy measures, highlighting how a social practice perspective can be more comprehensively integrated to foster sustainable mobility patterns.

Normalization as Dynamic of Change Towards Less Resource-heavy Consumption? Examples from Across Food, Mobility and Housing

201

Bente Halkier[1], Line Kryger Aagaard[2]

1University of Copenhagen, Denmark; 2University of Aalborg, Denmark

Normalization is typically used as an example of a societal dynamic, which silently legitimizes material over-consumption. We argue that normalization can also be seen as a dynamic that can work in favour of changes towards less resource-heavy consumption. Here, normalization consists in increased practical frequency and social expectation of experiencing and carrying out less resource-intensive consumption across different social contexts. In order for such normalization processes to happen, usually support from public interventions and collaborations between organized public and private actors are necessary. In Denmark, such interventions are already initiated in the food consumption area, where a number of public kitchens are being changed towards serving more plant-rich diets. In this paper, we are comparing differences and similarities between three consumption areas – food, mobility and housing – with regards to potentials for using normalization as dynamic of change towards less resource-heavy consumption. We draw upon the Danish research project "Food, mobility and housing in the sustainable transition of everyday life", take a starting-point in a practice theoretical perspective, and use data-examples from focus groups with representative from

institutional and organisational actors across the three areas of consumption.

Transforming Consumption-Production Relationships? Unsustainable Lock-ins and Possible Pathways across Food, Mobility and Housing

Line Kryger Aagaard, Kirsten Gram-Hanssen

Aalborg University, Denmark

Within the last century, global carbon emissions have exploded in tandem with rising consumption levels. Current lifestyles and consumption patterns are at odds with planetary boundaries, especially in affluent countries. Food, mobility, and housing comprise the majority of consumption emissions, requiring rapid reductions. While much research exists on these areas separately, less has been done to explore their interconnectedness. This paper looks at such interconnections through the case of Denmark, a country showcasing exceeding consumption emissions. While businesses, politicians and citizens broadly agree on the need for emission reductions, conflicting views exist on where the responsibility lies. Should individuals consume less and greener? Or are systems of provision responsible for change? Instead of taking an either-or perspective, the paper explores production-consumption relationships, attending to the institutional material arrangements that frame and potentially lock these relationships into unsustainable patterns. Exploring differences, similarities, and connections between food, mobility and housing, the paper draws on seven focus groups with professional stakeholders across the three fields. With a total of 50 participants from key organizations, including major companies, public authorities, civil society organizations and sustainability frontrunners, the paper presents unique insights on interactions between systems of provision, production, and regulation that currently poses sustainability challenges. Three analytical themes are highlighted: Economy and ownership; Regulation and responsibility; and Spatial and temporal dimensions. Finally, possibilities and pathways are identified that can push towards more sustainable production-consumption relationships in the future, and implications for the Danish context are discussed.

RN05 | T09_01: Clothing consumption 3: Sustainability

Material memories

Philip Warkander, Hanna Wittrock

University of Borås, Sweden

In the last 15 years, clothing consumption has risen by 60% while clothes remain for a shorter time – approximately 2,5 years – in people's wardrobes. During the same period, the monetary value of garments has generally decreased. In short, clothes have never been produced in such vast quantities as now, and they have never been as inexpensive. An effect of this over-production is that the financial, symbolic, and emotional value of fashion has been lost. It is a consequence of the divide between consumer markets and areas of production, initiated in the mid-20th century due to innovations in international shipping and logistics. In other areas, such as food and wine, a resistance to mass production and standardisation has steadily been growing. Interest in natural and low-intervention wine is one the rise, as is a commitment to locally sourced food that respect the traditions and customs of a certain area.

This paper builds on the two year-long ethnographic study, conducted together with Hanna Wittrock, that resulted in the monography "Modeminne" (English: Memories of Fashion, published 2023). In this project, we interviewed a wide selection of different types of informants to explore and unpack emotional connections to material, textile objects. By highlighting the important role that garments play in the story a person constructs about their life, we explore new ways of emphasizing the importance of long-lasting materiality over fast-moving trends.

202

Wardrobe Revelations: Rethinking Repair Practices and Clothing Consumption

Kirsi Laitala

Oslo Metropolitan University, Norway

Global clothing production and consumption pose significant challenges to environmental, social, and economic sustainability, particularly driven by the fast-fashion business model linking the global North and South. This study, based on a Norwegian consumer survey (N=1200), investigates factors influencing volumes of clothing consumption. Analyzing acquisition, ownership (wardrobe size), and disposal volumes, principal component analysis (PCA) factor extraction was used to identify key constructs related to respondents' preferences and perceptions of clothing acquisition, use and repair practices.

Gender and age emerge as pivotal determinants, with women reporting higher acquisition, ownership, and disposal levels than men. Those in their 50s possess the largest wardrobes, while younger individuals exhibited a higher

frequency of clothing acquisition and disposal, and thus higher turnover rates of their wardrobe contents.

Surprisingly, the study reveals that higher repair intentions or focus on quality do not correspond to reduced consumption. These counterintuitive results challenge conventional assumptions about the relationship between these practices and overall consumption. Similarly, factors such as the allure of sales, impulse buying, and the desire to appear well-dressed contributed to increased consumption levels, emphasizing the influence of psychological and social factors.

The lack of correlation between reduced consumption and the intention to focus on buying fewer quality items and repairing more implies a need for alternative strategies that consumers can apply to address their consumption levels and related sustainability challenges in the fashion industry. This research emphasizes the urgency of reevaluating current practices and fostering a more sustainable and conscientious approach to clothing consumption.

Caring Circularities: Enacting Circular Consumption by Caring for and with Clothes

Réka Tölg, Christian Fuentes

Lund University, Sweden

What role does care have in circular consumption? In a circular system consumers need to acquire, use, look after and part with products in ways that recirculate or reuse materials and minimise waste. Thus, although seldom made explicit, consumer care is built into the circular economy project. In this paper we aim to contribute to the emerging body of sociological work on circular consumption by bringing fore the role of care.

Theoretically combining Tronto's (1993) influential work on care and theories of practice (Reckwitz, 2002; Schatzki, 2001) we develop an approach that focuses on care practices – i.e., sets of interconnected doings and saying and their associated competences, materialities and meanings, which care is a part of. Using this framework, we empirically explore and conceptualise how care practices are performed as part of circular consumption and how the involved care practices shape, enable, and/or hinder caring circularities.

The analysis builds on a study conducted with 24 households and their circular consumption of clothing. Our findings suggest that accomplishing circularity in everyday clothing consumption involves developing care awareness and taking on responsibility for the care of and with clothes. We also point out that accomplishment of care practices in this context is complicated by multiple care struggles and care dilemmas. We contribute to sociological circular consumption research by showing that being and acting as a caring circular consumer is often challenging and fraught with problems, as the caring circular consumer is attempting to carry out care practices.

Fashion Supply Chains Revisited – and Transformed?

Kornelia Hahn

University of Salzburg, Austria

The revision of fashion supply chains focuses on empirical studies of consumer practices when it comes to shop clothes. It aims to learning more about how to best implement more sustainable alternatives as compared to the current supply chains of the global fashion industry. The empirical studies include handling and sense-making of the commodified clothes within fashion stores; assembling, storing, and curating of wardrobes at home; and the expertise of professional sellers of donated clothes. Interestingly, the results of this research are not aligned with conventional fashion theory which highlight consumers' demands for e.g. novelty, brands or plenty of choice. The results rather suggest how consumers necessarily need to engage with clothes by shaping their individual spatial, temporal, and material orders what proves to be less appealing to consumers as generally assumed.

RN05 | T09_02: Home and consumption

Assembling a New Home: Infrastructure, Market and Everyday Practices

I-Liang Wahn

Tunghai University, Taiwan

The commodification of housing has been a key aspect in the formation of consumer society, and home became a base of consumption. This paper advances our understanding of how a house is turned into a home by examining home selling and furnishing in an urban area in Taiwan. The paper uses the concept of market device to explores how real estate developers, domestic designers, and ikea construct ideal homes through community design, sample homes, and decoration inspirations. It then adopts a social practice theory perspective to explore how different types of home owners use furnishing to imagine and enact everyday practices and family relations. The analysis shows that home ideals reflect socioeconomic transformations in Taiwan and the home is materially and discursively assembled on three connected levels. The home is situated in specific landscape and infrastructures, designed and structured by market actors, and arranged by consumers with things. These material and discursive assemblages shape the meaning of home as well as everyday practices and commodities and things consumed in the home. The paper argues that the dynamics between infrastructure, market and social relations provide a new way to understand home and everyday practices and also a new approach to think about sustainable consumption.

Keeping Up a Rental Home? Tenants' Home Maintenance Practices

Sara-Ellen Laitinen, Eliisa Kylkilahti

University of Helsinki, Finland

The energy efficiency of existing houses and their usage should be improved to reduce emissions resulting from housing. Maintenance of an apartment keeps it in good condition and habitable for a longer period but can also influence the environmental impact of housing. Consumption studies have examined home-related maintenance from perspectives such as energy renovations (e.g., Bartiaux et al., 2014) goods repair (e.g., Gregson et al., 2009), or cleaning (e.g., Berner, 1998). Homeowners have agency in how they renovate, repair, and maintain their homes, but the agency of renters is often weaker. To develop their agency, it is important to investigate their maintenance practices and habits on home upkeep. Currently, there are only few studies on maintenance in the context of social housing (e.g., Costarelli et al., 2020; Moore et al., 2017; van Mossel & Jansen, 2010). This study aims to understand maintenance practices in households from a practice-theoretical perspective. The purpose of this study is to investigate how rental tenants perceive home maintenance practices and what barriers or incentives exist for home upkeep. These questions will be addressed by analyzing interviews that will be conducted to tenants living in municipal rental housing in a Finnish suburb. The aim is to gather more information on how socioeconomically disadvantaged tenants maintain their homes and identify ways to encourage them to take better care of their apartments. If residents can be encouraged to maintain their homes, it may also be possible to reduce energy waste.

How Much Money Does Making It Yourself Save? An Evaluation of DIY Through Ethno-Accounting

Vic Sessego

ENS Paris Saclay, France

Using a case study of a Black man doing DIY, and especially mechanics as a side hustle, we aim at presenting the ethno-accounting method (developed in France by Alain Cottereau) and how it can be useful for the study of consumption and particularly prosumption. By doing rigorous and contextualized accounting, the method we present can shed a new light on the study of consumption. By going back to the material bases of consumption and their meaning for social actors, ethno-accounting allows us to take into consideration their articulation in the way people count. Notably using data on a house renovation and especially consumption of DIY materials and products, we show that one can save as much as half of the price making it oneself, as well as give a special meaning to the work accomplished. Furthermore, the evaluation of the side hustle especially shows the importance of trust in the informal economy. Trust is indeed central when the rules of the marketplace cannot be guaranteed, as in the informal economy. But it also leads to stronger bonds, as illustrated by mutual service exchanges in our case study.

Homes Where We Sometimes Live. The Sociological Lens Of Culture And Consumption On (Italian) Houses.

Gian Paolo Lazzer[1], Francesca Setiffi[2]

1Ca' Foscari, University of Venice, Italy; 2University of Padova (Italy), Italy

Many sociologists and anthropologists have focused on the study of material culture in the domestic sphere. The houses represent an interesting challenge for sociology that adopts the perspective of consumer culture, even if today the theoretical reflections and empirical data refer mainly to urban sociologists. The paper is divided into three parts: the first reflects on how social and cultural change has affected houses in Italy from the economic boom until today; the second identifies the key concepts that can be used to analyse the social meanings of houses (such as

private/public; clean/dirty, etc.); while the third discusses the cultural and social process that is likely to affect the houses of the future (the buildings and the design of the interior spaces). Houses can be seen as "living" spaces, full of practices and routines, the direct representation of the structure of society (levels of equality and inequality) and the material expression of cultural change: technological change, smart working, smart ageing, environmental sustainability. Through a combination of theoretical reflections and statistical data, as well as socio-historical empirical findings, the paper aims to provide new insights into how houses can be categorised in different ways: a place to stay, a place to live, a place of the future.

RN05 | T09_03: Sustainable consumption 7: Sustainable lifestyles

Lifestyles and New Urban Economies: Fresh Empirical Evidence from the 14 Metropolitan Areas in Italy

Laura Sartori[1], Francesca Forno[2], Laura Azzolina[3]

1Univ. of Bologna, Italy; 2Univ. of Trento, IT; 3Univ of Palermo, IT

Relying on literature on both consumption and practices, lifestyles and platforms (Zukin 1998; Brenner 2019; Graham 2020), we define NUEs as place-based relational ecosystems emerging at the intersection of urban-bound lifestyles and platforms in the light of the ongoing digital transformation, where citizens, organizations and municipalities interact, triggering economic innovation and sustainable consumption practices (Shove 2010).

Our research question relates to the multiple ways by which New Urban Economies are associated with novel urban lifestyles, transformative social practices and platformization in three dynamic and innovative fields: 1. Food, 2. Mobility, 3. Care.

205

We will present the results of a novel and high-quality survey based on a representative sample of the residents of the 14 Italian Metropolitan Areas. The goal is to deliver and discuss empirical evidence about how social practice theory addresses the major issue of the so-called value-action gap (Keller et al. 2016), offering an "in-between" approach to understanding the promotion of practices of consumption by simultaneously considering a) consumers' changing meanings and materialities and b) the shaping forces surrounding consumption decisions.

Prosumption Culture and Urban-Rural Solidarity Networks in Gudul-Ankara

Simay Ozlu Diniz

Baskent University, Turkiye

The research question of this study aims to reveal how the rural-urban solidarity networks between the Cittaslow Güdül and Ankara have developed through the production system. This study will examine the impact of the UNDP supported Tahtacıörencik Natural Life Collective (TADYA) and solidarity economics in Güdül on rural-urban relationship networks. Cittaslow Güdül, which comes to the forefront with its agroecological activities rather than tourism, presents the importance of Slow Food principles (good, clean and fair food) for social and environmental sustainability. In this context, community-supported agriculture (CSA) collective TADYA acts as a mediator between rural-urban actors and transfers these agroecological products to the city. Theoretically, relationships between rural-urban areas are evolving due to transportation, technology, and ideological collaboration, resulting in a closer connection between the countryside and the city, creating a hybrid model rather than a dichotomic separation (Actor Network Theory – Latour). One example of this relationship is CSA, a prosumption model that resocializes and respatializes food due to ethical consumption, catalyzing a shift towards food democracy. The qualitative study will involve online interviews (netnography) of TADYA producers (16), as well as in depth interviews with consumers (10), and leaders of active organizations in the region (5) in order to understand the motives of the producers, life-style of the consumers and the contributions of the leaders. Collected data will be analyzed through discourse analysis. The expected findings of the research is that CSA in Güdül represents a form of social innovation built upon reciprocity, hybridity, and solidarity economics between producers and consumers, fostering rural-urban proximity, as articulated by Polanyi. Understanding the place of the CSA model in the Cittaslow Güdül for the sustainable food systems and determining how it shapes the rural-urban solidarity economics will contribute to the sociology of consumption and urban-rural literature in a developing countries. I haven't joined an ESA Summer School before and I believe that it will benefit my ongoing PhD thesis research as well as my future academic studies through academic collaborations and networking.

Fair Trade in Portugal: A Comparative Analysis of Operational Strategies and Resilience Amidst the Pandemic

Cláudia Amador[1], Sandra Coelho[2]

1Universidade Católica Portuguesa, Portugal;
2Universidade da Beira Interior, Portugal

Fair Trade is a social movement that arrived late in Portugal. The first Portuguese Fair Trade shop opened only in 1999, in Amarante. Twenty-five years later, we investigated the current situation of Fair Trade in Portugal. We conducted semi-directive interviews with leaders of the three organizations managing the three remaining worldshops: Porto, Lisbon, and Amarante. The results show that the COVID-19 pandemic had different effects on these shops: in Porto and Lisbon, leaders report difficulties in keeping the shops open, facing an increasing shortage of volunteers and a less expressive sales volume. On the other hand, in Amarante, sales continue to increase, and volunteer manpower is abundant. These results stem from different operational methods in the three organizations: while Porto and Lisbon maintain the traditional worldshop format, Amarante adopted a different strategy by opening a restaurant where meals are cooked with Fair Trade products and work with projects funded by European funds dedicated to youth, ensuring a constant supply of volunteers to work in the shop. Simultaneously, these young individuals are accommodated in the Youth House of Amarante, where the restaurant and Fair Trade shop operate. This implies that, by having their meals in that bar and restaurant, they consistently consume Fair Trade products. We conclude that in Portugal, Fair Trade seems to be on the verge of extinction in Porto and Lisbon, while in Amarante, due to a strategic shift in how products are handled, the future appears promising.

Mapping the Digitalization Of (sustainable) Consumption: a Cross-country Survey

Arne Dulsrud[1], Manisha Anantharaman[2], Sabina Kuraj[1], Aykut Coskun[3], Maria Fuentes[4], Christian Clemm[5], Linares-Ramirez Noemi[6]

1OsloMet, Norway; 2Science Po, France; 3Koc University, Turkey; 4Lund University, Sweden; 5Universiyt of Tokyo, Japan; 6St Mary's College, USA

How does the digitalization of consumption practices vary across political-economic and socio-material contexts, and what does this mean for the shift to more sustainable forms of consumption? The past two decades have seen a proliferation of digital interventions into consumers' everyday lives. Digital platforms provisioning food and mobility goods and services explicitly claim sustainability propositions and offer promising ways to reduce the environmental impact of daily consumption activities. Yet, the extent, type, market orientation, and architecture of platformization pathways are not uniform, affecting their sustainability potential. Drawing on a database of digital platforms provisioning food and mobility in five countries (USA, Sweden, Norway, Turkey, and Japan) with varying levels of economic and infrastructural digitalization, as well as distinct political-economic systems and consumption cultures, we explore how these factors shape platformization trajectories. We focus on four types of sustainability-oriented platforms: for food, platforms that connect local food providers and consumers, and those that promise to innovate technologically mediated ways of redistributing surplus food and, through that, reduce food waste. For mobility, we focus on platforms that facilitate access to shared transport through cars, bicycles, and e-scooters. Our findings confirm that while the degree and types of digitalization for each

platform type vary based on legal, political-economic, and cultural environments, business models transcend national and regional specificities. While our work presents a mapping of digital provisioning platforms across five countries, identifying the similarities and differences, It is essential to understand how end users use (or stop using) these provisioning platforms better to align them to the particularities of the local context.

RN06 | Critical Political Economy
RN06 | T01_01: Disaster Capitalism and Critical Political Economy: Catastrophe or Emancipation?

Russo-Ukrainian War, Russia's Neocolonial Multipolarity and Inadequacy of Scholarship: Failing Towards Fascism in Plain Sight

Yuliya Yurchenko[1], Owen Worth[2]

1University of Greenwich, United Kingdom; 2University of Limerick, Ireland

Taking the Russo-Ukrainian relations and war as a starting point, we deploy Gramscian political economy to show the deficiencies of extant scholarship on both and the region. We argue that Russia's perceived "apparent irrationalities", Putinversteher-ing, proliferation of neorealism and historical materialism overtly lacking current material are consistently rooted in a deep ahistoric, decontextualised, and categorically problematic representation in scholarship of what Russia is and was, regionally and domestically. While western imperialisms and military interventions enjoyed much-deserved scrutiny, Russian geopolitics of self-victimisation thrived in western academia's Russia fetishism, glorifying and vilifying alike, thus clouding critical scrutiny and adequate positioning of its object in global (geo)politics. Post-1991 regional hegemonic contestations (Worth 2005) and the current era of crises created an environment where certain actors have moved to shape future forms of world order (Worth 2019) of the (dis)integrating empire of capital (Yurchenko 2022). Conditions being imperfect, Putin tried to force a 19th century style of multipolarity where (neo) colonial invasions are rooted in the legacies of internal colonisation of Eurasia. Russia's failure to modernise or keep regional geopolitical superiority after productive relations in the post-Soviet space started to break down has led to this move and ultimately to the full-scale invasion of Ukraine. Russia and multipolarity is thus only counter-hegemonic in a sense that it disrupts the liberal institutional order on which a global hegemony can be built. Through the prism of the Russo-Ukrainian war, we discuss Russia's authoritarian entrenchment, the manufacturing of the narrative of civilisational exceptionalism, 'self-othering' and self-victimisation, neocolonial domestic and foreign policies, and the inevitability of the recent turn to schizofascism (Snyder 2022) against the failure to build a functioning capitalist state.

Surviving Disaster Capitalism: The Crisis In Social Reproduction And The Gender-Energy Nexus

Aliki Koutlou

University of Manchester, United Kingdom

In the current conjuncture of an energy crisis that swept much of Europe, the paper centres on the gender-energy nexus, outlining its articulations in and through this crisis. Crucially, it approaches this crisis from the lens of social reproduction and unpacks its gendered nature. To do so, the paper conceptualises energy as deeply imbricated in social reproduction, arguing that its commodified and commercialised provision is an instance of the privatisation of social reproduction. It explores the gender-energy nexus its complexity, dynamism and uneven articulations across the global economy though existing work on energy poverty and gender in the UK in as well as existing research on energy debt in Greece and its linkages to the gendered nature of using and not being able to afford energy in households. In doing so, the paper highlights how energy is political in the gendered nature of its provision and usage, elucidating the embodied ways in which women are forced to get by and act as 'fixes' of this crisis.

Palestinian Struggle as a Proxy War: Saudi ambition and its effects on Saudi soft power in the Islamic World

Mariam Khawar

University of Helsinki, Finland

The recent increase in violence in the conflict between Israel and Palestine has gone beyond its historical precedence. The violence occurs within the geopolitical struggles of each party's allies and rivals as part of the regional geopolitical game. Saudi Arabia has been a supporter of the Palestinian struggle and resisted recognising the statehood of Israel since 1948. Contrary to this, Saudi Arabia and Israel have been working towards the 'normalisation' of diplomatic relations mediated by the United States of America. A large part of Saudi normalisation with Israel is the country's ambition of diversification away from oil production and the expansion of nuclear energy. Nuclear proliferation even in the civil sphere is almost impossible without American support in the current global political order.

This paper explores how Saudi Arabia's nuclear energy ambitions have affected its policy stances in the Palestine-Israel conflict. Saudi Arabia holds economic and political power in the region and normative power in the Islamic world. It is doubtful that Saudi Arabia will be able to realise its nuclear energy ambition immediately. Saudi Arabia will continue leveraging these in favour of the normalisation of ties with Israel. In such a case, despite paying lip service to the ideological support to Palestine, Saudi Arabia will no longer be an ally in the struggle. Withdrawing support for Palestine in

208

favour of improved ties with Israel may prove to be a rational geopolitical move but may come at the cost of valuable soft power, the Saudi state's normative strength within the ideological Islamic geopolitical space.

A Question Of Collaboration: (How) Can Commons Networks Scale Alternatives To Capitalism?

Bernd Bonfert

Aarhus University, Denmark

Commons-based initiatives have gained increasing attention in recent years in response to intensifying climate emergencies and global supply chain disruptions. This is especially evident in the food and energy sectors, where community-supported agricultures (CSAs) and local energy communities (LECs) have been praised for their potential for fostering decommodification, democratization, and degrowth within essential systems of reproduction. However, such initiatives remain limited in scope and accessibility due to their small size and inability to benefit from economies of scale. Many are thus building larger networks to diffuse commoning practices, involve new actors, and advocate for policy change. Put differently, they are pursuing alternative ways to 'grow' outside the capitalist market paradigm by engaging in different forms of 'scaling' the commons.

This paper seeks to investigate the role of these commons networks in organizing, diffusing and promoting commons-based economies. It draws on scholarly concepts of diverse economies, polycentric governance, and social movement networks to understand how such networks are governed, what roles different actors play, what strategies they develop to scale beyond the local level, and what achievements and challenges they encounter.

Data is drawn from qualitative case studies of networks among both CSAs and LECs in the UK, Germany, Sweden, the Netherlands, and Belgium, using interviews, observation, and document analyses. By investigating cases in both the food and energy sector, and at different scales, the paper not only describes individual commons networks but also explains their sector – and scale-specific differences and discusses strategic implications for their ability to transform the economy.

RN06 | T02_01: From Climate Crisis to Climate Justice?

What has the disruptive protest of Just Stop Oil achieved?

Oscar Berglund

University of Bristol, United Kingdom

The scholarship on the policy impact and effectiveness of protest is fast-growing across the social science. One important claim in this literature is that disruptive protest, or civil disobedience, is more likely to influence politics, society and policy than less disruptive kinds of protest. The way that protestors conceive of their own agency can in policy terms be conceptualised as trying to achieve a focusing event. That is, the aim of protestors is often to influence agenda setting and problem definitions in a way that makes some policy outcomes more likely than others. The protests that achieve this can be considered focusing events in their own right. Examples in recent decades include the anti-World Trade Organisation protests in Seattle in 1999, the Occupy protests in 2011, the various climate protests in 2019 and the Black Lives Matter protests in 2020.

This paper studies contemporary climate change protest in the UK, specifically the activities of the group Just Stop Oil (JSO). JSO has specialised in attention-grabbing civil disobedience involving relatively small numbers of protest. Whilst JSO have achieved much media attention, this attention has arguably not achieved the status of a focusing event. The paper is a case study of JSO's civil disobedience campaign. It uses a variety of methods, including opinion polls and interviews with the general public, media content analysis, interviews with elected politicians, and focus groups with JSO activists and other climate campaigners.

Exploitation is Exploitation: The Imperative of Veganism to a Progressive Political Economy

Emma Foster[1], Peter Kerr[2], Chris Forster[3]

1University of Birmingham; 2University of Birmingham; 3University of Birmingham

This paper explores the potential of veganism as praxis to fundamentally disrupt capitalist political economy.

In general, the Left have found it difficult to find an adequate register to theorise (and seek the amelioration of) the oppression of other-than-human animals. Testament to this is the troubled relationship which many on the Left have with veganism. Rather than recognising veganism as a strategy to challenge capitalism, it is often regarded as a distraction from the principal imperative of overcoming the capitalist exploitation that occurs between humans. Moreover, veganism has been problematised as a lifestyle

209

choice, presented as the 'right thing to do' but restricted to only relatively wealthy individuals. As such, vegans are often criticised for passing negative judgment on non-vegans, while obscuring that this option is inaccessible for many.

Recently, some Leftist scholars have begun to argue that veganism presents a meaningful challenge to capitalism (Dickstein et al, 2022; Sexton et al, 2022). Here veganism is considered as a boycott of markets rooted in the exploitation/oppression/death of other-than human animals, on which capitalism heavily relies. In this paper, we go further than recognising veganism as a tool, to contend that even these arguments underplay the intimate inter-relationship between the exploitation of other-than-human animals and human-animals. From a queer-trans-ecology perspective, we argue that the exploitation of other-than-humans cannot be decoupled from the exploitation of humans in a cis-heteropatriarchal capitalist system. Therefore, it follows, that it is imperative for the Left to fight against the exploitation/oppression of other-than-human species if they are to pursue their commitments towards social and environmental justice.

Authoritarian Legitimation: Accumulation, Climate Crisis and the Search for Consent in Late Neoliberalism

Thomas Da Costa Vieira[1], Joseph Ward[2], Rosa Maryon[3]

1London School of Economics, United Kingdom; 2University of Sheffield; 3University of the West of England Bristol

In a context of generalised stagnation, neoliberal governments throughout the globe have elevated home affairs policy and advanced a 'mutated' politics of legitimation characterised by explicit forms of 'othering' and hostility towards the wider political system. While scholars of authoritarian neoliberalism have mapped these recent shifts in governing strategies in some good detail, the literature has failed to offer a fuller theorisation of legitimation in authoritarian neoliberalism. We contribute to the literature through a mixed Gramscian-Foucauldian framework, arguing that in late neoliberalism, legitimation increasingly depends on, and cultivates, a "reactionary" form of common sense that aims to restore the normalcy of inward-looking national projects and regressive accumulation regimes. Indeed, governments increasingly seek to maintain electoral support for the collapsing neoliberal project among limited segments of the population who may be aligned with authoritarian values. We conceptualise this "authoritarian legitimation" and its contradictions for governing capacity and popular support, in particular as it is both faced by, and feeds off, resistance from below. Looking at both the neoliberal "heartlands" and Global Southern neoliberal states, we examine the legitimation of the emerging neoliberal climate regime, characterised by the rolling out of undemocratic green transitions paired with the repression of climate protest.

Towards The Hegemony Of Post-growth: Exploring Social Change Through The Case Of The Circular Economy

Brais Suárez Eiroa[1,2], Antonio Ferreira[2], Victor Sánchez Juárez[1], Aitor Alonso Rodríguez[1]

1Universidade de Vigo, Spain; 2CITTA, Portugal

The question of power and politics in explaining and shaping sustainability transitions is increasingly being addressed in the literature. Nevertheless, neo-Gramscian theories and concepts remain underutilised in the literature on sustainability transitions, creating a gap in the understanding of such transitions from a critical political economy perspective. To go one step further, in this article we focus on social change in the context of sustainability transitions from a neo-Gramscian perspective, drawing in particular on the work of Bob Jessop and his strategic-relational approach. More specifically, we focus on the question of growth and seek to deepen our understanding of how post-growth societies might emerge. The question of post-growth is highly topical, as there is ample evidence that growth and ecological impacts are inextricably linked. We creatively examine the case of the circular economy, which currently plays an important role at the centre of the sustainability debate, and assess the role of the circular economy in enabling or preventing post-growth societies. The liminal nature of the circular economy is an excellent example of how a struggle to maintain or conquer hegemony takes place, particularly at the level of discourses and social imaginaries. The article therefore offers alternative, adapted accounts of various Gramscian concepts that could be crucial for understanding sustainability transitions, i.e. ideology, historical bloc, hegemonic crisis, organic change, passive revolution and war of position. The article concludes with suggestions for future research on circular economy, post-growth, sustainability transitions and social change from the perspective of critical political economy.

RN06 | T02_02: Critical digital capitalism

Silicon Valley's New World Order: Artificial Intelligence, Universal Basic Income, and the Equity-Growth Playbook

Mark Richard Sean Howard

University of California Santa Cruz, United States of America

In 2011, venture capitalist Marc Andreesen proclaimed software was eating the world. By 2017, OpenAI scientists had argued artificial intelligence (AI) was eating software. In this paper, I explore the actualization of these claims through a historical materialist lens. Drawing on Althusser, Gramsci, Land, and Zuboff, I explore the progressive commercialization and monopolization of OpenAI, along with its relation to Worldcoin, a biometrics-based cryptocurrency offering global universal basic income (UBI).

There are four parts.

First, I sketch the implications of generative AI through the lens of historical materialism. I then outline the progressive commercialization of OpenAI, a de facto AI monopoly that, driven by venture capital, is set to dominate the future of AI.

Second, I explore the value proposition of WorldCoin—its aim to be a global monopoly in digital identification and UBI; its investor relations to OpenAI and the AI revolution; and its pursuit of neocolonial practices as a means of obtaining hegemony over global currency.

Third, I show how the aims of OpenAI and WorldCoin merge in a field of social necessity serving capitalist hierarchies. Not only does WorldCoin exploit a future world of AI-induced "postemployment," but with the provision of its "World ID" facilitates unprecedented access to data, the raw material upon which AI depends.

Finally, both firms frame public actors as the true AI/UBI threat, legitimizing their own role as the owners and providers of these soon-to-be socially necessary goods. I argue that OpenAI and Worldcoin are legitimizing a drift away from public benefits and provisions towards private ownership and consumption, towards a new hierarchy of power, wealth, and influence in which every human being has "skin in the [capitalist] game."

Digital Capitalism as Disaster Capitalism: The Power of AI to Undermine Democracy

Peter Imbusch, Joris Steg

Bergische Universität Wuppertal, Germany

Artificial intelligence is a key technology of the 21st century that has and will continue to have a far-reaching impact on all areas of society and people's everyday lives. Technological revolutions always have had the potential to substantially transform power relations and power structures in a society and to lead to unrest and social upheaval.

When the economic and social effects of AI are considered, the focus is usually on the transformation of the economic and working world or on ethical and normative aspects. However, the power issues associated with the development and application of AI usually remain strangely underexposed and undertheorised.

The presentation looks at the influence of AI on social power structures and asks how power relations in economy, politics and society are being transformed by the use of artificial intelligence and what consequences this has for economy, society and democracy.

It is shown that AI does not have an emancipating, equalising, levelling and democratising effect per se. Rather, AI and the digital capitalism lead firstly to an automated alienation, secondly to a promotion of financialisation, which enormously accelerates and potentiates the crisis-prone nature of capitalism, and thirdly to a potentiation, centralisation, monopolisation and stabilisation of the infrastructural, informational and market-dominating power of already powerful players. This is accompanied by an intensification of inequalities and an increase of tensions and conflicts. In this respect, digital capitalism is mutating into disaster capitalism, which has the power and potential to undermine democracy as a form of government and as a way of life.

211

Mobilizing AI to hack the life course and counterplay precarious Ageing – A Critical Political Economy Approach

Gustavo Sugahara

DINÂMIA'CET – Iscte, Portugal

Research on the effects of ageism towards older people, which spans various aspects of life including health, work, and participation, has been substantial. There is also an emerging field of study investigating 'digital ageism,' but no existing research attempts to link discussions around both the technological revolutions (as suggested by Perez) and the demographic revolution (proposed by Butler and others). This theoretical exploration delves into the potential relevance of a Critical Political Economy Approach to ageing. It introduces the concept of 'precarious ageing', which expands the idea of precariat to include household

circumstances and the welfare state, and the increased threat posed by AI. This article discusses the segmentation of the life course as a significant characteristic of technological paradigms, particularly in relation to the influence of digital technologies and the rise of AI as a dominant force in mediating ageism. The proposition is that the segmentation of the life course is a key feature of technological paradigms and the additional years of life gained since the dawn of the industrial revolution represent a disruptive force with widespread repercussions. This paper also aims to raise both public and scientific awareness of the potential impact of new, open-ended forms of governance, which could harness this longevity dividend.

Workers' Right to the Subject: The Social Relations Of Data Production

Phoebe Moore

UNIVERSITY OF ESSEX, United Kingdom

The use of data to profile and make decisions about data subjects for citizenship, targeted advertising, job recruitment and other reasons, has been eminently normalised, which is an emerging threat to protected spaces for personal subjectivation and identity formation. The 'right to the subject'; or to agency via personal subject formation outside bilateral profiling; is at stake. This is especially true for workers. Algorithmic management infused with worker control mechanisms occurs in structurally and objectively unequal conditions within subjective, and unequal, social relations. Data harms protections in European privacy and data protection law, despite being heralded as the strongest in the world, are insufficient to protect workers' right to the subject. Indeed, structural features of inequality within the capitalist data political economy mean that workers experience different power relations to consumers and citizens. Analysing the social relations surrounding policy features of 'consent', and 'risk', with focus on the General Data Protection Regulation (GDPR) and the negotiations for the AI Act, it is not difficult to see that these policies do not protect all data subjects' rights to the subject identically. Indeed, workers never have the capacity to truly consent at work; and the risks workers face are different from that of other data subjects such as consumers. Data subjects do not, across categories, have equal access to equality, within, and because of, the social relations of data production. From a cross-disciplinary perspective and with contributions to sociology, critical theory, media and policy studies, this article argues that workers' right to the subject is at stake, in datafied social relations.

RN06 | T03_01: Work and its contradictions in contemporary capitalism

Consciousness And Structure: A Marxist Analysis Of Subjectivity In Women Workers' Mobilisation Processes

Loreto Rojas Viver

UAM, Spain

The question I am asking in my research is about the effects of the capitalist crisis in shaping the political subjectivity (or revolutionary consciousness) of different sectors of working women in the current conjuncture of the crisis of the welfare state, the hegemonisation and institutionalisation of feminism and the decline of the labour movement.

In order to do so, I want to update the approach to the question of consciousness in Marxism, in connection with the structural analysis of the economic and political conjuncture, from the Marxist analysis of capitalism. This is a way of putting on the table the concrete development of the contradictory unity between subject and object, trying to analyse the emergence of forms of consciousness that seek social transformation, that are subjectively aware of their objective position in the social structure.

For this, the methodology I am using is mainly qualitative, with in-depth interviews with the different actors involved in trade unions and other political organisations active today, as well as participant observation in assemblies, actions and other situations of interest.

At the moment, I am realising that there is no mechanical, deterministic extrapolation of the potential of the crisis situation for social mobilisation, there is no mechanical or identity relationship between the subjective and objective conditions for mobilisation, and we could better speak of a contradictory, dialectical unity, in which although the objetive conditiones are given, this does not necessarily imply a maturation of the subjective conditions, of the state of the contesting subject, but this is also understood as an objective question.

The elaboration on this is interesting, because it puts the focus on the limitations of trade unions and social movements, in a situation of international division of labour under imperialism, as opposed to the overemphasis on the emancipatory potential of struggles in many studies on social mobilisation. A focus on limits is necessary in order to overcome the problems that organisations encounter in advancing their emancipatory goals.

On The Economy-Immanent Genesis Of Material Poverty

Alexander Heublein

University of Bamberg, Germany

In my talk i want to contribute to a theoretical understanding of why and how phenomena of material poverty form an integral part of contemporary capitalist economy. Starting from a marxist point of view i mostly draw on Moishe Postones critical reconstruction of Marx's theory.

Postone locates the most important factor for an economy-immanent impoverishment in the contradictory structure of work in capitalism. Work functions as the primary source of production of material wealth and at the same time as the central instance of societal mediation between people (Marx' so called „abstract labor").

The latter function entails the following: People can only access material goods by means of laboring. Now the structure of capital and wage working transforms this function: Access to material wealth is conditioned by the profitability of work for capital.

This in turn leads to the paradoxical consequence that the development of productivity of work negatively impacts its function of enabling people to access material wealth: As work becomes more efficient (produces more goods per time unit), it also becomes more dispensable for the profits of capital. This is the root of the simultaneity of wealth and impoverishment in capitalist society: As work becomes more productive, material wealth grows, yet people loose the opportunity to access it.

In my talk i plan firstly on elaborating this contradiction on a theoretical level and secondly illustrate it pointing towards empirical developments. I'd like to show that a primary example of this lies in the growing expansion of the minimum wages sector in contemporary Germany: Here we have a striking example of an impoverishment-tendency amidst one of the wealthiest western countries.

Superfluity In Times Of Crises

Iñigo de Loyola Rodriguez

UNED, Spain

This paper aims to analyze the inherent tendency of capital to create a relative surplus population as a mechanism of disciplining and subjectivation the global labor force exacerbated by the economic estagnation. This tendency inherent to the process of capital accumulation whereby living labor is expelled from the productive processes due to the need to revolutionize production by increasing the technical composition of capital, is compensated by a series of counter tendencies, such as the expansion of production to other sectors or productive fields, causing part of the eventually surplus labor force to be reabsorbed as part of the global social labor. However, the crisis in the logic of social reproduction that we have been experiencing for more than two decades added to a combination of phenomena (deindustrialization, population growth, etc.) has given rise to the creation of a consolidated surplus population. This part of the active population has become incapable of being reabsorbed by the productive process and, therefore, deprived of the only way to access its means of subsistence: the wage relationship. In this sense, this tendency of capital emerges as a source of increasingly coercive power of capital over the lives of those who, deprived of direct access to their means of subsistence, have no choice but to sell their labor power and, therefore, have to adapt both objectively and subjectively to the imperatives of the expanded reproduction of capital on pain of being branded as socially unnecessary and condemned to chronic unemployment or underemployment. This tendency ultimately results in increased competitiveness among workers, total adaptation to social imperatives and the pacification of any kind of resistance to the capitalist social configuration.

Circuits of Digitized Capitalism: A Neo-Marxian Analysis

Jeremy Markham Schulz

UC Berkeley, United States of America

This paper reconceptualizes the dynamics of digitized capitalism in light of recent appropriations of Marxian theory. Conceiving of capitalism as a complex totality constituted by multiple intersecting circuits in line with Harvey (2018, 1982) and Postone (1993), the paper dissects the ways in which digital technology is deployed at multiple points in the capitalist accumulation process. Within the primary circuit of capital accumulation, digital technologies are deployed as commodities within the valorization circuit, but also as mechanisms for the capture of value at the point of capital realization. This second mode of deployment happens in the so-called platform economy and gives rise to a specialized form of rent-seeking based on the monopolization of transactional environments. At the same time, wherever digital technologies are deployed as fixed capital within the commodity production process itself, they appear within the secondary circuit of capital accumulation. Here they constitute what can be conceptualized as a specialized form of fixed capital which combines material and immaterial elements with sometimes divergent lifecycles and periods of economic devaluation. Finally, as artifical intelligence accelerates, it has become conceivable that digital technologies will soon reach the point where autonomous artificial intelligences or "digital minds" can replicate the behaviors of human capitalist actors, namely workers, consumers, capitalist enterprise owners, and investors. In this way, digital technologies will be positioned to transform capitalism from the "inside," paving the way for a fundamental evolution of capitalism.

RN06 | T03_02: Polycrisis or Disaster Capitalism?

World Bank, Covid-19 and Finance for Better Recovery: Capitalism for Disaster or Disaster for Capitalism?

Julia Loginovich

University of Manchester, United Kingdom

Disaster capitalism – which understands crises as instrumentally central to capitalist accumulation (Klein 2007; Harvey 2007) – is a concept useful today. Covid-19 highlighted the emergence of crises as tools for sustained capitalist accumulation through financialised methods of disaster recovery, in line with literature on disaster financialization (Grove 2012; Paudel et al 2020). This paper, questioning the relevance and refining the Disaster Capitalism concept, explores its applicability to the World Bank's pandemic response. Via the analysis of the WDR 2022 "Finance for Better Recovery" it shows how Covid-19 facilitated the Bank's promotion of financialised, market-driven modes of capital accumulation through 3 legitimising narratives – interrelatedness of risks; uncertainty; inequality – juxtaposed against the Covid crisis as a fresh opportunity for "Building Back Better". As a natural disaster, the pandemic (more than 2008 crisis) emerged in these Bank's narratives as an exogenous threat, a scapegoat of an origin external to capitalism, thus enabling the portrayal of capitalist financialization as a solution. This externalisation of disaster, however, creating an "outside", established a parallel narrative in the Bank's discourse – one questioning and threatening the legitimacy of capitalism in the face of external shocks. Therefore, this paper proposes a reconceptualization of Disaster Capitalism as simultaneously coexisting Capitalism for Disaster and Disaster for Capitalism. Such analytical distinction allows for a greater acknowledgement of emancipatory potential contained within disasters and critical resistance based in the recognition of the inherent dysfunctionality of capitalism as a system, susceptible not to just self-generated but exogenous crises, that require praxis beyond internal financial "fixes".

In The Homeland Of Polycrisis: A Critical Political Economy Perspective On The Berlusconi Era And Its Legacy

Daniela Caterina[1], Adriano Cozzolino[2], Gemma Gasseau[3], Davide Monaco[4]

1Huazhong University of Science and Technology, China, People's Republic of; 2University of Campania Luigi Vanvitelli, Italy; 3Scuola Normale Superiore, Italy; 4Independent researcher

Within the horizon of disaster capitalism, Italy is a case in point for understanding political projects of neoliberalization and the related rise of far-right forces. The present contribution builds on the argument that, in order to understand the current conjuncture, we need a historical grounding. Therefore, it proposes a critical political economy (CPE) analysis of Silvio Berlusconi's hegemonic project and of how its legacy shapes the management of the current Polycrisis by right-wing forces in a country already showcasing early signs of disaster capitalism through decades-long crisis and economic stagnation.

In fact, Berlusconi's recent death has sparked a lively debate in domestic and international circles about his political legacy. Nevertheless, critical perspectives on this are still missing: the tone of the debate easily falls into culturalism and moralist concerns that remain blind to key political-economic factors. We are, therefore, in dire need of a theoretically informed empirical study of Berlusconi's political-economic project within CPE.

We aim at filling this gap by looking at several analytical dimensions such as ideology-discourse, policy-making, social bloc formation (including coercion and consent), and, finally, the State project – that is, how Berlusconi tried to portray and change State apparatuses, powers and interventions. In our view, this constitutes a crucial perspective to look at how right-wing hegemonic projects are changing, and thus draw the implications of Berlusconi's legacy for the present constellation – especially in relation to the current right-wing government, and to recent developments in the literature on competing hegemonic projects and transnational social forces.

The Politics of Natural Disaster: A Case Study of post-Earthquake Hatay, Turkey

Ayse Serdar, Aslı Öğüt Erbil

Istanbul Technical University, Turkiye

On February 6, 2023, two earthquakes with magnitudes 7.8 and 7.7 hit Southeastern Turkey, with epicenters in Kahramanmaraş, officially causing over 50 000 deaths. The deadliest disaster in the history of modern Turkey impacted 11 provinces, with Hatay province experiencing the highest death toll and extensive destruction. This presentation examines the politics of natural disaster in Turkey focusing on the post-earthquake situation in Hatay. As the home of ancient Antioch, Hatay is distinguished by its unique blend of ethnic, religious and sectarian diversity reflecting a multi-cultural social fabric. The Hatay province also holds the third highest number of Syrian refugees relative to its local population in Turkey. Given its specific vulnerabilities, the massive displacement and destruction caused by the earthquake pose a severe threat to its urban, environmental and human heritage. Against this local backdrop, the politics of recovery and rebuilding in Hatay are shaped by the over-centralization, neoliberalization and marketization of the statecraft in Turkey's authoritarian neoliberal regime. This political framework poses risks of accumulation by dispossession both in material and symbolic forms. Informed by the perspectives of environmental and disaster justice, the presentation explores how the politics of natural disaster and recovery are formulated and executed. It analyzes

their impact on the life opportunities, identities and rights of Hatay residents, as well as how these dynamics mobilize locals around particular social and environmental problems that they face.The presentation relies on fieldwork conducted in Hatay and an analysis of national media over the one-year period following the earthquake.

Small Boats and the Global Libidinal Economy of Disaster Capitalism

Ben Whitham

SOAS University of London, United Kingdom

This paper draws upon the theoretical framework of global libidinal economy (GLE) to critically evaluate UK migration discourse on 'small boats', locating it within the field of Disaster Capitalism. GLE analysis, I argue, is essential to understanding the tendency toward Disaster Capitalism. Both traditional, neo-classical international political economy (IPE) and critical, Marxian approaches rest upon rationalist paradigms – the key difference being that the former legitimise capitalist social relations while the latter look for 'a way out' (Kapoor et al., 2023: 5). GLE, on the other hand, demands that we pay attention to the 'unconscious circuits of excess and antagonism' that accompany international political-economic structures and practices (Kapoor et al., 2023: 1). Through GLE, I suggest, we can understand the meteoric rise of the UK's 'small boats' discourse – and the material policies and practices it has enabled – as dependent upon non-rational psychosocial investments and desires. Specifically, confrontation with the causes of the 'polycrisis' (Tooze, 2022) that Disaster Capitalism has engendered is avoided or transmuted through this discourse. The success of the small boats discourse in capturing attention does not reflect a widespread belief that people arriving by small boat are somehow the real cause of the UK's 'great variety of morbid symptoms' (Gramsci, 1971: 276). Instead, the rise of this discourse reflects a tendency within the GLE of Disaster Capitalism to 'never learn from one's mistakes', which often specifically entails 'acting against one's own self-interest' to the point of 'dooming the prospect of progress' (Kapoor et al., 2023: 8). The paper concludes by considering the prospects for transcending the self-harm of the small boats discourse and challenging the repetition of Disaster Capitalism.

RN06 | T04_01: Climate change and class struggle?

Class Consciousness and the Climate Crisis: A Lukács – Veblen Approach

Konstantinos Loizos

Centre of Planning and Economic Research (KEPE), Greece

The climate crisis is an offspring of the capitalist way of economic development which colonizes and commercializes ever-extended spaces of both social and physical environments. In this respect, climate issues directly become class issues to the degree that the working class is formed as a revolutionary class. Following Lukács in this respect, class consciousness is a constitutive continuous process of class formation and, at the same time, a continuous challenge against reification and fragmentation. Reversing this process entails a new integrating relationship with nature which denies capitalist commercialization both at the social and climate level. However, building class consciousness is not possible without a class struggle which entails two things: action at the group level on the one hand, and perception at the individual level, on the other hand. In Veblen's terms, collective action should go hand in hand with the revision of beliefs and change in the related habits of thought. Changing habits of thought entails a much deeper process rather than a revision of beliefs to the degree that it challenges an individual's fundamental way of thinking. Approaching from a critical political economy point of view the problem of class consciousness in its relationship to the climate crisis has the advantage of being able to grasp at the same time two dimensions: a) the problem of continuous and profound change that proletariat consciousness requires both in capitalist conditions and in conditions of socialist transformation and b) the ability of class consciousness to represent a fundamentally different approach to nature which transcends its bourgeois reification and seeks for a new integration within history.

Disaster Colonialism, Tourism, And Mobilities: Injustice In The Context Of Climate Change

Francesca Colla

University of Trento, Italy

Tourism is one of the leading industries to take advantage of post-disaster contexts in processes that can be framed as disaster capitalism. In postcolonial geographies, it is crucial to understand disaster capitalism as rooted in long histories of colonial capitalism. The tourist industry exemplifies this connection. Tourism epistemically and materially relies upon neocolonial imaginaries and practices that essentialize places and people and enable their exploitation and dispossession.

This calls for an analysis of the multiple lines that connect tourism, (neo)colonialism, and disaster capitalism: climate change mobilities increasingly stand at the crossroads of these multiple lines. In the context of climate change, relocation and eviction can be proposed and/or implemented in post-disaster contexts when portions of land are labeled as vulnerable/risky/uninhabitable—a non-exhaustive list—displacing local communities. It is in this space that capital interests, often in concert with state power, engage in land grabbing for the purpose of tourism development.

The paper presents research conducted on the island of Barbuda following the destructive passage of Hurricane Irma in September 2017. After having been displaced, Barbudans are resisting tourism development carried out by foreign investors with support from the national government, framing it as disaster capitalism.

An analysis of this case through a perspective informed by climate justice and mobility justice, understood as two sides of the same coin, will reveal the increasing normative role of climate change discourse to justify mobilities and advance private interests in disaster contexts.

The Global Social and Ecological Disasters: Green Finance and Human Rights as Entry Points for Progressive Struggles?

Johannes Jäger

University of Applied Sciences BFI Vienna, Austria

Given the highly unequal over-use of global natural resources and the ecological and social disasters going along with this, the paper analyses the potential for progressive strategies. Thereby, the paper critically analysis two processes at the EU-level aiming at addressing environmental (and social) problems. Firstly, it focusses on the initiatives in green finance that are fostered by capitalist groups in finance and industry. Secondly, it analyses the attempts at the EU-level to force European companies to comply with human rights standards and ecological standards in the global periphery, referred to as the European Corporate Sustainability Due Diligence Directive (EU-CSDDD). Both, the debate around green finance as well as the remerging discussion on global social and environmental standards in the context of the EU-CSDDD provide entry points to for a critical questioning of capitalist structures. However, until know, capitalism has not been put into question within these debates. The following questions arise: How could radical reformist progressive strategies be fostered? Who could be the proponents of radical reforms? Will this suffice and lead to structural changes that push back capitalism? This links to the classical question of reform or revolution which is reappearing in the context of the deepening multiple crises of disaster capitalism.

Investigating Class Dynamics in Transition to Sustainable Energy

Gökçe Yeniev

University of Bristol, United Kingdom

While the transition to sustainable/renewable energy holds promise for the climate crisis, its labour implications are not straightforward. This paper theoretically explores the intricate facets of the energy transition, offering both quantitative and qualitative insights to uncover its likely impact on labour and class dynamics. Historically, transitions in labour, such as the transition from coal to gas, as exemplified by Timothy Mitchell's concept of "carbon democracy" or transformations in the capitalist mode of production in the 1960s and 1970s, marked by the emergence of the "mass-worker" and the increase in the automated processes have fundamentally reshaped the class dynamics. Yet, the transition from fossil fuels to renewables is no ordinary shift; it entails a complex narrative that has frequently been oversimplified by assuming that change should occur primarily from the bottom up, through grassroots movements, or be brought by government policy while overlooking the intricate power plays, authority structures, and divergent interests of various stakeholders. This paper endeavors to shed light upon the class dynamics in the context of energy transition, combining Antonio Gramci's framework on "historical bloc" with Erik Olin Wright's class analysis. Thereby, it contributes to the broader theoretical discussions around the question of how to enable a just and sustainable energy transition. Incorporating class dynamics into the energy transition enhances our understanding of power structures, the potential impacts on different classes, and the distribution of benefits and burdens.

RN06 | T04_02: Post-Capitalist Knowledge for a Post-Capitalist Future?

Capitalism and the Fragmenting Pillars of Society and Education

Hugh Lauder

University of Bath, United Kingdom

In this paper I examine the effects of three modes of capitalist accumulation on four of the key pillars of society and education. Education crystallizes the tensions that capitalism presents, so for this paper I will focus on it; attention will be drawn to the wider societal and political implications. They are:

Time – The socialization of students into capitalist time when due to the climate crisis we are fast running out of time.

Knowledge and Truth – the polarization of wealth and income have led to culture wars, a questioning of science and the notion of fake truth. This is having a fundamental impact on what counts as knowledge and what should be included in the curriculum

Democratic Citizenship – the primary aim of education under neo-Liberalism has been getting a good job. This instrumental aim has meant that many other important aims are such as citizenship are seen as irrelevant at a time when authoritarianism is a threat.

Contribution – this is typically understood in terms of employment. But a broken labour market and the advent of new technologies, e.g., AI means we need to rethink the political economy of citizens making a contribution.

While these fragmenting pillars raise fundamental tensions, they also create a space in which a progressive education is possible.

Constructing a Radical Scientific Advisory Group

Sam Colclough

Durham University, United Kingdom

The COVID-19 pandemic cemented the status of scientific advisory groups as key actors in contemporary governance frameworks. This paper seeks to develop an account of what a scientific advisory group underpinned by a commitment to radical political economy might look like in order to elucidate how science can be mobilised towards transformative ends. It is imagined that such science advice could orient the activities of radical political organisations during an emergency. The paper argues that an inextricable relationship exists between political economies and ways of knowing in the advisory context. This builds on prior research at the intersection of sociology and philosophy which focused on two such institutions in the UK during the pandemic:

SAGE, the formal advisory group informing government decision-making, and Independent SAGE, an advisory group formed by public health scientists concerned about a lack of transparency in SAGE. If the bodies of knowledge produced by these groups unavoidably embodied particular political economies – paternalistic neoliberalism and third way social democracy, respectively – then it follows that alternative political economic preferences can underpin the knowledge production of other scientific advisory groups. Having established the defensibility of such an endeavour, the paper then considers the construction of scientific advisory groups seeking to address the underlying causes of crises, in contrast to the more limited focus on epidemiological firefighting that characterised advisory groups during the pandemic. A critical science then becomes available to activists, facilitating the avoidance of anti-scientism on the one hand and an uncritical veneration of science on the other.

Out of Time: Exploring the Temporal Dimensions of Catastrophe Capitalism

Alistair Bernal Holmes

Goldsmiths, University of London, United Kingdom

After decades in which the political imaginary was confined to the narrow horizon of the present, far-away-sounding dates – 2035, 2050, 2100 – have returned to everyday conversation. Indeed, the widespread adoption of the notion of an 'anthropocene' situates our current era within the vast expanse of geological time. To what extent do these changes signal a break with the 'presentist' regimes of temporality and historicity characteristic of the neoliberal epoch, epitomised by the Thatcherite slogan 'there is no alternative'?

This paper seeks to explore the temporal dimensions of the current crisis of capitalism in order to better understand the challenges facing those who wish to avoid the catastrophe intrinsic to the unchecked progress of the present economic system. Despite renewed talk of the future, it remains a future locked-in to the economic rhythms of the present – of turnover cycles, returns on investments and the ever increasing expansion of growth. As we contend with the environmental consequences of industry past, the spiraling tendrils of accumulation reach out decades into the future, ensnaring it in the logic of capital. Meanwhile, in an increasingly financialised world, impossible demands are placed on future labour in an attempt to forestall present crises. These echo the temporal fixes to delay the climate crisis championed by the proponents of geoengineering. The effect of this indebtedness to the near-future (itself an extension of the present) is an inescapable urgency – heightened immeasurably by the need to avert climate disaster. However, this urgency curtails transformative action, instead feeding back into accelerative circuits of technological development and accumulation.

217

Future is always for someone and for some purposes: Futures Studies meet Critical political Economy

Adriano Cozzolino

University of Campania "L. Vanvitelli", Italy

Future Studies represent a branch of the social sciences explicitly devoted to the study and exploration of possible futures through foresight techniques and methods. In relation to the birth of the discipline, it can be located after the Second World War within the US military and consulting/think tank complex (the fundamental actor in the early development of foresight analysis and FS is RAND corporation). In light of this genesis, in the first phase, FS were characterised by a positivist – and therefore reductionist – approach to the future (behaviourism was dominant at the time), which in turn was conceived in a very deterministic manner. Prediction and control were the purposes of foresight. Things started to change after the consolidation of post-positivist approaches in the broader realm of social sciences. FS underwent fundamental changes starting from its foundational questions: What is the future? How is it linked to the present? How can we study it? In recent years, FS have had an initial but important opening towards critical, feminist and decolonial positions. While these positions are gaining strength today, critical political economy still remains marginal to the political and espistemological horizon of FS. The purpose of this presentation is to begin a more structured dialogue between CPE and FS. In particular: breaking with a technocratic approach to the future as a matter for experts only and in which only experts must hava a say; deconstructing the idea of the future as a single one for all classes and marginalised communities, thus discussing the plurality of its ontology; encouraging and making explicit a more bottom-up approach to the construction of desired futures.

RN06 | T05_01: The Politics and Ideology of the Right

The Road to God-Knows Where? Ideological Inconsistency,The Polycrisis and the European Far-Right

Owen Worth

University of Limerick, Ireland

The European Far Right has continued to grow and develop into different mutations as a continued symptom of the Polycrisis. Whilst Brexit was seen to a degree as a process that would stem the desire to leave the EU, it has not halted the growth and success of the radical right across Europe. As a result, a consortium of discourses has emerged since the Brexit vote that provide a contrasting set of position on the EU and in turn a contrasting set of wider ideilogical objectives. From a European-wide ethnic nationalism on the one hand to a re-affirmation of an EU exit on the other, alongside a whole range of different approaches between the two, the far-right has sought to re-define its traditional Euro-sceptic stance of national withdrawal. This paper will outline these competing positions and argue that they add to the contradictions and inconsistencies that have long characterised far-right discourses. It will suggest that these contrasting and confusing narratives only serves to highlight the insecurities and unpredictability of the Polycrisis.

The Republican Right, Performative Crisis, and the Rules of Reproduction

Rodney Loeppky

York University, Canada

The United States, by many accounts, is experiencing a breakdown in its party system, with an accompanying threat to its democratic institutions. Beyond the obvious lack of bipartisan cooperation, actors across the Republican Party seem willing to flout political convention, engage in flagrant hypocrisy or contradictory behaviour, and even publicly denigrate long-held political values. Donald Trump's political ascendance remains a factor, but even his bombastic political antics have required an accommodating political milieu, one infiltrated with the perception of imminent crisis in American society. The proposed paper seeks to explain the ever-increasing restrictive politics of the right through a change in the 'rules of reproduction' for Republican actors, a process underway since the advent of the Tea Party. The rules of reproduction—a concept utilized within political Marxism—explains social agents' historical actions, based on the degree to which those actions conform to prevailing societal rules for social reproduction or survival. Starting with the 2008 financial crisis and the emerging political struggle around the Affordable Care Act, Republican rules of reproduction were 'innovatively' altered, and have come to be oriented around a depiction

218

of American society in crisis or collapse. Corresponding to this, the accepted political reaction to perceived crisis has become draconian policy prescriptions oriented around swift 'action'. Across a range of issue areas—immigration, abortion, voting rights, etc—Republican behaviour adheres to rules that require a harsh performative depiction of societal decay and collapse, while aspiring (often begrudgingly) to policies that will, ostensibly, put America right again.

Economic neoliberalism and international relations during the Cold War: from Pinochet's Chile to the epoch of Thatcher and Reagan.

Manos Vostanis

Ionian Univeristy, Greece

This paper explores the origins and evolution of neoliberal theory, examining its impact on diverse geographical areas. Neoliberalism, as an economic, ideological, and political movement, advocated the principles of market fundamentalism, while simultaneously promising to address the challenges associated with the accumulation of international capital during the 1970s and 1980s. However, the neoliberal policies enacted by Augusto Pinochet (1973-1990), Margaret Thatcher (1979-1990), and Ronald Reagan (1981-1989) were shaped by historical developments within the capitalist 'cosmosystem'. In the context of the proliferation of the "Geography of Uneven Development," it can be argued that the narratives surrounding neoliberalism have emerged as a result of the imposition of a standardised economic model by a dominant regime, rather than promoting diversification. In other words, the aforementioned policies were not determined by innovation and competition among national, regional, or metropolitan governance and economic development models. On the contrary, occasionally resulted in monopolistic outcomes. To conduct a thorough analysis of this project, we employ an interdisciplinary methodology that integrates archival research and theories from subfields of international relations. The incorporation of materials pertaining to foreign policy, intelligence, and public opinion will facilitate the examination of this insufficiently researched topic. This approach will yield timely scholarly outputs that will enrich various subdisciplines within the realms of social sciences and humanities.

Neoliberal Recomposition Of 'Non-market' Spaces: An Examination Of The Big Society's Success in England

Ian Bruff

University of Manchester, United Kingdom

The 'Big Society' agenda, promoted by the British Conservative Party in the years after global financial meltdown in 2008, is widely understood to have been a failure. Yet this view is reliant upon an unnecessarily narrow understanding of policy success (or lack of). At most, it is seen as a rhetorical cover for the often-brutal austerity programme introduced by the Conservative-Liberal Democrat coalition from 2010 onwards. In contrast, this presentation argues that the agenda was instrumental in shaping how austerity politics played out after 2010 in England. Of particular importance was the growing role in public service delivery of private, profit-making companies on the one hand, and voluntary, charitable work on the other. Therefore, the Big Society's impact can be understood as a neoliberal recomposition of 'non-market' spaces, which was always at the heart of the neoliberal worldview. There are implications in and beyond England. Firstly, a reappraisal of the Big Society in the 2020s is overdue if we are to acknowledge fully what happened in England regarding the multiple austerian legacies generated across the 2010s. Secondly, the how of austerity needs to be examined as much as the what, opening up the scope for research enquiries into austerity's (after)lives in and across multiple local, regional and national contexts. Finally, social reproduction – in conceptual, methodological and analytical terms – must be central to how contemporary capitalism is understood, explained and transformed, especially regarding struggles over 'non-market' (re)compositions.

219

RN06 | T06_01: Understanding finance, money, and debt in contemporary capitalism

Financialisation as a Process

Christian Koutny

Goldsmiths University, United Kingdom

We propose a novel context for financialisation and argue, that financialisation can be understood as a process within the totality of capital, exhibiting specific structural forms. To address this, we propose a systematic approach that employs Marx's 'moments of capital' – production, realisation, consumption, and distribution – and define financialisation as a general tendency of capital. Marx's moments of capital stress the notion that capital is a process that expands perpetually through continuous accumulation, but keeps its constituent elements in the form of a metabolic totality. We show with our approach that each individual moment of capital exhibits financialisation, defined as growing importance of financial deals over material expansion.

The contemporary structural form of financialisation is fuelled by the production of an increasing mass of surplus, manages overaccumulated capital that lacks profitable investment opportunities to be realised, supports consumption that lacks adequate current income, and successfully intervenes in the distribution of incomes through shareholder-value orientation practices.

With this framework, we can demonstrate that the contemporary structural form of financialisation is governed by its function to absorb social surplus, which continuously rises due to laws of monopoly capital. Because of this, the management of incomes takes on central significance in explaining economic stability. In other words, the perpetuation of the specific structural form of the process of financialisation, rests on the successful management of surplus. In this paper we show how financialisation arises from each moment of capital individually, integrated in a metabolic whole. This framework substantially changes the interpretation of "what financialisation actually is" and thereby of much of the empirical literature on financialisation.

Financialization in Football: Unveiling Complexities, Resisting Transitions, and Nurturing Academic Discourse

Pau Lopez Gaitan

University of Bristol, UK

There has been growing interest in the impact of financialization on employment relations (Thompson and Cushen, 2020; Batt and Appelbaum, 2014), industrial action (Gouzoulis, 2021), and new investors (Clark, 2023). This presentation aims to further enrich the literature of financialization by examining its manifestations and the emerging resistance within the football industry. Utilizing Sydney Rothstein's 2022 framework, the study investigates the complex impacts of financialization on these football clubs, while also placing significant emphasis on the growing resistance movements.

The preliminary results from our fieldwork at FC Barcelona and RCD Espanyol provide insightful examples of financialization's impact, particularly in terms of layoffs and organizational restructuring. Despite their contrasting ownership models – FC Barcelona being fan-owned and RCD Espanyol as a classic capitalist firm – both clubs serve as exemplars of financialization's permeability. This comparative analysis seeks to understand the tension between financial priorities, characterized by a focus on short-term gains and stringent performance metrics, and the traditional values intrinsic to football. This tension has instigated varied forms of resistance from a range of stakeholders, including fans, players, and club employees, thus offering a fertile ground for academic exploration and discussion.

Rothstein's framework critically guides our analysis of these resistance movements. It is employed not just to interpret responses to immediate financial strategies, but also to provide a broader perspective on the cultural shift towards a financialized model within football. By highlighting the case of football, this presentation contributes significantly to the literature on financialization, aiming to provide a nuanced understanding of how financialization unfolds in specific industries and the ways in which resistance movements can inform and challenge prevailing economic theories and practices.

In the Engine Room of Societal Transformations. Money and the Reconfiguration of Infrastructural Regimes

Oliver Bierhoff

Bielefeld University of Applied Sciences and Arts, Germany

Societies rely on infrastructures for functionality and reproduction. This is particularly evident during crises, which expose the precarious state of both infrastructures and social orders. It can therefore be concluded that infrastructures are also crucial for societal transformations and deserve increased attention in efforts to achieve a more sustainable development. However, a significant challenge arises when considering the current state of infrastructure. Substantial investments are required not only for their maintenance but, more critically, for their socio-ecological reorganization. However, the lack of concrete ideas on how to design sustainable infrastructures is not the only significant challenge. The main obstacle is the lack of money.

Based on this, the thesis is discussed that money itself represents a – specifically shaped – societal infrastructure that needs to be transformed before opportunities for further infrastruc-tural transformations can open up, because money occupies a focal position in modern moneta-ry societies and their intricate infrastructural network, serving as

the "infrastructure of infra-structures". Therefore, a transformation of the present political architecture of this monetary "superstructure", which implies a transformation of orthodox notions of money, monetary economy and monetary policy, appears to be a crucial prerequisite for a reconfiguration of infrastructural regimes as a whole.

In this way emancipatory spaces of possibility could emerge whose perspective – continuing the "socialisation of the monetary machine" (A. Sahr) – could consist in a "socialisation", i.e. public re-appropriation of further material and social infrastructures and a de-commodification of their services. This could enable a socio-ecological 're-embedding,' thereby interrupting the dynamics of disaster capitalism and making sustainability as an infrastructurally enabled public good more attainable.

Public Debt and the Top One Percent Through the Interest Channel: The Italian Case, 1974-2021

Aggela Papadopoulou

SOAS University of London, United Kingdom

This paper offers the first time series analysis on the drivers of the top percentile's income share in Italy from 1974 to 2019, focusing primarily on the effects of public debt. First, the paper presents the mechanisms through which domestically held public debt can increase the top one percent income share, either via interest payments or capital gains from bond trading. Subsequently, it scrutinizes the evolution of public debt and the income share of the top one percent in Italy, in parallel with the historical development of political and economic institutions. This part highlights that, due to high-risk premia, Italy has historically faced high borrowing costs, and its sovereign bonds were never considered safe assets. Building on the historical analysis, this paper demonstrates econometrically that domestic public debt, and in particular interest payments on domestic public debt increase the income share of the top one percent in Italy for the period 1974 to 2019. In addition, union density and welfare spending have equalizing effects as they reduce the income share of the top centile, whereas exports and total returns on equity further induce inequality.

RN06 | T06_02: Alternatives in and beyond disaster capitalism

Economic Alternatives to Capitalism: Anthropology of Resistance through Zapatista Coffee Exchange

Miria Gambardella

Universitat Autònoma de Barcelona, Spain

"The destructive advance of Capital, always through war, devastated nations and upon their ruins erected a new global order: the market. The entire world became a big warehouse for commodities. Everything can be bought and sold: water, wind, land, plants and animals, governments, knowledge, fun, desire, love, hate, people. But that wasn't enough either. It is not possible to dominate the world if one does not dominate ideas. [...] In the current world war, the dispute is between the system and humanity. That is why the anticapitalist struggle is a struggle for humanity." (EZLN 2017)

Since long before their public uprising 30 years ago, the EZLN has been progressively building an alternative social, political and economic organization through the reappropriation of the land directly by rural communities, claiming gradual independence from Mexican state. Their fight for autonomy sets an example for multiple social movements around the globe resisting predatory and destructive capitalism.

This study aims to investigate – from an engaged anthropological perspective – the ethics behind activist coffee exchange in solidarity with Zapatista rebellion, observing strategies implemented to rationally justify commercial exchanges while demonizing "market economy" and its dehumanizing powers. Through the lenses of informal economic practices as forms of resistance, the attempt is to underline possible tensions between claims for territorial and political autonomy and relations with international solidarity networks holding purchasing powers and to observe how activities are narrated and performed to build trade alternatives and opportunities for action within a highly politicized economic sphere.

From A Radical Disruptor To A Mainstream Alternative: Exploring The Plausible Futures Of The Political Left In Europe, The Case Of EHBildu

Nagore Calvo Mendizabal

KCL, United Kingdom

It is widely argued that the political left in Europe is currently in crisis with growing support for right-wing movements

221

and parties, and a tendency for the traditional left to move towards the centre. This tendency is also visible in the Spanish case, with the political stabilisation of PSOE under the leadership of Pedro Sanchez, and the support of Sumar.

Nationalist movement in Ireland and Basque Country have been traditionally associated with the left and have in more recent years transition towards a non-violent political context. They have also become key players in the political systems in Ireland, Northern Ireland and Spain.

In this paper I will focus on the evolution and developments within EHBildu coalition party, widely associated with the Basque independent movement, in Spain. I will argue EHBildu offers an example of political development that has maintained association with grassroots organisations, and ideas of the progressive left including anti-austerity, feminism, income equalities, strong welfare state, environmentalism and social responsibility of economic players.

Specifically, within the context of Spain I will explore whether EH Bildu can constitute an alternative political option as demonstrated in recent electoral results (e.g. May and July 2023), as well as constitute itself as a building block for a stronger alternative left by challenging the ongoing organic crisis of the traditional conservative party, PNV in the aftermath of the global financial crisis and continued support for neoliberal solutions. The paper will try to draw preliminary conclusions about the Left in Basque Country, and how its experience can inform and/or hinder the development of a progressive Left in Spain and wider European context.

empowerment of grassroots activism and the scale of effective disruption: for this purpose, we sketch out examples indicating why municipal, nationwide and international forms of organisation are complementary and necessary pieces of Platform Socialist advances. Finally, the DP*+ combines strategic positioning and manoeuvring: rather than being antinomic, both strategies are necessary to disrupt platform capitalism. Ultimately, we aim to provide an analytical toolkit for critical scholars and progressive activists to debate the forms of organisation of disruptive politics in the digital age.

222

The Digital Princess*+: a Normative Theory of Transformative Subjectivities in Platform Capitalism

Marco Guglielmo[1], Bradley Ward[2]

1Royal Holloway University of London, United Kingdom;
2University of Southampton, United Kingdom

The paper develops a normative theory of the Digital Princess*+ (DP*+) as the collective and connective subject for Platform Socialist advances. Critical digital studies have made fundamental advances in knowledge about how digital platforms play essential roles in splitting and demobilising the movements of platform labour (Fuchs 2014; Moore & Woodcock 2021). However, the issue of what kind of political organisation can disrupt platform capitalism is under-theorised: for instance, proponents of Social Democracy 4.0 (Fuchs 2019) or left-wing populist alliances (Gilbert & Williams 2022), do not specify the attributes of these formations. We propose an update of Gramscian theorisation of the Modern Prince as the necessary collective organisation to disrupt hegemony: the Digital Princess is fluid (*) and pluralistic (+) as any Socialist organisation is a platform for feminist, anti-racist, ecologist liberation. We elaborate on three propositions by drawing on our previous work on the organisational attributes of the Progressive Network-Systems (Guglielmo & Ward, in press). First, the DP*+ connects struggles to reclaim the re-appropriation of the digital means of production – data centres and digital infrastructures – as an ideological cement. Second, the DP*+ is multi-level and multi-layered to secure both the

RN06 | T07_01: Understanding the Global in Global Capitalism

Corridor Wars: The Fight To Restructure Global Trade Routes

Reda Mokhtar El Ftouh

International University of Rabat, Morocco

The war in Gaza has put into on a new light on a trend in the structure of the global economy that had been launched by the Chinese One Belt One Road programme. ndeed, the India-Middle East-Europe Economic Corridor had been in negociation as a competing plan sponsored by the US, and to be estblished by India, Israel, Saudi Arabia and the UAE. In the current paper, we discuss what the recent emergence of such plans mean for global political economy. In fact, they paint a completely new picture of International political economy at this start of 21st century. Contrary to the start of the 20th century, where colonialism enabled the construction of infrastructures for the exploitation of the colonized, the current turn of the century sees the abandonment of significant parts of state sovreignty around infrastructural networks for the global trade system. This is called to be transforming of both national politics, the global economy and global governance.

Foreign Policy as Domestic Political Economy: A Critical Analysis

Rong Wei

University of Birmingham, United Kingdom

Foreign policy is somewhat of a neglected area within the field of critical political economy. This paper analyses how foreign policy is presented in traditional international relations and suggests a more critical alternative which not only links foreign policy to domestic political economy but sees foreign policy as an aspect of domestic political economy. The paper is in two parts. Part one analyses the theoretical literature and suggests that a critical political economy alternative is to be found in the `primacy of domestic politics' approach originally developed by Eckart Kehr. The fundamental issue for Kehr was not simply whether domestic political considerations sometimes cause foreign policy to deviate from its predetermined course in minor details, but rather the extent to which foreign policy was `determined all along the line by the social structure'. In short, Kehr argues that it is `technically impossible to isolate foreign policy from all other aspects of life' and erroneous to consider it purely a matter of the Foreign Office and inter-state diplomacy. Ruling parties proceed from the objectives of their domestic political economy and foreign policy is `a means to their domestic ends'. Part two of the paper provides an empirical illustration, drawing on newly released archives, of the use of Kehr's framework looking at the UK Conservative government's strategy in negotiations with China over the return of Hong Kong to China with effect from 1 July 1997.

Regional pathologies of late-stage neoliberalization: A Regulation Theory account

Saori Shibata[1], David J. Bailey[2]

1University of Sheffield, United Kingdom; 2University of Birmingham, United Kingdom

This paper considers the way that states promote a neoliberal regime of accumulation through regional expansion. In doing so, the paper argues that we can grasp a better understanding of the tensions, or 'pathologies', that mark both regional integration, and the development of the neoliberal mode of regulation. In depicting a number of 'pathologies', we seek to describe systemically-produced problems, social ills, or sources of dysfunctionality, that afflict neoliberalism as a social system. The central insights of Regulation Theory – that multiple and inter-connected institutional efforts are required in any attempt to address the intrinsic crisis-tendencies of any particular regime of capital accumulation, but that these institutional forms will in turn generate new crisis-tendencies – is presented as a framework through which to produce a more coherent account of the pathologies that are afflicting both Japan and the wider East Asian region. Whilst these pathologies are addressed here through an exploration of the case of Japan in East Asia, nevertheless, this same process of accumulation through expansionary neoliberalization has generated similar problems across the contemporary global political economy, and as such offers insights into the broader problems afflicting late-stage neoliberalism.

223

RN06 | T07_02: Capitalist forms and their contestation

Understanding Contemporary Disaster Capitalism Through The Value Form

Paula Schwevers

Univesity of Birmingham, United Kingdom

Coercion and consent in disaster capitalism has reached a new perceived high in our lifetimes. The violent imposition of capitalism lies in the fundamental supposition of the class struggle (Burnham, 1994). The question of the origins of capitalism necessarily calls for an integral conceptualisation of the conditions for its perpetual quest for profit maximisation. Capitalism as social process encapsulates the whole of global relations organised under the exchange of commodities. The capitalist mode of production necessitates the violent imposition of order and the rule of money. The predisposition of social organisation around the incentives of money mediating the production of commodities is based on the predomination of waged labour and the imposition of labour discipline (de Angelis, 2001). The separation of the means of production from their immediate producers is necessary to create the double freedom of the wage labourer. Governance finds itself in a state of primitive accumulation manifest in permanent crisis management. Pressures on the domestic sphere in terms of industrial and commercial capital mirror, determine and interact in an international race to stay competitive in the foreign markets. Value in this appears in the general social form not as the satisfaction of basic needs but for sustained profitability in economic performance of individual nation states to stay on top. The creation of value as social form (Lange, 2019) and necessary element in the process of valorisation is directly counterposed of the need of capitalism for competitiveness vis-à-vis the need of its nation to secure means for subsistence. This presents nothing "but an unfortune" (Marx, 1887:509). The historical specificity of capitalism is this mute compulsion (Mau, 2019).

Understanding State Expenditure Through a Critical Political Economy Lens

Robin Jaspert

Goethe University Frankfurt, Germany

To confront Disaster Capitalism resources are needed. Beyond solidarity, financial means have been proven useful to facilitate social infrastructures of care, health, and research in capitalism. However, there are only limited means for social forces outside the dominant capital fractions to access finance and the quantitatively spoken biggest path to generate large scale funding runs via the credit-extension capacities of the nation-state. Insofar, it becomes a pivotal question, how levels of expenditure differ and how these are being determined.

There are various strands of scholarship – from neoclassical economics to monetary sovereignty – trying to explain diverging levels of expenditure either through state revenue, access to liquidity or re-financing conditions on international and national financial markets as well as with multilateral institutions. However, these structure-focused approaches tend to sideline the political agency of social forces pushing for the provision of social infrastructures as well as the regressive forces seeking the opposite. I argue that, within a certain spectrum being structurally determined, the power dynamics of the social forces within that particular administrative area and partially beyond are indeed decisive. Insofar, the level of state expenditure is ultimately decided in a political process. Understanding these processes is key for a Critical Political Economy, particularly in an era of plummeting state expenditures in the Global South. Through a large n-study I identify cases of dependent economies in the Global South whose expenditure cannot solely be explained through structural factors and demonstrate that social forces are the only way to explain diverging expenditures.

Renting Out The City: Property Rights As A Locus Of Class Struggle In Post-Austerity Lisbon

Shawn Nichols

University of California, Santa Cruz, United States of America

Just over a decade ago, the city of Lisbon served as a symbol of the devastation of the Eurozone crisis. After accepting emergency loans in 2011, the Portuguese government adopted a series of reforms to attract foreign investment that included abandoning tenancy protections, a "golden visa" program offering residency permits in exchange for real estate investments in excess of €500,000, and a variety of tax incentives. In the wake of such policies, a rent gap, as theorized by Neil Smith, developed, the closing of which was accelerated by the emergence of short-term rental platforms, such as Airbnb. As foreign capital flooded the Portuguese housing market, residential buildings were converted into short-term rentals (STRs) for tourists and expatriates, with rent increases, displacement, and social opposition following. In response, Portuguese officials have proposed a series of policies that, rather than meaningfully address the affordability issue, arguably further redistribute public resources to private investors. Contributing a neo-Gramscian voice to critical urban studies and geography perspectives focusing on the links between the financialization of housing markets, the use of STR platforms, and displacement, this article directs attention to the issue of property rights at stake in the affordable housing crisis in Lisbon. In doing so, it asserts that the state's mediation of the boundaries between the public and private through the codification of property rights represents the front lines of a vigorous class struggle, the outcome of which has significant concrete distributional impacts.

Regulating Transnational Supply Chains Within Increased Geopolitical Competition. The Eu Directive For Corporate Sustainability Due Diligence

Riccardo Fornasari[1], Vincenzo Maccarrone[2]

1Université Paris Nanterre; 2Scuola Normale Superiore

The proposal for a directive of the European Parliament and of the Council on Corporate Sustainability Due Diligence (CSDDD) is a notable example of the current transformations of the global economic order. Building upon the models of national legislations (French, German, and Dutch), the proposal purportedly aims to force large companies to realize due diligence in their value chains to prevent violations of human, environment and labor rights. Furthermore, the directive should apply not only to EU companies, but also to large transnational companies operating in the EU.

Combining political economy, legal and sociological analysis, this paper aims to analyze this phenomenon from a world-system and neo-Gramscian perspective, assessing how the directive might affect unequal exchange between core and peripheral countries and why fractions of capital of the core may be favorable to such purported transformations. Indeed, as the proposed directive – at least discursively – aims to enhance the respect of human rights, labor rights and to fight climate change, it will jeopardize two of the pillars of unequal exchange, that are «cheap labor» and «cheap nature». A combined analysis of the potential impact of the CSDDD and the fractions of capital that support such normative project casts light on how strategies to cope with the climate crisis, and human rights and labor rights violations may contribute to shaping the new economic order. In doing so, the paper would contribute to the debate on global governance and the emergence of a post-neoliberal order.

RN06 | T08_01: Resistance, struggle, and survival in contemporary capitalism

From State to Market Feminism: Impacts on Feminist Organizations and Organizing

Caroline Julie Demeyère

Copenhagen Business School, Denmark

This article explores the shift from State to market feminism, and its effects on feminist organizations and organizing. I draw on the case of the gender equality field in a French region, from the first regional public policies in 1981 to 2020.

The methodology combines an historical perspective of the actors in the field and their relationships (archival work) and a field-level ethnography of the on-going relational dynamics between (feminist and non feminist) associative actors, with governments, and with the 'newcomers' market actors (consultancy firms, corporate foundations). I have studied this fieldwork during 3 years as a researcher and a feminist associative actor.

The findings consist in an ethnographic case study mobilizing vignettes. They highlight the nuanced effects of the transition from State to market feminism on feminist organizations and their workers. While some organizations adapt to market pressures, adopting business-like approaches and depoliticizing their agendas ('NGOisation'), others resist and maintain a focus on advocacy and community-based initiatives, but are marginalized. Mutual organizational stigma nurtures a polarization: the 'co-opted' feminist organizations who manage to navigate the market, and the 'amateur activist' organizations who do not.

I discuss the risks of a two-tiered feminism, while collaboration between diverse feminist organizations has been crucial to deliver gender equality public services to vulnerable populations (e.g. to combat gender-based violence).

The study contributes to existing literature on commodification of social cause, and feminist organizing. Understanding the effects of market feminism is essential to build possibilities to resist it.

Women's Production and Reproduction Work that Powers the Artificial Intelligence Industry

Asmita Bhutani

York University, Canada

The proliferation of the Artificial Intelligence (AI) industry fundamentally relies upon human labour of data annotation. Although most data annotation platform companies

225

operate from the US and Europe, the labour force for this low-wage, piece work is primarily home-based workers in Global South countries, and India has emerged as a significant location for this work. As a feminist scholar, I center my attention on the lives and experiences of women in India working on these platforms. The paper draws on Marxist feminist and international division of labour frameworks as I interrogate two key institutions: the family and the State. Presenting a range of ethnographic data of women in different parts of India working as home-based workers, I argue that the family and the State play a key role in reproducing feminized platform work and ways they normalizing intensive working conditions for women. These social relations with the family and the State, in turn, shape women's ideas of themselves as workers, their political subjectivity on the platforms, and their imaginaries of resistance against families, paid work and international labour regimes. Finally, I also draw upon interviews with union organizers to conceptualize and critique the existing state and concerns around platform organizing from a feminist perspective. In doing so, I highlight dimensions of informal organizing that women data annotators in India do and the possibilities of expanding the organizing agenda for platform work towards a more collective working-class struggle against capitalist political economy.

Survival Work Under Austerity – Self-Organising Welfare For Migrant Women Within A Hostile State.

Warda Mehek Khokhar

University of Manchester, United Kingdom

This project looks at the various ways in which South Asian migrant women in Greater Manchester, UK, engage in 'survival work' under the UK government's hostile environment policies. It frames the legacy of austerity and privatisation of the local voluntary sector, as part of an attempt to make life in the UK difficult for migrant women through a gradual neoliberalisation of welfare services that they rely on. This slow encroachment on access to welfare due to reduced funding available to provide basic needs such as shelter, healthcare and food, will be explored to show that the most long lasting impact on migrants' access to the welfare state, has been from the state itself and a consistent effort to produce a hostile environment for migrants across the UK.

Migrant communities within the UK are made up of some of the most vulnerable and disadvantaged people in contemporary Britain. However, despite this, migrant communities flourish across Britain, developing internal hidden modes of survival which enable their care in lieu of a welfare state that protects and empowers them. Using photovoice as its central methodology, this project unearths the Shadow Care Infrastructures (SCI's) (Power et al, 2022) crucial to emancipating themselves, from the ongoing neoliberalisation of the welfare state, whilst simultaneously offering us a radical conceptual roadmap to resistance against such structures.

Resistance in the post-2008 World: how to Subvert Neo-liberal Practices and Ideas in the Case of UK Higher Education

Valentina Ilcheva Kostadinova

University of Buckingham, United Kingdom

This paper engages with the issue of resistance and engendering change to our current neo-liberal status quo. It starts by arguing that the 2008 financial crash exposed some fundamental problems with this system, while the ways in which it was tackled led to wide-spread discontent, expressed in phenomena like Brexit or the rise of populism across the Western world. Arguably, these could be conducive to challenging the prevailing institutions and practices. Next, the paper discusses what and how we should resist, putting forward the proposition that post-structuralism provides important insights into challenging the currently dominant neo-liberal worldview. The last substantive section builds on these points to advance a particular suggestion for utilising these ideas in practice, focusing on ways of resisting neo-liberal practices in the field of Higher Education in the United Kingdom. The idea is to try to subvert the use of the Teaching Excellence Framework (TEF) or League Tables through educating prospective students about alternative elements that can be considered in the formulation of their outcomes (i.e. the contractual status of the academic staff that will be providing the prospective students' teaching or the number of hours they teach per week). The goal is for such inquiries during the admission process to put pressure on Universities to take action on improving the 'input' side of teaching. This will not only help academic staff in its on-going struggle over employment terms and conditions but would also open up space for understanding education as a good in its own right rather than follow the neo-liberal instrumental approach to knowledge.

RN06 | T09_01: Extractivism, Climate Coloniality, and the Green Transition

Spatial Responses to Climate Coloniality: Reworking Hierarchies of Energy and Harm in Hydropower Infrastructures

Alke Jenss

Arnold Bergstraesser Institute, Germany

In the production of energy increasingly turning towards renewables, spaces of harm and privilege are related through energy flows and infrastructures such as transmission lines or hydropower dams. Linking recent analysis on global political economy's co-constitutive relation with the local and recent work on the coloniality of infrastructures, I argue that the spaces and relations that such energy infrastructures have produced are hierarchical, and energy sacrifice and privilege have to be understood in relation to each other. Yet the relations built can also produce alliances of contestation that themselves shape space. Based on interviews and participant observation in Costa Rica, I explore what the conversion of a planned sacrifice zone into areas where people can live and care for nature tells us about how people forge spatial relations in the process of contesting such large-scale infrastructure projects, reworking socio-spatial hierarchies in the process. In the case of the now archived Diquís hydropower project, presented by successive governments as securing 'climate-friendly' energy, alliances of environmental and indigenous activists decried it would have transformed indigenous territories into a (flooded) sacrifice zone.

The Extractivist Logic Of Ecological Law And The Speculative Subject Of Sustainability

Magnus Granberg, Emelie Pilflod Larsson

Mid Sweden University, Sweden

This study uses the theory of legal form developed by Evgeny Pashukanis to explore how capital presents itself as the subject of the "green development" of the Swedish north, overlapping with indigenous Sami land. Analyzing the drive to establish a windmill park in the inland municipality of Ånge, we focus on the legal codification of ecosocial relationships through a process of value attribution or speculation, where capital emerges as subject by sustaining and valorizing local forms of natural life and culture in conformity with the Environmental code. This case allows us to explore the process of commodification entailed by the subsumption of ecosocial relationships into capital as subject of sustainability, as well as the interconnected context of "green" capitalism. Ånge has increasingly been described as a hub in the production of hydrogen gas, which is needed to power the green steel industries along the northern coastline, and Ånge itself is set to become a "new, innovative industrial ecosystem". The windmill park we focus on is part of this larger context of capital accumulation, which is ideologically and politically premised on the presentation of capital as a subject of sustainability that preserves and develops preexisting ecosocial values. Using Pashukanis' theory in an analysis of the licensing procedure in the prospecting phase of windmill establishment, we explore how areas are figured as "sustainable" extractivist zones through the process of value attribution.

International Financial Subordination & the Climate Crisis – How Are the Positions of Kenya and Bolivia in the International Monetary System Shaping the Green Transition –

Stefan Andrzej Zylinski

University of Bristol, United Kingdom

The green transition is being shaped by the macro-financial architectures of global capitalism. Articulating the structural power of finance, these architectures are shaped by market-based finance, reflecting the dollars' hegemonic position in the international monetary system. Green transition policymaking and the economic governance frameworks that surround it are refracted through these market-financial logics; structuring institutional forms, constructing opportunities for intervention, and distorting development pathways.

Although hegemonic, the ways that macro-financial architectures manifest are deeply uneven, contradictory and unequal. This study will explore how these processes, manifest in the form of international financial subordination (IFS) – limiting policy space, increasing costs and instability – operate in the Global South to shape the green transition. Telling the story of how the financial structures of capitalism shape its productive processes, this study focuses on the cases of critical mineral mining in Bolivia and renewable energy development in Kenya. Situated in critical political economy, this study will utilise novel analyses of (secondary) empirical data combined with primary data (elite interviews) gathered through fieldwork in Bolivia and Kenya.

On these foundations, this study will serve the broader purpose of improving understanding on the finance-green transition nexus, exploring themes that include: the different roles countries/sectors in the Global South are playing in the global green transition, the financial structures, mechanisms and governance frameworks shaping them, and the tensions, contradictions and risks that emerge between these dynamics of IFS, efforts towards sustainable development, and the global response to the climate crisis.

Who Owns Space? The Role of Tech Giants in Outer Space Commercialization

Diliara Valeeva

University of Amsterdam

Outer space is evolving into a trillion-dollar industry, fueled by massive investments from tech companies and entrepreneurs. Traditionally a political battleground, the space race now involves economic players competing for space activities such as communication and surveillance, space mining, and travel. This commercialization of space enhances tech companies' influence in global politics and raises environmental concerns, impacting humanity's future. This research delves into the political, economic, and regulatory challenges accompanying the commercialization of space. It maps the influence of private actors on space commercialization, highlighting societal reactions to billionaire-led space races, and scrutinizing the ideological shifts accompanying these enterprises. The study also addresses the regulatory, environmental, and political challenges posed by privatizing what was previously considered a global commons.

RN06 | T09_02: Liberalism and Neoliberalism in and before disaster capitalism

Overcoming 'The Problem Of Consent': The US Taxpayer Revolt, Thatcher's Industrial Relations Reform And Neoliberal Direct Democracy

Joseph William Ward

University of Sheffield, United Kingdom

Scholarship has long documented neoliberalism's 'profoundly anti-democratic' tendencies. However, a stream of work from Stuart Hall through to Quinn Slobodian's recent intellectual-historical accounts suggests a more complex relationship between neoliberalism and democracy. Speaking to these debates, this article highlights the role of direct democratic mechanisms – namely the referendum and citizen's initiative – in the emergence of neoliberal economic policy in the USA and the UK. It draws on recently released archival records to reveal the connections between the Proposition 13 movement in California and the wider 'taxpayer revolt' which preceded Ronald Reagan's election as President, and proposals for a referendum on industrial relations reform within the UK Conservative Party prior to, and in the immediate aftermath of, Margaret Thatcher's election as Prime Minister. In so doing, the article argues that neoliberal intellectuals and politicians combined elements of the British jurist A.V. Dicey's case for utilising the referendum as a 'people's veto' with key tenets of neoliberal economic policy – such as monetarism and tax reform – in their search for democratic institutions to build and maintain popular legitimacy for neoliberalism.

228

The Effect Of The Deindustrialization Policies Of Turkey And Argentina After The 2000s On The Democratization Process

Sevim Musaoğlu[1], Şenay Gökbayrak[2]

1Ankara University, Turkiye; 2Ankara University, Turkiye

The concept of deindustrialization, which developed from the experiences of Latin American countries in the neoliberal period, has also been used for the Turkish economy since the early 2000s. In the study, the great stagnation process in the global economy is followed with respect of globalization and post-globalization discussions. It is examined in terms of the deterioration of income distribution, social exclusion and democracy gap from the point of the subject. Then, the relative loss of importance of the industry in the national

economy and the problem of democracy deficit in Turkey and Argentina in terms of political economy are discussed. This study accepts that the capitalist logic is also globalized and that globalizing capitalism affects the economic, social and political life as a whole. Democracy problems emerging today, increasing pressure on workers, unions and labour organizations, and the regression felt in social policies are considered the results of this logic. In this study, democracy will be discussed regarding labour and control/supervision mechanisms. It should be kept in mind that there are important links between organized labour, industrialization and democracy. The constitutions of Turkey and Argentina during the import substitution development period of Turkey and Argentina significantly reflected this correlation. However, the deindustrialization process in developed countries (which differs in countries) is not the same as in developing countries. In this process, institutional qualities and the tradition of democracy have been significantly influential. In the deindustrialization process, the need for excessive accumulation of international capital has impacted political regimes. This study will mainly focus on the phenomenon of deindustrialization, which can be considered as another result of globalizing capitalism, and its effect on democracy.

The Future Has an Ancient Heart: Property Rights and Republican Freedom in 19th Century Spain

Jaume Montés

229

Universitat de Barcelona, Spain

Recently, several scholars have highlighted the impediment of legally recognised property rights in addressing some of the consequences of disaster capitalism. What are the historical origins of this absolute, exclusive and excluding conception of property? What has been the sociopolitical tradition that has provided an alternative to it? This paper will attempt to offer a historically grounded interpretation that helps to answer both questions. It will be based on the case study of the construction of the Spanish capitalist state during the long liberal revolution of the 19th century. It is known that the liberal reforms of the twenties and thirties came to positivise and accelerate a process of land privatisation whereby large social majorities were deprived of access to their means of subsistence —access which they exercised either through former communal property or through land tenure. Faced with the consolidation of capitalist property relations, the nineteenth-century Spanish republican tradition opposed a fiduciary conception in which the property of any resource (significantly, land) is public, and society can therefore impose on the individual owner the conditions it deems convenient to guarantee the universalisation of freedom. In some of its variants, such as that represented by the so-called 'socialism' of the federal leader and former president of the First Spanish Republic Francisco Pi y Margall, it is a precedent of what would later be known as the 'social function of property', the basis of the social constitutionalism of the 20th century. Thus, the study of these republican institutional designs will allow us to understand that property not only recognises rights, but also imposes duties; duties that can help to overcome disaster capitalism.

RN07 | Sociology of Culture

RN07 | T01_01: Precarity, liminality and culture on the margins

Loneliness In The City: Imaginary Expressions Of States Of Liminality

Wendell Marcel Alves da Costa

Sao Paulo University, Brazil

The objective of this communication is to present how loneliness is constructed in contemporary South American films based on the representation of destabilized affections in the urban spaces of the cities of Belo Horizonte (Brazil) and Caracas (Venezuela). It is observable in recent films produced in South America – and expanding to Latin America – urban characters who occupy spaces of solitude in places with an intense network of sociability, such as squares, streets and avenues that lead towards the Center. Lonely characters float in the city as they encounter other characters, being able to relate for a few moments, leaving no emotional remains that provide affective structures for lasting relationships, constituting emotional states of liminality. The phenomenon of loneliness is identifiable in different narratives about the urban, such as in the film works O Homem das Muldões (Marcelo Gomes and Cao Guimarães, 2013) and Pelo Malo (Mariana Rondón, 2013). Thus, the methodology is anchored in the interpretation of filmic discourses and the filmic analysis of images, deconstructing allegorical signs, symbols of intimacy and codes, comparing filmic realities to define an interpretative panel of urban imaginaries. The theoretical foundation is anchored in a philosophical socio-anthropology, inventing a dialogue with the Sociology of Culture and Urban Sociology, based on authors such as Gaston Bachelard (1993), Michel de Certeau (2014), Gilles Deleuze (2005), Armando Silva (2014) and Gilbert Durand (1993, 1997).

Making Plans and Envisaging Alternative Futures: the Life Stories of Migrants Experiencing Homelessness

Simon Stewart

University of Portsmouth, United Kingdom

This paper is based on the analysis of life story interviews that were conducted with migrants experiencing homelessness during the COVID-19 pandemic in the UK. Life stories have the benefit of providing insight into experiences of homelessness and, more generally, structures of domination from the perspective of those most impacted. This research method has been widely deployed in research on dominated groups, e.g. in feminist, Black and postcolonial feminist, and indigenous studies (Nadar, 2014; Ranco and Haverkamp, 2022; Srigley et al., 2018). In this paper, particular attention is paid to how the research participants retrospectively review plans they made in the past, and the extent to which they are able to make plans in the present with view to transforming their lives. The paper utilises a cultural sociological framework to highlight the ways in which the respondents anticipate a meaningful future, articulating what Bourdieu (2000: 223) terms 'the practical relation to the forth-coming', while struggling to control the present and without access to resources or secure accommodation. One thing becomes particularly clear in the life story narratives: prolonged waiting, whether for the outcome of a Home Office decision or for longer term accommodation, is linked to powerlessness and hinders the ability to make plans and envisage alternative futures.

Rap in a Postmigrational Society: On the Articulation of Tensions and Transformations in Germany's Digital Hip-Hop Culture

Marc Dietrich, Heidi Süß

University of Trier, Germany

Based on our book on „Rap & Racism" (Dietrich/Süß 2023) we like to interpret sociology of culture as a qualitative analysis of popular symbolic representations within a society in transformation: Like other postmodern western societies, also the German society is not only structured by a steady growth on the level of ethnic-cultural diversity but also by a diversification of understandings in gender and sexuality. With regards to a new structural change in the public sphere (Habermas 2021), it is particularly the digital arena in the field of pop culture, where powerful negotiations on cultural identity, racism and gender can be reconstructed. Findings from our research project "Music Videos, Scene Media and Social Media – on the Negotiation of Racism in German hip-hop" (2018-2022, funded by the German Research Foundation) clearly show that polarizing discourses of a „postmigrational society" (Foroutan 2021) articulate in German rap: All relevant actors (artists, YouTube-recipients, journalists) negotiate racism as a topic that raises bigger social questions about race/ethnicity, gender, power – but also hierarchies in change: Who are the oppressed and which are the hegemonic social groups in the current society?

In our presentation, we like to examine three points:

(1) How an innovative qualitative analysis of digital culture functions as a way to analyze social transformations and tensions

(2) How postmigrational conflicts on representation, participation and resources are politically articulated in the field of German rap

(3) How the negotiations of racism and images of gender/sexuality create new alliances that provoke traditional views on power and ethnicity

Navigating Temporality: Postdocs Experiences of Planning and Living in Academia

Anna Khanukaeva

Uppsala University, Sweden

Postdocs hold a highly competitive yet vulnerable position; they have secured a position in stark competition but cannot count on secure future jobs. This position highlights one of the main challenges in current academia: pressure to outperform others in the present while working to secure a future career path. While previous research has shown that this is a precarious position, and touches upon how postdocs deal with uncertainty related to formal employment, I focus on how postdocs themselves make sense of their situation and explore the complexity of their position. This paper therefore examines how postdocs make sense of their experiences of pressures and temporal conditions in academic work. Based on a thematic analysis of 29 in-depth interviews with postdocs in social sciences in Sweden, I focus on how postdocs navigate the temporal conditions of academic work. Examining postdocs' use of metaphors, I show the various ways in which they understand time, schedules, pace and rhythms, related to the career timeline, planning of the future, and day-to-day time pressures of academic work. I explore the distinction between the governing time of academia, which structures the time of an academic career, and the experienced time, which is the postdocs' lived experiences of this timeline. In showing this, I contribute to research on how postdocs actively deal with the flexibility of academic time, embracing, resisting or finding ways to make sense of and incorporate other temporal orders of life. This research provides insights into the temporal orders at play in academics' lives and how people, through social practices such as scheduling, navigate academic temporality and its involved power dynamics on the ground.

RN07 | T01_02: Critical responses to climate change

Climate Boundaries: Tracing the Social Bases Behind Climate "Culture Wars"

Till Hilmar

University of Vienna, Austria

The concept of "climate boundaries" leverages sociological insights from symbolic boundary research (Michèle Lamont, Sighard Neckel, Andreas Wimmer) to trace how people make sense of the climate crisis in everyday contexts. Symbolic boundaries involve constructions of "us" and "them", defining who belongs to the "in-group" and who is excluded. The approach recognizes that people live in contexts of social and economic inequality and posits that people interpret these inequalities in dynamic ways that shape social and political trust. In our project, we apply it to everyday social demarcations in the climate crisis, recognizing that it is not just an environmental issue but also an unfolding process of transformation – a process of social inequality and resource redistribution.

Climate boundaries are useful for understanding the ways in which the climate transformation is negotiated as a question of redistributing resources, recognition, and attention, without necessarily viewing this as a process of polarization in attitudes. Unlike polarization, the approach also foregrounds in-depth reasoning, such as through emotions and narratives, and regards individuals as embedded in networks of social relations.

This presentation will explore how these boundaries can be conceptualized by taking into consideration the varying class backgrounds of people who differently relate lifestyle issues – such as bike-riding, eating meat, flying, or driving large cars – to the climate transformation, including also climate policies such as carbon taxes and changing labor markets. It is part of our Horizon project CIDAPE (WP4, starting 03/24), which will conduct a pan-European comparison using interviews and group discussions in Norway, Slovakia, Austria, and Spain. Fieldwork is scheduled to begin in late summer 2024; therefore, this presentation will focus on conceptualizing climate boundaries.

Social and Cultural Consequences of Climate Change: Case of Puerto Rico and Rhodes, Greece

Thomas Peter Carlon, Elena Chernyak

Hartwick College – Oneonta, New York, United States of America.

Puerto Rico, a commonwealth of the United States, has been devastated by many tragedies and hardships, ranging from natural disasters to near-financial collapses. Similarly,

231

the Greek Island of Rhodes, the largest Dodecanese, was ravaged by wildfires and national economic hardship that jeopardized the social fabric. A changing climate has become a topic of concern for leaders worldwide. The changing environment exasperates financial woes and tensions between groups. 2017 proved a critical year for Puerto Rico. In the wake of Hurricane Maria, which left parts of the island without power for over a year, a mass exodus occurred, with families and livelihoods broken as young adults pursued more abundant opportunities stateside. The cost of this exodus extended far beyond economic productivity, with significant consequences for families, community groups, and daily social life in Puerto Rico. More recently, in the Summer months of 2023, over 80 wildfires devastated Greece. It is estimated that 19,000 residents of Rhodes were evacuated by land and sea. Considering these socio-political and economic factors, this research analyzes and compares the overall impact of Hurricane Maria and the 2023 Rhodes wildfires, with careful attention given to family displacement, labor concerns, and economic productivity. Using census data and mass media, I will discuss the exodus of Puerto Ricans following the hurricane. In Greece, attention will be given to recovery and the economic cost of these disasters during the height of the island's tourist season. Further, I use comparative-historical methods to examine differences in responses over time.

Irony of the Planetary: The Sustainability Development Goals and the Hardships of Global Transformation

Jörn Ahrens

Justus Liebig University Giessen, Germany

In 2015 the United Nations adopted 17 Sustainable Development Goals (SDG) to instruct processes for a global transformation in the fields of social equity, education, and environment until 2030. Following the UN, these goals have been largely failed yet. Nevertheless, the rhetoric of transformation has been successfully established in the public, political, and economic discourse. This makes it necessary to reflect on two aspects. The first is the meaning of sustainability, a concept developed in the 1987 Brundtland Report and since then not much reflected. What does sustainability mean as a concept and global practice? Does it proliferate a global increase of safety, equity, and well-being? Or does it, according to approaches in post-development, foster existing hegemonies? Why is it, of all things, the economy that especially leans on this concept? Secondly, we need to reflect on the meaning of transformation. Especially in the social sciences and humanities, a coherent understanding of transformation is lacking. Does transformation aim at a fundamental revision of the social (global) order? Or does it remain a mere adjustment, and therefore a consolidation, of the existing institutions and modes of sociation? Don't especially modern, basically dynamic societies develop either way constant modes of social transformation as they are fundamentally built on the self-understanding of permanent change? What does it than mean when they explicitly, and immanently, articulate agendas for transformation? Can this be seen as a response to an emerging situation of social crisis? As both categories decisively foster the recent understanding of the planetary as an agenda for ethics and equity beyond mere globalism: Is this category thus suitable for an understanding of the contemporary situation?

Performing the Sacred: A Dramaturgical Account of Eco-Catastrophist Action

Louis Volont

Hamburg University and HafenCity University Hamburg, Germany

As the climate crisis marches on, the eco-catastrophist work of Extinction Rebellion (XR) attracts much attention. Every XR action fuels the climate culture wars anew through its well-known trope of impending disaster. Given the many responses that XR actions attract, it remains however undertheorized how exactly XR's trope gains such reactive potency. This paper answers this question through a cultural sociological lens, rooted in neo-Durkheimian theories on ritual performance. The paper's main claim is that XR actions essentially constitute localized performances of 'the sacred' in the broadest sense: the life situation of the collective self. The paper then goes on to disentangle three dramaturgical tools used by XR to signify the sacred. 1) 'Mise-en-scène': through claiming a temporary place in public space, XR disrupts the profane rhythm of life (the 'to-and-fro' movement of cars, the 'up-and-down' pounding of pumpjacks). 2) 'Collective representations of temporal movement': Once a scene is occupied, XR dyadically contrasts two possible movements through time, namely the demonic course (the collective self which moves towards Judgement Day) and the positive course (the collective self which salves its sins and renews life on earth). 3) 'Symbolic materiality': to symbolize these temporal movements, XR focuses particularly on the ritualistic expulsion of material dirt – 'fossil filth'. The paper concludes that these three elements allow us to explain the debates and responses proffered by the movement. As moments of transgressive effervescence, XR actions fuse 'inwards' with the participants on the scene but fail to fuse outwards with the observing community-as-audience.

RN07 | T02_01: Cultural consumption: food, drink and cinema

Sparkling Waters Run Deep: Developing the Cultural Sociology of Fashionable 'Mineral Water'

David Inglis

University of Helsinki, Finland

What could be more innocuous than sipping from a glass of something marketed as 'mineral water'? Yet sociological analysis of water raises complex and sometimes vexed moral and ethical issues, including matters of pollution and purity. Water politics is a defining feature of the 21st century world. Examining water-related phenomena as these are playing out in the contemporary sartorial fashion industry and associated culture-producing domains is crucial for understanding environmentally destructive practices. Water pollution and the waste of water resources in the making of clothes must be understood in relation to the consumption of apparently unrelated issues to do with the consumption of fashionable 'mineral water' by fashion professionals and fashionable people more generally. Taking a long-term historical approach, which encompasses changes in perceptions and practices of water worldwide over the last five centuries or so, the paper considers how different 'water ontologies' are constructed and variously relate to, create, and occlude each other. The fashionable and apparently virtuous nature of modern 'mineral water' is analysed against a global backdrop of a series of social struggles over the nature of water and who has the right to define and use it.

Confessions of a Champagne Sociologist

Anna-Mari Almila

Sapienza University of Rome, Italy

Since the time of the court of Louis XIV, which established champagne's reputation as an aphrodisiac, the sparkling wine produced in the region of Champagne, France, has been at the heart of heterosexual seduction, high life, and celebrations. Champagne is both ultra-masculine – associated with its supposed inventor, the monk Dom Pérignon, Napoleon's officers with their sabres, Formula 1 races, and hip-hop – and hyper-feminine: made by famous Champagne widows in the 19th century, marketed with female names, images, and associations, and the favourite drink of both respectable and disreputable women.

The other side of champagne is more sinister, involving battles over legislative rights, streams of nationalism and xenophobia, exploitation of migrant labour, and environmental damage. The tension between glamour and gruesomeness is obvious, yet it remains carefully hidden behind elaborate marketing imagery of carefree, beautiful people and idyllic sun-glossed vineyards. Champagne is a well-established icon, which is nevertheless constantly and elaborately worked upon in order to maintain its prestige.

As a cool climate is essential for producing high quality sparkling wine, climate change was felt in Champagne early on, which made the region focus on carbon footprints and sustainability earlier than many other wine-making areas. Yet champagne can hardly be considered sustainable either in environmental or in social senses. This places the champagne-curious cultural sociologist in a difficult place epistemologically: Is the sociologist only an observer, recorder, and analyst of questionable practices, inequalities, and harms – or is she herself somehow culpable, when she reaches her hand out for yet another delicious glass, tasted in the interests of research?

The Italian Debate on Cultured Meat: Cultural Categories and Animal Question

Ludovica Malknecht

Università Europea di Roma, Italy

Italy has been the first country to preventively ban the production, trade, and import of cultured meat. This topic has become the subject of extensive discussion in the public discourse, marked by a strong polarization between positions opposing cultured meat in reference to the economic interests of meat industry, public health, and national traditions, and positions supporting the potential benefits of cultured meat commercialization for the environment, health, and livestocked animals.

The use of mainstream notions such as nature, tradition, national culture, environmental sustainability in this debate will be examined through the analysis of frames (Goffman 1974, Entman 1993, 2007) that emerge in broadcast information media. Analysing these debates helps to highlight the connections between power structures, 'meat culture' (Potts 2016), the exploitation of non-human animals, and discourses aimed at normalizing it (Joy 2010, Freeman 2016).

On one hand, the processes of legitimation and consensus production (Weber 1922; Luhmann 1970, Hall 1982, Herman and Chomsky 1988, Fuchs 2011) regarding animal exploitation in livestock industry will be considered. On the other hand, the reference to environmental sustainability, often mentioned in such debates, will also be problematized in light of the ethical and political concerns raised by the "animal question" (Kalof 2017, Malknecht 2021) and from an ecological perspective (Tota 2023) aimed at introducing alternative cultural categories for considering living beings that are oppressed and exploited in daily human practices and production systems.

Predicting Cinema Attendance For Romantic, Sci-Fi, Documentary And Horror Films: A Factorial Survey Approach

Yevhen Voronin

University of Wuppertal, Germany

The movie market gives rise to unique and incommensurable products, prompting consumers to rely on various judgment devices to acquire knowledge and make choices. At the same time, the market encompasses movies spanning diverse genres. Drawing upon Karpik's (2010) theory of the economics of singularities and a recent empirical study by Schmidt (2020), this study employs a factorial survey to investigate the role of movie ratings and recommendations in predicting the likelihood of going to the cinema to watch a movie across four genres: romance, sci-fi, documentary and horror — genres distinguished by their varying levels of social stratification and popularity.

The vignettes in this study portray movie offers as images depicting either low, middle or high ratings by movie experts, broad users and peers as well as personal recommendations from close friends, parents or neither. The data were collected among students at a university in Germany from December 2023 to January 2024.

First, the results reveal that personal recommendation by close friends, rather than parents, holds the highest significance regardless of the genre. Second, the ratings by experts, users and peers also emerge as positive predictors, the gain from each rating's increase from the middle level to the highest level is greater than the loss from a decrease from the middle level to the lowest level. Third, the orientation on specific judgment devices can depend on individual characteristics of respondents, such as trust in family and importance of friends, genre preferences and the level of cultural omnivorousness.

This study illustrates the peculiarities of movie consumption, underlining the multifaceted interplay between judgment devices, individual characteristics, and genre-specific characteristics.

RN07 | T02_02: Resistance, activism and identity

Visual Fights for Change: Climate Activism on Social Media

Charlotte Bruns

Erasmus University of Technology, Netherlands, The

This paper focuses on Extinction Rebellion's (XR's) visual identity on Instagram, exploring how environmental activism and the cultural industry are structurally intertwined in its visual online self-presentation. XR, a global movement advocating urgent action against climate change, employs a distinctive visual way of expression and addressing hierarchies and inequalities to convey its message. The iconic hourglass within a circle serves as a visual anchor, symbolizing the urgency of time running out. The study engages in a visual analysis to decipher how XR's visuals contribute to the movement's overall image and mobilization strategy. XR activists orchestrate protests, where vibrant colors, imaginative banners, and theatrical performances become integral components in capturing public attention and fostering a shared collective identity. A notable aspect of XR's protest are the reference to and interaction with cultural icons and symbols. The movement makes use of (and attacks, as is the case with monuments such as the Brandenburger Tor in Berlin and artwork as the Mona Lisa in Paris) cultural symbols of power. Through a combination with visual idioms of liminality, civil disobedience, and hedonistic party culture, the activist movement creates a subversive image that resonates visually and garners widespread coverage from diverse media outlets. By employing comparative visual analysis and drawing on sociological frameworks, this research paper contributes to our understanding of the polarized debate around climate change. It highlights the relationship between visual communication, activism, cultural tensions and the mobilization of public sentiment.

Approaching the End of Lazuri: The Transformation of Laz's Ethnic Boundaries in the Age of Social Media

Özlem Şendeniz

Iğdır University, Turkiye

Living as an autochthonous ethnic minority in Turkey and Georgia, the crucial aspect of the identity of the Lazes is their mother tongue, Lazuri (Laz Language). Lazuri is included in the list of endangered languages by UNESCO. Today, the new generations do not learn Lazuri as their mother tongue, and the generations whose mother tongue is Lazuri are aging. Despite this threat of language and cultural extinction, the ethnic boundaries of Lazness are being stretched, and symbolic capital and identity performances are transformed into a new performance space through

social media. Social media, utilized as a new performance space by Lazness, which is caught between language and culture, also affects citizenship performances in terms of opening a space where production can be made in Lazuri without conflicting with Turkishness. This study aims to explore the gap between fluid identities and identities, which will be based on "The Reproduction of Lazuri on Social Media." The research examines the symbolic capital that reproduces itself on social media and its counterpart in everyday life.

Rituals of Resistance, Diasporic Encounters, and the Limits of Free-(Idi)oms: The Cultural Politics of Barcelona's Free Improvisation Scene

Ádám Havas

University of Barcelona, Spain

Based on ongoing cross-disciplinary research employing (auto)ethnography and qualitative interview techniques, this talk aims to explore the tensions between free improvisation and social activism, with a particular emphasis on the experiences of diaspora musicians living in Catalonia. Following the outline of the theoretical framework informed by postcolonial scholarship, Miklós Hadas' concept of "plural habitus," and the legacy of Stuart Hall, I draw on the results of my ethnographic fieldwork and over twenty in-depth interviews with musicians from diverse multi-ethnic backgrounds. Profoundly embedded in Barcelona's loosely connected network of cultural centers promoting a range of grassroots social initiatives, the aesthetic radicalism of performance rituals (as conceptualized by some musicians in the context of free improvisation events) manifests controversial aspects of social resistance stemming from the tensions between anti-commercialism, non-idiomatic jazz aesthetics, and egalitarian ideological visions connected to the tangible impact of global capitalism on local communities. The talk provides an interpretation of the social meanings of these ephemeral acts of resistance and aims to establish (free) "improvisation" as a relevant sociological category that captures alternative cultural models to neoliberalism due to its emphasis on resilience, trust, collaboration, and creativity. Therefore, my objective is to pose relevant questions concerning the cultural motifs of radical musical experimentation in a specific multi-ethnic context of the West Mediterranean that seeks to transcend genre-, class-, "race-", and place-based boundaries, creating a utopian realm of transnational artistic encounters.

Humorous Accounts of Stigmatized Living Situations – Identity Negotiation and Resistance Through Humor

Sandra Barbro Martina Wiksten

Stockholm University, Sweden

Multiethnic residential areas, located in the outskirts of bigger cities of Sweden, (the suburbs, sw förorten), has become the center of attention in Swedish public debates – with a focus on poverty, social stigma, cramped housing accommodation, and escalating gang violence, . Simultaneously with increasing media attention follows political suggestions, drawing on alarming narratives and aiming to restrict citizens' rights to privacy (e.g. by giving police powers to search people who are not yet suspected of a crime). This paper approaches these stories through an interest in humor practices. By focusing on teenage girls, living in some of these Suburbs, the paper examines examples of humor content that the participants themselves enjoy and relate to. Drawing on a critical perspective of humor, inspired by Billig (2005), and a performative view on identity (Butler, 1990), humorous practices can both make fun of the Suburbs , and provide counter-narratives, such as from the perspective of a young, feminist, Kurdish-Swedish girl or a female Somali-Swedish rapper doing humor about everyday life in the suburb. The paper aims to explore how identity, place and politics is expressed and made fun of/in to humorous narratives, and further how humorous framings of politics and urban segregation, may work as means to both reproduce and subvert discourses surrounding youth in Swedish suburbs.

Billig, M. (2005). Laughter and ridicule: Towards a social critique of humour. SAGE.

Butler, J. (1990). Gender trouble: Feminism and the subversion of identity. Routledge.

RN07 | T03_01: Symbolic boundaries, taste and status

"This is a Place for People Like Me": Unraveling Symbolic Boundaries in Diverse Urban Neighborhoods in Brussels

Hannah Weytjens

KU Leuven, Belgium

In an era marked by increasing urbanization and cultural diversity, cities like Brussels have become vibrant hubs of multicultural experiences. However, this diversity often manifests as a patchwork rather than a melting pot. Different people in the same urban environment have their own lifestyle and (sub)culture, and often prefer places that fit their preferences. Hence, they form scenes – unique combinations of a place, the people who are present, the amenities and shared norms and values. In this article, I will explore how symbolic boundaries are drawn between different scenes through identifying "people like us"/"amenities for us"/"places for us" and "others" in the context of diverse neighborhoods. In short, based on walking interviews through the neighborhoods of Molenbeek and Matonge and participant observations in two different organizations in Molenbeek, I examine the process in which scenes form and continue to exist through boundary work.

The findings not only shed light on how symbolic boundaries are drawn in a neighborhood context, but also offer insights into the broader discourse on urban diversity and social sorting in cities. By understanding how scenes form and evolve within diverse urban contexts, this research contributes valuable knowledge essential for policymakers, urban planners, and sociologists striving to create inclusive and harmonious cities.

The Contemporary Composition of French Music Tastes: Refining the Concept of Social and Cultural Differentiation

Raphaël Nowak[1], Hervé Glevarec[2]

1University of York, United Kingdom; 2CNRS, France

Music is often described as having a ubiquitous presence within contemporary society. Such ubiquity is characterised by a diversification of music styles/genres, and an increasing differentiation and omnivorousness of music tastes. The stylistic diversification of music genres has further entrenched oppositions in the field of cultural sociology, between theorists that argue that the contemporary composition of music tastes continues to align with, and even confirms, the homological theory of Pierre Bourdieu (1984) on the one hand, and those that argue in favour of a questioning of Bourdieu's conceptual precepts in light of an increasing omnivorousness/eclecticism of music tastes.

This paper will contribute to those conversations by asking what the contemporary composition of French music tastes is and how it can be understood and theorised in the age of digital media. It will draw on quantitative data collected by the French Ministry of Culture in 2018 with over 9,000 individuals. After discussing the contemporary distribution of taste on the basis of demographic variables, we will show the central oppositions in contemporary music taste, structured around levels of education and age.

Our aim with this is to show that the principle of distinction does not prevail in contemporary music tastes, but rather that there is a broad competency in music that is translated by strategies of differentiation between different tastes. We will therefore question the premise of stratification of repertoires of music preferences and argue in favour of an exploration of their distribution, which includes interrogating how liking a music genre involves a range of meanings.

It Bothers me to Hear it. Analysis of Distastes in Serbia and Croatia

Predrag Cveticanin[1], Inga Tomic Koludrovic[2], Mirko Petric[3], Zeljka Zdravkovic[4], Adrian Leguina[5]

1University of Nis; 2Ivo Pilar Institute of Social Sciences; 3Ivo Pilar Institute of Social Sciences; 4University of Zadar; 5Loughborough University

In this paper, we analyse how musical (dis)tastes are used to establish class boundaries in Serbia and Croatia. In this, we follow the tradition established by Veblen (1889), Weber (1978 [1922]), Bourdieu (1984 [1979]), Douglas and Isherwood (1979), Di Maggio (1987); Lamont and Lareau (1988), and Bryson (1996).

Bourdieu insists that tastes, as "manifested preferences", are asserted purely negatively, which finds expression in the refusal of other tastes. In his words, "In matters of taste, more than anywhere else, all determination is negation; and tastes are perhaps first and foremost distastes, disgust provoked by horror or visceral intolerance ('sick-making') of the tastes of others" (Bourdieu, 1984: 56). What is more, according to Bourdieu, "Aversion to different life-styles is perhaps one of the strongest barriers between the classes." (ibid). Similarly, Bryson states that instead of studying cultural preferences, researchers should focus on „how people use cultural taste to reinforce symbolic boundaries between themselves and categories of people they dislike" (1996: 885).

In this presentation, we use primary data from two large scale projects to analyse musical distates in Serbia and Croatia. In both of the mentioned surveys, besides options ranging from „like very much" to „dislike very much" we included the option „it bothers me to hear it", in order to capture „visceral intolerance ('sick-making') of the tastes of others". Our results indicate that major symbolic divisions separating two social classes in Serbia and Croatia run between those who prefer local musical forms (in particular, newly composed folk music and turbo-folk), and those who prefer global musical forms (rock, jazz and classical music).

Gender, Generation and Class: Inequalities and Cultural Consumption in Post-transitional Croatia

Mirko Petric[1], Inga Tomic-Koludrovic[1], Cveticanin Predrag[2], Leguina Adrian[3]

1Ivo Pilar Institute of Social Sciences, Croatia; 2Center For Empirical Cultural Studies Of South-East Europe, Serbia; 3Loughborough University, UK

As argued in the classical Huyssens's (1986) article, the gendering of mass culture as feminine and inferior lasted from the late 19th to the late 20th century. Due to the changes in women's educational attainment and participation in the labour market, one of the most consistent findings in the late 20th and early 21st century empirical study of cultural consumption has been that women are more likely than men to participate in highbrow cultural consumption. However, recent contributions have shown that gendered cultural consumption is highly context-dependent and related to the level of gender equality in the organisation of work and care for the family in different countries, as well as to different measures comprised in the human development index.

While previous empirical studies (Lagaert and Rose, 2018; Petrić et al., 2021) place Croatia among the post-socialist countries with statistically significant higher female to male highbrow participation rates, there are also indications (Zdravković et al., 2018) that there are notable class and generational differences in gendered consumption patterns. This paper attempts to research these differences using data from a 2024 nationally proportional survey (knowledge panel), and applying a post-Bourdieusian model (Cvetičanin et al., 2021) for analysing class structure in hybrid post-socialist societies. The goal is to provide a detailed account of how inequalities generated by exploitative market mechanisms and different types of intertwined social closure mechanisms affect gendered cultural consumption in the social space of post-transitional Croatia.

RN07 | T03_02: Beauty and fashion

Beauty and Boundary-drawing in Hong Kong: a Q-sort Study of Beauty Repertoires, Social Class and Ethnic Distinctions in Times of Rapid Social Change

Wanying Zhou, Giselinde Kuipers

KU Leuven, Belgium

This study analyzes beauty standards and symbolic boundaries in Hong Kong. As physical appearance has increasingly become important in social life, beauty has become a canvas for expressing identities as well as social concerns. This is especially true for Hong Kong, a city marked by a strong consumer and beauty culture: appearance is very central to Hong Kong life, and in the current socio-political transformation, is becoming one field in which class, ethnicity and politics can be expressed in ways that are more difficult to express directly. This paper presents the results of an ongoing study of beauty tastes and symbolic boundaries: how do people of different backgrounds assess the beauty of men and women, and what social categories do they distinguish? Taking a "Lamontian" approach to the study of East-Asia, we focus on evaluations as symbolic boundary drawing. We use Q-methodology – -a combination of Q-sort and in-depth interviews – – to study the beauty standards and tastes of 40 Hong Kong residents. We map our informants' repertoires of beauty, and the relevance to people's age, gender, race, education, and social status. We zoom in on how beauty standards mark symbolic boundaries related to class and ethnicity, as we assume these are the central divides in contemporary Hong Kong.

237

Beauty As A Political Tool For Emancipation Or Repression? Introducing The Concept Of Beautyvism

Sanne Pieters, Luuc Brans

KU Leuven, Belgium

Beauty has been the subject and object of political struggle throughout recent history. This is not surprising: we know that beauty plays an increasingly important role in social inequalities (Havlin and Báez, 2018; Widdows, 2018). In addition, beauty as a regime (Kuipers, 2022) ties moral values to physical appearances. This makes beauty of interest to social movements, which deal with beauty with various tactics and political aims in mind. For example, the Black is Beautiful campaign instrumentalizes beauty to address broader social justice struggles, while the Fat Acceptance movement treats changing beauty ideals as a goal in itself

and the importance of beauty for conservative movements like Tradwives may serve reactionary political agendas.

How to sociologize these political struggles over beauty? This chapter takes a closer look at social movements with beauty at their heart, a type of beauty politics which we call beautyvism. After reviewing state-of-the-art literature on the political purchase of beauty (Craig, 2002, 2021; Jha, 2016; Elias, Gill and Scharff, 2017; Lakoff and Scherr, 2022), we propose to use the tools of social movement theory to gain a stronger understanding of beautyvism as a form of beauty politics. We thus introduce a typology of beautyvism, based on characteristics of social movements drawn from the social movement literature: goals, ideological frames, political opportunity structure and resources (Baumann, 2007; Snow, Soule and Kriesi, 2018; Della Porta and Diani, 2020). Based on a literature review of empirical studies, we then compare the Black is Beautiful campaign, the Fat Acceptance movement and online Incel and Tradwive movements to show how beauty is politicized differently between these movements.

Conceptualizing the Force of Fashion Fhrough Luhmann's Systems Theory

Rudi Laermans[1], Aurelie Van de Peer[2]

1University of Leuven, Belgium; 2University of Leuven, Belgium

Sociologists have recognized the prevalence of relational temporal logics in fashion, extending across seemingly unrelated societal domains. This paper employs Niklas Luhmann's systems theory to present a comprehensive conceptualization, delving into the understanding, often intuitively acknowledged in sociology, that fashion influences even those societal realms lacking typical aesthetic dimensions, such as science. The interdependent logic of advancement and backwardness, characteristic of fashion semantics, manifests across various functional systems, varying in intensity within operational functional subsystems. Through an explorative analysis, we examine fashion's role in three functional subsystems: science, the arts (particularly contemporary art), and the economic system of the fashion industry.

In science, we posit that fashion operates as a 'performative semantic,' discernible at the system's program and method levels. In contemporary art, a loose coupling is observed between the primary (unchangeable) system code of fitting/non-fitting and the secondary code of fashion, representing In/Out. Lastly, the fashion industry reveals a structural coupling or entanglement between the primary economic subsystem code of payment/non-payment and the fashion code of In/Out. This paper contributes to theory construction within the sociology of fashion, providing a conceptual framework to comprehend the impact of fashion. We conclude by highlighting the implications of our findings for the empirical development of fashion sociology.

RN07 | T03_03: Cultural production, evaluation and transformation

Literary Works as Agents of Social Change: Cultural Sociology of Literature and the Case of Dystopian Novels

Jan Vana

Czech Academy of Sciences, Czech Republic

The contemporary sociology of literature is predominantly shaped by research on literary production that subordinates literary works to social interactions and institutions—the work of Pierre Bourdieu and his followers being a prime example. The "social" is often treated as a ubiquitous essence and literary works as effects of social causes. To counterbalance this a priori epistemological asymmetry, I propose a cultural sociology of literature that focuses on the process of meaning-making as it occurs within the reading experience between the reader and the text in a given socio-historical setting. Following the Yale School of Cultural Sociology, I approach literary works as analytically autonomous agents that actively shape their social surroundings. The analytical autonomy is conceptualized through the aesthetic experience of reading where the text exerts its agency over the reader by immersion into the text's aesthetic structure. The specificity of literary agency, I argue, lies in 1/ the intimate, highly subjective confluence between the text and the reader within the reading experience, which is, nevertheless, 2/ traceable on the level of more persistent collective patterns, which Raymond Williams dubbed "structures of feeling." I demonstrate the model by following how selected novels perform their agency over readers through their inner aesthetic structure, and how the aesthetic effect of these novels is then mobilized in the extra-literary discourse to call for social action. Empirically, I access the aesthetic experience via the triangulation between the text and the social contexts of production and reception. This sort of aesthetic mobilization is analyzed in four dystopian novels: Parable of the Sower (Butler, 1993), Oryx and Crake (Atwood, 2003), Never Let Me Go (Ishiguro, 2005), and The Road (McCarthy, 2006).

Transformation of Cultural Fields and Cultural Mechanisms of Inequality Reproduction

Ilias Latypov

HSE University, Russian Federation

The results of the project "Recognition, distinction and emotional drivers of action: a cultural and symbolic dimension of social mobility" are presented. The project involved

238

50 biographical interviews with young people aged 26-28 from different regions of Russia. The sample was based on the panel sample of the Trajectories in Education and Careers project, which has been conducted since 2011.

The story of Russian youth who were born in the 90s is the story of the confrontation of various cultural fields. People from the small regions were born and grew up in difficult conditions: economical poverty, bullying at school, low education of parents. Adulthood has allowed many of them to overcome these conditions. The people who stayed in these regions remember these 90s well, but they have seen how much has changed since then. They don't treat the past too negatively. But people who have left their region for the capital or another large city already perceive their past cultural experience based on the new one. These people are more negative about their past and don't want to go back. People from Moscow and other large cities have had better conditions and show much less cultural shift. The results of the project show how different cultural experiences and cultural mechanisms of reproduction of inequality generate opportunities for social mobility. The outlook for the future is conditioned both by these cultural processes and by the new political situation, about which it is difficult to talk and difficult to make long-term plans.

Using ChatGPT To Research Culture: A Case Study Among Rock-climbers

Otto Segersven, Ilkka Arminen

University of Helsinki Faculty of Social Sciences, Finland

AI will not only transform many of the social worlds studied by cultural sociologists, but it may also transform how we do research by introducing new tools of research. This research explores the potential of combining the Imitation Game (IG) with artificial intelligence (AI) chatbots for sociological research. AI chatbots are computer programs that generate human-like responses to a given message. The IG is a sociological experiment, in which members of a culture try, through anonymous conversation, to identify their group members from outsiders pretending to be members of their group. I present a modified IG, in which members of a culture try to identify their peers from an AI chatbot pretending to be a member of their group. In this particular experiment, rock climbers engage in an anonymous conversation with human rock climbers and an AI chatbot known as ChatGPT, and try to identify which is which. IGs between subcultures and AI chatbots can open up a novel way of researching a range of phenomena, such as the very nature of culture, the limits of AI and peoples understanding thereof; and how different groups construct and convey their identities. I shall describe how the experiment was done, present initial results and assess the methods potential for research in the sociology of culture.

The Impact of Local Administration Evaluation Methods on Cultural Production and Heritage Management Policies

Uxío Novo Rey, María Andrade Suarez

UNIVERSIDADE DA CORUÑA – UDC, Spain

This study delves into the impact of public administration evaluation methodologies on local cultural production and heritage management, focusing on two specific cases in Santiago de Compostela (Galicia NUTS ES111, Spain). The first case revolves around the "Matadoiro Compostela," an urban cultural regeneration project, while the second pertains to grants allocated for cultural activities between 2018 and 2021 in the same city.

By employing a combination of secondary source analysis and in-depth interviews, this research aims to uncover how specific values significantly influence the evaluation processes, thereby molding the direction of public cultural initiatives. Both cases illuminate inherent value conflicts and the intricate web of interactions among stakeholders, each driven by their unique value-laden agendas.

The findings underscore a prevailing trend wherein instrumental economic value predominantly occupies the top tier within the hierarchy of local cultural policies. This configuration fosters a tendency to prioritize aesthetic elements and meritocratic criteria associated with excellence, often at the expense of social outcomes and values. Consequently, the dominant principles of Participation and Economic value frequently give rise to noticeable tensions and clashes in the cultural policy landscape.

In essence, this study highlights the substantial influence wielded by evaluation methodologies in shaping the contours of cultural policies at the local level. It emphasizes the overarching presence of economic values and their profound implications in directing and configuring the landscape of cultural endeavors within the community.

The research findings hold critical implications for policymakers, cultural administrators, and stakeholders, urging a reevaluation of the prevailing evaluative frameworks to strike a more harmonious balance between economic imperatives and social-cultural values in the realm of public cultural management.

The Art World and Meanings of Struggle Songs

Anna Schwenck

Siegen University, Germany

In her article for the Oxford Handbook of Cultural Sociology, Lisa McCormick makes the compelling argument to make music and its meanings the focus of a cultural sociology of music (2017). She argues that sociologists need to go beyond what she calls the "production-consumption paradigm" that also influenced Howard Becker's concept of art worlds. In this paper, I seek to bring together McCormick's justified call for an analysis of music as meaningful artistic performance, with Becker's important sociological displacement of the individual genius and elitist definitions of art through the notion of art worlds (1982).

As I show for the phenomenon of struggle songs in today's South Africa, their composition and performance—a differentiation Becker collapses in the concept of production—is as much a cooperative act as the debates and conflicts over these songs' meanings. Combining an analysis of musical affordances of a song (DeNora 2000) with in-depth interviews with musicians and activists in South Africa, I seek to bridge the production-consumption divide in sociological analyses of music and engage with struggle songs' shared and contested meanings as well as with their performative effects for musicking and politics.

The Paradox of Public Funding for the Arts: Tensions Between Support and Constraint

Cat MacKeigan

Nova Scotia Community College, Canada

Public funding is often seen as a vital source of support for the arts sector, enabling artistic practice and cultural expression. However, public funding also entails administrative processes that impose constraints and challenges on the arts sector. This paper examines this paradox of public funding through empirical research on the experiences of professional theatre practitioners in Nova Scotia, Canada. I used institutional ethnography and an equity lens, taking up the artists' standpoint to conduct interviews with theatre professionals and provincial public servants, observe theatre production and administrative activities, and review the grey literature related to the provincial arts funding system. I found that the administrative processes of public funding create tensions on the communication, trust, work value, and well-being of arts practitioners, attributed to an insufficiency of language, prevalence of invisible work, misalignment of the funding cycle, attribution of work value, looming burnout, and limitations in sector capacity. Moreover, I found that this paradox creates and reflects tensions and inequities in the relationship between the funders and the funded, and among the arts sector activities. My paper contributes to the sociology of culture by identifying and addressing the policy externalities that create challenges and barriers for arts practitioners affecting their working conditions and sustainability in the arts sector. I also provide policy recommendations to address such externalities and to improve and transform the public funding models and practices for the arts sector, such as enhancing accessible language and communication, recognizing and valuing the invisible work, aligning the funding cycle with the artistic cycle, diversifying the criteria and indicators of value, preventing and reducing sector burnout, and strengthening the sector's administrative capacity.

Artists and the Cultural sector: an Ethnography of Anxieties

Inês Subtil[1], Paulo Castro Seixas[2], Gonçalo D. Santos[1]

1Center for Research in Anthropology and Health, University of Coimbra. Faculty of Science and Technology of the University of Coimbra, Portugal; 2Center for Research in Anthropology and Health. University of Lisbon, Portugal

The cultural sector, vital for the development of Europe, has been characterized by a chronic devaluation and disinvestment. Worsened by the Covid-19 crisis, which has devastated the world and the cultural sector in particular, tensions and anxieties usually present in the sector were intensified. Due to this, job insecurity and uncertainty became the norm for cultural sector workers. Financial and cultural markets as we used to know were damaged and the public policy response was insufficient. In response, the cultural workers stood up, reaffirming culture as work, reorganizing and transforming the sector with the emergence of bottom-up policies.

This research aims to explore the anxieties surrounding the sector, proposing an ethnographic approach. This approach contributes to a qualitative analysis of the sector, helping to build appropriate proposals and public policies. Using ethnographic methods, this article focuses on five main issues: employment status and career paths, financing and job insecurity, the intersection between economic pressures and creative demand, recognition strategies and artistic visibility, impacts of globalization and digitalization. Artists and authors are the studied population, through an analysis of cultural practices, narratives, identities and career paths in artistic production.

Talking About Art: Howard Becker and the Metaphor of Social Organization

Andrea Lombardinilo

Gabriele d'Annunzio University, Chieti-Pescara, Italy

The final chapter of Art Worlds can be read as an insightful analysis of both creative and productive processes featuring the circulation of works of art and their socio-cultural impact. What roles do conventions and clichés play in the construction of reputation? How do artists cope with the risks of standardization and the search for originality? In this sense, Becker dwells on the power that metaphors have in sociological research applied also to artistic processes: "Ways of talking about art, generalized, are ways of talking about society and social processes generally".

Thus, the talk about art turns into an epistemological reflection on the rhetorical paradigms ruling social life. This is why – Becker points out – "we can use such terms as social organization or social structure as a metaphorical way of referring to those recurring networks and their activities". Such metaphors imply that the action occurs regularly or often, in compliance with the incessant becoming of artistic forms.

This is what happened, for instance, when novels became common in Britain in the nineteenth centuries: William Makepeace Thackeray, Anthony Trollope and Charles Dickens, for instance, showed how the relationship between art and society can be influenced by technical innovations, especially when the reproducibility of texts and contents had become an economic and commercial enterprise thanks to the rapid diffusion of newspapers.

Becker's enlightening reflections on the development of novels demonstrate the role played by language in the construction of popular narrative worlds, as in the case of poetry and plays during the first industrial revolution.

RN07 | T04_02: Culture in national contexts

European Capitals Of Culture: Assessing Qualitative Impacts And Persistent Inequalities

Belmira Coutinho[1], Manuel Gama[2], Rui Vieira Cruz[2]

1University of Aveiro, Portugal; 2University of Minho, Portugal

As 12 Portuguese cities prepared their candidacy for European Capital of Culture (ECoC) 2027, a team of researchers from PolObs at the University of Minho set out to take a deeper look at the ECoC initiative. As part of this study, we analyzed the European decisions that define the ECoC, seeking to establish a contrast between the 2007-2019 directive and the current one, 2020-2033. This was followed by a thorough reading of European Commission (EC) documents containing recommendations for ECoC candidate cities and a critical analysis of the indicators proposed by the EC. This process found that most of the indicative indicators and data collection sources suggested in the guidelines lend themselves exclusively or primarily to quantitative analysis. While this is adequate for gauging general trends and understanding the volumes and numbers involved, it is not sufficient for an in-depth evaluation of the initiative's impact. There is limited relevance in assessing the "increased support for multicultural projects e.g. by cultural minorities" if these projects remain relegated to a place of low culture and/or exoticization. Nevertheless, some winning (e.g. Plovdiv, Chemnitz) or candidate cities (e.g. Tampere, Trenčín) have put forward proposals for tailored indicators that should be taken into account for the future of the initiative, and may become part of the ECoC indicator framework after 2033. Drawing on a collection of over 500 indicators, this article analyzes the ways cities have found or proposed to evaluate the impacts and results of their ECoC that reconcile standardized indicators with qualitative indicators relating to the local context, particularly in terms of the involvement of marginalized communities.

Cultural Scenes and Political Behavior: An Approach to the Left-Right Cleavage in the Spanish Context.

Cristina González Benítez, Cristina Mateos Mora, Clemente Jesús Navarro Yáñez

UNIVERSIDAD PABLO DE OLAVIDE, Spain

The analysis of the context goes beyond examining its physical or socio-economic dimensions; it also emphasizes the investigation of symbolic-cultural processes linked to the

241

residential zone. The neighborhood serves as a relevant context for elucidating individuals' life opportunities by establishing diverse structures for social interactions and the development of various lifestyles (Gieryn, 2000; Giddens, 1993). Commencing from the contextual effect, a theoretical space is opened to address how the effects of cultural scenes—considering the distinction between innovative and communitarian characterizations—within these environments may condition individuals' relationships and attitudes toward the political-institutional system.

Urban sociology is not indifferent to the sociopolitical phenomena, and there is an intention to respond contextually to sociopolitical trends within the territory through the lens of the "neighborhood effect" (Silver, 2014; Cox, 1969; Leib and Quinton, 2011; Brown et al., 2005; Johnston, 2005).

The objective of this communication is to explore, within the framework of the "neighborhood effect," whether the cultural scene influences individuals' political attitudes, with attention to ideology based on voting for left or right-wing parties in Spain. To achieve this, multivariable analyses will be conducted using cultural scene indicators (Mateos, 2022) to understand the relationship between communitarian and innovative scenes and voting for left and right-wing parties in Spain. This analysis will utilize secondary data from the National Classification of Economic Activities (CNAE) and primary data obtained from the survey conducted in the HEALTHY-SCENES Project, funded by the Ministry of Science and Innovation.

Cultural Practices In Portugal: Comparing Braga Audiences' Dataset With Portuguese National Survey Results

Rui Vieira Cruz[1], Manuel Gama[1], Belmira Coutinho[2]

1University of Minho, Portugal; 2University of Aveiro, Portugal

Portugal cultural practices and consumption are generally low, with a participation below European average. Similarly, at the scientific level, there are gaps and scarce consistent studies that longitudinally follow audiences and their practices. In this regard, we highlight the Portuguese reading practices study, in 2007, the public's study in national museums, in 2019, and the first survey of Portuguese cultural practices, in 2020.

Within the scope of Portuguese European Capital of Culture 2027 (EcoC'27) and although indicators aim to widen access and participation on culture (SO2), there were limitations in the development of audience studies. The majority of the 12 Portuguese candidate cities did not conduct a pre-candidacy audience study, making it difficult to analyse the impacts of ECoC'27 in case of victory. Hence, we focus on Braga, an ECoC'27 finalist and one city that developed study, and a future Portuguese Capital of Culture (PCoC) 2025.

We intend to understand data alignment between Braga ECoC'27 audiences' study and Portuguese cultural practices survey. Regarding data collection, Braga's dataset was comprised of 3 discussion groups, 9 interviews, and 2 online questionnaires, thus creating a sample of 1011 individuals, contrasting with Portuguese cultural survey sample of 2000 questionnaires applied via Computer Assisted Personal Interview (CAPI).

This presentation reveals the conclusions, differences, and similarities of both studies, to understand the needs and levels of action, both at local and national level, and new frameworks for assessing an ECoC and PCoC '25 impacts, hence contributing to a more robust cultural system.

British Cultural Influence In Southern Spain: A Social Network Analysis

Maribel Serrano-Macías[1], Javier Alvarez-Galvez[2]

1Pablo de Olavide University, Spain; 2Computational Social Science DataLab, INDESS, University of Cadiz, Spain

In the 18th and 19th centuries, the southern region of Spain witnessed a substantial influx of British individuals, specifically in the provinces of Huelva, Seville, and Cadiz. The Cromwellian wars and the Protestant Reformation prompted many Catholic families, predominantly traders, to emigrate from their home countries in search of a better life and opportunities for prosperity. This, coupled with the longstanding commercial traditions between nations, facilitated migration to Andalusia, which boasted significant commercial ports serving as links to the Americas. In this study, we integrate genealogical research on British families settled in southern Spain with social network analysis techniques geared toward community identification. This approach enables us to examine the dynamics of cultural influence that led to the current formation of the contexts in which these groups established themselves. Our findings highlight the dissemination of British lifestyles and cultural forms in these regions of Spain through anglophile Spaniards who acted as promoters and disseminators of cultural influences, significantly impacting the current configuration of cities such as Jerez, Seville, and Cadiz, as well as the attitudes and behaviors of the local population in these geographical areas. This study reveals that British citizens established matrimonial ties in an endogamous manner, either with their compatriots or individuals of similar social and economic status, to ensure the continuity of their businesses.

242

RN07 | T04_03: Trust, conspiracy and law

Echoes of Doubt: Unraveling the Sociological Relevance of the Impostor Phenomenon

Max P. Jansen

Goethe University Frankfurt, Germany

In recent years, more and more people seem to be rejecting conventional information sources, placing exaggerated trust in personal perceptions over objective data, dismissing evidence contrary to their view, and believing they possess special insight into what's 'really' going on. Such thoughts are often linked to conspiracy narratives and subject of sociological debates since they can pose significant challenges to social cohesion, exemplified during the SARS-CoV-2 pandemic, the Russian invasion of Ukraine, and the erosion of trust in public institutions. However, interestingly, traits like this are also associated with a phenomenon that receives very little attention from sociologists: the Impostor Phenomenon (IP). Thus, this paper addresses the question: "How prevalent is impostor thinking across different social groups, and what specific social consequences emerge from its prevalence?"

Applying Pierre Bourdieu's habitus concept, this study defines the Impostor Phenomenon (IP) as a manifestation of 'internalized oppression.' It draws on data from a recent register-based survey covering adolescents and adults across Germany to examine societal dynamics connected to IP. Descriptive methods are used to assess the prevalence of IP across diverse social groups (i.e., social class, gender, ethnicity, and education). Inferential statistics are utilized to delve into IP's societal consequences, particularly its associations with topics that (re-)shape social transformations, including discriminatory experiences, social tensions, (lack of) social cohesion and solidarity, social and institutional trust, as well as polarizing attitudes.

The findings underscore the widespread prevalence of the Impostor Phenomenon across diverse social groups, emphasizing its societal impact and reinforcing the concept of internalized oppression. Crucially, the analysis identifies correlations between IP and social and institutional trust (varying across sectors such as public broadcasting, education, judiciary, and law enforcement) as well as its influence on polarization and social cohesion. Against the backdrop of evolving social structures and pressing contemporary challenges, the paper contributes pioneering large-scale evidence on IP and its social consequences. Moreover, by bridging micro-level distress sentiments with macro-level institutional challenges, it offers a profound sociological perspective on IP. This fertile perspective can contribute to a more comprehensive understanding of this ubiquitous phenomenon and its implications for broader societal dynamics.

Building Trust in Prison Culture

Maruta Herding

German Youth Institute, Germany

Prisons are places strongly shaped by distrust. Neither the structural framework of the institution nor everyday prison life promote trust as part of everyday culture. Punishment and rehabilitation are linked to control, security and the deprivation of freedom. Control measures such as detention, body searches, urine sampling or cell searches are often performed and perceived as displays of hierarchy and power. Circulating private information poses a danger to prisoners in the subculture of prison life and in the detainees' hierarchy. This constitutes an unfavourable starting point for building trust.

In this situation, something is supposed to take place that strongly requires trust: social work at prison. It aims at supporting detainees to develop a positive life plan and to reprocess the criminal past. This only works in a professional relationship built on trust.

This paper will address the problem of trust in distrustful prison culture drawing on extensive field material (and indepth qualitative analysis) on social work by external projects, working at German prisons with the mandate of preventing political and religious extremism. How is it possible to build trust in prison, given the contradiction between a required trustful work relationship and the distrustful prison culture? What individual meaning do prisoners, officers and social workers associate with trust? The findings suggest that – although the topic of radicalisation further aggravates the situation – , external projects are able to advance in building trust, e.g. by accentuating their role of being outsiders to the system, but also by a person-centered pedagogical approach.

Legal Conspirators: Legal Language in the Conspiratorial Milieu

Dominik Zelinsky

Slovak Academy of Sciences, Slovak Republic

The theme of conspiracy theories has, over the past decade, become central to the culture wars rocking American and European societies and politics. Conspiracy theories, and the lay theorists who espouse them, have on the one hand been seen as a socially pathological tendency with the potential to eat away the trust in our societies. On the other, researchers have highlighted the fact that it is an already existing deficit of trust in politics and political institutions that expands the tendency to believe in conspiracy theories.

This research focuses on specific phenomenon in conspiracy theory milieu: the role played by legal practicioners and legal language in conspiracy milieu. While conspiracy theories are often seen as irrational, their practicioners routinely engage in analysis of complex legal arguments and lawyers often play a prominent role in the movement. Some conspiracy theory milieus, such as the Sovereign Citizen Movement, are themselves based on a peculiar interpretation of legal rules of modern societies. Yet, the role of

243

lawyers and 'legal talk' in conspiracy theories has not yet been adequately understood.

This project takes a cultural sociological perspective and focuses on two 'conspiracy lawyers' from Czechia and Slovakia (Norbert Naxera and Judita Lassakova), providing an comparative perspective on legal talk in conspiracy theories milieu and better insight into the role of legal language in the culture of conspiracy theories.

Spreading The Imagined Nation From Legislature To Collective Memory: The Correlation Between The Hungarian Fundamental Law And Kossuth Square

Graziela Ares

University of Coimbra, Portugal

In 2011, the government led by Viktor Orbán approved the new Hungarian Fundamental Law (HFL). The code was criticized for creating a constitutional identity based on ethnicity and history, for distancing itself from European Union values, for appealing to an idealized past and present, for exchanging constitutional rights by values and morals, and many other controversial aspects.

In the same year, 2011, the resolution 61/2011.(VII. 13.) approved the transformation of Kossuth Square (KS), around the Parliament building, into Hungary's "main constitutional square". The law did not specify how the renovation should be done but demanded to restore the image of the square as it was in 1944. Thenceforth, a material and symbolic image of the nation envisioned by the majority government was (re)created in KS.

More than a decade later, is it possible to find a correlation between the KS reconfiguration and the constitutional reform in 2011?

To answer this research question, my study compares the recurring criticisms found in the literature about the HFL (Bánkuti, Halmai, Scheppele; Pap; Zoltán et al.; Szente et al.; Fekete) with a dedicated analysis of the square, based on the literature about monuments and symbolic politics in Budapest (Ares and Grinspum; Sarkisova and Apor; Kovács; Erőss) and the review of official documents, images, interviews, and my continuous visits to the square over the last 13 years.

Like observed in the constitution, I expect to prove that the renovation of KS:

i) is a political process grounded on framed versions of the past (Traverso, Koselleck) to justify autocratic acts in the present,

ii) envisioned and linked the Hungarian nation to standards outlined by a political community that claims to be legitimized by ethnicity, religion, and ballots to do so,

iii) is used to dissociate the communist period from the domestic history and responsibility,

iv) replaced republican references with monarchical ones, and

v) take the whole (totality) for the parts (majority) in the name of the nation to silence dissent views.

My work contributes to problematizing the transcendency of an imagined nation (Anderson) from norms and institutions to public spaces and collective memory (Hallbwacks).

244

RN07 | T05_01: Fashion

The Transformation is in the Wear: Mapping the Impact of Learning about Sustainable Fashion Practices at School

Aurélie Van de Peer

Leuven University, Belgium

Fashion holds a unique significance in the lives of teenagers, with schools functioning as a daily runway where appearances carry social status, and a single fashion misstep can lead to ostracization. Teenagers, as a consumer group, often face blame for unsustainable fashion practices, including overconsumption of poorly made garments produced under inhumane working conditions. Simultaneously, they are recognized as key agents engaging in more sustainable alternative status signals, such as opting for secondhand clothing. Despite this, the existing body of research exploring the intersection of sustainable fashion and education has predominantly centered on design students in higher fashion education. Addressing this gap, this study examines the experiences of teenagers in Flanders (Belgium) with a curriculum, spanning January to June 2022, that delved into how the fashion industry exceeds planetary and human boundaries. Employing praxis education, students applied theoretical knowledge by organizing a school-wide clothes swap event. Utilizing four qualitative data sets—researcher field notes, transcripts of class discussions, student clothing diaries during the teaching period, and wardrobe interviews with 11 students post-curriculum—this study explores the impact of this sustainable fashion approach on students' clothing consumption practices. Rather than transforming clothing purchases, the post-curriculum sustainability shift occurred in how clothes from the students' wardrobes were used and worn. This discovery contributes to the emerging trend in sustainable fashion literature, urging scholars to emphasize 'use' in the practice of sustainability. It adds to this literature by highlighting that a focus on how individuals organize the everyday materiality of clothing in their wardrobes embodies the fears, dreams, and hopes associated with the practice of dressing (sustainably).

Real, Touch & Feel: The multi-layered authenticity, originality and creativity of fashion in Kenya

Tommy Tse

University of Amsterdam, Netherlands, The

To what extent is the Western-centric theory of authenticity and creativity relevant to Kenyan fashion consumers' habitual consumption practices? Numerous existing studies have already concluded that a product's authenticity is not among its inherent characteristics, but is ascribed to it through a complex creative process of negotiations and (re)appropriations. Based on my 10-week (auto)ethnography in Nairobi's fashion markets (22), focus group (43) and wardrobe interviews (12) with Kenyan consumers, I realised the materiality of fashion and consumer's continual interactions with different social actors also play a vital role in reshaping meanings of authenticity. As a global North, middle-class, male consumer who is well-versed with the Western fashion system, my understanding of authenticity started to evolve shortly after living in Nairobi and interacting with the Kenyan fashion designers, seamstresses, wholesalers, retailers and consumers. My resistance to consuming "fake" (often Chinese-made) products changed after trying on a pair of "original" Adidas sneakers – insisted by a team of retailers who spent half an hour scouting around the Toi Market for the "treasure". Three days later, I finally realised they are not "original-original" when several male custom-made fashion designers in another market spotted my new trophies, came by and touched them. Denise cheerfully commented, "They are not real, but it [7,5000 KES] is a good deal…even better than the original!" Rather than feeling cheated, the incident led me further to question the multi-layered values, meanings and materialities of fashion, also remap the oft-muddled relationships among authenticity, originality and creativity through a context-specific analytical lens.

Sure It Works in Practice, but Does It Work in Theory? The Geography of Skill and the Problem of Unique Capabilities in the Global Fashion Industry

Alexander D Hoppe

Max Planck Institute for the Study of Societies

Unlike the textile industry, which has been globalized for hundreds of years, the apparel industry fragmented across global value chains only after WWII. In the U.S. and Europe there were immediate academic and strategic responses to the threat of offshoring. Although initially effective, failures were nearly complete by the early 2000s. The strongest remaining arguments today focus on the unlikelihood or impossibility of offshoring fashion design. Because it is culturally expressive, temporally exigent, and high-value work, almost all scholars argue that design remains decidedly unsusceptible to offshoring. In a review of the literature since the beginning of the knowledge economy in the 1950s, I find nearly 100 specific claims about the unlikelihood of Western fashion capitals losing their monopoly on design services. Claims across the social sciences are based on either (a) data collected exclusively from within fashion capitals, (b) limited amounts of data from small suppliers, or (c) theoretical expectations. There is little room to explain recent empirical findings that design is indeed being offshored to semi-peripheral suppliers in India, China, and Turkey. I define unique capabilities as a presumption of geographically and jurisdictionally restricted functional expertise. Either design is no longer a high-value cultural service—in which case we must ask why we have spent the last 70 years classifying it exclusively in this way, and what

245

this means for other "post-industrial" work—or we need to reckon with the ideological relevance of unique capabilities.

Fashioning A Sustainable Future: How The Climate Crisis Transforms Cultural Fields

Luuc Brans

KU Leuven University, Belgium

Fashion is predicated on constant change against a backdrop of order (Aspers & Godart, 2013). But like other cultural fields, fashion needs to transform not only superficially but fundamentally as lawmakers and consumers demand sustainability in fashion. Cultural sociologists previously studied sustainability through consumption as 'politicized distinction' (Baumann et al. 2022; Huddart Kennedy, 2021; Prieur et al, 2023). Yet we know little of the way the climate crisis transforms cultural production. I thus ask: How do people in fashion's cultural production navigate sustainability and how does this reshape the field?

This paper, based on years-long dissertation research, turns to cultural intermediaries (Smith Maguire & Matthews, 2014) in European fashion to study how they develop new ideologies of cultural legitimacy, rooted in sustainability (Bourdieu, 1993; Lizé 2016). I therefore observed at fashion weeks, interviewed European fashion journalists, analyzed fashion media (Brans & Kuipers, 2023), and looked at fashion apps (Brans, 2023). Finally, I studied how the EU and the UN intervene in the field through their sustainability policies. Taken together, this paints a picture of key players' strategies and ideologies (Swidler, 1993) in a field under transition.

I conclude that the climate crisis subverts hierarchies in fashion, ultimately leading to the field's fracture. The result is the birth of a new field: a political aesthetic economy (cf. Entwistle, 2022) that extends recognition to people in its supply chain and Gaia (Lamont, 2023; Latour, 2020). These results are important beyond fashion for any cultural field struggling with sustainability, from food to design.

RN07 | T05_02: Culture, technology and transformation

"From the Culture of Risk to the Culture of Emergency: Changes in Cultural Systems and Communication in the Digital Society"

Francesca Cubeddu[1], Emiliana Mangone[2]

1IRPPS-CNR of Rome, Italy; 2University of Salerno, Italy

The social system and its organisation are often modified by events of risk, crisis, and/or emergency. Three aspects that are also culturally constructed based on an understanding of the conditions of uncertainty and that promote actions, practices and processes typical of the society in which they occur. Risk, crisis and emergency, are three terms often defined in everyday life by a single term, "emergency", but in reality they refer to very specific events, which are communicated in different ways and have distinct cultural characteristics. In the contemporary time dimension, not only risk is observed, but also the social and cultural impacts generated by crises or emergencies that may follow.

Communication – differentiated according to the different degree of digitisation – allows to cope with these events by safeguarding the population, reducing social exposure and building tools that lead to the emergence and maintenance of a culture of risk, crisis and emergency. These safeguards provide also social security, generating social trust in the political and management systems.

Based on these differentiations, after a social and cultural brief definition of the three terms, the way to communicate risk events and emergency situations in the digital society will be analysed, with the support of some case studies.

Cultural Resources Of Imagination: Analysing Metaphors Of Self-Transformation

Maria Kucheryavaya

The Moscow Centre for Cultural Sociology, HSE University, Russian Federation

Within the self-help narrative, the idea of changing oneself to improve the individual in order to create a prosperous life has become widespread. The focus of this presentation will be on a specific type of self change – transformation, which involves radically changing yourself and your own life. The mainstream in the study of self-help culture and self-transformations is the concept of reflexivity developed mainly in the works of A. Giddens. This approach, however, does not fully demonstrate the heuristic power of transformation as

246

a centering element of personal growth narratives since it limits transformation to a controlled and conscious process. A number of studies note that fiction and fantasy, i.e., processes involving imagination, play an important role in the process of transformation and transformational decision making. The self-help discourse has even introduced new 'repertoires of imagination'. This emotionally charged power of imagination seems important in exploring what constitutes the sense-making structure of transformation as a process of imagining an alternative self.

The purpose of this paper is to explore the internal cultural logic of imagination that underlies transformation as a process of imagining oneself as other. Drawing on the resources of structural hermeneutics, the symbolic structure of such imagination is examined by highlighting key metaphors that support the narrative of transformation. Metaphors represent experiences framed by certain cultural repertoires that condition what linguistic resources are used to create a metaphor, where it is used, and how it is interpreted (i.e., to which semantic domains it refers). The empirical base of the study is social media posts published by personal development experts (period of data gathering – from November 2021 to November 2022).

Social Representations of Technology: Intersectional Imaginaries

Giulia Crippa

Università di Bologna, Italy

Social imaginary codifies visions that are stabilized and publicly replicated as shared representations of the forms of (dis)order in social life. My proposal is to study technological representations as products of the social imaginary in two Brazilian fiction series: 3%, (Netflix, 2016 – 2020), which stages dystopian and utopian imaginaries, in its relationship with the political and social transformations of the last thirty years in Brazil. The 3% series provides important symbolic materials for the elaboration of patterns, beliefs, themes, and behaviors. The narrative is based on a pre-existing set of symbolic materials, which are represented by stimulating levels of emotional involvement in the context of Brazilian social, political and economic changes, but not only. Key elements of the social representation of technology in the series are technological dependence and inclusion/exclusion. I also selected the series Omniscient (Netflix 2020), which proposes the theme of social control, dear to dystopian science fiction since Orwell, staging it in a social imaginary very close to the technology already present (Zuboff, 2019).

In both series, female protagonists are evidents and I have tried to understand the intertwining of women and technology (Haraway, 1995 and 2019; De Lauretis, 1987). The representation of technology thus identifies ideological webs between imaginaries and reality.

Changing for Everything To Remain the Same: The Technical Extensions of the Human in Art and Culture

Rita Ribeiro[1], Daniel Noversa[2]

1University of Minho, Portugal; 2University of Minho, Portugal

Culture and art have always embodied technology and produced representations of non-human extensions of the human world, namely through the imagination of hybrid creatures. Such technical extensions of the human projected the ex-human, the human beyond the human, transformed and expanded. Today the main issue is no longer the technical reproduction of art or the artistic creation of a post-human fantasy, but with the technological and hybrid production of art and culture. Specifically, artistic expressions and cultural practices are growing and diversifying as a result of scientific and technological advances that are beyond the comprehension of ordinary citizens, suggesting that the field of human culture is rapidly unfolding in post-human forms. The aim is to explore how a post-human culture is being projected (especially through the effects of artificial intelligence) that goes beyond artistic fiction and incorporates non-human creation. In addition to the ethics and ontology of these forms of cultural and artistic creation, it is necessary to consider the sociological implications of the non-human extension of the human world. I propose to do this along three lines: a) the reinforcement of cultural and social inequalities resulting from technical transformations, as they strengthen artistic and cultural territories for the holders of cultural capital, now in its scientific and technological variant; b) the normalisation of ethnic, racial, gender and class biases in the cultural and artistic representations that machine intelligence generates; c) the mechanisms of symbolic power that underpin the effectiveness of the processes of naturalisation of post-human visions of the world.

RN07 | T05_03: Cultural practices and well-being

Towards a Cultural Sociology of Yoga: The Malleability of Cultural Industries at the Intersection of Hybrid Fields

Matteo Di Placido

University of Turin, Italy

Due to its social significance, transnational appeal and the variety of meanings associated with its practice, yoga is capturing the attention of scholars, activists and practitioners across the globe. According to contemporary research, yoga is simultaneously lived and experienced as part of a religious path (most notably Hinduism but not only), a spiritual practice focused on practitioners' self, a leisure activity and a health regime for middle-aged, affluent, white women. Importantly, yoga is all of these things, but to different people, at different times and in different places. While most of the available literature to date concerns itself with the genealogical reconstruction or philological study of yoga, this presentation proposes a cultural sociology of yoga capable to account for yoga's malleable character at the intersection of different social fields. More specifically, this contribution postulates that yoga is a shape-shifting socio-cultural object that ought to be understood in relation to its position at the intersections of the fitness and wellness industry, therapeutic culture and the landscape of contemporary spiritualities. In so doing, a cultural sociology of yoga contributes to unveil the ambivalences, changes and institutional structures inherent in the yoga industry (understood as a hybrid cultural industry) that has particular impact in relationship to issues of time and space management, body care, power and authority and social action and interaction.

Soothing Tension: Dimensions of Practice in the Well-Being Social Complex

Carol J. Petty

George Mason University

With the grand political project having left the building, and the technocratic one serving its final debut, a well-being social complex clamors for center stage. Crisis after bitter crisis, no turn in sight, our social nerves are shot. The scientist and the shaman offer to soothe us, but what will happen if we take their cures? This paper confronts the openings and closures of well-being frontiers via an analysis of two consolidating, yet differently legitimized terrains: the science podcast and the shamanic institute. Data include audio (20 hours) and visual (450 images) content produced in 2022 and 2023. Interviews (N=4) with content producers and service providers further situate the logic of these human 'recalibration' fields. Research data were selectively coded for expressions of desirable human optimization, modalities of change, and the ends of psychological transformation. This analysis yielded a typology of ambivalent well-being projects: sober adaptation and hypnotic awakening. The conclusion dissects each of these projects' capacity to transcend the 'therapeutic program' diagnosed in the writings of Herbert Marcuse and Philip Rieff.

The Peaceful Mind and Violence-Free Sociality: Russian Psychotherapists' Vision of Psychotherapy's Mission

Arsenii Khitrov

University of Oslo, Norway

Recent studies indicate a growing popularity of private psychotherapy in various countries, including Russia. Psychotherapy is often seen as a technology of the self, shaping individuals' values, discourse, and behaviour. It is commonly perceived as individualistic, focusing solely on personal experiences and grounded in the mistrust towards social institutions. In this talk, I explore an overlooked aspect of psychotherapy: how psychotherapists envision the social world and possible collective transformation. I approach psychotherapy as a cultural, i.e., meaning-making industry. My ethnographic and interview-based research, conducted at a therapeutic training centre in Russia from 2021 to 2022, reveals a prevalent ideal of a socially transformative 'therapised' subject and violence-free sociality. These ideals imply breaking the cycle of violence imposed by the state and family across generations and passing on new attitudes resulting from therapy to future generations as a sort of heritage, ultimately making Russia a 'normal', i.e., 'European' country. I investigate ethnographically the implications and tensions of pursuing these ideals amidst the major disruptions caused by the pandemic and Russia's war against Ukraine.

The health and cultural value of House of Memories Cymru

Steve Nolan, Rafaela Neiva Ganga, Pouria Motalebi, Marcus Hansen

Liverpool John Moores University, United Kingdom

House of Memories is a museum-led dementia awareness training for dementia carers. Since 2012, House of Memories evaluations have consistently shown positive outcomes, including i) increased awareness; ii) carers improved wellbeing; iii) improved capacity for critical and creative care; and iv) increased cultural engagement (Ganga & Wilson, 2020). Nonetheless, peer-reviewed evidence to inform policy is limited, and further research is required to advance the field.

248

This paper aims to provide evidence of the effectiveness of House of Memories Cymru in i) connecting Welsh museums with the health and social care sector; ii) improving the wellbeing of older people and those living with dementia (PLWD); and ii) placing Wales as a dementia-friendly destination.

This mixed-methods pre-post study comprises two surveys, pre and post-House of Memories Cymru Training, for health and social care professionals and family carers in Wales. It includes quantitative profiling, Dementia Core Skills Training, and measures of subjective well-being. Two post-training focus groups assess the impact on dementia care skills.

The paper provides empirical evidence of the effectiveness of the House of Memories Cymru in informing the implementation of the Welsh Governments Programme for the 6th Senedd, demonstrating how House of Memories Cymru development skills to facilitate PLWD and their carers (partners/family) to visit Wales; and those living in Wales: i) better quality of life; ii) retention of Welsh language skills, through the implementation of digital innovation (House of Memories app – co-designed by PLWD, use museum collections for reminiscence with carers) supporting carers and PLWD to live better.

RN07 | T06_01: Culture, politics and polarisation

Culture Wars as a Libidinal Economy of Impotence

Joost Van Loon

Katholische Universität Eichstätt-Ingolstadt, Germany

Opportunistic and often cynical practices of imitating White-Nationalist authoritarianism in the USA, amplified an unholy alliance between Trump and the Republican Party, have started to have a serious impact upon European public culture. Fermented by a radically eroding lack of trust in the existing national and international institutions that have consolidated a neo liberal order over the last five decades, a new national-identitarian ethos has emerged that openly rejects the very idea of a common humanity, let alone a shared planetary existence. Being good social liberals, many sociologists have continued to mix sociological analyses with normative standpoints rejecting this ethos and subsequently found themselves entangled in so called "culture wars" that have placed them under the suspicion of indoctrinating their students with "woke ideology". Instead of understanding culture wars as either an autonomous event or derivative of neoliberal political economy, this paper offers a theoretical exploration of the libidinal economy of impotence (Berardi, 2017). By focusing on the production and circulation of desire, this analysis aims to sidestep the stalemate between moralism and cynicism and provide a radical alternative to the unholy alliance between sociology and liberal pluralism. Simultaneously, by foregrounding the concept of desire as pivotal to analyses of cultural processes, I hope to contribute to the ongoing development of this particular domain of the discipline of Sociology.

249

Exploring Incels: A Sociological Inquiry into Ethical Approaches and Methodologies for Interviewing Self-Identified Incel Men

Kirsti Inkeri Sippel

University of Turku, Finland

Incels, short for involuntarily celibate, are men who struggle to form romantic and sexual relationships. Incels operate within the manosphere and share a male supremacist ideology characterised by the glorification of violence against women, entitlement to sexual fulfilment, and masculine dominance hierarchies. As incel networks mostly function in the digital realm, research on incel culture has largely centered on examining online discussions. Methodologically, the emphasis has been on employing both qualitative and quantitative approaches, with some studies incorporating email interviews. While face-to-face interviews offer numerous scientific advantages, they also present ethical

and practical challenges. However, live interviews provide in-depth information on a still-under-researched topic, enabling researchers to ensure that the respondent is not an online troll, ask complex questions, and better understand men identifying as incels. With a focus on methodological challenges, this research aims to address the ethical and practical aspects of interviewing a marginal, possibly hostile, group in a live setting providing examples of in-depth interviews conducted on Finnish incels during 2022 and 2023. Special attention will be given to concerns regarding the participant's privacy, establishing a trusting environment with participants who may be initially untrusting, and ensuring both the physical and emotional safety of the researcher.

Media Use, Cultural Orientations and Support for Right-wing Populist Political Parties: Comparing Nine European Countries

Marc Verboord[1], Riie Heikkilä[2], Susanne Janssen[1], Semi Purhonen[2]

1Erasmus University Rotterdam, Netherlands, The; 2Tampere University, Finland

In the past decades, right-wing populist political parties have become increasingly prominent in European politics. These parties often have political agendas which promote xenophobia, intolerance toward minority groups, anti-elitism, and even anti-democratic sentiments. This paper studies how media use and cultural orientations predict right-wing populist voting from a cross-national perspective. By examining the populist party support in nine European countries we increase our insight in how contextual elements shape the impact of culture. We advance on existing studies through a more fine-grained analysis of digital media by distinguishing between online news websites, social media and video platforms. Furthermore, taking a cue from political science work on cultural grievances, we compare various dimensions of culture that potentially predict right-wing populist voting (e.g. conservative values, domestic cultural orientation). We employ survey data collected in 2021 as part of a large European research project in Croatia, Denmark, Finland, France, the Netherlands, Serbia, Spain, Switzerland, and the United Kingdom. These European countries differ, among other things, in terms of their media systems and dominant socio-cultural value orientations, yet in all countries populist parties are active. We conducted a multilevel analysis with right-wing populist party support as dependent variable. The (preliminary) results show differences between using public television broadcasters and press (less populist voting) and commercial television and online video platforms (more populist voting). We find also clear effects of cultural variables, both cultural values and cultural consumption. However, there are also cross-national differences in how right-wing populist voting can be explained by these factors.

Illiberal Cultural Policies in Contemporary Spain: A Case Study of VOX's Parliamentary and Executive Actions

Mariano Martín Zamorano Barrios

University of Barcelona, Spain

This paper delves into the realm of illiberal cultural policies within the context of contemporary Spanish politics, with a particular focus on the VOX party. While existing literature has started to explore cultural policies implemented by illiberal governments in countries like Hungary and Poland (Bonet & Zamorano, 2021), the unique features of such policies in Spain remain largely unexamined. Moreover, the cultural dimension of populism and the radical right has been partially addressed in current research, often overshadowed by topics such as immigration and economic policies (Bozóki, 2017; Mudde (2016).

Focusing on VOX's rise to power in Andalusia after the 2018 elections and its subsequent impact on public discourse, this presentation employs a content analysis methodology supplemented by policy analysis. It uses documentary analysis and qualitative interviews with key stakeholders (5). The study scrutinizes parliamentary speeches and projects from 2019 to 2022, shedding light on the cultural policies advocated by VOX in the Spanish Congress of Deputies and their execution at the regional level in the Government of Castilla y León since 2022.

The research posits two hypotheses: first, a revival of the fascist notion of the traditional family and its core heritage flags, such as bullfighting, as a foundational cultural marker of cultural action in Spain, and second, a potential continuity with liberal cultural policies historically upheld by the traditional right, notably the Popular Party, albeit framed within libertarian rhetoric. By identifying exclusionary mechanisms and agents supporting this political project, the study aims to unveil the constitutive dimension of local cultural policies in the Spanish State and its singularity concerning the growing landscape of neo-authoritarian cultural policies worldwide.

RN07 | T06_02: Cultural responses to social tensions and divisions

Stand-up Comedy as a Site for Tension and Transformation

Carolina Silveira

Canterbury Christ Church University, United Kingdom

Taking British Stand-up comedy as the object of analysis, this paper explores the political possibilities and limitations of comedy. Stand-up comedy is recognised by many academics as a form of social commentary that can affirm or subvert cultural norms, or at the very least, can act as a 'social thermometer' that tells us what is going on in society (Davies, 1990; Silveira, 2021). As such, stand-up comedy is highly relevant for cultural sociologists, despite being an under-investigated area of study. This paper takes a critical look at the transformation of British stand-up over the years, from 'alternative comedy' to mass market commodification (Sutton, 2021; Quirk and Wilson, 2022). It also investigates stand-up comedy's potential to be 'political' (Quirk, 2016; Holm, 2017) and affect social change in an era of cynicism and post-truth. This study uses a discourse analysis approach and draws its data from live stand-up comedy performances at the Brighton Fringe Festival 2023/24. It also examines past comedy studies literature and publicly-available data such as Fringe Festival Annual Reviews to analyse the political economy of UK comedy.

Social Divisions In The New Forms Of Digital Cultural Consumption. The Case of Musical Streaming In Portuguese Society.

Telma Talina Mendes

ISCTE-IUL, Portugal

The disruption of the traditional models of the music industry and its gradual transition to the technological model has led to countless changes in the way music is consumed, produced and shared. With the increasing use of online platforms to consume music, the fluidity between the individual and technology has brought new dynamics to the specific practices of this consumption. This research aims to understand how the use of the Internet and its practical applications have been incorporated into cultural consumption, with a specific focus on music consumption. It also aims to present the different polarisations that can be found in these new online practices – especially in terms of age group, education and class – and to explore the implications that these different segmentations can have and how they manifest themselves, while trying to understand the reasons for their existence. To do this, we will present data from the 2020 Portuguese Cultural Practices Survey

(conducted by the Institute of Social Sciences of the University of Lisbon – ICS-UL), which has a representative sample of the Portuguese population aged 15 and over. The latest operationalisation of the ACM model, according to Costa and Mauritti (2018), will be used to divide the socio-professional classes that exist in Portugal. In summary, this presentation aims to discuss new forms of cultural consumption, especially those related to online music practices, and the divisions that have been and are being created thanks to these recent social phenomena.

Moral Responsibility and Music Festival Curation

Jo Haynes[1], Ian Woodward[2]

1University of Bristol, United Kingdom; 2University of Southern Denmark

Music festivals have become a ubiquitous aspect of music economies and wider cultural processes of participation and regeneration. On the one hand they are framed as authentic spaces for community, connection and celebration. On the other, they are now at the centre of various tensions about the environment, social inclusion, migration, commodification, and digitisation. In this context, we seek to reframe understandings of the possibilities, strategies and tasks of the contemporary music festival via ideas about moral and civic action. Drawing on the cases of three festivals in Britain and Denmark and data from interviews with organisers, we explore how and why the music festival is now compelled to adopt an emblematic role in addressing a wide range of social, environmental, political and cultural issues. Whereas classical literatures on festivals emphasised liminality, boundary-crossing and freedom, contemporary literature has yet to coherently address festivals as a working surface for negotiating sociocultural and political issues and imagining alternative futures. Our analysis highlight elements of festival organisers' practical management of bodies, objects and spaces, before pointing to the major analytical contribution this paper makes centred around moral discourses associated with curation, and the alignment of business with ideological and cultural components of festival making. We emphasise the moral dimensions underpinning conceptual and practical aspects of music festival production and demonstrate that festivals are a moral frontier for sharpening values and habits of responsibility and civic action.

251

RN07 | T06_03: National and ethnic identities

Feeling the Nation and Politics: Taiwanese Popular Music in China

Chun-ming Huang

National Chengchi University, Taiwan

Taiwan's pop music is enormously popular in China. This has been neglected in the literature. This paper aims to examine the reasons why this success has taken place, while hostile political relations remain. Based on interviews conducted in Beijing, Shenzhen and Guangzhou, a total of 74 Chinese people born after the Opening-Up and those experienced the Cultural Revolution, this study illustrates how there exists a multi-mediated structure of feeling about disputed national identities towards Taiwan's pop: On the one hand, some fans idealise Taiwanese pop as a "better version" of "Chinese pop" and produce reflexive resources to feed into their understanding when thinking about Taiwan and China; on the other hand, when Taiwanese pop contradicts their patriotism, they may propose a variety of consumerist sentiments, negotiation and conflicts, highlighting the importance of nationalism. This study positions Chinese fans' perceptions of Taiwanese pop as a paradox of foreign and national cultures. How music audiences listen to Taiwanese pop is related to their imaginative strategies of Taiwan, requiring a "meaning-centred" sociological understanding of culture. Since the ambiguous and still unresolved relations between China and Taiwan today have made some Chinese audiences ambivalent towards Taiwan and its cultural product. This study suggests that the development of Taiwanese pop in China may have benefited from that dilemma, and identifies the powerful of connection and contradiction of national identity and identity vis-à-vis music so that the music experience can be rendered into a political experience. This shows that Taiwan's popular music in China is a co-production, intertwined with both sides' political practices.

Far-right Movements in European Capitals of Culture: New Challenges to Democracy

Pedro Menezes

University of Porto, Portugal

This work intends to discuss the emergency of far-right movements in European Capitals of Culture (ECOC). Attributed since 1985, ECOC is an accreditation that the European Union annually gives to cities of the continent that use culture as a tool of social, urban and economic development. Simultaneously, the title celebrates the diversity and the unity of the continent: in the one hand, plurality is stimulated, since the specificities of each ECOC are stressed; in the other hand, singularity is promoted, given that all these different cities are integrated in one single network of ECOCs. Parallel to that, Europe has been watching the rise of far-right movements. This new conservative wave supports antidemocratic agendas, that threat ECOC's values: if ECOC stands for tolerance, balance between diversity and integration, and looks for a pan-European horizon, these movements resort to racism and xenophobia. In face of this conflicting landscape, this work aims to analyse this overlapping of these two opposite tendencies: the rising of far-right movements in ECOCs. Contrary to what one might suppose, instead of rejecting the ECOC title, these conservative groups are trying to appropriate it, rebrand it and use it according to their own interests. This suggests that the idea of culture is not being denied, but disputed. Comparing three ECOCs that are dealing with this issue (Chemnitz, Trencin and Timisoara), I ask: how do these far-right movements and the ECOC's commission deal with each other? In times of Brexit, a war in the continent, and crises of the original European project, how does the EU face this challenge to democracy and to its founding values?

The Process of Constructing Polishness and National Identity Using Engaged Clothing. Visual Content Analysis

Jowita Baran

Jagiellonian Uniwersity, Poland

252

The proposed presentation will focus on the analysis of different, often full of tensions and contradictions, visions of national identity. I have observed a recent trend in Poland of "engaged clothes", i.e., clothing whose content (colours and prints) pertains to current social issues that are significant to specific groups of people. I examine these every day, banal items with the aim of addressing a question: what visions of national identity do they reproduce? What symbols and combinations of symbols are used in clothes?

I look at these specific clothes – patriotic, rainbow, feminist, and leftist – and point out that all these popular clothing "styles" take part in the active reproduction of national identity – although each of them does it using their own unique combinations of symbols. The presentation will be based on content analysis of photos of products sold by the engaged stores (over 2,500 products).

The focus of the presentation is how national identity is reproduced through banal elements of everyday life, and how different visions of it and different ways of these processes can be observed. Referring to the ethnic-civic continuum of constructing national identity I will draw attention to the „mess of the nation", which is expressed in the coexistence of different visions of national identity within one nation, and to the ambiguity of symbols, including: national symbols that can mean not only different, but even contradictory ideas.

When Does Ethnicity Become Important? Symbolic Boundary Making Between the 'established' and the 'outsiders' of Radical Right Voters in Small Flemish Towns.

Ona Eliza Schyvens, Stijn Oosterlynck, Gert Verschraegen

University of Antwerp, Belgium

The starting point of this article is that processes of so-called 'superdiversification' are no longer confined to large 'gateway' cities, but have recently spread to peripheral areas and small and medium-sized towns (SMSTs). While individuals increasingly belong to multiple, sometimes overlapping symbolic categories, these rapid demographic transitions can also create strong symbolic boundaries between minority and majority ethnic groups. This is particularly the case for SMSTs in the Dender region, which are experiencing a more recent and faster process of superdiversification that is linked to spatial, demographic and housing market developments in Brussels and giving rise to local radical right parties. Despite the growing scholarly attention to symbolic boundaries between the 'established' and 'outsiders', the boundary-making processes of radical right voters have received little attention and have only been studied in large cities. Therefore, this article uses the conceptual framework from cultural sociology (symbolic boundary work) to explore how radical right voters draw symbolic boundaries between groups, taking into account the interplay of multiple and emerging dimensions of difference, including migration status, length of residence, ethno-national, ethno-racial and cultural markers. The study is based on multi-sited ethnographic observations, which are complemented with 20 semi-structured interviews.

RN07 | T07_01: Public spaces, monuments and memory

The Curious Case of Atrium Urbanism

Paul Jones

University of Liverpool, United Kingdom

All produced spaces are curious since they could, by definition, be different. Atriums – double height or greater vertical voids typically to be found in skyscrapers' lobbies – are an interesting illustration of this general contention. An internal feature of super-tall architecture the world over, the atrium flourishes in parts of cities where land value is high; given that atria could be occupied with directly rentable space, the voided volumes of this architectural feature are ostensibly puzzling.

Drawing primarily on the ideas of Henri Lefebvre and Walter Benjamin, this paper suggests that the presence of atria in major commercial – and increasingly public – buildings in cities the world over grows from oblique attempts to generate surplus value. Paradoxically, it is the ostensibly empty space of the atrium that is key to explaining this strategy. The tension between 'empty' (more properly voided) space and surplus value is a crucial here; the argument is that voids of open space can actually increase the value of objects, bodies, and practices that are assembled in and around them. The intriguing possibility that air itself can be monetised in a context of rentier capitalism suggests a tension between the formal architectural openness and flexibility of the atrium and the the hard, bounded and exclusionary nature of the space in practice. Defamiliarising the atrium – a distinctive and singular architectural feature of this moment – suggests a wider research agenda for those interested in critical analysis of the seemingly contradictory spaces that are produced when capital builds.

The Death of the Monument or the Never-Ending Battle over the Post-WWII Memories

Svetlana Hristova

South-West University, Bulgaria

The subject of the current paper is the symbolic battle of interpretations around the Soviet War Memorials commemorating the end of the WWII, which could be found until recently in different European countries where the Red Army has passed during its march to Berlin in 1945. After the fall of the Iron Wall, these monuments have been growingly contested and some of them – removed, a process which received a new vigour after the Russian invasion into Ukraine on February 24, 2022. The story will be narrated through the recent demolition of the Monument of

253

the Red Army, raised in 1954 in the heart of the Bulgarian capital Sofia, spectacularly cut into parts with a flex and removed from the Sofia public space just before Christmas 2023. The event unleashed new waves of symbolic confrontations and public protests: monument had to be guarded by military forces days and nights in order to be disassembled and removed from its pedestal. By comparing the public city policies towards different WWII monuments such as the Soviet War Memorials in Viena (1945) and in Berlin (started in 1945 and completed in 1949), and the Liberty Statue on the Gellert Hill in Budapest (1947), the analysis will differentiate three main approaches to the Soviet War memorials which reflect not only three different regimes of cultural commemoration of the WWII, but also three different intepretative canons of the presence.

Women's Role in Preserving Identity and Intangible Cultural Heritage in Arbëresh Communities of Calabria.

Rudina Hoxha (Duraj)

National Centre for Studies on Arbëresh [Albanian] Communities (QSPA)

The purpose of this paper is to consider, from a sociological perspective, the existing relationship between identity and culture refers to the specific situation of women belonging to the Arbëresh communities in Italy, who were settled in different regions of Italy after the Ottoman invasion of Albania, during the 1400s until 1700s. A major part of the society's collective memory is women's intangible cultural heritages. Women's cultural heritages are collections of oral histories, songs, narrations, dances, and culinary and traditional knowledge that are preserved and passed from one generation to another, to document and honor the contributions of their communities. Over hundreds of years of historical and cultural social transformation, women in Arbëresh communities managed to synthesize their role in preserving their identity and cultural heritage. The purpose of this article is to highlight the role of women in the preservation of the cultural heritage of Arbëresh communities, using interviews as a research method to gather qualitative data.

RN07 | T07_02: Lifestyle and inequalities in the field of education

A New University, New Students, New Cultural Lifestyles? The Transformation of Norwegian University Students 1998-2020.

Jan Fredrik Hovden

University of Bergen, Norway

For Bourdieu and Passeron in their early work on social and cultural reproduction (Inheritors 1964, Reproduction 1970), the university offered a privileged site for studying the relations between social advantages and the use of culture. Traditionally, European universities have been crucial sites for well-to-do young peoples' experimentation with and socialisation for traditional highbrow, avant-garde, and popular culture, and with various forms of political engagement. In the last twenty years, the universities have been the site of several reforms and transformations, both of the institution itself (the Bologna process, the mass university) and the more overarching changes following the digitalisation of culture and new media, which have provided mass access to cultural products. Analysing three surveys on cultural practices of Norwegian students from 1998, 2008 and 2020, this paper explores the changing historical relationship between the students' social class, their use of and relation to the university system, and their cultural lifestyles, using multiple correspondence analysis. Some important results are the surprisingly robust nature of class structuration of their lifestyles, the falling importance (but not disappearance) of the use and knowledge of art as an important cultural distinction, and the increasing disenchantment and detachment to both the traditional (legitime) national cultural sphere and the university itself. While access to the university per se has been somewhat democratised, this social expansion has also led to increasing social differences in students' careers, living conditions and cultural lifestyles.

Creative Work and Class Inequalities: Are Universities the Problem?

Orian Brook[1], Dave O'Brien[2], Mark Taylor[3]

1University of Edinburgh; 2Unviersity of Manchester; 3University of Sheffield

The class crisis in creative work in the UK is well-established: people working in creative roles are disproportionately likely to have grown up in middle-class households; this is a longstanding issue, and that interacts in important ways with other dimensions of social inequality, such as gender and ethnic group.

Education is often posed as a means of countering these inequalities. If advantages are embedded through the family, the education system can do its part to level the playing field: this is particularly acute at higher education, given the clear majority of creative workers who hold degrees. However, higher education is also a means through which social inequalities can widen, through the application process, through courses themselves, and through differences between institutions.

We therefore ask: are universities mitigating or exacerbating the class crisis in UK creative work?

We use administrative data from the UK. First, we show the class imbalance in applications to creative courses in the first place, comparing them with the actual student body of these courses, distinguishing between creative courses and comparing them with higher education more generally. We then compare across three major groups of institutions: the Russell Group, a lobby group comprising 24 research-intensive universities; other universities established prior to 1992; and institutions that received university status in 1992 or later. Throughout, we show that class inequalities are not isolated, but also contribute to ethnic inequalities.

Through this combination of approaches, we show that the education system is not simply a channel through which inequalities persist, but an accelerator of inequalities.

Institutional Culture and Effectiveness in Higher Education in the Light of Faculty Members's Perceptions

Zsuzsanna Demeter-Karászi[1], Gabriella Pusztai[1], Katalin Pallay[2]

1University of Debrecen, Hungary; 2Ferenc Rákóczi II. Transcarpathian Hungarian College of Higher Education, Ucraine

Higher education in Central and Eastern Europe is undergoing another major transformation, with an important element being the increase in the proportion of endowed institutions and the introduction of competitive performance assessment for higher education staff, with the promise of differentiated pay, which is being introduced in institutions across the region. There has been a lot of research on the impact of the private business-sector model and the changes in higher education work, but it rarely takes into account the institutional community to which the faculty members belong and the organisational culture of that community. We hypothesise that this in turn will significantly determine the response to the challenges. In order to test our hypothesis, we link the meso – and micro-levels, so institutional and individual views, and examine whether institutional culture and the perception of faculty members effectiveness are related. Our research questions relate to their homogeneity and context, and in order to answer them we conducted qualitative research, analysing the text of focus group interviews with 41 higher education teachers. The main findings of the research show that, despite the same social, policy and territorial challenges, there is a very

diverse institutional culture in the institutions, and a great diversity in the views of faculty members on effectiveness. Views on institutional culture and effectiveness are related but not exclusive. Our findings may be important for higher education policy makers to monitor and manage the impact of change.

Educational Goals of Young Palestinian Women in East Jerusalem: A Study of Patriarchal Landscapes

Al-Khansaa Diab

The David Yellin Academic College of Education, Israel

This research examines the complex social dynamics encountered by young Palestinian women in East Jerusalem as they pursue higher education in Israeli institutions. Against cultural and political intricacies, their narratives reveal interplay among gender, education, and societal norms. Central to this study is their negotiation with patriarchal authority, particularly fathers and extended family, to gain trust and support for their educational aspirations. The research articulates these women's experiences, emphasizing their resilience and agency in challenging traditional gender roles and expectations.

The study unravels these women's multifaceted negotiation processes by employing in-depth interviews and thematic analysis. It illuminates their academic obstacles and the complex persuasion tactics employed, where respect for familial and cultural values is deftly balanced with educational ambitions. This negotiation gradually shifts family and societal perceptions, especially regarding women's roles and capabilities in higher education and broader society.

The study contributes to the discourse on women's education in conflict zones, highlighting the tension in the role of family and social networks in educational pursuits. It demonstrates how conventional patriarchal structures can be navigated and sometimes reshaped to align with new aspirations for female empowerment and education. Additionally, the research provides insights into women's negotiation tactics in traditional societies, framing these negotiations as part of their agency and strategic action.

Beyond its local context, this research offers a perspective for examining similar phenomena in regions experiencing cultural and sociopolitical conflict. It underscores the importance of addressing gender-specific educational barriers and suggests global strategies to support young women in similar contexts.

RN07 | T08_01: Reading cultures

Not Sharing. Reading And Interiority in the UK

María Angélica Thumala Olave

University of Edinburgh, United Kingdom

Much of the scholarship about reading practices of the past decades focuses on sharing. The interactions taking place in book groups and book clubs, between customer-reviewers on social media, at literary festivals, book talks and mass reading events are examined in order to counter what sociologist Elizabeth Long (2003) called 'the ideology of the solitary reader'. Aligning itself with developments in literary criticism and book history, the sociology of reading discovered that readers are social beings. In its enthusiasm for new sites where to investigate the observable expressions of reading, including the paratextual devices that sustain book markets, the sociology of reading has in important ways neglected the transformations taking place within the reading self, an unquestionably social entity. Focusing on the accounts by readers in the UK from different backgrounds and age-groups (using interviews and the archive of the Mass Observation Project), I explore the stance of readers who withhold their response to books in two ways: avoiding or abandoning book clubs and keeping for themselves the aesthetic-ethical impact of their favourite or most significant books. When these two stances overlap we observe the drive to protect sacralised, "personal" or "intimate" experiences, possible interactions with texts which emerged with the notion of the modern self and its literary correlate, the novel (Taylor 1989). The paper will dwell on the interplay between the desire to protect the reading experience from pollution by sharing and the ever-strong cultural imperative of self-expression.

Independent Reading Mediators: Differences, Definitions, and Motivations

Mariana Martins[1,2], José Soares Neves[1,2]

1Iscte – CIES – Centro de Investigação e Estudos de Sociologia; 2OPAC – Observatório Português das Atividades Culturais, Portugal

For the research "Reading Promotion Practices: Survey of Reading Mediators in Portugal", exploratory interviews were conducted with a plurality of individuals whose activities are linked to reading. The identification of a multitude of reading mediators underscores the need to explore and detail their differences, paying closer empirical attention to the stratification and differentiation within this category, considering their dispositions, professional contexts, and the impacts of their practices. Regarding the definitions of reading promotion and mediation, there is a diversity of interpretations, with some authors choosing to use both terms interchangeably. Given the multiplicity of professions represented by the interviewees, there is a question of whether all can be categorized as reading mediators or if some predominantly play a role more aligned with reading promotion than mediation per se. In this regard, more specific definitions of the terms are necessary. Once this differentiation is made, how can we categorize those who are promoters and those who are mediators of reading? These are aspects that we aim to address in this article. We will deepen our analysis of the figure of the independent mediator, seeking to understand, through their practices, trajectories, and discourses, their motivations, dispositions, and positions in the field of mediation. The goal is to understand the choices of these professionals, unveiling the reasons that drive them to pursue this profession, based on the intersection between the notion of vocation (Dubois, 2013) and cultural capital (Bourdieu and Passeron, 1992; Bourdieu, 2016), as well as to comprehend more deeply the nature and significance of this unique profession within the system of professions (Abott, 1988).

Reading Mediation: Policies, Agents, and Professional Practices

José Soares Neves, João Trocado da Mata, Mariana Oliveira Martins, Miguel Lopes

CIES_Iscte, Portugal

256

This communication discusses the practices and role of reading mediators as a professional category situated at the intersection of culture and education. From a broader context of cultural intermediation to a more specific one of reading mediation, the aim is to explore the functions of these agents within the chain of creation-manipulation-transmission of symbolic goods (Bovone, 1997, 105). This includes their role as key agents in the process of cultural legitimation and the formation of tastes (Bourdieu, 1984, 1996) to promote reading for pleasure. Ultimately, a categorization of reading mediators is proposed, considering the multiplicity of functions, institutional contexts, and professional backgrounds of these agents.

The main theoretical references for this study are the sociology of reading and reading practices, considered as a cultural leisure practice (Lopes, Neves & Ávila, 2021, p. 649). The analysis focuses on reading mediators (Griswold & Wohl, 2015; Petit, 1999), their professional and institutional contexts, and reading promotion practices (Alçada, 2021; Martinho, 2013; Neves, Lima & Borges, 2008; Neves & Lima, 2009).

This communication is part of the ongoing research "Reading Promotion Practices: Survey of Reading Mediators in Portugal," promoted by the National Reading Plan 2027 (PNL2027). The research is conducted within the framework of the Portuguese Observatory of Cultural Activities (OPAC) in 2022 and 2023.

Evolution of Reading Practices Among School Students in Portugal (2019-2023)

João Trocado Mata, José Soares Neves, Patrícia Ávila, Miguel Ângelo Lopes

Iscte-iul, Portugal

Sudies on the reading practices of school students have been revealing a decrease in the indices of leisure reading in recent decades (OECD, 2010, 2019, 2021; Clark and Picton, 2020), with this decrease being more pronounced among boys (Clark and Rumbold, 2006; OECD, 2010, 2019, 2021; Clark and Teravainen-Goff, 2020; Cole et al., 2022), with age and throughout the levels of education (Baudelot and Cartier, 1998; Lopes, 2003; Mullis et al., 2012; Baudelot, 2014; Kurcirkova and Cremin, 2020).

The main objective of this presentation is to analyze the evolution of reading practices for pleasure (Clark and Rumbold, 2006; Cremin, 2007; Clark and Teravainen, 2017; Monge and Quesada, 2019; Melo, 2020; Kurcirkova and Cremin, 2020; Merga, 2021) among students enrolled in primary, lower and upper secondary education in mainland Portugal between 2019 and 2023, namely, before and after the establishment of exceptional and temporary measures in the field of education, within the scope of the Covid-19 pandemic. This presentation also aims to deepen the available knowledge on reading among young school-age individuals in Portugal (Lages et al., 2007; Mata, et al., 2020; Mata, et al., 2021) and to contribute to the mapping of new frameworks for the development of this practice, within the context of the growing importance of information and communication technologies (Cardoso, 2013; Martins and Garcia, 2016; Octobre, 2019; Merga, 2021).

The research privileges a quantitative methodology, resorting to the analysis of data from two large survey operations. Each survey was administered to a national representative sample of primary, lower and upper secondary students in mainland Portugal of more than 20 thousand respondents.

RN07 | T09_01: Beauty standards

Beauty Standards As Cultural Capital: A Contextual-Comparative Study Of Beauty And Symbolic Boundaries In Accra, Brussels, Buenos Aires, Hong Kong and Tehran

Giselinde Kuipers, Emmanuel Narh, Sanne Pieters, Narges Pirhayati, Carolina Rabasa Rucki, Wanying Zhou

KU Leuven, Belgium

A growing body of research shows that physical appearance or 'aesthetic capital' is an important resource in today's media-saturated, service-oriented, consumer societies. However, most of this research assumes a wide consensus on beauty standards, arguing that 'objective' beauty brings economic and social rewards. In this presentation, we investigate if and how beauty standards function as cultural capital: variable cultural standards that mark symbolic boundaries and social status. Moreover, we investigate how this varies across contexts, hypothesizing that beauty standards are more likely to function as status-related boundary markers in more diverse contexts.

In this presentation, we first explain the construction and design of a context-specific

instrument for studying beauty standards in five global cities on four continents: Accra, Brussels, Buenos Aires, Hong Kong and Tehran. In close collaboration and using a strictly defined set of criteria, we have designed five sets of visual Q-sort decks that allow us to trace variations (and similarities) in beauty standards for bodies and faces of women and men in each city. These Q-decks form the basis of interviews that simultaneously provide a quantitative mapping of standards across social categories, and qualitative analysis of repertoires of evaluating beauty.

Second, we will present the first results of these studies, which will be carried out between January and July 2024. We will do 40 Q-interviews among a stratified sample of the population of each city. For every city we will present the result of a factor analysis showing the main taste patterns and their relation to main social divides; the degree of consensus or variation in beauty standards; and the main repertoires of evaluation of beauty.

257

The Beauty Of Being Elite: Physical Appearance, Beauty Taste And Status (Re)production Of The Political Elite In Buenos Aires

Carolina Belen Rabasa Rucki

KU Leuven, Belgium

We all know not to judge a book by its cover. Yet, it appears society can't escape beauty, defined as an ever-present set of aesthetic evaluations over physical appearance deeply rooted in cultural repertoires (Kuipers, 2015; Lamont 2000). In this presentation, we introduce our ongoing line of research on beauty and inequality through the political elite of Buenos Aires (Argentina), as an elite group that transpires within a field that is highly influential over Argentinian culture.

Firstly, we introduce the importance of studying beauty through elites in a peripheral setting, as it presents new perspectives on its link with social inequalities, hierarchies and classifications. Secondly, we focus on the role of the elite's beauty taste when it comes to looking good and looking right. Here, beauty taste is presented as dispositions on embodied cultural capital and strongly related to status (re)production processes. Thirdly, we focus on a micro-interactional level to investigate the role of evaluations over appearance. Particularly, around boundary-drawing micro-mechanisms such as code-switching and gatekeeping, wherein aesthetic appearances become an essential element for the elite group members' status reproduction.

We present an ongoing research design that uses qualitative methods to understand the dynamics around the politician's public image. For this, we combine observational shadowing techniques and interviews with the politicians themselves, their press teams and aesthetic assistants. By doing so, we aim to understand how looking good and looking right works, accounting for class and gender variables, regarding the (re)production of their status as political elites.

Evaluations of Beauty: Analyzing the Association of Gender and Social Class in Perceptions and Evaluations of Physical Appearance

Anna Grahn, Outi Sarpila

University of Turku, Finland

Physical appearance has gained increasing interest in the field of sociology in recent decades. In cultural sociological research on appearance, there has been a particular focus on the embodiment of social class. This focus extends to the evaluation of appearance, which is, in essence, considered 'double embodied' meaning that people both assess others but also undertake body and beauty work in alignment with their own aesthetic dispositions. Based on previous research, we know how differences between social classes become apparent, especially along the thin-fat axis, and for men, also along the muscular-non-muscular axis. In contrast to earlier sociological research, this study also examines the latter aspect concerning women. We analyze to what extent the fit body ideal has emerged alongside the thin body ideal for female bodies, and the significance of muscularity from the perspective of double embodiment. We use unique survey data collected in 2023 (N=349). In the survey, respondents were presented a female figural scale portraying 11 images of female bodies varying in body fat and muscularity. Respondents were asked to choose the most and the least beautiful body and the body that they thought would correspond to their idea of a middle-aged Finnish woman on average. Also, female respondents were asked what body type reflected best their current body. Our preliminary results suggest that the respondent's social class and gender are associated with the evaluation of physical appearance. In particular, the differences are larger between social categories when assessing the least beautiful body.

RN07 | T09_02: Cultural consumption and commercial tensions

Cultural Resurgence: Romanian Brands as Custodians of Tradition

Mara Georgia Lixandru[1], Nicoleta Elena Apostol[2]

1University of Bucharest, Romania; 2University of Bucharest, Romania

The following article comprehensively explores the pivotal role of Romanian brands in preserving and revitalizing cultural traditions, situating the investigation within the existing literature on the symbiotic relationship between brands and cultural heritage. Drawing on contemporary sociological theories that underscore the transformative power of brands as cultural intermediaries (Goh et al., 2016)—shaping collective memory and identity, and functioning as both preservers and innovators in the dynamic interplay between tradition and modernity—the research utilizes the qualitative case study method to scrutinize the strategies employed by three Romanian brands (IIANA, IONA, and Vinarte). The discourse acknowledges the challenges posed by globalization to cultural heritage preservation, highlighting the potential of brands as agents of cultural continuity.

To delve into the intricate dynamics at play, the research adopts the case study method, a qualitative approach facilitating an in-depth examination of specific instances within their real-life context. According to Yin (2014), a case study is an empirical inquiry investigating a contemporary phenomenon within its real-life context, particularly when the boundaries between the phenomenon and context are unclear. This method offers a nuanced understanding of the strategies employed by three Romanian brands (IIANA, IONA, and Vinarte) in preserving and revitalizing cultural traditions.

The overarching research question guiding this study is: How do Romanian brands strategically contribute to the preservation and revitalization of cultural traditions, and what are the implications of their efforts in the face of globalization? Subsequently, the investigation addresses specific inquiries related to branding strategies, cultural symbolism incorporation, and consumer perceptions (Cova & Dalli, 2009) through these case studies, highlighting the strategies employed by these brands to revive and celebrate Romanian traditions.

Simplification and/or Stereotypization? Examining the "Toon Gaze" in Children Animated Series as a Cultural, Media and Commercial Tension

Silvia Leonzi, Giovanni Ciofalo, Michele Balducci

Sapienza University of Rome, Italy

The aim of the paper is to examine the complex interaction between production and representation in the children's animated series available on streaming platforms. In particular, the study focuses on the impact of this phenomenon on contemporary cultural and creative industries, with a specific focus on Italy.

The research, of which some first results were presented at the previous ESA 2021 Conference, is based on a four-year study that investigates a potential media disorder that arises from the creation, diffusion, and consolidation of media representations in children's animated series. The study explores the ethical-behavioral, aesthetic, and narrative aspects of animated series and examines the potential for cross-stereotyping and oversimplification. The study defines this type of cultural and media disorder as a possible "Toon Gaze," which also refers to the transmedia impact of the series available on the major SVOD platforms in Italy.

The research employs a dual approach, analyzing the content of over 300 episodes from 12 series targeting both preschool and older audiences (ages 6 to 12). This detailed investigation is followed by the construction of transmedia maps for each series, examining spreadability and extractability and exploring ancillary products such as toys, merchandise, and co-branding.

According to the study, simplification is often employed in children's content to make it more easily understandable and recognizable under commercial logics. However, this practice also perpetuates harmful stereotypes, and vice versa. This double tension, presented also from a transmedia perspective, defines "Toon Gaze" as a disorder that affects cultural, media, and social levels.

Compared to What? Repertoires of Comparison in the Cultural Construction of Reality

Galen Watts[1], Mischa Dekker[2], Thijs van Dooremalen[3]

1University of Waterloo, Canada; 2KU Leuven, Belgium; 3Leiden University, Netherlands

Comparison is ubiquitous in social life, yet some comparisons are far more common, institutionalized and influential than others. Inspired by work in cultural sociology, we call these repertoires of comparison (RoCs). RoCs are employed at different levels of society (local, national, global) and

259

across myriad social contexts (sports clubs, city offices, the media). For example, horrific events are frequently compared to the paradigmatic case of 9/11 to assess their gravity and Greenwich Village long served as a model neighborhood for city policy makers. Our aim in this article is to put RoCs on the sociological map. We argue that RoCs matter because they: a) encode and express moral judgements; b) shape our frames of reference; c) guide aspirations and aversions; and d) inform symbolic boundary drawing. We then discuss how RoCs emerge, become contested, and which social factors contribute to their transformation or replacement.

Inclusive Regulation of Cultural Supply: Strategies for the Implementation of the Cultural Consumption Basket

Agnese Hermane, Anda Lake

Latvian Academy of Culture, Latvia

Researchers in various contexts have theoretically and empirically uncovered the potential of cultural participation to foster more inclusive and socially cohesive communities (Warren and Jones 2018). To address the challenge of enhancing cultural access, a proposed solution is the introduction of a 'cultural consumption basket' which defines the groups of cultural services provided to inhabitants. Analysis of 2022 Latvian Culture Barometer data reveals noteworthy disparities in cultural consumption and participation, particularly among individuals with differing incomes, ethnic backgrounds, and across regions. The lowest participation is evident in sparsely populated border regions adjacent to Russia. The aim of the study is to identify cultural resource enhancement strategies for less privileged groups. Key research questions revolve around identifying cultural policy strategies that mitigate barriers to cultural access for at-risk groups and exploring the conditions under which the cultural consumption basket effectively addresses this issue. The theoretical framework is rooted in the challenges of decision-making regarding basket elements identified in cultural policy practice. The empirical research is based on an action research design. To test the feasibility of implementing a cultural consumption basket, an exploratory scenario planning approach was used in practice, with five case studies simulating iterative decision-making practices to develop stakeholder flexibility and adaptability in decision-making, allowing for adjustments based on feedback and changing circumstances. In line with Warren and Jones (2018), this methodology aligns with the assumption that selecting basket elements requires participatory, inclusive forms of cultural governance, involving distributed and discursive public decision-making strategies.

RN09 | Economic Sociology

RN09 | T01_01: Changing concepts and perspectives in economic sociology?

This session covers new concepts that have emerged in economic sociology over the last decades. We will discuss how they might contribute to the perspectives and field of economic sociology in the future

"The Commons: A Fresh Thought for Economic Sociology"

Andrea Maurer

Trier University, Germany

While some economic sociologists have started to introduce approaches from different backgrounds I'm going to ask how we can develop the core program in a way that allows us to deal with new questions/issues such as sustainability.

Economic sociologists have developed a successful research programme focusing on the social embeddedness of market exchange. However, economy sociology has not been able to deal appropriately with challenging topics such as climate change and sustainability in the use of resources.

How can we develop our core program in a way that allows us to deal with these new issues? After a review of new economic sociology's core ideas, I will suggest the Commons approach, which as a social science concept can be combined with our ideas and tools to allow us to deal more appropriately with the topics our global community faces.

We will see that the Commons approach broadens the perspective of market exchange by focusing on the common goal of restricting the overuse of scarce natural resources. In this session, we will explore and discuss the tension between societal and economic principles and discover when markets may not be an effective tool for organizing the economy.

Redefining the Public Dimension of Property

Jordi Mundó

Universitat de Barcelona, Spain

In contemporary sociology, the issue of property has lost the centrality it had in classical sociology. Also in mainstream economics, the concern with property has too often neglected a sound social and normative analysis, being more interested in the mechanisms of safeguarding private property rights than in their justification and in gaining an understanding of the historical processes that have given rise to them, including their hegemonies and resistances.

This has led to a pattern of analysis and discussion in the social sciences that tends to approach property as a solved political problem. This paper [1] will show how the persistence of a privatist conception of property, deeply rooted in economic, social and political interests, is also explained by an application of law that conceives public law as residual with respect to private law and that has developed an expansive notion of property through the principle of freedom of contract. [2] It will reflect on how legal realism and other social science developments have channelled a pluralistic, relational and integrated understanding of property in historical and social contexts, and promoted a recovery of the public dimension of property. [3] Finally, it will assess how this conception of rights enables a reconceptualization of the contemporary commons.

The political economy of the old industrial triangle: Genoa, Turin and Milan

Emanuele Nebbia Colomba

Sapienza University of Rome, Italy

The social sciences have developed various theoretical approaches to analyze the relationship between the state and the market. One of the most developed strands is "comparative political economy" CPE, which can be seen as an attempt to theorize different responses to the crisis of Fordist-Keynesian compromise: from industrial districts to varieties of capitalism till the "growth models". CPE has been criticized for "methodological nationalism" and is now opening up to the study of national sub-units (Fraccaroli, Regan, Blyth 2023).

This paper, part of my doctoral dissertation, seeks to make both a theoretical and empirical contribution to the literature.

In the 1960s and 1970s, the cities of the so-called "industrial triangle", Genoa, Turin, and Milan, pulled Italy towards a phase of steady economic growth known as the "economic miracle". However, with the crisis of the Fordist-Keynesian compromise, the three cities entered a crisis and made different development choices: Turin tried to focus on tourism and the organization of major international events, hosting the 2006 Winter Olympics. Milan is the city among the three that has become more financialized and can be categorized as a "global city". Genoa has tried with little success to revive its industrial apparatus. The paper is based on the triangulation of several key stakeholder interviews lasting an average of one hour each and analysis of policy documents and newspapers aimed at investigating the perceptions of local elites – mayors, parliamentarians, trade unionists, and industrialists – on the strategic choices made at three "critical junctures" from 1990 to the present.

261

Towards a Sociology of Innovation Ecosystems: Decision-Making Under Uncertainty Between Social Construction and Bounded Rationality

Simone D'Alessandro

University G. d'Annunzio of Chieti-Pescara, Italy

Starting from the Schumpeterian approach and arriving at the most recent anti-mainstream theories on Innovation Ecosystems, the research examines, through

theories, models, and business cases, the problematic relationships between Innovation, Invention, and Creative Processes in an attempt to understand, from a sociological perspective, the decision-making processes induced by expectations and uncertainties. Different schools of thought in economics, agree that innovation is the main driver of growth. Disagreement arises when economists attempt to explain how innovation occurs, as there is a lack of shared understanding about the expectations of its decision-makers and implementers. There is also a lack of understanding about the social and cultural constructions of decision-makers, which are influenced by conditions of uncertainty, mistrust, error, and "non-knowledge" (Gross, McGoey, 2015). The imagined innovation may be considered feasible in the start-up phase but fail during its development. The innovator, in an ex-ante phase, cannot predict how a new hypothesis will evolve. In many cases, as we shall see, he will remove the observation of obstacles, because he is influenced by beliefs and convictions that disregard rational choices, even bounded ones.

RN09 | T02_01: Imaginaries and concepts of economic transition

In this session we will have a closer look on how to theorize and view current transitions in the economy.

Beyond Utopian Visions: Unveiling the Complex Realities of Alternative Spaces in a World of Challenges

Ewa Zielińska

University of Warsaw, Warsaw

In the midst of contemporary challenges, this study explores the transformative potential of alternative spaces, positioned as catalysts for change amid the climate crisis, urban gentrification, and the commodification of both visible and invisible cultural values. Despite their perceived revolutionary potential, the intricate interplay between alternative places and socio-economic conditions remains inadequately explored, leading to a romanticized view of countercultural initiatives. This decade-long research, encompassing 206 alternative places in Polish cities, seeks to demystify this phenomenon. Through a wide array of sociological tools, it addresses pressing questions: What institutional mechanisms contribute to the ghettoization of these spaces, despite their professed openness? Why do engaged social actors often find themselves on the brink of self-exploitation? How do efforts to sustain spontaneous actions inadvertently create hidden circuits of norms and power? Furthermore, this investigation aims to unravel the feasibility of eliciting societal change through alternative spaces. Can these initiatives provoke meaningful shifts in public policies, or are they constrained by systemic forces? The comprehensive analysis draws from long-term participatory research, encompassing a leading initiative and 15 case studies from diverse regions of Poland. Qualitative text analysis of nearly 200 mission statements enriches our understanding. The results, interpreted within the frameworks of commodification (Harvey), institutional isomorphism (DiMaggio & Powell), and the capitalist spirit (Boltanski & Chiapello), provide nuanced insights into the dynamics shaping alternative spaces. As we navigate the complex landscape of contemporary challenges, this research contributes a vital perspective, examining the potential for grassroots endeavors to effect transformative change in diverse societal spheres.

262

Imaginaries and Conventions in Commensuration Work: The Financial Valuation of Social Values in Socially Sustainable Investing

Rami Kaplan[1], Zeev Rosenhek[2]

1Tel Aviv University; 2The Open University of Israel

This paper studies the commensuration work that serves as foundation for the operation of socially sustainable investing (SSI), a global field of financial activity that entails the inclusion of extra-financial factors related to particular social values into investment practices and products. We consider SSI as a field that is constituted by the interweaving between two orders of worth understood in society as separate and even hostile: the civic order of worth and a financialized version of the market order of worth. We postulate that the operation of SSI is dependent upon the commensuration work conducted by institutional actors who formulate imaginaries and conventions that inform the production and operation of market devices and products. We probe the imaginaries and conventions that constitute SSI, focusing on the ways in which they define rules of valuation through which extra-financial factors are financially valued.

At the empirical level, we examine the imaginaries and conventions formulated by Principles for Responsible Investment (PRI), an international multilateral organization composed by institutions in the financial industry in partnership with the UN that has played a central role in the development of the SSI market, especially by promoting principles, general standards, practical blueprints and tools. We analyze the repertoires of notions, categories, and causal and prescriptive models inscribed in documents produced by PRI that represent imaginaries and conventions addressing issues of commensurability between the two different orders of worth that constitute the field. The paper contributes to the study of processes of valuation from a pragmatic perspective, shedding light on the ways in which institutional actors conduct commensuration work between different orders of worth through the formulation and communication of imaginaries and conventions.

From Burdens of Ownership to Pleasures of (Co-)Use? Post-ownership as a Mediatised Discourse of a Socio-Economic Transformation

Juhana Venäläinen

University of Eastern Finland, Finland

Why are we repeatedly presented with the idea that owning tangible things is outdated and old-fashioned? In the 2010s and early 2020s, the concept of moving beyond the individual ownership of material possessions has emerged as a recognisable cultural trope, promising a socially and environmentally sustainable shift in consumption practices.

Instead of hoarding personal collections – and thereby contributing to overconsumption – the discourse promotes non-possessive practices such as leasing cars, borrowing tools from libraries, accessing culture and clothing through subscription services, and using shared vehicles to get around in urban spaces. Even household items and personal belongings have come to be seen as material surpluses that, because of their low rate of use, should be 'decluttered', minimised or recycled for new uses through sharing platforms.

This presentation explores how the discourse of post-ownership emerges as a cultural ideal that works to challenge and redefine the social and cultural meanings of ownership. It specifically approaches post-ownership through its mediatised representations, which articulate the practices of relinquishing ownership through multiple themes. The methodology is based on thematic and critical discourse analysis of a large dataset of articles published in Finnish magazines between 2010 and 2023.

In terms of cultural ideals, increased material ownership has traditionally been a marker of upward social mobility and implied the freedom of use one's belongings without external constraints. Conversely, the recent discourse of post-ownership frames material ownership as a burdensome obligation that limits personal freedom and hinders the achievement of life goals.

The Refeudalisation of Digital Capitalism

263

Christian Eberlein

Universität Hamburg (UHH), Germany

Scandals in recent years highlight how platform companies have exerted influence over the digital public sphere to advance their own (profit-driven) interests. Following Habermas, sociology has, thus, delved into the realm of digital capitalism, exploring the possibility of a new structural transformation of the public sphere. Building on Habermas' concept of refeudalisation, Sighard Neckel has pointed out that the rise of financial capitalism has led to a concentration of power, wealth, and recognition that bears similarities to what platform companies represent in digital capitalism in terms of economic and political influence.

Drawing from his conclusions, this presentation aims to investigate the emergence of neofeudal forms of power, recognition, and wealth distribution in digital capitalism. The findings reveal (1) a refeudalisation of the economic organization and (2) a refeudalisation of the social structure:

(1) Major internet corporations owe their ascent and the accompanying concentration of power, wealth, and recognition to the subversion of bourgeois market principles such as competition and performance. Their success relies on exploiting power and the potential for rent extraction.

(2) A polarization of social structure emerges, characterized by the formation of a wealth oligarchy drawn from company shareholders on one side, and the precarisation and extreme marketisation of self-employed workers in the Gig Economy on the other.

I want to contribute to the ongoing discourse on the societal implications of digital capitalism, highlighting potential neofeudal trends in the digital-driven social change and the tensions between society and digitalisation.

RN09 | T02_02: Tensions between economy and society

These papers provide a comprehensive overview of the intersections between economic policies, social outcomes, and political attitudes.

One Size Fits All? The Link Between Firm Size, Job Outcomes, and Political Attitudes

Sinisa Hadziabdic[1], Sebastian Kohl[2]

1Max Planck Institute for the Study of Societies, Germany;
2Free University of Berlin, Germany

Given the recent re-concentration of the economy in many private industries, the impact of working in firms of different sizes on occupational and political outcomes is of renewed interest. Using micro-level data for the US and Germany, two most dissimilar cases in terms of labor market and political institutions, we show that large firms provide substantially more material and welfare benefits to their workers, while small firms are characterized by the highest job satisfaction and more harmonious relational dynamics. Workers in medium-sized firms appear to be "betwixt and between," being worst off in many dimensions, thus contradicting utopias of medium-sized-firm capitalism. Within firms of similar size, we also document a significant polarization between employers' and their employees' job experiences and political views. With the number of waking hours spent at the workplace, the firm has been a neglected locus of social sorting and socialization through which the economy shapes society.

Pension Saving In A Gendered Lifecourse

Hayley James

Aston University, United Kingdom

With changes to welfare state provision, saving for a pension throughout one's working life is essential to provide an income during later life. In the UK, automatic enrolment has increased participation in pension saving, but many people are still saving at minimum rates that are unlikely to deliver adequate incomes in later life. This is especially a concern for women, who earn (and therefore save) less but also live longer, exposing them to a great risk of poverty in later life.

However, our understanding of pension saving, predominantly as a consumption smoothing vehicle, is based on a one-size-fits-all perspective of the savings lifecycle, where accumulation peaks in midlife. Drawing on qualitative research on pension saving decisions amongst men and

women aged 25-45 years old working for large employers in the UK, I demonstrate that pension saving is shaped by experiences of the gendered lifecourse, with different norms, narratives and sanctions operating in relation to pension saving at different stages. I identify three gendered lifecourse moments which affect pension saving, ultimately modifying the savings lifecycle, with implications for workplace pension policy in the UK and more broadly.

Economic Progress: Reconstructing collective self-understanding in Chile and Spain.

Rommy Morales-Olivares

University of Barcelona, Spain

The paper aims to empirically study the controversies surrounding the notion of economic progress by organised actors in the public sphere since 2011, from a comparative perspective in Chile and Spain, and how their ways of understanding economic progress have temporarily changed. In sociological terms, economic progress is characterised by a constant uncertainty about the future; trust in the economic system and the experience of contingency (Bourdieu, 1979; Habermas, 1999; Koselleck 2004; Luhmann 2007; Wagner 2016; Beckert, 2016). This indeterminate future offers the possibility for actors to shape it, is sustained by promissory legitimacy and expresses a proximate imaginary (Beckert, 2016). Beckert defined promissory legitimacy as "the support that political authority can derive from the credibility of the promises that political leaders make regarding future states of the world to justify decisions and persuade others to follow them in the proposed course of action" (Beckert, 2020: 318). If social actors lose hope, legitimacy fails and a legitimation crisis arises as the hopes that actors had regarding the future are destroyed (Habermas, 1973; Beckert, 2019).

In Chile and Spain, collective actors have acquired an oppositional consciousness to the institutionality of Economic Progress unprecedented in recent history, which has been radicalised since 2011 with favourable cultural and institutional conditions for its deployment; they no longer sustain a legitimised version of economic progress; new claims for the future are thus expressed. The reason for this crisis of legitimacy is not entirely clear, but several authors argue that it is due to the fact that the promises of economic progress have not been fulfilled.

Open Secrets: Impact of Promises in Nacala Special Economic Zone as Facilitators for Land Acquisition Amélia Machava

Amélia David Machava

Eduardo Mondlane University, Mozambique

The mechanisms of the land acquisition for Special Economic Zones (SEZ) projects have had economic, social and environmental impacts. The Government of Mozambique created the SEZ of Nacala. The SEZ of Nacala is public property and is located in the middle of urban residential and most families have agriculture as their main source of subsistence, food security, income and work. In exchange, the investors make promises, but these are not fulfilled. The lack of compliance has impacted the social and economic conditions of families. The study aims to analyze the impact of land acquisition promises on the implementation of the SEZ for the communities of Nacala. The mixed approach was the methodology used. The empirical basis of this study is made up of testimonies from Nacala residents about the communities' survival strategies and the impacts of land acquisition promises on the implementation of the Nacala of SEZ. The study reveals that 79.8% of interviewees believe that there have been changes in the source of income and a reduction in cultivated land with the implementation of the SEZ. Fishing, commerce and salaried work became the main sources of income for the population in the urban area. Agriculture continues to be the main source of survival and food, income and work in rural areas. The results suggest that 91.2% of those interviewed admit that there were promises and that 63.0% say they were not kept. The interviewed admit that the investors together with local leaders made these promises. The research also revealed that monetary compensation encouraged corruption among investors and local leaders, due to the presence of intermediaries and commissions mainly in Nacala-Porto.

RN09 | T03_01: Tensions between identities, norms and reality

This session explores the complex interplay between societal norms, individual identities, and economic realities. Presentations will delve into diverse contexts and issues, offering empirical insights and theoretical reflections on how these tensions manifest in different societies.

When Middle Class Fantasies Hit the Wall: The Case of Turkish Economic Crisis

Gokhan Alper Ataser[1], Ilknur Ekiz-Ataser[2], Ozlem Altunsu-Sonmez[1]

1SELCUK UNIVERSITY, Turkiye; 2KTO KARATAY UNIVERSITY, Turkiye

In this study, we are attempting to define the ways in which the middle-class subjectively interprets its' class position in the context of recent economic crisis in Turkey. Turkish society is experiencing hyperinflation for the last three years. With the sudden decline of real wages and purchasing power, majority of the population is facing economic difficulties. The middle classes – mostly salaried workers – might be the segment of the society which experiences not only financial hardships but also a crisis of values and identity. Emergency economy policies are aiming at suppressing consumption by interest rate hikes, limiting consumer loans and installments in credit card purchases. In the face of such measures, the middle classes not only feel impoverished, but also feel disillusionment since their upwards-oriented consumption patterns are significantly disturbed. Based on fifty in-depth interviews, information with regard to perceptions of downward social mobility, changes in consumption patterns, values regarding upwards mobility especially through education and hard-work, and anxiety about the future are qualitatively analyzed. All interviewees are higher-education graduates, working and married professionals living in Konya, Türkiye. Our analysis demonstrates that the belief towards education and hard-work, a central value of middle-classes is preserved although it is severely shaken. A recurrent theme in such deduction is the ever-increasing difficulty of buying a home and a car, which are seen as basic indicators of success. Unsurprisingly, their subjective definitions of their class position still as middle class, but with a deep sense of injustice as a source of resentment.

Fair Reward by the Table: How Unequal are Salary Tables?

Miloslav Bahna

Institute for Sociology, Slovak Academy of Sciences, Slovak Republic

While the public call for a reduction of wage inequality is the prevalent sentiment in equal and unequal societies alike, so is the acknowledgment of the necessity of rewarding skills and training with higher wages. An almost universal solution to "just differences" in salaries are pay scales. These typically account for the complexity of training for the carried out tasks (pay grades) and provide seniority or performance-based bonuses (steps). While the presence of pay scales in a country has been observed to reduce wage inequality growth, a comparative analysis of inequality levels designed by these tables plotting wages across the full scale of professions has not been attempted so far. In my paper I analyze pay scales in the public sector in several dozen countries from all regions of the world. I compare the ratio between the least and the most valued positions of the pay scales with public preferences for pay differences as measured in the ISSP Social Inequality survey. The general observation is that pay scales generate almost universally higher levels of inequality than those preferred by the general public. While the ratio between a job demanding the most skills and an unskilled position is between 2 and 35 in the analyzed salary tables, the seniority or performance premium ratios are smaller, typically between 1.1 and 1.62. Comparing origins of salary tables in the analyzed countries, I discuss factors which increase and decrease the level of inequality these tables allow. I also look at the relationship between objective income inequality, its perceptions and pay scales in a country.

Unemployment and the Social Norm to Work – An Empirical Assessment Using Computational and Panel Methods

Sebastian Prechsl[2], Christoph Müller[1]

1Institute for Employment Research (IAB), Germany; 2Friedrich-Alexander-Universität Erlangen-Nürnberg (FAU)

While the negative unemployment effect on subjective wellbeing (SWB) is well-documented (Brand, 2015), the contextual factors leading to heterogeneous effects are less clear. One strand of literature argues that increasing contextual unemployment mitigates the unemployment effect on SWB, as stigma is less prevalent if unemployed are surrounded by unemployed (Frey & Stutzer, 2002). In contrast to contextual habituation, studies argue that a higher unemployment rate worsens the labor market prospects of unemployed, thus amplifying the SWB losses (Oesch & Lipps, 2013). Given these contradictory findings, the question remains whether the unemployment rate is a suitable moderator to identify the role of the social norm to work for the unemployment effect on SWB.

We conducted a sentiment analysis with text data from the second largest German newspaper, constructing a measure reflecting the negativity in the discourse on unemployment, which we merged with 22 waves of the German SOEP. This enables us to purge the effect of stigmatization among the unemployed from regional unemployment. Using time distributed fixed effects (Ludwig & Brüderl, 2021), we find strong negative effects of unemployment on SWB and a stronger effect of becoming and staying unemployed in regions with higher unemployment rates, contradicting the hypothesis of contextual habituation. We also find that negativity in the discourse on unemployment amplifies the effect of becoming unemployed on SWB controlling for regional unemployment. Moreover, the negative effect of media discourse remains in regions with high unemployment. Thus, regional unemployment seems to be only a crude measure for the prevalence of the social norm to work.

Divided Economies? Language, Ethnicity, and Market Challenges in Multicultural Environments – A Case Study from Transylvania, Romania

Zsombor Csata[1,2]

1Centre For Social Sciences, Hungary; 2Babeș-Bolyai University, Romania

This study engages in an exploration of ethnic parallelism in a multicultural economy, focusing specifically on its manifestation in the private sector. Drawing on insights from institutional economics, microeconomics, and new economic sociology, the analysis explores the effects of marketization on interethnic relations in Transylvania, Romania. Against the backdrop of mainstream neoliberal economic tenet, which emphasizes lower state regulation in the private economy, we argue that marketization, rather than fostering equitable accommodation of diversity, often inadvertently encourage ethnic segregation in multicultural societies.

To illustrate our arguments, we present two compelling examples. The first example, set in the realm of market exchange, sheds light on the challenges faced by Hungarians in Transylvania who engage less in trading on Romanian online platforms. This phenomenon leads to information asymmetries and suboptimal resource allocation, hindering optimal economic outcomes. The second example, rooted in the business realm, underscores the impact of coethnicity on labor management, showing how the lack of symmetric treatment of multilingualism results in coordination failures and welfare disadvantages.

The conclusion drawn from our study is straightforward: there is a critical need for public institutions that actively facilitate the crossing of linguistic and ethnic boundaries. These institutions are essential for fostering equitable accommodation and harmonious integration in multicultural societies, acting as a linchpin for addressing the challenges posed by ethnic parallelism.

RN09 | T03_02: Trust and solidarity in contemporary economies

This session examines the evolving notions of trust and cooperation within capitalist frameworks, highlighting the interplay between digital and analogue realms, financial promises, and cooperative structures.

Trust in the Magic of Financial Capitalism: How Investment Podcasters Promise to Transform Lives

Merja Elisa Porttikivi[1], Ella Lillqvist[1,2]

1University of Vaasa, Finland; 2University of Eastern Finland

Today's world is increasingly characterised by uncertainty, as we are constantly confronted with various crises. Yet, faith in the continuing long-term upward trajectory of the stock market remains unaffected by recurring financial crises or any general anxieties about the future. In this paper, we use the notion of "magical capitalism" (Moeran, 2017; Lee, 2022) to show how some people are able to maintain or regain trust in their individual future by leveraging a prevalent unwavering faith in the future success of financial capitalism. In a re-enchanted world, modern magicians, magical rites and magical representations work together to overcome unpredictability and related anxieties (Moeran, 2017). "Financial influencers" in various social media can be seen as such magicians and gurus who reveal their magical rites to their followers.

We conduct discourse analysis on three Finnish investment podcasts where the magical properties of investing constitute a prevailing discourse. In these podcasts, the economic system is seen as the strongest force that nothing can ultimately undermine. It is suggested that gaining the power to utilise this force – through investing – will allow people to magically transform their own future for the better. This individual solution obfuscates the tension between trust in financial capitalism and lack of trust in the collective future more widely. This study thus sheds light on magical capitalism and the hyper-individualised discursive processes it uses and maintains.

Analogue Trust In A Digital World: A Qualitative Research On Blablacar

Zeynep Aykut, Yılmaz Ceyhun Çakır, Muhammed Fatih Karakaya

Istanbul University, Turkiye

Online sharing applications (Uber, Lyft, Blablacar, Airbnb, Couchsurfing, Eatwith, and so an), or those called sharing economy platforms are becoming widespread. With the increasing use of these online platforms, the concept of "digital trust" has started to be used and taken its place in the literature. Blablacar, a ride sharing application is one of the most famous applications in the platform economy. In the Blablacar application, people who usually travel between cities come together and share their journeys with other users. Blablacar was not very popular in Türkiye before pandemic. Thus, Blablacar had to close its office in Türkiye in 2016 but kept letting users access to the platform online via Google Play and Apple Store. After the to pandemic and economic turmoil now more people use Blablacar for their journeys in Türkiye. Here, the main issue besides economic factors in using Blablacar is trust. Blablacar emphasizes that the platform enables users to assess each other's trustworthiness via certain online evaluation facilities. It enables people to trust the application rather than the very person they will share the ride. Hence emerges digital trust. Digital trust resembles the Luhmannian "systemic trust" as opposed to personal trust. Yet In this study, semi-structured interviews and participatory ride sharing journeys in Türkiye as well as a discourse analysis of the posts on Blablacar's websites revealed that there are also "self-made trust" while experiencing the application, the "manageable distrust" provided by the previous experience of someone they trusted, and the "analogue trust" are all accompanying the "digital trust".

Worker Cooperatives in Capitalist Contexts

Kristin Wiksell

University of Gothenburg, Sweden

Worker cooperatives are economic associations equally owned and democratically governed by workers with the potential to contribute to economic democracy and social change. This study explores how small worker co-ops in Sweden are constructed and organized by co-operators in ways that can resist capitalism, while at the same time having to relate to capitalism as the context in which they operate. The qualitative study shows that worker co-ops challenge capitalism, associated with economic ideals and hierarchical control, by instead enacting social ideals such as equal work relations through friendships, uncommodified work time and freedom to self-govern. The worker co-ops value work that may not generate monetary profit but can contribute to a socially and ecologically sustainable society. However, worker co-ops risk the reproduction of power and compromise of ideals in order to survive within capitalist market economic contexts. In order to get customers in competition with other businesses, worker co-ops sometimes sell their services to lower cost than they would like according to their ideals and present themselves as conventional rather than cooperative businesses. The organizational form of cooperatives is not always seen as positive from a marketing perspective which may limit the worker co-ops potential to spread knowledge on the organizational form. This research highlights possibilities and pitfalls of organizing for social change.

The Role of Generalized and Institutional Trust in the Support of EU Policies

György Lengyel, Gabriella Ilonszki

Corvinus University of Budpest, Hungary

Drawing on the results of a recent Hungarian empirical study, we investigate whether trust has a significant effect on the perception of EU policies. The question is to what extent people accept EU policy competence in the short and long term. We interpret types of trust as expectations that people in general and institutions in particular will act in a predictable and cooperative way in the near and distant future. It seems reasonable to assume that trust types are positively related to supranational policies for collective well-being. But is this the case in all circumstances? What if trust in institutions falls below a critical level? What if collective identity overrides pragmatic considerations? What is the impact if the governing elite and the pro-government media project a negative image of the EU institutions? The study seeks answers to these questions.

RN09 | T04_01: Platform economy

From different perspectives new economic forms caused by digitalization are analyzed.

The Role of Digital Platforms in Generational Justice: Stock Apps and Youth Financial Civic Movements in Taiwan and Japan

Mayumi Tabata

Senshu University, Japan

Taiwan and Japan similarly achieved rapid economic growth from the 1960s to the 1980s, during the era in developmental states and authoritarian regimes. However, in recent years, with the expansion of the global economy, wealth inequality between elders and youths has become a serious social problem in these countries. Nonetheless, it is argued that the youth in these East Asian countries are making efforts to reduce the wealth gap between generations by empowering themselves and enhancing financial literacy. Based on interviews with young generations in Taiwan and Japan, it is found that digital platforms like stock apps and SNS serve as a functional system to transform intergenerational wealth disparity, as they develop youth financial civic movements and provide young generation with services such as a platform for stock trading that doesn't require in-person interaction and instruction and sharing of fundamental financial literacy knowledge by SNS influencers. Furthermore, unlike the speculative investment attitude of seasoned investors, younger generations tend to choose less risky investment methods primarily to mitigate economic uncertainties in the future. They tend to avoid high-risk entrepreneurship and speculative investments, preferring to enhance their financial literacy through social media and engage in stock investments with as little risk as possible. This research contributes to understanding the development of science and technology, along with new business models like the platform economy, aimed at promoting solidarity and generational justice and addressing intergenerational wealth inequality.

Socio-Demographic And Values-Related Factors Of Retail Investment Apps Usage

Ivan Iudin

HSE University, Russian Federation

Over the past decade more than 20 million Russians began engaging in a novel for them financial practice – stock market investing. The way most Russian retail investors engage with and within the stock market is via digital technologies. According to Bank of Russia (2023), nearly 90% of clients open brokerage accounts online, while over 70% of clients with non-zero accounts interact with their stock broker via mobile investing apps. This study outlines the factors that drive use of key technology in retail investing – mobile investment apps. Current research utilizes survey data of Monitoring Study of Society's Digital Transformation (2022) by ISSEK HSE. The final sample includes only adult respondents (n = 9452). Retail investors are identified as people, who used mobile investment apps during past three months. Data suggests the actual number of investors to be smaller compared to the number of opened brokerage accounts – only around 4% of the general population. To outline the factors driving mobile investment apps usage binary logistic regression is estimated. Four groups of factors are tested. These are socio-demographic characteristics, human capital, technological readiness, and basic human values. Findings suggest that (1) young men, who come from wealthier households, (2) who are educated and willing to learn, those (3) who express strong innovativeness and low levels of technological discomfort levels, as well as those, (4) who have pronounced value orientations of autonomy, power, and universalism and low levels of conformism and tradition have higher likelihood of being mobile investment apps users.

Selling the Gig: How Content Creators Shape Workers Understandings of Their Lives on Food Delivery Platforms

Mehmet Cansoy[1], Serdar Arslan[2], Tayfun Mertan[3], Duygun Ruben[4]

1Fairfield University, United States of America; 2Alanya Alaaddin Keykubat University, Turkey; 3Koc University, Turkey; 4Boston College, United States of America

At the end of 2023, there were at least 15 gig economy platforms facilitating food delivery in Turkey. Estimates for the number of delivery drivers that keep these platforms working from the low six figures to much higher. An understudied aspect of how such a large workforce is mobilized is the content creators focused on the delivery work. In this paper, we study 20 content creators who produce videos, maintain a social media presence, and engage with current or prospective delivery drivers in many venues. Using content analysis of 100 hours of video and audio and interviews with the creators, we study how these creators understand (and contextualize for their audience) delivery work, focusing on their approach to entreprenurialism, platform vs. worker power, safety and social status. Our findings show that the creators occupy a range of complex, and not necessarily internally consistent, positions on all these issues. A critical set of creators operate on an underlying belief in the individual's ability to work, earn, and avoid negative outcomes. These creators mostly interact with prospective drivers or less successful beginners. Another set of creators focus more on systemic problems either with specific platforms or the occupation as a whole. Their audience is much smaller, comprising primarily of longer term drivers that are relatively more educated and more politically engaged.

269

Work Digitalization, Robots, Threat of Job Loss, Growth of Mistrust and Impact on Voting

Sokratis Koniordos

University of the Peloponnese, Greece

It is well established that the introduction of digitalization in workplaces polarizes jobs with the gradual elimination of middle-skilled jobs. The hallowing out of the middle observed throughout Europe affects jobs and work-tasks that are repetitive, patterned, or ordinary (non-creative), designated as "routine" (Auter et al., 2003). It is industrial workers and clerks who think of themselves in terms of revenue as middle class that have seen jobs such as theirs trimmed down that fear that they will be replaced by AI automated systems and robots too. Accordingly, there might be political aftereffects. Indeed, findings in the literature indicate that those left out due to the introduction of new technologies in the workplaces, tend to turn against the status quo and vote for populist political parties. The necessary intermediate step for such a development is the loss of political trust. The implicit contract between principal and agent in political trust relations is thought to have been adversely affected, as the former is perceived to have not provided the necessary protection by the latter, i.e. they did not fulfill their responsibility, therefore the judgment would be that they are not trustworthy. Hence the agents' decisions or policies (with respect to the digitalization of work) are not trusted by principals, or that this would be a case of skeptical mistrust on their part (Norris, 2019).

Thus, the causal chain seems to lead from digitalized automation/robotization, to fear for ones' job, to self-perceptions of social/status decline, to loss of political trust, to reacting by voting for populist agents. The purpose of the proposed presentation is to discuss this line of reasoning relying on a relevant literature review.

RN09 | T04_02: New forms of stratification in economy and society

We see new and different forms of social stratification and a change in social bevaviour in the economy nowadays. The session covers the distribution of social capital, life satisfaction, as well as women and quer entreprenurship.

How Important is Life Satisfaction in Today's Society? Case Study: Middle Class

Małgorzata Szczepaniak[1], Gabriela Neagu[2]

1Nicolaus Copernicus University in Torun Poland, Poland; 2Research Institute for Quality of Life, Romanian Academy, Romania

The middle classes in the Central Eastern European states, which have undergone systemic transformation, are still in the process of being created and are not as well recognized as in the more developed countries of Western Europe with longer capitalist traditions. The current situation brings new challenges, especially for the middle class. If at the level of the countries of Western Europe, studies have demonstrated the accentuation of occupational polarization, growing income inequalities, and social insecurity among the middle class as a result of technological and political transformations, as far as Eastern Europe is concerned, only necessity is mentioned analysis of these aspects.

The middle class has always mattered economically, socio-politically, and culturally in all societies. Treating the middle class as a marginal social group is not a solution for countries that want a consolidated democracy and a functioning capitalist economy. All the transformations that have occurred in recent years are likely to change the level of satisfaction with the life of the middle class, especially in the East, with an impact on other life dimensions.

The objective we propose is to contribute to the debates regarding the middle class in the CEE, especially in Poland and Romania, aiming to identify the factors, and conditions that contribute to the increase or decrease in the level of satisfaction with life. The analysis will be carried out based on a database of the World Values Study covering the period between Wave 5 (2005-2009) and Wave 7 (2017-2022). Moreover, he comparison of two criteria of middle-class affiliation, namely sociological (occupational) and economic (income), will be conducted in terms of the impact on life satisfaction.

270

Culture of Rugged Individualism and the Unequal Development of Social Capital in the US

Harris Hyun-soo Kim

Ewha Womans University, Korea, Republic of (South Korea)

One of the central tenets of economic sociology is that economic outcomes are socially embedded. A recent study by Chetty et al. (2022) epitomizes this proposition, according to which intergenerational mobility in the US is powerfully shaped by the extent to which people are networked across socioeconomic strata. More specifically, geographic regions with higher interpersonal connectivity bridging class lines exhibit higher rates of upward mobility. The present study's aim is to investigate a critical issue that is largely taken for granted not only in Chetty et al. (2022) but in the bulk of sociological scholarship: the differential distribution, or inequality, of social capital. Why are some places endowed with more stocks of social capital? This research proposes and demonstrates that the above query can be partly answered by the Frontier Thesis proposed by the historian Frederick Jackson Turner (1893), i.e., the culture of individualism associated with the Westward Expansion (1803 – 1890). By merging archival data with the contemporary administrative (Facebook) data on dyadic friendship ties within and across counties, I argue that the American Exceptionalism of rugged individualism has profoundly impacted the trajectories of social capital formation across the country. Adjusting for a host of historical covariates and based on alternative modeling strategies (OLS regression with state fixed effects, multilevel analysis, and sequential g-estimation), evidence indicates that geographic areas characterized by more exposure to the frontier experience, that is, with a greater legacy of individualism, are today less 'socially embedded.'

Queer Entrepreneurialism? How Start-up Culture And Activism Merge In A "Queer And Feminist Incubator"

Philip Balsiger, Simon Vuille

University of Neuchatel, Switzerland

Over the past decades, an increased blurring of boundaries between activism and entrepreneurship has taken place, where social change objectives are pursued through the means of the corporation. While this development arguably has its roots in neoliberal ideology valuing the corporation and markets as the most efficient way to address social problems, it has more recently been emulating start-up culture in physical and virtual spaces like impact hubs where activist and entrepreneurial discourses and practices meet through training programs, networking events or funding competitions. In this paper, we analyze one such space that is dedicated to feminist and queer activism. At this point of convergence between activist and capitalist discourses, there's a longstanding queer and radical feminist critique of "homocapitalism" (Rao, 2015), i.e. the commercialization of queer and feminist issues that creates forms of homonormativity marginalizing non-conforming queer bodies. However, recent work has questioned the continued transformative and critical potential of anti-categorical and non-normative queer perspectives by showing that they can become the basis of capitalist initiatives, creating something like an "extra-ordinary homonormativity" (Burchiellaro, 2022). Drawing on this literature on homonormativity and gay capitalism, as well as on the literature on moral markets, this paper proposes an empirical analysis of the self-proclaimed "first queer and feminist incubator", a (physical and virtual) space that aims at supporting start-up businesses in Switzerland. We ask how gender and queer issues get translated into entrepreneurial discourses and organizational models through such spaces, and what repercussions this has on representations of gendered and queer bodies and politics. The study will use qualitative data from interviews, (online) observations, and text and visual data from websites, to document these processes.

Top Italian Leaders: A Comparative Gender Analysis

Rossella Di Federico

Università di Teramo, Italy

The essay investigates the socio-demographic, educational and, above all, professional characteristics of the world-famous Italian power elite (top leader) in the cultural, political and economic fields. To this purpose, a qualitative and quantitative research was conducted based on the analysis of a database created by coding approximately 9,000 profiles of European personalities with international fame. The top Italian leaders (378) were extrapolated from the database. A descriptive analysis is provided which highlights that the Italian top leaders are mainly older men. We observe a sort of 'longue durée' of male dominance and gerontocracy due to which, for the members of the Italian elite, systematic gender and generational turnover seems to be very difficult to achieve. The horizontal segmentation of the sectors of power in Italy is highlighted, which is associated with an accentuated vertical segregation. The result is the presence of a pyramidal management structure at the top decision-making levels, at the base of which there is the prevalence of women in the less powerful positions.

271

RN09 | T05_01: Crises, migration, refugees

The economy is often influenced by social crises that force people to migrate. The sessions deals with how crises and migration shape economic action and structure and how economic performance shapes migration.

The session covers various topics dealing with migration and refugees, including the transfer of money.

Economy of Fleeing and Settling: Ukrainian Refugees in Poland and Australia.

Maria Nawojczyk[1], Lukasz Krzyzowski[2], Oleksandra Missa[1], Anastasija Plakhotnyk[3], Janusz Mucha[4]

1The AGH University of Krakow, Poland; 2Edith Cowan University, Australia; 3Jagiellonian University, Poland; 4University of Białystok, Poland

Russia's military aggression against Ukraine which started in 2022 has resulted in a significant wave of people fleeing their homes and seeking safety and stability not only internally but also in European countries, including Poland, and outside of Europe as well. Refugees often encounter barriers when accessing services due to a lack of knowledge about available resources, bureaucratic complexities, language barriers, and cultural differences. These challenges can lead to limited access to vital services, such as healthcare, education, employment, and child care. Institutional support plays a critical role in addressing the challenges faced by refugees in accessing services. Effective institutional support involves the provision of information, guidance, and assistance to help refugees understand and navigate the legal, administrative, and social systems of the host country. Different types of capital and resources that refugees have, as well as the skills in using them, may contribute to different levels of economic security. How this feeling was shaped and its dynamics over time will be the subject of our presentation.

Our findings are based on comparative analysis of humanitarian infrastructure and refugee systems in Poland and Australia for supporting Ukrainian refugees. These systems are assessed by refugees based on their own experiences. In Poland, we conducted longitudinal research in three waves of in-depth interviews covering a period of almost two years. In Australia, we conducted one series of in-depth interviews. We supplement all the material with expert knowledge. We hope this research aims to provide valuable insights into best practices that could be applied to support Ukrainian refugees.

Climate-related Wealth Threats: Understanding a Key Source of 21st Century Instability

Philipp Golka

Max Planck Institute for the Study of Societies, Germany

As famously argued by Thomas Piketty, decades of low growth and capital-friendly legislation have led to unprecedented income and wealth inequalities. With visions of wage-led growth exhausted, private wealth is increasingly becoming a key source of economic and social security across Western societies. However, the climate crisis creates distinct forms of threat to private wealth as carbon-emitting assets (such as fossil fuel extraction rights) need to face devaluation to meet the 1.5 degrees goal, and various other assets face significant climate-related vulnerabilities. Attempting to understand how societies – and governments – respond to these threats, scholars of international relations and political economy have shed light on actors' structural power as well as the material incentives inherent to asset ownership. But despite their importance, these perspectives seem insufficient from a sociological perspective as actors such as farmers often act against their material interests of climate preservation. Needed – and provided here – is thus a genuinely sociological perspective that unpacks how climate-related wealth threats are produced, disseminated and entangled with social and political identities. Social media platforms are a key site for the production and circulation of these threats, making social media discourse key to understand whether actors perceive the climate crisis or rather climate mitigation as a threat to their wealth. This paper provides a conceptual perspective on climate-related wealth threats as well as first empirical insights on their production, framing and resonance in social media.

Money on the Move: Financial Infrastructure for Remittances

Alexandra Keiner[1,2]

1Weizenbaum Institute, Germany; 2Goethe University Frankfurt, Germany

Due to the concentration of power in the hands of a small number of actors, access to payment infrastructures is unevenly distributed across people and regions. Migrants who send money to family and friends in their countries of origin are affected by this concentration of power in financial infrastructures and the lack of a global payment infrastructure.

Digital technologies promise to make international payments – including remittances – more convenient, cheaper and faster via borderless communication channels. Although fees for digital transaction services are now cheaper than those for cash, the extent to which digital services actually lead to greater inclusion and reduce social inequalities in remittances is questionable. The vulnerability of migrant workers and the fragmentation of the infrastructure continue to benefit traditional money transfer providers:

the so-called "money transfer operators" (MTOs) such as Western Union or MoneyGram. These providers have a dense global network of money transfer offices and have entered the digital remittance business, competing with original digital services.

Given this important role of MTOs in the digitization of remittances, two aims are pursued based on the initial results of the analysis of MTOS annual reports and interviews with MTO staff and remittance senders and receivers. First, to provide an overview of the technical and (geo)political difficulties and barriers that can arise in the digital transfer of remittances. Second, how MTOs deal with these barriers and what strategies they use to embrace the digitalization of remittances and benefit from the difficulties. The empirical focus is on remittances sent between Germany and Southeastern Europe, specifically Romania and Moldova.

Italian Women Entrepreneurs During the Covid-19 Pandemic: Striving for a Collective Response Through Female Employer and Business Membership Organizations

Elisa Errico, Luisa De Vita

Sapienza University of Rome

The unprecedented crisis triggered by the Covid-19 pandemic has affected women's businesses and their employer and business membership organizations (EBMOs). These associations in Italy are significant for the representational power for female entrepreneurs and their political relevance in industrial relations. This chapter explores Italian EBMOs' characteristics and their capacity to support female entrepreneurs during the Covid-19 pandemic. Hence, we examine what types of supportive actions these EBMOs put in place for their members before and during this turbulent time. We employed a qualitative methodology using semi-structured interviews with the Heads of the most relevant female Italian EBMOs. Thematic analysis of the findings revealed that women's EBMOs are based on a mix of professional and informal ties between members; these organizations are both locally anchored and open to international partnerships. Thanks to these characteristics, Italian EBMOs helped female entrepreneurs to collectively and effectively respond to the challenges posed by the pandemic. Regarding types of supportive actions, these EBMOs offered both technical-instrumental and emotional-psychological support to members during the Coronavirus pandemic. The findings also show both reinforcement and adaptation of these supporting actions of Italian female EBMOs to the new requests of women entrepreneurs with appreciable results.

RN09 | T05_02: Digitization
The session covers various aspects of the overall process of digitalization.

Technoinvestor's Hegemony and the Crisis of Patrimonialism

Ruben Juste[1,2]

1Universidad Carlos III de Madrid; 2Universidad de Castilla-La Mancha

The way we live today is being rapidly transformed by digitalization. Digital applications have helped to make friends, or share our research findings. However, there are some fears about of the hegemony of a few corporations in the digital era, even more with the appraisal of Artificial Intelligence in the orbit of these corporations. In this sense, it is necessary to analyze these corporations and their leaders through a social class lens. These leaders are unified by a common view and a material and legal form of property that binds them together as a class. They are the world's largest investors and heads of technological corporations. But also, they are shaping new social relationships and a new way of living. This hegemony has eroded national boundaries, and what is important, it has undermined the national-state hegemony, and the classes that headed the old national-patrimonialism bloc. Family, state, and property were the bases of an old power bloc that brought together old corporations, rich families, political and economic leaders, and workers. It is what Weber used to called as patrimonialism, or the appropriation of the administration and wealth by a small group, also referred as power elite by Wright Mills after II World War. This work uses social network analysis methodology and data from digital and technological corporations to explain technoinvestor's hegemony and class alliances.

Unveiling the Political Economy of Cryptomarkets

Meropi Tzanetakis[1], Matias Dewey[2], Julia Buxton[1]

1University of Manchester, United Kingdom; 2University of St. Gallen, Switzerland

This paper addresses a notable gap in the expanding field of cryptomarket research, which has predominantly focused on the internal social organisational dynamics of these platforms, neglecting essential socio-political factors influencing their emergence. Our study introduces a political-economic perspective to illuminate the intricate interplay shaping the ecosystem of cryptomarkets, particularly those utilising encryption technologies to circumvent drug control policies. While cryptomarkets are not globally ubiquitous, their prevalence in Global North countries raises questions about the socio-political underpinnings that contribute to their formation.

273

Drawing on the political economy of illicit markets, our research delves into macro-conditions facilitating the proliferation of cryptomarkets. The analysis underscores the complex nexus involving government policies, drug markets, digital technologies, socio-economic factors, geographical location, and power dynamics. By exploring unintended consequences of government interventions, reliable postal services, fintech payment systems, technological literacy, trust, and social relationships, our study reveals how these elements contribute to the social order within cryptomarkets. Notably, the paper sheds light on why cryptomarkets are less prevalent in traditional drug cultivation and production countries in Asia or Latin America.

By adopting a political-economic lens, this paper connects the dots between cryptomarket actors, infrastructures, and broader societal structures. The examination of darknet-based drug markets as a global phenomenon concentrated in the Global North underscores the significance of profit opportunities and existing infrastructural capabilities in shaping these markets. Understanding the political economy of cryptomarkets is imperative for formulating effective policies that address both the root causes and manifestations of illicit online activities within a broader societal context.

Emerging Regulatory Tensions: A Multidimensional Embeddedness Frame for Analyzing Digital Transformation

Ilan Talmud

University of Haifa, Israel

This paper suggests research strategy aimed at examining the ways in which various institutional dimensions teniously intersect, as demonstrated in the current attempts to mold the nascent regulation of cryptocurrency. The market is depicted as an arena which is (a) structurally built around networks, (b) institutionally enabled, controlled, and reproduced by social and political institutions, (c) derived from the basic rules of capitalist political economy, (d) perceived and enacted by cognitive scripts, myths, and rhetoric devices, aiming at market performativity; and (e) made by techno-structures, providing its mechanism, devices, social affordances, and material utterance. I demonstrate this frame by examining significant tenions manifested in the relations between five embedded aspects of cryptocurrency instrutable market.

The findings are drawn from a four years' multi-sited ethnographic study of the Israeli Bitcoin / Blockchain communities, and from a netnographic inquiry into the global cryptocurrencies' online communities and related eco-systems.

I argue that this synthetic analytic strategy is especially efficacious for the examination of the transformation of market boundaries, and the interactive tenuous impacts of various societal factors on institutional transformation. It is especially useful for examine the tenious junctures between moral valuation of goods and flows, institutional barriers, and political power. This frame contributes to our comprehension of the relations between various dimensions of market embeddedness, as well as the dynamic associations between organizations, markets and politics.

The Future Behind. Manufacturing Companies and Regional Systems of Digitization: the Italian Case

Alberto Gherardini, Francesco Ramella

University of Turin, Italy

In recent years, there has been a strong reassessment of the role of manufacturing in development, while the growth in employment in service industries is no longer read in a "rival" key, and there is increasing talk of the "servitization" of manufacturing. Even in the richest countries, the thesis of the decoupling between industrialization and development is not fully supported by the data since, in reality, the advanced economies that have experienced more sustained growth in recent years had a very strong industrial base in the late last century.

274

Our presentation aims to analyze the transformation of Italian manufacturing in a territorial key following the process of digitization of the economy. In particular, we will deal with the impact of digitization a) on the Italian path to manufacturing innovation and b) on regional governance and territorial disparities. We will move from a perspective of political economy, using an integrated frame that holds together the analysis of the micro (agency factors), meso (relational factors) and macro (contextual factors) dimensions of digitization processes.

RN09 | T06_01: New modes of consumptions and production

Currently, we all observed new modes of consumption and production. This sessions deals with different forms of this change such as vegetarianism etc.

How Is Creditworthiness Gauged? The Interactions Between Actors In Microfinance Lending In Rural Gujarat, India

Kalpeshkumar Ambalal Chauhan, Jillet Sarah Sam

Indian Institute of Technology Kanpur

Existing Sociology of finance studies demonstrate that creditworthiness is gauged through individual's caste, gender, family history, employment and credit score. Some studies stemming from microfinance's joint liability loans have observed that borrowers' creditworthiness can also be established by considering the group, specifically trust and social relations amongst group members. However, the literature hasn't explored: How does the process of assessment of an individual's creditworthiness interact with the process of assessing the creditworthiness of their households, borrowing group and community? And how do the different actors involved in these processes interact with each other to establish the borrower's creditworthiness?

This paper addresses these gaps through ethnographic fieldwork among microfinance institutions (MFIs) that were engaged in joint liability loans to lower socio-economic status women in the Kheda and Mahisagar districts of Gujarat (India) in two phases in the year 2022 and 2023. Our first finding is that rather than the credit score of an individual, MFI officers focus on their credit report. Further, they interpret the report by interacting with different actors engaged in the process. Our second finding is that, not just borrowing groups and lenders, there are multiple actors who are engaged in establishing the borrowers' creditworthiness. These actors constantly interact with each other and gather various formal and informal information to establish borrowers' creditworthiness. Here, findings showed that assessing the group's creditworthiness in joint liability loans is interconnected with the creditworthiness of individual, their households, and their hamlets (caste/sub-caste-based community). Further, creditworthy members arrange proxy borrowers which the group members collectively support and make it invisible to MFIs. Lastly, all these findings show that establishing a borrower's creditworthiness is a multi-layered and complex process.

"Fresh Vegetable and Fruits Procurement System for Supermarkets in Vietnam"

Fumie Takanashi[1], Shozo Sakata[2,3]

1Tokyo University of Agriculture, Japan; 2Institute of Developing Economies, Japan External Trade Organization, Japan; 3International Institute of Social Studies, Erasmus University, the Netherlands

Multinational supermarket chains have changed downstream food consumption and upstream production and distribution systems globally. While there are numerous studies on global value chains in supermarkets, few address domestic agricultural production in the supermarket-led value chain in emerging countries. In Vietnam, although modern distribution still accounts for a low percentage of total food distribution, supermarkets are expanding due to policies aimed at modernizing food distribution. This study investigates the procurement system for fresh vegetables and fruits from domestic suppliers by supermarkets in Vietnam.

The results show that the latter conclude contracts with suppliers to ensure the quality of their products. Two main suppliers observed are 1) large-scale commercial farms and 2) cooperatives of small farming households. However, some farms/cooperatives that supply fresh vegetables directly to supermarkets procure from other farms/cooperatives in remote areas and resell under their brand to meet the quantitative demand of supermarkets. It has been suggested that supermarkets outsource the procurement of fresh fruits and vegetables to producers, possibly creating a power gap between producers within social and geographic proximity and those in remote areas. This phenomenon is at odds with the trend in developed countries, where supermarkets eliminate middlemen and contract only with producers who meet quality and quantity requirements. It will be necessary in the future to examine the social or economic validity of maintaining the multi-level distribution structure in supermarket-led value chains in Vietnam.

275

From Romance To Finances: Examining Social Media Influencers' Household Economies

Tinca Lukan, Jožica Čehovin Zajc

University of Ljubljana, Slovenia

Social media influencers as platform workers are widely recognized for their skill in fostering a sense of intimacy with their audience. Yet, there remains a lack of understanding regarding how social media influencing (re)shapes the actual intimate relationships and household economies. Drawing on relational economic sociology, this study leverages insights from more than 50 in-depth interviews with influencers in Slovenia and investigates the strategies female influencers employ to manage intimate relationships. The findings reveal that the oft-mocked "Instagram boyfriend" often plays a crucial role in the success of an influencers'

business. Intimate partners offer entrepreneurial support, act as investors and provide diverse forms of assistance. In return, influencers engage in relational work, a practice of matching economic transactions with social ties. They create distinct kinds of monies to compensate their partners. They gift, pay and bribe them with products from brand collaborations. Influencers frequently earn more than their male partners, requiring them to navigate potential "ego issues". Hence they earmark influencer income as "pin money" which historically refers to supplementary household income earned by women. The money made through influencing is merged into the family's housekeeping money spent on home, clothing and food. By earmarking influencer income as more frivolous and less serious than that of their male partners, influencers reproduce a form of financial submissiveness. This study is unique in its focus on the household relations of influencers, revealing how global social media platforms make a landfall into intimate relations.

New Forms of Value Storage and Its Effects on Consumer Behaviour and Financial Subjectivities.

Matilde Masso, Loreto Vazquez

University of A Coruña, Spain

This communication analyzes the main transformations of payment methods and their effects on spending, saving and indebtedness patterns.The digitization of payment methods and systems and the reconceptualization of monetary functions as a consequence of the expansion of monetary instruments based on platforms linked to technological giants entails numerous transformations related to the structure of monetary transactions, which in turn leads to new behavioral patterns and financial subjectivities. To this end, this communication analyzes the most relevant contributions and limitations in the theory of mental accounting (Thaler, 1999) and the social marking of money (Zelizer, 2011), in order to identify how the digitalization of payment methods affects to the categorization processes developed by different social groups. The communication focuses specifically on two closely related aspects: first, on how new patterns of electronic consumption affect the temporal categorization processes of individual budgets and expenses. Second, how digitalization increases unnecessary consumption, making it difficult to achieve mid-term goals. The theorical analysis carried out is accompanied by the discussion of the operationalization model of the monetary categorization processes, and the design of a telephone survey of individuals over 18 years of age in Spain.

RN09 | T06_02: Consumption, consumer behaviour and life conduct

We will see and discus different forms of consumer behaviour and especially how digitalization influences consumer behaviour

Exploring Consumer Dispositions: Investigating the Homology between Consumer and Work/Study Dispositions among Business Students and Professionals

Lilian Amabili Leupold[1,2]

1Technische Universität Dresden; 2EU Business School, Germany

This qualitative study investigates the potential parallels between consumer dispositions and professional or educational practices among business students and professional, focusing on national and international students primarily across Germany. It investigates the parallels between consumer dispositions and professional or educational practices among these students and professionals. Employing the 'Dokumentarische Methode' for qualitative analysis, the research delves into how individuals' engagement with the consumer world intersects with their work and study behaviors.

The research unpacks how consumption practices, shaped by societal contexts, might not just reflect but also actively influence broader life practices. These practices are not merely individual actions; they are integral to how people craft their professional and academic journeys.

Drawing on Pierre Bourdieu's theoretical constructs of habitus and social, cultural and economic capital, the study examines how consumer dispositions evolve over time, influenced by individuals' life experiences and shifting societal dynamics. It examines to what extent these consumption practices are indicative of broader behavioral patterns within professional and educational spheres and explores their potential repercussions on social mobility.

The exploration of these potential homologies sheds new light on consumer practices, suggesting they are more substantive than simple economic decisions or acts of communication. This insight could lead to a more comprehensive understanding of consumption and its wider implications in society, especially in terms of how consumer dispositions and practices may be interrelated with social mobility trajectories. By positing that these practices are deeply embedded in one's Habitus, the research provides a different perspective on consumer culture.

This work aims to contribute to the body of knowledge on consumer culture and social stratification by examining the intersection of consumer dispositions with educational and

276

professional practices. It underscores the importance of considering the experiences (and the formed dispositions) as a consumer as a potential factor in understanding and analyzing social mobility.

Digital Political Consumerism. A Comparative Analysis of how Consumers use their Power in Online Markets

Sebastian Koos

University of Konstanz, Germany

A large field of research has explored how consumers use markets as an arena for politics and ethical purchasing. Yet, most studies on political consumerism focus on everyday shopping in offline markets, neglecting the immense rise of online markets, platforms and apps, on which an ever growing share of private economic exchange takes place. In Europe, for instance about 70% of all internet users have bought products online in 2022. Have these online markets also become an arena for ethical and political purchasing? If so, what are the drivers of such consumption behaviour? Here we develop the concept of "digital political consumerism" to capture the distinct way in which citizens use their economic power in the digital realm. Based on a novel survey among more than 13,000 respondents in six advanced democracies (Germany, Sweden, Spain, Poland, USA and Japan) we measure the extent to which people have bought or boycotted online for ethical, political or environmental reasons. We find that more than half of all respondents engage online in positive buying and more than 25 % in boycotting. Contrary to research on offline political consumerism, we find that women report equal or lower levels of political consumption compared to men. Moreover, people that perceive big tech companies as a risk to liberal democratic society are more likely to engage in online boycotting, while people perceiving these companies as beneficial are more likely to buy positively.

Consumers on the Internet: the Unequal Diffusion of eCommerce

Kristal Martina Crupi

University of Catania, Italy

The diffusion of innovation is a distribution of benefits derived from a new product/service in a scalar and sequential way (Rogers, 1983): greater resources gain immediate advantage, generating cumulative effects of disadvantage. Despite the rhetoric of the democratization effect within Californian ideology, it was immediately evident how the benefits of the ICT would not be socially equally distributed.

To deepen the relationship between e-commerce and inequalities it addresses two main questions: what resources allow an early access to eCommerce and a greater exploitation of its advantages? Does the endowment of cultural and social capital (Bourdieu, 1980) influence the ability to convert into economic capital through eCommerce?

The aim of the analysis is to examine the development of e-commerce in Europe, highlighting variations between countries. The paper wants to detect whether the growth of e-commerce and its benefits are inclusive in all social groups, assessing whether market digitalization acts as a "democratizer" or contributes to rising inequalities. Using Eurostat survey on "ICT usage in households and by individuals", it focuses on two groups of countries, one with a level of digitalization close to the European average (Italy, Germany, France), and a group of countries with the highest level of digitalization (Finland, Denmark, Netherlands) (EC, 2022).

Preliminary analyses show that the use of e-commerce follows a trend of constant growth and the cumulative advantage for early adopters. In addition, the data confirm the cumulative disadvantages of countries with a low level of digitalization compared to those with a high level of digitalization.

Prosumer Economy: Careers, Professionalization and Social Recognition of Consumer-producers in the Platform Economy

Davide Luca Arcidiacono

UNIVERSITY OF CATANIA, Italy

277

Digitalization has created an apparent paradox: on the one hand, a public debate strongly oriented toward the prospect of technological unemployment; on the other hand, a reality in which human labor is increasingly fundamental to value creation but is increasingly undervalued and devalued. However, when we talk about the "devaluation" or "removal" of labor we are not talking about something new, but a process rooted since the paradigm of standard labor relations began to crumble. In this scenario, the productive role of consumers and their ability to mimesis and transform into professional producers represents a key factor in understanding the digital transition and its impact on the labor market.

Before that time, Capitalist organizations sought to remove or conceal the "productive role of consumers. The sociology of new media and organizational analysis were the first disciplines to recognize the blurring lines between consumption and production (Ritzer 1993; Terranova 2000; Bruns 2008; Arvidsson 2013), and the increasing co-productive role of consumers (Barnard 1938; Dujarier 2008; Glucksmann 2009; Stark and Witkins 2018)

The purpose of this paper is to analyze the process of transition to work and professionalization of prosumers in the platform economy through the use of so-called "career anchors" (Schein & Van Maanen 2019) and how these actually contribute to explaining a different approach in the "battle for recognition" (Honneth and Rancière 2016) of their productive contribution.

From a methodological point of view, preference was given to a multi-sited ethnographic investigation through observation and interviews (60), both in online platforms or in the various digital communities of prosumers (Fitness Influencers; Second-hand Re-sellers and Meme Creators)

RN09 | T07_01: Labor relations and markets in times of crises

Labour relations and markets are a core element of modern economies. How they are influenced by crises is the topic of the session.

Job Stress Among Young Remote Workers

Juan Vicente Castellanos-Quintana, Alberto Veira Ramos

UC3M, Spain

Teleworking transforms relationship between workers in the absence of physical contact. The implementation of teleworking brings with greater effort to adapt (Felstead & Henseke, 2017).

Teleworking brings with also a growing digitalization (Rodríguez Rodríguez, 2020). This has contributed to the discrimination of segments in more precarious conditions (temporary or part-time jobs) (María & Romero, 2020).

Emanuel, Harrington, & Pallais, 2022, found that the loss of proximity reduces perceived support, especially for young people. Nearly two-thirds of workers' on-the-job learning comes from feedback and guidance from co-workers, much of which is now online (Herkenhoff et al., 2018). According to Morgan Stanley's CEO: "The office is where we develop people" (Kelly, 2021).

Some tech companies embrace remote work because they see the office as outdated. However, the office may be more valuable to some workers than others. For example, younger workers may need more in-office interactions for on-the-job training.

Our research question is whether young people who tele-work communicate less with their colleagues and bosses, and whether this has any impact on their satisfaction with their main job and their level of stress at work.

To this end, the opinion of young people aged 16 to 30 is studied based on data from the European Social Survey (wave 10) using the module on digital communication. We analysed data of 4,523 young respondents of the 30 countries participating in the ESS which main activity in the last week was paid work.

Avoiding Organising and Attributing Failure in Organisations: Are Subjective Factors the Explanation?

Martin Hájek[1], Kristián Šrám[2]

1Charles University, Czechia; 2Faculty of Social Sciences, Charles University

In this paper I will address the issue of neutralising or marginalising failure in organisations. The phrases 'failure is not an option', 'too big to fail' or 'fail fast, fail often' are well known, but are understood as performative expressions aimed at preventing or accepting failure, rather than identifying situations in which failure is organisationally avoided. Drawing on empirical research in four fields – start-ups, platforms, development NGOs and environmental education – I will explain different practices of avoiding failure declaration: (a) the use of algorithmic evaluation infrastructures, as in platforms; (b) hiring external evaluators, as in startups; or (c) self-evaluation, as in many non-profit projects. Alongside these structural measures, we can observe the reinforcement of the non-failure ideology, i.e. the resignation to maintain organised failure practices and the preference for the idea that all supported projects or actors should preferably succeed. It can be argued that the common ground of both practices and ideology is that failure in an organisation is never entirely routine, as it requires the subjective involvement of its personnel. Declaring a project or organisation a failure after it has been supported or implemented is a personally sensitive and usually uncomfortable matter. To avoid the subjective burden of judging the failure of others, decision-makers try to externalise the identification and judgement of failure, or to achieve organisational goals without declaring anyone a failure.

278

Understanding Misperceptions of Occupational Incomes – An Empirical Analysis of Occupational and Individual Factors Based on Representative Survey Data

Timo Schnepf[1,2], Daniela Rohrbach-Schmidt[1], Christian Ebner[2]

1BIBB, Germany; 2TU Braunschweig

The aim of the present study is to describe and explain how people assess occupational incomes and how these assessments differ from the real world.

We argue that misperceptions of occupational earnings are first, a function of specific occupational characteristics. For instance, the monetary value of an occupation may be overestimated or underestimated based on the actual income position of the occupation, its associated tasks, its actual and perceived qualification level, or its social composition (share of women, migrants, unemployed, etc.). Second, misperceptions can be based on individual characteristics and the social position of the raters. For example, it can be

hypothesized that income misperceptions are weaker with increasing levels of education and cognitive capabilities. Based on the reference group theory, raters may not only systematically misperceive their own income position (Cruces 2013; Karadja et al. 2017; Hvidberg et al. 2021), but also the income position of socially close occupations.

The analyses are based on novel representative survey data for Germany (year 2018). Around 9,000 People were each asked to estimate the income deciles for 5 randomly selected occupations (out of 402 in total). Estimated income values were compared to reported income data in a representative survey of employees (BIBB/BAuA Employment Surveys 2012, 2018 with 20,000 respondents each).

First findings suggest that misperceptions are strongest at the edges of the actual income distribution. Further, we find high variability for occupational characteristics such as actual and perceived qualification level and occupational fields. At the individual level, we find strong support for the reference group theory where individuals misperceive occupations from their own social strata the strongest.

Return on Education: What Demand do Employers Create in the Labor Market?

Torgyn Kaidarova[2], Aliya Sarsekeyeva[1], Adil Rodionov[2], Aslanbek Amrin[1], Arsen Avsatkarinov[2], Gulnaz Kassimova[2], Amirlan Nurgazin[2]

1quot;El Umiti" Corparate foundation, Kazakhstan; 2Kazakhstan Sociology Lab

Investigating return from schooling, scholars have traditionally focused on the supply side, collecting data from employees. This research focuses on the demand side and describes how employers create a system of signals, talking about which requirements are essential for potential candidates. These signals are primarily in the form of salary amounts. Using open data about vacancies of a popular government platform – enbek.kz – that covering low and medium-paid jobs in the public and quasi-public sectors, small and medium-sized businesses, we analyze 75 thousand vacancies. There are two groups of vacancies posted on Enbek.kz: state-subsidized and unsubsidized. Unsubsidized vacancies are offers from small and medium-sized businesses that seek to maximize profits. State-subsidized vacancies serve different purposes and are often related to the desire of officials to report about the maximum number of jobs. Centering our attention on these differences this research becomes more comprehensive and better demonstrates the effects for potential applicants. We conduct a comparative analysis of the two types, regressing the potential level of wages on the level of education, language proficiency, skills, and other factors. In addition, we separately use quantile regression to estimate how different the effect of an additional year of work is for the lowest – and highest-paying jobs. Thus, this study contributes to the human capital research program by shedding light on how signals from employers influence returns to education.

RN09 | T07_02: Net-zero economy

This session explores the various dimensions of sustainable transitions and entrepreneurial innovations in diverse contexts.

The Transition Toward Low-carbon Behaviors: Insights From The Italian Context

Giacomo Bazzani, Angela Perulli, Vincenzo Marasco

Università degli studi di Firenze, Italy

The shift to a climate-neutral society necessitates moving beyond supply-side mitigation policies, emphasizing altering household consumption. This presentation unveils preliminary findings from research scrutinizing factors influencing the shift to low-carbon consumption in the Italian context, grounded in a theoretical framework highlighting economic dimensions of climate solidarity.

The prevailing literature on low-carbon behaviors in social science and humanities often leans towards an environmental paradigm, framing such behavior solely as pro-environmental. However, we assert an alternative perspective, characterizing low-carbon behavior as a manifestation of prosocial conduct, notably reflecting a form of solidarity with other people, especially in developing countries and future generations.

Our presentation integrates well-established sociological theories explaining the development of prosocial behavior with recent research on low-carbon behaviors, shedding light on mechanisms underpinning the emergence of economic solidarity. Employing the PISMA protocol, a systematic literature review identifies social, cultural, and crucially, economic factors fostering the transition to low-emission lifestyles. This review not only illuminates policy implications but significantly enhances the social sciences and humanities' capacity to comprehend the economic processes facilitating climate neutrality.

Moreover, we present the first insights from a national survey conducted in Italy, offering a distinctive perspective on the population's economic considerations in embracing low-carbon living and potential policy interventions. This contribution not only advances our understanding of societal aspects crucial for sustainable climate goals but also provides actionable economic insights for policymakers striving towards a low-carbon future.

279

Chemical Life: Conceptualising and Overcoming Net Zero and Green Growth

Johannes Hollenhorst

London School of Economics, United Kingdom

Now dominant political and economic responses to climate change remain largely unchallenged by the Anthropocene event in the social sciences and instead continue to reduce climate change to technological problems. On important aspect are chemical technologies which aim to replace hydrocarbons like coal, oil, and gas with substances like ammonia, hydrogen, or e-fuels. These Chemical De-Carbonisation Substances (CDCS) are largely designed to perform the same functions as hydrocarbons to repeat the social practices of the carbon past by other means. As chemical technologies, CDCS are underpinning the political imaginary of net zero which assumes that decarbonisation can unlock rather than inhibit future economic growth. While the materiality underpinning "the economy" (Mitchell, 1998) is changing through the new paradigm of net zero, the misrepresentation of the socio-ecological consequences of the political and economic action of the hydrocarbon age (Mitchell, 2009) is effectively reproduced through such chemical alternatives. In response, this article introduces the concept of chemical life to enable social science research on and beyond CDCS by creating a problem space (Lury, 2020) in which the use and alternatives to CDCS can be explored. To achieve this, chemical life integrates the Anthropocene event in the social sciences with an event in chemistry which also challenged the boundaries between human and natural history, namely the theorisation of non-linear thermodynamics (e.g. Stengers and Prigogine, 1984). From this integrated perspective, life becomes intelligible as a non-linear thermodynamic phenomenon and highlights the politics involved in seeking to manage it through political and economic concept rooted in linear thermodynamics alone (e.g. Mirowski, 1989). The article finally analyses how the use of non-linear rather than linear concepts contribute to more socio-ecological futures.

Social and Institutional Foundations of Solar Energy Entrepreneurs in Developing Countries – The Case of Turkiye

Yelda Erden Topal[2], Betul Hande Gursoy Haksevenler[1]

1Marmara University, Turkiye; 2METU, Middle East Technical University, Turkiye

In developing countries, energy supply with domestic and renewable sources generated by in-house developed technologies and power plants built by local investors and entrepreneurs are of great importance mainly for sustainable and secure energy supply. Emerging technologies, including those harnessing solar energy for energy needs, are currently underutilized compared to other energy sources. Consequently, it becomes imperative to pinpoint and evaluate the obstacles that influence renewable energy entrepreneurs specifically in developing countries. For this purpose, we examine the Turkish Solar Energy Entrepreneurial Ecosystem. In the Turkish case, there are various research outputs on potentials and obstacles for renewable energy sources, however specific studies on renewable energy entrepreneurs cannot be found. Moreover, challenges identified for Turkiye's renewable energy technologies diffusion about project finances, infrastructure, governance and regulation, labour market, and market dynamics of new technologies are perfectly aligned with findings on challenges for renewable energy entrepreneurs in developing countries such as availability of financial resources, cost of renewable energy technologies, availability of skilled workforce, problems on physical infrastructure and logistics, Insufficient governmental or policy backing. Based on this conceptual context, the research question is "What are the challenges for renewable energy entrepreneurs in the Turkish Solar Energy Sector?". We answer through qualitative analysis and propose policy implications. To this aim, we conducted 11 semi-structured interviews with the key stakeholders from renewable energy entrepreneurs, regulatory institutions experts, funding agency, academics in universities and research institutions. Through the analysis of the data, we propose policy proposals to solve these challenges and to develop the Turkish Renewable Energy Entrepreneurial Ecosystem with the lessons learnt from the solar energy sector.

Sustainability Management in Peripheral SME's: The case of Salento

Marco Marrone, Angelo Salento

University of Salento, Italy

Sustainability is now becoming the only viable option for corporations. Environmental and political challenges, new consumption sensibilities, stricter national and international regulations and the rise of ESG finance are just some of the factors that are affecting business organization. This is the case of sustainability management, a new managerial approach that is rising at global level and that is not only introducing new managerial figures – sustainability manager – but that is deeply transforming their overall strategy. However, this does not come without risks, especially for what concern those SME's operating in peripheral territories. They must face not only the lack of resources and infrastructures, but also the difficulty to see their practices recognized by mainstream principles of sustainability management.

By taking the case of Salento – a peninsula in the peninsula, located in the south eastern part of Italy – the aim of the presentation will be exploring both challenges and opportunities for SME's in peripheral territories. These will be analyzed employing a wide range of empirical data. Firstly, 15 background interviews conducted among experts and stakeholders (employers' association, trade union representative and local policymaker). Secondly, a questionnaire

composed by 42 demands distributed among 50 SME's located in Salento from April 2023 to October 2023. Thirdly, 3 focus groups, each participated by 8 SME's representatives, in 3 sectors: manufacturing, craftmanship and "advanced" services. The conclusion will elaborate the proposal of "sustainability district" as a possible solution to address challenges and opportunities emerging from the research.

RN09 | T08_01: Finance and money 1

This session explores the intricate relationship between trust, money, and payment systems across different cultural and economic contexts.

Fast Payment Systems and Central Banks: Israel and Sweden Compared

Daniel Mamam, Keren Borenstein-Nativ

Ben-Gurion University of the Negev, Israel

Following the global financial crisis, central banks, in contrast to their traditional course of action, increased their involvement in advancing technological innovations. Yet, economic sociology scholars have not devoted enough attention to this development. We focus on a fast retail payment system that allows the payees to receive funds within seconds. This system has been adopted in over 60 countries and is crucial to reducing the use of cash and enhancing cross-border payments. In some countries, such as Sweden, the central bank establishes and operates this system, while in others, such as Israel, its involvement is less intensive and confined to facilitating the establishment of this system and determining the operation rules. The Riksbank established and operated the RIX-Instant payment, despite the widespread use of the mobile application Swish to make and receive instant payments. The Riksbank was discontent that payments in the Swish system were settled in a privately owned system, which increased risks and costs, prevented diverse types of payments, and discouraged cross-border payments, especially with Nordic countries and the Euro area. In Israel, in contrast, the Bank of Israel encouraged the private company owned by the largest commercial banks that manage the Bank Automated Settlement System to establish and operate this system. This decision originated from the high costs and the Israeli central bank's involvement in other financial infrastructural projects. The comparative analysis enables us to address the diverse roles of central banks in advancing technological innovations alongside other "unconventional" policies adopted since the global financial crisis.

Is Money a Matter of Trust? A Popular Thesis Put to the Empirical Test

Klaus Kraemer[1], Sebastian Nessel[2], Jakob Gasser[1]

1University of Graz, Austria; 2Vienna University of Economics and Business

In (economic) sociology, trust is seen as a fundamental concept for addressing the problem of uncertainty. In the case of money, the extent to which trust is involved becomes

281

questionable since choices are absent. Classical sociology implies a relation between trust and knowledge, as money usage relies on a form of mimetic "weak inductive knowledge". This discussion addresses the question of the relation between trust in political, private, and monetary institutions and knowledge of the monetary order through the application of logistic regression models to an original dataset representative of the Austrian population (n=2000). Additionally, we consider the influence of sociodemographic variables and investment behavior. The main result shows that higher levels of knowledge are associated with lower levels of trust. As a result, we argue that assumptions about the role of trust in economic sociology, particularly in the sociology of money, should be reconsidered and that a more nuanced approach should be taken to how trust and knowledge—and their relationships with each other—are conceptualized even under conditions of crisis or non-crises in economic and monetary order.

Inside the Payer's Mind. A Mixed-Methods Investigation in the Sociology of Money.

Constanze M. Rammer, Nico Tackner

University of Graz, Austria

While there has been a trend towards digital payment methods across countries, Austria shows an astonishing persistence of cash payments despite sufficient digital infrastructure. In order to study when, why, and how people pay as they do, we are conducting a mixed-methods research project. A prior qualitative investigation (consisting of focused interviews, group interviews as well as expert interviews) aimed at aiding the construction of our standardized questionnaire as well as generating causal hypotheses by tracing processes. The survey was then carried out, representative of the Austrian residential population. Which allowed us in turn to test the causal mechanisms identified via the qualitative investigation using structural equation models. We find, among other things, that a stronger affinity towards cash even persists within those who primarily pay cashless. A major causal mechanism for either using cash as well as carrying a sufficient amount of cash as a backup are prior experiences of failure with digital payments (e.g. card malfunction). These experiences shape what we call "Subjective Expectations of Liquidity": Am I more insecure or more certain that a payment with a specific payment instrument will work? The more insecure one is with digital payment methods, the more likely he/she is to use cash more frequently for payments, or at least to carry a sufficient amount of cash as a backup.

"As Long As It Is Halal, Every Payment is a Prayer": Re-sacralizing the Card Payments with Tayyab Card

M. Fatih Karakaya

Istanbul University, Turkiye

The dominant narrative of economics takes economic phenomena as ahistorical, apolitical, acultural, asocial, and amoral. According to this narrative, fully rational individuals make choices based on a self-interest that maximizes their utility. Yet, such an amoral, asocial and apolitical understanding of an abstract individual is nothing but an illusion. Since the late 1970s, there have been many sociologists who deal with moral aspects of economic behaviours and actions from a sociological point of view. Moreover, within the field of finance there is a growing scholarly and practical subfield, i.e. Islamic Finance as well. Although there are three Islamic Banks, which are called Participation Banks in Türkiye, card payment has been a controversial issue due to its being interwoven with financial interest. To overcome this controversy, a card payment company established in 2018 has launched a so-called Islamic Card, i.e. Tayyab Card. Tayyab Card presents itself as Türkiye's first so-called Islamic Card that complies with the religious principles while enabling its holders to handle electronic payment features. In addition to the usual charge card and interest-free savings account features, Tayyab Card provides its users to check if an investment is halal or not. Besides these financial long standing services, Tayyab Card also enables its users to follow up prayer times, to direct debit charities, and to get the chance of participating a lottery for a religious visit to holy lands in Kingdom of Saudi Arabia. This study aims at conducting a phenomenological analysis of how new digital payment applications enable their users' re-sacralization of the finance in general, and card payments in particular.

282

RN09 | T09_01: AIs and digitalized labor

In recent years digitalization has shaped and changed the work sphere tremendously. In this session we will deal with different developments and effects of this process.

Automation in Shared Service Centres: Implications for Skills and Autonomy in a Global Organisation

Zuzanna Kowalik[1,2], Piotr Lewandowski[2], Maciej Grodzicki[3], Tomasz Geodecki[4]

1University of Warsaw, Poland; 2Institute for Structural Research; 3Jagiellonian University; 4Kraków Unviersity of Economics

The Central and Eastern European business services sector has experienced significant growth, propelled by globalisation, outsourcing, and the increasing demand for tech-related expertise. This growth has given rise to the establishment of shared service centres (SSCs), which heavily rely on a sizeable workforce to manage routine and transactional tasks, such as data entry and invoice processing. These tasks, while essential, do not demand a high level of specialised knowledge.

However, the landscape of SSC employment is undergoing a transformation with the introduction of technologies like Intelligent Process Automation (IPA), Robotic Process Automation (RPA), and Artificial Intelligence (AI). This shift is leading to the automation and streamlining of routine tasks, necessitating employees to adapt by acquiring new skills.

The study is grounded in 31 individual in-depth interviews conducted in Warsaw and Kraków across four companies. Informed by Braverman's thesis on deskilling, the study challenges this narrative, revealing that automation in SSCs can prompt upskilling and enhance workers' autonomy. We emphasise the negotiated nature of automation processes shaped by interactions among headquarters, SSCs, and their workers. Workers actively participated in automating processes, ultimately eliminating the most mundane tasks. This resulted in upskilling, heightened job satisfaction, and empowerment. However, the extent of this phenomenon is contingent upon automation being driven by labour shortages, which, in turn, restrict the expansion of SSCs in Poland. This situation encourages companies to leverage the specific expertise ingrained in their existing workforce. The study underscores the importance of fostering employee-driven automation and upskilling initiatives for overall job satisfaction and quality.

Not a Unique, Transformative Change – Expectations of Hungarian Journalists and Copywriters About Generative AI

Lilla Vicsek, Róbert Pintér, Zsófia Bauer

Corvinus University of Budapest, Hungary

Last year, media coverage in many countries, including Hungary, featured high expectations regarding generative AI. A significant portion of these discussions focused on the profound implications AI might have on labor markets and a wide range of professions, including copywriters and journalists. In 2023, we conducted interview research with 15 copywriters and 15 journalists in Hungary to examine various factors that shape their expectations about the potential impact of generative AI on the future of their occupations and their own career prospects. Preliminary results indicate that they do not perceive this as a unique or radical change, and feel they will be well-positioned to navigate their future. Their skeptical attitude towards significant change is based, among other things, on the belief that changes in Hungary will be slower, as well as a perspective in which they project the current limitations of AI (such as hallucinations) into the future. They also express resistance to media representations, claiming that these exaggerate potential effects and developments. On a personal level, they exhibit optimism bias: believing that while others may be negatively affected, they will be able to use the technology to their advantage. The research situates the discourse around AI's impact on expectations within the broader context of media hype and techno-optimism, contributing to the understanding of the complex interplay between anticipatory practices and media hypes. By anchoring our analysis in the sociology of expectations, the study aims to explore how the anticipated futures of AI are constructed, understood, and navigated by those who are directly impacted.

AIs as Trustworthy Decision-Makers: Evidence from a Factorial Survey Experiment

Patrick Schenk, Gabriel Abend, Vanessa Müller

University of Lucerne, Switzerland

You're starving. So, you insert a 5€ bill in a vending machine and get a bag of chips. Did the vending machine decide to give you the chips? Of course not. Meanwhile, your company needs to hire a new employee. An AI analyzed hundreds of applications and outputs the best candidate. Did the AI decide who's the right person for the job? It's not so clear. AIs are said to be autonomous and objective, implying they're capable of making trustworthy decisions. But would you trust their decisions if so much is at stake?

Our project empirically investigates people's views about such questions. Using a moral decisionism framework

(Abend 2018), we claim that the attribution of decision-making capacity and trustworthiness are social facts that vary across groups. To explain these variations, we administered a factorial survey experiment to a random sample of the Swiss population (n ≈ 1900). Participants were asked to attribute decision-making capacity and trustworthiness to AIs and human agents in three socio-economic contexts: job recruitment, journalism, and healthcare. Additionally, we manipulated several aspects of these situations, e.g., transparency or discriminatory bias.

Unlike previous research (e.g., Langer et al. 2023; Kieslich et al. 2022), the combination of a factorial survey and a large sample of the general population allows us to compare different economic situations and social groups (class, gender, region), providing new insights on trust and moral decision-making in the age of AI. Our findings also speak to timely social quandaries, including algorithmic discrimination and explainable AI.

RN09 | T09_02: Finance and money 2

This session delves into various aspects of trust and financial practices, from children's savings to the politicization of inflation and the role of social banking.

Saving The Children's Savings: How Turkish Commercial Banks Promote Piggy Banks to Children as A Financial Product

Zehra Zeynep Sadıkoğlu, Muhammed Fatih Karakaya

Istanbul University

The sociological studies on childhood and on finance have grown separately since late 1980s. Yet the intersection of the two has not been a distinct field of study. Two major figures around the subject, Viviana Zelizer and Nina Bandelj have studied the intersection of economic and/or non-economic value of children and financial parenting practices while barely mentioning the financialization of childhood. However, the promotion of financial products and services to children has always been one of the main marketing strategies of commercial banks since the early 20th century. This study aims to analyze the children's piggy banks advertorials of three major commercial banks (Türkiye İş Bankası, Vakıfbank, Halkbank) in Türkiye. A semiological analysis of those advertorials, based on the coding of their texts, visual (symbols, objects, subjects) and auditory products, reveal that financial behavior of investing/saving in children's piggy banks is encouraged to develop the child's future socio-economic security. Although the advertorials promoting saving in children's piggy banks are embedded in the cultural/social/moral/political context of intensive parenthood and the ongoing digitalization of the daily life, there is an ambiguity in those advertorials as to whether they address children or parents, and whether those interlocutors are financial investors or consumers. In any case these advertorials all insist on educating children and their socialisation into responsible individuals equipped with the idea of saving. All in all, advertorials promoting financial products to children appear as an actant in the process of assembling children as economic agents, or at least as future clients.

284

Inflation Rates and the Myth of Neutral Money – Towards a Sociological Critique of the De-politicization of Inflation

Florian Penz

Vienna University of Economics and Business, Austria

To economic sociologists, it has become received knowledge that the economic discipline not only describes but actively 'performs' the modern market economy. Thus, certain economic technologies, metaphors, and concepts enter our ordinary lifeworld and shape how we think about the economy at large. A case in point is inflation. Over the past century, inflation has evolved into one of the most central concepts of economic policy, and the inflation-rate has emerged as a 'quasi-positive' and 'de-politicized' standard. Unlike markets, prices, and competition, inflation has received little attention from economic sociology. Further, if sociology has engaged with inflation, it often implicitly adopted the orthodox understanding of inflation as a uniform and neutral rise in prices. This paper traces the emergence of 'single-metric' inflation rates as a powerful indicator informing and justifying economic policies during the second half of the 20th century. With the rise of central-banks as the institutional cornerstone of the contemporary monetary order, inflation-targeting has emerged as guiding-principle for monetary policies, and inflation rates (as measured by the CPI) have been legally enshrined in the monetary constitution of modern market economies. By depicting inflation as a neutral, collective burden, the rise of the 'quasi-positive' inflation rate has been key to a process of de-politicizing periods of rising prices. Reducing inflation to a single metric dovetails with an 'ideology of unpolitical money' and plays an important role in disguising distributional effects. It is argued that the political history of inflation measurement, the empirical reality of changes in relative prices, and the disciplining effect of monetary policies such as rising interest rates on organized labour suggest that inflation needs to be regarded as a complex, context-dependent phenomenon pervaded by power relations. Consequently, this paper adds to an incipient sociological perspective on inflation by laying bare the performative role of inflation rates in re-defining periods of rising prices as a politically neutral, uniform and natural phenomenon. In that, its mission is located in the burgeoning field of a 'sociology of money' – that views money as a set of social relations – and adds to a power-sensitive perspective on central-bank-led capitalism.

Unveiling Social Banking: A definition through the configuration of its dimensions.

Yolanda Cotelo-Ourens, Carles Maixé-Altés, Matilde Massó-Lago

University of A Coruna, Spain

This work analyzes social banking, specifically, its definition through the different configurations of its key characteristics. The relevance of this conceptualization has been growing since the legitimacy crisis suffered by banking entities in 2008. As a result of which, ethical and sustainable behaviour began to conform a central aspect, no longer exclusive of this banking typology, instead, of the whole banking system. Consequently, increasing the difficulty of forging the social banking characterization and definition. With the aim of contributing to overcoming these difficulties, a dynamic multi-theoretical framework is proposed built over the linkages among legitimacy, stakeholder and institutional theories. This set the theorical anchors of the definition, base of the empirical analysis of the conceptualization develop trough the fuzzy-set qualitative comparative analysis of the non-financial reports of the main Spanish banking entities in 2022. The principal conclusion is that social banks are necessary defined by a triple social, environmental, and economic objective, and a participatory governance structure. While the dimensions that sufficiently determine this typology are a banking practice with criteria and a contribution to either the financial inclusion or the solidary economy, representing alternative combinations of dimensions that lead a bank to be social. The analysis yields important findings regarding its inclusiveness and its social contribution. Furthermore, in the analysed empirical context of Spain, new insights are brought contributing to explain the evolution of its traditional banking characterization. Thus, it contributes to the theoretical and empirical basis of social banking, at the same time that allows deepening on the characterization of each particular banking system, advancing the knowledge required to foster banking sustainability and sustainable development.

Money Constraints and Creativity. The Case of Italian Minimum Income.

Giulio Bertoluzza

University of Bergamo, Italy

When considering minimum income (MI) schemes, the monetary transfer is subject to constraints. In Italy, it is disbursed through a prepaid card with purchase limits. Therefore, beneficiaries develop creative strategies to overcome the imposed restrictions and use the money in the way that best suits their needs. However, the meanings attached to these constraints and strategies are poorly examined. In analyzing low-income groups, money is presented as functional in a market-driven way and essential to help households meet their basic needs (Daly, 2017).

285

This contribution aims to study the constraints and strategies related to the money disbursed in MI, focusing on the Italian experience of the Citizenship Income. The study addresses two main research questions:

1. What meanings do beneficiaries attribute to the constraints of the money received?

2. How do these constraints relate to the actions of beneficiaries in using this money?

I draw on relational work theory, which views economic transactions as fundamentally social interactions and apply it at the institutional level (Bandelj, 2020). Constraints and strategies can be framed as a part of the attempt to find viable matches across interpersonal ties, economic transactions, media of exchange and negotiated meanings (Zelizer, 2012).

This contribution builds on the results of the PRIN 2017 research project CoPInG, which studied the implementation of Citizenship Income in four regions of Northern Italy. It is based on a qualitative thematic analysis of unstructured interviews with a biographical approach with 128 beneficiaries of the measure.

This case is relevant because it provides meaningful insights into the existing tension between the dimensions of social inclusion and the disciplining of the poor. Furthermore, relational work theory helps to reveal the structural relationship between society and its poor, as it is through relational work that people negotiate their relationship of equality and inequality (Bandelj, 2020). In this negotiation, constraints and strategies can be framed as different types of money earmarking (Zelizer, 1994). Constraints as state earmarking, and strategies as a creative way to challenge the dominant system. This paper is significant also because it helps to imagine new ways of designing and implementing anti-poverty policies.

RN10 | Sociology of Education

RN10 | T01_01: Educational Context and Environment (I)

The Academic Climate As A Mediator Between Reading Achievement And The Composition Of Elementary Schools

Anja Kürzinger, Stefan Immerfall

University of Education Schwäbisch Gmünd, Germany

The increasing segregation and declining reading achievement in German primary schools raises the question of how schools can be designed to promote learning and reduce composition effects. International studies highlight the pivotal role of an academic climate emphasizing academic success. Unlike other student – and school-related factors such as socioeconomic background and school composition, school academic climate could be modified to reduce achievement gaps between students and schools.

The present study addresses a research gap in Germany on learning conditions in segregated elementary schools and examines whether various aspects of the academic climate mediate the relationship between school composition and students' reading performance. The academic climate was assessed by 145 school principals in 2021 and its operationalization is based on school performance studies (e.g. SEAS: school emphasis on academic success in PIRLS). This measurement was combined with VERA 3 data from 2019. It includes the reading performance of 5.507 students (M=495.91; SD=131.69) at the 145 schools and the socio-cultural school composition (cultural capital was operationalized via number of books at home: M=3.16; SD=1.17, 1-5; non-German everyday language: 24%; SD=0.43).

Multilevel analyses suggest an effect of the cultural composition on reading achievement, which is mediated by SEAS (β=0.38***) as one of the academic climate indicators. Among the sub-aspects of SEAS, parental trust (β=0.29*) and academic emphasis (β=0.25*) appear to be particularly associated with reading achievement. In contrast, school achievement orientation, equity beliefs and collective school efficacy do not appear to be associated with reading achievement, controlling for school composition.

Initial takeaways from the study include the importance of parental trust and academic emphasis as potential learning-enhancing features of disadvantaged elementary schools.

Institutional Habitus in Upper Secondary Schools in Disadvantaged Areas: a Comparison of Educational Reproduction in Helsinki and Barcelona

Sonja Kosunen[1], Aina Tarabini[2]

1University of Eastern Finland; 2Autonomous University of Barcelona

This presentation draws on a bourdieusian research tradition to analyze the reproduction of social class differences by means of daily educational policies and practices. We focus on comparing the role of institutional habitus in the (re)production of social positions in education in upper secondary schools in two disadvantaged areas, one in the metropolitan area of Helsinki and the other in the city of Barcelona. The data comprises an ethnographic field-work and ethnographic interviews with students (n=17 in Helsinki, n=18 in Barcelona) in upper secondary schools that are positioned in disadvantaged areas in the urban landscape. We explore qualitatively, how the students regard the role of different forms of capital and their transformations in the process of navigating through their educational paths in secondary education, how are their future educational aspirations in higher education and furthermore in the labour-market constructed, and what is the role of the institutional habitus of the upper secondary school in the construction of these aspirations. We compare two socio-historically different settings, but expect to find relevant differences in how the institutions in disadvantaged areas are reinforcing, compensating or reducing the existing differences between social groups. Our contribution, therefore, helps to provide further evidence on 1) the persistent impacts and tensions that social class generates in the reproduction of young people's educational trajectories independently of systemic and institutional factors and, simultaneously, on 2) the transformative potential that specific systemic and institutional arrangements can generate in young people's opportunities and lives.

Teacher effectiveness: insights from Italy

Giovanni Abbiati[1], Giulia Assirelli[2]

1University of Brescia, Italy; 2Catholic University of Milan, Italy

This paper explores the concept of teacher effectiveness, that is the impact of teachers on students' cognitive growth as measured through standardized tests. Sociologists have been traditionally hesitant to use this concept due to its alignment with an efficiency-driven educational model. Nevertheless, the increasing recognition of teachers' role in influencing students' achievement and educational paths requires a deeper examination and integration into existing empirical and theoretical frameworks in Sociology.

287

In this paper we provide teacher effectiveness estimates for Italy, a country characterized by marked educational inequalities despite its highly centralized system, particularly in the lower and upper secondary school cycles.

We analyze data from representative samples of 8th and 10th graders collected during the 2017-18 and 2018-19 school years. The data include language and mathematics competence scores and socio-demographic information, combined with surveys from their language and mathematics teachers. These school years are chosen because the questionnaire administered to teachers includes an item that allows the identification of those who have followed sample students from the beginning of their educational cycle (the target of the analyses).

In line with the literature, teacher effectiveness is estimated by regressing students' scores against a teacher dummy variable, previous competences, and individual-level factors. The distribution of effectiveness estimates will be explored across schools, families, and regions, and it will be assessed its predictive power in shaping students' future educational trajectories. This study will contribute to a deeper understanding of teacher effectiveness and its implications for addressing educational inequalities.

Educational Practices and Effects of the School Climate at the "Lycée d'adulte (High School for adults)" in France, for Early School Leavers

Emi Kawabata

Osaka university, Japan

This study clarifies the characteristics of pedagogical practices and the school climate at the high school for adults, how they impact the school and its students.

The percentage of early school leavers in France currently stands at 8.2 percent, a significant decrease from the previous 2010 survey (DEPP, 2020). This is due to the impact of France's active early school-leaving support measures aimed at returning early school leavers to school and job training. However, most of these institutions have an age limit of 25 as an admission policy. There is also a little research done on early school-leaving support for adults.

The study is based on data collected in the only high school in France to offer a baccalaureate preparatory course for early school leavers, open to students at any age. This study interviewed a principal and two teachers.

The study found that the school was able to construct a special school climate by understanding the students' backgrounds as [the school's educational practices], confirming compatibility with the school environment, hiring teachers with experience in teaching adults, a positive understanding of the students as [the teachers' educational practices], and [students] who have a variety of experiences and backgrounds and are supportive of others. It was also clear that this had resulted not only in obtaining of a baccalaureate degree, but also in a recovery of self-esteem through the building of social relationships between teachers and students, gaining school experiences, and the acquisition of knowledge and skills.

RN10 | T01_02: Migration, Ethnicity, and Racism in Education (I)

Rethinking inclusive education through decolonization: Azerbaijan's Access to Inclusive Education

Turana Abdullayeva

The University of Sheffield, United Kingdom

The paper examines the obstacles that Azerbaijan's inclusive education policies face in their attempt to be implemented successfully. According to Thomas and Loxley (2022), the study supports the theory of "helicopter inclusion," which holds that ideas from high-income countries frequently flow more freely to low-income countries in the form of aid, frequently with insufficient consideration for local customs. Many post-soviet countries face significant challenges in implementing inclusive education policies today as a result of their long-standing reliance on several pilot programmes and training provided by NGOs.

In light of historical, cultural, and social factors, the study investigates the barriers that prevent inclusive education policies from being implemented successfully in Azerbaijan's educational system. The primary focus of the study is the identification of these limitations in the educational system of Azerbaijan.

This work tried to found an answer to the dominant narratives and power dynamics hidden in postcolonial educational systems like Azerbaijan's by examining inclusive education through the prism of decolonial disability studies. In addition, this research recognises the richness and heterogeneity of the post-Soviet space, cognizant of the fact that every nation and environment possesses unique historical, cultural, and social contexts. The results show that inclusive education policy is based more on enforcing a one-size-fits-all inclusive education paradigm than it is on promoting coordination, communication, and mutual learning among individuals and locations. The implementation of inclusive education should draw on global experience while considering the particular characteristics and circumstances of every educational system.

Polish Language Courses. Addressing the Needs of Forced Migrants from Ukraine

Agata Pałka, Milena Maj, Maria Tulisow, Karolina Messyasz

Educational Research Institute, Poland

As a result of Russia's invasion of Ukraine in February 2022, a large number of forced migrants arrived in Poland in a short time. This posed many challenges to Polish institutions. In

288

addition to the necessity to meet basic needs, the opportunity to learn Polish has become particularly important, as it significantly increases the chance of integration. Our analysis is based on the IDI with representatives of institutions providing Polish language courses, as well as teachers and learners from these entities.

In Warsaw, which received the largest number of forced migrants of all Polish cities, even before the escalation of the war there were many entities offering Polish language lessons primarily from the private and non-governmental sectors. However, due to the unexpected demand, various new initiatives emerged by universities and cultural institutions.

The purpose of the paper is to present the scope of support in the area of Polish language teaching for migrants from Ukraine, taking into account the characteristics of institutions providing Polish language courses, the specifics of the offer aimed at migrants, methods and techniques of education and ways of learning in the context of migrants' needs. We also aim to point out the barriers and institutional difficulties arising from the learning specificity of forced migrant adults. In addition, we intend to present the strengths of the offer and the solutions devised.

Principals' Responses to Racism in Irish Post-Primary Schools

Sorcha Mellon[1], Ciaran O'Gallchoir[2], Melanie Groening McKenna[2]

1Trinity College Dublin, Ireland; 2Maynooth University, Ireland

In recent years, Ireland has seen significant social change. Communities that were once largely homogenous have become increasingly racially diverse, challenging the way in which post-primary schools in Ireland operate. It is widely acknowledged that School Leaders can have a decisive effect on racist and anti-racist practices (Gillborn, 1995; Ryan, 2003).

This study seeks to understand how School Leaders have experienced increasing racial diversity and incidents of Racism within their own school contexts. It will consider the extent to which School Leaders feel equipped to manage Race-related issues and examine the continual professional development available. This study contributes to the limited literature on race in Irish schools as it is the first study which explores specifically Post-Primary School Leaders' experiences of Racism. This is of particular importance in gaining insight into how Racism is understood and managed in Irish Post-Primary schools.

The qualitative, constructionist approach was employed in this research study as a critical

lens through which the lived experience of School Leaders could be considered. The

researcher conducted eight semi-structured interviews with Post-Primary Principals which included presenting participants with a series of vignettes in order to provide a more realistic context for subsequent questions asked (Steiner et al., 2016). The data set was then analysed using the Braun and Clarke six phase guide to thematic analysis.

The findings of this study indicate that limited understandings of racial identity and of

Whiteness function in Irish schools to support the existing hegemonic structures of systemic and institutional Racism. The findings also indicate that there is little to no support available for school Leaders grappling with these issues. There is evidence to suggest that when leaders understand what Racism is, they are in a better position to tackle it in their school and lead action towards Anti-Racism (Miller,2021).

There are significant implications for policy and practice resulting from this study, perhaps most importantly, the demand from school leaders' for appropriate professional support and leadership. While this study was carried out in Ireland, it is also of relevance to other jurisdictions where schools are facing increasing diversity among their student population.

Teachers and White Privilege Attitudes: Correlates and Consequences for In-service Secondary Education Teachers

Fanny D'hondt[1], Jolien Inghels[2], Mieke Van Houtte[1], Peter A.J. Stevens[1]

1Ghent University, Belgium; 2Universiteit Antwerpen

Racial – ethnic educational inequality remains a key issue in the field of education with far-reaching consequences for large numbers of adolescents, and broader society. The white privilege perspective reframes the issue of racial-ethnic educational inequality by highlighting how the educational system favours white students, while subjecting racial-ethnic minoritized students to disadvantages. This study examines the white privilege attitudes of in-service teachers, as teachers are essential in the realization of educational equity. However, at the same time, in Western countries the teacher profession is predominantly occupied by white individuals, hence, those in a key position belong predominantly to this invisible and dominant social category. The goal of the current study is to address the gaps in the literature by employing quantitative research methods to be able to explain variability in the level of white privilege awareness and the level of white privilege remorse (being an affective reaction) among in-service teachers. We will analyse the data of 631 Flemish secondary school teachers and consider various correlates, including socio-demographic characteristics and the ethnic composition of the teaching context, and examine how white privilege awareness/remorse relates with multicultural teaching. Multicultural teaching is chosen as a focal point in this explorative study due to its significance in discussions surrounding educational equity for all students. Hence, by using a quantitative approach and by focusing on in-service teachers, this study aims to realize highly innovative insights that could help teachers and teacher-educators to understand and address white privilege better.

Norm Critical Pedagogy In Online Higher Education: Teachers' Experiences From A Behaviour Science Programme

Sophia Yakhlef

Kristianstad University, Sweden

Norm-critical pedagogy in higher education, stemming from intersectional gender, feminist, queer, and critical pedagogy, is gaining popularity in Sweden. It challenges norms related to power dimensions like 'whiteness,' 'Swedishness,' and 'middle-class norms,' as well as heteronormativity and body functionality. Rather than viewing students as a homogenous group, this approach emphasizes differences and encourages teachers to critically assess their methods, materials, and course literature. Additionally, the classical sociological literature, often referred to as the sociological canon, has faced challenges from feminist, post-colonial, and queer theorists. These developments prompt further exploration of their implications for sociological and behavioural science education, as well as pedagogical practices. This study examines the implementation of norm-critical pedagogy in an online behavioural science program (including sociology and criminology) at Kristianstad University in Sweden. Interviews with teachers highlight the benefits, but also the tension and pitfalls of adopting this perspective, as well as its impact on inclusive online education.

Inside the University Teaching Book of Russian Ideology

Roman Smirnov

Freie University Berlin, Germany

The study of ideological textbooks is an important element of the scientific analysis of Russia and higher education under Putin since they contain "officially approved dissemination" of the ideology of the political regime. Using the method of sociological discourse analysis, I studied three textbooks on the university subject "Fundamentals of Russian Statehood".

The information presented in textbooks contains all the signs of ideology. The discourse contains a picture of the modern world, an interpretation of the past, and the legitimation of foreign and domestic policies of Russia. Contradictory statements, meaningless terms, and alternative history play a special role in a strategy of suppressing and confusing the reader.

As a result of the study, I was able to answer the following research question.

Q1. What is the ideological image of Russia in ideological teaching book? Russia appears in an exceptionally good light. Allegedly, Russia protects its unique culture, people, and freedom, and seeks to protect and defend its sovereignty and the cultural uniqueness of other nations. There is a try to show cultural and moral superiority over the West. So-called "Russian traditional values" are based in fact on chauvinism, nationalism, and antiwesternism.

Q2. What is the image of democracy and freedom? In textbooks, democracy, liberalism, and Western values are presented in a demonized form. Western values can lead to the disintegration of personality, and liberalism, referred to as liberal fascism or dictatorship of minorities, is dangerous for national culture. The most unenviable fate of the term "democracy" is that it is postulated that there is no democracy in Europe at all, and the term is used for political pressure on non-European nations and states.

What Do Sociologists Do And How Do We Become One? Norwegian, English And Hungarian University Students' Experiences

Rita Hordósy[1], Meryem Betul Yasdiman[1,2]

1University of Nottingham, United Kingdom; 2Nottingham Trent University, United Kingdom

Drawing on Burawoy's assertion (2014) that sociology is infused with moral purpose, this paper explores how sociology undergraduate and postgraduate students understand and discuss their disciplinary choice, as well as possible sociological futures in the three national contexts of Norway, England and Hungary.

Based on an international comparative design, the study uses first, administrative secondary data to explore the patterns of student enrolment onto sociology courses over time. The sociology enrolment figures are contextualised with data university expansion in general. Second, it uses interviews with current students to explore their perceptions on subject choice and possible futures. A total of 38 face-to-face or online semi-structured interviews with sociology Bachelor's, Master's, and PhD students, the similarities and differences in Hungarian (HU = 17), English (EN = 9) and Norwegian (NO = 12) students' views are outlined.

The paper provides a typology along the axes of sociology focusing on oneself or others, and it being a generic or specific discipline. This typology for motivation ranges from an explanation for personal experience; to gaining tools to understand society, politics, broader inequalities; to sociological studies being a general basis for a career and hope for changing others' inequalities. Further, using Markus and Nurius (1986) concept of possible selves, the paper provides a brief window into possible sociological futures. Students' perceptions of the roles and activities, goals and outputs, as well as organisational settings one needs to work in to be considered a sociologist are outlined and related to their future sociological selves.

Doing The Heavy Lifting: The Experiences of Working-class Professional Services and Administrative Staff in Russell Group Universities

Jessica Anne Pilgrim-Brown

University of Bristol, United Kingdom

At present, research which seeks to understand social class based experiences of universities in the UK has focused predominantly on the experiences of working-class academics and working class students. There is currently a large gap in research which has not yet addressed the experiences of working-class professional services and administrative staff. In fact, professional services voices in themselves rarely feature in academic literature regardless of social class background. This paper outlines findings of an EdD thesis. Using semi-structured interviews and narrative inquiry, the experiences of 13 working-class professional services employees at Russell Group universities were collected. This paper looks at the experiences of those working in professional services in UK universities. All participants reported generally good relationships with others in professional services teams and working-class students who they sought to help. Where participants mentioned relationships with students from other social class backgrounds and academics, these relationships were reported with a distinctly negative framing. Working-class professional services staff are subjected to poor behaviour, distain, a lack of respect, with derogatory and demeaning action on the part of academics and students from other social class backgrounds. It hopes to contribute to knowledge by investigating the complexities of organizational culture through the experiences that professional services staff have working day to day in Russell Group universities.

Educational Disparities Among Native And Immigrant Students In Italy: Analysis From Pre-pandemic To Post-pandemic Periods

Francesca Carimando[1], Loris Vergolini[1,3], Eleonora Vlach[2]

1University of Bologna; 2Goethe University Frankfurt; 3FBK IRVAPP

The study focuses on analysing the differences in educational performance between native and immigrant students before the pandemic and assessing COVID-19's impact on their learning outcomes. It also explores recovery patterns in the 2022-2023 academic year, providing a comprehensive analysis of the educational landscape in Italy in the face of the pandemic's challenges. In other words, it delves into the ethnic achievement gap throughout pre-pandemic, pandemic, and post-pandemic periods, examining also variables such as socioeconomic status, gender, and language spoken at home. By examining these critical periods, the paper aims to enhance the dialogue on the educational challenges exacerbated by the pandemic. It seeks to provide insights into mitigating educational losses and understanding the nature of disparities during the recovery process. Emphasizing the need for inclusive educational policies, the study underscores the importance of ensuring equitable opportunities and support for all students in Italy's post-pandemic educational landscape.

This paper employs data from the Italian National Evaluation System for Student Performance (INVALSI) on the whole population of students enrolled at all educational levels (i.e., grades 2, 5, 8,10, and 13) from 2018/2019 to 2022/2023. The analytical strategy is based on comparing the ethnic achievement gap between different cohorts of students. Preliminary analyses, performed through OLS regression, show that immigrant students consistently lag behind their native peers before the pandemic. The crisis widened these gaps, particularly in early education. The 2022-2023 data reveal diverging trends: higher grades exhibit recovery signs, while lower grades persistently underperform, highlighting an incomplete levelling of educational disparities.

291

Organizational Cheating and Underlying Education Policies: An Example From Turkey

Rahsan Nazli Somel

Bogazici University, Turkiye

Since the 1970s, increased individual and inter-school competition in education, and competition based on measurable outcomes and market logic, has de-emphasized education as a process. Consequently, cheating in schools has changed its nature. Cheating, traditionally considered an individual act undertaken by students, has also become one of the tools to get ahead in inter-school competitions and is organized by schools. Research on this type of organizational cheating treats it as a sporadic and isolated phenomenon decoupled from the core educational practices; it is considered to arise only when the school organization members face external pressure to meet certain criteria, but without being habitually involved in the process. This study, in contrast, reveals how organizational cheating is habitually performed by teachers and administrators who have assimilated the logic of the neoliberal education market. The research was conducted in eight Turkish public high schools in 2022. It involved group interviews with students and teachers and expert interviews with school principals, and the data was analyzed using the Documentary Method. In two of the eight schools, we observed a type of cheating regulated and controlled by the school organization. The educational characteristics of these two schools, and where they stand in the educational competition, provide insight into the conditions that promote the emergence of organizational cheating. These include recent changes in how the university entrance competition is regulated and the introduction of a new type of privileged school in Turkey.

This study was supported by the Boğaziçi University Research Fund grant number 19163.

School Responses to Desegregation Policies in Barcelona: A Realist Evaluation Approach

Marcel Pagès Martín, Andrea Jover Pujol, Adrián Zancajo Silla, Edgar Quilabert Agudo

Universitat Autònoma de Barcelona, Spain

School segregation is amongst the most important challenges that educational systems face today, with public administrations adopting pro-equity public policies aiming to tackle it since the 2000s. With its Shock Plan Against School Segregation (SPASS), launched in 2019, Barcelona aims to distribute pupils more equitably by means of a set of instruments, namely targeted funding, preassigned school seats, and quotas for vulnerable students. Nonetheless, due to its short track, little is known about how desegregation policies work, how their instruments are being enacted by schools and families, which mechanisms are being triggered with what outcomes, and particularly how schools' context and actors mediate them. With this research, we aim to contribute to the international debate about these educational reforms beyond the specific case of Barcelona. In this study, we analyse the enactment of these policies at the school level. Analytically and methodologically, we draw on a realist evaluation approach (Pawson & Tilley, 2004). We follow a mixed-methods approach based on three data sources: first, semi-structured interviews with school principals [n=32] and mid-level implementers from the local educational authority [n=8]; second, survey data from school principals [n=80]; and third, administrative records. Findings show that the immediate school context, the actors' knowledge and beliefs about the policy, and their position is the local education market determine the implementation process and produce diverse school-level practices, often diverging from expected policy outcomes. Despite a single-case study, this paper informs reforms of this kind adopted elsewhere and offers relevant insights into the design, implementation, and evaluation of desegregation policies.

Resonance vs. Alienation: Predicting School Thriving in Diverse Contexts

Orhan Agirdag, Aurélie Van de Peer

KU Leuven, Belgium

The recent interpretation of critical theory, as introduced by Rosa, introduces the concept of 'resonance' as a new paradigm for understanding the conditions conducive to a good life. This concept contrasts with alienation, a central theme in traditional critical theory. Resonance entails an interaction between individuals and their world, fostering a sense of deep connection and meaningful engagement, extending not only between humans but also with objects. This contrasts with alienation, characterized by a state of disconnection from oneself, others, and the environment.

Rosa's approach shifts critical theory towards fostering relationships marked by reciprocity, aiming to nurture a sense of fulfillment, efficacy, and competence. However, empirical explorations of resonance in educational contexts are notably sparse. To address this gap, we analyze quantitative data from 59 Belgian primary schools involving 3,000 students, complemented by qualitative focus group data from 33 students.

Our examination focuses on academic achievement, efficacy, belonging, feelings of futility, student-teacher relationships, and curriculum meaningfulness. The results of our multilevel analyses indicate that mutual connections between students, and between students and teachers, as well as between students and the curriculum, are crucial for academic efficacy and are associated with reduced alienation. The qualitative evidence suggests that in diverse schools, an approach to diversity that resonates with children's cultural experiences promotes greater belonging and reduces alienation from school.

This research aligns with and significantly contributes to Rosa's theoretical framework regarding the concept of a good life within education. Additionally, it offers valuable insights for school professionals and policymakers.

292

RN10 | T02_02: Migration, Ethnicity, and Racism in Education (II)

Global Teachers, Local Challenges: Examining Migrant Educators' Professional Experiences

Antonina Tereshchenko[1], Alan Benson[2]

1Brunel University London, United Kingdom; 2London Metropolitan University, United Kingdom

Existing research indicates that teaching is becoming a more global labour market, with substantial teacher migration from the developing to more affluent countries, including into and within Europe (Krause et al. 2023, Reid et al. 2014, Bartlett 2014). The available literature synthesis shows that migrant teachers face substantial challenges during their professional transition, even when they are migrating between Anglophone systems (Bense 2016).

This paper examines how the themes identified in the literature synthesis are manifested in England – a rapidly growing destination country for global migrant teachers due to government's policy to address teacher shortages via recruiting overseas. This case study is based on a series of semi-structured interviews collected with 16 mathematics teachers from a variety of migration backgrounds during their teacher education programme at a London university. The interviews focused on their teaching experiences at the two teaching placements in secondary schools, normally required by the programme. The paper discusses issues of professional identities, multilingualism and racialised experiences, with a particular focus on intersectional discrimination.

The second part of the paper outlines the findings of our rapid evidence assessment on the state of knowledge, policies and interventions in the field of supporting migrant teachers in local education contexts worldwide. We assess how promising such approaches might be and what gaps are there in our understanding of their likely effectiveness. This review also identifies promising areas for future research.

Intercultural Education To Encounter Migrant-Driven Diversity: Assessing The Tension Between Policy And Bottom-Up Implementation Practices

Irene Landini

University of Antwerp, Italy

In the wake of the increase of pupils with migratory background in several schools across Europe, the Council of Europe (2008) has started promoting 'intercultural education' as the main educational strategy to accommodate growing cultural and linguistic diversity brought by migrants. Intercultural education is also meant to promote interactions among pupils with different cultural/linguistic affiliations.

The intercultural education research has pointed out the existence of a tension between the official discourse about intercultural education, and its actual implementation and operationalization in the classroom practice, in Europe (Rapanta and Trovao 2021). Existing studies explicitly call for further research in the field, to better disentangle the extent, specific dimensions and potential explanatory factors behind this policy-practice gap.

This article addresses this research gap by providing an in-depth analysis of intercultural implementation practices, taking the case of the city of Trento as case study. The analysis takes the perspectives of teachers and inductively explores their experiences in four different public primary and middle schools, characterized by different types of migrant population (in terms of languages, ethnic groups and total amount of migrant pupils). The analysis considers differences among teachers, based on their professional background and previous experiences with migration. To make sense of the findings, I rely on an analytical framework combining elements from the studies on intercultural education with some insights from the bottom-up studies on policy implementation (Lipsky, 1980).

This research aims at expanding the current understanding of the policy-practice gap in the field of intercultural education, intended as the main strategy to deal with migration-driven diversity in classrooms. Moreover, the article intends to advance a new argument about potential explanatory factors behind this policy-practice tension.

The School Achievement of Students with an Immigrant Background at the End of Primary School in Portugal

Ana Filipa da Costa Cândido, Teresa de Jesus Seabra de Almeida

Centre for Research and Studies in Sociology (CIES-Iscte)

The official annual data on pupils of immigrant origin published by the Portuguese Directorate-General for Education and Science Statistics primarily focuses on the citizenship of pupils citizenship, excluding those with Portuguese citizenship of immigrant origin or host country citizenship (descendants of immigrants).To address this limitation, this article employs microdata from DGEEG/MEC, incorporating information on the pupils' and parents' countries of birth to identify descendants of immigrants. In this paper, we focus on the situation of students with an immigrant background at the end of primary education regarding their academic achievement, measured by no. of retentions during the school path. The main objective is to go beyond the 'foreign student category' and deepen the scientific knowledge about the descendants of immigrants by tracing their socio-demographic profile, exploring intragroup variability, and relating it to their academic achievement. For this

purpose, we start by comparing the students' educational achievement according to the categories based on (national/foreign) and the categories determined by the country of birth of their parents (native/immigrant origin). Secondly, we explore intragroup variability by comparing educational achievement using subcategories related to generational status (first and second generations), the type of ancestry (single or mixed national origin) and national origins (the 18 with the highest share of students). Lastly, we use parents' educational attainment level to explore whether the gaps we identified in these comparisons persist when we control for parental educational attainment.

Education In Peril: Barriers And Challenges In Education Of Ukrainian Refugee Students In Europe – A Systematic Review

Renata Aniela Ziobro

Korea University, Korea, Republic of (South Korea)

Background: After the outbreak of the Russian-Ukraine war in February 2022, more than 6 million Ukrainians have fled to European countries. It is estimated that more than half of Ukrainian refugee minors were not enrolled in schools in host countries, implying various challenges in refugee education. Yet, due to heterogeneity of variables and nascent character of this phenomenon, there has been no systematic review of those barriers. The objective of this systematic review was to assess the challenges and barriers in education faced by Ukrainian refugee students in Europe.

Methods: Following PRISMA framework, a systematic review was conducted across multiple databases for English studies and international organizations' reports published after February 24th, 2022 using a set of keywords.

Results: From a total of 277 articles, 171 duplicates were removed, and after screening of the abstracts, 103 were excluded for not meeting inclusion criteria. Out of 68 full studies assessed for eligibility, a total of 17 articles were included in the review. Significant challenges were found at all individual, interpersonal, institutional and societal levels, affecting not only children but parents and teachers also. Analysis has recognized seven different barriers to education: language, low enrollment rate, school capacity and preparation, legal/financial/administrative barriers, mental health and trauma, technical issues, perceived discrimination and others.

Conclusion: Ukraine refugee children in Europe encounter various education barriers after relocation. Since the most challenges have been identified at the institutional level, policy makers and administrations are recommended to implement measures to facilitate successful education for these children.

Can "Educational Priority Schools" compensate society?

Sílvia de Almeida[1], João Firmino[2], César Morais[3], Luís Catela Nunes[4]

1Interdisciplinary Centre of Social Sciences, School of Social Sciences and Humanities, NOVA University of Lisbon; 2Nova School of Business and Economics, NOVA University of Lisbon; 3Interdisciplinary Centre of Social Sciences, School of Social Sciences and Humanities, NOVA University of Lisbon; 4Nova School of Business and Economics, NOVA University of Lisbon

Priority education policies that favor the allocation of additional resources to schools with populations of low socio-economic status and low academic results are widespread internationally, with the aim of combating educational inequalities. In general, the results of these programs have been widely criticized for not reducing the various types of existing segregation (Owen, 2018; Felouzis, Fouquet-Chauprade and Charmillot, 2018), or for not including an integrated policy for economically and socially disadvantaged territories, marked by poverty and social exclusion (Anyon, 2005; Warren and Mapp, 2011).

In Portugal, this program is called Priority Intervention Educational Territories (TEIP) and some results have shown that (Ferraz, Neves & Nata, 2018, 2019), that TEIP schools have not come close to other schools in terms of school results. students. This study aims to measure the difference in academic results of students enrolled in the 9th grade in Portuguese public schools in Mainland Portugal, in the 2016/2017 school year.

To measure differences in academic performance considering the immigrant background of the student, and whether he/she is enrolled in a TEIP or non-TEIP school, we use linear regression models. The variables of interest are the following three indicators of student performance: (a) the score obtained in the 9th grade national Mathematics exam; (b) the score obtained in the 9th grade national Portuguese Language exam.

Our findings show that vis-à-vis non-TEIP Native students, all the remaining groups are associated with statistically significant worse results both on the 9th grade national exams, as well as in the probability of obtaining a successful academic record in the 3rd cycle .

294

RN10 | T02_03: Higher Education (II)

Breaking the Glass Ceiling: The Meaning and Difficulties of Being a First-Generation Arab-Palestinian Faculty Member in Israeli Academia

Raghda Alnabilsy

Ruppin Academic Center, Israel

This qualitative study, which employed semi-structured interviews, explored the paths of 15 Arab-Palestinian citizens of Israel, an indigenous minority, who are faculty members in Israeli institutions of higher education. The research analyzed the interviewees' experiences, in light of the contexts of these lecturers' lives: the Israeli-Palestinian conflict, the collective social-cultural context, and the fact that these academics belong to the first-generation of students in higher education. The study explored the interviewees' choice of academic career, the meaning of this choice for them and the difficulties they face, due to these contexts. Three central themes emerged: (a) the process of choosing and entering academia, as a first-generation student and faculty member, in order to gain power and social mobility; (b) the academic path as a symbol of pride for the family and for the Arab-Palestinian collective; and (c) difficulties lecturers face in their academic careers. In order to break the glass ceiling, Arab-Palestinian lecturers have to overcome socio-political structural obstacles. The knowledge gained from this study can encourage institutions of higher education in Israel to help advance the Arab-Palestinian minority, by understanding the structural and political context in which they live and work.

UK Universities (Re)Acting to Confucius Institutes – Dynamics of Institutional Autonomy, Political and Financial Vulnerability

Roxana-Diana Baltaru[1], Radu-Dragomir Manac[2]

1University of Bergen, Norway; 2University of Essex, UK

This research paper explores the institutional-level factors associated with the opening of Confucius Institutes in the UK. It brings a much-needed contribution to the ongoing debate surrounding the rise and fall of Confucius Institutes around the world. In the UK, many universities opened Confucius Institutes in the spirits of cultural exchange and entrepreneurship and then closed them, reflecting the contradictory messages from British Prime Ministers who pledged to ban Confucius Institutes (which they viewed as a political 'threats') before eventually U-turning on their proposals. The factors underpinning UK universities' decision to open (or close) Confucius Institutes are of key interest to the sociological institutionalist scholarship. They provide a case study for exploring whether (and if so, how) structural and cultural constraints elaborated in resource dependency and external legitimacy theories play a role in universities. Using a nationally representative dataset of approximatively 100 UK universities observed over a decade (from 2008 to 2018), we conducted a range of panel data regression analyses in order to rigorously assess the relationship between university characteristics (from university prestige to its share of income from tuition fees) and the presence of a Confucius Institute in its premises. We found that despite their purported institutional autonomy, universities' approach towards Confucius Institutes is underpinned by a complex dynamic between maintaining institutional prestige and navigating an increasingly competitive and politicized global higher education field.

The State School as a Development of Academic Capital – a Study of Access to Higher Education in Portugal and England

Luany Promenzio[1], Saulo Aristides de Souza[2]

1Durham University, United Kingdom; 2University of Coimbra, Portugal

295

Higher education is a domain in which access is still very restricted for people from the working class in many societies. As an aggravating factor, the most popular institutions and courses are the least accessible to these students. This study presents an analysis of 16 interviews carried out with working-class students who managed to access high-status medical degree programs at universities in England and Portugal, to see how these students had these accesses and what their experiences are like within the different institutions. With the analytical support of Pierre Bourdieu's concepts of habitus, field and capital, this study reveals that although elite institutions provide better conditions for graduates to be competitive in the job market, they also produce much more need to confront the habitus of the working class. It is argued that these accesses are related to three essential pillars: family, school and mainly academic capital. It should also be added that the experiences of these students can be very different between institutions in the two countries. In Portuguese institutions, academic capital appears as a credential of recognition among peers and a means of obtaining social capital, whereas in England, this movement is not apparent and may indicate an even more deeply rooted inequality in the educational system. This suggests that in Portugal the state school system still appears to provide its students with competitiveness and, therefore, a means of acquiring academic capital. On the other hand, for English students from state schools, this variable seems to be much more problematic, as they lose the ability to demonstrate academic capital in the area.

RN10 | T02_04: Inequality in Education (I)

Education as common good: Marginality and Social Justice

Mauro Giardiello[1], Rosa Capobianco[2]

1University of Roma Tre, Italy; 2University of Roma Tre, Italy

In contemporary societies the consolidation of the neoliberal educational model has enhanced a standardized and instrumental educational practice, aimed at the accumulation of credentials to promote individualized trajectories. An orientation towards interpreting the educational marginalization of young people has prevailed, shifting the focus on individual responsibility of failure in education, rather than on structural barriers.

Although recent analyses highlight that the theme of educational injustice is generated by a specific neo-liberal idea of justice, nevertheless they also underline the need to interpret educational marginalization through a key of plural reading of social justice.

The aim of this contribution is to offer a theoretical reflection on the alternative value of the paradigm of education as 'common good' in interpreting the educational marginality connected to social injustices. The theoretical premise is based on the idea that the characteristics of this approach, centered on the collective management of learning processes and on the promotion of autonomy and self-confidence, are connected with the two-dimensional paradigm of social justice. More specifically, the contribution intends to develop the link between educational marginality and education as "common good" through the following lines of analysis: educational marginality understood as absence of participation due to the emergence of redistributive injustice and misrecognition; comparison between the sociological approaches from the North and the South of the world; education as common good capable of achieving a conceptual integration of the redistributive dimension with that of recognition in order to guarantee participatory parity in school and in non-formal education.

Privatization In Education And Its Effect On The Already Existing Private Schools – The Case Of Hungary

Eszter Berényi

ELTE University Budapest, HUngary, Hungary

This presentation discusses the effects of education privatization in Hungary.

The government which came to power in 2010, introduced a series of policies and budgetary measures that led to an increasing privatization of the sector. As a consequence, the share of state education at the primary level has decreased from 95% to 77% in a short period of time. The Church has emerged as the second largest provider of primary education. Additionally, among urban middle-class families there has been a growing distrust in the state and therefore, a new demand for private schools, resulting in a threefold increase in the number of students attending them between 2010 and 2023.

Our research involved interviewing private school principals and managers about recent changes in education policy and their impact on their schools and educational visions.

The majority of the private schools were established to provide an alternative educational programme to mainstream education and a more child-centred atmosphere. The leaders of these schools perceive the tightening of content regulation, the emergence of a new type of consumer, and the schools' increasing reliance on tuition fees as threats to their 'true' legacy.

However, other stakeholders view themselves as participants in the school market and their institutions as businesses that must adapt to the new situation and comply with the new rules. They are ready to alter the services provided by the school or removing parts of their curriculum that do not align with the new political expectations or are not viable under the new regulations.

The findings suggest that privatization triggered by the state do not have the same effect on the different actors in the private sector.

A Family Affair: Micro-Class Reproduction in Academia

Thea Strømme, Sam Friedman

Centre for the study of professions, Osloe Metropolotan University, Norway

While the representation and diversity of academic professionals in terms of gender and internationalisation has been high on the agenda both in public debates and in research (e.g. Pietilä et al., 2021), the issue of socio-economic background is remarkably absent, partly because of a lack of good data sources. We use a combination of population-wide register data from Norwegian public registers and data not previously utilized for this purpose: the Research Personnel register provided by statistics Norway and investigate the association between social background factors and the likelihood of ending up in various academic positions. We have access to information about all academics in Norway born from 1955-1980 working in the years 2011-2020 and their parents. Our dependent variables are having professor title, a permanent job as faculty, or a more general research position, that involves working in universities or in private research institutions. Preliminary findings show a relative strong association between having parents in all upper-class positions, but especially a cultural class position. There are systematic associations between parents' level of education and the probability of ending up in such a position, and especially having parents with a PhD is important: those with one or two parents with a PhD are 30 times more likely to end up in a faculty or professor position than those from a working-class background. When we

include a control for own PhD, the results changes, but we still find significant differences, especially between those coming from a cultural upper-class background and those originating in the working class, and between those with parents with a PhD and those with parents with less than upper secondary school.

The National Reading Plan In Areas Of Social Vulnerability: Exploratory Data And Socio-Educational Tensions

Ana Cíntia Moreira Sales[1,2], Natália Azevedo[1,2]

1Faculdade de Letras da Universidade do Porto, Portugal.; 2Instituto de Sociologia da Universidade do Porto, Portugal.

This paper presents data from the exploratory phase of the project "Between Discourses and Practices: the Role of the State in shaping Child Readers in Socially Vulnerable Areas in Porto" funded by the Foundation for Science and Technology. The research is a qualitative methodological case study that focuses on the analysis of the set of discourses and practices of the State regarding the implementation and promotion of the National Reading Plan, which seeks to solve structural educational problems and to promote reading skills. The objective is to understand how the State and the school operate in specific realities and contexts, particularly in areas of social vulnerability. This study investigates the development of the National Reading Plan in a school in the Priority Educational Intervention Territory in the municipality of Porto, Portugal, with a 3rd-grade class of the 1st Cycle of Basic Education. The exploratory phase has allowed, so far, to situate some tensions experienced by the targeted social agents: a significant number of students outside the regular school level, the attempt of institutions (State and school) to recover learning due to the pandemic through the creation of the 21/23 School + Plan, and the difficulties faced by children in the territorial context and educational assistance. It is pertinent to understand the obstacles to the formation of readers and to promote sociological visibility in stigmatized spaces, to know the experiences and problems faced by the school community — that is, education professionals, children, and their families.

RN10 | T02_05: Vocational Education and Training (I)

Learning to Labour under the Employability Agenda: School-to-Work Transitions of Indonesian Vocational Graduates

Senza Arsendy

University of Melbourne, Australia

Over the last decades, the way young people move from school to work has changed significantly. Education no longer guarantees a pathway to employment. In Indonesia, despite the fact that today the younger generation has a higher education level than their parents, the country's youth unemployment rate is extremely high. By engaging critically with Bourdieusian framework, my research attempts to understand how youth from low-income families navigate their post-school aspirations. This study focuses on vocational graduates in Indonesia. They are not only dominated by low-income youth, but they are also the largest unemployed group in Indonesia, making them an appropriate case to study how young people respond to disjuncture between schooling and employment. Not only is my project useful to unpack the struggle and strategies young people use to navigate the rapid change in their transitions, but also to give insights on how they make sense of their experiences within the context of a disconnect between education and employment. Furthermore, a case study of vocational graduates in a Global South will allow me to bring Southern perspectives to existing debates in youth sociology about navigating social reproduction in the face of social change.

297

Legitimizing Discourses of the Non-formal Guidance Teaching Function Among the Third and Fourth Years of ESO Teachers in Spain

Sagar Hernández Chuliá, Sonsoles San Román Gago

Universidad Autónoma de Madrid, Spain

The objective of this paper is to analyze the legitimizing discourses of the non-formal guidance teaching function among the third and fourth years of ESO teachers in Spain. To this end, we analyze the content of several discussion groups composed of third and fourth years of ESO teachers in Spain. We conclude that there are four ideal-types of legitimizing discourses of the non-formal guidance teaching function among the third and fourth years of ESO teachers in Spain: a) The laboralist ideal-type, whose ultimate

objective is to provide students with relevant information and capacities so that they can develop, based on their own criteria and skills, their laboral path. b) The axiological ideal-type, whose ultimate objective is to provide students with certain values. c) The affective, especially emotional, ideal-type, whose ultimate objective is to provide students with certain skills regarding the affective-emotional management (management of one's own emotions, development of self-confidence, ability to take initiative, etc.). d) The traditional ideal-type, whose ultimate objective is to provide students with relevant information and capacities so that they can develop, based on their own criteria and skills, their academic career.

The Appeal of Carpentry: Two Contrasting Class-related Perceptions of Masculinity and Independence in Vocational Education and Training (VET)

Laura Gilliam

Aarhus University, Denmark,

In Danish society, vocational education and training (VET) are widely viewed as inferior to more academic youth educations, leading to declining applications from youth. VET and craftsmanship in fields like carpentry, has been associated with a low academic level, hard routine labor, and tough masculinity. With a growing need for craftsmen in Danish society, recent political efforts have aimed to enhance the reputation of vocational schools and craftsmanship, to appeal to young people across social class backgrounds.

This paper, drawing on fieldwork and interviews at a Copenhagen vocational school, investigates why young people are drawn to carpentry. The research reveals two distinct class and age-related perspectives among the mainly male pupils. Young men from lower socioeconomic backgrounds tend to view carpentry as a pragmatic choice leading to highly desired economic independence, masculinity and adulthood, and providing an escape from academic demands. In contrast, the slightly older, middle-class pupils see carpentry as a personal endeavor, a skill for self-sufficiency, 'do it yourself'-masculinity, and a pathway to an alternative – sustainable or anti-consumerist – livelihood. For the lower-class group, giving their labor power to an employer "concerns an experiential separation of the inner self from the work" (Willis 1977:102), while for the middle-class group, work rather requires an expression of self.

The appeal of carpentry thus varies significantly with class. Both perspectives, however, highlight a pursuit of positive masculinity and independence, expected to be found outside academic education and work, but closely intertwined with tensions of relations between manual labor, masculinity, and class.

Multiprofessional Cooperation In Career And Study Guidance At Eye Level: A Multiperspective Approach To Co-Constructive Concept Development

Monique Ratermann-Busse, Susanne Enssen

University of Duisburg-Essen, Germany

The transition from school to vocational training or higher education involves various uncertainty factors for students that arise due to social, technological and economic developments and the associated change processes on the labour market (Mittermüller 2020; Pool Maag 2008b; Bigos 2020). It is therefore increasingly important to prepare and support transition processes into vocational education and training with the involvement of different professions due to the heterogeneous needs of students (e.g. due to inclusion, migration, educational inequality).

In a sub-project of a nationwide federal and state initiative in Germany research-based design concepts were developed in a co-constructivly dialog between educational science and educational practice for a multi-professional career and study orientation as a cross-sectional task of organisational development at schools. The presentation firstly aims to introduce the central elements of the sub-project which is based on a design-based-research approach (Anderson/Schattuck 2012; Reinermann 2005), emphasizing co-constructive exchange between schools, cooperation partners, and science. This concept envisions a close connection between the research process and the design process through dialogue-oriented formats (Ratermann-Busse 2023).

Central results from the workshop phase will be presented, derived from surveys on the status quo of multiprofessional cooperation based on five thematic building blocks. The data foundation includes guideline-based interviews with school-related (n=11) and extracurricular actors (n=8), participant observations of vocational and educational orientation offerings (n=5), and supplementary student surveys (n=150). Additionally, insights from research-based development workshops for concept development with schools (n=2) will be presented.

Our contribution will demonstrate how insights into multiprofessional cooperation are used for the development of transferable reflection instruments, work materials, recommendations, and their implementation in school life and teacher training.

Can Socioeconomic Diversity in Classrooms Reduce Socioeconomic Inequality? The Role of Inter-SES Support in Student Networks

Chenru Hou[1,2], Georg Lorenz[1,3], Camilla Rjosk[1]

1University of Potsdam; 2Humboldt-Universität Berlin; 3Leipzig University

Following the transformation of European societies and their school tracking systems, the varying levels of Socioeconomic Status (SES) diversity and their effects on students require comprehensive understanding. One set of arguments emphasizes the benefits of more diverse classroom contexts on SES-based achievement equality, by enhancing the access to social capital, which can be accessed through inter-SES support with students' social network among peers. However, homophily—the tendency to interact with similar others—might foster segregation along SES, thereby reducing peers' inter-SES support. Consolidation, which highlight that homophily based on one trait may inadvertently lead to segregation based on another, is another argumentation considered detrimental to inter-SES support.

We explore whether higher-level SES diversity elevates inter-SES support in classroom networks, whether SES consolidation with gender and ethnic origin hinders inter-SES support, and whether enhanced inter-SES support reduces SES-based achievement inequality.

Utilizing multi-level regression models with data from a large-scale German assessment study with about 35,000 ninth-grade students, the results indicate that SES diversity increases inter-SES support. Moreover, inter-SES support is associated with reduced achievement inequality. Conversely, classrooms with stronger SES consolidation with gender and ethnic origin exhibit reduced inter-SES support. However, a direct link between SES diversity and achievement inequality is not evident, likely due to countervailing mechanisms within classrooms.

These findings contribute to insights in understanding educational inequality in times of transformation, suggesting mixed-SES classrooms facilitate inter-SES support among peers, which in turn promotes achievement equality. Nevertheless, increased SES consolidation challenges this advantage, calling for prudence in educational practices.

Desegregation Policies in Barcelona: Unequal Effects and Impacts

Edgar Quilabert[1], Adrián Zancajo[1], Sheila González[2]

1Autonomous University of Barcelona, Spain; 2University of Barcelona, Spain

School segregation has emerged as a core challenge in Barcelona (Spain) in the past few years. Driven by wide margins of school choice, a large share of private subsidized schools, and sustained inaction from local government bodies, the uneven distribution of students across schools became a persistent issue. In response, the city's educational authorities implemented the Shock Plan Against School Segregation (SP) in 2018. This policy aims to promote a more balanced distribution of socially disadvantaged students through targeted funding, preassigned school seats, and quotas for vulnerable students. In this paper we explore the impact of SP on the distribution of socially disadvantaged students across schools in Barcelona. We design a quasi-experimental study employing Interrupted Time Series regression analysis to estimate the impact of these policies on school segregation, concentration, and social stratification between public and private schools. This allows us to estimate the causality between the implementation of these policies and the evolution of school segregation in Barcelona for the past decade. Findings show that the impact of desegregation policies have significant variations among different groups of students—such as those with immigrant backgrounds or those considered vulnerable—and across different areas of the city. The paper concludes by exploring the various factors and mechanisms behind these differential impacts, shedding light on the complexities of policy effects in diverse urban contexts.

'To Mix or Not to Mix': Exploring Classroom Formation Processes, Teacher Discourses and Practices in the Last Stage of Primary Education in the Lisbon Area

Adriana Albuquerque

Centre for Research and Studies in Sociology (CIES-Iscte), Portugal

This paper intends to contribute to a better understanding of the rationales behind school agents' decisions about student sorting into classrooms. Specifically, we explore the challenges schools face when dealing with social and cultural diversity within the classroom. Portugal constitutes a valuable case study, since its primary education is split in two stages, at the cusp of which students usually change schools for the first time and schools face the option of maintaining or changing the previous classroom formations.

Since 2nd stage primary schools draw students from multiple 1st stage schools with diverse student populations, it

299

is important to assess whether (and why) schools perceive the possibility of mixing students as a challenge or an advantage. Literature shows that school composition shapes the ways teachers conduct their practice and the expectations they develop about their students' academic abilities. Studies also point towards a general preference for ability grouping, but there is little research concerning the criteria for such preference, specifically, how school composition and teachers' collective expectations inform it.

We draw from a multimethod research project focused on the Lisbon area (Portugal), which combines official student microdata statistical analysis with interview content analysis conducted in two comparative case studies, in schools with different social and ethnic compositions. We demonstrate how classroom segregation develops in primary education, and its impacts on social and ethnic inequalities in grade repetition rates and Mathematics' grades. We also find that in disadvantaged schools with low expectations, teachers might be less inclined to mix students due to (i) fears this will disturb the classroom order, and (ii) lack of confidence in instructional differentiation as a method for dealing with learner diversity.

School competition and bilingual education in Spain. The case of Andalusia

Juan Miguel Gómez Espino[1], Ildefonso Marqués Perales[2], Alberto Álvarez de Sotomayor[3]

1Universidad Pablo de Olavide (de Sevilla), Spain; 2Universidad de Sevilla; 3Universidad de Córdoba

Over the last two decades, studies have firmly characterised the Spanish system of school choice as a quasi-market education system. A space of competitive interdependencies in which the logics of school actions and the strategies of families are closely interconnected and mutually influence each other. In this context, we understand that the responses of schools to a certain education policy include complex processes of interpretation, reinterpretation and recontextualisation. In this sense, participation (or refusal to do so) in a curricular and pedagogical measure can be considered a "substantive response" on the part of schools to distinguish themselves within the local market in which they are competing.

Similarly, over the last two decades, Spanish-English bilingual education programmes have become one of the most widespread non-compulsory educational policies throughout Spain. Starting from this theoretical-analytical framework, we wonder to what extent the participation of schools in this programme responds to this competitive logic and to what extent may generate inequalities in access to this type of education.

We use data from PISA 2018 in the region of Andalusia (n=1,766). We take advantage of the fact that this edition of PISA contains a variable that measures the competence that schools have. Using logistic regression analysis, we measure the effect of this variable on the probability that schools offer the bilingual programme, after controlling for other school and contextual variables.

The most explanatory variables turn out to be type of school (public schools, more than private ones), the average socioeconomic level of the school (those with the highest socioeconomic level to those with the lowest level), and, thirdly, the existence of other schools with which they compete for students.

Refugee Adolescents' Aspirations Over Time: Cooling Down, Stabilization, or Warming Up?

Hannah Glinka

Martin-Luther-University Halle-Wittenberg, Germany

In 2022, approximately 246,000 refugees in Germany, who had arrived between 2015 and 2018, were aged between 14 and 18. This age range is pivotal for shaping career aspirations, future plans, and adapting educational trajectories. Despite facing challenging educational situations, studies indicate that refugee adolescents generally aim for academic pathways. However, their educational and career aspirations are susceptible to change based on various influences and contexts, leading to either a "cooling down" or "warming up" effect.

The study sought to address the following questions: Do career aspirations of refugee adolescents change over time? What are the reasons for changes in aspirations? To explore these questions, we conducted qualitative interviews with 16 refugees aged between 17 and 31 in East Germany. Qualitative content analysis, as per Kuckartz's methodology, was used to analyse the interview material.

The analysis identified three distinct groups. In the first group, career aspirations remained consistently high, with adjustments made to the path of achievement. Crucial factors contributing to stable aspirations included support from teachers, diverse opportunities in Germany compared to their home country, and a high motivation to learn.

The second group experienced a "cooling-out" dynamic, where career aspirations were downwardly adjusted over time. Factors influencing these adaptations included high academic requirements, age, the necessity of livelihood, and the influence of significant others.

In contrast, the third group exhibited a tendency towards a "warming-up" of aspirations. Initially focused on work and income, these refugees now aspire to attain school qualifications and undergo vocational training. This shift was driven by a desire to confront limited professional opportunities without qualifications and overcome experiences of discrimination.

What we Know (and Don't Know) About Roma Parents: Lessons from an International Systematic Literature Review

Mihály Fónai[1], Tímea Ceglédi[2], Katinka Pallay[2,3], Gabriella Hegedűs[2,4,5]

1University of Debrecen, Doctoral School of Humanities, Hungary; 2Parent-Teacher Cooperation Research Group of Hungarian Academy of Sciences & University of Debrecen; 3Ferenc Rákóczi II. Transcarpathian Hungarian College of Higher Education, Department of Pedagogy, Psychology, Primary and Preschool Education and Management of Educational Institutions, Ukraine; 4English Language Pedagogy Research Group, University of Debrecen; 5Shadow and Public Education Research Group, Eötvös Loránd University

Roma parents play an inescapable role in the success of reducing the educational disadvantage of Roma pupils. The presentation aims to provide a systematic overview of what is currently known in the international literature about the Roma parents' involvement in their children's education. The target group of "Roma, Romani, Gypsy, Traveller" is defined based on the Council of Europe's definition.

A systematic literature review was conducted following the PRISMA protocol, where the EBSCO Discovery Service as a search engine (which includes academic databases) was applied. The keywords were: 1) Gypsy or Gypsies or Roma or Romani or Traveller; and 2) Parents or Caregivers or Mother or Father or Parent. The search was confined to an abstract-level search, including only peer-reviewed English language studies within the field of education. The geographical location and the date of the studies were not limited. The 139 search results were subjected to title, abstract, and then full-text screening using multiple double-checks. The inclusion and exclusion criteria were focused on selecting studies that provided scientific information about Roma parents and were relevant to education. The final analysis included 62 selected studies.

One of the key findings is the collision of the perspectives among the different actors along with the review of good practices. The presentation also identifies patterns of differences between the 26 countries covered by the research, such as deficit – and solution-oriented discourses. Additionally, it highlights under-researched areas of the topic, including Roma parents' involvement at home, and language-related aspects of parenting.

Governing Refugee Higher Education: A comparative study of English and German Universities

Dr Eugenia Katartzi[1], Dr Lisa Damaschke-Deitrick[2], Dr Nihaya Jaber[1]

1University of Nottingham, United Kingdom; 2University of Tübingen, Germany

In the global context of unprecedented migratory flows, the education of refugees is gaining increased research and policy attention. However, refugee Higher Education (HE) remains under-studied, with UNHCR (2022) lamenting the lack of cross-national data. Our project fills this gap through comparatively examining refugee HE participation in two key settlement countries, Germany and England and their respective high participation (Marginson, 2016) University systems. In employing a qualitative case study design the project focuses on four universities in England and Germany, examining their institutional structures and cultures of refugee support, the prevailing discourses around the management of diversity and their rhetorical constructions of refugee students. The methodology includes in-depth interviews with refugee students and with key institutional actors, along with discourse analysis of Equality, Diversity and Inclusion (EDI) documents. Further, the project explores the key institutional actors' perspectives seeking to unearth the implicit, cultural, systemic assumptions that may lead to unintended exclusionary practices for refugee students in HE (Stevenson and Baker, 2019). Centring on refugee voices, the presentation will document the lived experiences and the enabling and constraining factors affecting displaced students' HE access and participation. Through taking an intersectional, social justice approach and drawing upon theory and research in the sociology of education and migration, the paper makes a significant contribution to the field of intersecting inequalities in higher education and refugee studies.

Transformative Education and Cultural Change in Northern Ireland's New Momentum for Restorative Practice in Schools

Brian Payne

Ulster University, United Kingdom

Drawing from contemporary perspectives on the Sociology of Education, this paper considers the role of restorative practice in schools as a means for strengthening institutions of society and bringing about transformational change. The paper considers the case of Northern Ireland where the use of restorative practises in schools has increased over the past decade, with growing calls for practices to be included in all new teacher training and embedded throughout schools' behaviour management processes.

Whilst restorative practises are recognised as a proven structured approach for conflict resolution and the management of problematic behaviours in children and young people, the international literature highlights how its use remains intermittent in schools, with a limited evidence base on perceived positive outcomes or success stories and a pre-occupation with issues of discipline and behaviour management. I argue that the post conflict conditions evident in Northern Ireland present an opportunity to realise the transformational potential of restorative approaches in education, particularly in bringing about cultural change that transcends the school gates.

The Transformative values and goals of restorative practices and the indicators of effectiveness espoused in Sociology of Education are used to propose a broader evaluative framework for fully considering the contribution of restorative approaches in education. The paper argues that current attempts to mainstream such practices in Northern Ireland can provide valuable support for the implementation of such approaches elsewhere.

Observing The Colonial Episteme in Academy

Elif Hatice Lootens, Bart Van de Putte, Peter Stevens

Ghent Universitu, Belgium

In the recent years, debates on diversity and decolonisation have attracted growing attention among academic discussions (Arday and Safia Mirza 2018). In this paper we draw from a long line of work that has engaged issues of racism and inequality in universities (e.g., Ahmed, 2012; Alexander & Arday, 2015; Bhopal & Pitkin, 2018). We examine the question: what happens when racialized bodies take up 'privileged' positions that have been predominantly reserved for white men. What is it like to represent diversity in white institutions? Research on experience on racialized minorities in the academic field often takes BA, MA students or full professors as subjects of interest (Bourabain, 2021). Since there is a lack of research done regarding the position of PhD students, it strikes our interest to examine their role within universities. Secondly, we want to have a deeper understanding of the experience they face with the "culture of silence" when the presence of racialized minorities decreases when moving up the academic ladder. Drawing on interviews with PhD researchers of colour, this paper provides a comprehensive view of the present position of PhD researchers of colour in a predominantly white institution.

Privatized Religion And Silent Othering: Religious Students' Social Navigation At Danish Further Education

Tine Brøndum

Aarhus University, Danish School Of Education, Denmark

In Denmark, institutions of further education are highly secular. Consequently, religious practice in public educational settings is often considered inappropriate, non-Danish, or in opposition to knowledge and open-mindedness (Gilliam 2022).

At the same time, rising numbers of religious, primarily Muslim students are attending further/higher education. However private their religious practice may be (Khawaja 2014), these students often stand out as hyper-visible and different from the majority norm due to for instance darker skin and hair or visible markers of religious practice, such as wearing a head scarf or abstaining from consuming alcohol.

Drawing on ongoing fieldwork and narrative interviews with students at the three study programmes early childhood education, medicine and electricity, this presentation will address religious students' social navigation and privatized religion in relation to processes of othering and racialization.

The presentation suggests considering religious practice as an invisible social infrastructure of difference and silence, that opens and closes for certain paths and communities in ways that are rarely explicitly discussed. While religious practice thus from an emic perspective are described as something private that convey peace, security and meaning, expressions of religiosity in public educational contexts gain affective value and are identified as problematic or even threatening (Ahmed 2012). From this perspective, religious practice becomes what Diane Reay (2005) has termed an "unsettling subject" imbued with silence or even shame. The presentation examines the educational consequences of such othering for the students, including their navigation within the social environments at the study programmes.

Open Educational Resources as a Chance for Holistic Education

Johannes Hiebl

DIPF | Leibniz Institute for Research and Information in Education, Germany

As mentioned in the Call for Papers, European societies are facing several challenges. One promising development in educational systems to overcome these challenges is known as Open Educational Resources (OER). OER refers to teaching and learning materials published under an open license for reuse. UNESCO recognizes OER as a contribution to promoting education for all people worldwide and attributes to them the potential to enhance the quality of education and to foster the democratization and dissemination of knowledge. Therefore, OER seems to benefit holistic education, not only by preparing students with knowledge in areas such as environmental sustainability, citizenship, politics, finance, and more, but also by fostering a new kind of digital literacy through participation in the reuse of OER and the so-called OER lifecycle.

Despite these opportunities, various funding initiatives, and the fact that UNESCO coined this term 20 years ago, OER remains a niche phenomenon in (German-language) university teaching. The obstacles identified so far in research, concerning the motives and attitudes of stakeholders, do not necessarily align with the challenges found in social practice.

To understand the emergence and availability, the dissemination, and the didactical use of openly licensed, freely accessible teaching and learning materials, certain analytical questions must be posed regarding OER, as well as the interaction order of educational processes:

1. To which social problem does the OER model offer a solution?

2. How is the OER model made available?

3. Are the OER model and the inherent production restrictions capable of addressing the interaction order in making educational resources available, and thus meeting the needs of education system actors?

303

Full Time Student with a Job or Working Part-Time Student? The Relationship Between Work and Study Progression for Students in Higher Education

Elisabeth Elman, Elisabeth Hovdhaugen

NIFU, Norway

A majority of higher education (HE) students work while studying, and studies indicate that this is more common among student in the Nordic countries than in the rest of Europe. Recent analyses indicate that two thirds of Norwegian HE students work during term-term (Lervåg et al. 2021). Hence, working while studying is common. However, does the amount of work a student do while studying affect (1) likelihood of completing on time (without delay) and (2) chances of completion at all.

Some earlier studies indicate that there is a negative effect of working on study progression, while other studies only find an effect of working on completion rates for students who work quite a lot, and a few even find working to be positive for study progression. Hence, previous studies are not in agreement on the potential impact of work on completion rates. This paper will use Norwegian registry data covering the entire student population to analyse how work, both measured as weekly working hours and as salary, impact student's chances of completion, both in general and completion within estimated time-to-degree. The paper will primarily focus on students who are taking their first undergraduate degree and who gets governmental student support. Preliminary findings suggest that student have to work a lot before this has any measurable impact on completion rates. However, student who work less than 10 hours are week are more likely to complete their degree timely, compared to students who have a heavier weekly workload.

RN10 | T03_04: Inequality in Education (II)

Identifying Potential: Exploring Opportunities for Excellence in Rural Schools

Aliya Sarsekeyeva[1], Zhaniya Aubakirova[2], Sulushash Kaztayeva[2], Assylkhan Yerkebulanov[2], Kuralay Issayeva[2], Assem Dauletkeldyyeva[2]

1El Umiti Corparate foundation, Kazakhstan; 2Kazakhstan Sociology Lab

The study examines the global challenge of educational inequality among rural schoolchildren, with a focus on Kazakhstan's innovative approach to identifying and nurturing gifted students in rural areas through the annual "Myn bala" Olympiad. This nationwide event engages over 60,000 6th-grade students from rural schools, providing a unique dataset for analysis. Our research aims to identify which rural schools offer greater opportunities for students to demonstrate exceptional abilities, delving into the factors that contribute to educational inequality on both individual and institutional levels.

Employing statistical modeling methods, including regression analysis and spatial analysis, the study seeks to uncover the mechanisms perpetuating educational disparities. This research contributes significantly to the academic and practical discourse on rural education, offering insights into the complexities and potential strategies for fostering talent in rural school settings. The findings not only illuminate the situation in Kazakhstan but also have broader implications for similar educational environments globally.

Education, (Un)Success in School, and Social Inequalities: The Role of Schools in the Reproduction of Social Inequalities in Portugal

Inês Tavares

Inequality Observatory, ISCTE – University Institute of Lisbon, Portugal

The present communication explores the reproduction of inequalities through the school system, based on a set of data encompassing its different components: students and their social characteristics, school organization and specifics directly related to individual schools, academic performance, and the subsequent academic (un)success of students. The data covers all students enrolled in the education system in mainland Portugal during the academic year 2018/19, spanning the twelve compulsory years of schooling, allowing for a detailed and extensive analysis.

304

The results of this predominantly quantitative study provide both a detailed snapshot of the education system in its various aspects and an understanding of how schools reproduce inequalities and where these are most intensified.

This communication is developed based on work conducted in a doctoral thesis, which utilized quantitative empirical data to deepen our understanding of education and school-related inequalities.

Towards Interdisciplinarity In The Educational System: Individuals And Institutions Navigating Professional, Epistemological, Emotional, And Cultural Tensions

Raminta Pucetaite[1], Olivia Levrini[2], Francesco de Zuani Cassina[2], Donata Jovarauskiene[1], Rimantas Rauleckas[1], Rasa Daugėlienė[1]

1Kaunas University of Technology, Lithuania; 2University of Bologna, Italy

In the "society of acceleration" (Rosa, 2013), educational systems have been called to provide new skills to deal with complexity and uncertainty. Interdisciplinarity has been seen as an approach to address challenges of contemporary society, yet little is known what challenges are faced by individuals and institutions when living it.

The paper sheds some empirical light on tensions perceived and/or experienced by actors of the educational system in the intersection of policy-driven programmes for and the lived interdisciplinarity. In our approach to tensions in interdisciplinarity we adopt the term boundary as a metaphor of a borderline adapted from Akkerman and Bakker (2011) to model interdisciplinarity and its paradoxical nature: boundary both separates and connects.

The empirical data come from two part-studies in the context of science education in four European countries: semi-structured interviews (n=30) and two interdisciplinary study groups with 16 unique persons in 2021-2022. Content and thematic analysis were the data analysis methods. As a result, four tensions of interdisciplinarity were distinguished:

(i) emotional and cultural tensions from following strategic programmes vs institutional practices,

(ii) cognitive, professional, emotional, and cultural tensions from belonging vs independence,

(iii) epistemological and emotional tensions from consolidated vs open procedures to problem solving,

(iv) epistemological and cognitive tensions from experiencing theory vs practice.

Approaches to overcoming the identified tensions suggest ways of developing identity of "disciplinary nomad" and language of professional exchanges and institutional conditions that facilitate interdisciplinarity (e.g. establishing a "third space", managing an equilibrium between sense-making skills (systems, critical, analytical thinking) and strange-making skills (creative, imaginative, anticipative

thinking), zooming in-zooming out (from details to big pictures and v.v.)).

Educational quality and transformations in Learning Communities. A case study in Chile.

Ignacia Palma

Universitat de Barcelona, Spain

Educational quality is one of the Sustainable Development Goals established globally by the United Nations for 2030. This involves implementing actions in educational institutions that are grounded in scientific evidence and effective in enhancing student learning and social cohesion. An illustrative example is the Learning Communities project (Flecha, 2015), currently implemented across European and Latin American countries. Its impact is associated with improvements in learning outcomes, student self-esteem and motivation, conflict reduction, and the fostering of friendships among students (León-Jiménez et al., 2020; Morlà-Folch et al., 2022; Soler et al., 2019).

In this context, the transformative potential of Learning Communities holds particular relevance for the Chilean education system, which is currently undergoing debates and implementing structural educational reforms aimed at reducing segregation, enhancing educational quality, and fostering inclusion.

This contribution, based on ongoing qualitative research, focuses on the transformations observed in two Learning Communities in the Coquimbo region of Chile. Both are primary schools with enrollments primarily composed of vulnerable students. The presentation specifically, examines three types of relationships: among students (S-S), between students and teachers (S-T), and between students and families (S-F). Each relationship highlights how the principles of dialogic learning and some of the Successful Educational Actions contribute to building capacities that enhance coexistence within schools.

The research concludes by reaffirming the transferability of the Learning Communities project and its potential to contribute to educational improvements in the Chilean context through the promotion of participation and inclusion.

RN10 | T03_05: Vocational Education and Training (II)

Better Progress Yet Worse Outcomes: The Academic Performance of Students Admitted to the Business School of a 'Higher Tariff' UK University with a Vocational BTEC Qualification.

Clive Robert Trusson, Maxine Clarke, Nishat Babu

Loughborough University, United Kingdom

Getting into an 'elite' university in the UK is theoretically possible for students who study for the UK's predominant vocational qualification – BTEC – rather than academic A-levels. However, publicly available data reveals that these 'higher tariff' universities (HTUs) are reluctant to accept 'BTEC students', even though UCAS, the national student admissions service, affords similar tariff points for excellent performance in BTEC and A-level study. This reluctance is founded upon a class-prejudiced rhetoric that considers vocational qualifications as inappropriate preparation for study at 'top' universities. Nonetheless, responding to 'widening participation' governmental pressures, HTUs accept small numbers of BTEC students onto some programmes.

This study compares the academic performance of BTEC-entry students who studied at an HTU's business school with that of their peers. By analysing data from three large cohort undergraduate programmes, across four start-dates (2016-2019), the somewhat paradoxical findings are statistically credible.

Firstly, BTEC-entry students consistently achieve lower marks in assessments than their peers, and graduate with a lower degree classification. This seemingly supports the rhetoric, prevalent in HTUs, that vocational BTEC qualifications do not prepare students well enough for academic study.

However, secondly, BTEC-entry students make better progress year-on-year throughout their programmes such that they significantly close the gap on their peers throughout the programme. This challenges the rhetoric that BTEC students will not benefit from studying at an HTU as much as others; their better progress suggests they benefit more.

Given the class dimension to BTEC qualifications in the UK, these findings have social justice/inclusivity policy implications.

Key Actors' Definitions of Learning Outcomes in Barcelona and Castelló VET.

Martí Manzano

Autonomous University of Barcelona, Spain

Learning outcomes are not neutral descriptors of skills. Rather, they result from the intersection of institutional arrangements, spatial and socio-economic determinants, discursive and socio-cultural influences, and individual factors. Also, the sociological production of learning outcomes in certain contexts influences the (re)production of inequalities in education, the differential production of learning identities and the articulation of education expectations.

Following the objectives of the Horizon Europe project CLEAR: Constructing Learning Outcomes in Europe, this communication asks how relevant actors as policy makers, principals of schools which offer vocational education and training, trade unions, public employment services and enterprises perceive and envisage learning outcomes of VET in Spain. A research based on documental policy analysis and the collection of data from twelve interviews with key policy actors and participants is conducted. Three educational and economic sectors are selected – Health, IT, and Cuisine – to understand and compare how learning outcomes are defined in different fields and the fieldwork is done in Barcelona and Castelló, allowing us to analyse how spatial inequalities between urban and rural sites affect the policy definition of learning outcomes.

One of the main results shows that the definition of learning outcomes is more because of path dependence, politics of non-decision-making and the autonomy of each school than to a coherent, coordinated, and well-implemented educational policy. Despite this non-strategic production of definitions and the specific logics of each selected sector, interviewed actors share a sense of naturalisation of the learning-outcomes as a neutral and individual key component of education.

Educational Upper-Secondary Spaces: The Spatial Dimension Of VET Provision And Its Implications For Students' Mobility

Mariona Farré

Autonomous University of Barcelona, Spain

This paper reflects upon the interweaving of spatial and social inequalities in the construction of upper-secondary educational choices. It particularly analyses the role of the geographical dimension of VET provision and planning in shaping students' horizons for action. Research has pointed out that educational transitions are key moments to explain the reproduction of social inequalities, occurring in a complex imbrication of systemic, institutional, and subjective levels (Tarabini & Ingram, 2018). On the other hand, previous investigations have also signalled the relevance

306

of spatiality – both in objective and subjective terms – in shaping students' opportunities and identitites. However, there is still room for more nuanced analysis about the role of space, its imbrication with other social inequalities and its effects on young people' self and lives (Farrugia, 2014). The objective of this paper is to contribute to the relational analysis of space by showing how VET provision and planning produce differential student's mobility patterns between different places. To do so, we developed a mixed-methods approach based on the analytical triangulation of interviews with policy makers and the analysis of secondary data on students' mobility. More specifically, through the analysis of mobility indicators, flow matrixes and interviews, we have developed a social network analysis of different educational spaces, in a relational, positional, and cross-sectional way. The data shows how different educational areas are constructed and how centre-periphery relationships between distinct places are settled on different educational spaces. Overall, spatiality contributes to enrich sociological understanding of student's transitions, occurring in structure and agency interaction.

Skills Or Credentials? How The Institutionalization Of Vocational Training Moderates The Wages Of Horizontal And Vertical Mismatches

Kevin Alan Franz Ruf

Institute for employment research, Germany

Occupational mismatches lead to negative effects on job satisfaction, lower productivity, increased psychological stress and wage penalties. Vocational education and training (VET) differ in terms of institutionalized standardisation and specificity of skills. This research explores the complex relationship between vocational training and occupational mismatches. I analyse the extent to which institutional factors, such as standardised training and skill specificity, moderate the wage penalties of horizontal (HMM), vertical mismatches (VMM), and full mismatches (FMM), uncovering stratification on the labour market. Drawing on human capital theory and signalling theory, I disentangle the effects of skills and formal credentials on the wage outcomes of mismatched workers.

The empirical analysis is based on German administrative data on employees from the Sample of Integrated Work Biographies (SIAB). I use field of training fixed-effects to explore how institutional factors moderate wages within different occupational segments. The results show that early career mismatches can have a significant impact on wages. Standardised training has a negative coefficient on wages for horizontal mismatches, but a positive coefficient when vertical mismatches occur within the same field. Conversely, increased skill specificity consistently leads to negative wage effects across all mismatch dimensions, demonstrating that specific skills are primarily advantageous in matched occupations.

Choosing School, Choosing Friends. Parents' Reflections on Upbringing and Choice of School

Eva Gulløv

Aarhus University, Denmark

Schools are a cornerstone of the Danish welfare model. Not only are they central to ensuring that children learn the necessary skills, they are also considered essential for societal cohesion, as children have to co-operate with others coming from diverse ethnic and class backgrounds. To ensure this, all children are offered a place in the local public school. However, since 2005, parents have extended free school-choice leading to a steady increase in the number of parents choosing another either public or privately run school (Epinion 2017).

This development makes school-choice particularly well suited for exploring cultural values and social preferences and distinctions; what parents prioritise for their children socially and educationally – now and on long terms. Based on ethnographic observations and interviews with parents of young children in three ethnically and socially mixed places in Denmark (2016-24), this paper will explore parents' reflections on school-choice. Almost none of the parents comment on the academic level of the schools they are considering, but despite expressing a firm belief in the value of social mixing, they all reflect on the social composition of the schools and how it might affect their children's moral development. Drawing on the concept of social imaginaries (Gaonkar 2002, Vigh 2006), the study demonstrates the wide range of cultural and social issues that school-choice involves, which relate not only to educational ambitions, but also to norms and values concerning childhood, upbringing, moral development, as well as social and geographical affiliations, distinctions, and mobility.

In The Academic Margins: Social Ostracism As An Intersection Of Psychological And Sociological Causes.

Alexander Zibenberg, Tamar Hager, Tuffaha Saba

Tel Hai College, Israel

The majority of studies dealing with the feeling of ostracism focus on ostracism in the organizational workspace and mainly take a psychological perspective. We assume sociological aspects also play a role in ostracism or its elimination. Our study examined ostracism in academic settings

307

within neoliberal regimes, looking specifically at students in an Israeli institution of higher education.

Diversity in the academy has been far from becoming an institutional asset and has not challenged social inequalities. An additional reason for exploring ostracism in Israeli higher education is that the economic, political, and social Israeli power structure and the continuous intractable Israeli-Palestinian conflict result in racial, ethnic, social, and institutional discrimination that has negative effects on Palestinian students' sense of belonging and wellbeing. Therefore, contrary to studies dealing with the effects of individual characteristics on feelings of ostracism, which seem to blame the victim, we focus on the social context, addressing the complexity of ethnic and national differentiation in the academic setting.

First, we tested the relations between a personality trait (conscientiousness), group cohesion, and students' feelings of ostracism, recreating the results predicted in the literature. Then, we challenged these results by comparing findings for Jewish and Arab students, in the context of the continuous, intractable conflict between majority (Jews) and minority (Arabs) groups. The sample included 352 students (81% Jews; 19% Arabs). Findings showed that psychological theories provided only a partial explanation of students' feelings of ostracism; critical sociological analysis of the members of the two groups is also required.

"Tell us What You do in Your Spare Time and we Will Predict Your Future"

Arnau Palou[1], Ona Valls[2]

1Universitat de Barcelona, Spain; 2University of Luxembourg, Luxembourg

The study we present analyzes the results of the "2022 Survey on Youth in Catalonia"(Spain) related to the block of questions about extracurricular activities. This work has three main objectives. The first objective is to provide information on the type of extracurricular activity that young people between 15 and 34 years old practiced when they were between 6 and 14 years old. The second is to detect inequalities in participation for socio-demographic reasons and, finally, to point out which activities have had an effect on the health and educational and work situation of young people today.

With a sample of 3665 young people, the results indicate that, first of all, young Catalan people are very active in extracurricular activities. Only 12% never practice any. Secondly, we have corroborated that there are differences in participation due to gender and economic reasons, as the literature on the subject already indicated. Finally, and as a more innovative result, we have seen that, on the one hand, young people who had studied a foreign language as an extracurricular activity, were more likely to arrive at university (controlled by sociodemographic variables) than the rest. They were also more likely to get a job from a high professional category (directors, managers, intellectual professions...). On the other hand, we have seen that young people who had done sport were more likely than the rest

to have very good health at the age of 35, and those who had never done so were more likely to have a regular or bad health state.

School Coexistence In The Post-Pandemic Context

Manuela Mendoza

Universidad de O'Higgins, Chile

At an international level, there is evidence of the decline in school coexistence during the pandemic. Chile is a key case in this respect since it is the OECD country that kept schools closed for the longest since 2020 due to the pandemic, with a total of 259 school days with total school closures (OECD, 2022), preventing students from interacting in the same physical space for an unusually long period of time. Available data suggests a serious deterioration after the reopening of schools, mainly reflected in situations of school violence (Bellei et al., 2022). However, there is no systematic diagnosis of the dynamics of school coexistence challenges in the post-pandemic period, nor is there a characterisation of institutional responses to the coexistence challenges. This paper presents the progress of a research project that seeks to contribute to filling this gap by focusing on public schools. School coexistence refers to the process of learning to live together and has been identified as a key part of education (Delors, 1998) since schools are privileged spaces to promote sustained contact and exchange (Choi and Lee, 2021). However, internal segregation and reinforcing stereotypes and prejudices between groups may be generated (Allport, 1979). The study aims to identify the challenges and strategies for school coexistence in public schools after the pandemic. A mixed methodology design is used based on descriptive analysis and multilevel factor analysis of the school climate of coexistence, interviews, and focus groups with key school actors. At the time of the conference, the findings of the statistical analysis will be presented by discussing them from an international perspective.

Tension, Trust And Transformation Among Refugee Syrian Children in Lebanese Temporary Settlements: The Right to Participation Paper II

Eleanore Hargreaves

UCL Faculty of Education and Society, London University, United Kingdom

This paper constitutes the second paper around the theme of Schooling for Refugee Children – the name of our forthcoming book. This paper focuses on the experiences of refugee children in temporary settlements in Lebanon, drawing on their own words. We use Nancy Fraser's (2008) conceptualisation of social justice as parity-of-participation as explained in Paper I, which distinguishes among three distinct, interconnected aspects of social justice: Redistribution, Recognition and Representation. This paper explores these three aspects in interpreting the verbatim words of 45 Syrian refugee children aged 8-14 years. We explain how, over three days in 2019, the children conveyed to us the following points: their sense of participating in a global Syrian community where trust between members was implicit; their admiration and trust for teachers who recognised them as agentic individuals; the tensions they faced in obtaining fair access to a wider curriculum and more schooling; their longing to return to ordinary life in Syria where they were recognised as fully valued individuals; and their strong will to succeed and make their voices heard, and despite significant setbacks, lead transformations in their future lives.

Article 2 of the UNCRC lists representation as the right of every child 'without discrimination of any kind, irrespective of the child's . . . national, ethnic or social origin'. Our findings illustrate that the children in our sample were, to some extent, learning how to articulate their own perspectives at school, engage in critical dialogue and present themselves in a confident and self-determined way. These attributes are likely to support their future struggles to be heard and have their perspectives acted-on.

Migrant Youths' Educational Trajectories in Post-Pandemic Times: Mapping the Experiences of Young Migrants in Urban Areas with High Density and Territorial Segregation

Ines Martins Macedo[1], Amalia Susana Creus Quinteros[2], Adriana Ornellas[3]

1Universitat Oberta de Catalunya, Spain; 2Universitat Oberta de Catalunya, Spain; 3Universitat Oberta de Catalunya, Spain

The proposal presents the first results of a research project funded by the Ministry of Science and Innovation of Spain that explores educational inequities that affect young non-European migrants in urban areas, paying special attention to the consequences of the COVID-19 pandemic on their educational trajectories. The study follows three main objectives: (a) identify structural and emerging post-pandemic forms of educational inequity deepened by urban segregation, (b) analyze the impact of the pandemic on the growing politics of fear and criminalization of immigration, (c) provide tools and methods to engage and empower young migrants in co-creating innovative joint solutions to combat educational inequities and urban segregation in a post-pandemic era. The research integrates different methodological strategies: an ethnographic and narrative approach to analyze educational trajectories in detail; a critical discourse analysis perspective to explore public and policy narratives related to immigration and youth during the COVID-19 crisis; a community-engaged research approach to involve young migrants in seeking solutions to educational inequities and segregation. Emerging results during the first year of field work – that included interviews, discussion groups and visual cartographies co-constructed with migrants – are allowing us to analyse how segregation, exclusion and educational disaffection operate in the context of fear and social tension caused by the pandemic, where anti-immigration narratives have been transformed and spread, increasing the stigmatisation and disaffection towards migrants, particularly young migrants.

309

Tension, Trust and Transformation Among Refugee Syrian Children in the UK: Representations of Syrian Refugee Children in an Inner London School – Paper IV

Jumana Al-Waeli

Ulster University – United Kingdom

This paper constitutes the fourth contribution from our forthcoming book Quality Schooling for Refugee Children. This paper shares the testimonies of six Syrian adolescents aged 13-16, collected over eight months in 2019-21, while the children attended an inner London secondary school. It

provides insight into how this group of Syrian refugees – this time in a permanent post-resettlement context in the UK – perceived and conceptualised social justice while reflecting on their educational and social experiences at school and the tensions and transformations that are integral to them.

The participants highlighted the tensions associated with experiences of misrecognition, lack of adequate distribution, and the absence of meaningful representation that hindered their sense of belonging and impeded their learning. They expressed that their humanity, previous educational experiences, abilities, needs, and voices were not valued but rather disregarded, causing them to feel excluded from the educational and social environment at school. The children also called on their teachers to adopt transformative pedagogies that can help build trustful and just learning environments by being compassionate and caring, as the lack of feeling socially safe – specifically, being trusted, respected, heard and included – impacted on their ability to adapt and prosper in school.

The young Syrians' accounts echoed McIntyre and Abrams' (2020) argument, which substantiates the provision of conditions for social justice as parity-of-participation (Fraser, 2008) for regaining a sense of home and ordinariness, where they feel safe and surrounded by trust, grow webs of belonging and develop a will to learn and succeed (Kohli, 2011).

Tension, Trust and Transformation among refugee Syrian children: context for representations of Syrian refugee children living in camps in Eastern Lebanon – Paper I

Brian Lally

Kingston University, United Kingdom

This paper conveys the essence of our book Schooling for Refugee Children (forthcoming, UCL Press, May 2024), co-written by five researchers from UK, Syria, Lebanon and USA. It examines the potential for transformative social justice both of and through schooling for refugee Syrian children in Lebanon and UK. This film gives some context to our presentations [https://youtu.be/aL1OsmRUCiQ].

This first presentation, part of four inputs by the authors, offers an overview of the broader education landscape for Syrian refugees and introduces the particular learning and living environments including the inherent tensions and uncertainties of life for the children there.

The authors held that, to maintain human rights, schooling would allow all children, including refugee Syrians, to develop their capacities; respond to their needs; ensure their right to participate on a par with all other children; and support their right to make their voices heard. On that basis, we designed research in Lebanon and England which offered a platform for Syrian refugee children in these different contexts to share their stories and represent their educational experiences. We also explore how children managed to continue learning during the difficult era of the COVID-19 pandemic, which coincided in Lebanon with a severe economic and political crisis that was further intensified by the massive explosion in the Beirut port area in 2020.

We drew on two social justice frameworks: Fraser's (2008) concept of social justice as parity of participation; and Kohli's (2011) view of refugee children needing to establish feelings of safety, belonging and success.

Impact and Contribution of Andalusian Universities to Society. Andalusian Studies Center

Rubén Martín-Gimeno, Eladia Illescas-Estévez, Ana Rocío Andreu-Pérez, Tristán Pertínez-Blasco, Raúl Lucena-Martínez, Eva Cataño-García, Diego De Haro-Gázquez

Fundación Centro de Estudios Andaluces, Spain

This study provides a comprehensive analysis of the universities in Andalusia, focusing on evaluating various aspects such as the quality of teaching, the perception of the university community and the citizenry in general, and the contribution of these institutions to society. Using a mixed methodology that combines quantitative and qualitative analysis, we have collected significant data from various sources, including surveys of students, academic staff, and Andalusian citizens. The study focuses on understanding the perception of the university system in Andalusia from two main perspectives: the internal, represented by the university community, and the external, reflected by the citizenry. This duality provides a holistic understanding of how Andalusian universities are valued by both their members and the society in which they are integrated. We delve into the needs and expectations of the university community, examining how they perceive the quality of teaching, the prestige of trained professionals, and the impact of the research conducted. In addition, we explore the Andalusian citizens' view of the contribution of universities to the community, assessing aspects such as the social utility of research and the prestige of the institutions at regional and national levels. Our findings suggest ways to improve educational quality and strengthen the link between universities and Andalusian society. This study not only provides a critical view of the current state of universities in Andalusia but also proposes data-based recommendations for their development and adaptation to the contemporary needs of society. With this, we seek to contribute to the debate on how universities can maximize their impact and relevance in the current social and cultural context.

The Global Space of International Students 2019

Mikael Börjesson

Uppsala University, Sweden

In order to understand the complex relations between sending and receiving countries, this paper draws on OECD data on international student flows between regions of origin and countries of destination. By means of a correspondence analysis (CA), the global space of international student flows, 2019, is depicted as having three main poles: one Pacific linking students from Asian regions to predominantly Anglo-Saxon countries of destination including the US, Australia, New Zeeland, and Canada, as well as Japan and South Korea, one European pole combining European countries of destination with European regions of origin, and one Franco-Iberian pole, where France, Portugal and Space are the countries of destination and Africa and Latin America are the main regions of origin. These three poles correspond to three different logics of student mobility: logics of marketisation, geographical proximity, and colonial heritage. They also are dominated by different languages: English, German and Slavic languages, and Latin languages. The Nordic countries primarily position themselves in the middle, in between the different poles. At a more detailed level, the space contains further differentiations. The European countries of destination are dispersed according to the axes, and, for instance, the eastern and western European countries are opposed in the third axis. Along the forth axis, Latin American as region of origin is polarised to the Arab region. Asian regions of origin are dispersed along the fifth axis. This implies the importance of analysing the national, regional and global levels in relation to each other.

Professional Noticing in Higher Education

Lucila Finkel, Pilar Parra

Universidad Complutense de Madrid, Spain

This paper explains how the concept of "professional noticing" can be applied to higher education by promoting innovative learning and teaching practices that enhance teachers' capacity to guide students through the professionalization process in their respective fields of study. Professional noticing can be defined as "learning to observe in specific ways as part of expertise development in a profession" (Jacobs et al., 2010, p. 170). Hence, supporting students in cultivating professional noticing skills is not only about intending to observe but also involves constructing practical professional knowledge. This knowledge is alternatively termed as "professional vision" (Goodwin, 1994) or a "professional frame" (Borich, 2016), which is used to make sense out of identified aspects in a practical situation. Beyond enhancing teachers' skills and contributing to curriculum development, professional noticing also readies students for a smoother transition into the labor market.

To achieve this objective, we employ the "Professional Noticing" method, applying its transdisciplinary component to professionalize various occupational groups in entrepreneurship education. We analyze evaluation procedures and learning outcomes from four European universities, presenting novel learning and teaching scenarios that utilize open educational resources to foster professional noticing skills, with the idea to gain new insights that are applicable across diverse educational fields.

RN10 | T04_04: Inequality in Education (III)

Educational Inequality and Inclusion From Intersectionality : The case of Special Education in Belgium's French-Speaking Region

Merve Ozden, Géraldine André, Miguel Souto Lopez

UCLouvain, Belgium

Special education in Belgium's French-speaking region, historically characterized by segregation and a predominance of boys from working-class and immigrant backgrounds, is undergoing a significant transformation towards inclusive schooling. This transition is being driven by a substantial educational reform, known as the Pacte pour un Enseignement d'Excellence (2015). We propose to focus on intersectionality, applying it to study the evolution of inequalities in special education in the context of new inclusive logics. The state of the art indicates that, although intersectionality offers a unique theoretical perspective that renews the study of educational inequalities (Gross et al. 2016), there are debates and unknowns regarding its methodological application (Choo and Ferree 2010, Davis 2008).

Our paper aims to address this gap in two steps. First, we thoroughly review and discuss the existing literature and academic debates around the conceptualization, analysis methods, and uses of intersectionality. Second, we introduce a unique methodological approach, notably inspired by the intra – and inter-category approaches of McCall (2005). In this phase, our discussion will be based on ongoing fieldwork, including interviews and observations with key actors involved in school guidance. The goal is to observe how inclusive logics are adopted by actors of the school guidance process towards inclusive education and their impact on school inequalities. The analysis of our data will be done with the prism of intersectionality to explore in depth the construction of the 'special educational needs' category and its interaction with other categorization processes, such as those related to race, gender, and socio-economic status.

Is CLIL Elitist? A Systematic And Critical Review Of The Literature On Equity And Bilingual Education In Europe.

Giuseppe Beluschi-Fabeni[1], Alberto Álvarez-Sotomayor[1], María Dolores Martín-Lagos López[2]

1Universidad de Córdoba, Spain; 2Universidad de Granada

What is the impact of CLIL-based educational programmes on equity and equality of opportunities? Are these programmes unequal? Possible elitism is one of the main critiques of CLIL present in the socio-educational debate among families, education professionals and the media. But what empirical evidence can we currently rely on to evaluate the impacts of CLIL on equity and equality of opportunities?

We present a systematic review of the results of empirical studies conducted in European countries on the equality of opportunities of CLIL programs, both in terms of access and academic achievement.

The literature reviewed presents conflicting results and conclusions, which are far from providing definitive answers. While the research on education equity and CLIL is increasing, it still falls short of addressing the whole spectrum of emerging questions and variables that need to be considered, as well as covering the totality of European-wide national education systems. Additionally, a critical examination of the existing studies raises doubts about the real scope of the empirical knowledge accumulated thus far.

This study is a part of the research project "EQUIBIL – Equity and Bilingual Education in Quasi-Market School Contexts: A Study of the Andalusian Case", funded by the National Research Plan. The project examines the impact of bilingual programmes implemented in Spain on equity and equality of educational opportunities.

312

Risk Society, Pandemic, and Educational Solutions: the Portuguese Case

Eva Gonçalves[1], João Sebastião[2], Luísa Delgado[3]

1CIES-Iscte, Portugal; 2CIES-Iscte, Portugal; 3CIES-Iscte, Portugal

During the COVID-19 pandemic, the closing of educational systems was one of the most significant impacts, worldwide. It is important to assess how educational policies dealt with the challenges brought by the pandemic – successes and constraints, solutions to and impacts on equal educational opportunities.

Focusing on the Portuguese case, we aimed to understand if measures taken in our country were effective to recover/maintain activities, offer quality and innovative education

and create solutions to, at least, not exacerbate social differences during lockdown and after.

We used a multimethod approach mobilising institutional reports and statistics from several sources and conducted semi-structured interviews to six School Directors (chosen to represent the diverse territorial differences of Portuguese public schools).

Results show the impacts of the pandemic crisis and the efficacy of the policy measures. Students, teachers, and families had to deal with learning equipment, tools, and methodologies unknown to most of them, and the importance of home space and reference adults in young peoples' lives. The difficulties in access to indispensable technological resources for each family, all sharing limited resources for education and telework. The increase of social differences between students (families) concerning resources and abilities. Finally, the determinant role of the local partners, particularly the city councils, in the entire process of dealing with the pandemic/lockdowns and impacts. To sum up, educational measures in Portugal were urgent and ambiguous, but not particularly helpful to mitigate the difficulties especially in disadvantaged territories and families.

Inclusive Vs. Achievement-Based Equity. Deconstructing Meritocratic Ideologies of Equity in School Systems

Michael Urban, Jonas Becker

Goethe-Universität Frankfurt am Main, Germany

While different theoretical perspectives emphasize that achievement is deeply interwoven with school processes, inclusion is an external political impulse, which became legally binding for most of the national school systems with the ratification of the UN-CRPD. Due to this externality, in most of the participating countries these legislative processes have not resulted in the realisation of inclusive education systems. The paper aims for a deeper understanding of the tense relationship of inclusion and achievement, as both stand for different functional logics. A main problem in this respect is the ideological construct of meritocratic equity that binds equity to ableist assumptions while shadowing the functional and subjectivating dimension of achievement in school systems. The paper draws on the reconstructive perspective of the BMBF-funded research project ReLInk using focused ethnography at four schools. In addition to participatory observations, we conducted episodic interviews with students (n=54), regular teachers (n=23), special education teachers (n=8), and other educational staff and therapists (n=4). Data analysis used coding and mapping strategies of GTM and situational analysis. Findings demonstrate the ubiquity and predominance of achievement as an implicit modality of processing teaching, whose functional importance relates to its subjectivating power. Because of its functional centrality, achievement also provides the frame within which dis/ability, special educational needs, and inclusion encounter in schools. One very important effect of this constellation is the consequence that inclusion can neither become a functional goal

with the power to shape the systems processes nor obtain the status as a criterion of justice in school systems. This complex and highly problematic constellation is secured, stabilised and hidden by the meritocratic ideology in nearly all national school systems.

313

RN10 | T04_05: Digital Technology and Education (I)

AI, Labor Market Revolution, and Human Rights: Navigating Challenges and Hope for Teaching Professions in the Digital Era

Anna Odrowaz-Coates

The Maria Grzegorzewska University, Poland

In this discussion, the author explores the impact of AI development on teaching professions in the context of the ongoing digital revolution. The rapid evolution of AI has led to significant changes in labour markets, primarily through the processes of automatization and augmentation. This transformative wave raises critical questions about the desirability of a world heavily reliant on AI, considering environmental concerns and the finite nature of resources. While AI holds the potential to enhance efficiency and offer innovative solutions for resource recovery and waste management, it also poses challenges. The automation of routine tasks may lead to job displacement in certain sectors, necessitating a shift in the desired skill set toward high-tech proficiency and ICT skills. This shift not only presents opportunities for re-education and re-training but also highlights the demand for instructors specializing in digital skills.

As AI continues to redefine work structures, the potential replacement of human workers raises the issue of how to occupy individuals' time, maintain a sense of belonging derived from professional life, and prevent the marginalization of the non-working population. The ethical considerations surrounding solidarity become increasingly crucial in this scenario. Teachers emerge as indispensable guides, preparing new generations for post-industrial landscapes and countering potential dystopian realities. Emphasizing empathy and global education for peace, educators play a vital role in instilling deep ethical considerations, with a focus on human rights as integral to sustainable development. In navigating the challenges posed by the ongoing digital revolution, teachers become pivotal figures in shaping a future that balances technological advancement with ethical and humane values. AI cannot teach empathy and emotional intelligence without human-to-human interaction. Teachers remain the needed profession.

The Italian Experience of Distance Learning. Some Lessons for a Policy Proposal on Ict in School Systems

Domenico Carbone[1], Crisitna Calvi[1], Anna Rosa Favretto[2]

1University of Eastern Piedmont, Italy; 2University of Turin, Italy

During the Covid-19 pandemic the majority of the states instituted measures to close schools and shift them to virtual platforms. This change happened in school systems that could rely on different infrastructures and levels of digitisation achieved so far. Starting from an analysis of the literature on distance learning, the paper will reconstruct the effects of this phenomenon on the Italian school system and will give indications useful for the development of digital educational policies. In particular, with regard to the first aspect, the focus will be on the consequences of distance learning on three important dimensions that characterise school systems and directly involve teachers and students: school inclusion, learning processes and digital skills. Distance learning has functioned as a great amplifier of both the criticalities and opportunities offered by the digitisation of the education system. Overcoming the former in order to strengthen the latter should be the starting point for the re-calibration of educational policies which, as we shall see, must be implemented starting from the centrality and relevance of the relational dimension in educational environments on which not only a successful learning process depends, but also the well-being of students and teachers. The need to take a bottom-up perspective in the construction of digital education policies that take into account the inequalities that permeate society, together with the adoption of a critical perspective in the choice of technological tools to be adopted could be the lesson learned from the Italian experience and useful for European school systems

314

Digital Transformation in HE: From The European Vision To The University Governance

Maria Chiara De Angelis, Stefania Capogna

Link Campus University, Italy

Digital transformation is at the heart of the epochal change we are going through, and it impacts the present and future learning contexts (formal, non-formal and informal) in which we are immersed. These changes require that Educational Institutions review teaching paradigms, organisation, management, evaluation processes, relations systems and competencies framework for teaching-learning processes (Johnson et al., 2016; EE.UU., 2013). In this challenging scenario, our work describes the main results of the Erasmus+ ECOLHE action research project. The main research goal was to observe how the shift towards digital processes and the adaptation of supranational indications took place, to capture differences, similarities and trajectories matured within this complex process of building a common space

for higher education and its growing emphasis on digital resources as a key to innovation and competitive development. The ECOLHE action research has analysed national public policies for e-learning in HE, adopting a mixed method to realise an exploratory and comparative analysis based on a collection of case studies (Zack, 2006) aimed at understanding the transformation of critical concepts from the supranational level to the national level while implementing inclusive and LLL processes based on digital technologies. The research contributed to examining the idea of an E-learning European HE Area (in the broader framework of the Bologna Process) to understand the translation process (Callon, 1986; Latour, 1987) into practice in a national context by Academic Bodies considering dominant rhetoric, orientations, legacies, obligations, risks and opportunities, expectations and educational paradigms in this reconstruction.

Shaping The Future...For Whom? Possibilities And Challenges Of The Rise Of AI In Latin American Education

Maria Cecilia Zsögön

The Maria Grzegorzewska University, Poland

The irruption of Artificial Intelligence (AI) in education is bringing about a significant transformation in the roles of educators worldwide. In this presentation we explore the potential and risks of AI powered tools for education in Latin America, a region known for its significant inequalities.

We propose that critical pedagogy can be an adequate approach to deal with AI based tools. This perspective aims to empower children with the tools to critically explore and interpret the world, fostering resilience against injustice, and promoting a commitment to transformative action.This approach is grounded on a critical examination of the purpose of education, and of the methods implemented in the classroom. Pedagogy, in this context, becomes a moral and political practice. Such a critical perspective can extend to AI-powered tools, aiding students in developing autonomy and responsibility for their own learning, while promoting innovative practices and bridging the digital gap prevalent in the region.

A crucial question emerges: are educators in Latin America prepared to confront this challenge? Could the introduction of this technology inadvertently exacerbate existing inequalities, exclusion, and perpetuate suffering for millions in the region?

The future is an open possibility, but now is the time for a meaningful debate on how we envision this future, with educators playing a central role in shaping it. This raises the question of whether their input will be acknowledged, or if the pervasive logic of capitalism ingrained in every institution, including education, will ultimately have the final say.

RN10 | T05_01: Curriculum Innovation and Development (I)

'Shelter From the Storm': Seeking Refuge in Effective Curriculum Enactment?

Aina Tarabini, Mauro Moschetti, Berta Llos

Autonomous University of Barcelona, Spain

Early School Leaving (ESL) and school disengagement are global phenomena that affect numerous young people. Among the multiple factors that explain educational exclusion there is the increasingly lack of meaning students attribute to learning (Tarabini, 2019). Research also highlights how different curricular approaches impact students' learning opportunities (Tedesco et al, 2014). Designing inclusive curricula that enable all students to learn presents both a striking challenge and opportunity for contemporary education systems. However, this issue is by no means easy or linear. Curriculum design is a socio-political construct (Young, 1971) that involves different conceptions about the nature of learning and the role of schooling in contemporary societies. Teachers play a key role in the enactment of curricular policies (Ball et al., 2012) and their influence extends to shaping the students' relationships with learning. The aim of this paper is to analyse the processes of curricular enactment and offer new evidence about how and under what circumstances it operates in favour of learning for all students. The findings draw on the case of Spain, one of the European countries with the highest levels of ESL and where a recent curriculum reform is being implemented, not without controversy. Data include curricular documents, interviews with principals, and focus groups with teachers in six secondary schools with different social compositions, pedagogic approaches, and organisational features. Overall, the paper contributes to identifying the tensions surrounding the enactment of the curriculum and its impact on the (re)production or transformation of social inequalities.

Exploring the Impact of Teacher-Student Similarity on Academic Outcomes: Evidence from Germany

Richard Nennstiel

University of Bern, Switzerland

This paper addresses the important but understudied issue of teacher-student demographic congruence and its impact on educational outcomes in the German education system. Using data from the National Educational Panel Study (NEPS), we examine whether primary, lower secondary, and

315

upper secondary students who are taught by teachers of the same gender or migration background show differences in academic achievement and grading fairness. Our analysis uses two primary indicators: (1) achievement growth in mathematics and reading, and (2) grades in mathematics and German, adjusted for test score differences. This study covers three different cohorts of students at different stages of education in Germany, providing a comprehensive view of the educational landscape. Preliminary results suggest a correlation between demographic similarity between teachers and students and better educational outcomes. Specifically, we observe evidence that having a teacher of the same gender or immigrant background as the student may (slightly) improve equity in grading and contribute to higher learning gains. These findings could have profound implications for educational policy and practice, highlighting the potential benefits of fostering teacher-student demographic congruence as a means of promoting equity and inclusivity in educational settings. The study's findings contribute to the broader discourse on social justice in education, suggesting that teacher-student similarity might be an influential factor in enhancing academic success and ensuring fair treatment across diverse student populations.

Does University Education Prepare Teacher Students For Teaching In Middle – And High School?

Marte Aune

UiT – The Arctic University of Norway, Norway

Teacher students in Norway who aim to become teachers in middle – and high school need to complete a five-year master's degree with a chosen curricular specialization. I aim to explore how we can create good sociology teachers, and I have conducted an analysis of the curriculums in the main sociological subjects of the teacher education at the University of Tromsø, and the national curriculums of middle school (pupils aged 13-16) and high school (pupils aged 16-19) in Norway. The main objective is to identify whether university courses prepare the teacher students for relevant subjects that they are going to teach to pupils at middle – and high school.

The study finds that the university curriculum provides the students with the necessary tools to teach in middle – and high school. An additional finding suggests that the sociological courses also cover interdisciplinary topics in middle – and high school; democracy and citizenship, sustainable development and health and life-mastery (my translations). I emphasize these topics because of their sociological relevance. All three interdisciplinary topics at the lower-level education are represented in the curriculum of the sociological courses, both theoretically and empirically. In addition to the analysis, I have conducted interviews with teacher students about their perspectives on the curriculum. An issue that might occur with the sociological courses at university is that the relevance of the curriculum to teaching is unclear to the students.

Conflict over Inclusive Education – the Case of Poland

Tomasz Płachecki

Educational Research Institute, Poland

Last year Poland witnessed intense debate on inclusive education. The catalyst for this dispute was the principle formulated by the European Union, according to which schools that maintain segregation of any disadvantaged group cannot be supported in UE funding programmes. In response, the integration of all students with disabilities into mainstream schools has been publicly questioned, including by some government officials. Some critics of inclusive education went so far as to present it as an imposed ideology with hidden agendas like reducing education quality and increasing costs.

Analyzing discourse and practices concerning inclusive education has a significance which goes beyond the context of national politics. Firstly, inclusiveness is becoming increasingly important for educational policy and social cohesion in times of crisis. Secondly, the idea of inclusive education has a critical potential towards capitalism (Boltanski, Chiapello 2007) and biopolitics (Foucault 2008), because it disrupts the perspective of "human capital" and redefines differences not as deficits but as identity aspects (e.g. the distinction between "deafness" and "deafhood" – Ladd 2003).

The research addresses two questions: What assumptions do inclusive education proponents and opponents hold about education and social inclusion? What conditions are necessary for the practical implementation of inclusive education in schools?

The study combines public discourse analysis, qualitative interviews with various administrative levels and quantitative data on secondary school graduates' careers.

Ladd, P. 2003 Understanding Deaf Culture

School Start Scrambles: The Interplay of Sociotemporal Factors on Women's Labor Force Participation

Boroka Bo[1], Denys Dukhovnov[2], Kara Anderson[3]

1University College Dublin, Ireland; 2University of California, Berkeley; 3McGeorge School of Law

This study shows that K-12 school start times along with contextual school and area-level sociodemographic factors are significant predictors of women's labor force participation. We draw on nationally representative survey data from three publicly available 2019 datasets: the American Community Survey, the National Historical Geographical Information Systems, and the Unlocking Time Survey. Analyses involve two stages. First, ordinary least squares regressions evaluate statistically significant relationships. The second stage uses Monte Carlo cross-validation and parametric bootstrap analyses tests to assess the predictive accuracy of the full model. Our results show that later school start times have important ramifications, extending beyond the mental and physical well-being of children. Women's labor force participation is nearly 5 percentage points higher in areas where schools start at or after the legally recommended time of 8:30am. We find that contextual economic and demographic factors are also significant when it comes to the relationship between school start times and in women's ability to participate in the labor force. Our work represents an important contribution to the ongoing school start time policy debate sweeping the United States. Considering the temporal needs of women and children, this work has important policy implications for sociotemporal disparities in well-being.

Exploring Intersectional Identities of Academic Staff Via Process Mining

Tammy Razi, Sigal Nagar-Ron, Sagit Kedem-Yemini

Sapir Academic College, Israel

The identity of educators, in terms of their gender, ethnicity and nationality, and the ways these axis intersect, is an issue not enough discussed – not only in the context of fair representation, but also in the context of its impact on students, as well as on the curriculum taught and on the knowledge produced. Thus, exploring the diverse identities of academic staff and the ways they intersect is of crucial importance to minimizing inequality in higher education – not only in terms of fair representation but also in terms of creating richer, deeper and more diverse academic perspectives. Not less importantly, these directly influence students' sense of belonging and self-esteem, which are especially relevant to first generation college students. These issues have a special relevance for a multicultural and divided society such as in the case of Israel.

Drawing on the concept of intersectionality, this paper demonstrates how application of process mining methodology enables to expose the inequalities prevalent among academic staff in Israel, both in terms of lack of fair representation, as well as biases in their promotion processes. By mapping the multiple axis of identities of 400 academic staff members, and their intersections, our study offers a comprehensive understanding of the power dynamics and obstacles hindering true and sustainable equality in academic institutions.

Our main findings expose the ethno-gendered and national-gendered nature of inequality in higher education

Is the Gender-gap Reversal a Feedback Loop? Social Factors Influencing Gender-gap Inequalities in Tertiary Education in European Countries

Tomáš Katrňák[1], Pia N. Blossfeld[2], Tomáš Doseděl[3]

1Masaryk University, Faculty of Social Studies, Czech Republic; 2Innsbruck University, Innsbruck, Austria; 3Masaryk University, Faculty of Social Studies, Czech Republic

The educational structures of the European populations have changed significantly over the last 20 years. The average proportion of young people (aged 25-34) in European countries who had attained tertiary education increased from 25% to 41% from 2000 to 2020 %. This educational expansion has been accompanied by a change of the gender ratio in favor of women and the growth of a gender-gap reversal (GGR). Women's chances to be enrolled in higher education have increased faster than men's, as has their tertiary education attainment. We analyze ESS (European social survey) data and answer the question why GGR has increased in European countries. We analyze the effects of parental educational hypogamy (marriage where the wife's educational level is higher than the husband's), parental educational homogamy (marriage where the husband's educational level is the same as the wife's), parental divorce, and single-parent family. We argue that these factors increase tertiary education attainment by gender and thus the GGR rises. The higher level of GGR then reinforces the prevalence of these factors on higher tertiary education for women, boosting gender inequality at the tertiary education level in favor of women. Based on this argument we test whether GGR is a positive feedback loop phenomenon. The results show that this interpretation could be plausible. GGR can be understood as a self-feeding system by which its increase is given.

Gender Differences in Class Engagement and Disruptive School Behaviour: Boys' Susceptibility to Peers' Motivation Culture.

Mieke Van Houtte

Ghent University, Belgium

This study starts from the observation that boys show less educational effort than girls, due to lower intrinsic/autonomous motivation. Generally, students' motivation is considered to be a personal feature, however, from a sociological perspective, it is appropriate to consider the possibility of autonomous and controlled motivation as shared beliefs by peers, or motivation culture. Such a students' motivation culture might explain why adolescents are more or less engaged or disruptive irrespective of their own motivation. Boys in particular are susceptible to the peer culture in school. Therefore this study first examined whether autonomous and controlled motivation are shared by students of the same school and whether such a motivation culture is associated with the school's student composition. Second, the study examined whether students', and specifically boys', class engagement and disruptive behaviour are associated with the autonomous and controlled motivation culture at their school. The main findings of analyses of data of 5.162 8th grade students (average age 14) in 57 Flemish secondary schools are (1) that schools are characterized by an autonomous and controlled motivated culture that is related to respectively schools' sex and migrant composition and schools' socioeconomic composition, and (2) that boys' disruptive behaviour is related to the autonomous motivation culture, confirming that boys are more susceptible to their peers' motivation culture. This research contributes to the research on motivation and to the research into the gender gap in educational performance by showing that boys are more susceptible to their school's motivation culture, leading to more disruptive behaviour.

RN10 | T05_03: Pathways, Retention and Dropout (I)

Accelerated Learning in Mathematics: Improved Learning and Teacher Bias

Øyvind Nicolay Wiborg[1], Håvard Helland[2], Karl Ingar Røberg[2]

1University of Oslo, Norway; 2Oslo Metropolitan University

This study examines high-achieving students in Norwegian lower secondary schools who follow accelerated learning trajectories in mathematics, so-called fast-tracks. These fast-tracks allow advanced students to take classes and exams in single subjects at a higher grade level than their current. We examine the differences between regular and fast-track students' academic achievements in mathematics. We do so to address whether and how fast tracks improve these high-performing students' learning. These questions are essential because higher-performing students' accelerated learning provides a unique window into student learning more generally. The analyses rely on high-quality administrative register data from Norway with complete information for all students. Fast-track students are overrepresented with top school grades, so effects might be underestimated using standard methods. Therefore, we rely on Tobit regression models to account for the ceiling effects in school grades and also deploy a novel application of cross-random effects (Mundlak), integrating a fixed effects methods design in the nonlinear Tobit models(Wooldridge, Allison). The results show that fast-track students outperform regular students in mathematics. The results suggest that (1) the fast tracks improve the students' learning, and (2) the students are selected and self-selected – based on prior performance and background characteristics. When comparing teacher-set grades vs. exam grades set by anonymous random assigned examinators, the results suggest that (3) teachers give fast-track students even better grades than regular students. One plausible explanation is that teachers perceive or label fast-track students as more talented than other students. The findings especially suggest that Norwegian teachers compensate disadvantaged fast-track students.

Addressing the Persistent Struggle: Tackling Mathematics Difficulties Among Danish Students

Mikkel Kjer, Julie Nicolajsen, Martin Williams Strandby

VIVE, Denmark

The PISA assessment reveals that 15% of 15-year-old Danes face significant challenges in mathematics, including conditions like dyscalculia, and this number has remained

318

relatively stable since 2000. This persistent issue holds potential far-reaching consequences, as students with mathematical difficulties often encounter substantial educational barriers, limiting their opportunities in the job market and daily life. Given the escalating importance of mathematical proficiency in an increasingly digitized society, addressing these challenges becomes paramount.

The literature underscores the multifaceted nature of the causes behind mathematical difficulties, involving students' inherent abilities, cognitive tools, motivation, and aspects of the learning environment, such as teaching approaches and resource availability. However, existing research primarily explores causes and solutions from the perspectives of adults, neglecting the crucial insights of students themselves. In our study, we fill this gap by examining the experiences and attitudes of students facing mathematics difficulties within a Danish school setting.

Employing a discourse-analytical framework, we analyze focus group data from pupils aged 8-12, constructing a typology outlining the causes of mathematical difficulties and suggesting optimal approaches for teachers to address these challenges. Our findings underscore the imperative need to incorporate students' experiences, insights, and assessments in developing effective interventions, as well as creating mapping and intervention materials for those struggling with mathematics. By integrating the perspectives of the students, we aim to contribute to a more comprehensive understanding of the challenges and pave the way for more student-centric solutions in the realm of mathematics education.

Under-prepared for Higher Education? To What Extent Are Students Who Access Higher Education Through Alternative Pathways as Well Prepared as Those Who Have Completed the Academic Track

Asgeir Skålholt, Elisabeth Hovdhaugen

NIFU, Norway

In mass higher education (HE), larger parts of a cohort enter HE. In a HE-system where most students are provided a spot, some students may enter with very modest grades, rendering them under-prepared for academic challenges in HE. Hence, the transition from upper secondary education to HE may be tough.

This paper aims at analysing how students who have completed the HE entrance qualification (HEEQ) through taking the supplementary academic year following two years of a vocational upper secondary programme do in HE, compared to students who completed the regular academic track in upper secondary. To make sure we are comparing similar groups we will restrict the data to students who have comparative grades, thus restricting the data to students who have average or lower grades.

We are using Norwegian registry data for the cohorts starting their third year in upper secondary in 2002-2014, consisting of both students who have gained HEEQ by completing a regular academic programme or by gaining HEEQ through taking the supplementary academic year. These cohorts are observed these cohorts for six years, giving them ample time to start and complete an undergraduate degree. Preliminary analyses indicate that students who have gained HEEQ through the supplementary year are more likely to go into professional degrees, such as nursing, engineering and teaching. And when taking account of prior grades from lower secondary, we also find minor differences in completion rates. This indicates that students who have gained HEEQ through alternative routes are not less prepared for HE.

First-Generation Students' University Transition Experiences in Germany through Bourdieu's Lens

Liang-Wen Lin-Januszewski

Universität Paderborn, Germany; Bergische Universität Wuppertal, Germany

First-year transition experiences play a key role in undergraduate life and are related to the construction of student identity, assimilation into academic settings, and inequalities in educational trajectories. Meanwhile, how structural and cultural characteristics of an individual's social background unevenly influence students' meaning-making practices during the transition process cannot be overlooked.

The purpose of this university-funded research project is to understand the struggles that first-generation college students face during their first-year transition experiences. These struggles arise from a cleavage between the individual's habitus, the field of university study, and the field of the individual's part-time job market. Along with the conceptual tools of capital, habitus, and field, this study emphasizes Bourdieu's theoretical perspectives on the experience of time and the affective dimension of habitus.

The ongoing study employs qualitative methods to investigate the experiences of first-year students during their transition to university life, as well as the reflections of second-year students on their first year at university. A content analysis has been conducted on 139 written reflexive narratives and 40 semi-structured interviews with students enrolled in 2021, 2022, and 2023 at a German university. The purpose of the analysis is to explore the academic and social aspects of the university transition experience for first-generation students, their perceptions of the meaning of higher education, and the process of identity construction.

The current project contributes to the understanding of educational inequalities experienced by first-generation students in the German higher education field. Additionally, it sheds light on how temporal experiences and the emotional dimension of habitus contribute to the knowledge of class reproduction in higher education institutions.

The Educational Space of Preschools in a Cultural Stronghold in Sweden

Ida Lidegran

Uppsala universitet, Sweden

In Sweden, the vast majority of families with children already choose preschool during their children's first or second year. This is a very tangible choice; if you do not actively choose preschool, you will not be offered a place. Thus, all families who need childcare must approach an educational related choice very early in the children's lives, long before the child has an opinion on the matter. The early choice required of families is based on the availability of a range of different types of preschools. With inspiration from Bourdieu's sociology of education the purpose of this paper is to explain the educational space of preschools in Uppsala where educated social groups dominate later in the educational system. The method used to construct the space of preschools in Uppsala is simple correspondence analysis (CA) and the data is based on data from Statistics Sweden (SCB). The data is on an individual level and contains information about children who attend preschool in 2017. The result of the correspondence analysis shows a three-part structure where the social groups with the most educational assets are drawn to a special form of preschools, so called parent cooperatives. The families that have a smaller volume of educational assets place their children in municipal preschools. In the part of the space where the commercialized and for-profit preschools are most widespread, the economic fractions of the lower middle class and of the middle class are over-represented.

Truancy, Social Support, and Mental Well-Being Among School-Children in Sweden

Gökhan Kaya[1], Miia Bask[2]

1Uppsala University, Sweden; 2Department of Sociology, Uppsala University

This study aims to explore the role of social support in reducing the mental wellbeing consequences associated with levels of truancy, defined as unexcused school absence. This study is based on two samples from the public health survey of children and adolescents in the southern Swedish province of Skåne (1.4 million inhabitants). The survey is population-based and cross-sectional, conducted in 2016 (n=27,395) and 2021 (n=26,198). Data are collected from two cohorts of students in compulsory education, 6th grade (about 12 years old), and 9th grade and one cohort in upper secondary school (11th grade). Preliminary findings show a consistent increase in mental well-being problems as truancy develops into persistent behaviour, particularly among 11th-grade students. Accessing support from diverse actors appears to play a crucial role in reducing mental health risks by approximately 16-27%. The preliminary results suggest the importance of the social context surrounding high levels of truancy and its potential role in proposing targeted interventions for improved mental wellbeing outcomes among school-age populations.

"The Life I Want to Live". Imagined Futures, Educational Choices, and the Notion of a Good Life

Sara Gil

Universitat Autònoma de Barcelona, Spain

Imagining futures is a crucial skill for constructing and reconstructing solid life projects, particularly among young people (Ball et al., 2002). Being able to imagine futures and to project oneself in those futures means, on the one hand, to identify the social position recognizable as suitable and desirable for oneself (Appadurai, 1988), and, on the other hand, to mediate and negotiate aspirations with wider institutional structures and social actors (Gale & Parker, 2015). However, this ability is constricted by young people's structures of capitals (Bourdieu, 2011) and the lives of those surrounding them, both in their life and in social media (Archer, 2007).

The aim of this paper is exploring the construction of imagined futures among academic upper secondary students in different programs and from different social classes and genders. In particular, it explores the role of students' notions of "good life" and desired future lifestyles in shaping educational and professional transitions and its unequal distribution among social origins and gender (Brooks et al., 2020; Ingram et al., 2023).

This contribution is based on a case study conducted in three academic upper secondary high schools in Catalonia (Spain). Data includes 24 in-depth interviews with biographical techniques and 279 letters written "from the future" (Sools, 2020), both with first years in different tracks of academic upper secondary studies (16yo). The analysis of young people's future narratives has provided relevant insights on the influence of views about family, territory, safety, fame, or success, among other, in constructing young peoples' imagined careers.

Enhancing Scientific Literacy through Dialogic Scientific Gatherings

Ana Burgues-Freitas[1], Lidia Bordanoba[2], Carla Jarque[2]

1University of Granada; 2University of Barcelona

Introduction: This study explores the impact of Dialogic Scientific Gatherings (DSGs) on enhancing scientific literacy among adults and primary school children. DSGs are acknowledged as Successful Educational Actions supported by the global scientific community. Rooted in Article 27 of the Universal Declaration of Human Rights, emphasizing

320

the right to engage in scientific progress, scientific literacy extends beyond grasping scientific concepts. It encompasses their practical application in daily life and the critical discernment of evidence-based information from misinformation. Our research inquiries include: How do DSGs influence scientific literacy, and what are the effects of improved scientific literacy on decision-making and societal engagement?

Theoretical Framework: Previous research, exemplified by Soler (2015), underscores the successful implementation of DSGs in adult education schools, leading to heightened scientific understanding, as noted by García-Carrión (2015). Recent studies, such as those by Buslón et al. (2020) and the ScienceLit Project (2018), further substantiate the positive societal impact of DSGs, particularly in advancing scientific literacy among participants.

Methodology: We conducted two case studies, one involving primary school children and the other targeting adult learners in two schools in Spain. Data collection comprised semi-structured interviews and communicative observations.

Results: Our findings affirm that DSGs significantly enhance scientific literacy, yielding marked improvements in instrumental learning, analytical and critical thinking, and social skills. Furthermore, promoting scientific literacy correlates with improved decision-making and heightened societal engagement.

This study underscores the pivotal role of DSGs in nurturing scientific literacy and acknowledges their recognition as a successful educational strategy.

RN10 | T05_05: Digital Technology and Education (II)

Does Distance Learning Deepen or Compensate Skills Inequalities?

Marcin Kocór[1], Barbara Worek[1], Magdalena Jelonek[2]

1Jagiellonian University in Krakow, Poland; 2Krakow University of Economics

As shown by studies such as the Human Capital Study 2017-2023, the ways of acquiring and improving skills are changing and informal education is beginning to play an increasingly important role in this field. This process has recently accelerated also because of distance learning, which was introduced on a large scale during the COVID-19 pandemic. The key in such learning is ICT skills, which become the basis for the acquisition of other skills.

The question we pose is whether the introduction of distance learning has contributed to reducing or increasing digital divide for the elderly in particular. Based on the results of two editions of the Human Capital Study from 2010-2014 and 2017-2023 (nearly 100,000 Poles surveyed), we identify cohorts of younger and older people and show how their levels of ICT skills changed before and after the pandemic, and how this affected their other skills and ways of learning in general.

321

In our analyses, we use the cumulative benefit/non-benefit theory, which indicates that there is a clear St. Matthew effect when it comes to differences in the ICT competencies of younger and older people, and there is a fairly strong impact of these differences on the level of other skills.

GenAI in Higher Education: Exploring Perspectives and Practices among University Students in Italy

Manuela Farinosi, Claudio Melchior, Adriano Cirulli

University of Udine, Italy

The current debate about the societal implications of generative AI (GenAI) raises fundamental questions for the future of education. While these AI-based tools hold promise in reshaping traditional educational practices and improving personalized learning experiences, they also introduce a range of risks (i.e. misinformation, lack of scientific rigor, security concerns) and prompt important ethical and organizational questions for higher education institutions.

To delve deeper into the role of GenAI in university, we conducted a nationwide survey as part of an interdepartmental research project on AI at the university of Udine, engaging over 1370 students across Italy. The findings reveal that around 40% of the respondents, mainly from technology-related programs, have integrated AI into their

learning routines. However, the actual percentage might be higher due to social desirability dynamics. Among prevalent practices, information retrieval and minimal utilization of AI in assignments stand out, with the latter sometimes perceived as potential fraudulent conduct. Overall, the gathered opinions exhibit a degree of incoherence, oscillating between positive and negative sentiments towards AI. This ambiguity suggests that, given the initial stages of AI diffusion, respondents have not yet formed precise opinions. An illustrative exemplification is evident in the awareness of ethical concerns, particularly regarding the risk of plagiarism. Despite such apprehensions, consensus prevails on the ethical integration of AI into education, as long as proper institutional frameworks are established. While personal risks are not widely recognized by respondents, concerns at the societal level are acknowledged. Moreover, questions have arisen about the conceivable repercussions of AI on creativity and critical thinking.

Digitalization of Academic Labor: Examples from Turkiye after Covid-19 Pandemic and 2023 Earthquakes

Duygu Özalp

Başkent University, Turkiye

In this study, the digitalization of academic labour in Turkiye is discussed in the context of the effects of disasters. Following the first case of the COVID-19 pandemic in Turkiye in March 2020, distance education was announced at all levels of national education including universities. A similar arrangement was declared because of the destruction caused by the earthquakes in February 2023. After Turkiye was shaken by two earthquakes with a magnitude of 7.7 and 7.4 in February 2023, the first regulation for higher education aimed to continue education remotely again. As seen, while managing international and national disasters, distance education emerges as a strategic route. However, the rapid and unexpected changes in the educational environment can be challenging for academics. There have been situations such as preparing suitable course materials for use on online platforms, using digital learning environments and tools, and switching from the classroom environment, which is a participatory learning area, to the computer-aided virtual classroom environment etc. Although this dramatic change has been perplexing for every scientific community, the scope of this study is limited to the fields of social sciences and humanities. Thus, this study focused on how these academics are affected by these pervasive changes, and how they have been continuing their teaching and research activities. A qualitative research approach has been followed and semi-structured in-depth interviews are being conducted with academics who are teaching in the fields of social sciences and humanities at state and foundation universities in Turkiye by following the maximum diversity sampling technique. With this research, the experiences of the academics will be revealed, and the issue of digitalization of academic labour will be examined in depth.

Examining Secondary Level Students' Racialized Experiences with a Computer Science Program

Noemi Linares-Ramirez

Saint Mary's College, United States of America

Existing educational research (Yelamarthi & Mawasha, 2010; Lam

et al., 2004) suggests diverse students need exposure to high-quality, culturally-inclusive CS programs given students are better able to connect with the content. A better understanding of how racially and ethnically diverse students experience these programs would help increase recruitment and retention in computer science. This article examines how low-income, racially and ethnically diverse students experience a computer science (CS) program. I was particularly interested in how the home and school environment influence students' CS participation and takeaways. This project is a multiple case study (Cresswell & Poth, 2016) at three secondary level schools with students from different racial and ethnic identities but similar socio-economic status. I conducted interviews (with students at each school before and after the program) and observations (throughout program implementation). I analyzed transcripts and field notes inductively and deductively. This study demonstrates how low-income students' experiences with a computer science program vary by racial and ethnic group. Students' overall experiences and takeaways of the program and computer science are largely based on messaging from teachers and parents informed by race and ethnicity despite similar class position. The diverse experiences of students with computer science may also apply to other educational programs.

322

RN10 | T06_01: Curriculum Innovation and Development (II)

The Constitution of a Collective Political Subject in a Public School

Guillermina Belavi

Universidad Complutense de Madrid, Spain

According to Laclau and Mouffe, the social is characterized by antagonistic relations. When the subjects reinterpret these relations as oppressive and generate political actions to overcome them, they constitute themselves as collective political subjects. This process is done with elements from other discursive horizons and underpins a counter-hegemony project to change the partial stabilization of a model of society.

Based on this theory and in the related democratic educational literature, this research aims to comprehend the process of constitution of a collective political agent around the project of an alternative education in a public school in Madrid.

Data was collected by an ethnographic study carried out in a school that overcame a severe situation of segregation and school dropout in a few years.

The results show the process of a few teachers making alliance while defining and articulating elements about what innovation, participation, and inclusion mean and how to do them in primary education. This alliance of teachers sought to dispute the dominant meanings in the school and create/occupy positions of power with an ever-present concern to institutionalize their power. The strength of the alliance and the articulation of the new meanings for education allured new teachers and families to the school and created barriers against perspectives that could challenge the new educational project. The process made it possible to change hegemonic balances within the school in the name of a more inclusive, participatory, and fair education.

This contribution is part of the State plan R&D (2022-2026) "Transformative resistance in schools. Counter-narratives in education for Social Justice" (Ref: PID2021-122310NB-I00) financed by the Ministry of Economy, Industry and Competitiveness of the Spanish Government.

Evidence-Based Policies and Practices in Sociology of Education: a Bibliometric Analysis

Eva Gonçalves[1], Lia Pappámikail[2], Susana Batista[3]

1CIES-ISCTE_IUL, Portugal; 2CIEQV, School of Education – IPSantarem,; 3CICS.NOVA-FCSH_UNL, Portugal

A paradigmatic example of a total social fact (Mauss, 2013), the field of educational research is particularly fruitful. In its attempt to understand the dynamics of learning, institutions, actors and resources – starting with schools – to fulfill the normative intentions that guide investments in education by states, communities, families, and students, it is a field constantly on the boil and under public scrutiny, also through the political action that interferes to improve it. Educational actors are not indifferent to scientific findings. Instead, they increasingly rely on these findings to justify their actions, materializing what has come to be called evidence-based policies and practices.

However, in science, the definition of research agendas, particularly in Sociology, is inseparable from the visibility of certain social phenomena/problems, paradigms, and established lines of research, but it also obeys to the priorities dictated by funding and political agencies, professional and organizational dynamics, etc. which contributes to shape what, when and where evidence is published. Using a bibliometric analysis strategy, i.e. prescribing thematic and methodological trends and correlations, the presence and absence of research objects, levels, and scales of analysis (Silva, Hayashi & Hayashi, 2011), we propose in this communication to draw up a detailed picture of scientific production in the sociology of education in indexed journals (SCOPUS, WoS, ERIC) over the last 10 years, concerning evidence-based educational practices and policies.

Perceptions On The Training Context In Vocational Education During Covid-19

Anina Rachel Singer

University of Bern, Switzerland

The majority of compulsory school leavers in Switzerland complete trainings in vocational education, with a diverse selection of 250 occupational programs. The Covid-19 pandemic confronted the vocational education and training (VET) system with unprecedented disruptions. The framework of training contexts was transformed profoundly, particularly because apprentices spend most of their time in training firms. Covid-19 and the introduced measures to contain the virus, forced (training) firms to close, work with stronger hygiene rules, cut personnel, work from home, implement short-timework, etc. This paper follows an in-depth, exploratory analysis and aims to answer the questions if and how the perceptions of VET stakeholders regarding the training context during the pandemic changed, by evaluating the impact on both individual and organizational levels. The training context is crucial in the training of apprentices,

323

it includes the recruitment, working climate or firm specific factors that form the setting of training. Training contexts are conditional to examine the quality of an occupational program. The study employs a mixed-methods approach, integrating group interviews with apprentices who completed their vocational training amid the pandemic, interviews with vocational trainers, and a comprehensive survey of a random sample of training firms. This approach captures a comprehensive perspective of the training context across different phases of the pandemic, providing insights into the experiences and adaptations of apprentices, trainers and training firms. Findings using thematic analysis indicate a significant shift in the training context due to Covid-19, leaving lasting impacts on contemporary training practices. Notably, the results suggest a disparity in the perception of stress and uncertainty between apprentices and vocational trainers. Apprentices associate their training context with tension and unpredictability, such as irregularities in staff presence. These contrasts highlight the need for in-depth research into the pandemic's varied effects on VET stakeholders. Furthermore, this leads to learnings for vocational education during times of crises whilst also underlining the existing strengths of the Swiss VET system.

I have never been at an ESA PhD Summer School.

Negotiating Provision for School Choice for a Diverse and Inclusive Society

Delma Byrne

Maynooth University, Ireland

In 2022, the Department of Education in the Republic of Ireland and the Catholic Bishops agreed a process that led to the pilot Schools Reconfiguration Process in eight towns and cities. This agreed process sought to support the transfer of patronage of a number of Catholic primary schools to multi-denominational school provision. Yet, by the end of the pilot process just two out of 63 participating schools transferred their patronage to date. While a rich literature exists relating to how families and young people negotiate school choice in the Irish context, much less understood is how provision for school choice is negotiated nationally.

While the availability of school choice is frequently identified as a market based educational reform that is neoliberal in nature (Apple 2006), in the Irish context more nuance is required. That is, the issue of school choice is not so clear cut in the Irish context as a result of the dominance of the Catholic church in the ownership and management of primary education. As it stands 88% of primary Catholic schools are under private patronage of the Catholic Church.

This paper reports on a research project that used this pilot reconfiguration scheme to better understand how school choice is negotiated in contemporary Irish society. This paper employs a mixed method approach using existing quantitative and textual data, as well as new qualitative data collection across a number of case study sites and with key stakeholders to better understand the network of forces that determine how school choice is negotiated in contemporary Irish society, and how these operate at national and local levels.

RN10 | T06_02: Gender and Education (II)

Barriers to Change in Canadian University Sexual Assault Prevention and Response

Andrea Quinlan[1], Curtis Fogel[2], Elizabeth Quinlan[3]

1University of Waterloo, Canada; 2Brock University, Canada; 3University of Saskatchewan, Canada

The problem of sexual assault at Canadian universities has been well-documented. However, the barriers that campus community members experience in generating changes aimed at better responding to sexual assault has received minimal scholarly attention. This paper reports on a research study employing participatory theatre (PT) to examine sexual assault advocacy and activism on Canadian university campuses and the challenges that students and instructors face in building coalitions to combat campus sexual assault and implement more culturally sensitive, trauma-informed care for survivors. The novel methodology of participatory theatre, which involves the use of theatrical games with participants, was chosen specifically for its unique capacity to reveal the structural antecedents of social problems, such as sexual assault, and the barriers to collaborative action. Grounded in existing literature on the sociology of education, this study examines the corporatization of universities, the growing precarity of the academic workforce particularly for women-identified instructors, and the rise of neoliberal policy-led solutions as impacts on activism directed to sexual assault on university campuses. In so doing, this paper reveals the multitude of barriers to change that campus community members face in doing anti-violence work and considers broader questions about the enduring impacts of the corporatization of higher education on the potentials to truly address the problem of sexual assault on campuses.

Developing Aspirations and Motivations of Low-Achievers in Four School-Contexts: the Impact of SES, Gender, and Immigrant Background

Haavard Helland[1], Thea Bertnes Strømme[1,2]

1Oslo Metropolitan University, Norway; 2NIFU Nordic Institute for Studies of innovation, research and education

This paper investigates students' aspirations and attitudes towards education among young people with a focus on those who obtain an academic qualification in upper secondary education, but with comparably low grades. While numerous studies have focused on either early school

leavers or high achievers, less is known about the educational aspirations of the students in the lower half of the achievement distribution. By using a longitudinal, comparative dataset from Norway, Spain, Belgium, and Iceland (ISCY), we explore how different educational contexts influence the development of students' aspirations and attitudes towards education. We ask how low performing students in academic tracks are developing and expressing their visions of future careers? How are these visions for the future shaped by class, gender, and country of residence? We link our findings with relational and contextual theories that interprets the shaping of young peoples' trajectories in light of sociohistorical, institutional, and cultural structures. Our preliminary findings show that aspirations towards HE are more common in systems where VET are less developed, and these differences seems to widen throughout upper secondary school. Moreover, students in more comprehensive systems become more positive towards school and education while in school, and their grades are less important for this development here than in the other systems. The paper contributes to the wider theoretical and empirical understanding of the 'missing middle' in the literature on youth transitions, and sheds light on how system level features influence future aspirations of this understudied group of students, and how socioeconomic background, gender and grades play into the process.

Gender Gaps in Mathematics and Reading: A Comparison Across Socio-educational Contexts in Europe

Daniel Bianchi-Calero[1], Gabriela Sicilia[2], Leopoldo Cabrera[1]

1Universidad de La Laguna, Spain; 2Universidad Politécnica de Cataluña, Spain

In this communication we address the problem of gender-related educational inequalities in Europe. We aim to show the existence of these gender gaps and their variation between Mediterranean, Central, Northern, Anglo-Saxon and Eastern European contexts, in order to suggest inclusive educational policies in favour of equal learning for boys and girls in reading and mathematics.

Using data from TIMSS-2019 and PIRLS-2021, we compare the performance distributions by gender in mathematics and reading across 30 European countries, with a total sample of 99,000 4th grade students and 3,500 schools. We use a two-stage multilevel model that allows us to identify the main predictors of gender effects in reading and mathematics outcomes by decomposing the variance at the within-school, between-school and between-country levels.

We find striking differences in the distributions of mathematics and reading achievement by gender across social and educational contexts in Europe. Across European countries as a whole, boys tend to perform better in mathematics and girls tend to perform better in reading. However, this hides substantial variability in the size of the gaps: in Mediterranean countries, boys perform better in both mathematics and reading, widening the gap in mathematics

and closing the gap in reading, while in Northern European countries the opposite is true, since girls' performance improves, widening the gender gap in reading and closing the gap in mathematics. Multilevel regressions show that these patterns may be associated with countries' average achievement, socio-economic status and gender equality indices.

The results also show a high variability of gender gaps between schools, pointing to the potential for resilience and improvement in school contexts and education policy to reduce gender gaps in mathematics and reading.

Sex Education: a research from European context to Italian context

Lisa D'Errico, Giuliano Flagiello

University of Naples Federico II, Italy

A global sex education aims at assuring not only physical health but also emotional, mental and social. The method should be positive and based on mutal respect of sexuality. Sexual rights must be guaranteed, protected and satisfyed. The research question is to prove that the lack of presence of SE programs causes a series of negative consequences, not only for the individual growth but for the social impact on the entire community. The initial exploratory analysis of European Context, compared to the Italian one, carried out through a report analysis of prevention of STIs, gender violence and homotransphobia, has highlighted a nonhomogenous reality, which is not careful to the young's needs of accessing information about sexuality. The research is carried out through an online survey, that has collected information on their access, the level of knowledge and the taboos connected to sexuality. The results show that the Italian school is not a source of information. Hence, the interest is to explore the trainers (teachers, principals), in particular of Neapolitan schools, through qualitative interviews basing on SE programs and their personal opinions. The results show an heterogeneous situation in terms of geographic diffusion, providers and objectives. The majority of programs is focused on the prevention of STIs by ignoring how much an holistic SE could be an investment, able to determine a series of positive consequences to the social context, like gender equality, homotransphobic discrimination reduction. It will produce in the subjects a relational ability to respect oneself and others.

Cultural Determinans of the Adult Learning Participation. Testing of the Theory of Cultural Reproduction

Marta Petelewicz[1], Julita Pieńkosz[1], Katarzyna Piotrowska[2]

1Educational Research Institute, Poland; 2Kozminski University, Poland

International research reveals recurrent patterns in participation in adult education, mostly drawing on the level of education, occupation, age or attitude. There is a lack of theoretical framework explaining how cultural factors, especially socio-cultural background, influence participation in adult education (AE).

We investigate the inequality in participation in AE through the lenses of the theory of cultural reproduction. In their seminal work Bourdieu and Passeron concentrated on inequalities within the educational system and significance of the different forms of capital. We assume that analogous relations can be observed in AE.

The key questions are: does the family cultural capital have a lasting impact on educational success throughout life? Does it determine participation in AE?

We used the data from the nationwide, random sample, survey of the Polish population (n=2561), aged 25 – 64 (2020). As we anticipated multivariate associations between the phenomena, with both direct and indirect effects, structural equation modeling (SEM) was applied.

The main hypotheses were confirmed. Higher institutionalized capital of the family: 1. increases the chances to achieve higher level of education and 2. influence embodied capital; and thus, indirectly, influnence the probability of undertaking AE. The influence of the cultural capital of the family of origin is persistent through the life course, on the various stages of educational career. Cultural and educational disadvantages are consolidated and enhanced through the selectivity of AE.

The findings can add to the area of research on educational inequalities, especially to the explanation of the paradox of the unequal demand for lifelong learning, stating that people with a high need, participate less.

Is ADHD A Determinant of Grade Retention? A Case Study of the Flemish Secondary Education System.

Timo Van Canegem

Department of Sociology, Ghent University, Belgium

Students diagnosed with ADHD are at risk of academic underachievement and may face stigmatization due to learning difficulties. The disorder also affects personality attributes such as frustration management, emotion regulation and self-control, leading to school misconduct and a strained teacher-student relationship. As a result, students with ADHD are more likely to face school detention or other disciplinary measures. In Flanders, grade retention can be used as a disciplinary response to misconduct. Hence, it is hypothesized that students with ADHD have an increased likelihood of being retained. Grade retention leads to a three to seven times higher chance of dropping out early, illustrating the need to study its potential determinants. What remains unclear, however, is whether a potential overrepresentation of students with ADHD would be caused by lower academic achievement levels, school misconduct resulting from specific personality attributes, stigmatization related to the diagnosis, or a combination of these factors. Therefore, this study examines whether ADHD remains a determinant of grade retention when accounting for academic performance and school misconduct. Longitudinal logistic regression analyses will be carried out on the Flemish LiSO dataset, in which 6,265 students from 50 schools were followed throughout secondary education over a period of six years (2013-2019). Academic achievement was repeatedly tested in mathematics, Dutch, and French, while school misconduct was based on both self-reported and teacher-reported data. Overall, studying the underlying causes of ADHD as a determinant of grade retention may contribute to the development of more effective educational interventions tailored to students with learning disorders.

Early school leaving: Trends and Challenges Characterizing Academic Production over the Last Two Decades

Liliana Zeferino, Natália Alves

Institute of Education, University of Lisbon, Portugal

Early School Leaving (ESL) is a complex and multifaceted phenomenon that, although not new, remains one of the most pressing political and social concerns in the European Union. The reduction of ESL is a priority assumed by Portugal, whose ESL rates have shown a very positive evolution, decreasing from 50% in 1992 to 6% in 2022.

This article, based on the analysis and discussion of 58 academic works, collected from Open Access Scientific Repositories in Portugal (RCAPP), seeks to answer the following

questions: What conceptions of ESL underlie academic work? What is the underlying theoretical and methodological conception? What new aspects are announced? What proposals for prevention and combat are presented?

The characterization of the selected corpus, the definition of ESL adopted, the research methodological design, and the results and conclusions are addressed. A critical approach is adopted in problematizing the ESL phenomenon, following the thinking of authors such as François Dubet (1994), Philippe Perrenoud (2001), and Pierre Bourdieu (2007), among others. Content analysis is adopted as the data processing technique.

The discussion of the data indicates the predominance of technicist and instrumental conceptions of the phenomenon and few contributions to promoting a broad and comprehensive dialogue in critical ESL research, placing it in a context of different power relations and inequality. Few present concrete proposals for prevention and combat ESL, suggesting the absence of easy or quick answers to this issue.

Second Opportunity School for Social Inclusion in South Italy: a Case Study

Glenda Cinotti[1,2], Serafino Celano[2]

1University of Milano Bicocca, Italy; 2Associazione per la Ricerca Sociale

The contribution will report the results of the evaluation of a project of second opportunity school for NEET in the age from 16 to 18 years, who left the school before the graduation in three cities of south Italy: Napoli, Reggio Calabria and Messina. The project aimed to give these teenagers a different educational path to help them to overcome their scholastic failures and social scripts, building useful skills for their working and relational growth.

The research, based on the Outcome Mapping approach, was oriented to evaluate the outcome of the project among the teenagers involved in terms of life and citizenship skills.

The evaluation used mixed methods including:

– evaluative rubrics computed from the educators and aimed to evaluate the evolution of participants' skills during the project;

– three focus group, one per city involved, with the teenagers and early adults who participated to the activities for two years;

– a survey to all the participants at the end of the project;

– Focus groups with educators.

Further analysis will involve individual interviews to the participants after one year from the conclusion of the project, to see the long-term impact of the intervention.

The main early finding of the research appears to be that forms of education alternative to vertical and theoretical teaching may succeed in the effort of make the teenagers feel supported instead of judged. The research shows in fact that many teenagers involved in the project had the opportunity to overcome their feeling of failure learnt at school and to appreciate the relevance of learning by doing and making mistakes, increasing their self-esteem and confidence in their own abilities. However the evaluation shows also some limits in the extents of these results among the participants and further research need to be done to see the long term impact and analyse the scalability of the model.

The case study aims to offer a contribution in terms of possible suggestions to improve the formal education system in its attempt to prevent students' educational and social exclusion, especially in difficult social contexts.

RN10 | T06_04: Confronting Epistemologies

Digital Harm: Young Poles' Views on the Responsibilities of Big Tech, Governments and Individual Users

Stanislaw Burdziej

Nicolaus Copernicus University, Poland

There is a consensus among researchers that excessive use of digital devices negatively impacts young users cognitive performance and self-esteem, reduces their ability to focus, their satisfaction with own life and achievements, lowers empathy and increases susceptibility to depression and other mental illnesses and disorders. Interestingly, research also shows that young people are increasingly aware of these negative impacts of digital media and are taking various actions to overcome them. In this paper, we report the results of a large and ongoing empirical research project aiming to explore young people's attitudes towards possible institutional solutions. In a series of FGIs and IDIs we explored Polish young people's attitudes towards tech regulation at three different levels: family rules, school guidelines and national legislation. Drawing on the emerging concept of digital harm we ask who do young people hold responsible for their digital addictions: Big Tech? governments? parents? or themselves? And correspondingly, what technological, political and personal strategies do they embrace growing up in the midst of the digital revolution?

Refusing Knowledges, Reclaiming Agency: Examining Various Ways Of Refusing And Resisting Knowledges And Their Various Functions In A Forced Migrant Education Context

Johanna Ennser-Kananen, Hoang Long Hai Nguyen, Venla Rantanen

University of Jyväskylä, Finland

Success at school requires students to acquire different kinds of knowledges, an especially challenging task for students belonging to cultural minorities and having heterogeneous schooling backgrounds. To students who are in the margins of Finnish society only the acquisition of the "right" kinds of knowledge leads to educational success. Knowledges and ways of knowing are constantly being negotiated in school contexts, by both teachers and students. Studying these issues is important because of the il/legitimization of knowledges through coloniality.

This paper will examine the epistemic refusals and resistance of adult forced migrant students in a community college setting. We will explore the different functions and ways students produce resistance and refusal to knowledges. Key

frameworks here are raciolinguistics as championed by Flores and Rosa and other raciolinguists, especially with the focus of rejecting abyssal thinking, epistemic in/justice, and funds of knowledge.

The aims of the paper are two-fold: First to explore the ways students resist and refuse knowledges that are deemed il/legitimate or projected on them, and secondly to provide teachers a framework through which to better engage with students and to provide the students a better learning environment. The paper will use methods of critical ethnography, discourse and thematic analysis.

The data consists of student interviews, classroom recordings, and teacher workshops, collected through 2020–2023, originally for a study to examine legitimacy of knowledges but we found refusal and resistance in addition to the il/legitimization of knowledges.

The Social Construction of Educational Statistics

Tiago Neves[1], Gil Nata[2]

1Universidade do Porto, Portugal; 2Universidade de Trás-os-Montes e Alto Douro

We currently live in a metric society (Mau, 2019), increasingly governed by numbers (Rose, 1991). This expanding measurement culture has had a deep impact on educational practices and processes (Biesta, 2009): from rankings (Sauder & Espeland, 2009) and the associated "terrors of performativity" (Ball, 2003) to the role played by International Large-Scale Assessments in educational policies, curriculum, and pedagogy (Addey et al., 2017). A "numerocratic power-knowledge regime" emerges (Angermüller, 2010) as we witness the growth of a "cult of quantification" (Mau, 2019). In this context, it is no surprise that a common reaction to educational statistics is to take figures at face-value, as relatively straightforward answers to given questions. To be sure, the emergence of such a scenario does not take place without resistance and critique. Opponents of this status quo claim that statistics are incapable of making sense of the richness and complexity of the educational world. In any case, there is an absence of analyses that pay attention to the nitty-gritty of how those statistics are produced. In this presentation, based on a mixed-methods approach to the Portuguese case, we explore the modes of production of crucial educational statistical rates: retention, dropout, and grade inflation. We consider both the formal, conceptual definitions of the three phenomena, and the ways in which data are created, collected and processed in order to ultimately produce the statistics. We show how, incentivised both by political and market rationales, educational actors tend to adhere to the system, even if that requires gaming the numbers.

RN10 | T06_05: Digital Technology and Education (III)

Perceptions and Attitudes of the Students of Babeș-Bolyai University Towards Online, Face-to-face, and Hybrid Learning During the COVID-19 Pandemic

Júlia Szabó[1], Réka Geambașu[2], Éva László[3], Valér Veres[4], Anamaria Bogdan[5]

1Babeș-Bolyai University, Romania; 2Babeș-Bolyai University, Romania; 3Babeș-Bolyai University, Romania; 4Babeș-Bolyai University, Romania; 5Babeș-Bolyai University, Romania

This paper presents the findings of an exploratory sociological survey conducted at Babeș-Bolyai University of Cluj-Napoca focusing on student experiences during the COVID-19 pandemic. The paper aims to investigate student experiences and attitudes toward different modes of education. Our research goals were to evaluate students' perspectives on online, face-to-face, and hybrid teaching activities, to assess the challenges they faced, to group students into clusters based on their attitudes toward online learning and to identify those factors that shape student experiences and preferences. The study utilizes cluster analysis as a methodological approach to categorize students into three groups according to their preferences for teaching modes: (1) "Balancers" (43.5%) favored a blend of online and in-person classes, (2) "Onliners" or "screenagers" (28.9%) preferred online courses, as opposed to (3) the adepts of face-to-face learning (27.6%).

In spite of its challenges online teaching was preferred by nearly 30% of the students, among whom those pursing their masters' degrees, and young people coming from lower status families and thus already in employment, were overrepresented. Their experiences and attitudes show that these students have indeed developed effective strategies for online education. In opposition to those who preferred face-to-face classes "onliners" were more likely to show satisfaction with their teachers, more likely to be better equipped for online courses and also to have passed the exams. With these results the article contributes to the scholarly and expert debate concerning the possible effects of the flexibilization of higher education upon students' access to tertiary education.

Growing Digitalization In Schools And Its Impacts On Social Exclusion And Education Equality Issues: A Systematic Review

Noel Clycq, Irene Landini

University of Antwerp, Belgium

In the wake of the Covid-19 pandemic, the reliance on digital devices and digital interactions and learning started becoming a common practice in several schools across Europe. On the one hand, digitalization is found to bring several advantages (Helm et al., 2021). On the other hand, we also find indications that the advantages brought by digitalization are unequally distributed across pupils and families. However, we still miss a conceptual framework mapping the diversity and characteristics of existing digital initiatives as well as their different impacts on social exclusion and education equality issues.

This article addresses this research gap. The study brings together the body of academic work on digitalization and education in a systematic literature review and extracts an array of cases. We pursue two main objectives. First, we aim at distinguishing different types of digital initiatives in the education domain, notably within public schools. We pursue that by regarding the selected cases through a conceptual framework based on the initiatives' target groups (pupils, parents, families), needs pursued (e.g., learning, student-teacher interactions, family-school interactions, or others) and specific type of digital tool used (e.g., WhatsApp/Telegram chats or similar, emails, online meetings though online educational platforms, ext.). Secondly, we intend to outline the main impacts of digitalization on social exclusion and education equality issues, based on the main findings in the cases extracted from the literature. Building on the article's results, we will eventually identify avenues for further research in the domain of sociology of education interested in digitalization and education.

Incorporating Generative AI in Student Assessment: What Learning Practices and Outcomes are Worth Pursuing in the Age of AI?

David Anzola

University College Dublin, Ireland

Generative AI has taken the world by storm, forcing us to rethink our practices in a variety of settings, including education. Because of AI's capabilities and its relatively sudden popularisation, the education system has disproportionately centred on how to preserve the curriculum while avoiding plagiarism. This approach, however, is unsustainable, first, because universities should prepare students for a labour market that will heavily rely on AI and, second, because of the technical difficulties in keeping this technology away from pedagogical practices (particularly, assessment).

This paper reports on the findings from an alternative assessment practice implemented in the module 'AI & society', taken by students in two MSc programmes at the intersection of social and data science. In their final assignment, students were asked to select a topic in which they felt they had expertise and assess the input-output connection during their interaction with a chatbot. The exercise offered insights on five main levels: (i) the role of personal expertise in judgements of adequacy and the identification of hallucinations, (ii) the significant quality variations in AI's output, (iii) the need for robust and dedicated training in prompt design, (iv) the uncertainty about users' cognitive positioning in their interaction with the technology, and (v) the challenge posed by bias to both users and future generations of AI. Beyond the context of this assessment, it will be argued, these insights can inspire alternative teaching and learning approaches that explicitly incorporate AI into the curriculum in a pedagogically fruitful manner.

Digitalization in Education: Unveiling New Forms of Inequality in the Spanish setting.

Albert García-Arnau[1], Susana Vázquez-Cupeiro[2]

1Universidad Complutense de Madrid, Spain; 2Universidad Complutense de Madrid, Spain

This proposal, part of the HORIZON 2020 project "PIONEERED: Pioneering Policies and Practices Tackling Educational Inequalities in Europe," examines the emerging educational inequalities stemming from the digitization of education, with a focus on Spain. Utilizing a qualitative methodology, this study engages with key stakeholders in the Spanish educational sector to explore the multifaceted impacts of digitalization on educational equity.

The rapid digitalization of education presents both opportunities and challenges. While it offers innovative educational practices, it also introduces new forms of inequality, particularly in educational equity. This research, informed by the PIONEERED project, incorporates life course analysis and intersectionality to analyze these inequalities within the European context.

Through interviews, focus groups, and workshops with a diverse range of education stakeholders in Spain, the study delves into the specific challenges and inequalities of digital education. Critical Discourse Analysis, enriched by life course and intersectional perspectives, is employed to understand how digital education inequalities manifest across different life stages and intersect with various social categories such as gender, race, and socio-economic status.

The findings reveal that digitalization in Spanish education leads to evolving forms of inequality, impacting different social groups in varied ways. These disparities are dynamic, changing over an individual's life course and are influenced by multiple intersecting factors.

The study underscores the necessity for policies that acknowledge the dynamic and multifaceted nature of educational inequalities in the digital era. Policymakers are urged to develop comprehensive strategies that go beyond providing equitable access to digital resources and literacy, addressing the complex realities of all students, and ensuring a more inclusive digital educational environment.

RN10 | T07_01: Curriculum Innovation and Development (III)

Against Entrepreneurship: Education, Nations, and Inequalities

Kirsty Morrin

University of Liverpool, United Kingdom

In this paper I unpack a series of conceptual, historical, and spatial understandings of 'entrepreneurship', and its relationship to education. The paper traces the changing uses and meaning of entrepreneurship over time. It explores entrepreneurship as a conceptual term, a vocational practice, and an emplaced policy initiative in educational settings. Empirically, I explore the ways in which entrepreneurial discourse marbles its logic through educational institutions in material, symbolic, and practical ways. I trace these entrepreneurial logics throughout the history of mass public education in England, the current academised system, and extend this to other global contexts. I argue there is a 'new' spirit of entrepreneurship in education, and building on Sennett's intervention to see entrepreneurs as a form of 'ideal everymen' [sic], Entrepreneurship I suggest, has become the 'ideal everynarrative' in formal educational discourse. Thinking beyond education, I consider the connected entrepreneurial public discourse, as one that reveals contradictory understandings of the term, conceals precariousness, and reproduces inequalities. The paper concludes by calling for a move against the current discourse for entrepreneurial initiatives in education, and instead suggests the need for broad and critical public conversations about its repeated failures.

The Lasting Heritage of Improved Teacher-student Relations in Middle School

Gianluca Argentin[1], Giulia Assirelli[2], Tiziano Gerosa[3], Matteo Moscatelli[2]

1Università di Milano Bicocca, Italy; 2Università Cattolica del Sacro Cuore, Italy; 3Scuola universitaria professionale della Svizzera italiana, Switzerland

Research on school effectiveness highlights the crucial role that teachers play in determining student achievement. However, prior studies failed in explaining the sources of this effect. The OpenTeQ project integrates economic, sociological, and pedagogical perspectives to test whether teachers' relational skills contribute to their effectiveness and whether these skills can be enhanced through large-scale interventions.

In the school year 2016/2017 we implemented a professional development intervention for lower secondary school teachers focused on the improvement of their relational skills. To evaluate the impact of the intervention we designed a cluster randomized controlled. Results showed a statistically significant improvement in teachers' self-efficacy and in students' interest and achievement in the main subjects (Italian and Mathematics).

Now, thanks to the availability of administrative data tracking students until the 2022/2023 school year (i.e. the end of the upper secondary cycle), we can evaluate the long-term effects of the intervention. Preliminary results show that the light-touch intervention developed during the lower secondary cycle still exerts its effect in the long run: treated students are found to more often enroll in the academic track (i.e. licei) and to better perform in the main subjects, as they register higher marks in Italian and Mathematics. These results not only confirm that teachers' relational skills are a relevant leverage for teachers' effectiveness, but also that light touch interventions can produce relevant long-lasting impacts.

Examining Dialogic Literary Gatherings (DLG): A Comprehensive Review of Evidence for Addressing Social and Educational Inequalities

Lidia Bordanoba, Paula Cañaveras, Carla Jarque

University of Barcelona, Spain

331

Introduction:

This systematic review examines the impact of Dialogic Literary Gatherings (DLGs) on social and educational inequalities (Ruiz-Eugenio et al., 2023). Analyzing 46 articles from 2010 to 2021, it highlights DLGs' role in fostering dialogue, overcoming barriers, enhancing self-improvement, and promoting social cohesion in different environments. The review highlights DLGs' potential for improving linguistic skills and values, offering valuable insights for educational research, practice, and policymaking. This communication responds in particular to the challenges addressed by RN10 1 (inclusivity), 5 (holistic education) and 6 (social justice).

Theoretical Framework:

Rooted in the dialogic learning principles of Ramon Flecha (2000) and drawing from the works of Bakhtin (2010), Bruner (1990), Freire (1970), Vygotsky (1978), among others, DLGs foster collective meaning construction through dialogue, cultivating critical thinking and interpersonal engagement.

Methodology:

The systematic review examines DLGs' impact on individuals of various ages and settings. It addresses seven key questions concerning dialogue, learning, and social cohesion. Following PRISMA standards, evidence from qualitative and quantitative inquiries offers a systematic assessment of DLGs' effectiveness in diverse contexts. Rigorous analysis is maintained through triangulation, ensuring comprehensive scrutiny.

Results:

Findings indicate DLGs foster egalitarian dialogue, break isolation, and promote mutual respect. Participants, including children, adolescents, adults, and prisoners, report enhanced communication skills, increased self-esteem, and improved attitudes towards learning and reading. DLGs also challenge stereotypes and foster non-violent coexistence. Moreover, they extend their impact beyond participants, influencing communities and shaping future aspirations. Examples include reduced recidivism rates in prisons and individuals pursuing higher education or community engagement post-participation.

How to Teach about Democracy? From a Curriculum Framework to Practice-based Approach to democracy in Poland

Paulina Sekuła, Marta Warat, Barbara Ostafińska-Molik, Inga Hajdarowicz

Jagiellonian University in Krakow, Poland

In recent years, the phenomena such as the citizens dissatisfaction with democratic processes, political inefficacy, low levels of trust, accountability and trust in governments, the rise of the far right, Eurosceptic antiimmigrant movements in Europe has directed attention to the crisis of democracy. While looking for possible remedies to democratic deficit, the education for democracy (EfD) has been identified as a possible tool to revive democratic approach and practices, equipping citizens with skills and knowledge necessary for civic and political engagement.

Based on the example of Poland, this presentation discusses how education can facilitate democratic behaviour and attitudes. We examine the tensions between the curriculum of education for democracy, as well as the further educational policies, and the practices of teachers, educators, and trainers who are members of the DEMOCRAT Living Lab created under the framework of the DEMOCRAT Horizon Europe project. We will, firstly, focus on the reported practical challenges in teaching EfD based on a comprehensive but theoretical curriculum covering the essential values and elements of EdF, but with little official support on the practical and participatory approach. In this context, the role of Living Labs as platforms for knowledge and practice exchange as well as for co-creating new and innovative educational approaches and tools. Secondly, we will capture different visions formulated by the practitioners of how democracy should be taught to facilitate the growth of democratic knowledge and practices.

RN10 | T07_02: Gender and Education (III)

Schooling Masculinities: Examining the shifting gaze on boys' bodies in Covid conditions

Michael Kehler, Gabriel Knott-Fayle

University of Calgary, Canada

The recent pandemic was a powerful and unsettling time for youth. Students were confronted with unfamiliar and challenging learning conditions that for many have had enduring consequences. This paper provides insight to the ways that a group of boys navigated the conditions that resulted from in-school and out of school pandemic restrictions. Drawing on a 6 month, funded, qualitative study conducted during Covid 19 in Alberta, Canada, we examine the impact covid conditions had on how boys negotiate masculinities in and out of school. With interview data from 10 adolescent boys and 5 parents, our research deepens understandings of situational masculinities and the respatialization of schooled masculinities. While conventional schooling conditions are well known for the disciplining gaze or the "tyranny of surveillance" of boys by boys, we consider the shifts in surveillance practices that result from covid learning conditions in public and private spaces. We specifically examine the tensions between public and private spaces and the role that surveillance and the panoptic gaze had for a group of adolescent boy's abilities to renegotiate performative enactments of normative masculinity. We consider the emergent expressions of masculinities and the ways that shifting covid regulations influenced and informed the daily expressions of masculinities. This research extends previous work that has questioned boys' self reflexive practices and in doing so offers insight to how boys reconfigured and reframed masculinities in what has historically been a limiting and limited context for disrupting normative masculinity.

The Role of Roma Women in Education During the Covid-19 Pandemic in Spain

Ane López de Aguileta, Lena de Botton, Adriana Aubert

University of Barcelona, Spain

Introduction:

Scientific literature has shown that the Roma population, particularly Roma women and girls, is subject to low educational expectations of them. Furthermore, some scientific study characterizes these women as meek and passive agents who do not change their circumstances and are unconcerned with their own or their children's education. Other research demonstrates that the disadvantages they

332

and Roma families faced in terms of access to excellent education were exacerbated during the pandemic. However, scientific evidence has also shown a Roma women's activism who are working to improve their situation and their communities'. However, there is a research void in the analysis of Roma women's activism during the Covid-19 outbreak in terms of educational outcomes.

Methodology:

Employing the communicative methodology, pioneer in the requirements of social impact and co-creation in the main research programmes, six women's focus groups and 30 life stories were conducted. In total, participants included 47 Roma women and 33 Roma men from three different Spanish autonomous communities. In addition, semi-structured interviews were conducted with 30 professionals working in the fields of education, social services, and civic organizations. This research is embedded in the ROM21 I+D+i project.

Results:

Despite feeling abandoned by certain educational centres, it was these Roma women who were most attached to the educational centres who were agents of change in their communities in terms of family education in the studied contexts. The research examines how these Roma women were empowered through resistance methods created in collaboration with their communities and specialized educational actors with positive results in the access to quality education of both their children and them.

Gender Differences and Key Predictors of the Intention to Leave Teaching Profession

Đurđica Degač

University of Zagreb, Faculty of Humanities and Social Sciences, Croatia

Relatively low social status, inadequate financial compensation for work, ageing of the teacher population and the feminization of teaching profession are some of the challenges that EU countries face in the field of education. Moreover, the shortage of teachers and teacher attrition noticeable in some countries appear as important educational and social issues, but also specifically a gender issue in the context of gender imbalances in the teaching profession and wider gender (in)equality in the workforce. Under the assumption that teacher shortages and high turnover lead to a decline in the efficiency of schools and their provision of quality education to citizens, addressing teacher attrition and gender differences in a feminised profession presents itself as a relevant social issue with repercussions beyond the education system. This paper, based on survey research conducted on a sample of upper secondary school teachers in the Republic of Croatia in 2024, examines key structural, institutional, interpersonal, and individual-level predictors of the intention to leave the teaching profession. Additionally, it explores gender-specific models explaining the intention to leave. Preliminary results show that lower levels of teachers' professional identity, job satisfaction, and work-life balance, combined with a higher level of perceived job opportunities, increase the likelihood of the intention to leave the teaching profession. The findings indicate gender disparities in certain factors such as work-life balance and intrinsic motivation, while no significant differences were observed in some of the anticipated predictors. Based on the research findings, practical social and education-related consequences and implications are investigated.

RN10 | T07_03: Expectations, Aspirations and Choices (I)

Tension and Affect in the Educational Decision-making Processes of Danish Lower Secondary School Seniors.

Lise Ulrik Andreasen

Aarhus University, Denmark

Despite initiatives aiming to enhance social mobility through education, Danish society encounters growing divisions based on factors such as gender, ethnicity, and social background. Young people in their final years of secondary school grapple with a crucial choice of future education, which is amplified by the increased importance of education in Danish society today. This presentation is based on continuous fieldwork in two schools in a Copenhagen suburb, where I focus on how young people's perception of themselves and others – in short, their social and affective imaginaries – shape their educational orientations and aspirations for the future. The presentation engages with empirical emergences of tension and affective discomfort linked to secondary school students' considerations of the local high school. This high school enrolls a significant number of students from a Muslim minority background, and the presentation delves into the ways in which young people manage conflicting emotions and tensions regarding their anti-racist awareness on one side and their reluctance towards attending the nearby high school on the other. As the concept of educational choice (Reay et al, 2005) becomes pervasive in the concluding years of school, it is intricately woven into everyday life becoming of young people. Emphasizing peer relations and the significance of how emotions "circulate and stick" (Ahmed, 2004), the presentation seeks to unravel the complexities surrounding affective dynamics of racialized othering and their role in shaping the educational trajectories of young people.

Can Public Bilingual Education Programmes Reduce the Rural-urban Gap in English Learning in Spain? The Case of Andalusia

Alberto Álvarez-Sotomayor[1], Juan Miguel Gómez-Espino[2]

1University of Córdoba, Spain; 2University Pablo de Olavide, Spain

Over the last two decades, Spanish-English bilingual education programmes based on the CLIL approach have expanded greatly in Spain. One of the declared aims of these programmes was the democratisation of the learning of English. Paradoxically, after these years, its supposed elitism has become one of the main criticisms. Yet, the equity implications of bilingual programmes have not been sufficiently analysed in empirical terms. In this sense, the rural – urban dimension has been particularly understudied. This study aims to contribute to filling this gap by analysing: (1) how both primary and secondary 'bilingual schools' are spatially distributed across this dimension; and (2) the effect that the 'size of the municipality' variable has on the probabilities of schools offering a bilingual programme.

We take all the schools offering either primary education (N=2,543) or compulsory secondary education (N=1,603) in the self-governing region of Andalusia. We run cartographic and statistical analyses (bivariate and multivariate) of geographically referenced data that have been previously processed using a Geographic Information System (GIS).

Cartographic and bivariate analyses show that bilingual schools are mainly concentrated in larger municipalities. Therefore, families residing in smaller municipalities have far fewer opportunities for their children to receive this type of education. Results from multivariate analysis show that this disadvantage of smaller municipalities has to do with the low presence of subsidised-private and private schools in these areas and with the much lower availability of this bilingual model within the state-run education system. Rural schools therefore face a new element of educational inequality.

Demands, Expectations And Perceptions Of Families From Different Social Classes About 0-3 Years Early Childhood Education in Spain.

Manuel Ángel Río Ruiz, María Ortega Gómez

University of Seville, Spain

Evidence on the impact of Early Childhood Education (ECEC) on improving educational outcomes promotes agreement, rarely seen in the European education policy field, to enhance educability in ECEC, especially for vulnerable children. However, although there are studies that identify family economic barriers, ECEC research rarely generates sufficient knowledge of a key aspect for the ECEC policies success: what are and how are the perceptions, expectations and ideologies of childcare and educability that families from different social class project onto ECEC services?

In the case of Spain, we hardly know how families from different social classes, exposed to different social constraints and influences, internalise and value the educational character that expert groups grant to ECEC, something that affects the family strategies applied and the family-school relationships.

The aim of this paper is to analyse convergences and divergences between the discourses of mothers from different social classes about ECEC, fundamentally what is considered by families to be quality ECEC and what positions they adopt (of adherence, distance, modulation, strategic re-appropriation) with respect to legitimate pedagogical discourses on ECEC. To this end, 39 interviews with mothers from the working classes, but with different educational levels, and 3 focus groups with 17 university mothers from

334

the professional middle classes with children aged 0 to 3 years old, were analysed. Our findings suggest, among other things, that the weight of pedagogical reasons in ECEC assessment and decision-making varies according to the family's social class.

Accounting For Taste: Uncovering The Learner-Learning Relationship Through Young Students' Taste For Learning

Paula Arboix Caldentey

Autonomous University of Barcelona, Spain

The rhetoric of the knowledge society has produced a common thought about the global significance of education (Ule et al., 2015), revealing its crucial role in perpetuating social inequalities (Bourdieu & Passeron, 1977). Understanding the relationship young people develop with learning is crucial in comprehending the construction of school experiences, learner identities, and subsequent educational trajectories among students (Tarabini, 2022).

Hence, exploring the intricacies of this learner-learning relationship remains imperative. This paper focuses on the Bourdieusian (1987) notion of taste as a mediating factor to understand the students' relationship with learning. It particularly analysis how the taste for schooling and the taste for learning is constructed in different social and school contexts, expanding the sociological understanding of the production of taste in the school field. Certainly, since taste is still linked to the ideology of 'natural gifts' (Bourdieu & Passeron, 1977), uncovering the social mechanisms that influence taste remains a significant sociological task, which is crucial for a better understanding of how educational inequalities are perpetuated.

This presentation argues that, just as taste for cultural consumption places individuals within (dis)advantaged positions in the social system, taste for learning similarly places learners within the educational field. The paper aims to explore how this learner-learning relationship is shaped through young people's likes and dislikes about their school experiences, in order to promote a fairer experience for all of them. To this end, the presentation, of theoretical nature, introduces an analytical model and methodological approach for examining the 'taste for learning', addressing its dimensions of what, how, where and with whom learning occurs.

RN10 | T07_04: Parental involvement with school (I)

Opportunities and Challenges for Teachers and School Support Staff Collaborating with Parents

Cintia Csók[1,2], Zsófia Vincze[1,2], Gabriella Pusztai[1,2]

1University of Debrecen, Hungary; 2MTA-DE-PARTNERS

There is a consensus in the literature that neither school nor family can be successful without the support of the other (Epstein et al. 2001, Paseka-Byrne 2019, Gerdes et al. 2020). However, the majority of teachers do not see the development of parent-school partnerships as a key task. According to PISA 2018 data, the Hungarian education system's performance in this area lags behind the OECD average. The changes following the pandemic and the challenges of working with parents from different social backgrounds and linguistic and cultural minorities make it particularly important to ask what factors influence parent-school cooperation and how teachers' competencies in this area can be strengthened. Qualitative research methods have been used to investigate school professionals' views and beliefs on parent-school relations. Quotas were defined for selecting school actors structured by county, school type, school provider, and career stage in the three most disadvantaged counties of Hungary. In this presentation, we present the results of the analysis of a large text database (N=60) based on focus group interviews with teachers and school support professionals. The analysis, based on grounded theory, was carried out using ATLAS.ti software. Our findings have enabled us to identify several factors (parental SES and racial-cultural background) that may influence the perceptions, preparedness, and effectiveness of teachers and school support staff in this area.

School-friendly Parents? Characteristics of Parental Involvement in Vocational Schools in Hungary

Anett Rusznák[1,2], Zsófia Kocsis[1,2], Gabriella Pusztai[1,2]

1University of Debrecen, Hungary; 2MTA-DE-PARTNERS Research Group

The parental involvement and its positive effect are the subject of numerous studies, most of which focus on parents of pre-school and primary school aged children. There are fewer studies that focus on vocational school. In Hungary, the social status of families in these schools is low, but the drop-out rate is high especially in vocational schools, which does not provide certification for admission to higher

335

education.It is particularly important to analyse the extent to which parents are treated as partners in vocational schools. The data collection is entitled The Relationship between Family and School from the Parents' Perspective. In 2022, we surveyed parents whose children attend one of the various levels of education from all school sectors (N=1000), but we focus on vocational secondary school (providing a high school diploma) and vocational schools (not giving a high school diploma). Findings have shown major barriers to parent-school contact. (1) Students from lower strata become independent sooner and do not want their parents to participate in school programs; (2) low SES parents feel uncomfortable at school (3) barriers are mostly related to parental way of life as well as cultural difficulties. The parents reported poor parent-child communication with regard to school life, further plans, and leisure time. In vocational schools, the parental involvement is less intense. This may be a risk factor, as these schools tend to recruit students from low socio-cultural backgrounds, so it would be important to involve parents, which would even have an indirect positive impact on performance.

La Socialización Familiar De Los Adolescentes En Andalucía

Mª Dolores Martín-Lagos López[1], Mónica Luque Suárez[1], Mª del Carmen Olmos Gómez[1], Alberto Álvarez de Sotomayor Posadillo[2]

1GRANADA, Spain; 2CÓRDOBA, Spain

En esta comunicación se quieren presentar los principales resultados de un proyecto de investigación financiado por CENTRA (Junta de Andalucía) sobre la socialización de los adolescentes en esta comunidad. Se trata de un estudio cualitativo con tres fases de trabajo: entrevistas a padres/ madres y/o tutores sobre el modo de socializar a sus hijos/ as. En segundo lugar, grupos de discusión con jóvenes que han sido adolescentes recientemente explicando su proceso de socialización. Finalmente, devolución de resultados y encuentro con expertos en diferentes áreas relacionadas con la adolescencia. El marco teórico parte de la adolescencia reflejada en los medios de comunicación como una adolescencia en riesgo y delitos. En esta comunicación se presentan los resultados del análisis de discurso de los progenitores. Las temáticas abordadas han sido trayectoria previa a la adolescencia, estilos educativos, alimentación, emociones, entre otras cuestiones. Resulta interesante el tipo de hogar y de familia en la explicación de la relación con sus hijos e hijas así como determinadas emociones alrededor del proceso como miedo o culpa.

Parental Involvement in Academic and Sport Achievement

Gabriella Pusztai, Klára Kovács

University of Debrecen, Faculty of Arts, Hungary

According to previous research, the positive impact of parental involvement on academic achievement was revealed. However, little is known about how parental involvement in sports activities of their children contributes to careers in sports and school. This presentation is about the differences in academic achievement, participation in sports activity, and sports results among students of parents involved or not involved in sports. In this research questionnaire survey was conducted among 7th and 8th-grade students learning in three primary schools in a Hungarian city (N = 121). Based on the parental involvement scale, three groups were differentiated, cluster and factor analysis, a Chi-square test and ANOVA, and linear regression were used. According to our results, children of parents involved in both sports and education are overrepresented among students who received awards because of their sports performance, among members of sports talent management programs, and among those who achieved first place in national sports competitions. On the contrary, the highest percentage of children of parents involved in education belongs to those who were given awards for excellent academic achievement. Regarding personality traits, obsessive passion (OP) is the most characteristic of students with non-involved parents and the least characteristic of children with parents involved in education. Belonging to both groups with involved parents can be considered a negative predictor of OP. In conclusion, it can be detected that there exists a positive interrelation between parental involvement in sports and education, and the academic and sports performance of their children.

Coping with Online Hate Speech Through Collective Intelligence in Children and Adolescents

Tatiana Íñiguez-Berrozpe, Francesco Marcaletti, Carmen Elboj-Saso, Pablo Bautista-Alcaine, Ana Cebollero-Salinas

University of Zaragoza, Spain

Minors are familiar with the hate speech that takes place on the Internet, becoming involved in it not only as spectators but also, and more seriously, as victims or aggressors. This is why the scientific literature has begun to ask about possible educational strategies for preventing and dealing with this problem in the virtual environments in which minors interact. This paper presents the results of several experiments carried out using Collective Intelligence software, with the participation of n.= 560 Spanish children and adolescents (10-16 years old). This technique aimed to make minors reflect on how to face this problem and prevent their participation in it, all through the knowledge that arises from the group, not individuality. The results show that as long as we create optimal working conditions, a community of individuals is more intelligent than the most intelligent of them, and a group of people perform an intellectual activity more effectively than one person alone, in this case through a Collective Intelligence platform. In this sense, this research shows, using a One-factor ANOVA with repeated measures analysis, that a large group of children and adolescents were able to improve their level of moral reasoning when addressing a case of hate speech and a case of social comparison (including hate speech) through an experimental design based on this type of intelligence. This result may have relevant socio-educational implications for preventing and coping with this problem, applying this model to specific strategies.

Should We be Worried about Violent Extremism Ideation among Faculty Members in Pakistani Universities

Faryal Razzaq[1], Sana Ashfaq[2], Muhammad Bin Ashfaq[3], Amna Siddiqui[4], Glenn Muschert[5]

1Karachi School of Business & Leadership, Pakistan; 2Islamabad Medical & Dental College, Pakistan; 3Rawal Institute of Health Sciences, Pakistan; 4The FEEEL (PVT) LTD; 5Khalifa University, UAE

When hiring faculty members in Pakistani universities, there is seldom a screening for violent and extremist tendencies. Faculty here influences and serves as role models for students. Likewise, when extremist views or sensitive issues surface in the class, there is a dire lack of faculty training to mitigate or address these concerns. Previous research has indicated a variable but notable inclination of Pakistan's university faculty towards extremist ideologies and violent extremism (VE). This study assessed the value and belief system that the faculty possesses in line with the national interest of countering VE in light of social problem theory. Without a nationally accepted anti-terrorism narrative, we utilized a mixed-method approach to come to a data-driven consensus on an accepted over-the-board academic narrative for anti-terrorism in Pakistan while generating a dialogue on a set of beliefs, causes, and concerns about VE. We conducted thematic analyses from online and in-person qualitative interviews with the faculty and administration in Higher Education Institutes (HEIs) and quantitative analyses for their violent extremism beliefs and emotional intelligence (EI). The results showed a significant negative correlation between lower EI and extremism and violent risk ideation. The study findings and interviews were instrumental in creating policy recommendations for HEIs, which revealed the need for capacity building of faculty and a thorough screening during the hiring process. After analysis of the qualitative data, researchers can suggest a coherent anti-terrorism narrative in the academic context. Moreover, the study also revealed an in-depth look into the perceptions about terrorism in a larger context of how VE and religious affiliation affect the psychological state of faculty in the Global South.

337

How Do Teachers Deal with "Education for Sustainable Development" (ESD) for a Socio-Ecological Transformation? Between Political Demands and School Practices.

Johanna Weselek

University of Education Heidelberg, Germany

In 2015, the "2030 Agenda" (UN 2015) was adopted by the United Nations. The central goal is the socio-ecological transformation. The 17 "Sustainable Development Goals" (SDGs) formulated therein provide an important political orientation for dealing with global challenges. Education, and in particular "Education for Sustainable Development" (ESD), are considered to be of great importance to achieve the global sustainability goals. Its relevance is emphasized even more in the current UNESCO program "ESD for 2030" (UNESCO 2020). In my presentation I will provide detailed insight into the challenges of implementing ESD in schools. My analysis is based on a qualitative reconstructive study with the help of the documentary method. I conducted 20 group discussions with teachers in Germany in order to to interrogate how they understand "sustainability" and how they approach ESD in their daily school business. My analysis reveals a dominance of the environmental aspect in the school sustainability discourse and a focus on individual

responsibility in the form of resource-conserving behaviour. Despite being anchored in the curriculum, whether and how ESD is addressed depends on the commitment of individuals. In addition, my results also show that sustainability is understood as a question of awareness, and that there is a strong tendency of reproducing existing social conditions due to a class-specific view of sustainability. In my presentation I will give a critical account of these findings and compare them with other national and international studies on the current implementation of ESD.

UN. (2015). Transforming our world: The 2030 Agenda for Sustainable Development. General Assembly. A/RES/70/1. United Nations. https://www.un.org/ga/search/view_doc. asp?symbol=A/RES/70/1&Lang=E

UNESCO. (2020). Education for sustainable development: A roadmap. #ESDfor2030 #BNE2030. UNESCO. https://documents-dds-ny.un.org/doc/UNDOC/GEN/N15/291/89/PDF/N1529189.pdf

The Role of Schools in Promoting the Ecosocial Transition. A Look at the Map on Sustainability Practices in Barcelona.

Santiago Eizaguirre Anglada[1], Javier Vergel[2], Marina Elias[3]

1University of Barcelona, Spain; 2University of Barcelona, Spain; 3University of Barcelona, Spain

The role of schools in promoting ecosocial transition practices is critical. This includes not only how schools foster environmental education in the curriculum but also how, in doing so, they move towards forms of participatory governance that have in their principles degrowth economics, ecofeminist approaches, and social inclusion policies. In this paper, based on the data generated in the context of the ECOSOCITIES project and explicitly on the map "Escoles + Sostenibles" from the Ajuntament of Barcelona, we ask ourselves about the nature of the ecological transition practices that schools promote. We observe how schools' ecological practices may be a clue to fostering new public policy instruments for economic well-being, the fight against social inequalities, and the fostering of community resilience. In this sense, we observe the different intervention agencies through which schools can work to promote transition dynamics (in the classroom, in school cloisters, through the associations of children's relatives, through work platforms with other schools, through municipal plans for the development of educational environments, or in within professional teacher associations). We approach a broad diversity of experiences, such as improving the pacification of cities, green paths or the physical environment that leads to school; the enhancement of the community ecosystem of the territory and its expanded education opportunities; the work on eco-dependency, the custody of biodiversity and the claim for air quality; or the impetus geared by gender commissions that work around the comprehensive rethinking of the forms of structural violence within school organisations.

RN10 | T08_02: Inclusive Education (I)

When The Inclusive Education Principle Turns Into Professional Paradoxes For Teachers: A Field Study In Primary Schools In Turkey

Metin Cevizci

Acıbadem University, Turkiye

In Turkey, the inclusive education principle appeared in the 1990s to organize the school life of certain groups of disabled children. However, although specialists in educational studies contribute to a normative bibliography that summarizes the ideal principles of inclusive education, it rarely becomes the subject of sociological research. Based upon a field study conducted between November 2018 and January 2020 in nine primary schools in Istanbul, with 74 interviewed actors (teachers, psychological counselors and parents of children with dyslexia and/or ADHD), in order to understand the medicalized definition and treatment of learning difficulties in terms of cognitive disabilities, this communication aims to review the experiences of teachers with the inclusive education. In the absence of institutional tools and efficient school arrangements, teachers find themselves in professional paradoxes to welcome disabled children into their classroom that can be summarized in three dimensions. On a perceptual level, teachers face the injunction to include children with disabilities while they find themselves among the main actors who externalize learning difficulties by reducing them to a neurocognitive problem redefined in terms of disabilities and attributing responsibility to medical actors. On a practical level, the principle of inclusion is not supported by practical institutional arrangements. Teachers find themselves obliged to assume the communication task (with parents, psychiatrists, rehabilitation centers and other actors) while the different actors involved in this process rarely communicate with each other. On an ethical level, reduced to the question of disability, the principle of inclusion constitutes for many teachers the antonym of social justice because to take care of these children in the class, they see themselves obliged to renounce others who would also need special interest.

338

How Can Social Capital Become a Facilitator of Inclusion?

Anett Hrabéczy, Tímea Ceglédi, Katinka Bacskai, Gabriella Pusztai

Parent-Teacher Cooperation Research Group of Hungarian Academy of Sciences & University of Debrecen

Students with special educational needs are a diverse group. Promoting their learning success is particularly challenging,

even in practice for inclusive schools. At the same time, parents are often left alone with diagnosis and treatment. Therefore, the focus of the presentation is on the families of successful students with special educational needs and the networks around their families. The research question is: What are the differences in social capital between parents of successful students with and without learning, behavioral and emotional disorders, and difficulties (SEN B)? The survey Value-Creating Education 2020 (n = 1156) was analyzed. Parents of 10-year-old children were asked whether their child needs special education services because of difficulties in learning. Separate ordinal regression models were used to examine predictors of academic achievement in the two subsamples of parents of students with and without special educational needs (SEN B). Results showed that factors supporting success differed between the two groups. Family background and involvement of professional helpers (teachers, psychologists, special education teachers) in child-raising were not among the predictors of academic success for students who need special education services because of learning problems, but the availability of an extensive network of the family had a positive significant effect.

Enhancing Educational Environments in Poland: Introducing Quality Indicators for Assistive Technologies in Schools of the Metropolis GZM

Aneta Maria Kochanowicz

WSB University, Poland

In the pursuit of creating inclusive and effective learning environments, it is necessary to introduce quality indicators for assistive technologies in schools across Poland. This aims to elevate the educational experience of students with diverse needs, creating a more accessible and supportive education. The U.S. Quality Indicators for Assistive Technology (QIAT) Consortium has identified a set of descriptors to serve as a guide in determining the quality of AT access and use. Basic information about these indicators was the basis for building standards for the use of AT in Poland, integrating the provision of AT services with the applicable educational policy. My research included translation, cultural adaptation, and validation of an American research tool previously unavailable in Poland. This research project allowed us to determine the level of implementation of assistive technologies for children and young people with disabilities in GZM schools, using a research tool to measure the quality and consistency of support provided in the field of AT by Metropolis GZM teachers. The Metropolis GZM comprises 41 cities and municipalities with approximately 2.3 million residents and around 240 thousand companies and institutions, contributing to approximately 8% of the country's GDP. The survey tool is designed to enable individual schools to assess their current practices and plan for improvements in the following areas: Consideration of AT Needs, Assessment of AT Needs, AT in the IEP, AT Implementation, Evaluation of Effectiveness of AT, AT in Transition, Administrative Support for AT, and AT Professional Development.

Discourses And Experiences On Special And Inclusive Education In Families Of Students With Disabilities In Spain

Eduardo Díaz

Universidad de Alcalá, Spain

At present, the latest law on education in Spain (LOMLOE), stipulates that within ten years, regular schools will have the necessary resources to accommodate students with disabilities in the best possible conditions. This process towards an inclusive education system has found resistances from institutions and companies which manage Special Education Schools (SES), as well as on behalf of families of students with Special Educational Needs (SEN) attending SES and that, generally, have had negative experiences in regular schools. Their reluctance has been expressed basically through social media, as analyzed by different studies (Huete et al., 2019; Rogero et al., 2022). This shows that it is useful to deepen our focus on the experiences of families of students with disabilities enrolled in both regular and special schools, in order to understand how their backgrounds influence the discourses that they adopt.

The main aim is to analyse the discourses towards special and regular education of families of students with SEN due to disability based on their experiences in the education system. The initial hypothesis is that the discourses against inclusive education can be partly explained by negative experiences in regular schools, which have led to identify the present situation of inclusion in the regular education with the model for inclusive education reflected in Spanish and international regulations. The main methodological strategy is the qualitative approach through group discussions to deepen on the different discourse positions towards inclusive or special education and how they relate to personal experience.

RN10 | T08_03: Expectations, Aspirations and Choices (II)

Structural Adjustment and Educational Reform: Youth Aspirations Towards the Future

Mei-Ling Lin

National Open University, Republic of China (Taiwan), Taiwan

Exploring landscapes of education in local is a daunting task as it involves a great deal of differences across places and spaces. The local communities have set out to research educational policies in their embeddedness in local economies, labour markets and individual life projects of young adults. The author analyses how a variety of local institutional, economic-material, and opportunity structures influences the objectives of educational policies targeting youth educational and labour market trajectories. Our analyses provide answers to the following three research questions: (1) to what extent are the objectives of educational policies influenced by the national skills formation regimes? (institutional opportunity structures); (2) to what extent are the objectives of educational policies based on the local demand for skills? (economic-material opportunity structures); (3) to what extent are the orientations of educational policies influencing youth educational and employment trajectories? (discursive opportunity structures). The paper discusses the educational reform in the age of globalization, with reference to structural adjustment and educational reform, the commodification of higher education, the decentralization of education, choice in education, the privatization of education, multiculturalism and education, the global pedagogies, the schooling for tomorrow, the new paradigm shift in pedagogy, and the Artificial Intelligence in education. Studying the complex relationships between educational policymaking on the one hand, and young adults' life courses on the other, requires a carefully established research approach. The multimethod design was used to bring together the results from the quantitative, qualitative and policy/document analysis.

Earnings and Career Paths of Creative Arts Graduates

Orian Brook

University of Edinburgh, United Kingdom

Since 2018 analysis of the Longitudinal Educational Outcomes (LEO) dataset, a linked administrative dataset created by the UK government, has estimated the "returns" to higher education – the difference in income for graduates, compared to those that don't attend University, and variations in graduate incomes according to the kind of institution that they attend, their social class origin, gender and ethnicity, and the subject(s) that they study. Economists reported that, on average, graduates of creative arts degrees (including art and design, performing arts and media studies) had only a small "graduate premium" in earnings compared to similar people who had not attended University, or at least less than graduates in other subjects. These findings have been linked to suggestions that the government should reduce the number of places on degrees that did not offer high graduate earnings, additional cuts that predominantly affect creative arts degrees, and announcements of programme closures by by several universities, largely in the creative arts.

This presentation will explore whether lower creative graduate earnings are associated with work within Cultural and Creative Industries (CCIs), in Education (a common destination for creative graduates) or elsewhere. It will explore social inequalities and differences by educational institution in earnings and career outcomes. To what extent are employment outcomes associated with social class background, gender, ethnicity and/or the prestige of the University, regardless of the subject studied? Is under-counting of freelance income an issue?

This research builds on recent analysis of social mobility in creative occupations, and mixed methods research on social inequalities in the creative economy, which have highlighted the role of higher education in the social stratification of creative careers.

Non-Formal Education Between Challenges and Opportunities: Two Case Studies in The Framework of European Youth Policies

Nadia Crescenzo

University of Salerno, Italy

In the contemporary scenario, the concept of 'education' is increasingly understood for its potential for emancipation, both personal and social. This approach finds its concrete implementation within the European mobility projects addressed to young people and youth workers, oriented towards the development of competences and skills in the youth sector.

Starting from this framework, the contribution illustrates the results of two case studies on non-formal education projects funded within the Erasmus+/Youth in Action Programme and implemented in Italy. The research work consisted in carrying out 2 participant observations and in conducting 18 interviews with trainers and young participants.

The first case study analyses the experiences and training paths of those working as trainers in the field of non-formal education in the European framework. The objective was to investigate the training and professional experiences and paths of the trainers, the organisational methods and methodologies designed and employed during a non-formal education training.

The second case study consists of a diachronic analysis of the experience of participating in a training for youth leaders who then coordinated international volunteer camps. The aim was to investigate the participants' motivations and expectations, their perceptions of non-formal education, as well as the competences and learning acquired

340

from the training, the effects of the implemented activities in terms of knowledge, competences and skills acquired, and their transfer into practice.

The results of the two case studies made it possible not only to highlight how, through the European perspective, young people's participation and adherence to European values is built, but also to highlight the challenges related to the training process provided by european institutions in the field of non-formal education.

Dismantling Neuroedumyths In Dialogue With Teachers: A Transformative Study in Socioneuroscience for Quality Education

Adriana Aubert Simon, Sandra Racionero Plaza, Ane López de Aguileta Jaussi

Universidad de Barcelona, Spain

Introduction.

Scientific publications about neuromyths, false ideas about how the brain works, have proliferated in the last few years (Dekker et al., 2012). However, there is a gap of scientific knowledge around neuroedumyths, i.e., the use of neuro-scientific concepts to explain education problems but making statements that are against evidence from education sciences, including evidence from sociology of education. This paper presents results from the first research study on neuroedumyths among teachers and does so from the perspective of socioneuroscience (Puigvert et al., 2019).

Method.

The study applied the innovative methodology called Public Lectures' Debates Analytics (PLDA). This has meant conducting interviews with twelve participants about the discussions in public lectures that they had attended. The lectures attended focused on neuroscience and school education and the later discussions with the public about the lecture involved the trainers/lecturers and the public.

Results.

The results showed the presence of four neuroedumyths among teachers (Racionero-Plaza et al., 2022): The brain needs to be bored to develop; Violence resides in masculine genes; Brain develops almost completely the first three years of life; and There are right-hemisphere students and left-hemisphere students. Likewise, we found that these neuroedumyhts have been spread among teachers by neuroscientists without knowledge of education sciences. This challenges the most common stand of blaming teachers for holding false ideas about the brain and education (Ferrero, Garaizar & Vadillo, 2016).

Conclusions.

These findings have important implications for teacher training, indicating the importance that those in charge of training teachers on neuroscience and education, are both knowledgeable of best sources in neuroscience (Kandel et al., 2013) and educational sciences (Flecha, 2015).

RN10 | T08_04: Parental involvement with school (II)

Parental Time Use on Educational Activities and Childcare in Turkey

Aylin Çakıroğlu Çevik[1], Caner Özdemir[2]

1TED University, Turkiye; 2Zonguldak Bülent Ecevit University, Turkiye

Many studies have shown how important parental involvement in education is for the academic achievement of the child(ren). Besides achievement, it is also related to other aspects such as a positive attitude towards learning and school, easier adjustment to the school environment, lower absenteeism or dropout rates, student well-being, and higher academic aspirations. The studies highlight the impact of various factors on parents' involvement, including family socioeconomic status, education level, parents' employment status, and gender. Although studies on parental involvement in Turkey focus primarily on achievement, few address the role of parents, gender norms, and family socioeconomic status, all of which impact the level or duration of parental involvement. In this paper, we investigate the amount of time parents spend on their children both in terms of involvement in their educational activities and other childcare activities. To this end, we employ the data from the Time Use Survey conducted by TURKSTAT in 2014-2015. The data contains a total of 4151 mothers and fathers from Turkey. Preliminary analyses show that gender, working status, education level, and income level are all associated with the total amount of time parents spend on their children's education and care. On the other hand, while we focus on the time spent on children's education, only gender has a significant effect. Women spend more time than men on the educational activities of their children. However, this gap between mothers and fathers shrinks in higher income and higher education groups.

Connecting Schools and Parents: The Trust-Building Role of Digital Educational Resources

Elena Nekhorosheva[1], Ekaterina Enchikova[2], Daria Kasatkina[1]

1Moscow City University, Russian Federation; 2University of Porto, Portugal

The rapid digitalization of education, particularly in the post-pandemic period, transforms the nature of parent-school relationships. Face-to-face interactions between parents and school representatives (teachers, administration) are often replaced by digital communications via school platforms, social groups, chats, or web portals. This shift raises concerns about parental trust, a cornerstone for effective collaboration between parents and schools. Despite its importance, trust remains underexplored in

341

academic research, often being treated as a peripheral factor rather than a central subject of study.

This study explores the role of digital resources on parent-school relations, focusing on their effect on parental trust. We use Structural Equation Modelling to analyze data from 16,535 parents with school-attending children to provide a comprehensive perspective on the issue. Our findings show that digital resources help parents engage with the school system. These resources offer additional information about the educational process and opportunities, increasing parents' understanding and involvement in their children's education. The positive experience with such services plays a significant role as a mediator. It helps mitigate the negative effects of previous difficulties parents experienced with the school systems.

Importantly, the study shows that effective implementation of digital services at both school and state levels can significantly boost parental trust in the educational system. By enhancing the accessibility and quality of these digital interfaces, educational institutions can foster a more transparent, engaged, and trusting relationship with parents, thereby contributing to the overall improvement of the educational landscape.

What Are the Relationships Between Parents and Teachers? – a Review of Research

Martyna Popławska

University of Warsaw, Poland

The results of research on the relationship between parents and teachers seem familiar. Researchers have written about how the relationship between the two parties seemingly appears to be good or very good (as parents and teachers often describe it in surveys). However, a closer look at the phenomenon reveals that each side has different expectations of the other. This often leads to misunderstandings and makes it difficult or impossible to cooperate. This is a significant social problem, as ineffective relationships between parents and teachers have a negative impact on students' performance at school. Therefore, during my presentation I will talk about a systematic literature review that was conducted on the topic of parent-teacher relationships. A research question was posed: What are the relationships between parents and teachers in early childhood education level? Therefore, scientific databases were searched to find scientific texts that describe the results of qualitative research on this topic. An additional aspect that I was interested in and that was included in this search was the issue of partnership in the relationship between parents and teachers. Specifically, I was looking for evidence on whether we can speak of a partnership between the aforementioned partners. Partnership is defined according to J. Epstein's concept of educational partnership and is considered the most desirable form of cooperation between parents and teachers. The review report was created using the JBI SUMARI programme. During the presentation, I will present the results of the review.

RN10 | T09_01: Politics, Citizenhip, and Sustainability (II)

Navigating Controversy: Understanding Students' Perspectives on Classroom Discussions on Sensitive Topics

Mikkel Kjer, Sidsel Andersen

The Danish Center for Social Science Research (VIVE), Denmark

The inclusion of controversial subjects in teaching serves as a normative anchor within the education system. Teaching controversial subjects offers students insights into significant historical and current societal events, enabling them to develop skills in openness, argumentation and source criticism. These skills are vital for navigating a democracy, especially considering children and young people's exposure fake news and consumption of non-traditional sources of information.

The literature underscores the complexity that teaching controversial subjects introduces for educators. This complexity arises primarily because controversial topics often reflect deeper societal or ideological disagreements, leading to strong emotions among teachers, students and parents. According to the literature, teachers may choose not to address a subject for various reasons, such as insufficient knowledge on a topic, considerations for specific students, or fear of social sanctions. Nevertheless, existing knowledge is based on the perspectives of adults. There is a noticeable gap in research exploring how students experience controversial subjects in teaching and their perspectives.

We analyze students' experiences and attitudes towards controversial subjects within a Danish teaching context. Employing a discourse-analytical framework, we examine focus group data from pupils aged 12–15. We develop a typology that categorizes students' considerations, determining when and why teaching a controversial subject is perceived as either justifiable or inappropriate. Our findings underscore the importance of considering students as co-creators of what is deemed controversial and emphasizing the need to take students' insights and assessments of teaching controversial subjects seriously

342

Subjects, Attainment or Selection? Disentangling the Effect of Schooling on Political Beliefs and Behaviour in Adulthood

Nicole Martin[2], Ralph Scott[2], Roland Kappe[1]

1University College London; 2University of Manchester

The role of educational experiences in shaping political attitudes and behaviour has received extensive attention in recent years. However, the mechanisms through which education changes people's political behaviour in adulthood are often hidden due to poor measures of education.

Using new linked administrative and survey data, we try to unpack the causal "black box" of education in the English context, where educational divides were starkly evident during the Brexit referendum and subsequent realignment of the electorate in 2019. Specifically, we link detailed administrative data on adults' school records to their political views in a large-scale probability household panel survey, and test how subjects studied in adolescence are linked with political attitudes and behaviour in adulthood, net of attainment and other characteristics.

We find that studying economics or business studies and, to a lesser extent, Maths is associated with more right-wing economic and social attitudes, and with voting for the Conservative Party. On the contrary, studying humanities and foreign languages is associated with more socially liberal and economically left-wing positions, and voting for the Labour Party. We argue that subject-specific effects on political outcomes may reflect direct learning from subject content, in addition to the socialisation and human capital effects identified in prior research. To further understand the causal foundation of these effects, we (i) analyse whether just passing a crucial educational hurdle at age 16 changes political behaviour in adulthood, and (ii) study schooling reforms that changed the set of subjects offered to students in different schools. Our results provide evidence for the micro-foundations of how educational expansion has reshaped patterns of political conflict.

Exploring the Relevance of Education in the Landscape of Conspiracy Theory Beliefs: A Comparative Study across V4 Countries

Terezia Šabová

Slovak Academy of Sciences, Slovak Republic

Nowadays, so-called alternative facts and conspiracy theories are receiving more and more attention among politicians and in public debates due to their visibility and the legitimacy they have gained over time. Concerns about the consequences of believing in conspiracy theories are being translated into the search for national and transnational strategies to define means and propose solutions to appropriately and effectively counter the conspiracy narrative. Education and training is seen as one of the key tools that can help combat conspiracy theories, disinformation and fake news. The importance of education in the context of belief in conspiracy theories this study attempts to clarify based on a large-scale comparative quantitative survey, which focused on social conflicts over conspiracy theories and which was carried out in Slovakia, the Czech Republic, Poland and Hungary (V4 countries). Education and its importance were monitored not only as an objective indicator, namely the degree of education attained, but also through the subjective relevance and contribution of formal education to the life of the interviewees and the degree of trust in the educational system of the countries concerned. This study aims to enhance our understanding of the dynamics underlying the role of education in shaping attitudes toward conspiracy theories. Ultimately, the findings may contribute to the ongoing discourse on devising effective strategies to mitigate the impact of misinformation and conspiracy narratives in society.

Policy Stakeholders and 'Free Speech' at School: Navigating Race, Religion, and Moral Panic

Aslı Kandemir, Karl Kitching, Reza Gholami, Md. Shajedur Rahman

University of Birmingham, United Kingdom

343

This paper outlines how policy stakeholders in England interpret and translate right-wing national policy on political speech regarding race and religion in schools. The paper is located in a wider global northern (US, France, Australia) context of right-wing moral panics, around the purported need to 'protect' schoolchildren from progressive (e.g., anti-racist, Islam-inclusive) speech (Begum 2022). Despite a history of research into right wing populist ideologies in education (Apple 2006), the specifics of how right-wing 'free speech' politics are translated in education policy contexts is under-researched. The paper presents qualitative analysis of individual interviews with 25 key policy stakeholders at the national and local level, purposively sampled given their role in writing or authoritatively interpreting polices. Drawing on critical post-structural ideas (Ball 1993), we conceptualise policy as discursively shaping, but not entirely closing down possibilities for 'free' subjects and objects of expression, in a school system characterised by polycentric (central government/local authority/school federation) governance. Using a thematic (inductive and deductive coding, cross-coding) approach (Braun and Clarke 2021), we demonstrate how state and third sector stakeholders navigate and enact 'free speech' policy discourses that raise 'concern' about who is vulnerable to problematic speech, what truth is, and how truth is accessed. We contend policy stakeholders recontextualise official policy ideas of school-based 'free speech' and 'political impartiality', and translate them into practices that may accommodate, circumvent or resist right-wing moral panics around progressive speech. The paper concludes that there is a complex web of stakeholder alignment with, accommodation or circumvention of, and resistance to the embedding of right-wing 'free speech' panics. Moreover, it argues that stakeholders define and seek to shape pedagogical spaces upon their own interpretation.

RN10 | T09_02: Inclusive Education (II)

'In a Normal School, You Are Seen as Different'. Disability and Separate Education in Italy.

Marco Romito, Miriam Serini

University of Milano-Bicocca, Italy

This contribution explores the social, organisational and institutional processes that produce disability as an organisational and biomedical category, and the justificatory discourse that normalises 'separate education' as a strategy of care and management of disability by the Italian school system.

Italian legislation establishes that pupils with disabilities must attend mainstream schools. However, 'special schools' for students with 'severe' disability are still relevant and constitutes the surface of a tendency to reject from mainstream education those pupils considered most problematic.

We designed an ethnographic research based on one ordinary primary school in the city of Milan to highlight the processes of management of disability within the framework of the regulations on school inclusion in force in the Italian context. Here we analyse the processes of spatialisation of disability within ordinary schools and the exclusionary processes that occur in school and classrooms contexts. A second study has been designed to explore the processes of channelling disabled pupils into 'special schools'. By means of interviews conducted with families who have 'chosen' these schools for their children, with teachers and health personnel, we highlight the conditions allowing the reproduction of a form of separate education whose existence finds fragile support in the regulations in force.

The contribution explores the empirical data weaving together different literature strands: the sociology of expertise (Eyal, 2013), symbolic interactionism (Mehan et a., 1986) and the perspective of intersectionality (McCall, 2005) to highlight the way in which choices, careers and processes of construction of the disabled identity are produced in different ways based on institutional, organizational and expertise knowledges, as well as according to the different socio-cultural positioning of families.

Implementing the Salamanca Thinking: Attitudes of Pre-school Teachers towards Inclusion in Kazakhstan, China and Russia

Elena R. Iarskaia-Smirnova[1], Filiz Polat[2], Jiayi Xu[1]

1National Research University Higher School of Econ; 2Nazarbayev University, Kazakhstan

Thirty years ago the Salamanka Statement proposed the movement towards education for all framing the policy of inclusion. A large body of literature revised the variations of how inclusive education has been conceived and implemented in various regions and countries (Ainscow 1999; Hegarty et al. 1996; Mittler 2000; Armstrong 2003). However, the debates on inclusion have mostly addressed policies and practices of the global West. Little attention has been paid to the post-communist experiences affected by socio-cultural heritage and current inclusion policy largely informed by the international, in particular, European policies. When the authors reveal the factors enabling or inhibiting inclusive education in post-communist contexts (Makoelle,Burmistrova 2021; Zimenkova,Jules 2014), they come across the path dependencies that are difficult to change (Kalinnikova Magnusson,Walton 2021). Currently, Russia, Kazakhstan and China gradually integrate into the global processes of reforming educational systems towards inclusion with legislative framework approved in Kazakhstan 2011, Russia 2012, China 2014. The teachers' attitudes and competence play crucial role (Polat et al 2023) in relation to the implementation of the Salamanca thinking (Ainscow et al 2019). While the early start of playing, learning and socializing together is the ground for future inclusive processes, the attitudes of pre-school teachers towards inclusion have been for a long time out of scope of the sociology of education. This paper aims to map the challenges of the transition towards inclusion of children with disabilities in three national contexts through the eyes of the pre-school teachers.

344

Educational Inclusivity in Kazakhstan: Progress, Challenges, and Future Directions

Aituar Kospakov

Astana IT University, Kazakhstan

The concept of inclusivity is an integral part of a fair society and the provision of equal rights and opportunities for all individuals. Thus, ensuring equal access to quality education for people with special educational needs plays not only a vital role in realizing the educational potential of an individual as a future professional in their field, but also contributes to socialization and overall improvement in quality of life and well-being. Global organizations, such as the United Nations, OECD, UNICEF, and the World Bank, have clearly defined inclusive education as one of the

priority directions in building a fair and favorable society. According to data, some countries have achieved significant results and positive systemic changes in the realm of inclusive education. However, there are countries that still face difficulties in providing inclusive and equal access to education for people with special educational needs. Kazakhstan, categorized as an upper-middle-income country, experiences a range of institutional and social challenges in implementing inclusive education. The purpose of this study is to analyze factors that serve as both systemic and social barriers in achieving key indicators of inclusivity in education, as well as to examine the experience and existing practices of inclusivity in educational institutions in Kazakhstan. At the same time, we have examined the concept of inclusivity and its role in the educational sphere, as well as analyzed existing strategies and programs for inclusive education at various universities in Kazakhstan.

The Impact of Psychiatric Diagnoses on the Process of Classification in the Special Educational Needs Category and Educational Orientation towards Special Education

Beata Fatime Gyarmati

University of Oradea, Romania

The present study explores the prevalence of psychiatric diagnoses among children assessed for special educational needs and their impact on the classification of children as having SEN and their educational orientation, particularly towards special education.

Through this study we primarily aim to identify possible overrepresentation based on certain personal characteristics, as well as to uncover the subtleties of the professionals' decision-making process and how diagnoses influence this process.

For this research we used data from the records of children with special educational needs in Bihor County, assessed between 2019-2022. The investigation follows a methodological approach that involves several steps, including coding and classifying the diagnoses in the children's records according to DSM-5 criteria, correlating the IQ determined by the psychiatrist with the category of mental disability in which the classification was made, bivariate and cluster analyses.

The main findings indicate significant correlations between psychiatric diagnoses and SEN classification, influenced by sociodemographic factors such as age, gender and family background. The study findings also suggest a lack of rigour in diagnoses for children experiencing educational difficulties, which may lead to overdiagnosis in children in vulnerable groups.

The study concludes that psychiatric diagnoses play a crucial role in the educational pathways of children with SEN, suggesting the need for rigour in the process of assessment, classification and educational referral.

RN10 | T09_03: Expectations, Aspirations and Choices (III)

Beyond Boundaries: Understanding the Higher Education Decision-making Process of Highland Ethnic Minority Students in Thailand

Chayanit Thipri

Corvinus University of Budapest, Hungary

Access to higher education is essential for personal development and economic security. However, ethnic minority students, who are among the most vulnerable groups, face numerous barriers to higher education. This qualitative study explores the decision-making process of highland ethnic minority students in Thailand, addressing unique challenges arising from their geographical and cultural contexts regarding their pursuit of higher education. Through semi-structured interviews with ten participants, the research identifies key factors facilitating or hindering their access to higher education.

The findings suggest that despite their strong desire to pursue higher education for personal and professional reasons, participants encounter significant barriers, especially statelessness and financial constraints. Moreover, limited access to education due to community values is also an important factor. The choice of university is primarily driven by location, affordability, and learning environment suitability, rather than the prestige of the institution. Participants' field of study selection is guided by practical considerations rather than parental influence. Additionally, the study found that participants who decided not to pursue higher education experienced regret, while the majority of those who continued their academic pursuits expressed satisfaction. Only one participant expressed a desire for a gap year to explore personal interests before committing to a study program. Interestingly, discrimination and language barriers play a lesser role in decision influences. The study highlights unique issues, including statelessness and the influence of community values on attitudes towards education, emphasizing the importance of structural, external, and internal factors affecting the higher education decision-making process of highland ethnic minority students in Thailand. These findings have important implications for policies and interventions aimed at promoting equitable access to higher education for highland ethnic minority students in Thailand.

345

Going All the Way: Identifying Careerists, Persisters, and Potential Desisters Among Pre-Service Teachers in Luxembourg.

Salvador Rivas, Axel Grund

University of Luxembourg, Luxembourg

The persisting worldwide teacher shortage presents a critical challenge for the education sector, exacerbated by contemporary societal transformations such as the COVID-19 pandemic, technological advancements, and increasing social inequalities. This paper focuses on the urgent need to identify candidates who are not only qualified but are also likely to commit to long-term teaching careers, thereby ensuring the sustainability and effectiveness of educational institutions.

The teacher shortage crisis is multifaceted, stemming from factors such as unattractive working conditions, insufficient salaries, and a lack of professional development opportunities. These challenges deter potential candidates from entering the profession and contribute to high attrition rates among existing educators. Using latent profile analysis on the different facets of the "Factors Influencing Teaching Choice" scale on a sample of 1126 candidates for admissions into Luxembourg's teacher training programme at the University of Luxembourg we attempt to identify the so called, "highly engaged persisters", "lower engaged desisters" and "classroom engaged careerists", each profile said to have a distinct likelihood of staying in the teaching profession. Using a combination of motivation and self-efficacy scales, along with important socio-demographic indicators we explore these constructs.

One key aspect of this strategy is the development of predictive models that can identify candidates with the potential for longevity in teaching careers. These models should consider not only academic qualifications and teaching skills but also personal attributes such as motivation, resilience, adaptability, and a passion for lifelong learning. By focusing on identifying and supporting individuals who are committed to teaching as a long-term profession, we can ensure a stable, qualified, and motivated teaching workforce, which is essential for the advancement of education in a rapidly changing world.

Adolescent Ambitions: Assessing the Aspirations-Expectations Gap in Romanian Youth

Adrian Hatos, Simina Morar-Bako

University of Oradea, Romania

Aspirations and expectations are crucial in linking a child's socio-economic and cultural background to their educational and social achievements. Current literature highlights a conceptual and theoretical discrepancy between aspirations and expectations, with empirical evidence suggesting a gap in teenagers' future projections. However, this literature often overlooks the differences in how these two characteristics are determined. Our research tackles this issue by examining contrasting expectations and aspirations regarding occupational status among Romanian teenagers. Utilizing a large dataset from a 2021 survey, we test the hypothesis of an expectations-aspirations gap. We employ multivariate models incorporating socio-economic controls and psycho-sociological predictors, aiming to elucidate the distinctions between how youth envision their future. Our findings indicate that the hypothesized gap between aspirations and expectations does not manifest regarding desired and expected occupational status. Nonetheless, our analysis of multivariate models for these two types of anticipations reveals peculiarities. These nuances offer insights into the socio-structural and psycho-attitudinal factors influencing them.

Post-16 Educational Pathways And Social Interactions. The Role Of Peers And Family Socio-Economic Status In Educational Strategies

Nicola Pensiero, Carlo Barone, Germ Janmaat

Southampton University, United Kingdom

After around three decades of research on educational inequalities, there is little consensus on the key micro processes accounting for the association between socio-economic origins and educational choices. This project investigated the extent to which expected occupational and social returns (e.g. conformity with peers' choices) account for the effects of socio-economic background on two milestones of the English education systems – GCSE subject choice and the decision to continue to A-Level, which have significant implications for future social mobility and labour market prospects. Using educational records from the National Pupil Database with data from Next Steps (1989 birth cohort; the Longitudinal Study of Young People in England), we use a broader definition of rational choice than the one used so far and tested several decision-making mechanisms including the absolute expected returns in terms of socio-economic status, the returns relative to the parents' socio-economic status, how much individuals like school subjects and the effect of peers' choices. We use a peers of peers methodology to identify the effect of peers and mediation analysis to assess the extent to which socio-economic differentials in educational choices can be accounted for by those mechanisms. We found that individuals do not take into account financial costs, have little consideration for absolute returns, whilst a substantial part of the socio-economic differentials in educational choices can be accounted for by the avoidance of downward mobility and the conformity with peers.

RN11 Sociology of Emotions
RN11 | T01_01: Theorizing Emotions, Feelings, Affects

(From) Emotions (to) Experiences

Eduardo Bericat

Universidad de Sevilla, Spain

This communication aims to present and reflect upon a seminal idea from John Dewey's Art as Experience. We believe this idea could play an essential role in the future development of the sociology of emotions. The American pragmatist philosopher told us that "we are given to thinking of emotions as things as simple and compact as are the words by which we name them. Joy, sorrow, hope, fear, anger, curiosity are treated as if each in itself were a sort of entity that enters full made upon the scene". However, "in fact emotions are qualities, when they are significant, of a complex experience that moves and changes". For Dewey, neither emotions can be fully understood apart from human experience, nor can life experience be understood apart from emotions. Emotions are "the moving and cementing force" of any experience. They provide "unity in and through its varied parts". In short, experience as a sociological category offers us a unique framework for studying emotions. Likewise, the methodology of life experiences analysis can be particularly useful for studying human interactions and the role affectivity plays in them.

Emotional Capital, Professional Identity And Education

Revital Weil-Gottshalk

Tel Aviv University, Israel

Unstable times, such as war or pandemic, emphasize emotional aspects in the educational arena. Yet these aspects are always central in the schools' daily routine – especially given the dominance of the psychological discourse today, that permeates the educational field, and the importance of schools in creating and distributing emotional repertoires in society. However, there are significant gaps between the systems' formal emotional agenda, and the reality of emotional practices in this domain.

This talk will present a work in progress, as part of my doctoral research, which deals with such gaps in Israeli elementary schools from a 'bottom-up' perspective, focusing on educators' emotional patterns that construct this professional domain. Proceeding from a cultural approach, emotions are seen here as an acquired, transformative, identity-dependent practice, embedded in power relations. The key to understanding emotional patterns, thus lies not in their 'content' but rather in the socio-cultural dynamics which occurs by the actors operating in their concrete spaces of action.

I examine this dynamic by in-depth interviews with schools' main 'emotion actors' – psychologists, counselors and principals – through analysis of their professional identity discourse. My preliminary analysis points at (1) an affinity between emotional capital and professional identity, and (2) tensions and ambiguities of these actors' professional self-concepts, reflecting power struggles, by which the structure of the educational system as a professional field is contested. I show how this dynamics produce school's emotion-educational domain as loose and marginal, despite the declared recognition of its importance.

Beyond A Reasonable Doubt: The Emotive-Cognitive Evaluation of Intent and Credibility

Alessandra Minissale, Stina Bergman Blix

Uppsala University, Sweden

Credibility and intent are the most recurrent legal categories in criminal cases across different legal systems, but the law does not offer a specific answer as to how their evaluation should be done in practice, especially in relation to the interpretation of emotional aspects associated with the facts at stake. Drawing on analysis of ethnographic data from trials and deliberations collected in Italian courts and prosecution offices, we discuss the emotive-cognitive dynamics at play in judges' and prosecutors' evaluation of credibility and intent, focusing on cases of murder, intimate partner violence, and rape. Using sociological concepts of epistemic emotions, emotional reflexivity, empathy, and legal encoding, we show that legal professionals use different practices to either avoid settling on feelings of certainty about witnesses' credibility and defendants' intent, or to overcome their feelings of doubts about said legal categories.

Emotionalising Reflexivity, Agency and Time

Mary Holmes[1], Karl Malmqvist[2], Åsa Wettergren[3]

1University of Edinburgh, United Kingdom; 2University of Gothenburg, Sweden; 3University of Gothenburg, Sweden

Theorising on agency, reflexivity and time is well established in sociology. However, these fields have not systematically theorised emotions. We revisit classic and contemporary theoretical contributions on agency and time, among them thinking, imagining, and projecting the future. Previous works either draw on emotion (and affect) in a common-sensical manner or overlook the role of emotions. We argue that emotions are central to reflexivity and therefore to making sense of past experience, assessing the present, and projecting the self into the future. We give particular attention to types of reflexivity that draw on background emotions related to past experiences of self and agency. This sheds new light on the role of emotions in navigating the more "habitual" moment-to-moment

347

activities of the present. Reflexivity can thus range from an emotive-cognitive activity to a purely emotional activity. Understanding emotive-cognitive and emotional reflexivity requires a new appreciation of the relationships between feelings and agency hinted at by Dewey, Mead, Schutz and Archer. Drawing on, among others, Castoriadis, we also push towards a fuller examination of temporal emotional imaginaries in times of rapid social change as people try to forecast potentially dystopian futures. The emotional consequences are more complex than navigating fear of risk and can include excitement, hope and even future-projected nostalgia, with consequences for action in the present. Emotionalising reflexivity, agency and time is therefore an urgent task to understand contemporary constructions of collective futures.

RN11 | T01_02: Variations of Emotion Management

An Act of Balance: The Dual Emotion Management of Legal Professionals in Rape Trials Involving Young People

Louise Høyer Bom

University of Copenhagen, Denmark

This paper examines how Danish legal professionals manage conflicting and coinciding emotions in rape trials. Based on in-depth interviews with 40 legal professionals (prosecutors, defense attorneys, judges and legal aids) and observations in 10 rape trials involving young people, I explore the balancing act that legal professionals perform in such sensitive trials. In recent years, sociological and ethnographic research has detailed how legal actors manage specific emotions such as empathy, loyalty and 'objectivity' as well as the lack of emotions in court, i.e. the 'dispassion' of law. Drawing on theories of emotion management and emotions in the judiciary, this paper identifies three sets of conflicting emotions that different legal actors manage in court: objectivity/protectiveness, loyalty/self-restraint and uneasiness/confidence. These findings illuminate how rape trials involving young people pose particular challenges to legal professionals who navigate and manage dual and even opposing emotions in court.

348

Between Retention and Rejection: Guilt Management in the Work-Family Conflict Among Long-Distance Commuter Fathers

Liat Sheffer

Bar-Ilan University, Israel

Guilt arising from the work-family conflict among working parents is considered a firm predictor of subsequent actions and adaptations in response to the conflict. Long-distance commuting fathers are much more likely to experience guilt due to their limited parental accessibility. The study investigates whether and how the therapeutic discourse serves upper middle-class, white-collar, long-distance commuting fathers in addressing and managing the guilt stemming from the work-family conflict.

Drawing on in-depth interviews with 31 Israeli long-distance commuting fathers, the study reveals that the fathers employ a therapeutic strategy to address their guilt, alternating between retention and the rejection of it. This strategy involves four distinct behavioral patterns: compensation, ambivalence, repression, and rejection. The cultural tools of the therapeutic discourse serve as a means to normalize or to push away feelings of guilt. In an era characterized by an increasing demand for active paternal involvement, this strategy allows long-distance commuting fathers

to focus on self-actualization, particularly through careers situated abroad, while concurrently fulfilling their parental responsibilities. Thus, I suggest considering guilt an inherent component of a comprehensive strategy for practicing involved fatherhood, particularly for prolonged periods of family separation resulting from career decisions.

Do Emotions Work Alone? Touching Rules and Emotional Labor in Service Work

Kristen Barber

University of Missouri-Kansas City, United States of America

Emotions have proven a productive focus of analysis for studying the routinization of gender and race through service work. Arlie Hochschild (1979), who coined emotional labor, helped us to better understand how the commercialization of human feelings pillar the contemporary economy. Yet, scholarship on emotions at work only briefly gestures to the body, which is a key component in performing and consuming service. For example, Hochschild noted that flight attendants smile "in the service of changing inner feelings" (pg. 562). I address this gap by theorizing touching rules, which explains how touch is culturally informed and organizationally controlled to meet social standards of acceptable interactions—interactions that reinforce gender, racial, and class distinctions. By studying men and women working in a high-touch industry—the men's grooming industry—I show how touching rules are elicited, expressed, and managed both physically and emotionally to put clients at ease. I consider the interplay of touch and emotions to show that women in particular end up managing the emotions of clients who might otherwise feel emasculated receiving seemingly indulgent, pampering services. I discuss how this study has implications for understanding how women become responsible for reproducing men's bodies, identities, and larger social privileges. Touching rules explain more fully the commercialization of human capacities and relationships in a service market, and how inequalities are buoyed by a cultural economy.

Emotion Management by Proxy: HR Navigating Tensions Through Managers in Highly Emotive Events

Johanna Tanja Marianne Finnholm

Gothenburg University, Sweden

This article posits that the HR function performs emotion work to proactively manage stakeholder emotions and reactions, both collectively and through managers. Drawing on interviews and observations of HR meetings within the case organization, the paper explores how HR displays a range of skilled emotion management techniques to manage emotions of fear and trust, especially pertinent in highly emotive situations of transformation or change.

However, the article contends that the organization's unemotive cognitive regimes makes for this emotion work to be performed mainly undercover, as HR applies strategies to provide outlets for managers with display and feeling rules that allows for emotions of fear and uncertainty. It asserts that HR balances between control and consent of managers with the purpose to make managers perform in their enactment of emotion management against employees, arguing the tension is recently exacerbated by the devolvement of HRM.

Contributing to the field of emotion management research, this article provides novel descriptions of emotion management on a collective level within in organizational settings characterized by long-term relationships. Introducing the concept of "emotion management by proxy," the paper defines it as using emotion management techniques to prepare individuals for potential future events that may elicit emotional reactions.

Furthermore, the paper advocates that HR engages in this management of emotions not merely to achieve organizational goals efficiency or productivity, but also are driven by a genuine concern for employee wellbeing. Proactive emotion management emerges as a skillset honed through experiential learning and of collective sharing of experience. The conclusion emphasizes the necessity for additional research to enhance both theoretical understanding and practical applications in the field.

349

RN11 | T02_01: Emotions and Politics

Are Politically Polarizing Emotions Really Detrimental To Democracy? Analysis Of Six European Countries

Monika Verbalyte

Europa-Universität Flensburg, Germany

Increasing affective polarization has been observed in many Western countries, however, there are not that many studies on what impacts on this process on the individual level beyond partisanship and sociodemographic characteristics. First, it is little known on how specific emotions drive this conceptually strongly affective process. Also, although the strong belief prevails that affective polarization is detrimental to democracy, and we know that it is driven by support for populist and radical right-wing voting, there are no empirical evidence that these people are also not favoring democratic form of governance.

In this paper, using the data from six European countries (France, Germany, Ireland, Spain, Italy and Poland), I will investigate what specific emotions – anger, contempt, anxiety, sadness, and hope – increase or mitigate political polarization and also whether and how these emotions are related to (anti-)democratic and (il)liberal values and attitudes. Results are surprising since polarization per se does not seem to be related to polarization, yet emotion like contempt does. I suggest that this means that political polarization is still an expression of democratic form of confrontation and is not detrimental to democracy but some polarizing emotions are.

Black Feminist Politics of Love: theoretical, political, and methodological implications

Alessandro Pratesi

University of Florence _ Universita' degli Studi di Firenze, Italy

Love has long played an important role in the history of feminist thinking, and particularly of Black Feminist Thought. Ferguson and Jonasdottir (2014) have recently charted the growing academic field of "love studies" that, since the 1990s, is increasingly being taken as a serious area of study on its own terms, rather than just in relation to connected concepts such as care or sexual desire. Within this novel field of study, love is being considered as an important ethical, social, and political force. Nevertheless, both the theoretical and political implications of love studies and the key contribution of Black Feminist theories to them have been considerably and consistently overlooked by mainstream academic scholarship.

Drawing on the work of some of the most relevant theorists of love studies (Ahmed, Berlant, Sedgwick, Braidotti, Hardt, Negri, Puar) and Black Feminist politics of love (Cooper, hooks, Lorde, Collins), this paper has four main goals: 1) relocating the roots of the so-called "affective turn" in the longstanding and still largely ignored contribution of Black Feminist Theories; 2) bridging and reconciling different conceptions and implications of love and love studies; 3) overcoming the limitations of identity-politics and intersectionality; 4) advancing and queering current debates on the theoretical, methodological, and political implications of Black Feminist politics of love.

Rediscovering the key role of Black Feminist politics of love and reinterpreting it in light of more recent developments on these matters provides fresh theoretical and methodological insights; but it also sets a new political agenda for positive transformation.

Emotions and Political Scandals: the Quatargate and Its Policy Responses in the European Parliament

Rosa M. Sanchez Salgado[1], Seda Gürkan[2]

1University of Amsterdam, Netherlands, The; 2Leiden University, Netherlands, The

While there is an increasing interest in the role of emotions in political science, not much is known about how emotions unfold in one of the most emotional situations that can be encountered in politics: political scandals. To explore the link between emotions and political scandals, and more specifically, how emotions shape the policy responses to political scandals, this article delves into one of the most shocking corruption scandals in decades: the money-for-influence scandal, also known as Qatargate. The Qatargate scandal constitutes an ideal case for tracing emotions at individual, group as well as institutional levels. Drawing on constructivist emotion literature, the paper explores how the MEPs experienced the violation of the norms within the European Parliament (EP), and how these emotions shaped the EP's political responses, both in terms of transparency and accountability in EU institutions and in terms of Foreign interference in EU democracies. One of the main contributions of this article is that it combines the study of 28 EP plenary debates (from December 2022 to September 2023) with interviews to 4 MEPs and EU officials. This article not only shows that emotions were very prominent in the wake of this scandal, but also how they contributed to the shaping of its policy responses.

Linking Emotions and Political Attitudes in Discourse: A Computational Analysis of November 2015 Paris Attacks Memories

Charles Payet[1,2]

1ENS Paris-Saclay, France; 2Institut des Sciences sociales du Politique – CNRS

The memory of violent events is a category of public action widely mobilized today with the aim of orienting citizens' attitudes and behavior. These memory policies (school programs, museums and memorials, commemorations) generally rely on the transmission of content with a strong emotional charge. Some studies (Bouchat et al., 2016) have shown that these devices can trigger the opposite effect to the one expected (e.g., strengthening pacifist attitudes). A sociological perspective could suggest that differentiated socializations, particularly in terms of affective habits, may also exert an influence on the link between emotion and political attitudes. I propose to study this link based on a corpus of nearly 1000 semi-structured interviews conducted as part of a research program on the memory of the November 13, 2015, attacks in Paris. I consider the research program not only as a scientific device but also as a memorial device, which questions and updates the memories and attitudes of volunteers about a past violent event. I measure the semantic emotionality of the narratives and discourses in the corpus using computational text analysis methods (word embeddings). Preliminary results show that the expressed emotionality is correlated (1) with socio-demographic characteristics such as gender and age, (2) with experience, but unexpectedly: emotionality does not necessarily decrease based on experiential distance from the event (participants living in Paris compared to survivors and witnesses). I then plan to explore the interactions between emotionality and the expression of political or moral considerations and lessons, and to examine whether affective habits modulate this relationship.

RN11 | T02_02: Emotions and Gender

Affective-Discursive Articulations of Anti-Gender Mobilizations in Turkey through the Translation of 'Alimony Victimhood' into Rage against Feminism

Haktan Ural

Ankara University, Turkiye

This study delves into the transformation of ongoing social media campaigns that oppose the implementation of indefinite alimony between divorced couples, evolving into symbolic resources that contribute to the discursive articulations of anti-gender mobilizations in Turkey. Analyzing the social media posts from two campaign accounts since they were created in 2018 on X (formerly Twitter), this research is situated within the framework of discourse-theoretical analysis of media texts, primarily drawing from Laclau and Mouffe's theory. This approach facilitates a comprehensive understanding not only of symbolic but also affective-emotional dimensions of discourse. By that means, the study reveals that affective intensities and emotional narratives profoundly inform the discursive articulations constructing vivid images of "victimized man" and "threatened family". Indeed, through these images, "alimony victimhood" emerges as a floating signifier of "anti-gender" imaginaries effectively constructing antagonistic subject positions. This antagonism, on the one hand, images feminism as a constitutive other and fosters rage against and disdain for queer feminist sensibilities. Therefore, it allows for the aggression of anti-gender mobilizations towards feminists and LGBTI+ communities. On the other hand, antagonistic subject positions are established through chains of equivalences linking "alimony victims" with Islamist and/or nationalist right. In this light, this research elucidates how the ways that emotional narratives and affective intensities stick to "anti-gender" discourse ultimately inform and fortify populist right in Turkey.

Mobilising Through Indignation: The Case of Autonomous Chilean Feminist Organisations

Carla Gabriela Quiroz Carvajal

University of Edinburgh, United Kingdom

In the realm of social movement research, indignation and anger often serve as catalysts for political action. Within the context of Chilean feminism, indignation plays a crucial role in establishing autonomous spaces for activism, serving as a transformative moment rooted in the perception of marginalisation from formal political spheres. Drawing from

semi-structured interviews with 35 autonomous feminist organisations, I argue that the sense of exclusion and indignation towards the formal political system have encouraged the formation of affective communities. This, in turn, represents an initiative to propose an alternative approach to political participation, diverging from the traditional notion of formal partisan politics.

The creation of these affective bridges emerges as the primary driver of social resistance in an environment marked by weakened political parties and a pervasive distrust of political institutions. This has resulted in the adoption of an anti-elite discourse and an anti-institutional approach, casting suspicion upon the more moderate and institutionalized repertoire of actions. This study aims to explain how Chilean feminist organisations have cultivated a culture of resistance within localised territories, advocating for a political agenda centered around self-determination. In this expression of autonomy, the core theme remains the indignation towards formal politics.

Providing Care At The Ticket Office: The Case Of Station Agents In Dealing With Victims Of Sexual Violence On The Francilian Rail Network

Manon Marguerit

Gustave Eiffel – RATP, France

In March 2020, Ile-de-France operator RATP set up a special unit to deploy measures (communication campaigns, exploratory walks, etc.) to prevent and combat sexual and gender-based violence in transport, which affects 87% of women (FNAUT survey, 2016). Agents at each station have been trained to apply a protocol for dealing with passengers who are victims of sexual violence. As part of my PhD thesis, I spent three months immersed as an agent, in order to analyse this protocol from the point of view of the agents who apply it on the ground. One of the steps consists of sheltering the victim in the ticket office, which is normally inaccessible to passengers.

This spatial proximity is unusual and does not necessarily establish an empathetic and emotional relationship between the agent and the victim, which is essential in providing care (Obertelli, 2016). The addition of this task to the day-to-day duties of the staff member raises the question of how the operator can identify and anticipate the conditions for implementing care work, understood as listening, caring and empathy, but also as a professional practice (Tronto, 2009; Molinier, 2013).

Under what conditions can agents provide care to victims on the RATP network? How can the theories of care help us to understand the transformation of the service profession? I hypothesise that (1) caring for victims can be compromised when the specific dimensions of care work are not taken into account and (2) agents overstep the boundaries (physical and emotional) that are supposed to frame their professional practice (Joseph, 1988; 1995; Gervais, 2021).

RN11 Sociology of Emotions

"Trapped Between Fear and Anger? The Emergence and Disintegration of a Community of Rebellion During Women's Protests Against the Tightening of Abortion Laws in Poland"

Monika Frąckowiak-Sochańska, Marta Zawodna-Stephan

Adam Mickiewicz University in Poznań, Poland

The presentation aims to analyze the role of the collectively experienced emotions in forming, persisting, and disintegrating a community of rebellion.

On 22 October 2020, during the pandemic, the Polish Constitutional Tribunal ruled that abortion due to "a high probability of severe and irreversible impairment of the fetus or an incurable life-threatening disease" is inconsistent with the Constitution. This ruling led to mass street protests of hundreds of thousands of people demonstrating despite the pandemic restrictions. The ruling affects all women by interfering with the intimate sphere of their lives. Additionally, the worsening of perinatal care during the pandemic increased the atmosphere of fear.

During the demonstrations (between 27.12.2020 and 6.04. 2021), we carried out qualitative research – the IDIs on a sample of 25 women supporting the protests, representing diverse sociodemographic categories.

352

Based on the research, we:

• analyze the context of emotions experienced both individually and collectively;

• show how the loss of ontological security as a consequence of the sentence led to the emergence of anxiety and sadness in respondents;

• reconstruct how anxiety and sadness evolved into anger, mobilizing engagement in the protest;

• show how the energy of the demonstrations burnt out and resulted in disillusionment when the goal of the protests was not achieved.

• show that despite the bitterness of the situation, women neither during the demonstrations nor afterwards were 'trapped' in difficult emotions and produced strategies for restoring emotional stability and building a sense of freedom despite systemic constraints.

RN11 | T03_01: Politics and Emotions

"La vida es para disfrutarla"? Polish Expatriates in Spain in Pursuit of Pleasure

Bogna Dowgiałło

University of Gdańsk, Poland

According to symbolic interactionist perspective, emotions are meaningful objects to be interpreted, controlled, used, or managed by social actors, who are engaged in understanding themselves and managing others' impressions of them (Thoits,1989). Symbolic interactionist analyses possess a capacity to illuminate two essential dimensions. First, it explores how individual emotions, experienced at the micro level, can ascend to influence and potentially transform broader social structures, contributing to the dynamic interplay between personal emotional experiences and societal norms. Second, the perspective examines the "downward" trajectory, wherein cultural norms, social structures, and institutional frameworks exert a shaping influence on individual emotions. This aspect reveals how societal elements prefigure the emotional repertoire available to individuals, guiding how emotions are experienced, expressed, and understood within specific cultural contexts (Shott, 1979).

This presentation seeks to dissect the tensions that emerge between the micro and macro levels as Polish expatriates in Spain undertake emotion work to modify the socialised feeling and display rules concerning pleasure. Concentrating on Polish seasonal ("sunlust") expatriates in Spain, the study employs Hochschild's emotion work concept (1983) to investigate how participants navigate Polish cultural norms of pleasure and guilt through emotion work, in alignment with the ethos of new hedonism (Campbell, 1987). Through qualitative analysis of in-depth interviews with 23 participants aged 50-60, this research sheds light on the complexities of emotion work and the ambivalences experienced by the participants as they try to integrate into a different cultural setting while still being influenced by their Polish background.

Exploring Emotional Narratives of Citizenship in Depopulated Rural Environments in Spain

Alberto Martín Pérez, Carmen Capdevila Murillo

University of Barcelona, Spain

This paper focuses on the development of a research project concerning the representations, experiences, and practices of citizenship in depopulated rural environments in Spain. Given the increasing integration of key demographic, economic, political, social, and cultural issues related to rural life into the sociological debate and public agenda, this research aims to explore the specificity of citizenship conditions in rural environments.

The pronounced aging of the rural population, the advancement of depopulation, the declining profitability of family economic activities in the primary sector, and limitations in the supply and access to public educational, health, gerontological, or cultural services highlight the growing inequality in access to citizenship rights for the inhabitants of these environments.

We propose to analyse and respond to the socioeconomic and sociopolitical challenges faced by these populations from the perspective of practices defining belonging and participation in society. Our focus is on a space traditionally positioned peripherally in citizenship, experiencing a clear disadvantage. To achieve this overarching goal, among the five specific milestones outlined in the project, this paper concentrates on defining the emotional landscape of citizenship in rural settings. We hypothesize that citizenship practices and experiences are influenced by emotional expressions functioning as markers of structural social positions.

Using a qualitative case study methodology, the project compares two inland Spain environments: one facing an extreme risk of depopulation and the other characterized by dynamic agroindustrial activity, albeit not immune to socio-demographic processes of depopulation and uncertainty about the future. Fieldwork is underway during spring 2024, and this paper will offer insights into the initial empirical results.

353

Fear of the Future. Effects of the Rise of Radical Right-wing Parties on Civil Society's Commitment to Diversity

Yvonne Albrecht[1,2], Andrea Prytula[2]

1Humboldt University; 2DeZIM-Institute (German Center of Integration and Migration Research)

The rising poll ratings of radical right-wing parties are causing increasing concern among civil society actors in Germany. Around a third of the projects surveyed by the German Centre for Integration and Migration Research (DeZIM) in the diversity shaping field of action of the federal programme 'Demokratie leben!' state that elections and a possible change of government pose challenges for their work. Civil society projects in regions with particularly high poll ratings for these parties are concerned about the extent to which their work against discrimination and racism will still be feasible after the upcoming elections. This concerns the funding of projects on the topic of promoting diversity – especially if there is a possibility that financial funding will be cut politically in the future. The question of the consequences of a possible participation of right-wing extremist parties in regional governments where the projects are located also concerns the actors– for example with regard to the future working atmosphere and possible increased threats.The intensification of right-wing-rhetoric from the conservative side in the run-up to elections – for example

caused by fear of losing voters – also makes project work more difficult. In general, it seems to the interviewees that it has become much more socially accepted to be racist. The paper focuses from an emotional-sociological perspective on the fears and sorrows of civil-society-actors in the diversity shaping field of action in Germany and asks which strategies actors develop for handling those emotions and being capable of acting.

Political Imaginations of Solidarity – The Role of Nostalgia and Hope

Katharina Scherke

University of Graz, Austria

Taking up the question of the CfP "How can bonding and solidarity be created in a deeply segregated society?" the paper will focus on the role of emotions for political imagination and political action.

Already Émile Durkheim (De la division du travail social. Études sur l'organisation des sociétés supérieures 1893) discussed the characteristics of solidarity in modern heterogeneous societies. Unlike in traditional societies, where solidarity is based on the similarity of individuals and a strong morality (mechanical solidarity), the source of solidarity in modern societies characterised by heterogeneity must be different. Taking up ideas of division of labour, Durkheim argued that mutual dependence of individuals forms the source of solidarity in modern societies (organic solidarity). However, according to Durkheim, a moral attitude is also necessary through which individualism itself is appreciated. Durkheim was not very specific about how this new morality can be developed. The paper will argue that political imagination is necessary in this respect in order to develop solidarity and corresponding moral attitudes in heterogenous societies. The paper will further argue that emotions and their management play an important role in this process of political imagination. Nostalgia and hope will be discussed as examples for the general capacity of emotions to bridge the past, present and future (Barbalet 1998) and also regarding their ability to support ideas of bonding and solidarity in heterogenous societies. In this way, a sociology of emotions perspective shall be added towards existing research on (political) imagination and creativity.

RN11 | T03_02: Emotion Work and Emotion Labour

Foster Care On The Market – Social Workers' Feeling Rules And Actions In Conflict.

Teres Hjärpe

Lund university, Sweden

This presentation focuses the emotional dilemmas of social workers who recruit and assess foster parents, in a context increasingly defined by market dynamics. Following privatization paralleled with increasing need for childcare, private and public actors today compete to contract potential foster parents in welfare states like Sweden. For this paper, 43 interviews (with social workers and managers), 21 observation days (shadowing) and 24 investigation documents have been analyzed, theoretically informed by Arlie Hochschild's conceptualizations of feeling rules, and the culturally rooted non-permeable wall between the family and the market spheres. The analysis demonstrates four ways in which social workers today make sense of and relate to this family-market division: They uphold and reconstruct the feeling rules by 1. placing "good" foster parents exclusively one side of the wall 2. getting angry when perceiving foster parents to be guided by the market logic and 3. expressing frustration over the consequences of privatization for social work practice. As a contrast, social workers also 4. cross over and make visits to the market side of the wall as actors to get the job done. The conflicting emotions and actions demonstrated by the social workers can be understood as expressions of a context where the market has advanced its positions and actions have adjusted, but where the individual actors' emotions are not (yet) aligned. The results can contribute to understand the nuances of moral stress and ethical conflicts in human service organizations.

354

How Do Sex Workers Manage Their Emotions In Concrete Confrontation With Clients?

Antonia Sophie Sendlhofer

University of Graz, Austria

"She can't have feelings". However, for all those involved in sex work, emotions play an important role alongside the physical aspect. Based on an extensive literature review, seven qualitative interviews with sex workers and three informal conversations with people who work with sex workers, this paper aims to explore both the emotions and the emotional work that sex workers do, as well as their use of emotional capital in their work. The sex workers who were interviewed work in a variety of different areas of sex work, so the sample includes escorts, a dominatrix and sex workers who work in a brothel. The introduction describes the situation of sex work in Austria and the theoretical

embedding of emotions in sex work. This is followed by an explanation of the methodological approach, including a reflection on the protocol as a method of documentation and the difficulties in accessing the field. The conclusion of this thesis is that sex workers need to develop emotion management skills to be able to work without being affected in a negative psychological way. Emotional work is used to draw a line between oneself and a client, as well as to engage with a client. For sex workers, who are confronted with different clients and their expectations on a daily basis, emotional and sexual capital are also useful in dealing with these different expectations. Both types of capital can be used by sex workers to present themselves in their role and to deal with clients. There is evidence that both emotional and sexual capital can multiply in the practice of sex work.

Smile, You're on Camera! Emotional Labor in (Post-)Pandemic Academia

Sara Major, Vladan Vidicki

University of Novi Sad, Serbia

Expressing, managing, and regulating emotions has become a standard part of everyday work activities in academia. When the COVID-19 pandemic shifted these activities online, emotion management became a crucial part of establishing the "new normal" and new forms of engagement arose to sustain it. The present study aims to explore the extent of emotional labor present in higher education and the degree to which this phenomenon has been impacted by the strained social circumstances, crisis, and uncertainty induced by the pandemic. We follow a longitudinal research design, comparing two datasets on the emotional labor conducted by academic staff at the University of Novi Sad in Serbia. The first round of data collection was carried out in 2020, during the very first months of the pandemic, while the second round took place several years on, in a post-pandemic setting. Data was gathered using a structured questionnaire, and respondents included 210 employees at the University, ranging from teaching assistants to full professors. We find notable differences in the characteristics of emotional labor between datasets, primarily concerning deep acting and emotion suppression, as well as a marked gender difference in both. Our contribution provides insight into changing relationships within academia and highlights how the pandemic has transformed the academic emotional repertoire.

RN11 | T04_01: Political changes and emotional dynamics

Demands, Myths and Emotions in Populism: Contemporary European Politics

Cristiano Gianolla[2], Andy Knott[1]

1University of Brighton, United Kingdom; 2Universidad de Coimbra

This paper operates through a post-Laclauian perspective to analyse contemporary European populisms of the right. It recognises the superiority of Laclau's account of populism over other approaches, including Mudde's ideational one. Yet it finds the formalism or logic of populism that Laclau elaborates to jar with the right populisms that have proliferated in Europe over recent decades. Laclau insists that demands are 'the basic unit' of social analysis, and form into a chain of equivalence from which the 'empty signifier' of a populism emerges. This constructs a frontier antagonising the extant hegemonic formation, posing as a rival political project. In contrast to this bottom-up directionality, we propose myth and emotions as capturing the multi-directionality of contemporary European right populisms. These have deployed nationalistic and other foundational myths in order to reconfigure the political scene, appealing to a people conceived as ethnos and ontos. In this paper, we outline the literature on political myth and emotions to engage in a fruitful conversation with Laclau's account of the role of demands in populism, and then turn to depicting how such myths and emotions have been operationalised through the three comparative cases of Italy, Portugal and the UK.

355

Modernisation of Grieving in Soviet Lithuania: Emotions and Practices to Support the Illusion of Immortality

Nerija Putinaitė

Vilnius University, Lithuania

Philippe Ariès, in exploring the relationship with death across different epochs, pointed to the transformed attitude towards death in modernity: people began to empty the rituals of death of their dramatic impact. The presentation aims to reveal that the space once occupied by a dramatic response to radical life transformation is now filled with emotions and practices that neutralize the radicality of the transformation.

The presentation examines the shift in society's relationship with death under the conditions of the Soviet regime in traditionally Catholic Lithuania. Modernization of death in this context is understood as a transformation of

religious meanings associated with death into materialistic and also politically charged meanings. The modernization of death meanings under the Soviet regime was systematically carried out, employing various political and propaganda measures to combat religious funeral rituals and create secular funeral practices. This involved shaping material incentives for people to avoid religious burial practices. The main measures of secularization, affecting both public and private life, were implemented from the second half of the 1950s.

As a response to the materialization and secularization of death, two societal reactions emerged. Firstly, there was an intense sentimentalization of mourning, indicating a very strong and personally significant relationship with the deceased. Secondly, it manifested as a peculiar incorporation of the deceased into the realm of the living through various memory practices, and can be viewed as an extended grieving process. Both reactions created a societal-supported illusion of immortality.

The analysis is based on inscriptions found on funeral wreath ribbons and epitaphs on tombstones, collected during ethnographic expeditions in Lithuania from 1968 to 1989, as well as other materials.

Emotional Tension of Ukraine at the Beginning of the War as a Factor of Transformation

Marina Biryukova

National Technical University "KhPI", Ukraine

The explosive increase in the group of refugees after February 24, 2022 is due to the extensive theater of military operations. The beginning of the war unleashed an explosion of various emotions among Ukrainians, fundamentally changing their social portrait.

The conclusions were drawn on the basis of an international Internet survey conducted in the summer of 2022 (N=1170 people) and devoted to an analytical description of social characteristics and practices carried out by refugees of the Russian-Ukrainian war. The survey contained quantitative measurements and qualitative assessments of the social well-being of Ukrainians.

According to the results of the study, the respondents had a certain emotional dissonance at the beginning of the war. They were frightened both by the actual events of the war and by the reflection in the mass media and social networks. By the time of the survey, the respondents felt more balanced, but still a feeling of anxiety and uncertainty prevailed. According to the results of the study, women described their own emotions as less disturbing compared to men. That is, men were more vulnerable to the so-called acoustic aggression. Emotional stress influenced a person's decision to evacuate.

The conducted classification of the sample of respondents according to their emotional state at the beginning of the war made it possible to determine that less than half of Ukrainians emotionally "endured" and were ready for active social practices. The sample of respondents was characterized not only by the criterion of having migrated – not migrating, but also by the criterion of emotional stress and readiness for active social practices.

Visual Image Analysis and Emotional Expressions in the Era of Deep Mediatization

Jingting Zhang

Shanghai International Studies University, China, People's Republic of

High-speed, low-latency 5G technology will bring about a shift in which everything is a terminal and a medium. Society has entered what A. Hepp defines as "deep media" and the concept of metaverse has been born. The relationship between people and images is not only one of "visual vision", but of "connective action and emotions", of fusion of the virtual and real worlds. The influence of the semiotic theory of Roland Barthes and Umberto Eco and the philosophical theory of Foucault on qualitative research methods is significant. The experience of digital immersion has changed the mode and form of our being in the world, and the analysis and perception of visual images has diversified. In this new metaverse scenario, can visual image analysis be used as a qualitative research method, and how can it be used, combined with media studies, to build a new analytical framework? This paper will discuss the relationship between visual image analysis and qualitative methodological research in the age of deep mediatization, in dialogue with Hans Belting's theory of "theoretical worlds through images," and reformulate the idea of "imageability" (Boehm, 1978). It is divided into the following parts: 1) space and time: visual images as a medium for qualitative research; 2) the virtual and the real: a new framework for the analysis of visual images and the emotional expression of "multiple selves"; 3) the interpretative dimension of images and iconography in the metaverse.

356

RN11 | T04_02: Emotional and affective communities

Affective Communities: Perspectives into Coexistence in Urban Neighbourhoods

Johanna Hokka, Eeva Puumala

Tampere University, Finland

In the context of rapid demographic, social, and political change, the question of how we live together and 'what is between us' have become burning questions across Europe. Peaceful coexistence is challenged by increased inequalities and polarisation that contribute to the development of affectively tensioned sociopolitical atmosphere. Nonetheless, instead of claiming that diversification would lead to the unravelling of social fabric, we propose that it paves the way for thinking of coexistence in terms of affective communities. Based on ethnographic interviews with diverse people in four cities in Finland and Sweden, we will explore how people form affective communities in socio-economically mixed urban neighbourhoods. Such neighbourhoods have mostly been discussed through stigma, meaning that there is a lack of empirical knowledge on 'what is going on' in these areas affectively. This knowledge is needed as affects play a crucial role in understanding how people organise their social relations in the everyday. Building on Sara Ahmed's thinking on affects, we examine how affects move people both towards and away from each other. This paper presents an empirically grounded and nuanced analysis of how, in segregating urban neighbourhoods, affects construct people's relation to each other as well as to their daily environments and the broader society. We will illustrate how communities and connections are affectively articulated and bring updated knowledge on the affective state of these neighbourhoods. Ultimately, this paper opens a new line of inquiry into the question of what-is-between-us in the city.

Collective Emotions, Rural Resistance and Green-Green Conflicts

Åsa Wettergren, Karl Malmqvist, Carl Cassegård

University of Gothenburg

The aim is to present the outline of a new project (financed by the Swedish Research Council, 2024-2027) investigating green-green conflicts in regional areas. In focus is how people with differing nature interests collectively articulate emotive-cognitive responses drawing on place and time. We define green-green conflicts to include all conflicts in which environmental values are pitted against each other. Often such conflicts emerge in rural areas pulling together locals with differing ideological views. We see green-green conflicts as cases both of clashing environmental nature interests and as cases of global/urban and local/rural values and priorities. Conducting qualitative case studies of place-specific rural conflicts, where competing nature interests are being articulated and corresponding groups are formed, we investigate 1. Conflict lines and group boundaries around nature interests; 2. Collectively shared emotions and perceptions of local past, present, and future; 3. Narration of the global threat of climate change in relation to local present and future. Theoretically we draw on structural theories of emotion, social movements and emotions, and emotions' enactment of past and imagined future as crucial for present emotive-cognitive action choices. Highlighting the impacts of environmental and climate initiatives on rural areas, and the diversity of people and protest motives in these, the results promise to advance understanding of rural resistance and urban-rural polarization. The findings will contribute to research fields on green-green rural conflicts, climate change and temporality, and to collective emotions and climate change.

Longing For Love: Tension Between Disillusion and Hope among Young Danish Adults

Malthe Sebastian Rye Thomsen

University of Copenhagen, Denmark

In Denmark, online dating has doubled in the past decade, reaching nearly 500,000 users in a population of 6 million. As a result, it has become a central aspect of young adults' romantic lives, with 18–30-year-olds being the primary focus of my PhD project, which is based on one year of fieldwork.

Studies on online dating highlight that users often reflect on partner preferences and scrutinize physical imperfections, contributing to a 'rejection mindset' where users casually delete and 'ghost' each other (Konings et al., 2023; Pronk & Denissen, 2020). Drawing inspiration from Zygmunt Bauman's critical theory on liquid love, many studies emphasize the transformation and consequences of marketization, the normalization of untrustworthiness, and disillusionment in dating life (Bandinelli & Gandini, 2022; Bauman, 2003; Davidson et al., 2020; Hobbs et al., 2017; Illouz, 2012, 2019; Portolan & McAlister, 2021).

While statistical and shorter qualitative approaches are valuable for examining structural factors, there is a need for a detailed, long-term study. My project contributes a phenomenological analysis of the emotions that dating experiences create and the emotion work that the present dating culture demands. Initial data supports insights on mistrust, cynicism, and disillusionment. However, I have also identified newfound hope in the search for a partner due to the development of new apps.

Thus, my preliminary findings add nuance to prevailing sociological theories on dating culture and have the potential to broaden the understanding of the emotions involved in this phenomenon.

Exploring the Emotional Landscape of Guilt, Shame, Pride, Resentment, and Despair in the Management of the 'Energy Poor' Stigma: Lessons from Public Policy Evaluation in Two Low-Income Vulnerable Neighborhoods in the Southern Periphery of Madrid

José Juan Osés Bermejo

Universidad Carlos III de Madrid

Public policies addressing both the underlying causes of energy poverty and the mitigation of its consequences have become increasingly prevalent in Europe over the past decade. These policies typically seek to democratize technological and architectural solutions for enhancing energy efficiency, along with providing cost-saving alternatives for domestic energy consumption. Consequently, they implore relevant sociopolitical actors to ensure accessibility of these solutions to vulnerable social groups enduring the most severe impacts of climate change, residential segregation dynamics, substandard housing conditions, and ultimately, poverty and/or social exclusion. Despite the frequent utilization of qualitative methods in evaluating energy poverty policies and programs, studies that aim to assess their outcomes often neglect the emotional dynamics that sustain the management of the "energy poor" stigma among the beneficiaries of specific interventions. Drawing upon evidence from a recent qualitative study that evaluates the outcomes of an energy poverty program implemented in two low-income neighborhoods of a peripheral municipality in southern Madrid, this contribution aims to elucidate the development of management modalities for the "energy poor" stigma. It emphasizes both the social-objective and subjective dimensions underlying the formation and development of these modalities. Emotions such as guilt, shame, pride, resentment, and despair prominently emerge in this context.

RN11 | T04_03: Collective emotions

Emotions: A Motivation for Action and a Sustaining Force for Citizens' Informal Activities in Times of Crisis

Magdalena Šťovíčková Jantulová

Charles University Faculty of Humanities, Czech Republic

Over the past few years, we have repeatedly faced the challenge of mobilizing resources and coordinating responses to the needs arising from social crises. Experience has shown that some of the key actors capable of responding quickly to emerging humanitarian crises are informal volunteers who offer their time and skills outside the framework of existing organizations, for the benefit of others, often unknown to them and free of charge. In presentation, I will explore the importance of emotions and show that they can play a crucial role in mobilizing and sustaining informal volunteering in crisis situations that without them these activities could not exist. The presentation focuses on informal volunteering during the Covid 19 and the refugee wave associated with the war in Ukraine in the Czech Republic. The data for this presentation consists of twenty case studies of informal volunteering. In my presentation, I address three themes: First, I discuss the importance of emotions as a motivating factor for volunteers who take on duties usually performed by governmental or NPO during crises. Specifically, I will focus on volunteers' empathy, their anger towards the state for not fulfilling its role and their fear of the crisis itself. Second, I examine how empathy, as well as anger or fear, leads to sustained voluntary activity as volunteers made sense of their emotions through their actions. Finally, I show how informal volunteering also created a new space for sociability and community due to the strong emotional and relational bonds that volunteers form with those they helped.

Localizing the Uprisings: Affective Politics of Solidarity and Contention among Turkey's Post-Gezi Local Urban Alliances

Derya Özkaya

University of Graz, Austria

Following the violent evacuation of the occupations during the summer of 2013, Turkey has witnessed a proliferation of self-organized local networks of political activism. While these networks have functioned as spheres of solidarity and togetherness mobilizing a new political language, they have also developed alternative strategies for reclaiming democracy in times of Turkey's authoritarian transformation. This paper delves into the aftermath of Turkey's Gezi uprisings, spanning two years, focusing on these

358

post-occupy local urban alliances that eventually became the main actors of urban resistance and political opposition. Unpacking the components of affective atmospheres that are reproduced through these collective experiences, it addresses how acting and feeling in alliances enrich or limit the alternative political imaginations in the pursuit of democracy. Its methodology is situated on nine months of ethnographic fieldwork in two cities, Istanbul, and a central Anatolian town, Eskişehir, in 2016 and 2017. Building on the analysis of in-depth interviews and informal conversations with the members of these local alliances and participant observation during their regular meetings and public events, the paper first revisits the post-Gezi political climate's promising potential to broaden the oppositional political field and discusses if and how collective emotions mobilized through these alliances—enthusiasm, belonging, pleasure, trust, care, solidarity, hope, and so on—contributed to envisage a new understanding of democratization from below. Then, it scrutinizes how this potential was soon replaced by the reproduction of conventional ways of doing politics shaped around parliamentary ambitions. Lastly, it discusses the possibility of establishing alternative modes of political relations going beyond temporary alliances at either local or national levels.

Navigating Affective Polarisation: Populism, Emotions and Political Tensions in Small-Town Poland

Aleksandra Maria Szymczyk

University of Manchester, United Kingdom

This paper brings into focus the central role of emotions in political polarisation amid heightened political tension in the run-up to the parliamentary elections in Poland in October 2023. Based on 13 months of ethnographic fieldwork in a small town in north-central Poland, I look at the affective dimensions of populist mobilisation and everyday politics in the eighth year of the rule of illiberal right-wing Law and Justice (PiS). PiS's rise to power has been seen as emblematic of a crisis of the hegemonic ideal of European liberal democracy that emerged during Poland's post-1989 'transition' period. The two terms of PiS rule have been dominated by controversy and protests over the rule of law, disregard for liberal democratic principles and repeated clashes with the EU. On the one hand, there is mounting concern over deepening political divisions resulting in an atmosphere of tension and distrust, as well as an erosion of civic community. On the other, there is recognition that the attendant emotions, such as fear and anger, have led to an unprecedented degree of political mobilisation.

Through interviews, participant observation and analysis of mediascapes, the paper looks at the emotions involved in grounded negotiations of polarisation amongst a small-town community and local political actors. Moreover, I examine the role of dialogue in efforts to reduce affective polarisation. I also reflect on the emotional labour of the researcher during ethnographic encounters involved in politically engaged research and the epistemological consequences of the affective space in which an interaction is situated.

Ayatollah Sistani's Emotional Entrepreneurism During the Jihad Against ISIS 2014-2017

Ali Alsayegh

Institute of Arab and Islamic Studies, University of Exeter, United Kingdom

In 2014, Grand Ayatollah Sistani announced a call to jihad against ISIS. In response, hundreds of thousands of his followers and other Shia volunteered with the Iraqi Security Forces, or non-state militias, to partake in the fight against the terrorist group. The jihad fatwa (edict) unleashed very powerful emotions such as anger, fear, pride, hope, and joy to motivate his followers to answer his call to action. However, without the continuous re-invocation of these emotions over the three-year period of the gruesomely fear-invoking war, their empowering effects would have certainly lessened or disappeared. In recognition of this potentiality, Sistani created a system of emotional sustainment to maintain the mujahideen's (fighters) morale during the war.

By conducting and analysing 40 semi-structured interviews with Sistani followers, seminary students and personalities during 2022 in Iraq, this paper seeks to sketch out how this system of motivation was manifested. Doing so means not only highlighting the specific empowering emotions Sistani and his networks stimulated, but also, how they did so through discourse and action, such as Sistani's one-on-one interactions with his mujahideen (fighters), sending motivational preachers to the frontlines of war to deploy encouragement mechanisms, and the emotional effect of logistics support provision. This work also aims to provide greater nuance to the understanding of emotions by underscoring how there exists a variety of different types of emotions from within the same emotive category (e.g. the 'hope' of inevitable victory is not the same, ontologically and functionally, as the 'hope' of martyrdom). The paper will do this by shedding light upon the dispiriting emotions each empowering emotion specifically counteracts in the quest to motivate Sistani's mujahideen.

RN11 | T05_01: Family, Gender and Emotions

"The Emotionally Regulated Child as Ideal Neoliberal Welfare State Subject"

Tale Steen-Johnsen, Lisbeth Ljosdal Skreland, May-Linda Magnussen

University of Agder, Norway

In this article, we use theory from sociologists Eva Illouz, Edgar Cabanas and Arlie Hochschild to shed light on how the emotionally regulated child has become an ideal in the modern, shifting, neoliberal welfare society. These theorists enable us to see how an emotionally regulated human being is an ideal subject in a market-driven society, where flexibility and adaptability are valuable qualities that make one successful. The regulated individual will seek internal solutions to structural challenges, also in challenging times, and is thus an well-functioning member of society. The well-regulated subject rarely protests or leaches her frustration outward. In this article, we show through empirical examples how welfare state interventions in Norway seek to support the development of emotionally regulated children. We refer to our own studies of trauma-informed care, ICDP (course in parental guidance) and lifeskills trainings in kindergarten to show that the emotionally regulated child has become an ideal for social programs and interventions in Early childhood Education and Care institutions. Read in the light of Illouz Cabanas and Hochschild, we can understand how the effort to create ideal neoliberal welfare subjects who seeks internal psychological solutions to her troubles, starts already in early childhood institutions.

"What if Carolina could Communicate her Emotions?" Girls Already Mothers

Dina De Carvalho

Instituto politécnico de viana do castelo, Portugal

In this study, we were concerned with analyzing the life narratives of adolescent girls-mothers and fathers, based on their stories, their voices, and the terms in which they narrate their experiences. We wanted to explore themes that are not usually addressed in studies on teenage pregnancy, and that require attention to the actors' voice and listening to it. It should be noted that we were based on an approach inspired by grounded theory. We will say that pregnancy presents itself as a stage of discovery for girl-mothers. There are sorrows, doubts, uncertainties that will progressively cease to exist in order to be able to build their own pregnancy. Temporarily, we are facing a phase outlined with the appearance of changes, whether physical or psychological, which will lead to moments in the lives of these peculiar adolescents, which will gradually allow teaching the young woman to be a mother or, alternatively, the rejection of pregnancy and motherhood. In the first case, which corresponds to most of the situations that were studied, the maternity project would end up being assumed, albeit through different trajectories.

Opening the Toilet's Door: Gendered Politics of Emotion Towards Excretions and Lavatories

Galia Ankori[1,2], Tamar Hager[1]

1Tel-Hai College; 2Child and Adolescence Mental Health Clinic of Maccabi Health Services, Sderot Binyamin 21 Netanya 4231111, Israel

This article analyzes the gendered politics of emotions of young Israeli women and men regarding toilet use and excretion. Highlighting the impact of gender, we avoided addressing intersectional dimensions, interviewing twenty white middle-class heterosexual Jewish Israelis about their toilet habits. We noticed three recurring themes: 1) All informants addressed the need for a certain level of lavatories' cleanliness, expressing feelings of disgust towards excretions and filthy toilets; 2) they claimed the importance of privacy and anonymity, describing the feeling of embarrassment whenever they feared being identified by others and 3) they infer indirectly to feelings of shame when diverting accepted social norms of toilet use. Although most informants shared these concerns, clear gender differences were also evident. Men and women differed in what they consider as socially and politically tolerable and legitimate levels of filth, social exposure, and defiance of social rules regarding urination, defecation, and toilet use. Moreover, despite general acceptance and compliance with the deep-rooted social norms and emotions, most of the informants, principally the women, conveyed a more intricate position. Identifying toilet habits as a mechanism of control intended primarily to subjugate women, they contested their own compliance by reflecting at times on their oppression. This paper attempts to offer directions toward greater equality between women and men, behind and beyond the toilet's door.

Who Cares? Relationship Between Gender, Emotional Support And Positive Emotions In Space Analog Missions

Inga Popovaite[1], Agnieszka Skorupa[2], Mateusz Paliga[2]

1Kaunas university of technology, Lithuania; 2University of Silesia in Katowice

We explore the relationship between gender, instrumental status, and emotional support in a space analog environment. Overwhelming emotional labor can potentially lead

to deteriorated emotional health and that is an important issue for long duration space missions (Alfano et al. 2018). Research shows that in mixed gender teams in space analog environments women are more interpersonal, caring, other-oriented than men (Bishop 2004). It suggests gendered emotional labor distribution in space analog environments but there is a lack of studies that specifically investigate this. It is important because overwhelming emotional labor in some cases can lead to deteriorated emotional well being (Erickson 2001).

Data come from 8 two-week long analog missions (n=43) that occurred in 2022-2023 in LunAres, an analog research base in Poland. We use self-administered questionnaires and regression models and our results indicate that women are seen as providing more emotional support, and while providing emotional support is overall positively linked with positive emotions, for women this relationship is negative. We discuss implications of these results for space missions.

RN11 | T05_02: Emotions in Digital Life

Constituting Affective Treatment: Affect, the Digital, And Sensuous Scenes

Taoyi Yang, Christian von Scheve

Freie Universität Berlin, Germany

The advent of digital technologies and media has profoundly changed the practices of (health)care and treatment. Doing physiotherapy at home while watching an instructor on health Apps, scrolling through aesthetically appealing, high-resolution close-ups of cuisine on social media, or listening to ambient sounds – all examples can be understood as practices geared towards inducing specific affective reactions, typically those increasing positive affect and overall well-being. Our paper proposes the concept of affective treatment to better understand those non-clinical, digital practices that aim for specific affective outcomes such as alleviating discomfort or lifting one's spirits. Although most forms of treatment and care boast an affective component, our concept focuses specifically on those practices to which affect is central. Drawing on digital ethnographic fieldwork, dramaturgical analysis, and the concept of affective arrangements, we suggest an understanding of the digital practices of affective treatment through sensuous scenes. Sensuous scenes are socio-material settings where and when digital practices occur, sensorially arranging interactions between digital users, digital technologies, and situated surroundings (e.g. a sofa, a picture) for affective treatment. Our analysis reveals three prototypical sensuous scenes that constitute affective treatment: First, the affective potentiality of certain sensuous scenes is closely intertwined with popular knowledge of health and well-being, and this knowledge is enacted in practices of affective treatment. Second, the affective relationality of digital content and situated engagement conjures imageries of past experiences and imaginaries of future life or other people that move individuals to care and feel cared for. Third, certain sensuous scenes are mostly void of linguistic meaning and semantics, gain their affective traction, and "heal" individuals almost exclusively through senses.

Digital Emotions, Social Sciences and Trust 4.0

Adrian Scribano

CONICET National Council for Scientific and Technical Research, Argentine Republic

Today it is common to read or hear about the revolution or society 4.0 (5.0,6.0) The virtual/mobile/digital revolution implies modifications in the management of work, social relations and obviously new politics of sensibilities are being developed. One of the most important aspects of the

361

advent of companies 4.0 is the rapid development of social media and the enormous growth of marketing and business value. Interactions between the face-to-face social world, the virtual world, and the "mobile" world of cell phones and tablets have grown exponentially.

In the above context, this presentation aims to answer, in a summary way, the following question: What are the connections between emotions, social sciences and trust in today's virtual/mobile/digital world?

To answer the question, the following argumentative strategy was constructed: a) the connections between emotions and the digital revolution are theoretically characterized, b) a look at the central place of the social sciences to develop trust in the digital world is synthesized, and c) some questions are formulated as challenges/agenda for the sociology of emotions in the drawn horizon.

It concludes by drawing attention to the importance of the sociology of emotions as a critical instrument for understanding our "new" ways of trusting science

Emotional Escalation On Social Media During Times Of Political Polarization

Rotem Leshem

Tel Aviv University, Israel

This study examines the role emotions play in reflecting and amplifying sociopolitical turmoil and polarization on social media. Israel 2017-2023 illustrates an intriguing case study, where social media echoed the emotional upheaval of a period of intense instability marked by five consecutive elections. This period has seen a criminal investigation launched against the Prime Minister, a global pandemic, and a protest sparked by an attempt at judicial reform.

My analysis uses a keyword-based dataset of over 10 million Hebrew tweets. Each tweet contains at least one emotive (i.e., emotional expression) associated with a negative reaction to social reality (for example, shame, painful, disgusting, etc). To evaluate how emotives circulate and expand on the social platform over time, I compared tweets from popular users (such as journalists, politicians, etc.) with those from average users. The analysis examines both frequency and engagement patterns as well as narrative performances in selected tweets.

According to preliminary findings, negative emotives have shifted from being dominated by popular users to being expressed more frequently and with higher engagement rates by regular users. It has been gradually occurring since 2019, with heated emotives becoming more actively used by users, mobilized in a manner that fuels contested events with polarizing affects and narratives. These findings suggest that the X (formerly Twitter) sphere in Hebrew is becoming more emotionally charged in a negative way, thereby reflecting and exacerbating political polarization.

Feeling Meritocracy? The Role of Affects in the Transmission of Meritocratic Beliefs on Social Media

Chiara Osorio Krauter

Humboldt University of Berlin

Recent studies show that the media is crucial for the transmission of meritocratic values (Carbone and Mijs, 2022). With the emergence of digital platforms, social media and online spaces they contribute significantly in this regard (Taylor and O'Brien, 2017; Paul 2018). Hashtags such as #studywithme and #studylife reveal millions of videos on TikTok, Instagram, Twitter, and YouTube aligned with meritocracy's core idea. This suggests that social media plays a role in promoting meritocracy, raising the question of the transmission of these beliefs. However, an analysis of how meritocratic beliefs are transmitted through social media is lacking. I argue that emotions and affects play a pivotal role in the transmission of meritocratic beliefs in social media.

To explore this, I use a case study approach to examine videos and comment sections of two top study content creators, @Marve and @Abao, on YouTube. Comments serve as linguistic material for tracing online affective processes (Massumi 2002).

The analysis reveals the transmission of meritocratic values through interactional rituals, highlighting unique aspects of #studywithme videos. Despite the absence of physical co-presence, these videos establish a shared focus on the productive and disciplined body through meticulous camera work. They create a shared mood and bodily experience, fostering collective engagement and motivation among viewers. The aestheticization of hard work and the comforting atmosphere play a central role in meritocratic value transmission through affect. Furthermore, while online spaces may appear free of barriers to outsiders, I argue that lifestyle representations in studytube videos inadvertently construct barriers. This leads to a 'meritocratic feeling' that cultivates its values. These findings stress the importance of studying emotions and affects as integral components of social order.

362

RN11 | T05_03: Migration, Place Making and Emotions

Emotional Dimensions of High-Skilled Migration

Seda Guven[1], Fuat Gullupinar[2]

1Anadolu University, Turkiye; 2Anadolu University, Turkiye

Emotions play a crucial role in shaping our daily lives and influencing the decisions we make. This emotional dimension is particularly evident in the process of migration, which inherently involves a diverse range of experiences, each accompanied by a spectrum of emotions. Whether driven by voluntary or forced motivations, individuals embarking on a migration journey undergo a range of emotions such as hope, anger, anxiety, happiness, loneliness, and nostalgia. This emotional element becomes especially significant in the context of transnational family dynamics, interactions with host societies, relationships within communities of origin, and connections with left-behind kin.

This study contributes to the existing literature by focusing on the emotional dimension of high-skilled migration and how the experiences of transnational high-skilled migrants are shaped by emotions. The purpose of the study is to understand the emotional motivations behind migration decisions, emotional ties with the country of origin, emotional dynamics—conflicts and negotiations—in migrant families and relationships, and emotional coping strategies employed. In this qualitative study, the data will be collected through semi-structured online in-depth interviews with highly skilled immigrants who have migrated to the United States from Turkiye, identified through snowball sampling. To enhance the depth of our findings, we will also gather audio diaries from participants at a later stage, following online interviews. This additional method aims to capture and delve into the participants' daily life emotional experiences, thereby enriching the overall dataset.

Survivor's Guilt? Emotional Dimension of Ukrainian Refugees' Sense of Belonging in Host Countries

Valeria Lazarenko

Humboldt University of Berlin, Germany

As the second anniversary of Russia's full-scale invasion of Ukraine approaches, host countries are reassessing their approach to refugee reception, moving from humanitarian protection to integration of those who have chosen to stay. Meanwhile, millions of refugees remain in a liminal position, living under 'temporary protection' in safe countries. As a consequence, such liminality leads to a transformation of refugees' sense of belonging, fuelled by of guilt, defined as both a self-conscious emotion and 'an unpleasant feeling accompanied by a belief that one should have thought, felt or acted differently' (Kubany and Watson, 2003).

Drawing on ongoing longitudinal case study ethnographic research into the personal experiences of Ukrainian refugee women in Berlin, the paper will focus on their feelings of guilt and it's relationship to feelings of (non)belonging. The data, collected repeatedly in late 2022 and late 2023, show that the experienced guilt is a complex multifaceted feeling, referring not only to the personal fact of survival, but also to feelings towards Ukrainian society (for staying safe, living a peaceful life, being detached from Ukrainian society and 'not doing enough to support the country'), and towards the society of the host country (for remaining 'a guest' and being a passive recipient of social benefits). The paper will explore this shared emotion and also highlight volunteering and civic activism as coping strategies used by Ukrainian refugees to overcome feelings of guilt and non-belonging to either Ukrainian or German society.

Learning From Affect. How Relationality And Emotions Matter In Place(making)

Naomi Rommens, Seline Westerhof, Beitske Boonstra

Erasmus University Rotterdam, Netherlands, The

Conflicts between citizens and governments are a recurring phenomenon in spatial development (Visser et al., 2019). When such 'participatory' conflicts arise, a common response of governments is to reiterate the rationality behind development plans. The laws, borders and limitations of the projects are once more explained. This is problematic, we argue, as this response does not acknowledge affective dimensions that come into play in the multitude of ways people relate to places or environments. The emotions, connected to memories, experiences, hopes, i.e., all that encompasses 'sense-of-place', are hardly recognized in bureaucratic reasoning wherein 'participation' is practiced. Consequently, citizens feel disengaged and frustrated with the processes and its stakeholders.

This paper argues that these affective aspects must become better recognised in participatory processes, enhancing people's attachment to a place, their informal relationships, and subsequently, their willingness to engage. This greater awareness of the interrelations between the human(s) and non-human (Latour, 2017) is substantial. Participation in spatial development is, after all, a people-place-relational endeavour.

In this study, we learn from inspiring practices of affect in placemaking, that centres community-driven transformations of spaces into meaningful places (Rommens et al., 2022). We take an inductive and qualitative approach on placemaking initiatives with different phases and governance approaches (top-down, market-driven, bottom-up) in three Dutch municipalities. By conducting interviews, photovoice, participatory mapping and document analysis, we learn how placemaking gives shape and space to affectivity, lessons that can add to the broader spatial participatory literature and practice.

363

RN11 | T06_01: Love, Trust, Wisdom, Loneliness

Memories of love. Exploring the Three Roles of (Emotion) Memories in Love Relationships

Swen Seebach[1], Natàlia Cantó Milà[2]

1UNIVERSITAT ABAT OLIBA CEU, Spain; 2Universitat Oberta de Catalunya, Spain

This presentation delves into the multifaceted roles that emotion memories play within the context of love relationships. This research examines three distinct roles that memories might play in love relationships, shaping their dynamics and outcomes.

The first role explores how emotion memories serve as reinforcements of love, acting as nourishment for the present and providing a deeper, more profound meaning to the relationship. By analyzing the positive emotional imprints (Ahmed 2000) from shared experiences, we can better understand how these memories contribute to the ongoing narrative of love. Conversely, the second role investigates the potential hindrance that emotion memories can pose. Emotion memories encapsulate moments that are left behind, carrying the weight of past conflicts, challenges, or disappointments. Unresolved emotions from these memories may act as stumbling blocks, impacting the present dynamics of the relationship. Understanding and addressing these hindrances are crucial for fostering healthy and resilient love connections.

The third role delves into the aspect of emotion memories as expectations within a relationship. Memories may shape the anticipation of what a relationship should be or what it will become. By viewing memories as integral parts of the love story—akin to a myth—we can unravel the narratives that influence partners' expectations and perceptions of their relationship's trajectory.

In conclusion, this presentation argues that a comprehensive analysis of emotion memories is essential for understanding love relationships. By viewing memories and emotion memories as integral components of a broader narrative encompassing love as a story, a myth, and a reality, we can gain insights into the complex interplay between past experiences and present dynamics in romantic partnerships.

Wisdom and Emotions: A Process-Relational View from the Sociology of Emotions

Jonathan G. Heaney

Queen's University Belfast

The study of wisdom has been growing exponentially over recent years. No longer seen in exclusively philosophical or theological terms, there is now a wide-ranging, international, and multidisciplinary 'science of wisdom' emerging. The dominant approaches to wisdom currently seem to come from cognitive science, psychology, neuroscience, education, organization and leadership studies, and gerontology. Increasingly, there seems to be a shift towards the operationalization and measurement of wisdom where psychometric approaches, coupled with cognitive-psychological conceptualizations of wisdom and its elements (including emotion), are to the fore. However, it is puzzling that, given this growth, and the widespread, albeit often passing, acknowledgment of the importance of 'social' considerations within this literature, that the sociology of wisdom remains almost entirely absent from this emerging field (Grossman etal, 2020). The exception is the work of Ricca Edmondson (2005, 2013; Edmondson & Wörner, 2019). Moreover, while the importance of emotion to the practice of wisdom is also widely acknowledged (e.g. Ardelt & Ferrari, 2014; Kunzmann & Glück, 2019), from a sociological perspective, this treatment is often problematic. For instance, in most models where it is included as a dimension or component of wisdom, emotional life is reduced to 'emotional regulation', 'emotional intelligence' or 'emotional homeostasis' (recalling older, recently fashionable Stoic ideas about emotion), or core emotions associated with wisdom, such as empathy, sympathy, and compassion, are often conflated, confused, or remain vague. In this paper, building on the sociocultural approach advocated by Edmondson, and arguing from specifically (emotions) sociological perspective that draws on relational sociology, I aim to theoretically explore the practice of (practical) wisdom in terms of the 'wise habitus', the 'wise situation', and cultural, emotional, and symbolic capital.

364

A Study on the Relationship Between Perceived Social Class, Social Trust, and Happiness Inequality in Türkiye

Hilal Arslan

Hacettepe University Institute of Population Studies, Turkiye

The empirical findings from national and international comparative studies indicate a positive correlation between high levels of social trust and subjective well-being. In societies where trust in others and institutions prevails, individuals often report greater life satisfaction and happiness. Conversely, a lack of social trust is frequently associated with lower subjective well-being, reflecting feelings of insecurity and diminished overall life contentment. These factors, in turn, impact the distribution of well-being across different socio-economic and socio-demographic groups. However, the role of perceived social class status is crucial in explaining this relationship, as individuals' beliefs about their socio-economic standing can influence the impact of trust on well-being. This study aims to examine the relationship between perceived mobility, social trust, and the distribution of happiness among socio-demographic groups rich in individual resources and those poor in resources in Türkiye, a country characterized by a neoliberal authoritarian system. Utilizing quantitative secondary data analysis

with the most current microdata sets of TURKSTAT Life Satisfaction Survey and the World Values Survey, comparative descriptive analyses and multivariate statistical models reveal a negative effect of social trust on happiness inequality in resource-rich socio-demographic groups with characteristics such as high educational attainment, subjective upper and upper-middle class positions, regular employment with social security, and a high level of satisfaction with the household's financial situation. Moreover, this effect varies due to the mediating and moderating roles of perceived social class.

The Perils of Loneliness: Exploring the Dilemmas and Possibilities for Affective Politics

Cihan Erdal

Carleton University, Canada

This study examines young activists' affective, relational, gendered, and temporal experiences of acting and thinking with others exposed to various forms of social suffering, unveiling the constraints within the struggles for appearance. Through the development of a hermeneutic investigation that integrates the phenomenological perspectives of Paul Ricoeur, Hannah Arendt, Achille Mbembe, and Sara Ahmed, the paper poses the question: How do the reflexive processes and affective engagement of young people with those suffering from rightlessness influence the potency of activist youth agency in confronting social and epistemic inequalities within a neoliberal context? The paper posits that the negative affective signs, including guilt, shame, exhaustion, depression, and burnout among the youth narratives, must be taken seriously, as the movement of these emotions in the intersubjective zones of activist spaces exacerbates the problem of loneliness in an Arendtian sense. The concept of activist youth loneliness is presented as a political phenomenon, resulting in a loss of trust not only in the selves of young people but also in others as allies, potentially hindering the development of world-building practices. Furthermore, the paper elucidates the affective antidotes as both actual and possible responses stemming from youth-led radical democratic spaces against the symptoms of rightlessness under neoliberalism. The analysis draws on the findings of the author's doctoral fieldwork, conducted between July 2020 and May 2022, consisting of in-depth interviews with youth (aged 18 to 34) who are striving for radical social change in European cities of Athens, Berlin, Istanbul, and Paris during the 2010s and 2020s.

RN11 | T06_02: Media and Emotions

Sincere Conversations in Public: The Origins And Meanings of Emotional Media Under War

Julia Lerner[1], Anna Novikova[2]

1Ben-Gurion University of the Negev, Israel; 2Higher School of Economics, Russia

During the initial months of the Russian war in Ukraine, millions of Russian-speaking viewers, both in Russia and abroad, became hooked on a particular YouTube format. The format consisted of 1-2 hour videos that featured staged dialogues between a journalist and prominent figures in contemporary Russian public life. It blends personal conversation with political expression in a way that is new to Russian-language media. Moreover, in a while, the genre was adopted by both liberal anti-war (ex. Skazi Gordeevoy, vDud') and pro-state patriotic (ex. Empatiya Manuchi) perspectives on the Russian cultural condition, political regime, and the violent events. If, in the first case, these conversations serve as collective moral therapy at the moment of political violence, in the second case, they transform political dogmatic messages into sincere emotional expressions.

This talk explores the origins and meanings of a particular genre of public self-reflection in both Russian and Western media. It highlights the genre's significance in light of contemporary processes of emotionalizing public domains (Lerner and Rivkin-Fish 2021, Illouz 2023), the culture of staged sincerity, and the dominance of therapeutic-psychological formats (Furedi 2004, Illouz 2003). Informed by politics and collective historical narratives on one hand, and intimate memories and personal moral dilemmas on the other, the genre of sincere emotional interviews has become a form of political defiance (Katriel 2021), moral collective therapy, but also an emotional effort of conformity. The analysis challenges the perception that emotional personal expression is apolitical and instead highlights its ideological, political (Tucker 2018), and also moral significance in the contemporary global context of psychologized political self, as well as in the violent context of war and national rupture.

365

Newspapers Narratives on Anti-government Protests in Slovenia: The Intersection of Subjective Strategies and Public Emotions

Barbara Gornik

Science and Research Centre Koper, Slovenia

Journalists just like other people, use and create narratives to remind, argue, legitimise, persuade, engage or even misinform the recipients of messages. The narratives they produce are strategic, functional, and purposeful – narratives do political work. The paper views narratives as socially embedded units, enmeshed in the local context and do not stand freely or are separated from the context. It examines emotional dimensions of media narratives on anti-government protests that emerged in Slovenia during the Covid 19 pandemic. The analysis is based on a combination of qualitative content analysis of newspaper articles about protests that appeared in Delo, Mladina and Demokracija in 2020 and semi-structured interviews with 20 journalists who wrote about these topics. The analysis looks at the emotional content in the newspaper articles and discusses it at the intersection of the journalists' subjective experiences, perspectives and strategies to create public emotions. The paper sheds light on journalists' views to explain how the surrounding (institutional) context influences the emotional aspects of media narratives, the telling of a story and the way it is told. Furthermore, it aims to discuss the dynamics between the micro and macro levels of journalists' (inter) actions as a crucial aspect that brings in the strategic dimensions of journalistic exploitation of emotions in the media narratives to counter, suppress, damage or facilitate social movements and thus influence processes of democratic strengthening and/or decline.

Digital Structural Violence-- – Aftermath of Emergency Remote Teaching on Students' Learning

Eunice Yin Yung Chiu

Universität Heidelberg, Germany

It has been three years since emergency remote teaching (ERT) was implemented due to covid-19. The suspension of traditional schooling has brought disruption on students' learning on multiple aspects including cognitive development, social skills and emotional literacy. The aftermath of the abrupt switch from in-person schooling to a virtual environment is manifested in the further widened attainment gap in classrooms. As noted by Farmer (2004), structural violence takes on a new form every era. The linkage students' socio-economic status (SES) and academic achievements have been discussed by numerous researchers. ERT has arguably interweaved the inequalities embedded within intersectionality that students belong in. Such digital structural violence impedes the learning of certain students, particularly those embodying specific social identities: low SES, special learning needs and with migration backgrounds. These groups of students are most neglected during ERT, their socio-psychological development and learning needs are often overlooked by other basic needs such as access to materials and resources. This research is qualitative-based, in-depth interviews were conducted on five secondary school teachers in Hong Kong and Singapore. The study reveals that i. students across intersectionality experienced an obvious drop in learning motivation; ii. structural violence has taken a digitised form, it is assembling multiple inequalities at once and ultimately harming students' learning; iii. the teacher-informants are most concerned about the depreciating emotional literacy of students and find it the most urgent yet the hardest learning loss to provide remedies for. As digitalisation of education has become an inevitable phenomenon, this research urges education policymakers to take actions regarding digital structural violence and ensure provision of quality education to all students.

Ecological Grief and Solastalgia. Emotions in View of Extinction and Environmental Loss

Julia Böcker

Leuphana University Lueneburg, Germany

The socio-ecological transformations caused by the climate change are not only accompanied by emotions such as anger, fear, and sorrow but also by feelings of grief and sadness. People around the globe anticipate and experience the loss of what is commonly referred to as 'nature', e.g., natural entities and environments, that also provide them with a home, a social or cultural identity, and a future.

People inhabiting the Harz Mountains in Germany mourn the dying forest. In 2019, in Iceland and Switzerland funerals for glaciers were held, marking their loss in public rituals (Schmidt 2021). Members of the Birth Strike movement mourn the decision to not have kids due to environmental conditions. The objects of loss, as these few examples show, differ regarding their materiality and the ascribed social meaning, value, and impact. Further, feelings of ecological grief on a micro level differ from their articulation and popularisation in public, also feeding into "politics of loss" (Eliott 2018) that touch upon the question whose naturecultural losses are acknowledged, prevented, and compensated and whose not.

The paper presents a sociological perspective on grief, sadness and mourning as common "climate emotions" (Neckel & Hasenfratz 2021). It will engage with concepts such as "ecological grief" (Cunsolo & Ellis 2018) and "solastalgia" (Albrecht 2007) – a term describing the emotional distress caused by environmental changes to home environments – to highlight and further develop their potential for sociological research on feelings and emotions in view of extinction and environmental loss.

RN11 | T07_01: Unequality and Emotions

Emotional Gifts At Work: Examining Inclusive Sympathy Towards Hard Of Hearing Employees

Ida Friis Thing

University of Copenhagen, Denmark

Research demonstrates that disabled people, across different functional impairments, encounter social exclusion in the workplace. But why is achieving inclusivity so challenging? Focusing on the case of hard-of-hearing employees and drawing insights from sociology of emotions and micro sociology, I examine the cost of inclusive sympathy and its influence on inclusion of employees with communication disabilities in the workplace. Through ethnographic fieldwork conducted in two workplaces and 29 interviews involving hard-of-hearing employees, colleagues, and managers, I find that demonstrating inclusive sympathy carries costs in areas such as rhythmic entrainment during interaction, emotional drain, and inconvenience. The cost of displaying sympathy hinders employees from participating in the interactional struggle to include hard-of-hearing individuals, consequently resulting in situational exclusion for this group. In general, these findings suggest that the cost of showing sympathy prevents employees from including colleagues with communication disabilities, despite their agreement with the feeling rule of inclusive sympathy as an obligation towards people with disabilities. These results challenge practitioners' assumptions regarding the lack of knowledge about disabilities as the reason for exclusion and suggest structural changes at the company level to avoid reliance on individual employees for achieving inclusion.

Emotions and the Normative Paradox of Unmet Equality Expectations – A View from the Periphery

Katrin Grossmann, Christoph Hedtke, Astrid Heck

University of Applied Sciences Erfurt, Germany

"It's getting less and less by the year," said an interview partner in a so-called "structurally weak" region in Germany, referring to the omnipresent perception of loss in his community: outmigration, declining infrastructure, decrease of vitality. Others report on unequal chances in the labour, housing, and real estate market, in the distribution of resources and burdens. These are also the regions where the far right achieves electoral success, coined lately as the revenge of the places that don't matter (Rodríguez-Pose 2018).

Most scholarly work seeks explanations for this in (perceived) growing distributional inequality, and the fear of a loss of material resources (Nachtwey 2016, Heitmeyer 2018). Others emphasize the emotional experience of decline, of feeling overlooked and neglected by politicians. Foroutan (2019) highlights that the promise of equality in a rather unequal reality forms a normative paradox that evokes feelings that can be successfully utilized by the far right. Peripheralization, a process of being cut off from resources and becoming increasingly dependent on the core, the regional and national governments, institutions, and economic players (Kühn 2015), plays a central role here. Emotions of embitterment (Hannemann et al. 2023) and resentment (Hochschild 2016) have been described as outcomes of lived experiences in the periphery.

Building on qualitative work in peripheralized localities in Germany, we disentangle the relation between emotions, place, and the unmet expectations of the normative promise of equality in explaining why a rather distinct number of people express a distance towards democratic institutions and are open to nationalist-authoritarian offers. Emotions here are an entry point to understanding the role of peripheralization in growing distrust in democratic institutions.

Feeling Black in University

Rae-Anne Janay Cohen

King's College London, United Kingdom

This presentation aims to thoroughly explore the intricate relationship between race and emotions, leveraging insights from my PhD thesis centred on the emotional experiences of Black students within an elite London university. While providing a concise overview of the research, the primary focus will be on delving into empirical data presented through narratives. This approach aims to unravel the unique emotional landscapes experienced and expressed by Black students offering a deep dive into the intersectionality and individuality encapsulated in the experiences of 'being Black' within elite academic spaces. This talk will not focus on one particular emotion but will highlight the vast emotional spectrum, capturing the nuances of joy, resilience, anger, frustration, comfort and more.

Marrying theoretical frameworks and historical examples of emotions tied to racial identity, the talk will illuminate how racialised emotions resonate at both the individual level and within the broader social collective of Black communities. By sharing these narratives, this talk will contribute to the developing academic field of sociology of emotions. Furthermore, it will provide a critical examination of the emotional wellbeing of Black students within elite British universities, pressing the need for holistic support systems in these spaces. Attendees will gain profound insight into the multifaceted nature of racialised emotions, prompting reflection on the implications for cultivating truly inclusive and equitable educational environments.

367

The (Limited) Space Of Anger: Unequal Conditions Of Anger Across Different Social Positions In Society

Betül Özkaya

Aalborg University, Denmark

Anger is an emotion that is often associated with experiences of injustice and can be a breeding ground for agency. Anger therefore has an important potential to create change, for whom its power is available. Building on theories in the sociology of emotions, this article analyzes the unequal conditions of anger based on interview data (50) and diary studies (30) collected in Denmark. The results show that young men with a minority ethnic background, who also have a darker skin color, find it more difficult to make use of the potential of anger when they encounter injustices in their everyday lives. This is firstly because young men with a minority ethnic background lack a language for anger. This is partly due to the fact that some of these young men learn from home to hold back their anger in the majority Danish society – in other words, they learn to overcompensate for their background and appearance through tight emotion regulation. This results in the second point of the article, which through empirical analysis shows how these young men in many aspects of their everyday lives encounter structural injustice that makes them angry, but which they choose not to express – because the consequences are too big if they do. The final point of the article is that when these young men do (finally) express their anger, they more often use less legitimate forms of expression in the majority Danish society – which links to the first finding of the analysis, as these young men have less of a language for anger, and the second point, as they often encounter injustices that they do not react to, and therefore do not have the opportunity to "micro-ventilate" their anger on an ongoing basis. All in all, this means that these racialized young men do not have the opportunity to make use of the potential of anger to respond to injustices and thus create change for the structural inequality they are subject to. This results in either a silenced anger or a reproduction of their weak class position through illegitimate anger management.

RN11 | T07_02: Emotions and post-pandemic effects

Putting Emotional Stratification into Context: Anger and Anxiety Disparities in the COVID-19 Pandemic.

Idayane Gonçalves Soares, Philipp Wunderlich, Christian von Scheve

Freie Universität Berlin, Germany

The stratified experience of emotions is a long-standing topic for the Sociology of Emotions and existing theoretical approaches propose several general mechanisms of stratification. However, empirical evidence is mixed and does not always conform to the theoretical expectations. This inconclusiveness may be due to a narrow focus on the emotional implications of persistent socio-structural positions. Instead, we suggest that emotions are often situated responses to specific events and, consequently, research should focus more closely on individual experiences in socio-political contexts. We therefore aim to assess how the COVID-19 pandemic contributed to emotional stratification, using survey data (N=1000). Beyond the expected decrease in negative emotions for those with higher incomes, changes in income resulting from the pandemic played a more substantial role, increasing the experience of anger and anxiety. Mediation analyses revealed that the effect of income loss on anger is partially due to respondents' anger about political measures taken during the pandemic and, to a lesser degree, due to anger about others' behaviors. Similarly, the effect of income loss on anxiety is partially mediated by specific anxieties about economic developments and health. Taken together, these findings suggest that going beyond a broad theoretical perspective on emotional stratification can reveal context-specific stratification effects.

Exploring Playfulness and Emotions in the Classroom Navigating the Post-Pandemic Educational Landscape with (Serious) Games

Giulia Conti

University of Modena and Reggio Emilia, Italy

Playing games generates a plethora of emotions, feelings, affects, and atmospheres. The presentation delves into the reasons why teaching playfulness, even in higher education, remains pertinent. Especially in the context of the COVID-19 pandemic, gamification and game-based learning have emerged as a powerful tool fostering connection despite physical distances, playing a crucial role in maintaining social bonds during these challenging times. A team directed by Giuseppe Riva (Riva et all, 2021) has underscored that

gamers exhibited enhanced performance in both work and academic settings throughout the pandemic. By leveraging the immersive nature of gaming, educators can create engaging learning experiences that resonate with students, fostering a conducive environment for navigating challenging subjects. Utilizing a qualitative research methodology, we aimed to explore the multifaceted impact of gaming in the context of higher education, shedding light on the emotional, and cognitive and sociological dimensions. The presentation will focus on an ongoing research about how to integrate serious games into the academic sphere, and provide a platform to address sensitive topics in the classroom. Focusing on emotions and (shared) feelings into the classroom, the study contends that embracing gaming in education not only addresses the immediate needs imposed by the pandemic but also offers a promising avenue for innovative and effective pedagogical practices.

Making Sense of the Pandemic: Shame Work in an Online COVID Advocacy Group

Maja Sawicka

University of Warsaw, Poland

The term "subaltern counterpublics" was coined by Nancy Fraser to denote "parallel discursive arenas where members of subordinated social groups invent and circulate counterdiscourses, which in turn permit them to formulate oppositional interpretations of their identities, interests and needs" (Fraser, 1990: 67). Subaltern counterpublics represent a social space where meanings and feelings oppositional to the dominant are shaped and shared. Both recent crises experienced worldwide and the prevalence of digital communication can be seen as factors contributing to the proliferation of subaltern counterpublics.

In this presentation, I will investigate the processes of meaning-making in a currently active online COVID advocacy group, resisting the dominant discourse and the definition of the situation that "the pandemic is over" and the infection itself no longer threatening. A key feature of this group is that it insists on sticking to prevention practices, including masking. My focus will be on the collective emotion work performed by the community in digital interactions: how do community members collectively regulate feelings towards COVID-19 to sustain a serious attitude towards the infection and mitigate the effects of shame experienced in interactions with friends, relatives, and strangers?

I will demonstrate that emotion work and its crucial component—shame work—underpin the community's ontological struggle to define the pandemic as still real and relevant. To conclude, I will discuss the importance of collective emotional regulation in the emergence of shared realities in online communities.

Institutional Work and Cultures of Compliance During COVID-19 in Tel Aviv and New Orleans

Vicki Mayer[1], Noa Lavie[2], Zeev Duckworth[1], Paromita Saha[3]

1Tulane University, United States of America; 2Academic College of Tel Aviv − − Yafo; 3Independent

This study merges a neo-institutional framework with the sociology of emotions, focusing on the culinary, film, and television sectors in Tel Aviv, Israel, and New Orleans, USA. We aim to understand how creative workers in these sectors navigated health policies during the COVID-19 peak (2020-2022). These policies were instigated at the national, sectoral, and the organizational level, reflecting a spectrum of institutional responses for regulating workplace practices. We interviewed 140 individuals, analyzing their emotional and practical responses to these policies, particularly noting their feelings about how workers embraced, endured, adapted, rejected, and resisted institutional policies. Their affective reflections on their workplace practices provide a map of generalizable "cultures of compliance," within which workers felt they could survive and thrive in varying institutional contexts.

We draw on Lawrence, Suddaby & Leca's (2010) challenge to explore how individual reflections position workers within broader institutional contexts, offering choices and limitations. The COVID-19 pandemic presented new institutional contexts, and our analysis seeks to understand how workers' hopes and fears reflect the evolution of these contexts from pre-COVID times. Building on the work of sociologists, such as Lok (2020), Friedland (2018), and Lok, Creed, DeJordy, Voronov (2017), we aim to contribute to recent theories positing that institutions are shaped and potentially transformed by emotions, and we and we add comparative lenses for such theorization.

369

RN11 | T08_01: Nostalgia, resentment and mistrust

Trajectories of mistrust

Merete Monrad[1], Morten Frederiksen[2]

1Aalborg University; 2Roskilde University

Employment services often require vulnerable citizens to share sensitive information about themselves. The information is used to match them with relevant job opportunities or document their lack of workability, in order to apply for disability pension or supported employment. Sharing sensitive information increases vulnerability and to do so voluntarily requires trust. But what happens when the citizen does not trust the state? In this paper we compare how vulnerable citizens navigate the encounter with employment services, both in the absence or presence of trust. Drawing on theories of trust, risk and uncertainty (Zinn 2006, 2009, Luhmann 2018, Barbalet 2019), we examine how trust and mistrust shape the strategies citizens use to manage complexity in the relation to unemployment services.

Based on 30 interviews with Danish unemployed citizens with problems besides unemployment, we develop a typology of strategies of interacting with the state depending on the citizen's level of trust. We examine citizen accounts of trust and mistrust evolving over time to understand how trajectories of mistrust arise and affect the citizen's encounter with the state. We show how trust enables a mode of collaboration in longer "leaps", whereas mistrust restrict collaboration to small steps, potentially leading to a vicious circle of increasing mistrust growing from experiences of "getting nowhere".

Two Types of Resentment

Mikko Salmela[1,2], Thomas Szanto[2]

1University of Helsinki, Finland; 2University of Copenhagen, Denmark

Resentment, a political emotion par excellence, is generally understood as moral anger in response to political or moral injustices or offences, geared at correcting wrongdoings, thus being an emotional gatekeeper for equal respect and democratic order. However, we argue that the complexity of resentment is not sufficiently understood. Not only do targets of resentment vary (e.g., socio-economic institutions responsible for austerity politics in left-wing populism vs. refugees, minorities or elites in right-wing populism); we suggest that underlying this variety there are two significantly diverse types of resentment with dissimilar a) socio-psychological dynamics, b) different intentional structure, c) ways in which they are epistemically and normatively appropriate, and d) political consequences. We argue, first, that the underexplored type of resentment emerges through the emotional mechanism of Ressentiment, which transforms self-targeting negative emotions and their vulnerable self into other-directed ones such as resentment and hatred with a morally superior self. The other, better known type of resentment emerges either spontaneously, or through another emotional mechanism of Social Sharing. We then detail how the targets of the Ressentiment-mediated resentment are indeterminate, generic others or scapegoats and how the affective focus of this type of resentment becomes the antagonistically defined allegedly threatened social identity instead of particular wrongs. Moreover, we show how the triggering emotions of this type of resentment become epistemically opaque and the outcome emotion inappropriate in different ways. Finally, we explore its motivational tendencies, suggesting that it leads to anomic, anti-solidaric or dormant violent political action associated with right-wing populism, authoritarianism, and extremism.

"I Feel I'd Just Be Adding to the Stereotype:" Apprehension of Reproducing Racialized Stigmas in Storytelling on Street Harassment in France

Mischa Dekker

KU Leuven, Belgium

Scholarship on covert racism, colorblindness, and white fragility sheds light on the discomfort surrounding the subject of race, and how this may lead people to avoid referencing it. These concepts focus on how uneasiness surrounding race leads people to strategically reinvent racism and marginalize those who challenge it. Consequently, the moral and emotional dimensions of people's concerns about wanting to avoid reproducing racialized stigmas remain understudied and undertheorized. To fill this gap, this article elaborates a theory on the apprehension of reproducing stigmas. I conceptualize this moral emotion as an anxiety about reinforcing the stigmatization of categories of people whom an individual considers to be already stigmatized. Such anxieties concern not only race, but also other subjects covered in the stigma literature, such as mental illness and poverty. I develop this concept inductively, based on a study of street harassment stories shared on online and offline platforms in France. These platforms were instrumental to putting street harassment on the political agenda around the world. However, one question in particular sparked debates and uneasiness among French activists: how to deal with stories that, in their view, reproduced stigmas about Black or Muslim men or disadvantaged areas? Based on a content analysis of 532 stories, ethnography, and interviews, this paper analyzes how victims structured their stories not solely based on what they sought to share, but also on the stigmas they wanted to avoid. Better understanding apprehensions and their effects is important for ongoing research on individuals' reflective work to avoid stigmatization.

RN11 | T08_02: Awareness and 'true happiness'

Awareness: Paradoxes of an Emotion Program

Nadine Maser, Sighard Neckel

University of Hamburg, Germany

Closely linked to current conflicts on minority rights, anti-discrimination, and diversity, awareness has emerged in recent years as a specific practice to prevent and avoid discrimination. Within this framework, certain feelings and emotions are perceived to be typical symptoms of conflicts between the privileged and the disadvantaged. This way, individual emotional experiences are linked to specific social categories, and therefore, are seen as playing a crucial part in anti-discrimination efforts. In this paper, we examine awareness as an emotion program that specifically seeks to gain regard for the concerns of individuals and groups whose identity claims are considered contested. Drawing on qualitative data from field research, which explored various anti-discrimination practices, from activist milieus up to today's club scene, the action problems, unintended consequences, and paradoxes associated with awareness are analysed. Awareness claims to raise sensitivity to discrimination and to contribute to the struggle against it. However, these claims are also associated with new problems in the prevention of discrimination, which cannot be tackled by awareness itself. By relying on a politically motivated form of emotion management, affective tensions are created that themselves refer back to awareness practices. In addressing these paradoxes of awareness, emotional sensitivity does not resolve experiences of discrimination when it leads to subjective feelings and emotional reactions becoming the decisive indicator of perceived power relations. How awareness practices could avoid such problems and paradoxes will be discussed in conclusion.

Why Does Class Resentment Not Transform Into Political Action? A Study Of The Food Delivery Workers' Affective Dispositions In The Capital Of Latvia.

Iveta Ķešāne[1], Maija Spuriņa[2]

1Latvian Academy of Culture, Latvia; 2Latvian Academy of Culture, Latvia

How do affective dispositions of the same occupational group members explain their political (in)actions towards their employers? To answer this question, we rely on 56 semi-structured interviews with the food delivery workers at two platforms in Rīga. Interviews were gathered from July 2022 to June 2023. The interview data is supplemented with publicly available courier chat analysis. Although most couriers express class resentment of the platforms they work for, we find they don't transform this resentment into political action against platforms. While couriers have transformed their class resentment of the platforms into political action in many European countries through strikes, protests, and boycotts, it has never occurred in Latvia. In this article, we interpret several reasons for this: it is due to (a) the variety of affective dispositions they hold about themselves as couriers, (b) low trust in each other, and (c) neoliberal feeling rules that prevail in Latvia. The variety of affective dispositions is due to their different histories of social class mobility. For example, the couriers who had better class positions before this job tend to feel ashamed of this job. This sense of shame stifles their political activism. The couriers who decide to do this job to fulfill other social roles and goals tend to feel good about this job and potentially could mobilize for class action. However, low trust towards others and neoliberal feeling rules prevent them. This study contributes to the literature on class mobilization and class analysis regarding the affect and emotional dynamics.

Exploring Ambivalent Emotional Landscapes in Narratives Surrounding Abortion Debate.

Anna Durnova, Julia Schmid, Sylvia Herzog

University of Vienna, Austria

Emotions play a dual role, acting as catalysts for actions and sources of complexity in human experiences. In public debates, they are frequently employed to categorize perspectives as either 'acceptable/legitimate' or 'unacceptable/illegitimate,' having a pivotal role in times of transformation; when public debates are contentious and fuel polarization. This paper seeks to deepen our understanding of how individual feelings arise from collective moods, creating emotional landscapes that influence people's sentiments within society and towards it.

To achieve this, the study delves into the nuanced emotional experiences of women intentionally choosing abortion, highlighting the significance of ambivalent emotional landscapes in polarized discussions.Drawing on insights from ten qualitative biographic-narrative interviews, our research explores how the absence of established practices and scripts for post-abortion situations leaves individuals within an ambivalent emotional landscape, giving rise to both internal and external stigmatization processes. Our preliminary findings reveal that stigmatization emerges from a misalignment between societal expectations regarding emotions and the authentic feelings experienced by individuals, necessitating intensive emotional work that often remains concealed and unacknowledged.

Set in Austria, where abortion is not only criminalized but also entangled in polarized political debates, our study underscores the importance of comprehending the ambivalent emotional landscapes surrounding the abortion debate. The analysis sheds light on the unexplored emotional terrain of this debate and its implications in a context where abortion remains criminalized and subject to

371

societal stigmatization. Additionally, our research contributes to sociological scholarship on emotions, examining the heuristic value of ambivalent emotional landscapes to gain a deeper understanding of heated public debates and contentious societal issues, such as abortion.

RN11 | T09_01: Emotions, politics, communities

What Makes a Good Humanitarian? Local Emotion as Resistance to the Isomorphic Pull of Professionalised Aid

Alex Odlum[1,2]

1University of Lausanne, Switzerland; 2Geneva Centre of Humanitarian Studies (University of Geneva and Graduate Institute of International and Development Studies)

Calls for the humanitarian aid industry to "localise" reflect a policy discourse aimed at wresting power over international crisis response from Western donors, United Nations agencies, and international non-governmental organisations, and putting it into the hands of the local communities, civil society and first responders in disaster affected countries. Such demands are based not only on the claim that local actors can yield a more efficient, effective, and appropriate use of scarce aid resources, but also in more emotive arguments that the international humanitarian endeavour is unfit for purpose and even represents a form of neo-colonialism. In this sense, the use emotions in localisation discourse may reflect peripheral resistance to the dominance of central powers of the global humanitarian organisational field. Specifically, high emotionality contrasts with the field's central norms, values, myths, and professional practices, which seek to regulate the raw emotion of inhumane suffering through institutions of detachment, particularly the debiasing norms of neutrality, impartiality and independence that are cornerstones of mainstream international humanitarianism. By re-injecting emotion into new forms of humanitarianism, peripheral entrants to the field may be able to resist or delay isomorphic forces expected under neo-institutional theory. We deploy computational linguistics methods to study a corpus of humanitarian activity reports published before and after the humanitarian localisation agenda was launched in 2016, to examine shifts in the sentiment of local actors' discourse, and to assess whether emotive discourse mediates the delayed adoption and rejection of central humanitarian norms and practices.

Emotions at the Core of Social Actors' Transformation During the Revolt in Chile

Karla Henriquez

Université catholique de Louvain, Belgium

Beyond the demands and collective actions of the October 2019 social revolt in Chile, the discussion also focused on the importance of emotions and their effects on the lives of those who participated in the protests. Activists commented on different experiences like feelings about

372

contradictory emotions, feeling new emotions, and talking about the emotions that are considered "negative" for capitalist productive models. These experiences around emotions allowed a before and after in the lives of activists. This paper will present findings in this framework, which are the result of focus groups and interviews conducted mainly with young people during the period of social revolt in Chile and when the pandemic arrived on the continent. Among the main conclusions are experiences of processes of subjectivation that allowed unexpected situations in the intimate lives of activists, provoked the questioning of ideal models of life, and allowed the emergence of a new subject.

Neo-Ottomanism and the Politics of Emotions in Turkey: Resentment, Nostalgia, Narcissism

Nagehan Tokdogan

Max Planck Institute for Human Development, Germany

My contribution explores the politics of emotions under the ruling Justice and Development Party (AKP) in Turkey, and the leadership of Recep Tayyip Erdoğan as a right wing populist leader. I cover the period after 2002 when the party swept to national power. I examine how emotional politics, and particularly the use of neo-Ottomanist narratives to create a new national mood, contributed to the durability of Erdoğan's rule. I analyse the interactions between national narratives, symbolic politics and politics of emotions, and argue that these interactions are the basis of the popular support the AKP and Erdoğan have enjoyed over two decades.

The Emotional Community of the Pariah, or Why did Hannah Arendt Have no 'Love' for the Jews?

Shaul Bar Haim

University of Essex, United Kingdom

Jewish 'self-hatred' was considered since the 19th century as a 'pathological' reaction for the ongoing attempt of modern Jews to assimilate within the European general society, where they often lived in cultural and religious 'ghettos' for centuries. One common claim within Jewish circles was that for fully assimilating in a modern non-Jewish society, the Jew had to internalize the anti-Jewish 'gentile' gaze, and often to identify with the anti-Semite aggressor (Reitter, 2012). After the founding of Israel in 1948 this discourse has shifted into a debate over the status of the non-Zionist Jew. Some diaspora Jews who did not support Israel were often accused of being 'self-hating Jews'.

This paper focuses on the exchange of letters between Hannah Arendt and Gershom Scholem, following Eichmann in Jerusalem (1963) – a book where she fiercely criticized the newly established state of Israel. Scholem accused Arendt of being a Jew that lacks any 'love' for her own kind, the

Jews. Arendt who presented in her writings the modern Jew as the ultimate 'pariah' in Modern European history, turned into pariah herself amongst Jewish establishments who portrayed her as a prototype for a self-hating Jew for decades to come.

This case study serves for arguing that self-cancelling feelings such as self-hatred among collectives and emotional communities with a long history of displacement and marginalization are not only the final outcome processes of internalizations and self-stigmatization, but could also be genuine authentic, non-pathologized set of feelings that need to be contextualized for what they are, namely real subjective living experiences. Ultimately this paper aims to expand our understanding of self-hatred as a crucial emotion in individual and collective identity making.

373

RN11 | T09_02: Emotions, work, unequality

Changing Emotional Codes, Emotional Burden, and Their Role in the Construction of Work-related Mental Health of Young Employees

Kristiina Lehmuskoski, Ari Väänänen, Pauliina Mattila-Holappa

Finnish Institute of Occupational Health, Finland

In Western countries, there has been a noticeable rise in work-related challenges pertaining to the mental health of young employees. This interview study analyses the new role of emotions in work disability and the conflicts arising from the emotion-oriented management of work ability among young employees. The study draws on data collected in 2021 from the municipal sector in Finland, consisting of interviews of young employees, supervisors, and occupational health care representatives (N=70). Qualitative analyses indicated three themes relevant to young employee's mental health related to emotions and their management: (1) The cultural demand for personal growth and the longing for authenticity arising from humanistic individualism, which is typical for well-educated employees working in knowledge-intensive jobs, results in intrapsychic emotional reflection. In contrast, (2) the emotional burden resulting from the erosion of ethical ideals of work is often reported among employees working in human service occupations. In addition, (3) emerging different emotional codes and behavioral standards in relation to work ability provoke moral reflections and ambiguities for both older and younger workers. Overall, mental health among young employees is linked to the change in the role of emotions as part of work disability through different cultural and occupational pathways. This change is producing new social tensions in the domain of occupational health.

People Are Extremely Busy Categorizing me into the Position of the Other: Exploring Humiliation and Strategies Among Individuals with Cerebral Palsy

Olivia Dahl Dahl

University of Copenhagen, Denmark

Starting from a Crip theory approach, the article focuses on understanding how emotions, particularly humiliation, unfold in the daily lives of individuals with disability. The article, based on qualitative interviews analyses the varied manifestations of humiliation faced by people with Cerebral palsy, connected to accessing support services due to legislative barriers, physical attribute-based ranking, essentializing language, stereotypical imagery, and neglect of cultural symbols. The article also explores strategies employed by people with CP to navigate humiliation. Findings highlight that participants use both individual strategies, such as accepting low-status positions or attempting to fit normality standards, as well as transformative, political strategies, where collective social identification demands an end to the devaluation of the group. The article sheds light on the complexities of emotional experiences of humiliation within an ableist framework. It discusses how emotions can both reproduce and transform notions of everyday life with disability and how it is possible to "crip up" interactional rituals, making it more accessible for individuals with disability to gain emotional energy, confidence, and agency.

Emotional Labor in Journalism: Advancing a New Theoretical Framework

Victoria Colesnic

Södertörn University, Sweden

Emotion has historically been seen as problematic within journalism, associated with bias and sensationalism, and conflicting with reason, resulting in its dismissal. Only in the last decades, following "an affective turn" in media studies (Clough & Halley 2007), did researchers begin exploring the influential role of emotions in journalistic work. This article critically examines how scholars have started to incorporate emotions into journalism research.

One term scholars often employ is Hochschild's concept of emotional labor (1983). However, the article argues that the term has been applied overly liberally. Some academics debate whether emotional labor in journalism involves the suppression or negotiation between personal and professional selves, while others frame it as a journalistic skill. The article states that the lack of a clear understanding of emotional labor among researchers hampers the practical application of the term in scholarly work, which remains "stalled at a crossroads" (Grandey & Gabriel 2015).

To overcome this standstill, the article proposes a two-part theoretical framework that operationalizes the concept within the context of journalism studies. Built upon Bolton (2005) and Hanitzsch & Vos (2017), the model breaks down journalists' emotions into five dimensions and argues that emotional labor is the interplay between them — an ongoing process of experiencing, acknowledging, articulating, expressing, and relating feelings to the industry's norms and expectations. The framework also identifies three types of feeling rules—societal, professional, and organizational—guiding journalists' emotion management.

By applying this model, researchers can locate, dissect, and explain specific instances of journalists engaging in emotional labor.

RN12 | T01_01: Social Dimensions of Water and Climate Challenges

Water Conflicts: More Than Conflicts Over Distribution? – Assessing Conflict Structures With Cases From Germany

Simon Rolf Winfried Brauner

Forschungszentrum Jülich, Germany

Conflicts tend to be complex and, in many cases, multi-faceted. This could create tensions for individuals involved in the conflict, as well as for those analysing the issue. However, by adapting Vuković et al.'s (2014) approach, we illustrate a possible way of structuring conflicts into different threads and, in a sense, unravel the conflict at hand. The aim of this study is to demonstrate the potential of the methodology adopted and its possible usefulness for subsequent conflict studies, recognising the importance of systematic conflict assessment and forward-looking research. Given that in some situations, conflicts are still ongoing, or new ones may emerge in certain cases, the study also briefly assesses the potential of using this adapted methodology as a structured basis for constructing scenario analyses. In this case, the current systematically explored knowledge on conflicts will be transformed for further use. As the central topic, we explore water conflicts, using examples from Germany. This choice reflects the uncertainty of future human behaviour and the impact of climate change on water resources. An uncertainty that also applies to Germany, which currently has good water supplies but may lose access to water due to degradation, climate change or mismanagement.

A New Water Culture for a Climate-resilient Europe

Carla Gomes[1], Marcella Conceição[1], Margarida Rebelo[2], Luísa Schmidt[1], Ana Delicado[1]

1Institute of Social Sciences of the University of Lisbon, Portugal; 2National Laboratory for Civil Engineering, Lisbon, Portugal

Climate change and increasing consumption are driving a paradigm shift in water use, as well as in our understanding of the water cycle as a whole. Water reuse used to be relegated to territories with chronic water scarcity, but the water crisis has become a striking reality for Europe as well. More intense droughts and heat, but also storms and floods, are expected, making it a challenge to manage available resources, while ensuring water quality for all purposes. Water-smart solutions have emerged as key in a new approach to managing the water cycle, especially in cities. This requires innovation in water reuse and storm water management.

As we face the need for significant investment in new infrastructure and governance systems, trust has emerged among the most crucial factors that can make or break a new water strategy, among stakeholders and public authorities. Risk perceptions of water scarcity and quality will be determinant for social attitudes towards a smart and circular economy for water, as will the notions of justice regarding future costs of water infrastructures and services.

This presentation analyses the key socio-economic drivers and barriers to adaptive, fair and resilient water governance. It is based on dedicated surveys and stakeholder meetings carried out between 2021 and 2024 in the six Living Labs of the project B-WaterSmart (H2020, funded by the European Commission, GA No. 869171) in Alicante (Spain), Bodø (Norway), East Frisia (Germany), Flanders (Belgium), Lisbon (Portugal) and Venice (Italy).

Understanding How Informal Water Networks Function In Accessing Water In Peri-Urban Small Town In India

Isaiamudhu SS

University of Hyderabad India, India

Scholars have since long argued about the problematic position of the peri-urban interface, characterized by administrative and jurisdictional ambiguity, environmental degradation and marginalization (Dupont, 2005; Narain &Nischal, 2007; Mehta, & Randhawa, 2009). Peri-urban waterscapes do not fit into existing urban or rural planning models because these same models largely fail to recognize the peri-urban interface as a distinct form of territorial development (Mehta et al 2014). Focusing on peri-urban areas for the study of water raises important questions about equity and justice, as it demonstrates how some groups gain improved access to water, while others are deprived of it as a consequence. This work attempts to conceptualize in detail the dynamics of community engagement to water access through informal access in peri-urban Madurai, a small town in Tamil Nadu, India. Madurai exhibits features of a shrinking city, which adds an angle of exacerbated inequalities. Here it is attempted to examine how informal access to water produces or reproduces inequalities in the peri-urban Madurai. A combination of qualitative and quantitative field work involving household level surveys in individual households and informal semi-structured interviews to water vendors in two localities of Madurai one in the center of the city (Avaniyapuram) and other in city periphery (Annaiyur) has been attempted. Broader themes that are under inquiry are dynamics of informal access in peri-urban, small town, shrinking city in India and if and how existing or new inequalities are produced or reproduced.

Towards a Climate Robust-water System: the Value of Water Through a Sociological Lens

Lien Dieleman, Frédéric Vandermoere, Robbe Geerts

University of Antwerp, Belgium

Tap water and its pricing has largely been of interest to economists, in part because water services are mainly perceived as production processes. As a result, much of the existing literature focuses on the economic value of water, leaving the social and cultural importance of water for citizens underexplored. This research takes a sociological perspective on the value of water and studies citizens' experiences and perceptions about (their use of) water. Applying a social practice approach to value creation, we conducted 15 in-depth interviews and developed a conceptual model of the sociological value of water. The results show that although the price of tap water is a concern for people, the actual value of water extends well beyond its price. Water has direct values for citizens in their everyday lives, as well as indirect value by contributing to broader societal systems. In their everyday lives, people (unconsciously) create value by integrating and using tap water when performing water practices such as showering, cooking, or cleaning. Citizens use water not so much for the sake of water itself, but in various household water practices associated with certain values: hygiene, health, relaxation, warmth and so on. People attach great importance to the experiences that water offers them and the values they can achieve through its use. According to our research, people may experience conflicts between these water values and water conservation. Future research needs to consider these conflicts when encouraging water conservation.

RN12 | T01_02: Collective Efforts and Care in Human-Animal Communities

Belief in the Fundamental Similarity of Humans and Other Animals – Edward Westermarck and Theodor W. Adorno and Their Criticism of Kant's Conception of Animal

Salla Maria Tuomivaara

University of Turku, Finland

Philosophers interested in the status of animals have repeatedly highlighted the negative effects of Immanuel Kant's philosophy on our ideas on animals and animality. Jacques Derrida (The Animal That Therefore I Am: More to Follow, 2008) wrote about Kant's hatred of animal, and especially about his hatred of human animality. When writing about our reluctance to accept human animality, Mary Midgley (The Concept of Beastliness: Philosophy, Ethics and Animal Behavior, 1973) has stressed Kant's role in our aversion to animality in philosophical theory and humanist tradition more largely.

In my research I trace the history of the invisibility of animals and its counter-traditions in the history of sociology. As a result of this enquiry, Edvard Westermarck, and Theodor W. Adorno have emerged as interesting exceptions. Westermarck as a sociologist of the classical period of sociology and Adorno as a much later representative of the post-war sociology share interest in both other animals and human animality, but also criticism of Kant's conception of animals and human animality. Both Westermarck and Adorno are also interested in the moral significance of the animals.

However, sociology has been efficient at ignoring those conceptions of animals that differ from more mainstream positions. Interest in Adorno's views on animal(s) has only been aroused in the 21st century, most probably resulting from Derrida's interest in Adorno's thoughts. Derrida pointed out that Adorno's thinking contains criticism against the Kantian attitude towards animals. Westermarck's ideas are still much less well known. In my presentation, I will go through the features that connect Adorno's and Westermarck's sociological ideas on animals and animality and attention given to Kant's views on animals in their texts too.

From Community to Activity to Care: Companionship in Human-Animal Relations

Kerstin Jürgens, Sarah Mönkeberg, Markus Kurth

Universität Kassel, Germany

A central part of the current planetary crisis is the loss of connection with the more-than-human world. However, while entire species are disappearing from the earth, a renewed turn to animals in particular can be observed: Countless humans share their daily lives with so-called pets, and this interspecies living together gives rise to relationships with a special quality in which the involved animals can be understood, with Haraway (2003), as "companions".

In the project "Animals as Companions" (German Research Foundation, DFG, project number 443785427) we have investigated how the companion status of animals is constituted in animal-human relationships. We have focused on Germany and the German-speaking countries and have worked with a broad set of qualitative research methods from a micro-sociological and cross-species perspective. Overall, we have conducted over 60 semi-structured interviews with keepers of various animals (in addition to dogs and cats, also various small animals, birds, exotic animals and horses) as well as over 30 interviews with service providers in the field of animal-related services and several ethnographies.

In the proposed presentation, we present empirical findings from our project. With Community, Activity and Care we highlight three modes in which animals and humans live a Companionship. Against this background, we would like to discuss at the conference whether and how Companionship holds potential for a convivial life between animals and humans (see van Dooren & Rose 2012) and what we can learn from it for the possibility of a peaceful cohabitation between humans and animals in times of climate crisis, biodiversity loss, and species extinction.

Exploring Dog Agency: An Inquiry Into Dog Agency and Augmentative Interspecies Communication Technology

Marie Verstraete

Ghent University, Belgium

Theories of animal agency have been developed since the introduction of animals into sociology. Specifically, scholars have defined and interpreted animal agency in a multitude of ways. However, these frameworks stay theoretical. As there has been few empirical testing of these theories to the everyday reality, we still do not know whether animals display agency or not. The main aim of this contribution is to empirically test agency in dogs, by investigating the experiences of dog owners with Augmentative Interspecies Communication (AIC) technology. The AIC technology

focused on is a soundboard with recordable answer buttons. In 2023, I conducted semi-structured interviews with 21 dog owners: 10 respondents from the USA and 11 respondents from Belgium, respectively with and without soundboard. The Generic Inductive Qualitative Model (GIQM) guided the coding and analysis of the interviews. The results suggest that dogs are agents and perform agentic acts. Still, it depends upon several factors whether dogs showcase agency. Often, dogs' actions are informed by their needs and wants and tailored to their interests and preferences. Bringing in the AIC technology into the dog-human relationship offers the dog more opportunities to display their agency. Additionally dog owners with a soundboard have more awareness of and insight into their dog's agency in comparison to dog owners without the soundboard. Lastly the soundboard improves the communication and connection between the dog and owner. Consequently AIC technology provides dogs with a platform to 'speak up' and improve their quality of life.

The Barking Third: Multispecies Entanglements In Dog-Assisted Therapy Sessions

Jirka Vierimaa, Olli Pyyhtinen

Tampere University, Finland

As an emerging field among other animal-assisted initiatives and interventions, dog-assisted therapy amounts to a distinctive form of therapeutic relationships, in which the nonhuman animal member may act as a mediator for trust-building between human members. By introducing companion animals like dogs to relations of care, therapy work may potentially benefit through dogs' potential capabilities to reduce stress and improve social skills. However, so far the literature on how the interaction with therapy dogs unfolds in therapeutic settings remains scarce. In the presentation, we aim to fill this gap by examining instances of a triadic interaction in dog-assisted therapy. Our analysis draws from ethnographic materials generated from real-life dog-assisted therapy sessions in Finland. By emphasising the role of the 'third' in the relations between the therapist and the client, we find cues that challenge the contemporary paradigm of therapy as a dyadic relationship between human members alone. Theoretically, we draw in the presentation especially from Georg Simmel's work on dyads and the sociological significance of thirds, while extending it to multispecies relationships by employing Michel Serres' thoughts and insights.

377

RN12 | T01_03: Engaging with Technologies: Perceptions and Participation

Reversing Risk Perception and Co-constructing Agri-photovoltaics Technology with Farmers. A Sociological Approach Based on the Regace Project.

Andrea Volterrani[1], Maria Cristina Antonucci[2]

1University of Rome Tor Vergata – Dept. of Enterprise Engineering; 2Italian National Research Council – Institute of Research on Population and Social Policies

Technological advancements, particularly in eco-friendly domains, have significantly heightened social awareness. Disruptive innovations, as defined by Bower and Christensen (1995), can transform sectors, requiring a comprehensive understanding and acceptance process. It's increasingly vital to grasp how society becomes aware of these innovations, especially when skepticism may hinder their adoption. Ramirez (2013) highlighted the influence of social networks on agricultural technology adoption, while Rose and Chilvers (2018) emphasized broadening responsible innovation in the era of smart farming. Energy and climate challenges underscore the urgency of engaging all societal sectors in embracing new technologies. This is crucial for energy solutions like agri-photovoltaics, where the HE Regace Project designed participation models for farmers. Early farmer involvement in agri-photovoltaic technology development ensures the social dimension of the project, aiming to avoid top-down impositions and promote co-development by future users. Participatory processes involving beneficiaries change the construction of technological innovation to co-construction, fostering awareness of the environmental sustainability of potential innovation actions (Antonucci, Sorice, Volterrani 2022). Recent studies (Spanaki, Sivarajah, Fakhimi Despoudi & Irani, 2022) have shown that agricultural sectors benefit from extra support and end-user involvement, ensuring a complete understanding of the impact and fair distribution of economic and social value.This paper discusses the initial outcomes of participation and involving farmers from five partner states in the REGACE project, by analysing the potential risks and benefits of this social-technological collaboration in the field of agriphotovoltaics.

In What Ways Does Rural Renewable Energy Infrastructure Shift the Local Interpretation Regarding Supra-local Narratives of Renewable Energy Transition

Frederic Lucas Wrage

Technische Hochschule Ingolstadt, Germany

The renewable energy transition is a central element of climate change mitigation. It is also of symbolic significance as a visible element of climate policy and transformation by design – and thus the subject of narrative discourse and socio-economic conflict. Rural residents are increasingly confronted with renewable energy infrastructure in their everyday life which may clash with local identities, structures and expectations (Mahon et al., 2023, 685f., 691; Reusswig et al., 2022, 186f., 192; Wüstenhagen et al., 2007, 2683f.).

The overall goal of my research is to understand the connection between metanarratives about socio-ecological transformation and the specific local situation. This connection has been underexplored, especially regarding PV (Schönauer & Glanz, 2023, 1f.; Vuichard et al., 2021, p. 1). In my paper I discuss first results based primarily on group discussions and generate an overview of relevant narratives and orientation structures regarding rural PV implementation. Methodologically I rely on the documentary method (Bohnsack, 2021, pp. 64–67), supplemented by narrative analysis (Arnold et al., 2012, 18f.) and mapping tools (Clarke et al., 2018, p. 127). I further develop a theoretical approach currently based on Anthony Giddens' theory of structuration (Giddens, 2017, pp. 49–62) and a materialist and metabolic view of socio-ecological transformation (see also Moore, 2020, pp. 29–33; Schaffartzik et al., 2021, p. 1408).

Preliminary findings suggest that rural identity is strongly connected to a specific land use and ownership concept based on food production on which legitimacy hinges, which is threatened by the introduction of PV.

Socio-technical Transitions in the Shipping Sector: the Case of Wind Propulsion

Isabella De Judicibus

Scuola Normale Superiore, Italy

Without international shipping, the world economy as we know it would not exist: grappling with geopolitical tensions and major disruptions in the logistics of "just-in-time" delivery, the sector not only transports massive amounts of fossil fuels, but also contributes to nearly 3% of global greenhouse gas emissions, which are expected to increase. While the sector's current decarbonisation strategy predominantly focuses on energy efficiency measures and the

378

uptake of alternative fuels, wind propulsion has been one forward-looking option employed by several companies.

The focus of this work is on wind propulsion initiatives for commercial cargo transport. The aim is to analyse the discursive and substantive configurations of such projects worldwide: values, organisational arrangements and financial situations. Why do they adopt a certain technology over another? This work also traces the emergence and historical development of wind propulsion as an alternative choice to conventional fossil-fuel based shipping. What does this reveal about the direction of a transition in the shipping sector?

Research on the sector's energy transition employs in-depth and regionally focused case studies, or sociological accounts of alternative operating economies, with little attention to a comprehensive picture of wind propulsion development worldwide and overtime. To address this gap, this research uses socio-technical configuration analysis (STCA), an emerging methodology in sustainability transition literature, and qualitative comparative case study research. As a result, this work evaluates shifts and dynamics in the socio-technical configurations of wind propulsion systems across different geographies and analyses their transformative potential in light of decarbonisation pressures.

The Ruins of the Anthropocene: Traces of the Past for a Socioecological Critique of the Present

Anna Clot-Garrell

University of Barcelona, Spain

This paper explores some of the tensions and contradictions that arise in current ecological crisis debates, particularly the 'new urgency to the politics of infrastructure' (Anand et al., 2018) surrounding the development of renewable infrastructures as a pivotal political response toward climate change. It empirically and theoretically explores the reverse side of ecological and energy transitions by examining the decay, abandonment, and transformation of carbon-intensive infrastructures that are in question today, given their territorial dependencies and environmental impacts. Drawing on ethnographic research conducted in a postindustrial rural region and historically extractivist periphery of the Catalan Pyrenees, I analyze the material and political life of fossil infrastructures in this exemplary carbon landscape, where the traces of the industrial past coexist with the present pressures of new 'green' projects. Such examination aims to provide a critical understanding of present futures, as encapsulated throughout the course of certain sustainable trajectories (Adloff & Neckel, 2021). Infrastructures are promising locations for research since they are sites with multiple spatial and temporal layers that refuse the easy separation between the human and the material (Boyer, 2018; Degens et al., 2022; Niewöhner, 2015; Rippa, 2023).

RN12 | T01_04: Theoretical Perspectives on Social Conflicts and Sustainability Transformations

Navigating Tensions in Eco-Social Welfare Policy Proposals; Between Transformation and Radical Pragmatism.

Mary Murphy

Maynooth University, Ireland

The desire to make a difference, to have an impact, to transform society for the better is widespread among sociological projects. This paper navigates the tension between the transformative (and what is at times understood as utopian) potential of eco-social welfare and the pragmatic possibilities of building 'from the seeds of the future' in the contemporary welfare-work nexus towards an eco-social welfare future. The paper argues environmental justice is essential in transformation to a sustainable future and that eco social welfare policy offers immediate foundational steps towards the compass point or north star. Key to this is moving from productivist welfare to a welfare that incorporates social reproduction and care and values many forms of contemporary unpaid work.

While much literature about future policy draws from and on utopian ideals about work, this paper offers pragmatic European examples from the contemporary welfare-work nexus that have the potential to be used towards transformative ends. Crucially these eco – social policies build on values of collective goods and freedoms, mutual interdependencies and advancing a broadly interpreted ethic of care. Building trust through new forms of institutions offers mechanisms for inclusivity, equality, participation and agency, and for advancing new understanding of state, society and markets. As such welfare reform can transform values and is part of the politics of transformation, helping to expand the boundaries of welfare imaginaries and bridging past, present and future.

379

Understanding Social Conflicts in Sustainability Transformations: Conceptual Frameworks, Research Findings, Lessons Learned and the Way Ahead.

Annegret Haase[1], Danny Otto[1], Kararzyna Kajdanek[2], Anika Schmidt[1], Diana Ayeh[1], Manuel Wolff[3]

1Helmholtz Centre for Environmental Research – UFZ, Germany; 2Wroclaw University; 3Humboldt University Berlin

Social conflicts play a pivotal role in processes of social and societal change. Their significance lies in their capacity to act as catalysts for change or signals indicating areas in need of transformation. Within the realm of conflicts, established power dynamics and practices undergo scrutiny, offering opportunities for challenge, reproduction, and occasional modification of power relations. Conflicts possess the potential to redefine the roles of various actors and instigate the formation or dissolution of alliances and interest groups. In this sense, conflicts can either propel or hinder transformational processes, reflecting divergent perspectives and interests among social actors or societal groups regarding the direction and goals of change.

In recent years, sustainability research has progressively delved into the explicit study of conflicts in the context of sustainability transformations. Despite the longstanding history of conflict study in the social sciences, these sustainability-focused inquiries employ varying conceptualizations and attribute diverse roles to conflicts within transformation processes, yielding disparate conclusions. In this systematic review, we leverage this body of research to address conceptual and methodological considerations surrounding social conflicts in sustainability transformation. Our inquiry investigates how existing research conceptualizes conflicts in sustainability transformations, identifies prevalent perspectives and insights, uncovers blind spots and shortcomings, and proposes methodological and methodical approaches to address these gaps.

This comprehensive review aims to contribute to a more systematic understanding of the intricate role of social conflicts as both realities and practices within the context of sustainability transformation.

Where Science and Technology Studies Meets Social Practice Theory: Contributions to Social Change Dynamics for Sustainability

Nicolas Baya-Laffite, Marlyne Sahakian

University of Geneva, Switzerland

How can theories be used to incite social change for sustainability transitions? This conceptual paper draws from Science and Technology Studies (STS) and Social Practice Theory approaches (SPA), emphasizing four ways in which the theories can be brought together to facilitate change in complex systems, based on a review of the literature. First, both theories propose a flat ontology, which avoids assumptions around agency and power. What has more capacity to act in a system can be revealed in a second phase, following empirical investigation. Second, STS and SPA both have a descriptive quality that inform detailed empirical studies, shedding light on practices, processes, actors, and power dynamics. In there many studies, STS priviledge a focus human and non-human actor interdependencies, co-production processes, often using controversies and accidents as heuristic situations, while SPA delves into the everyday, collective dimension of life and practices embedded in norms. Related to this, and thirdly, both theories take seriously material and institutional dimensions: both STS and SPA emphasize the significance of materiality, including technologies, but also of collective conventions, and how these dimensions might make a given systems more, or less, resistant to change. Finally, both theories can also be used to envision possible futures, which can be performative in the present towards supporting social change. They therefore have both a descriptive and prospective quality. Our aim with this contribution is to provide a framework for operationalizing both theories together, with suggestions on how they might be applied to tackle different sustainability transitions challenges.

380

RN12 | T02_01: Climate Friendly Futures and Youth

Youth Perspectives on Sustainable Futures: Insights from Collaborative Engagements in Greece and Scotland

Kostas Stavrianakis, Jacob Nielsen, Zoe Morrison

Robert Gordon University, United Kingdom

The global recognition of the critical role played by youths in shaping a sustainable future is underlined by increasing support from international organizations, supported by national, local, and regional policies. Evidently, youth-led initiatives such as the "School Strike for Climate" have emerged as powerful expressions of dissent against inadequate climate policies that threaten their future well-being. This study delves into the concerns of school students and examines their role in fostering sustainability.

Our investigation builds on collaborative activities with 15–16-year-old students in Greece and Scotland. Employing innovative engagement strategies, we facilitated PlayDecide card games and sessions, focusing on Climate Change and CCUS acceptance, respectively. The exploration concluded with a role-playing game centred on the acceptance of renewable energy technologies. These sessions were recorded and transcribed, while narrative analysis was used to derive meaningful insights.

Preliminary findings suggest that participating students emphasized in their discussions the well-being of family and friends, while highlighting a lack of trust in older generations, including politicians. They strongly conveyed their belief that the impetus for change lies within their own generation. Biodiversity decline and the uncertain impacts of climate change on the natural environment emerged as significant but controversial topics as opinions varied amongst students. Furthermore, students expressed concerns about day-to-day life, highlighting the tangible effects of recent energy price inflation on their lives.

This research sheds light on the nuanced perspectives of youth regarding sustainability, highlighting the need for inclusive policies and actions that consider their perspectives while empowering them as active actors to a sustainable future.

Teenagers and Young Adults Awareness on Energy Savings in Northern EU: Between Accountability and Desire for Energy Saving

Nadine Roudil

CRH – UMR 7218 LAVUE, France

This communication will focus on teenagers and young adults concern on energy and environmental issues in Six northern EU countries (France, Luxembourg, Netherlands, Ireland, Northern Ireland and Germany). It will characterize how their sense of responsibility in environmental issues is built, how they promote sobriety standards and how this learning about eco-responsibility practices has an impact on their relationship to energy.

This communication examines the reasons why young people are considered as accountable in the fight against global warming and how this situation makes it possible to assert the responsibility of youth in certain public problems, which legitimizes an intervention on their environmental concern.

Based on a quantitative (n=1627) and a qualitative (n=40) surveys starting from semi directives interviews conducted in eleven high school in six different EU countries, this communication will underline the reality of environmental and energy awareness among adolescents and young adults. As learning places, it is therefore interesting to examine how schools take up the energy issue to make it a principle of energy saving education whose principles are supposed to be applied elsewhere. The survey examines the reception of energy efficiency policies and its results on youth energy practices. This presentation will question youth's representation of public policies action as well as political discourses to deal with energy and climate issues. If Young people are targeted by energy saving campaigns at school (European union green education programs) from which they learn the principles to apply them, their lifestyles remain consumerist even based on environmentally responsible principles.

Wanderlust on a Warming Planet: Climate-Friendly Learning in Young Adults' Vacation Practices

Katinka Bundgård Fals, Lars Kjerulf Petersen

Aarhus University, Denmark

This article explores the social dynamics enabling and impeding climate-friendly practice change using the vacation practices of Danish young adults as a prism.

Going on vacation is often a highly carbon-intensive practice, and much scholarship has described holidays as notoriously hard to reconcile with climate concern. This schism is particularly salient for young adults, who are often found to be particularly concerned about climate change but also travel more often and across longer distances than other

381

age groups. As such, young adults' vacation practices constitute a topical case of the social dynamics that foster and impede climate-friendly practice change.

With an environmental sociology outset, this article employs an interdisciplinary approach combining theories of practice (Schatzki, 1996; Shove et al., 2012) with the fields of environmental and sustainability education (Wals, 2007), informal learning (Gramatakos & Lavau, 2019; Lysgaard, 2018), and climate change communication (Ballantyne, 2016; Wibeck, 2014) to describe the social learning involved in climate-friendly practice change and social media's roles in it.

Based on digital ethnography and interviews and focus groups with 36 Danish 18-29-year-olds of varied socio-demographic backgrounds, the article describes the social learning involved in reproducing and changing young adults' vacation practices.

It finds that climate-friendly practice change is limited, but does occur, and draws insights from prevailing changes to describe obstacles and opportunities for further climate-friendly practice change. The article shows how learning involved in such climate-friendly practice change is highly situated and social, and that important parts of these learning processes are unfolding via social and other digital media. It concludes by highlighting possibilities and impediments for further climate-friendly practice change – in young adults' vacation practices and beyond.

Imagining Alternative Mobility Futures In The Brussels Region: A Practice Approach

Françoise Bartiaux

Université catholique de Louvain, Belgium

The Brussels metropolitan area is one of the most congested areas in Europe every working day, despite the fact that alternatives to car mobility (mainly, but not only, by train) are converging on the capital. This presentation focuses on the practice of commuting by car to the Brussels region and is framed by social practice theories. The future of this commuting practice, as imagined by the commuters themselves, will be analysed, focusing on the space considered and the creativity applied. Some elements and paradoxes that may challenge commuting practices and more sustainable mobility transitions are also discussed. The data for this study come from two dozen in-depth interviews conducted in 2022 and 2023 with commuters, namely with beneficiaries of a company car, a specific fiscal scheme. This scheme often comes with a free fuel card for both private and professional trips and is financially very advantageous for those who benefit from it, raising questions of environmental justice. Preliminary results suggest a paradox: commuters with a company car experience larger and more numerous spaces travelled to thanks to the company car and the free fuel card, but they do show a cognitive closure in imagining alternative mobility projects, thanks to or because of the company car and the facility it provides.

Future Generations are like Cheshire Cat? Deciphering Future Generations in Climate Policies and Energy Transition – Findings from Dual Literature Reviews

Marcin Paweł Mielewczyk

Jagiellonian University, Poland

Mitigation and adaptation to climate change is a process stretched over time. To this end, climate policies, including the energy transition, have embraced their impact on future generations, who have become one of the stakeholders of these policies. This is evident in the data on the growth of publications referring to "future generations" in recent years. The presence of future generations is therefore fundamental in decision-making processes, but this is a blurry notion that needs to unpack the assumptions that comprise it. This concept is not easy to operationalize as long as each author adopts a different definition of who is already and who is not yet a "future generation". For some, it is the generation of our children (already present in the world), for others it is all those who are not yet born. However, the question arises, should the future generations who will appear in the world in the next 10-20 years be treated equally with those who will be here in another, 100, 200, or even 1,000 years? In this paper, I present the results of two systematic literature reviews on how authors of scientific articles use the term "future generations." By juxtaposing how future generations are conceptualized in the climate change literature ("future generations" AND "climate change" n=105) with the energy transition literature ("future generations" AND "energy transition" n=20), I show that these two research fields differ in the way they conceptualize and include future generations as stakeholders of proposed climate policies. These articles reveal two tendencies: to rhetorically invoke future generations as a normative category to reinforce the call to action on the intergenerational justice framework, and to try to conceptualize future generations depending on the purpose of the research and position of the authors. In the latter case the authors make normative expectations more realistic by creates future generations as a group with certain characteristics needed to be taken into account in a particular case. Future generations are thus what we make them out to be when we talk about them, which then blur in air when we finish. Utterly like the Cheshire Cat.

382

RN12 | T02_02: Spatial Disparities and Vulnerabilities to Environmental and Technological Hazards

Socio-Spatial Inequalities in Energy Transition, Crisis Adaptation and Sustainability in Contemporary Hungary

Lea Kőszeghy, Bernadett Csurgó, Gergely Horzsa

HUN-REN Centre for Social Sciences

Energy transition – being a key component of climate change adaptation – has been increasingly on the international political and policy agenda in the recent years. Meanwhile, since 2021 a new energy crisis began to unfold, related to post-pandemic economic development and Russia's aggression in Ukraine, which put an abrupt adaptation pressure on households. Crisis adaptation of households may be in line with energy transition, but tensions may also arise between sustainability and households' responses to the energy crisis.

Households' reaction to such changes in the context of their energy use is contingent on their energy use characteristics and problems, as well as their resources (financial and non-financial) concerning energy transition and crisis adaptation, therefore it shows distinct socio-spatial patterns. E.g. resource poor households in energy poverty, and areas where such households concentrate, may suffer systematic disadvantages during energy transition, which is by now reflected by the strengthening just transition discourse. Socio-spatial inequalities in the crisis adaptation of households is meanwhile a lesser examined topic yet, similarly to potential tensions between sustainability and crisis adaptation.

The presentation aims to contribute to building up scientific knowledge on these issues, by analysing socio-spatial disparities in energy use and households' strategies concerning energy transition and crisis adaptation in contemporary Hungary, and by presenting specific examples of potential tensions between crisis adaptation and environmental sustainability. The analysis is based on primary quantitative and qualitative data collection: a survey conducted in February-March 2023 representative for the adult population of Hungary, and case studies concerning the energy use of higher status, as well as socially deprived households. (Research funding: NRDI No. 138020; 146987.)

Socio-Spatial Vulnerability to Environmental Risks in Lithuania: Understanding Stressors and identifying "Hot Spots"

Aistė Balžekienė, Paulina Budrytė, Audronė Telešienė

Kaunas university of Technology, Lithuania

The response to complex environmental risks requires the understanding of local contexts, juxtaposing spatial distributions of environmental risks and social vulnerabilities of local communities. Environmental risk reduction should include both physical (for example, the level of air pollution) and human dimensions of vulnerabilities (Frigerio, 2016). Research shows that social vulnerabilities combined with the exposure to environmental risks reveal spatial patterns of risk areas (Radushynski, 2023).

The aim of this presentation is to reveal the patterns of socio-spatial vulnerabilities to environmental risks in Lithuania, juxtaposing the official data of environmental risks (air and water pollution, floods, forest fires) with the population census data of 2021.

Our analysis allows to identify "hot spots" with multiple environmental risks and high social vulnerabilities and understand main factors towards increasing the resilience of local communities to environmental risks. Identification of social stressors in the areas of high environmental risks allow to better plan prevention and mitigation measures.

This presentation is based on the project „Socio-spatial determinants of societal vulnerability and resilience to crises and strengthening the crisis response potential of communities"(SERENITY), funded by the Research Council of Lithuania, no. S-VIS-23-21

Corrosive Communities: Tension and (Mis)Trust in Anticipation of Technological Disasters

Adriana M. Szabo[1], Thomas E. Shriver[2], Alison E. Adams[3]

1Arizona State University; 2North Carolina State University; 3University of Florida

Extant research regarding environmental disasters has highlighted the unique effects of chronic technological disasters such as oil spills or industrial contamination on local communities. Specifically, scholars have underscored how human-made disasters can lead to significant fissures and a deterioration of social capital among residents, a phenomenon known as "corrosive communities." Yet, we know comparatively less about cases where corrosive communities emerge in anticipation of potential localized technological disasters. To address this gap in the literature, we examined the case of Roșia Montană in Romania, where a social rift emerged as a result of a proposed gold mining project. Some members of the community organized to

383

opposed the proposed project, citing concerns over environmental and political threats. On the other side, proponents and supporters of the gold mining project disputed the legitimacy of the activists' claims resorting to vilification and threats. Our data come from a years-long study that relies on in-depth interviews (n=31), participant observation during protest events, and document analysis, including news coverage (n=180 news articles) and government documents. Our examination of this case allowed us to map specific pathways that lead to significant community contention in the process of environmental decision making. Our results show that threats of arbitration within the context of intractable conflicts can lead to an erosion of trust, contentious relationships, and heightened perceptions of environmental risk among local residents. We conclude our paper by discussing the implications of our work in the context of actual and potential technological disasters and corrosive communities.

A Sociological Analysis of Climate Justice and Vulnerability in Portugal

Luísa Schmidt, Carla Gomes

Institute of Social Sciences of the University of Lisbon, Portugal

The current cycle of climate change is taking place on a global scale, affecting populations and societies across the board. This global condition often leads to the omission of two differentiations that are acutely relevant for sociology: (1) the historical global inequalities that have led to this situation, and (2) the differentiated vulnerabilities to the impacts of climate change. Sociological analysis must examine these intricate issues of responsibility and climate justice across various territories and social scales.

The Portuguese case offers a suitable context to study the wicked problem of climate justice: a society affected by deep inequalities, as well as rapid and recent processes of modernisation; a territory that is doubly exposed to the impacts of climate change, due to its southern position in Europe and to its Atlantic front; its adaptive capacity is heavily dependent on policies and funding support from the European Union. Yet, Portugal still maintains social structures of local solidarity and cooperation – localism – based on some traditional values that have proved especially valuable in face of the financial, pandemic and political crises.

This paper presents the sociological dimensions that expose the strengths and vulnerabilities of the Portuguese society in the face of climate change. It considers the key social and territorial dynamics of the country, both in economic and political-institutional terms, and above all in terms of justice. All this in the light of the foundations of sociological knowledge, which in Portugal were revived after the Democratic Revolution that celebrates its 50th anniversary.

RN12 | T02_03: Technological and Social Approaches to Climate Solutions

Problem-shifting? Tackling Climate Change with Mining CRMs in Europe's Remote Regions

Leena Johanna Suopajärvi

University of Lapland, Finland

As the recent Critical Raw Materials Act proves, the EU wants to increase the production of critical minerals in its region in response to being a fossil-free continent in 2050, marketed as a Green Deal. To strengthen Europe's independence from mineralization and metal production in China or developing countries, mining activity is to be increased in Europe – and in practice, it means, on the sparsely populated outskirts of Europe. For example, Europe's northernmost county, Finnish Lapland, is the hot spot for mineral exploration and mining. Around 80 percent of mineral exploration in Finland is situated in Lapland, and half a dozen new mining projects are pending in the province with no prior mining history.

This can be seen as a problem-shifting: the global and European climate crisis and geopolitical risks related to CRMs are solved by supporting new mines in remote regions of Europe. The general problem is moved in place and in time: problem-solving is located, for example, in Northern environments and pushed to the futures of local communities as mines may involve an environmental risk and, in any case, environmental cumulative impacts are realized. What do Lappish people think about the EU's mineral policy? The answer is not clear-cut. Local communities' views are divided on the development of the mining industry in their home regions, and there are local, national as well global reasons behind the different opinions. These themes are discussed in a presentation funded by the underlying research, the Horizon Europe project AGEMERA.

Emerging Narratives Around the Future Of Deep-sea Mining

Xavier Lemaire

University College London, United Kingdom

Countries and private corporations are moving towards the exploitation of polymetallic nodules from the seabed, known as deep sea mining. While deep sea mining is is currently not authorised – but could be in a near future – exploration is currently permitted.

Deep sea mining is faced with large uncertainties, as there is no existing commercial project acting as precedent, making governance and regulation particularly challenging.

384

Policy decision-makers look to land-based mining but cannot establish regulations entirely fit-for-purpose if the environmental, social and governance risks of deep sea-mining are not studied and understood better. If deep-sea mining is worldwide approved, it may play a significant role in the global supply of metals required for the energy transition, in particular cobalt, copper, manganese, and nickel but with likely irremediable long-term environmental impacts.

The emerging literature on the environmental, social and governance dimensions of deep-sea mining emphasize the need to understand if/why this new mining activity is considered as socially acceptable in some countries and not in others and what are the arguments of mining companies and countries supporting deep-sea mining and the ones of NGOs and countries opposing deep-sea mining.

This paper looks at the coalition of actors against or in favour of deep-sea mining. A discourse analyse present the emerging narratives around deep-sea mining and helps to understand how all the unknowns of this totally new activity are apprehended by different categories of stakeholders and how positions of each of them are shifting.

Navigating the Future of Carbon Capture and Storage Technology: The Interplay of Social Acceptance and Political Development

Farid Karimi[1], Darrick Evensen[2]

1University of Jyväskylä, Finland; 2University of Edinburgh, Scotland

Carbon Capture Utilisation and Storage (CC(U)S) technology faces dual challenges—technical and non-technical. These non-technical hurdles encompass social, political, economic, legal and regulatory dimensions. Neglecting any can impede CC(U)S hubs and clusters. These challenges are dynamic, evolving in response to shifts in public perceptions, national politics, local planning, regulations, and policies.

Public awareness of and acceptance of CO2 storage is low, especially when compared to a more positive perception of Carbon Capture and Use (CCU). It requires an ongoing, comprehensive engagement strategy beyond scientific dissemination, employing multiple channels, ensuring credibility and transparency, and framing CC(U)S as a vital part of climate change mitigation. A challenge arises from mistrust towards politicians, policymakers, and major industry players as communicators for CC(U)S. Research institutions and non-governmental organisations (NGOs) enjoy higher public trust and should lead in disseminating accurate, accessible information on CC(U)S within the broader climate action context.

Addressing these non-technical challenges demands proactive engagement with regulators, local communities, and civil society organisations. Overlooking this aspect can delay operationalisation, from scoping to planning and implementation. CC(U) 's journey to a sustainable future is multidimensional, intertwining technology, society, and politics.

In sum, CC(U)S success hinges on navigating non-technical hurdles that evolve with time. This research is based on an extensive review of literature on the topic, a stakeholders' workshop and a survey of stakeholders to highlight practical approaches for moving forward to address the aforementioned social and political challenges associated with CC(U)S.

Socialising the Carbon Cycle – Reconfiguring Climate Change through Carbon Dioxide Removal

Jan Gilles

London School of Economics and Political Science, United Kingdom

For around 12.000 years carbon has circulated relatively stable within the boundaries of the natural carbon cycle. The increased exploitation of fossil carbon reserves by modern societies has led to a surge in atmospheric greenhouse gas concentration causing an unbalancing of this cycle resulting in rising temperatures at a speed unseen in the deep history of the planet. To counter this the Intergovernmental Panel on Climate Change has outlined different "net-zero scenarios" to achieve a rebalancing of human emission with the natural carbon cycle. Alongside emissions reductions, Net-Zero demands the active removal of Co2 from the atmosphere through different carbon dioxide removal (CDR) methods. My paper explores how the emerging culture of CDR reconfigures climate change mitigation from abandonment to control. I argue that through the explicit effort to remove carbon from the atmosphere, the carbon cycle is becoming the social carbon cycle. Carbon is no longer treated as a natural externality to be observed by a system of scientific practices assuming dynamic development independent of human observation and action, but instead it is treated as a formable, designable, and manageable materiality structuring both social life and environmental conditions. The paper follows an STS approach and is based on the analysis of interviews with actors in the British carbon dioxide removal industry. Based on this data, I outline how the emerging political economy of CDR speculates on controlling atmospheric Co2 levels through a technology-market nexus, and critically evaluate how the relationship between humans and the environment is renegotiated through CDR.

385

RN12 | T02_04: Critical Perspectives on Food Practices and Cultures

Food Practices And Food Cultures In The UK And Hungary For Sustainability And Net-zero Emission Transition

Xinfang Wang

University of Birmingham, United Kingdom

Food systems are globally responsible for 20-40% of total greenhouse gas emissions. The EU aims to be climate-neutral by 2050, including the food sector from farm to fork. Consumer preferences in relation to food choice and mode of shopping have changed significantly, especially during the COVID19 pandemic, which could have long lasting impacts on how people purchase, store, and cook food in the future. The impacts on energy and emissions have not been researched or analysed in detail. Any technology advances need to be considered within a complete food system context from a social perspective. Potential climate and social impacts on the global food system and the resultant impacts to the EU food system need to be understood to ensure resilience and sustainability. To address the gap in the literature and analyse social, behavioural, and public perception issues for reducing energy and carbon emissions across the food chain, we conducted survey questionnaires in the UK and Hungary to understand how consumers' food related perception and behaviours have changed, and the impacts on energy and emissions reduction by 2050. The survey focuses on younger generations who will be the main consumer groups in 2050. It collects data of their perspectives on food sustainability, alternative protein, frozen food compared to fresh food, food waste reduction, shopping online versus in-person, and food packaging. Results are compared between UK and Hungary on the similarities and differences of the two case study countries and the implications for energy and emissions of their food chain.

Sustainability Assessment In Co-Creation With Practitioners: How Can Transdisciplinary And Transformative Research Support The Shift Towards Sustainable Food Supply Chains?

Pia Laborgne[1], Eva Wendeberg[1], Cigdem Adem[2], Rebecka Milestad[3], Arnim Wiek[4], Kanang Kantamaturapoj[5], Natapol Thongplew[6]

1Karlsruhe Institute for Technology KIT, Germany; 2Middle East Technical University, Turkey; 3KTH, Sweden; 4Albert-Ludwigs-Universität, Germany; 5Mahidol University, Thailand; 6Ubon Ratchathani University, Thailand

As the global community faces the challenges of climate change, resource depletion, environmental injustice and social inequality, understanding and promoting sustainable practices in consumption and production, including distribution, has become essential. In 2023, the Belmont Forum launched a research program on Sustainable Consumption and Production Systems (SSCP2022) with seven international projects. One of the projects, "Co-Creation of Sustainable Transformations of Food Supply Chains through Cooperative Business Models and Governance (Co-SFSC)" coordinates transdisciplinary and transformative research on sustainable local/regional food supply chains in five hubs and with six teams in Turkey, Thailand, Taiwan, Sweden, Germany and the USA. The initial aim is to assess the status quo of current food supply structures and, based on this, to develop sustainable structures through cooperative business and governance models.

Sustainability assessment plays a crucial role in evaluating the environmental, social and economic impacts of human activities and provides guidance to all stakeholders for transformation strategies in the food supply system.

The paper presents the transdisciplinary sustainability assessment within the project, focusing on the co-creation process and the joint definition of objectives and critical indicators for the assessment of sustainability and resilience of food supply chains. It highlights the importance and implementation of stakeholder engagement throughout the assessment process and strategies to foster collaboration between different stakeholders.

Key questions in the research process are: How can sustainability assessment contribute to the transformation process towards sustainable food systems? How can we integrate innovative and participatory methods and traditional ecological knowledge into sustainability assessment? To what extent are practice partners/stakeholders involved in the transformation process? What are their needs, challenges and opportunities? What information and support can transdisciplinary research offer them?

386

Waste, Identity, 'Other': How Are Sustainable Societies Possible?

Christina Marouli

Deree – American College of Greece, Greece

United Nations sustainable development goals (SDGs) demonstrate the intricate and multi-faceted nature of the unsustainability of modern societies, expressed as tensions or even crises. So, where to start in order to transition to sustainable societies? This paper addresses this question by starting from the issue of food waste as a 'window of clarity' for understanding the institutions and cultural conventions that lead to unsustainable practices (i.e. the sociological theoretical tradition of waste). It adopts a sociological perspective that connects food waste, social representation and identity formation, and the construction of the 'other'. It first discusses food waste as an environmental issue and points to the tensions/contradictions in contemporary societies that generate food waste. It focuses on its representation as the negative 'other' in the food systems, and the implications about the culture that creates it. It then looks into the 'othering' process of marginalized groups, and draws parallels between the two 'othering' processes highlighting how they are based on a similar logic of dichotomisation and polarities of 'good' and 'bad'. It argues that it is this fragmented, binary and antithetical logic that needs to be challenged at its roots for sustainable societies to become possible. It proposes that the representation of human and non-human entities, as well as the analysis of contemporary socio-environmental problems, should become relational and should be based on the 'no waste' and 'interdependence' principles of natural ecosystems, of which humans are a part. It concludes with implications for education.

A Critical Analysis of Sustainable Labels on Food. How Consumers are deceived by Greenwashing

Mariaclaudia Cusumano[1], Luca Daconto[2]

1University of Milan-Bicocca, Italy; 2University of Milan-Bicocca, Italy

The Agenda 2030 has successfully popularized the term Sustainable. However, it is crucial to acknowledge the concept of the Limits to Growth and the introduction of Sustainable Development in the report Our Common Future, which first emphasized the integration of Environment, Society, and Economy. Sustainable Development can be perceived as a superficial slogan or, worse, a marketing strategy used to convey a sense of concern for the environment or society. This deceptive practice or marketing strategy, known as Greenwashing, is increasingly employed by businesses to dissuade consumers from changing their consumption patterns while maintaining high levels of consumption.

Greenwashing poses significant risks and challenges to the effective transition towards sustainability. This phenomenon is particularly prevalent in the food industry, despite the declining quality of industrialized food.

Given the growing consumer consciousness regarding food consumption and matters of concerns about environmental and social issues, corporations are investing more in communication strategies than in actual sustainability practices. Therefore, the objective of this study is to examine a specific group of Italian industrialized food products that utilize packaging elements and language associated with Sustainability and the Environment. The study focuses on two key aspects of sustainability: a) Social Sustainability, by evaluating nutritional quality and saturated fats, considering shelf-life and exploring potential implications in terms of not communicable diseases; b) Environmental impact through food miles.

By analyzing product labels, we aim to identify practices of Greenwashing within the industrialized food sector and assess whether the Italian food industry is genuinely participating in the ecological and social transition or whether it is perpetuating delays in addressing climate change through deceptive marketing strategies.

So Celebrated and Underutilised: Food Policy Debates Around Legumes

Bálint Balázs

ESSRG, Hungary

Legumes can improve arable cropping systems' sustainability and enhance farmed animal and human diet quality. Paradoxically, their production and consumption in Europe are low, whereas their demand for feed is high. Current EU policy agendas push for transformative changes, market and infrastructure restructuring towards plant-based diets, which are replete with paradoxes. Policy objectives frequently contradict each other, with ecological objectives often clashing with economic and international trade objectives. This paper draws on our case studies conducted in five European countries under the RADIANT project, which revealed that legumes have central roles in food policy debates. However, stakeholder interviews indicate that legumes offer contradictory narratives and promiscuous and antagonistic visions among stakeholders, which explains their underutilization. This paper offers an action researchers' perspective on interpretative policy analysis that engages multiple stakeholders and decision-makers in envisioning more favourable policy and governance frameworks. The role of new methodologies required for policy deliberations in science-society-policy interfaces is highlighted to create policy innovations that meet current and future food and nutritional security challenges.

RN12 | T02_05: Conflicts, Policies and Practices in Forest Management

The Forest-Linked Lives of Rural Women and Their Grassroots Protests Against Deforestation: The Case of Aegean Forests, Turkey.

Nihan Bozok

İstanbul Beykent Üniversity, Turkiye

Turkey's Aegean forests have seen significant deforestation in recent decade, which constitutes more than half of the forest loss in the country. In opposition to the detrimental consequences of deforestation, including forest fires, mining, and construction, local women, especially elderly women from villages, have organized grassroots movements. Based on my ethnographic fieldwork conducted in the forest villages of the Aegean region between 2018 and 2022 and utilizing a feminist multispecies approach, I argue that the interwoven lives of rural women and forest ecosystems serve as the primary driving force behind these grassroots initiatives. First, the local women have strong roots in the forest. They began matching their daily activities with the forest's cycles when they were children, so they have a more sustainable perspective on the forest's resources. Second, foraging is a common activity for local women who have an in-depth knowledge of the forest's edible flora. What Scott (2022) terms "plants for runaways" are the benefits of foraging, which include a reduction in rural poverty, a space for women to connect, and independence from domesticating ties at home. Third, through their ceremonies, arts and crafts, and culinary traditions, elder women have deep connections to the forest, which forms the foundation of what Kimmerer (2013) discusses as "indigenous wisdom" based on reciprocity with nature. By examining these three themes, I demonstrate how local women collaborate to preserve their slow, reciprocal, and long-term relationships with the forests, which are crucial to both their well-being and the sustainability of the forest ecosystem.

Conflicts and Social Mobilization against Clearcutting as an Opportunity to Question the Forest Social Order

Philippe Deuffic

Inrae (National research institute for agriculture and environment), France

Protests and conflicts against clearcutting have increased tenfold in the last ten years in France. NGOs and citizen movements are so active that they are succeeding in suspending and even stopping many harvesting operations in the most productive forest regions. How did this social movement emerge and how are forest owners' associations reacting to this strong social mobilization against clearcutting? Using a socio-constructivist theoretical framework to analyze the rise and fall of social problems, we will show how ENGOS and local citizens' movements are joining forces today to put clearcutting regulations on the political agenda through highly effective grassroots and internet communication campaigns. Conflicts are also stimulated by the "greening" and "climatisation" of social debates, which means that every logging action should be evaluated according to its ecological and climatic impacts. Clearcuts illustrate these conflicting views by questioning the impact of forest management operations on the landscape, ecosystem services and the ambivalent role of forestry in the economic development of remote rural areas. More generally, these protests are putting into question the forest social order that usually prevail in the forest sector. Despite some moments of violence, we show that these conflicts can be a positive moment according to Georg Simmel' approach of conflicts to discuss the social contract between citizens, forest owners' organizations and forest policy makers. Finally, we will show how these conflicts lead some forest owners to reconsider certain forestry techniques such as clearcutting and policy makers to adapt forestry regulations concerning clearcutting at the margin.

Measuring, Managing and Governing Ecosystems – the shaping of indexes and indicators in Nordic forestry politics

Gisle Andersen[2], Monika Berg[1], Hogne Sataoen[1]

1Örebro University, Sweden; 2NORCE, Bergen, Norway

With the realization that ecosystems are vital for human life, public, political, and scientific attention is paid to maintaining ecosystem stability and 'health'. There has been a shift towards ecosystem-based management, which represents changes in the key principles – the logic – underpinning political, administrative, and science-based processes. The extent and impact of this shift is yet to be seen. However, current knowledge indicates that, rather than a shift towards more environmentally friendly policy, the new logic supports policy decisions that seek to maximize the human benefits from ecosystems. How can this be explained?

In this study, we seek to analyze administrative and science-based processes in environmental policy, targeting biodiversity and ecosystem management in Swedish and Norwegian forestry politics. The empirical material consists of documents and interviews with actors within authorities, academia, civil society, and consultants. We develop and apply a theoretical framework that addresses the interdependencies of governing, measuring, and managing nature. We are particularly interested in how new forms of measuring and assessing the state of nature affect decisions and how nature is represented and managed. Norway

and Sweden are institutionally similar countries that are currently developing rather different measurement systems and indicators for assessing ecosystem health. We will seek to explore how these measurements are shaped and assess their political nature and effects. Thereby, the study seeks to deepen the understanding of processes that make 'nature' governable through specific government technologies and to increase our knowledge of how environmental expertise on ecosystems is formed and authorized in national policy formation.

"Hands off Our Forests!" – Responses to the EU's Climate Change Policies in the Authoritarian Policy Context of the Polish Forest Management

Krzysztof Niedziałkowski[1], Agata Konczal[2], Marcin Mielewczyk[1,3]

1Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland; 2Forest and Nature Conservation Policy Group, Wageningen University; 3Doctoral School in Social Science, Jagiellonian University

The European Green Deal (EGD) introduced ambitious targets for the role of forests in climate change mitigation and biodiversity protection, which may seem overly ambitious to some European Union (EU) Member States. In Poland, the EGD has raised serious concerns among key forest policy stakeholders. The aims of this paper are to explore the attitudes of coalitions within the forest policy field towards the EUFS and to examine the impact of the authoritarian shift in Poland on forest policy and its responsiveness to the EGD. Data collection methods included desk research and 30 semi-structured interviews. We argue that the relatively slow adoption of climate change mitigation measures in Poland is due to the strong position of the State Forestry Administration, which does not consider climate change to be a pressing issue. This is reinforced by the fact that forest policy is controlled by a party with a Eurosceptic agenda. While the authoritarian characteristics of the political context of forest policy have initially compromised the implementation of the EGD, they have also undermined the relationships within the dominant forest coalition on the ground and the social legitimacy of foresters. As a result, a major external shock to the sub-system associated with the general election and change of ruling party in 2023 opens a window of opportunity for a major policy shift in line with EU expectations. This paper aims to fill a gap in the existing literature on forest policy responses to climate change. It also contributes to the literature on the impact of authoritarian rule on the character and dynamics of forest policy.

Embracing Degradation: Doing State by Monitoring Thermal State(s) of Permafrost(s)

Anastasiya Halauniova

Sciences Po, France

Today, everyone seems to care about the degradation of the frozen earth called permafrost. Defined as the ground that maintains a negative temperature for at least two consecutive years, permafrost is no longer reliably frozen. Recent studies have shown that permafrost is thawing and converting into a climatic 'hazard' by releasing carbon dioxide, as well as by causing infrastructures and buildings to crack and break. In this context, monitoring permafrost's thermal state came to be seen as the way to control the processes of its degradation. This paper examines the building of the state-sponsored monitoring system in Russia as a lens through which to explore the state-building processes in the age of environmental crisis. Building upon in-depth interviews with permafrost practitioners—state representatives and scientists who deal with issues of thawing permafrost—and document analysis, I demonstrate how and why states come to be interested in degrading permafrost. I argue that the state enrolls thawing permafrost in its extractive economic and territorial ambitions by reducing complex permafrost processes to 'ballpark' temperatures and by blaming permafrost for economic losses and infrastructural failures. Yet, thawing permafrost is not passive during these processes, and thanks to its ambiguous ontological nature and dynamic material qualities, it directs and redirects the goals of the Russian state in new directions. Following the practices of permafrost practitioners allows us to recognize that there are multiple permafrost(s) in action, which remain out of reach for the state-sponsored monitoring gaze.

389

RN12 | T03_01: Climate Change Narratives and Policies

The Translation from Climate Change to a Nation State Ranking

Elisabeth Strietzel

Bielefeld University, Germany

The global community is facing new challenges and problems due to the crisis caused by human-made climate change. To limit global warming, greenhouse gas emissions need to be reduced as soon as possible. The timeframe for limiting global warming is closing and necessitates far-reaching transformations within societies around the world. The disproportionate burden of climate change on those who are least responsible for causing it raises questions of climate justice and the need for urgent action. Civil society organizations and NGOs around the world are advocating for swift action by governments responsible for a significant portion of emissions. To achieve this, actors need to attract media coverage and create narratives to push for political action. Although rankings are often seen critically by social scientists, performance indicators have become a popular tool for NGOs and other actors to draw media attention to their causes and advocate for change. Using the Climate Change Performance Index as a case study, this presentation will show how the ranking team transforms climate data into a ranking and generates media attention with its publication. The presentation builds upon ethnographic fieldwork conducted within the ranking team of the Climate Change Performance Index during the publication cycle of 2022 and 2023. The talk offers insights into the work of ranking production in the field of climate governance, the mechanisms of a decentralized media strategy as well as the considerations made to transform climate data into media content.

The Rise of the Climate State: The Contrasting Cases of Climate Strategies in Japan and the EU

Everardus Wilhelmus Stapper

Tilburg University, Netherlands, The

Wildfires, snowstorms and rising temperatures are going hand in hand with rising inequalities and political dissatisfaction. Through the Paris Climate Accord, the world has pledged to become climate neutral in 2050. This implies that large parts of the economy need to be restructured and the role of the state in society is changing. This raises the question whether we see the transformation of the welfare state into a climate state?

In this paper, I contrast two approaches to achieving carbon neutrality in high income countries with a large welfare state – Japan and the EU. Japan has launched its Green Growth Strategy (GGS) to become climate neutral in 2050. This will be mainly achieved by decarbonizing industries and investing in climate adaptation. Whereas the EU's plan – the European Green Deal – also aims to reduce social inequalities and increase political support through its 'Just Transition Mechanism'. The cases will give insight in the changing role of the state and logics concerning the economy and the climate.

In order to analyze the plans, I will use the tools provided by critical sociological pragmatism and socio-legal studies (Boltanski & Chiapello, 2005; Macaulay, 1979). First, I have done a desk analysis of the most important laws and regulations concerning the goal to become climate neutral in 2050. Second, I have completed a discourse analysis based on editorials in newspapers. Third, I have mapped the policy networks in the two capital cities. I have done this through a mix of desk-research and (20+) interviews with key-actors.

Climate Change Or The Anthropocene? Anatomy of a Narrative Tangle

Luigi Pellizzoni

Scuola Normale Superiore, Italy

Anthropocene has become synonymous with climate change. But while the latter term has a precise, albeit controversial, referent, what exactly does the former refer to? A new geologic epoch, says the definition, determined by human impact on the planet. So its referent is not a thing but a relation. But what does such an account mean, and aim at? In this contribution, I examine the conceptual and narrative tangle that has taken shape around the notion of the Anthropocene. The hypothesis is that it is, or belongs to, a governmental dispositive in Foucault's sense of something (rarely resulting from actual design) aimed at protecting the dominant order through the assertion of a regime of truth. This happens first of all by means of discourses, where concepts and ideas are narratively connected, that is translated into stories with implicit and explicit causal factors and related moral lessons. I begin by discussing the main storylines found in the Anthropocene debate; what distinguishes them and what unites them. The emergent picture is already intricated, but it becomes even more so when the link between the Anthropocene and other concepts, Gaia and Earth in particular, is addressed. The result is an elusive interplay of cross-references. I then try to identify the deep mechanism that constitutes the dispositive. I conclude by briefly questioning how to escape it, paving the way to a real climate change politics – an urgent question, as the effectiveness of the dispositive can be measured against the failures of climate negotiations and the emergence at social movement level of a 'post-apocalypticism' of questionable political effectiveness.

390

Writing France's climate trajectory. Work and bureaucratic diplomacy around the elaboration of the National Low-Carbon Strategy (SNBC)

Francois-Mathieu Poupeau

CNRS, Ecole des Ponts ParisTech, University of Gustave Eiffel, France

The concept of "strategic State" has taken root in the field of public action. It reflects a desire to (re)position the State over the long term, at a time when many collective problems require us to look to the future. Among them, the climate issue occupies an increasingly important place. While the notion of "urgency", which has now become an integral part of the political agenda, requires the State to act quickly in this area, its intervention is also accompanied by anticipation and the construction of a "desirable future", as evidenced by the creation and mobilization of several instruments.

This contribution aims to illustrate this activity by taking the example of the National Low-Carbon Strategy (SNBC). Based on a survey of the elaboration of this document from 2017 to 2020, it looks at how the administration in charge of climate issues endeavored to set a trajectory for France, with a view to achieving carbon neutrality by 2050. By examining its tools and working practices, as well as its interactions with the bureaucratic players involved in the process, it shows that the construction of a climate future is an eminently negotiated exercise, which struggles to extricate itself from short – and medium-term contingencies, symbolized by the weight of sectoral administrations and the nature of the arbitrations carried out at the highest level of the State. This work is akin to diplomacy, a term often reserved for the analysis of international relations, but which seems to us heuristic to qualify a facet of bureaucratic activity rarely highlighted in research on the sociology of State.

Smoothing Out Tensions: An Embedding Function of Urban Climate Change Adaptation Plans in Poland

Renata Putkowska-Smoter

Warsaw University of Life Sciences, Poland

This study critically examines urban environmental documents as a tool of expressing public obligations. Drawing inspiration from the political ecology perspective and science and technology studies, the analysis investigates the power relations involved in designing a written policy under socio-economic tensions. Tracing the development of urban adaptation plans in Poland from 2007 to 2023 demonstrates how environmental documents embedded a translation of complex and uncertain climate threats within an acceptable public obligations. Employing a practice-oriented analysis developed by Kristin Asdal and Hilde Reinertsen, key phases of translation were derived from extensive documentation triangulated with in-depth interviews. The results suggest that, due to EU-inspired and project-based local environmental documents, climate change adaptation in Poland was successfully problematized as a manageable urban issue and then secured through the enrolment of local administration. However, as the issue went through the form of adaptation plans anchored in administrative logic, its mobilization objectives were limited to the internal dynamics of local bureaucracy. In conclusion, the study debates the prospects of environmental documents, including the alternatives in facilitating local preparedness for climate change that are sensitive to their embedding function.

391

RN12 | T03_02: Integrating Indigenous Knowledge and Community Insights into Biodiversity Protection

Transforming biodiversity governance? Indigenous Peoples' contributions and the Kunming-Montreal Global Biodiversity Framework

Elissavet {Elsa} Tsioumani, Louisa Parks

University of Trento, Italy

The 2022 Kunming-Montreal Global Biodiversity arguably marked a radical rights-turn in global biodiversity governance. For the first time in the context of the Convention on Biological Diversity (CBD), the new global framework included a strong focus on rights-based approaches, different value systems, and non-market-based approaches, and specific clauses recognizing the rights of Indigenous Peoples and local communities (IPLCs) to land, territories, and resources. This paper will assess this – rather surprising – outcome, combining legal and sociological analysis, based on a literature review, content analysis of UN documents, participant observation at CBD meetings, and interviews with key negotiators. It will first provide an overview of the contribution of IPLCs to the conservation and sustainable use of biodiversity, and of the evolution of the CBD framework to partially recognize such a contribution. It will review opportunities for the meaningful participation of IPLCs in CBD processes. Meaningful participation is understood as a collaborative process based on the recognition of IPLCs and their contribution to biodiversity conservation and sustainable use. It will focus in particular on the Nagoya Protocol on access to genetic resources and fair and equitable benefit-sharing, and the Kunming-Montreal Global Biodiversity Framework, investigating the conditions that enabled recognition of IPLCs' rights.

Rethinking Multispecies Society, Politics and Justice from Indigenous Sámi Perspectives

Sanna Valkonen, Áile Aikio, Saara Alakorva, Anne-Maria Magga

UNIVERSITY OF LAPLAND, Finland

Scholars of environmental humanities, posthuman research and related studies have already for some time highlighted the need for operationalizing new forms of interspecies responsibility, justice, politics, ethics and care in order to find the way out of the planetary emergency. Though it is increasingly acknowledged by scholars that posthumanist, multispecies and more-than-human perspectives in social theory are very much indebted to Indigenous relational ontologies, Indigenous Peoples as academic subjects and their knowledge and epistemes continue to be marginalized. The Indigenous Sámi People living in Northern Europe have to a considerable degree retained own societal, cultural, political and intellectual traditions and institutions that are characterized by human-environment relationality and the centrality of more-than-human perspectives and agency. In our presentation, we, as Sámi social science scholars, will discuss how Sámi societal and political traditions and thought can open new perspectives to sociological and posthuman conversations on environment and society and hence, to rethink, rearticulate and transform the questions of inter – and multispecies responsibility, justice and politics.

Co-management And Local Ecological Knowledge as a Facilitator of Ecosystemic Transformations: The Case of the Lira Fishing Community

Javier Seijo Villamizar[1,2], Gill Ainsworth[1,2], Sebastián Villasante[1,2]

1University of Santiago de Compostela, Spain; 2EqualSeaLab

392

Introduction: The project Mar de Lira and the Marine Reserve of Fishing Interest "Os Miñarzos", was born as a participatory process of a processual and reticular type from the own community of Lira. Its objective was to generate an ad-hoc co-management tool that would allow the transfer of local and/or traditional ecological knowledge between the fishing sector located in the Northwest Cantabrian fishing ground, stakeholders, civil society and Public Administration. Objectives: Within this framework, the objective of this proposal is to demonstrate that a participatory civic culture in the decision-making process is positive and demonstrative for managing fisheries micro-societies from a vision of sustainable and eco-responsible development. Methodology: the research steps lead to the systematization of explanatory variables and show the ecosystemic sustainability indicators that gave rise to the configuration of the first ecosystemic project for the Autonomous Community of Galicia. Discussion: We reflect on the evolution of local and/or traditional ecological knowledge, and how this tool is fundamental in the management of fisheries and the organization of fishing communities. The case of Galicia in Carnota (Lira fishing community) is given as an example. Results: the attributes that guide traditional knowledge and how this is reflected in the case of Carnota (Lira fishing community) are indicated.

Urban Ecosystem and Actors of Regeneration. Pavia and the Experience of the Horti

Emanuela Dal Zotto

University of Pavia, Italy

The National Biodiversity Strategy for 2030 reaffirms the close relationship between biodiversity protection and restoration and overall health (following the one-health approach), adaptation to climate change, the economy, and sustainable development.

This relationship, applicable to all terrestrial and marine ecosystems, takes on particular significance in the case of the urban ecosystem, considering that over 55% of the world's population currently resides in cities and three-quarters of the demand for natural resources and over 70% of CO2 emissions originate from cities. Hence, there is a need, as indicated by specific goal 10 of the National Biodiversity Strategy, to "halt the loss of green, urban, and peri-urban ecosystems, promote urban greening, and introduce and spread nature-based solutions." This necessity acknowledges the numerous ecosystem services offered by urban greenery.

In September 2022, in the center of Pavia, the historic university college Almo Collegio Borromeo revitalized and opened to the public a space of over three acres. This space combines various activities that integrate the naturalistic dimension, cultural dimension and the social and entrepreneurial dimension.

Horti Borromaici involve collaboration at the local level among public actors, private and civil society's entities, in the realization of an urban regeneration project that places urban greenery and biodiversity at its core. This contribution, by retracing the genesis of the initiative through in-depth interviews, investigates this collaboration, focusing on the motivations of the different actors involved, the value each assigns to biodiversity, and the constraints and opportunities that the local context has presented within the framework of current national and local regulations. The aim is to understand which entities and under what conditions can play a crucial role in urban regeneration processes.

RN12 | T03_03: Understanding Energy Poverty

Tackling Energy Poverty: The Role of Energy Communities

Jordan Young, Sol Maria Halleck Vega

Wageningen University, the Netherlands

Climate change and energy poverty are urgent concerns, which the recent energy crisis has made more pressing to solve. Energy communities (ECs) have been highlighted to be key enablers for a fair and green energy transition. However, the potential of ECs to tackle energy poverty remains ambiguous. Three key aims of this paper are to: i) provide an overview of approaches taken by ECs to address energy poverty, ii) highlight barriers faced by ECs vis-à-vis implementation of energy poverty alleviation measures, and iii) assess ECs' (lack of) engagement with tackling energy poverty via a survey and econometric model on self-assessed effectiveness. The latter is done for the Netherlands, which makes for an interesting case due to a doubling of ECs over the past decade and prevalence of energy poverty. The survey response rate was slightly over 25%, with 53% of these ECs being active in addressing energy poverty. Among key results is that measures aimed at strengthening support at neighborhood level (e.g. via investing in provision of local public goods) are used much less compared to financial and other measures. However, this merits more attention since energy poverty not only revolves around housing quality and financial situation of households, but also aspects related to social isolation and institutional trust. The insights for the Netherlands can also be valuable for ECs and policy makers in other countries contemplating or already working towards addressing energy poverty challenges.

393

Profile of Households Suffering from Energy Poverty in the Municipality of Getafe (Madrid).

Iván López, Victoria Sanagustín Fons

University of Zaragoza, Spain

This research is part of the European project ENERGY POVERTY INTELLIGENCE UNIT – EPIU GETAFE (2020) which aims to reduce energy poverty in Getafe (Madrid). The objective of the study is to identify households with visible and hidden energy poverty and their features. Specific conflicts are analyzed, such as the difficulties to keep the house at an adequate temperature, access to the social bonus, payment of energy bills, strategies at home to deal with excess cold or heat, reduction in consumption of home gas or electricity, and the understanding energy bills. The methodological approach is mainly quantitative using an ad hoc survey. The sample includes 741 households interviewed (3.3%

sampling error), distributed almost equally among the neighborhoods of Las Margaritas and La Alhóndiga-Fátima. The questionnaire comprises 41 questions, and the field work was carried out in July 2022. Through the analysis of latent classes, five profiles have been identified based on their characteristics of homes that suffer or not from energy poverty. Despite other deep statistical analysis, an initial view shows that 13,0% of households suffer from very high energy poverty, and 33% at a high intensity. Likewise, one in four households does not suffer from energy poverty, and two groups with different characteristics suffer from moderate poverty.

Double Energy Vulnerability: Residential and Transport Energy Poverty and the Education Outcomes of Young People in Ireland.

Monika da Silva Pedroso, Nessa Winston, Paráic Carroll, Orla Dingley

University College Dublin, Ireland

Traditional policymaking often fails to address the new societal implications of the climate crisis and resulting decarbonisation strategies. New eco-social risks are emerging across the life course in the form of residential and transport energy poverty. This paper investigates whether these forms of energy poverty affect – either directly or indirectly – the educational attainment and mental health outcomes of children. Existing research on energy poverty in Ireland has demonstrated that children are more likely to present with health and behavioural conditions when living in poorer housing conditions, such as dampness and lack of heating. However, there is a significant gap in the literature on eco-social risks in the life course in terms of understanding and addressing the role of both residential and transport energy poverty on children's educational achievement and mental health outcomes. Three research questions are explored here: 1) whether there is a direct association between energy poverty in the residential and transport energy domains and educational and/or mental health outcomes; 2) whether associated factors (e.g. gender, degree of urbanisation, income, parental education) affect how energy poverty potentially impacts on educational and mental health outcomes of children by exacerbating social exclusion and inequalities; and 3) whether these dynamics change across time and whether a cumulative impact is evident. We use data from the Growing Up in Ireland study (GUI) – the largest and most relevant longitudinal study on children's development in Ireland. Preliminary findings indicate that energy deprivation is associated with the lower educational achievement and poor mental health of children. Eco-social policies to mitigate these inequalities are discussed.

Causal Stories On The Energy Poverty-Health Nexus: Narratives From Local Stakeholders In France

Ute Dubois

ISG International Business School, France

While there is a growing awareness of the links between energy poverty and poor health among academics and policy makers, approaches to address these links within a unified policy framework have not yet been developed in France. However, several stakeholders mainly at the local level already work on issues related to both energy poverty and health, often focusing on specific aspects, such as social vulnerability, housing, or health. This research explores the views of local stakeholders on the energy poverty-health nexus. Local authorities and stakeholders such as charities, housing associations, care services, health professionals, or energy suppliers, who are in direct contact with households, are well placed to identify the difficulties of households related to both energy poverty and to health. But what is their understanding of the complex relations between energy poverty and health, and to what extent are they able to integrate considerations related to the energy poverty-health nexus in their professional practice?

This research is based on a case study of a medium-sized city in central France. Based on semi-structured interviews with stakeholders working in different policy fields, we explore how they view the energy poverty-health nexus. From a theoretical perspective, this research shows the importance of considering the different understandings of the topic that drive stakeholders' approaches and decision making, especially on issues that cut across policy fields. From a practical point of view, this work helps to reflect on the potential and limitations of integrating the energy poverty-health nexus into local public policymaking.

RN12 | T03_04: Media Narratives and Environmental Communication

'The Worst Day of the Year' – Media Narratives About the Wildfires of October 2017 in Portugal

Elisabete Figueiredo[1], Cristina Ribeiro[2], Eduarda Fernandes[3]

1Department of Social, Political and Territorial Sciences & GOVCOPP – Research Unit on Governance, Competitiveness and Public Policies, University of Aveiro, Portugal; 2CESAM – Centre for Environmental and Marine Studies, University of Aveiro, Portugal; 3School of Technology and Management, CARME, Polytechnic Institute of Leiria, Portugal

Mass media has a powerful influence in social transformation and strongly impacts on personal and collective views and attitudes regarding some events, by exposing us to a set of facts, opinions and perspectives, often subjectively selected to be disseminated. Media both echoes and helps to create public attitudes, tensions and diverse levels of trust about a large set of issues, also affecting political and policy decisions. Particularly regarding dramatic events – such as extreme environmental events – mass media narratives tend to amplify their occurrence, consequences and to overexploit the views and feelings of the victims. This was the case of the media coverage regarding the wildfires of October 2017 in Portugal which destroyed more than 200 000 hectares of forest (half of the whole burnt area that year). Based on a content analysis of the news issued by eight newspapers with different territorial coverage and periodicity, the current study analyses the (print) media narratives around the wildfires occurred on the 15th October 2017 in the specific case of the Matas do Litoral territories most affected by those fires. The analysis focuses on the news issued immediately after the fires (from 15th October to 15th November 2017) to understand the immediate media handling of the events, considering the way they were communicated together with the political responses; their environmental and socioeconomic impacts; the agents and actors considered alongside their views and feelings. Results show a clear amplification of the role, response and accountability of (mainly political) agents and a greater emphasis on the socioeconomic impacts.

*This presentation was elaborated in the ambit of the ShareFOREST project (PCIF/GRF/0050/2019)

A Content Analysis of the News on Violence against Working Animals in Türkiye

Figen Uzar Özdemir

Zonguldak Bülent Ecevit University, Turkiye

Violence against animals, in all its abusive forms, is a serious violation of animal rights. In the field of human-animal studies, the topic is usually discussed in relation to violence against humans. Following this, we can claim that violence against animals can be conceptualized as a form of 'masculine domination' (Bourdieu 1998). Within this theoretical framework, this study aims to examine how violence against working horses, donkeys and mules are represented in the media in Turkey.

For this aim, I conducted a content analysis of news on violence against equine animals in three popular newspapers in Turkey, namely, Sabah, Hürriyet and Cumhuriyet between the years 2010 and 2023. I analyzed in these news the following themes: features of the animals and of the violence performers depicted; the context and details of the incident given; what happens after the incident, whether there is a penalty given to the violence performer mentioned in the news. This analysis demonstrated that physical violence against animals is conceptualized as torture and sexual violence in the form of bestiality and rape are represented in the newspapers. News on exploitation of animal labor rarely appear in the newspapers analyzed. Nearly all of the agents of violence are men, performing the violent act individually or mostly in groups. The incidents take place in rural parts of the country where donkeys, horses and mules are still being used. The vulnerability of the animals which are abused is usually depicted in the news by a stress on their disability, such as blindness or old age.

395

New Stories About Air Pollution – Addressing Justice, Inclusion and Complexity in Media Storytelling

Pawas Bisht

Keele University (UK), United Kingdom

Air pollution is the greatest threat to human health in India, reducing life expectancy, on average, by 5 years. New Delhi is one of the world's most polluted capital cities with levels of air pollution nearly 15 times the specified WHO limit (5µg/m3) for fine particulate matter (PM2.5). Media narratives about air pollution are of vital significance in shaping public understanding, framing political discourse, and generating attitudinal, behavioural and policy changes needed to mitigate the problem (Singh and Thachil 2023). This presentation will share insights from an ongoing British Academy funded project, 'Storytelling for Environmental Change' which seeks to identify and overcome limitations in existing media narratives around the issue. The presentation will firstly draw on findings from a large-scale qualitative content analysis to reveal the limited media framing of air pollution in mainstream Indian news media, focussing

in particular on the episodic, fragmented, and hyper-partisan nature of the storytelling. The presentation will then share insights from the practice-based strand of the project which has developed three new film narratives around air pollution. The discussion will use concrete examples from these new films to illuminate new storytelling pathways that address questions of justice, inclusion and complexity around the issue of air pollution. Overall, the presentation responds to the conference theme by reflecting upon key tensions in media storytelling around the air pollution crisis and highlighting pathways for restoring public trust and generating transformative policy action.

Creating Trust and Tension: Framing Climate Change in Media and Public Debate

Yulia Belinskaya[1], Johanna Daser[1], Andreas Gebesmair[1], Jessica Richter[2], Georg Vogt[1]

1St. Pölten University of Applied Sciences, Austria; 2St. Pölten Institute of Rural History, Austria

Trust in the context of climate change discourse involves the reliance on scientific evidence, official institutions, and communication channels. In this sense, the role of the media in disseminating scientific findings, policies, and positions of social players is crucial in shaping public trust. Up to now, however, there is little research into how the media present climate change and combine visual and textual media.

This talk presents an interdisciplinary study exploring climate change media discourse that draws on perspectives from history, sociology, communication science, and film analysis. The investigation focuses on the media's role in shaping public trust in climate change in Austria, addressing regional dynamics.

Adopting a multimodal approach, the research analyses both textual and video sources reporting on two specific cases, spanning from the 1970s to the present: 1) the media coverage on soy, exploring its centrality in the global food regime and its symbolic significance in discussions about alternative lifestyles and sustainable development; 2) struggles surrounding wind turbines, considering their role as alternatives to fossil fuels, and the tensions and conflicts they invoke in regional and local contexts. The study examines framing processes, visual arguments, fields of action, and the interplay of frames across time, medium, and journalist perspectives.

The authors present their ideas for the development of a systematic methodological framework based on framing analysis. This approach is aimed to be applicable to diverse cases, enriching the understanding of climate communication across perspectives and time frames.

The Role of Media and Learning in Transitions Towards Climate Friendly Vacation Practices

Lars Kjerulf Petersen

Aarhus University, Denmark

This presentation explores the pertinent issue of how and through which forums pro-environmental practice changes are instigated, and how they are dispersed and integrated into new patterns of bodily and cognitive performances. What is it that can set practice changes in motion, reshuffle the constituent elements of any given practice and even sustain them over time? These explorations are unfolded with reference to an ongoing project about transition to climate friendly vacation practices and draw on both practice theory and actor-network theory. One key theoretical and empirical concern in the presentation is how we can and indeed must understand items of media content – the imaginaries and ethics, competences and regulations they convey – as an integral part of the maintenance as well as the transformation of lifeworld practices. Another key concern is how items of media content together with social network interactions are involved in the informal learning processes through which practice changes are developed and consolidated. Preliminary empirical findings, to be included in the presentation, indicate that dominant conceptions of the good vacation often are tied to resource intensive practices but for the most part just as well could be tied to less resource intensive practices. Furthermore, conventional and social media as well as social network interactions all play a role in the creation of concrete vacation desires as well as in the learning of new vacation goals and competences.

RN12 | T03_05: Frontiers of Climate Crises, Military Conflicts, and Displacement

On The Possibility Of Live In Post-human War

Ilenia Picardi

University of naples Federico II, Italy

According to recently published research the projected emissions from the first 60 days of the Israel-Gaza war were greater than the annual emissions of 20 individual countries and territories (Neimark et al, 2024), while other research has highlighted the dramatic effects that the Russian-Ukrainian conflict is having, and will have in the future, on the environment, as well as on the world economy, geopolitics and food security (Rawtani et al. 2022; Pereira, 2022). Beginning with an analysis of ongoing tragic conflicts, this paper explores the entanglements between current environmental crises and humanitarian crises. The conceptual frame of the paper is based on the Social Studies of Science and Technology, which proposes perspectives aimed at overcoming the environment/society dichotomy to analyse relationships constructed through agency inscribed in a human-non-human continuum. Following this perspective, war can be analysed as a socio-material practice characterising the Anthropocene by undermining multispecies cohabitations. In this scenario, I introduce the concept of post-human war, a new form of war based on the ever-closer integration on the battlefield of the following elements a) sensor networks, b) digitisation of command infrastructure, c) autonomous and AI systems. Post-human war, whose agency is distributed among human and non-human actors, infrastructures, and artificial intelligence systems, will have relevant environmental implications, analysed in this paper.

The Climate of Occupation – Precarious Social Ecologies and New Climate Frontiers in Pastoralist Communities in Israel and Palestine.

Miri Lavi-Neeman

Arava Institute for Environmental Studies

This paper explores ways in which climate changes articulate with Israel's "nature management" in pastoralist communities of Area C and in the Negev/Naqab. An ethnographic study of these Palestinian communities forms the basis of this paper, which argues that formal and informal practices of occupation, such as land grabs, enclosures of grazing zones, limits on mobility of people and animals, and on access to land-based infrastructure, work as a social ecological regime producing precarious social ecologies –as well as new forms of vulnerability and new environmental

subjectivities. The paper draws on the ways in which political ecology, as an epistemological framework, engages with climate change studies. It argues theoretically that investigating the nexus between the occupation and climate change illuminates the ways we understand climate concepts and vocabularies (such as mobility adaptation resilience) that now compose the new hegemonic discourses of climate research and policy. It highlights the importance of understanding climate change as articulated with other pressures in producing social vulnerability and precarity. While empirically looking into pastoralist communities at the geographical edges of the state, the paper contributes to understanding climate changes from the "margins of states" as spaces of many limits but also of potential political possibilities and resourcefulness. Finally, from a regional perspective, the paper attempts to further develop a political ecology of Israel/Palestine as a powerful framework for investigating sociopolitical dimensions of climate change in the region.

Climate Crisis And Its Link With Socio-Political Vulnerability In The Middle East

Carmit Lubanov

Tahadhari Center for Climate and Migration in Euro-Med (TCCMEM)

At the opening of the recent UN annual conference COP28, His Highness King Abdullah of Jordan said "In a region already on the frontlines of climate change, the massive destruction of war makes the environmental threats of water scarcity and food insecurity even more severe"… "let's be inclusive of the most vulnerable: Palestinians, severely impacted by the war on Gaza; Populations around the world, affected by conflict and poverty";

The presentation is addressing the question of 'How poor is the state of the countries in the Middle East, in the context of climate preparedness towards 2030 objectives?', and presents a regional outline developed by Tahadhari Center for Climate and Migration in Euro-Med (Brussels), aimed to focus the attention of climate politics on the Middle East and the South Mediterranean.

It is suggested to examine the goals agreed upon Paris in the terminology so familiar in the Middle East: 'Mitigation of the climate risk' and 'adaptation for climate security', and to propose an outline that is challenging the 2030 goals in a regional prism.

The new research to be presented is aimed to future assessment of mitigation of climate risks and adaptation towards climate security across the Mediterranean region, the linkages between climate change and National security are discussed vis-à-vis the current geopolitical landscape and associated transboundary challenges, in defined geopolitical regions, as Middle East, and South Mediterranean. As for South Mediterranean, prospective climate risks include migratory pressures, climate refugees, water stress and food insecurity that were reviewed.

Vertical Migrations And Climate Change In The Italian Metro-mountain

Filippo Barbera[1], Andrea Membretti[1], Silvia Keeling[2], Viktoriia Tomnyuk[1]

1University of Turin; 2University of Milan

Internal migration often receives less attention than international migration, a trend particularly pronounced in Italy where media and political focus has long centered on arrivals from abroad. However, in the past 15-20 years, Italy has witnessed a notable reversal in migration patterns. The once-abandoned Alpine and Apennine mountain regions are experiencing an increasing influx of "new highlanders," drawn by a complex mix of factors, including emerging environmental and climatic considerations. Climate change and land vulnerability are now significant drivers affecting individuals' choices of where to live (Membretti and Lucchini, 2018; Brandano et al., 2023; Dematteis et al., 2023).

To address this phenomenon, the "Climate Migration in the Italian Metro-mountain" (MICLIMI) project has been initiated. This research endeavor aims to omprehensively investigate, quantify, and understand internal migration attributed to climatic factors, particularly within the northwestern Po Valley metromountain. Key project objectives encompass assessing the scale of vertical migration within the country, gauging urban residents' perceptions of climate change impacts in their daily lives, evaluating their interest in relocating to mountainous regions, and identifying migration patterns, especially from cities like Milan and Turin.

The study's findings reveal heightened concerns among urban residents, notably among younger individuals and women, regarding the current and future impact of climate change on their cities. Heatwaves, in particular, are a prominent concern, influencing their consideration of relocating to cooler mountain areas. This climate-driven internal migration trend signifies a significant transformation in Italy's demographic and environmental landscape, as it challenges traditional migration narratives and underscores the growing influence of climate factors on human movement within the country.

RN12 | T04_01: Navigating Tensions in Urban Environmental Activism

Enviromental Activists' Empowerment in Network Organisation. The Case of Polish Smog Alert

Michał Wróblewski[1], Sebastian Medoń[2], Joanna Suchomska[1]

1Nicolaus Copernicus University in Toruń, Poland; 2The AGH University of Krakow

Empowerment can be defined as "a process, a mechanism by which people, organizations, and communities gain mastery over their affairs" (Rappaport 1987: 12) or as a process of acquiring "participatory competence" (Gerschick et al. 1990), understood as a sense of agency, ciritical political awareness, or specific capacities for action. From the perspective of social movement theory, a sense of empowerment is particularly important among subjective factors, as it can be one of the key aspects of the institutionalization or sustainability of activist involvement (Drury, Reicher 2005).

The purpose of this presentation is to analyze the sources and dimensions of empowerment of activists affiliated with the Polish Smog Alert. It is a network of more than 50 local organizations involved in the fight for clean air. Its establishment is related to the fact that Poland is one of the most polluted countries in the EU (EEA 2022). Polish air pollution activism is specific for several reasons. First, it takes a network form. Second, it can get away with being extremely effective in the area of raising social awareness and changing the policy.

The presentation will focus on how empowerment works in a networked or coalition-based organization, pointing primarily to the roles of: 1) core beliefs; 2) institutional and organizational resources; 3) knowledge and mutual learning processes. As the example of the Polish Smog Alarm shows, activists within network organizations can derive a sense of empowerment from the fact of functioning in a broader coalition, and at the same time the network nature of the organization can counteract various processes of disempowerment.

Unraveling the dilemmas of the eco-engaged: An In-Depth Analysis of Sustainable Citizenship's Contradictions and Ambivalence

Hanne Dallenes, Frédéric Vandermoere, Robbe Geerts

University of Antwerp, Belgium

In the pursuit of a sustainable society, a large amount of research predominantly focusses on how to enhance a positive ecological transition. Within this line of research, the concept of sustainable citizenship presents interesting avenues incorporating the sustainability issue into our classic notion of citizenship. However, environmental behaviour relies on a range of complex choices and practices which encounter various conflicts with multiple structural barriers, even with individuals who perceive themselves as eco-engaged. Yet, it is unclear what the complexities of everyday life mean for the debate of sustainable citizenship. Moreover, the attitude-behaviour gap illustrates that even eco-engaged citizens do not always translate their environmental values into concrete actions. How do citizens, for instance, give meaning to a pronounced environmental sensitivity on one domain of action with an indifference in other domains? Hence, in this study we aim to better understand how self-identified sustainable citizens navigate the responsibilities of sustainable citizenship. Our goal is to open up the black box of the attitude-behaviour gap by unravelling the complex dilemma's and inconsistencies faced by the self-perceived ecological citizen. We approach sustainable citizenship from a cultural sociological, practice-based perspective to understand how it operates in the complexity of everyday life. We conducted + − 20 in-depth interviews with self-identified sustainable citizens. The findings illustrate the importance of understanding sustainable citizenship in terms of contradictions and ambivalence. Moreover, the results depict the embeddedness of sustainable practices in real life and the complexities of incorporating normative behaviors into different life spheres.

The Power of Knowledge. The Role of Activists' Technical Expertise in Urban Environmental Conflicts

Elisabetta Mocca

University of Salamanca, Spain

In the face of the continuous attempts of city governments to privatise and commodify green spaces, local residents organise in neighbourhood-level movements, which employ technical knowledge to support their arguments.

The use of expert knowledge by environmental movements has been explored by different disciplines across the social sciences, which paid attention to activists' learning process, knowledge production and communication of expert knowledge. Drawing on this diverse scholarship, the paper reports a qualitative study comprising individual and group interviews undertaken in the city of Turin, Italy. Here, a host of sub-local green movements formed against a series of interventions planned by the city council.

The paper examines the importance of knowledge as a means to counter unsustainable local projects. The evidence provides insights on how the reasons mobilising these small urban green movements, while being political, are also strongly driven by scientific and legal knowledge. The local residents clustered around a common cause harness their insider skills to mount a sound opposition to the city council's projects. To do so, the technical expertise of the activists is shared within the movements and harnessed to build an evidence-based resistance against the city council's projects.

The paper maintains that activists' technical expertise serves as an effective weapon in urban environmental conflicts. Empowered by their knowledge of environmental issues and planning regulations, urban green activists are capable of interacting with local institutions to make their voice heard. Furthermore, the practice of collective self-education provides urban green activists with an heightened awareness of their ecological rights. Ultimately, the activists' ecological knowledge enables them to claim their ownership of the city's green areas, opening up opportunities for participatory ecological democratic practices.

Participatory Processes in the Making of Urban Ecological Transition: the Role of Social Movilization in the Case of Barcelona.

Victoria Sánchez Belando, Marc Pradel Miquel

University of Barcelona, Spain

This paper examines the role of citizens and urban social movements in setting ecological transition agendas by analyzing the case of Barcelona. Since the Paris Summit and the Intergovernmental Panel on Climate Change Report of 2018 many cities are rethinking and redesigning their policies on public space, mobility and economic growth. The case of Barcelona shows how a coalition government led by an anti-austerity party emerging from the financial crisis such as Barcelona en Comú (2015-2023) has developed an ambitious agenda on ecological transition with the participation of urban social movements, including not only traditional actors, such as neighborhood associations, but also new ecological movements such as Extinction Rebellion or Fridays for future. This paper focus on the participatory processes for the development of the Climate Plan and the Declaration of Climate Emergency which accelerated plans for ecological transition. Based on qualitative analysis that include interviews and documentary analysis, we examine firstly the conditions and forms in which urban social movements could intervene in the process of strategic planning for the ecological transition and, secondly their impact in defining policy mechanisms and regulations. Results show that ecological movements had a significant role

399

in configurating ambitious goals for transition in a moment in which the local government set the ecological transition at the center of policy action. Nevertheless, the agenda has been weakened by the COVID-19 emergency and the change in the political color of the city council.

RN12 | T04_02: Environmental Attitudes, Awareness and Concern

Environmental Attitudes: Unpacking the Impact of Carbon Inequality

Pär Fredrik Dalén

Stockholm University, Sweden

Global awareness of the dangers of climate change often fails to translate into public support for protecting the environment, especially when personal sacrifices are required. Previous studies of individual countries suggest that people's unwillingness to pay for protecting the environment is largely attributed to perceptions of unfairness concerning how costs and benefits are distributed. This study aims to advance knowledge about these issues from a country-comparative perspective. More specifically, it examines whether and how inequality in the distribution of carbon emissions within and across countries is important for peoples' willingness to pay higher taxes and prices to protect the environment. My primary hypotheses posit that individuals show greater willingness to pay in countries where (1) the majority maintains lower per capita carbon emissions than the wealthiest decile, and/or (2) carbon inequality has increased over time. Additionally, (3) the inclination to pay is contingent upon the perceived effectiveness of the government, suggesting a reinforcing effect with high levels of Quality of Government. These theoretical hypotheses are explored by using all four waves of the International Social Survey Programme (ISSP) environmental modules (1993, 2000, 2010, 2020), combined with macro-level data on the distribution of carbon emissions from the World Inequality Database (WID).

400

Attitudes Regarding the Environmental and Climate Crisis in Austria – With a Special Focus on Rural Areas

Sigrid Kroismayr

University of Economics and Business Vienna, Austria

Rural areas are typically perceived as places with conservative and traditional values. This perception is particularly influenced by the election behavior of the rural population in various European countries, who have increasingly voted for right-wing parties that place little emphasis on climate and environmental issues.

Against this background, it is interesting to explore whether the attitudes and behavior of the rural population differ from that of the urban population in relation to environmental and climate issues. Both the environmental and climate crises are intrinsically linked to the future prospects

of coming generations. Therefore, it is equally interesting to explore whether environmental and climate attitudes differ between young people in rural and urban areas. It is hypothesized that for the youth, climate and environmentally related issues are more important than for older individuals, as evidenced by movements like Fridays for Future.

Data from the Austrian Social Survey (SSÖ) 2021 is utilized to address these questions. In the last survey, there was a focus on questions regarding the environment and climate. The selection of questions comprises attitudes towards causes of climate change, measures to protect the climate and environment, willingness to change behavior, and environmental activism. Where question comparability permits, earlier surveys are also considered for a temporal comparison.

"Climate Change Awareness: The Case of Medical Doctors in Artvin"

Öznur Yılmaz-Altun

Artvin Coruh University, Turkiye

Climate change refers to the long-term and continuous change in climatic conditions. The social impacts of this process are reflections of the climate crisis. The social impacts of climate change should be analyzed and evaluated in various aspects. One of the most important consequences of climate change/crisis is that all aspects of society are affected. In this respect, being aware of the change and transformation created by climate change in our daily lives is an important starting point for the future of the world in this process. The first step in examining the interaction of climate change and society is to determine awareness. Turkey is seriously affected by climate change due to its geographical location. However, does the society have a climate awareness to the extent of this impact? This question is of equal importance with the question of why the sociology of climate change is important.

One of the direct and indirect risks of climate change is its impact on human health. In this respect, doctors' awareness of climate change becomes very important. Doctors who are aware of climate change play a pioneering role in raising public health awareness as well as taking precautions by informing their patients about the risks in this regard. This study aims to measure the awareness of the doctors working in Artvin on the effects of climate change on daily life, as well as their awareness on the damage caused by climate change on health and its social impact. The results of this quantitative study conducted with doctors working in Artvin center and various districts will reveal the status of climate change awareness among doctors in Turkey.

Assessing Portuguese Healthcare Professionals' Perspectives on Climate Change-Related Health Policies and National Health Service Readiness: A Qualitative Study

Nidia Ponte[1,2], Fátima Alves[1,2,3,4], Diogo Guedes Vidal[1,2]

1Department of Social Sciences and Management, Universidade Aberta, 1250-100 Lisbon, Portugal; 2Centre for Functional Ecology—Science for People and the Planet (CFE), Associate Laboratory TERRA, Department of Life Sciences (DCV), University of Coimbra (UC), 3000-456 Coimbra, Portugal; 3Observatory of Sustainable and Healthy Territories of Bocaina, Paraty 23970-000, RJ, Brazil; 4Sergio Arouca National School of Public Health (Ensp), Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro 21041-210, RJ, Brazil

In alignment with the urgent sociological imperative to address the multidimensional crises stemming from climate change (CC), biodiversity loss, and socio-political tensions, this abstract delves into the critical realm of healthcare preparedness facing escalating climate impacts. With the increasing impacts of CC on health, understanding how health professionals, especially physicians, are informed and prepared to deal with these challenges has become imperative. This study explores Portuguese healthcare professionals' perspectives on climate change-related health policies and the National Health Service's (SNS) readiness to tackle climate impacts. A qualitative methodology was applied, and thirteen interviews were conducted with physicians from various medical specialties in Portugal, aged between 28 and 73, using a semi-structured interview script. This work contributed to confirming that the CC health policies in Portugal are still very incipient and require more proactive measures, interconnected across various dimensions, particularly concerning healthcare professionals. The main result of this research highlights the need for more consistent communication and more precise guidelines for dealing with the impacts of climate change on public health.

RN12 | T04_03: Energy Transition, Resistance, and Acceptance

Cultures Of Resistance To Low-Carbon Transitions In Europe: Insights From Poland And Spain

Giulia Garzon, Benjamin Kirchler, Katharina Rusch, Andrea Kollmann

Energieinstitut an der Johannes Kepler Universität Linz, Austria

In the face of the adverse consequences of climate change, the urgency of advancing low-carbon transitions is widely recognized. However, environmental policies, such as coal phase-out, have sparked social tensions and resistance across various economic sectors and segments of society. Resistance manifests itself, for instance, through protests, activism and political dissent. This paper delves into the cultural dimension of resistance to low-carbon transitions in Europe, drawing insights from resistance-related dynamics in the coal-transitioning countries of Poland and Spain. The study, conducted as part of the CURE project, analyzes responses to the 2018 Europe-wide ECHOES survey (n=18,037) to explore how factors such as fossil fuel dependency, identity, cultural frames of reference, and community engagement with the transition interact with and contribute to opposition to energy transition policies. Based on the analysis of this comprehensive dataset, the paper aims to lay the foundations for a theory that elucidates the origins of resistance to low-carbon transitions. This theoretical framework enriches our understanding of resistance dynamics by emphasizing the complex interplay of socio-economic, cultural, and political factors. The findings of this study underscore the need for further research on the cultural dimensions of resistance in different European contexts and the importance of considering cultural aspects in fostering effective low-carbon transitions globally.

Green Transition and Critical Raw Minerals – Social Awareness and Acceptance in Four Countries

Tuija Mononen, Tuija Jartti, Mikko Piltonen, Saara Österberg

University of Eastern Finland, Finland

The Green Transition has become a key narrative for European policy since the European Green Deal was launched. Mining activities, especially those connected to critical raw minerals, has a central role in Green Deal and the green transition. CRMs are an important element in the Green Deal industrial strategy. The idea of just transition is at the core of the Green Deal as well. The just transition can bring tensions and trade-offs between different perceptions and experiences.

Social acceptance of mining activities has become the key challenge for the whole sector's future. The discussion regarding local acceptance has been growing during the past decade as the industry's negative impacts have begun receiving more attention. Acceptance is driven by perceptions and level of trust. Information and knowledge play an important role in how mining activities are perceived and accepted. Communities and citizens need information to be aware and to be able to participate in making informed decisions about exploration and mining activities. It is also of great interest whether citizens' knowledge could contribute political and technical insights, for example, to environmental problem solving.

This presentation is based on the results of a research project on social awareness and acceptance on green transition and CRMs in four case countries: Finland, Czech Republic, Poland, and Portugal. In this presentation, the discussions in community events, results of the citizen survey and results of the interviews of local people will be explored. The results tell what kind of worries there are among the local communities. What citizens know about green transition and CRMs, what they want to know, what the information is like, how it should be?

Non-mobilization in the face of Environmental Risks of Energy Projects: Role of the Visions of the World as a Product of Socialization and Social History

Umut Sari

Centre Max Weber, France

Why do members of a community where polluting energy projects are planned remain silent in the face of the risks that threaten their lives and livelihoods? Despite a dozen of proposed coal-fired power plant (CFPP) projects in the small city of Yumurtalık in southern Turkey, there was no mobilization effort among the residents, nor were they willing to cooperate with the environmental activists who tried to develop a mobilization in the main city of the region, Adana. In-depth interviews with residents reveal that they had in fact ambivalent feelings and thoughts about these new CFPP projects. However, perceptions of "inevitability of energy projects", "powerlessness of citizens", and "inefficacity of collective action" generate a fatalist resignation that prevent residents from engaging in collective action even if they are concerned about the risks of CFPPs. These findings are in line with the studies that emphasize that grievances are present but contained in such communities. A closer analysis of the findings shows that these perceptions are socially situated: there are regularities in the ways of reasoning behind the perceptions in terms of social origins and political orientations of actors. The present study argues that the perceptions that generate the fatalist resignation in the face of environmental risks are anchored in the visions of the world that actors have interiorized during

previous socialization, which itself is shaped by the social history of the context with its peculiar tensions. Hence, Bourdieu's concept "vision of the world" is a useful alternative to ideology employed in the literature on environmental non-mobilization, thanks to its ability to shed light on the links between perceptions, biography and context.

Who Owns the Wind? Ownership and Land Rush in the Context of the German Wind Energy Development

Marco Sonnberger[1], Maria Pfeiffer[1], Matthias Gross[1,2], Alena Bleicher[3]

1University of Jena, Germany; 2Helmholtz-Centre for Environmental Research; 3Harz University of Applied Sciences

In the context of the phase out of coal and nuclear energy in Germany, the federal government has made ambitious plans for the future development of wind energy. By 2032, 2% of the German national territory are supposed to be dedicated to wind energy production. In this context, local conflicts over the expansion of wind energy are sparked by issues such as the distribution of costs and benefits. Thereby, questions of land ownership as well as access and disposal rights to such land become a determining factor of distributive justice.

In our presentation, we first elaborate on sociological approaches to ownership and highlight the (often neglected) relevance of property rights in the context of wind energy development. Based on semi-structured interviews with stakeholders, decision-makers, consultants as wells as community energy actors we dig deeper into conflicts arising from the appropriation of land for wind turbines and their effects on the local creation of value and associated community benefits. We show which factors influence how local communities deal with ownership conflicts around wind energy projects. Among these factors are social cohesion and mutual trust, active municipal planning and organizing, and historical experiences of local cooperation.

RN12 | T04_04: Integrating Sustainability and Environmental Awareness in Higher Education

Mapping The Green Mindset: A Cross-National Analysis Of European Graduates' Climate Attitudes And The Role Of Higher Education

Louisa Köppen, Kai Mühleck

German Centre for Higher Education Research and Science Studies (DZHW), Germany

To address climate change and work towards a green and sustainable society and economy in Europe, it is inevitable to equip future generations with relevant competencies to enable them to make informed decisions and take action in this area (Borgonovi et al., 2022; Leicht, 2012). In this context, higher education (HE) is expected to play a curial role (European Commission, 2020). Through education, research, and outreach, HE not only imparts knowledge and attitudes to students, but possesses the power to transfer these to society, raise awareness and initiate transformative development (Witte, 2023; McCowan, 2022; Michelsen & Rickmann, 2012). Graduates, in particular, form an interesting group of bridging actors, as they convey their acquired competencies and attitudes to diverse segments of society (McCowan, 2022). Therefore, this paper investigates European graduates' attitudes towards environmental sustainability and climate change, including cause knowledge, climate worries and intentions to act, which are considered outcomes of their HE. Further, it explores the role of HE characteristics (e.g., type of institution, degree level, field of study, prevalence of environmental topics in the curriculum) in shaping climate attitudes. For the analyses, we utilize an extract of the EUORGRADUATE 2022 dataset encompassing eight European countries. This approach allows for a cross-national perspective to consider differences arising from country-specific contextual factors. As this is an explorative study, we mainly run descriptive analyses on climate attitudes, but also include multivariate analyses to illuminate the relationship between HE characteristics and climate attitudes.

403

The Elusive Educational Competencies for Sustainability in Universities

Josep Espluga-Trenc[1], Maria Marcet[1], Markku Lehtonen[1], Ana Prades[2], Silvia German[2]

1Universitat Autònoma de Barcelona, Spain; 2CIEMAT-CISOT, Spain

Universities have an important role to play in generating new ways of thinking and acting that will make it possible to face the socio-ecological challenges of the 21st century with greater guarantees. This has been assumed by numerous international institutions, from UNESCO to the European Commission, among others, which have proposed numerous guidelines and good practice guides to move in this direction. Here we present the results of a European research project (ECF4CLIM, EU H2020, G.A. 101036505), which, among other things, has studied how sustainability is promoted in four European universities (from 4 different countries: Finland, Portugal, Romania, and Spain). Methodologically, a documentary analysis of the regulations and action programs of these universities has been carried out, as well as a series of reconvened focus groups (n=8) with students, and in-depth interviews with faculty and staff (n=35), with the aim of capturing the perceptions, experiences and expectations of the different actors regarding the evolution of sustainability in their respective educational centers. The results show how the promotion of educational competencies for sustainability often clashes with numerous organizational and contextual factors of the universities, over which they do not always have sufficient resources or power to modify them. From this, it is concluded that the promotion of sustainability competencies is not something that can be done only by focusing on the knowledge, skills or attitudes of individuals, but should be contemplated more broadly, attending to the intersection between the individual, collective-organizational and environmental spheres. The results show also the main difficulties in doing so and reflect on how to overcome them.

Forest Connections: Widening and Integrating Knowledges for Socioecological Regeneration in a University Context

Oriana Rainho Brás

Universidade de Lisboa, Portugal

It is becoming increasingly clear that we need interdisciplinary, multidimensional, sensitive approaches to tackle environmental problems. Extreme urgency in reverting climate change and increasing evidence on the positive effects of reconnecting with nature underline the importance of community involvement in such processes. Universities have an enormous potential to contribute to social and ecological regeneration depending on their ability to open and (re)connect areas of knowledge and ways of learning, and to foster deeper and positive ways of being in the world. This is where TERRARE Action-research for social and ecological regeneration, acts. We create a tiny forest at SOCIUS/CSG, ISEG, Universidade de Lisboa, Portugal, through a series of participative workshops facilitated by and anthropologist and a biologist, involving students, faculty members, researchers and university staff, who learn the Miyawaki method, design the tiny forest, work on the land, and care for the space and the plants. Moreover, it intends to be a living lab inspiring other studies and processes.

In this paper, we present the project's first results, focusing especially on the processes of knowledge exchange, integration and creation occurring in the workshops and beyond. More concretely, we assess if and how learning and doing together bring about an adequate knowledge to act on reforestation and soil health in the city. Put in other words, how can a tiny forest in the university be a living lab for the current socioenvironmental problems we face?

Pro-ecological Worldview as a Predictor of Preparedness of University Student Population in Serbia to Change Their Living Habits

Jasmina Petrović[1], Olivera Marković-Savić[2]

1University of Niš, Faculty of Philosophy, Serbia; 2University of Priština in Kosovska Mitrovica, Faculty of Philosophy, Serbia

Decreased visibility of most ecological risks that societies are facing nowadays may lead to a delayed response towards mitigating the anthropogenic environmental impact, thus endangering the sustainable development of the society and the survival of all living things on Earth. Accordingly, the aim of this study is to determine the degree of adopted ecological worldview and the preparedness of university students in Serbia to change their living habits. Another aim is to determine the frequency of specific ecological practices that help reduce environmental risk. The data were collected through an online survey on a convenience sample of 330 students from different universities in Serbia. The results obtained using the revised NEP (New Ecological Paradigm) scale indicate that the largest share of students in Serbia have a partially developed ecological worldview (69.39% of the respondents). The degree of ecological awareness is a statistically significant predictor of preparedness to change one's living habits. However, regarding the already adopted practices that help reduce ecological risk, there are no significant differences among students with different degrees of ecological awareness. Such data suggest a pressing need to implement higher education programs that will sensitize students to the importance of individual contribution to reducing ecological risk through the adoption of pro-ecological behavioral patterns. To that extent, the obtained results are in agreement with the conclusions of the UNESCO World Conference on Education for Sustainable Development, held in Berlin in May 2021, which insisted on the necessity of curriculum change at all education levels.

Environmental Awareness And Action: Volunteering As A Tool For Sustainability

Iker Jimeno[1,2], Josep Tur-Vives[1,2], José Javier Mañas-Navarro[1], Pablo Aznar-Crespo[1]

1University of Alicante, Spain; 2Lankoa, Spain

The growing concern for the environment has prompted institutions, businesses, and civil society to embrace sustainability criteria in their action plans. Despite environmental advocacy, scientific literature highlights a gap between expressed concerns and actual pro-environmental practices, evidenced by structural and socio-cultural barriers. This study addresses this challenge by proposing applied strategies, focusing on environmental volunteering as a tool to promote awareness and pro-environmental behavior. The environmental volunteering program at the University of Alicante is examined, designed to achieve three goals: increase environmental sensitivity, encourage learning in this field, and promote sustainable lifestyles. Activities encompass interventions in natural spaces, awareness actions, and educational tools aimed at the university community. To assess the impact of these activities on sensitivity and pro-environmental behavior, a survey was conducted among participants in environmental volunteering. The results show a positive impact, suggesting that volunteering has contributed to translating environmental concerns into concrete actions. The integration of these initiatives into action plans of institutions and organizations can be seen as a valid tool to progress towards real sustainability, materializing pro-environmental behaviors in response to growing environmental concerns.

RN12 | T05_01: Empowering Environmental Activists and Organizations

Bringing A Case Together: The Role of Environmental Organizations in The Legal Consciousness of Environmental Movements in Turkey

Ruya Yuksel

Boğaziçi University, Turkiye

In the face of environmental destruction, applying to law is one of the primary strategies in struggling against environmental assaults on living areas. Most of the time, an environmental struggle is accompanied by a legal struggle. In these struggles and/or movements, the actors are composed of local communities, environmental lawyers, and environmental organizations. Together they form a movement and a legal consciousness that goes before and beyond lawsuit processes. Legal consciousness is a concept analyzing lay people's views, perceptions, and approaches regarding the law and rights. This consciousness does not derive solely from "state law" but also from other sources such as social norms, or customs. This paper explores the impact of environmental organizations on the legal consciousness of environmental movements in the context of three place-based rural movements (Akbelen, Avdan, Deştin) in Turkey. I argue that the legal consciousness of these movements is shaped heavily by local communities' approach determined by historical/territorial rights and environmental organizations' approach to commons. By examining the intertwined relations between these actors, I will portray how their consciousnesses come together and form a narrative/discourse, how they are institutionalized and how their engagement with the law facilitates their institutionalism (and vice versa), and how they manage the (social) media relations and communications where they tell their narratives. I suggest that environmental organizations could play a role as intermediaries between local communities, environmental lawyers, and the media.

405

Unpacking a Mega (Industrial) Project in Turkey: Ecological Conflicts and Environmental Movements within the Changing Forms of State-Society/Citizenship Relations

Ibrahim Gundogdu

Zonguldak Bulent Ecevit University, Turkiye

This paper investigates the recent development of a mega (industrial) project on the largest river basin area (Filyos

Valley) in an old mining region of Turkey which leads to a further example of ecological conflicts and environmental movements that have increasingly been on the political agenda of the country since 2010s. The project, including the third biggest port of the country, industrial park, and free economic zone on an area of nearly 3,000 hectares, has been constructed by an exclusive hybrid governance between state and capital within a process of huge land reclamation from the sea and the river. Based on urgent land expropriation, deforestation and large infrastructural operations, this mega industrial project has caused ecological and political conflicts among peasants, local urbanites, the state, and capital, with distinct forms of environmental resistances. Contrary to the critical analyses that separate contemporary environmental movements such as "environmentalism of the poor/ of the rich/ of the malcontent" depending on the sociological compositions and/or political opinions of the comprising individuals, I suggest "working-class environmentalism" as an encompassing concept that is to be built on value theory and class relations in order to understand distinct environmental resistances against the state and capital in unity. Drawing on a field study with the social actors involved in this mega project in Turkey, however, I argue that such environmental resistances also constitute a creative tension over the priorities to follow, thereby requiring an urgent political perspective to align themselves against the changing forms of state-society/citizenship relations in contemporary capitalism.

Challenging Restrictive Governance: Transnational Environmental NGOs in China and Turkey

Ceren Cevik[1,2]

1Max Planck Institute for Study of Societies, Germany;
2University of Duisburg-Essen, Germany

As climate change emerges as one of the most pressing issues facing humanity, the significance of transnational linkages has been increasing. While the current state of the art has produced many insights about civil society organizations, there is still much to discover when it comes to non-governmental organizations (NGOs) in restrictive contexts. There are a lot of discussions on what kind of factors affect the strategies and operations of NGOs, yet we do not know what kind of elements and factors affect the possible interactions between them in contexts in which their operations are heavily monitored and regulated through a variety of authoritarian institutions. Over the years, civil society research has predominantly examined the democratic regimes. However, the escalating presence of authoritarian regimes globally, coupled with the environmental challenges affecting human life, has brought to the forefront the significance of environmental activism within authoritarian contexts. This research proposal suggests that focusing on transnational ENGOs in restrictive contexts can contribute to a better understanding of how domestic institutional structures and regulations develop and change over the years in these contexts and affect the opportunity structures for transnational activism. Bridging the theoretical approaches from the fields of social movement studies,

international relations, and organizational studies, the goal is to offer a comprehensive understanding of state-society relations in China and Turkey, where domestic regulatory structures heavily restrict the operations of tENGOs. The over-arching research question of this project is: how do the tENGOs continue operating in restrictive contexts characterized by oppressive regulations?

Climate Justice through Environmentalist and Worker Coalitions?: Placial Thickness and the Case of Ex-GKN for Future

Eugene Nulman, Daniela Chironi

Scuola Normale Superiore, Italy

Alliances between climate activists and workers at the grassroots level are growing but remain marginal even though they may prove critical for climate change mitigation and a just transition. Our paper looks at a the exemplary case of a coalition between metalworkers who were formerly part of the automotive industry and the Italian branch of the climate justice organization Fridays for Future. We argue that the coalition formed as a part of process of placial thickening where platially thick coalitions are those with high levels of shared values, identity, and ideas or solidarity. Place is typically not accounted for in coalition typologies and, unlike space, place emphasizes shared meaning that can only be arrived at from the participants within the space. Thus, placial thickness can change over time as participants' views change. Through interviews of coalition partners and participant observation of coalition events, we argue for the importance of placially thick coalitions in establishing and deepening climate consciousness and actions across greater numbers of sectors and segments of the population. Furthermore, the case study demonstrates the critical role of solidarity within inter-movement or inter-sector coalitions where shared values, identity, and ideas require development.

406

RN12 | T05_02: Theoretical Frameworks and Knowledge in Environmental Sociology

Social Change Beyond Planetary Boundaries: Why is it Necessary for Environmental Sociology to Maintain an Ongoing Dialogue with Systemic Analysis and the Humanities?

Ernest Garcia

Universitat de València, Spain

Since the first report to the Club of Rome on limits to growth, awareness of the ecological crisis owes much to systemic thinking. From systemic analysis we know that industrial civilization began, towards the middle of the 20th century, an extreme, unsustainable acceleration, a very rapid rise supported by the exponential growth in the consumption of materials and fossil energy. As a result, the limits of the planet have been exceeded. Therefore, the way-down is unavoidable, with a substantial degrowth in the physical magnitudes of the system. Forcing things with more technology and more inequality can only gain a little time. All this constitutes a framework that restricts the possible answers to social and political problems. We ignore, on the other hand, whether some unsuspected technological miracle will temporarily alter the picture. Or what will be the concrete trajectories of the descent. Or if politics will be able to maintain democratic procedures. Or whether revolutions will give rise to significantly new social forms. Or whether cultures will express more solidarity or every man for himself. In all of this, nothing saves us from dismay. To explore all this without oversimplification requires a certain amount of Pascalian esprit de finesse, some capacity for qualitative analysis. Environmental sociology must dialogue with systems analysis and the humanities to establish practicable balances between what we know and what we ignore.

To The Public, With The Public, By The Public. Exploring The Potential Of Public Sociology For A Sustainable World.

Kris Van Koppen

Wageningen University, Netherlands, The

Most of the pleas for a public sociology, such as Burawoy's address at the ASA conference of 2004, promote it as a sociology that explicitly speaks to the public on issues of society, power, and justice. A public environmental sociology, then, should aim at communicating to the public sphere about environmental risks, their societal origins, and their unequal impacts. This is what many environmental sociologists have been doing from the 1970s on. More recently, the concept of doing science with citizens has become increasingly popular, as testified by the rise of citizen science and transdisciplinary research. In the context of sustainable development, we find such initiatives in, e.g., transdisciplinary approaches to nature conservation and citizen monitoring of environmental risks. Building on these approaches, and weighing them against critiques of meritocracy, this paper focuses on a third and more radical interpretation, which does not aim at engaging citizens in practices that are primarily the domain of scientists, but at supporting self-standing ways of sociological thinking among the public. It argues that this is possible and needed. Possible, because sociology, unlike natural sciences, is fundamentally rooted in practices of everyday life. Needed, because public sociological skills are crucial in crafting a democratic and sustainable society. The paper ends with outlining key conditions for this type of public sociology, e.g., in the use of theory concepts.

Environmental Social Coordination: Contributions of Pragmatic Sociology to Environmental-sociological Theory

Anders Blok

University of Copenhagen, Denmark

407

While scholars in French pragmatic sociology have made contributions to environment-society research, this has seldom been articulated at the level of how pragmatic sociology advances debates in environmental-sociological theory. The present paper addresses this lacuna. It starts from the assumption that pragmatic sociology has much to offer in terms of what Kari Norgaard – following C. Wright Mills – has called the sociological imagination in times of climate change. In this language, pragmatic sociology helps make visible relations between private environmental troubles and public environmental issues, via a general yet versatile conceptual architecture of the key modes of engaging in and forging commonality via environmental social coordination. In doing so, it allows for integrating key theoretical debates and associated domains of research in environmental sociology that are otherwise often treated separately, across micro-to-macro scales. Coordination, in pragmatic sociology, is inherently uncertain, leading to an emphasis on the situational yet institutionally embedded activation, justification, critique, testing, or replacement of shared conventions of coordination, from everyday settings of environmental concern to matters of transnational environmental politics. More concretely, the paper outlines three avenues, roughly corresponding to a micro-macro continuum, along which pragmatic sociology fruitfully engages with and stands to advance key environmental-sociological debates: first, questions of everyday environmental engagement (consumption practices, everyday eco-citizenships); second, questions of public environmental discourses (media debates, civil society mobilization); and third, questions of multi-scalar environmental governance (neoliberal stakeholder governance, environmental state accountability). Each strand is illustrated by drawing on the author's and other's existing research.

Toward Inclusive Environmental Sustainabilities: a Theoretical Framework for a Counterhegemonic Research Agenda

Sherilyn MacGregor[1], Tally Katz-Gerro[2], Nafhesa Ali[3], Zarina Ahmad[1], Catherine Walker[4]

1University of Manchester, United Kingdom; 2University of Haifa, Israel; 3Northumbria University, UK; 4Newcastle University, UK

Across the social sciences there is growing recognition of the need for critical analysis of Eurocentrism, as well as concrete efforts to redress its epistemic injustices. Yet much European research on environmental sustainability remains framed by Western assumptions and pays insufficient attention to how socio-cultural differences and structural inequalities shape everyday understandings and practices. The Toward Inclusive Environmental Sustainability (TIES) research project aims to pose fundamental challenges to Eurocentric sustainability research by centering the knowledge of migrants (specifically people who have moved from global south to global north contexts) who inhabit a unique 'translocational position' (Anthias 2021) from which to consider prevailing assumptions in the field. In this paper we draw on our research with Manchester (UK) residents who were born in Pakistan and Somalia to illustrate the value of translocational ('journey-based') knowing – as distinct from indigenous ways of knowing – for responding to the climate crisis. Our analysis of empirical findings informs (and is informed by) a theoretical framework that we argue should guide a new agenda for counterhegemonic and inclusive sustainability scholarship. This framework consist of: i) contextualisation: foregrounding anti-migration and bordering practices in European sustainability politics; ii) symmetry: researching the attitudes and behaviours of dominant social actors alongside the marginalised to avoid othering; iii) intersectionality: analysing multiple, shifting and co-constitutive axes of social inequalities to avoid homogenisation and apolitical framings; and iv) translocational epistemology: attending to how people's sustainability knowledge is shaped by changes in locations (i.e., by moving from one physical place in the world to another; by moving from the social position of native to migrant).

RN12 | T05_03: Hydrogen and Wind Power: Public Sentiment and Socio-Technological Perspectives

Public Perception on Hydrogen: A Polish Case Study on Acceptance and Awareness in Energy Transition

Katarzyna Iwinska[1,2]

1Collegium Civitas, Poland; 2Łukasiewicz-ITECH

Energy transition encompasses the adoption of innovative and advanced technologies, often unfamiliar to the general public. This research is the first in Poland delving into the societal discourse and acceptability of hydrogen (H2) technology. It comprehensively addresses public understanding and attitudes towards H2 alongside an analysis of media narratives shaping these perceptions.

Critical to advancing Poland's low-carbon emission goals and decarbonization agenda is the cultivation of an informed society actively engaged in energy democracy. To this end, the presented research employs a mixed-method approach: (1) survey data (CAWI, N=2008, assess acceptance and opinions regarding H2), (2) regional Focus Group Interviews (FGIs) provide a deeper understanding of energy awareness, (3) Natural Language Processing (NLP) is utilized for discourse analysis in media, mapping prevalent topics and identifying leading communicators.

Preliminary findings indicate a notable lack of knowledge about H2 technologies within Polish society. There exists a pronounced demand for enhanced information dissemination and expert knowledge. The media discourse predominantly features business-oriented experts, highlighting a deficiency in governmental communication strategies related to low-carbon emissions and H2 initiatives.

Based on these results, the study raises further questions concerning energy justice and the democratic inclusion of laypeople in energy transition processes. Methodological and epistemological reflections also emerge regarding the role of sociologists in informing, educating, and increasing societal awareness about new technologies. Furthermore, the research prompts broader ethical deliberations about the engagement of sociological research teams in emerging technologies like Carbon Capture, Utilization, and Storage (CCUS), hydrogen, and Electric Vehicles (EVs).

408

Stakeholders' Perceptions of Hydrogen And Reflections On Energy Transition Governance

Francisca Teixeira[1,2], Cristina Parente[1,2], Jorge Cerdeira[1,2,3]

1Faculdade de Letras da Universidade do Porto; 2Instituto de Sociologia da Universidade do Porto; 3Centro de Economia e Finanças da Universidade do Porto

Few studies address perceptions of hydrogen production. This study aims to fill these gaps using a mixed-method approach, including semi-structured interviews (n=11) and a questionnaire survey (n=73), to understand stakeholders' perceptions of hydrogen production sources through a social construction lens of technology. The results indicate a preference for hydrogen produced from renewable sources over hydrogen produced from non-renewable sources, even when considering higher costs. While prior knowledge of hydrogen, expectations, technological imaginaries, organizational aspects, and subjective stance are relevant aspects for perception's construction, sociodemographic characteristics do not play a significant role in shaping stakeholders' perceptions. The key informants identified hydrogen as a matter that had been overlooked for over a decade, despite its prominent position in the policies and economic approaches of numerous countries. This exclusion of civil society from decision-making suggests that energy democracy, which is based on information dissemination and participation, is not being achieved. Therefore, this study highlights the importance of reflecting on energy governance in hydrogen agendas.

Energizing Tomorrow: Exploring Poland's Socio-Technological Imaginaries in Hydrogen Technologies

Joanna Grudowska[1,2]

1Nicolaus Copernicus University, Poland; 2Łukasiewicz Research Network – ITECH Institute of Technology and Innovation, Poland

Decarbonisation is one of the most important challenges of the 21st century. Hydrogen is identified as a key element of the energy and climate transition, which is the main mechanism for achieving the objectives of the Paris Agreement and the European Green Deal. Effective decarbonisation will require new energy technologies, but also new ways of understanding language, vision and discursive policies related to emerging innovations and transformations.

Sociotechnical imaginaries (STIs) is a concept aimed at understanding the creation of a technological future as a key element of social life. STIs can be defined as collective imaginations, beliefs and social concepts that influence the design, development and implementation of technology. STIs understood as visions of a desirable future are: collectively sustained, institutionally stabilized and realized in the public sphere. STIs allow for the conceptualisation of possible forms of the future in the study of energy transisition.

The study is based on 24 individual in-depth interviews (IDI) with experts representing industry, transport, research and development institutions, public administration, industry associations and institutions. The purpose of the research was to identify 1) STIs at the national level, present in the development of technologies in Poland and their nature, 2) key actants and factors involved in the process of creating and stabilising hydrogen imaginers, 3) actors involved in creating, maintaining and legitimising STIs.

Preliminary research results show that the identified imaginaries related to the development of hydrogen technologies associate to the decarbonisation of the Polish socio-technical system. Moreover, the STI are associated with different visions of development models of polish hydrogen society&economy.

Literature review shows that STIs have been repeatedly used to identify STIs in the context of the energy transition in many countries around the world. STIs was used to explore nuclear power in Poland and its implications for the energy transition, and to identify dominant and alternative STIs relating to the energy transition in Poland. Original contribution of research is to focus on the area of hygrogen economy&society in case of Poland using STI concept.

The author is not yet an ESA member, but will join before the PhD Summer School begins.

409

Beyond NIMBY: Unpacking Public Sentiment on Wind Power in Norway

Olve Krange

Norwegian institute for nature research, Norway

In public discourse, local opposition to wind power (WP) projects is frequently labeled as "Not In My Back Yard" (NIMBY). Characterizing arguments against WP as NIMBY and those advocating for them as NIMBYs not only dismisses the validity of the argument but also suggests a moral devaluation of opposing perspectives. However, research literature on the subject indicates that the phenomenon is more nuanced, viewing NIMBY as primarily a 'proxy' for deeper underlying factors. Acceptance or resistance to WP developments is equally likely to be influenced by factors such as environmental attitudes, identification with the local landscape, past experiences with industrial impacts on nature, and more. Additionally, the extent to which one envisions addressing climate problems within an economic system that requires continuous growth (ecomodernism) or leans towards the notion of necessary negative growth (degrowth) can also shape opinion formation. This paper aims to explore the fundamental dimensions of attitudes towards WP and assess the prevalence of NIMBYism in the Norwegian population. By probing into people's perspectives on wind power development in Norway and additionally in nature near their own residences, we can identify the proportion of the population that can be classified as NIMBYs.

RN12 | T05_04: Innovative Approaches to Sustainable Food Systems

Co-Creating Sustainable Transformations of Food Supply Chains through Cooperative Business Models and Governance and Visioning

Çigdem Adem[1], Işıl Servetoğlu[2], F. Hazal Ince[3], Aylin Topal[4], Zuhre Aksoy[5], Fikret Adaman[6]

1Middle East Technical University, Department of Political Science and Public Administration,Turkiye; 2Middle East Technical University, Department of Political Science and Public Administration; 3Boğaziçi University, Department of Political Science and International Relations, Türkiye; 4Middle East Technical University, Department of Political Science and Public Administration; 5Boğaziçi University, Department of Political Science and International Relations, Türkiye; 6Boğaziçi University, Department of Economics, Türkiye

In 2022, Belmont Forum launched a call for collaborative research action on Sustainable Consumption and Production Systems, and seven projects were selected. One of these projects, the project "Co-Creation of Sustainable Transformations of Food Supply Chains through Cooperative Business Models and Governance", coordinates research on sustainable food supply chains (FSCs) in five hubs with six teams from Turkey, Thailand, Taiwan, Sweden, Germany and the USA. The aim is to assess the current status of FSCs and to develop sustainable structures through cooperative business and governance models. In the Turkish hub the research questions are: (1) How can we contribute to strengthening the governance of consumer cooperatives? (2) How can food policy councils support food cooperatives through democratic governance? The practice partners include consumer and producer cooperatives as well as Izmir and Antalya municipalities and the Istanbul City Council as their supporting entrepreneurial ecosystems. Research assesses the sustainability of the current collaborative model, creates a sustainable vision together with producers and consumers, and develops a strategy for increasing the sustainability of a FSC. In doing so, it will explore how traditional agricultural and ecological knowledge will contribute to sustainability.

For Weber and Wiek (2021), one of the four steps of the research process is transdisciplinary sustainability visioning. In December 2023, we carried out a visioning study with our practice partners, the preliminary results of which will be presented. Visioning was structured around the current situation, the vision and how to get there based on the sustainability criteria of an FSC achieving environmental integrity, socio-cultural wellbeing, economic viability and good governance.

Tracing the Fermentation Revival: an Analysis of Microbial Logics Across Health-Food-Sustainability Crises

Maya Hey

University of Helsinki, Finland

Fermentation transforms foods (like flour to bread, milk to cheese) using microbes such as bacteria and yeast. It is a practice that has shaped human-microbe cultures for millennia in literal and figurative ways, building up niche environments and resilient societies. Within this history, the world has been witnessing a fermentation revival (from around 2003) that originated in the US as part of a food movement. Fastforward and fermentation today leverages microbes to mitigate public health crises as well as climate crises, using food to manifest sustainable futures on a global/planetary scale. By focusing on the revival, the paper aims to better understand new forms of what I call "microbial logic" which arise from that period, and how these logics emerge and shift across health, food, and sustainability discourses—all the way to the contemporary moment.

This paper combines the disciplinary commitments of sociology, cultural studies, and gender studies and uses discourse analysis along with conjunctural analysis as its methodology. It contrasts two microbial logics that pivot around fermentation: (1) health interventions in the form of gut microbiome hacks, and (2) sustainability interventions via biotechnologies like precision fermentation. Curiously, the logics between the two contradict each other. Descriptions of microbes called in to solve our health crisis (as biodiverse, crucial, health-promoting agents) stand at odds with the way microbes are framed to solve our sustainability crisis (as single-function, disposable tools). Microbes are necessary, but also expendable in these discordant framings. The paper analyses the social, political, and environmental implications of such contradictions, and it argues that studying the dis/continuities of microbial logics will be crucial to understanding what (microbial) solutions can mitigate multiple (human) crises.

410

The Perception Of Sustainability Transformation In Food Production

Boldizsár Gergely Megyesi, Bálint Balázs

Environmental Social Sciences Research Group Nonprofit Ltd., Hungary; Institute for Sociology, Centre for Social Sciences, Hungary

The planned paper aims at exploring how agricultural innovations and consumers' understanding of the socioeconomic sustainability of agricultural innovations are related to each other, and understand how these innovation may result transformative change. Our research is based on a series of case-studies conducted in four European countries as a part of the EcoNutri project on agricultural innovations. The analysed agricultural innovations are diverse; we aimed at analysing both conventional and organic practices, green-house and open-air sites and innovations with different role in the supply chain.

The current presentation is based on the in-depth analysis of two Hungarian cases: the first one was conducted in an intensive, technology-driven vegetable production company, which sells its products in supermarkets and export markets. The second case explores the practices of an organic farm using direct sales. The case studies on the innovations aim to explore the motivation of the stakeholders along the value chain to involve in the respective innovation. By exploring their aims and motivations, we can better understand how do the different stakeholders participate in the innovation process? How are their ideas and interests represented there? How do the actors along the value chain perceive technological changes and digitalisation?

Our case study-based research aims to understand the role of consumers' values or value judgments' in their decisions. We also aim at revealing their perception of environmental, social and economic consequences of producing fruit, vegetables, and other foodstuffs. As the case studies also explore bottlenecks and challenges in the societal considerations around pollution of agrifood production in the conclusions we consider how society can adapt to these changes.

Citizens' Expectations about Food Sustainability and Support for Policy Measures

Mari Niva[1], Johanna Mäkelä[1], Laura Salmivaara[1], Mia Silfver[1,2]

1University of Helsinki, Finland; 2University of Eastern Finland, Finland

The transformation to more ecologically sustainable futures requires that the food system as a whole develops into a more climate friendly and environmentally benign direction. Indeed, sustainability of food is prominently on the public agenda and is increasingly taking root in food production and consumption as well. It is evident, however, that practices of production and consumption are persistent and do not easily change towards sustainability without political measures that support such a transformation. Previous research suggests that various kinds of policies based on both regulatory (e.g., restrictions on the sales or marketing of foods of animal origin), economic (e.g., taxes based on climate emissions) and information-based measures (e.g., public campaigns and education) as well as voluntary actions by market and other actors (e.g., product and assortment decisions) are needed to promote the transformation. This study looks into citizens' support for policy measures to advance ecologically sustainable food consumption and their expectations about the future of food consumption and production. The study is based on data from a quantitative survey (to be collected in early 2024) representative of the Finnish population (N appr. 1,000–1,200). We will analyse 1) to what extent citizens support regulatory, economic and information-based measures advancing the ecological sustainability of food consumption, 2) citizens' expectations about the developments in food production and consumption in the coming years (e.g., regarding climate emissions, consumption of animal – and plant-based foods, political measures) as well as 3) socioeconomic and food practice related differences in policy support and future expectations.

RN12 | T06_01: Public Perception and Resilience to Climate Extremes and Environmental Risks

Revitalize to Decrease Resilience? Vulnerability to Meteorological Risks of Polish Towns in the Context of Revitalization Processes.

Adam Choryński, Iwona Pińskwar, Michał Krzyżaniak

Poznan University of Life Sciences, Poland

Extreme weather events pose a serious threat for human health and resources, especially in urban areas. Moreover, extreme weather events are to increase in their intensity and frequency. In Poland several occurrence of heavy rainfall, strong winds and heat waves, bringing losses and even harming people, have been reported in recent years. Regardless, vulnerable urban areas are often undergoing revitalization investments and these are significantly changing the surface, sometimes transforming the function of modernized areas.

411

Aim of the paper is to analyze whether extreme meteorological events and adaptation to climatic hazards are taken into account during the decision-making processes on implementation of the revitalization activities, and what is the role of such investments in changing vulnerability of towns to meteorological phenomena.

The study is conducted as qualitative comparative analysis of eight case studies of Polish towns. These are selected on the basis of availability of proper quality meteorological data, previous experiences with extreme weather events, as well as on the information on realized revitalization processes. An analysis of decision-making processes within institutions involved in local risk management in the context of extreme meteorological events, as well decision-making regarding revitalization activities is conducted. These information are obtained through in-depth interviews with local key stakeholders.

Based on limited analyses so far, one may expect, that in Poland revitalization processes are among the factors that increase urban vulnerability to extreme weather. Nevertheless, it cannot be treated as the only sufficient factor behind the risk associated with meteorological events.

Climate Change and Weather Extremes: Between Fear and Trust

Marian Adolf[1], Nico Stehr[2]

1FHWien der WKW | University of Applied Sciences Vienna, Austria; 2Zeppelin University

This paper examines representations of the environment in historical times through common sense and science with particular reference to climate. Such semantics are emergent phenomena that are mediated by specific social contexts and evolve in response to various social events and natural pressures. The question arises as to what characteristic features are attributed to climate in the past and in contemporary society? It is believed that our understanding of climate is strongly influenced by our experiences of extreme weather events. Extreme events are occasions that paradoxically strengthen confidence in the normality of the climate. The collective awareness of a stable climate is a form of relief for an essentially fragile human existence. Steadiness moderates fear and provides orientation. The way in which society deals with and explains weather extremes thus generally provides an important point of reference for the semantics of a society's representation of the environment. Starting as early as 1889 with Eduard Brueckner's pioneering work on the relation of climate and society, we discuss our topic by turning to some of the classics of sociological theory and putting them in dialogue with contemporary research.

Do Disaster Experiences Impact Public Opinion on Climate Change in European Countries?

Piotr Matczak, Piotr Cichocki, Piotr Jabkowski

Adam Mickiewicz University, Poland

Public opinion is an essential factor for effective climate policy implementation. An unresolved issue is whether ideological or structural factors influence opinion about CC. Some studies claimed the impact. Demski et al. (2017) and Spence et al. (2011) demonstrated that the experience of flooding leads to increased climate change concerns. The survey in Germany showed that experiencing seasonal temperature changes influences personal CC concerns (Pfeifer & Otto, 2023). At the same time, several studies demonstrated no impact of disasters on public opinion (Gärtner and Schoen 2021; Whitmarsh 2008). Thus, no agreement can be found in the literature on whether experiencing extreme climatic/weather conditions impacts peoples' opinions or behavior.

In this study, we assume that individuals exposed to acute or long-term extreme weather events will perceive CC more seriously compared to those exposed to extreme weather events less frequently. Besides, we hypothesized that the experience of extreme climate events weakens the dependence of CC perception on ideological and socio-economic filters. We contribute to the literature by analyzing whether a shift in public opinion due to extreme weather

events exists and how it opens a "window of opportunity" for effectively implementing climate policy.

The study relies on the Eurobarometer survey and Emdat records of natural disaster events. Both databases provide location data (respondent place of residence, disaster occurrence); we apply NUTS1 locations to incorporate within-country diversities of opinions and structural conditions. We focus on "heat waves" and "storms". By using multi-level logistic regression, we investigate the potential impact of disaster exposure on climate-change perceptions in the context of other variables, both individual (left-right orientation, type of dwelling) and country-level characteristics (GDP per capita).

Barcelona Residents' Perceptions of Heatwaves, Air Pollution and Noise: Examining the Link Between Environmental Exposures and Risk Perception from Neighbourhood Stigma Theory

Àlex Boso Gaspar[1], Christian Oltra[1], Boris Álvarez[2], Álvaro Hofflinger[3]

1CIEMAT, Spain; 2Universidad de la Frontera, Chile; 3Arizona State University, USA

412

Environmental stressors pose significant threats to human well-being, especially in urban areas. While extensive research has documented higher exposures in socially vulnerable neighborhoods, limited attention has been given to evaluating residents' perceptions of environmental risks within their own communities. Our study addresses this gap by examining perceptions of residential outdoor environmental quality, integrating objective data on built and social environments with multiple measures of pollution, heatwaves, and noise, alongside an original survey of Barcelona residents. Consistent with scholarly discourse, our results reveal distinct levels of concern among the three environmental risks, with heat stress evoking the highest level of concern. We also identify variations in concern levels across socio-demographic factors, including age, gender, and education. Notably, perceptions of environmental exposures appear to be influenced more by neighborhood socioeconomic position than by respondents' individual ability to perceive the problem. By examining the profiles of those most concerned, we pinpoint individuals with heightened environmental sensitivity. We finally discuss the implications of our findings through the lens of neighborhood stigma theory. Our analysis yields valuable insights into the public perception of environmental stressors in urban settings, underscoring the necessity for tailored interventions to effectively address these concerns.

RN12 | T06_02: Political Preferences and Environmentalism

Exploring the Role of Political Parties' Ideological Cleavage and Environmental Issue Salience in Explaining People's Attitudes Toward Environment across 28 European Countries

Mariusz Baranowski, Piotr Jabkowski

Adam Mickiewicz University, Poznan, Poland

This presentation explores the relationship between political ideology and support for environmental protection in Europe, focusing mainly on the nuanced differences between Western/Northern and Central and Eastern Europe (CEE). While the prevailing notion is that left-wing individuals are more pro-environment (compared to their right-win counterparts), we delve into the universality of this observation, its causes, the role of individuals' ideology and positions of political parties towards environmental issues as predictors of environmental attitudes in European countries.

We worked on data from the European Values Survey (2017) and Chapel Hill Expert Survey (2019) by integrating individual-level information on citizens' environmental and political attitudes with party-level positions on ideology, policy and environmental issues in 28 European countries. We note substantial cross-country variation of individuals' and parties' positions toward the environment, with respondents and parties in Northern and Western Europe paying significantly more attention to environmental sustainability than those in CEE and Southern Europe.

By scrutinizing the theoretical and empirical boundary conditions, we focus on the contextual factors constraining the relationship between political ideology and environmental attitudes, thereby providing a nuanced understanding of the dynamics at play in European regions. The data confirm that the effect of left-right self-placement is lower for individuals supporting parties that limit salience to the environment; at the same time, the left-right respondent's orientation does not predict environmental attitudes well outside Western and Northern Europe. Our study emphasizes that party positions matter, and environmental issue salience is a powerful moderator of an individual's attitudes.

Extreme-right Parties And Climate Change Concern In Europe

José M. Echavarren, Luz González-Soriano, Álvaro Fernández-Díaz

Universidad Pablo Olavide

Conservative positions, typically aligned with more traditionalist conceptions, have been studied as obstacles to the development of environmental awareness. However, pro-environmental discourses can also be found within some currents grouped under the term "ecofascisms" (Forchtner, 2020); where, for example, the protection of the country's natural resources is an argument to limit immigration (Zimmerman, 1995). In principle, one might expect that far-right parties are more inclined towards ecofascist ideology and, therefore, could stimulate environmental awareness among their voters (or sympathisers) and also their concern for the harmful effects of climate change in their respective countries. However, in many cases, these parties have an ultraliberal economic ideology that may be opposed to pro-environmental measures and force them to be skeptical on environmental issues (Dunlap, 1975). We hypothetise the existence of two kinds of extreme-right parties in Europe, one conservative and the other, more linked to ultra-liberal solutions in the economic realm. The first kind of parties would align with ecofascism and enhance climate change concern amongst right-winged individuals, the later would cause the opposite effect. To test our hypotheses, we will use multilevel analysis techniques and utilize data from the International Social Survey Programme Environment IV (2020) and the Manifestos Project to construct second-level variables regarding far-right parties.

The Banal Influence: Nationalism and Climate Change

William Kerr

Liverpool John Moore's University, United Kingdom

Within sociology, there has been growing interest in exploring the connections between nationalism, the nation-state system, and climate change (Conversi, 2020; Conversi and Hau, 2021; Deese, 2019: Ch 2). Alongside this, studies have explored how the surrounding culture shapes people's responses to climate change in their everyday lives. Notably, this can provide a series of narratives that enable the construction of defences to either shut out the reality of climate change as a threat or deflect from it by casting responsibility elsewhere (Norgaard, 2011; Westcott, 2019). However, an important gap in these studies is a consideration of how nationalism, as part of the surrounding culture, influences individuals' responses to the climate crisis, and in particular how it shapes politicians' responses. The purpose of this paper is to address the key question: How does the ideology of nationalism interact with and influence climate change discourse and policy? To look into this, I will examine a selection of political speeches from leaders of the UK Conservative and Labour parties, both of which

413

have made 'patriotism' a key component of their identity, on the subject of climate change, from within the last five years. Using the frame of 'banal nationalism' (Billig, 1997), I will consider how the ideology of nationalism influences decision-making and prioritisation within the policy proposals and rhetoric deployed, exploring the tensions created between the need to mitigate the climate crisis, while fitting this within an acceptable frame of nationalism.

A Climate Skeptic Knows His Place – Exploring Authoritarianism, Right-Wing Populism, and Climate Skeptical Beliefs in Southern Norway

Marthe Elden Wilhelmsen

University of Agder, Norway

Despite an expanding body of scientific evidence, climate skepticism remains a global and growing phenomenon. Moreover, climate skepticism cannot be understood as an isolated occurrence but needs to be analyzed in connection with wider social and political trends such as the rise of right-wing populism and opposition to allegedly "liberal" agendas that include questions of intergenerational justice, gender, and ethnicity. Norway presents a particularly interesting yet paradoxical case. On the one hand, Norway aspires to be a "global climate leader". On the other hand, the extraction of oil and gas continues to serve as the economic backbone of Norway's progressive, liberal agenda. Views of Norway having the "greenest oil" reflects Nordic exceptionalism and aligns with the right-wing populist patterns concerning ethnicity and gender.

Drawing on ethnographic research from 2022 to 2024, this paper investigates how hierarchical and authoritarian worldviews shape attitudes, utilizing theories of whiteness (Gabay 2018) to examine the ontological and epistemological structures forming Norwegian exceptionalism. The study employs walking methods (O'Neill and Roberts 2020) and ego social network analysis (McPherson et al. 2001) to enrich ethnographic data, providing a nuanced understanding of authority and climate skepticism.

My research unveils how identity and culture shape the populist, nationalist, and anti-scientific values underpinning climate skepticism. Who can and should be trusted if experts and those in power are viewed as corrupt? How are these views being justified amongst the climate skeptics? The main findings suggest that climate skepticism functions as an identity marker, expressing group belonging among self-proclaimed ostracized truth seekers. This skepticism is deeply intertwined with right-wing populist mobilization, which fosters masculinist identity politics at the intersection of gender, class, and ethnicity.

Understanding how authoritarian views are connected helps unravel a piece of this complex puzzle of climate skepticism. Ethnographic methods, instrumental in building trust with initially skeptical participants, offer a unique lens into the complex nature of climate skepticism and its intersection with broader social transformations.

RN12 | T06_03: Social Practices and Inequalities in Energy Contexts

Social Practices, Gender And Materiality: Women's Agency In Bioenergy-dependent Households And Communities In Ethiopia

Harald F. Grabher[1], Melanie Pichler[1], Henrike Rau[2]

1University of Natural Resources and Life Sciences (BOKU), Vienna, Austria; 2Ludwig-Maximilians-University (LMU), Munich, Germany

Social practices to provide vital energy services reinforce the high dependence of households in low – and middle-income countries on bioenergy, and aggravate the manifold associated social and environmental challenges. This study explores women's agency in the reproduction of domestic energy-related practices in rural, biomass-dependent households in Ethiopia to shed light on the gendered nature of social practices that shape and reflect local biomass-based energy systems.

Women's everyday lives in the case study region revolve around practises towards providing energy services. For example, women collect wood fuel or dung, produce charcoal and use hearth fires for cooking, hygiene or space heating. Energy-efficient cookstoves are touted solution to a wide array of social challenges, a narrative that side-lines women's agency. Simplistic technological approaches risk entrenching the provision of energy services as a gendered female chore. This interdisciplinary research employs Social Practice Theory and the Stock-Flow-Practice nexus perspective to analyse the interlinkages between agency, practices, meanings and the use of materials in rural Ethiopia using an innovative mixed-methods approach.

Study results reveal women's agency is seriously curtailed by prevalent social practices, but a small option space exists for women to actively reshape their practices. Within households, men take advantage of the energy services and benefits provided by women's work. In the communities, women remain side-lined in the governance of local institutions that could guide energy transitions by channelling agency. However, in households that involve women in decision-making, women steer fuel choices, control energy service generation, and embrace new technologies, suggesting that women exploit their limited agency. Our findings highlight the importance of investigating women's agency that unfolds through their engagement in social practices and institutions impacting rural energy.

414

Off-grid Community and Energy Innovation in Africa: The LoCEL-H2 Project

Amalia Caputo, Rosanna De Rosa, Dario Minervini, Giulia Mariangela Mininni, Ivano Scotti, Anna Maria Zaccaria

University of Naples Federico II, Italy

The difficulty of accessing safe and reliable energy provision is a relevant problem, particularly in the rural areas of the Global South (IEA report, 2023). Stand-alone systems (photovoltaic systems with batteries) and local microgrids seem viable solutions for these off-grid rural communities. At the same time, these innovations occur in a context where introducing these technologies may reinforce social asymmetries.

The European project LoCEL-H2 (Low-cost, Circular, plug-and-play, prosumer Energy system for off-grid Locations, including Hydrogen) fits into this scenario. The research aims to test clean and reliable energy systems for off-grid communities in Pakistan and to implement this solution in two cases in Africa, one in Zambia and one in Ivory Coast. Through the development of photovoltaic systems with batteries together with an innovative hydrogen production system (named battolyser) for kitchen use, the research aims to verify not only the technical-economic sustainability of the system but also its social and cultural implications for promoting benefits for the community as a whole. These points recall issues like inclusion and social control of energy.

In this contribution, we intend to present the approach and methodology of LoCEL-H2 to promote a fair social-energy innovation and to present the very preliminary results of the research based on the first field research in Pakistan to obtain insight into electrified and not-electrified communities with solar microgrids.

Societal Responses to Energy Transition in Spain: Survey Insights on Gender, Generational Divide, and the Influence of Fossil Fuel Dependency

Ángel Alonso Domínguez[1], Manuel Docampo García[2], Xaquín Pérez Sindin[3], Alexia Sanz Hernández[4]

1University of Oviedo, Spain; 2University of A Coruña, Spain; 3University of Warsaw, Poland; 4University of Zaragoza, Spain

This paper explores the sociology of the social tensions arising from the ongoing energy transition, particularly in Spain, where rapid and substantial economic shifts are unfolding. We conduct a survey to a representative sample of the population (1,500). The variables included in the questionnaire deal with sentiments toward the social and economic impact of the energy transition, as well as overall environmental values and attitudes. We have adopted a multi-stage sample design. The population was divided into two clusters: those living in the former coal mining areas (800 respondents) and the rest of the country (800 respondents). Subsequently, we stratified each of the clusters according to age and sex. The data was collected through a CATI (Computer Assisted Telephone Interviews) survey technique. The results confirm that the younger and female population exhibits more positive sentiments toward the energy transition. These differences, however, are less significant or even non-existent in the former mining areas. The results challenge some of the main theories in the field of environmental sociology. We refer, for example, to the concept of addictive economies by William Freudenburg. Compared to other rural regions, areas dependent on fossil fuels have been marked by a cyclical pattern of booms and busts. Freudenburg argues that during boom periods, stakeholders often neglect the negative aspects, the potential for an eventual bust, and the necessity of maintaining diverse economic options. In times of economic downturn, it becomes challenging to conceive alternative developmental paths, and a sense of nostalgia for the prosperous periods prevails. This issue is compounded by the older generation, who benefited from the booms and whose experiences influence the attitudes of younger generations.

Energy Prosumerism In Poor Rural Areas: A Practice-Based Account

415

Dario Minervini, Ivano Scotti

University of Naples "Federico II", Italy

Energy prosumerism is usually claimed as a proactive model for households and communities to self-produce, consume and share energy. Particularly in Europe, it refers to energy communities, where local shareholders' groups (sometimes supported by municipalities) manage and own decentralised green systems for a proximity energy flow. Energy prosumerism is often intertwined with energy poverty because it is supposed to contrast the dynamics of exclusion in the access to secure, clean, and affordable energy. Both prosumerism and energy poverty share a deep normative common understanding about "what should be" a fair and just energy transition. However, these experiences need to be questioned, in terms of the variety of the social practices that are involved.

Based on the first data collected in the Horizon 2020 project (LoCEL-H2), this contribution aims to show how prosumerism and energy poverty are embedded in specific cultural and material contexts, understanding how energy prosumeris is translated in practice, by whom and for what. Adopting a social practice-based approach, provisional findings of fieldwork conducted in three sites in the Punjab Province (Pakistan) are presented. The main line of discussion is that the prosumption model needs to be questioned as proactive and endogenous (since it does not necessarily imply a bottom-up experience) and that the energy poverty condition does not necessarily mean a passive attitude in a "no choice scenario" (since the poor can manage their own poorness).

Social Stratification in Experienced Agency During the Green Transition

Laura Heiskala, Elina Kilpi-Jakonen

University of Turku, Finland

Western societies are shifting towards ecologically sustainable economies. The implementation of these green transition policies will have varying impacts on members of society. Vulnerable individuals, who lack the means and resources to adapt, may experience the greatest impact from large societal upheavals. However, those with more resources may resist change more because they may perceive a potential loss if policies are implemented to curb consumption (Wiedmann et al., 2020). We aim to identify those cultural, social and material factors – either structural or individual – that narrow and limit people's experienced agency during the implementation of the green transition. In particular, we examine how socio-economic resources measured objectively, subjectively and intergenerationally are associated with individuals' views on green transition policies at the individual and societal level and their agency in adapting to these changes.

We employ multivariate analysis methods including linear regression analysis and factor analysis to analyse Finnish data from the International Social Survey Programme 2020 (N=1137), which concentrated on environmental questions, as well as survey data collected in Finland during spring 2024. These data allow an up-to-date assessment on how socioeconomic resources are associated with agency regarding the green transition, with a strong focus on a multifaceted view of socioeconomic resources, including intergenerational trajectories.

We expect more socio-economically advantaged individuals to feel greater agency in protecting the environment than those less advantaged. However, we also expect particularly those individuals who are in intergenerationally high positions to be less willing to reduce their level of living to protect the environment.

RN12 | T06_04: Advancing Sustainability in Agricultural and Fisheries Practices

Small-scale Agriculture in Tunisia and its Challenges: Between Dispossession and Resistance

Costanza Pizzo

Università di Palermo, Italy

This contribution seeks to investigate and assess Tunisian small-scale farmers' agricultural strategies based on local knowledge and social capital. In the context of an agricultural sector and a set of national/international policies which economically and politically marginalises small-scale farmers, coupled with the advancement of climate change risks, the project aims to explore local resistance agricultural strategies. These strategies are envisioned as emblematic of an agrifood system grounded in the principles of food sovereignty, valorisation of local knowledge and local savoir-faire, and which could represent the only sustainable system to deal with the climate and rural migration challenges. The primary case study will be the Oasis system in the South of Tunisia, with a comprehensive assessment of these agricultural systems and strategies from both technical (e.g., use and conservation of local seeds, water conservation, and irrigation techniques) and social capital perspectives (including social roles within rural communities and community and reciprocity strategies).

The theoretical framework underpinning this study draws on diverse interdisciplinary post-colonial perspectives, incorporating insights from Environmental Sociology, Critical Agrarian Studies, and Political Ecology. This approach is adopted to gain a comprehensive understanding of the intricate multilevel dynamics spanning from local to global scales, and to discern the intersectional impacts of these dynamics on small-scale farmers.

As for the research methodology, I intend to engage a qualitative research approach, through semi-structured interviews and participant observation, in order to investigate the dynamics on the ground. This fieldwork is based on pre-existing research experiences on the ground with local farmers, cooperatives, andorganizations. The early findings underscore the resilience of Tunisian small-scale farmers in the face of agricultural challenges, emphasizing the pivotal role of local knowledge in crafting effective resistance strategies within the Oasis system.

This study finds its relevance in the gap in the academic field of research projects in Tunisia that consider the local system as a possible alternative and solution to the aforementioned environmental and migration challenges, and political and economic dynamics.

416

Possibilities for Profound Land-use Change in a Drying Area

Boldizsár Megyesi[1], Alexandra Czeglédi[1], Péter Kajner[2], András Király[2], György Pataki[1]

1Environmental Social Science Research Group, Hungary; 2WWF, Hungary

The Sand Ridge in the Danube-Tisza Interfluve of Hungary grapples with severe water scarcity due to recurrent droughts, significantly affecting agricultural activities and farmers' incomes. The combination of slightly decreasing annual precipitation, increasing temperatures due to climate change, water (mis)management, and agricultural practices compound these challenges. While local and regional actors acknowledge water scarcity issues, they harbour diverse expectations regarding solutions. Some farmers, supported by the local government and associations, have cooperated voluntarily to conserve water and enhance agricultural efficiency. They have initiated landscape restoration using nature-based water retention measures to fulfil biodiversity and climate objectives. However, most farmers and local stakeholders anticipate solutions from external actors. In the MOSAIC (Horizon 2020) research project, we investigate drivers and motivations behind local land use changes. We aim to initiate a science-policy process encouraging farmers and stakeholders to alter their existing practices, such as reducing groundwater over-exploitation, cultivating less water-intensive crops, and employing non-tillage farming techniques. We establish a 'policy lab' to support multi-stakeholder planning and equip the local farmers' coalition with tools to incentivise key stakeholders to implement jointly defined sustainable land use plans. The research, rooted in semi-structured interviews with farmers, local decision-makers, experts, and activists, delves into prevailing circumstances and recognises that farm-level land use decisions impact not only individual farms but also the broader local socio-environmental milieu. Thus, we aim (1) to gain insights into the social and power dynamics of different actors affecting land use changes, (2) determinants shaping decision-making at local and regional levels and (3) to elucidate effective methods for instigating transformative change with diverse local stakeholders possessing distinct interests, power and knowledge regarding their land and agriculture.

Agricultural Digitalisation and Just Transition: a Framework for the Analysis

Marco Fama[1], Alessandra Corrado[2], Maura Benegiamo[3]

1University of Bergamo, Italy; 2University of Calabria, Italy; 3University of Pisa, Italy

Digital agriculture is generally depicted as a new technological frontier allowing both the efficiency and sustainability of the agri-food sector to be increased through the introduction of innovative "green" and cost-effective solutions. However, there is still little empirical evidence on the wider environmental and socio-economic implications of ongoing agricultural digitalisation processes. While the existing literature tends to focus on the potential outcomes of agricultural digitalisation in terms of productivity and market possibilities for farmers, issues related to the broader effects that digitalisation may have on local ecosystems and agrarian structures are often neglected. For instance, there is still much to know about the potential role of digital technologies in reinforcing or contrasting existing power asymmetries and inequalities in agriculture and rural areas, as well as about their impact on the reconfiguration of the relationship between agricultural work and territorial sustainability. The paper makes the point that the digitalisation of agriculture is a political and ecological process representing an important element of the uneven and combined patterns of the capitalist development of agriculture. As such, broader perspectives on political economy and critical agrarian studies are needed to analyse the impact of agricultural digitalisation. At the same time, it is also important to consider that the practices and discourses that inform agricultural digitalisation are strongly shaped by social, economic and environmental factors that may vary enormously across different settings. Starting from these premises, the authors propose a critical framework for equipping empirical research on digital agriculture with a more comprehensive understanding of local contexts, while also retaining a wider political economy perspective inspired by the concept of "just transition".

417

The Morality of Non-compliance in Capture Fisheries: a Quantitative Exploration of IUU Fishing in Croatia

Drazen Cepic[1], Branko Ancic[2], Ivan Puzek[1]

1University of Zadar, Croatia; 2Institute for Social Research in Zagreb, Croatia

While the importance of morality and values for the conservation of natural resources has been well established in the general literature, in the scholarship on capture fisheries the most direct link between the two dimensions is found in studying fishers' non-compliant behaviour. However, up to now, the theme of morality and non-compliance/illegalities in capture fisheries, has been explored primarily through qualitative research. On the other hand, the quantitative research has been mostly limited to the deterrence model of non-compliance, which has largely left out the mechanisms through which normative reasoning translates into justification for non-compliance. In this paper we explore the association of non-compliance with fishers' values, based on the sample of 550 fishers from Croatia. Aiming to unpack moral drivers to non-compliant behavior by looking at various normative statements, we are using the framework of modes of justification (originally drawn from Boltanski and Thévenot's research), which traces how non-compliance can be founded on diverse and competing concepts of fairness. Finally, the level of compliance is analyzed with regard to fishers' environmental attitudes. The sample was collected as part of the project "Sustainable fishing: social relations, identity and co-management of

Adriatic fishery resources", funded by the Croatian Science Foundation, and includes a general population of fishers, including large scale, small scale, and recreational fishers.

RN12 | T06_05: Housing and Environmental Sustainability in Urban Contexts

Health-promoting Housing in Climate Change as an Interplay of Spatial, Environmental and Social Innovations

Nina Berding, Helena Schulte, Förster Agnes

RWTH Aachen, Germany

Structural, natural, and social environmental conditions directly impact everyday life and human health. Further, the living space and living environment in the neighborhood are key determinants of individual well-being as central everyday places for people (BMAS 2021: 530). The significant influence of the spatial interiors is not surprising. In industrialized countries such as Germany, people spend an average of 90% of their time in living and working spaces. Building conditions and social behavior interact with each other. How we behave depends largely on the spaces that surround us. At the same time, behavior determines the space.

A multidimensional perspective with various interacting factors (performance of building components, space efficiency, renewal cycles, everyday living routines, aesthetic requirements, etc.) plays an important role here, making climate adaptation and health an interesting vehicle for housing development. People and their behavior must be considered just as much as the conditions under which they operate.

The interdisciplinary Urban Health Solutions working group at RWTH Aachen University deals with the interdependencies between people, buildings and the living environment with regard to the design of health-promoting conditions and impulses for health-promoting behavior. The presentation will provide insights of initial conceptual ideas for our research approach in relation to the adaptability of man-building-district to the consequences of climate change and put them up for discussion.

418

Green Construction Practices in Portugal

Ana Horta

Institute of Social Sciences, University of Lisbon, Portugal

The environmental sustainability of residential buildings has long been an important concern in international policy agendas. This concern has only grown in recent years due to climate change and natural resource depletion. Indeed, buildings have considerable environmental impacts, such as those related to the materials used in their construction and renovation or the energy and water consumption that

result from their use. Considering the life cycle of buildings, their carbon footprints are significant. The recognition of the need to reduce buildings' energy consumption and CO2 emissions has led to the development of standards defining green construction, as well as policies promoting energy efficiency, decarbonization and the use of solar energy and intelligent technologies in buildings in several regions across the world. However, at a time of high housing costs and housing shortages, how are different social agents relating to these concerns? Considering that some studies have observed an unwillingness of potential buyers to prefer green buildings over regular ones, this presentation analyzes the case of housing currently placed on the market in Portugal. The analysis is focused on the claims and features chosen by real estate agencies to promote houses on websites. In this way, an attempt is made to capture the ideals, values and preferences perceived by advertisers as making a house more attractive to potential customers, in order to influence their choice. Content analysis of housing advertisements is thus used as a basis for discussing and understanding current practices related to the environmental sustainability of buildings.

Investigating the Social Dimension of Sustainable Housing: Problematic Perceptions of Bamboo and Natural Building Materials in Informal Settlements

Bianca Galmarini, Paolo Costa, Leonardo Chiesi

Università di Firenze, Italy

In times of ecological transition, building with natural materials and employing low-tech construction methods become crucial in addressing the global needs for affordable and healthy housing worldwide. Scientific research has highlighted environmental sustainability of bamboo, its low carbon footprint, thermal regulation, and structural resilience. In addition to being one of the most traditionally used materials for housing worldwide, current research focusing on engineered bamboo and bamboo-based composite materials indicates a growing and renewed interest in this natural resource in the building sector. However, people's perceptions on bamboo can interfere with its actual adoption as a housing building material.

Empirical research from Nueva Esperanza, an informal settlement in central Colombia, reveals that despite the long established tradition of the bamboo-based building technique of Bahareque, the inhabitants' relationship with bamboo has changed over time. In-depth interviews and observations reveal that bamboo is perceived by inhabitants with stigma, as a temporary and emergency material, confined to poor and marginalized contexts. This misconception about the durability, resilience, and value of bamboo is perpetuated by the misapplications of bamboo techniques, and is affected by a standardized and globalized ideal of housing that oversees traditional and local knowledge.

This research emphasizes how housing building choices are often based on symbolic rather than functional considerations, and shows how social and cultural dimensions are often neglected in the technocentric approach of sustainability policies. Insights from this study extend to other natural building materials, and reflect on the combined effects of cultural globalization, modernization, and standardized construction practices in marginalizing local building materials and traditional building knowledge.

The impacts of the European Green Capital designation of urban sustainability accounting frameworks: the case of Brescia, Italy

Lavinia Colantoni, Matteo Tarantino, Gaia Amadori

Catholic University of the Sacred Heart, Italy

The study investigates the impact on cities' sustainability assessment frameworks of their candidacy to sustainability related designation such as European Green Capital Award (EGCA). This work focuses on the candidacy of the Italian city of Brescia for the EGCA in 2023. Facing environmental challenges, Brescia's application provides a compelling case study for assessing the impact of the candidacy on the city's environmental impact assessment. Since its establishment in 2006, the EGCA has recognized cities for their substantial contributions to improving quality of life and promoting sustainable development.

Despite the significance of city designations, there is a noticeable gap in scholarly attention regarding how such titles influence cities' performance assessment frameworks and their communication. This exploration at the intersection of environmental communication, accountability reporting and city initiatives provides valuable insights for scholars, policymakers, and practitioners in the field.

The research articulates a methodology to assess such impacts founded on the hypothesis that EGCA candidacy leads cities to advance their sustainability assessment frameworks aligning them with transnational frameworks.

The research methodology combines qualitative and quantitative approaches. The use of participant observation, in-depth unstructured interviews and document review provides a comprehensive qualitative analysis. The quantitative analysis, comparing indicators submitted for the EGCA with existing environmental KPIs, adds a valuable dimension to the research, especially in terms of cities innovation.

This analysis concentrated on the period of heightened engagement by the Municipality, specifically from January to April 2023. During this time, the Municipality submitted seven datasheets addressing different sustainability issues, encompassing the current, past, and future status of the city.

RN12 | T07_01: Emotions, Memories and Reflections on Environmental Change

Loss Of A Healthy Natural Environment: A Study Of Collective Memory.

Marta Aguilar Gil

UNIVERSIDAD DE SEVILLA / FACULTA DE CIENCIAS DE LA EDUCACIÓN, Spain

This research recovers the collective memory of elderly people who recall experiences lived alongside the Tagus River in the city of Toledo (Spain). The study develops an individual and collective narrative story to add to our understanding of the relationship between society and its environment during the years 1950-1970. A qualitative methodology is used through documentary analysis techniques and in-depth interviews. The results obtained from the testimonies reflect the influence that the Tagus River had as a natural heritage on the socialization and emotions of Toledo society. The sociological study carried out is unique, since it is the first in which, through collective memory, a contrast is made between the enjoyments of a natural fluvial environment in good condition compared to its current state of an ecosystem in deterioration.

Places Live with Us – Environmental Trauma of Four Generations

Outi Marja Autti

University of Oulu, Finland

This paper discusses the link between ecosystem and human health along a dammed river, Iijoki, in Finland. My data consists of qualitative interviews of three women, the grandmother, her daughter, and granddaughter, all talking about their environment and its changes. The informants have lived in the same place and have witnessed different phases of the river – a free river, a dammed one with dry riverbeds, and partially restored, heavily regulated river. The dramatic changes in the environment have weakened the informants' place attachment and sense of belonging. In a rapidly changed environment, the informants' place relation has become contradicted, as the landscape no longer mirrors the histories of local communities, nor their activities.

Places live with us and are often only highlighted when something unusual happens. Klaus Eder has argued that maintaining a modern world requires the exploitation of nature, but at the same time it causes anxiety. The need to understand traumatic experiences and their transmission within a framework of social and cultural influences has been recognised. Pioneers in social science trauma research include Jeff Alexander and Ron Eyerman, whose

writings on cultural trauma have been widely used by other disciplines. Trauma research is clearly an emerging research framework, particularly in the environmental social sciences. Recent research on climate change has recognised the importance of exploring the social dimensions of environmental change as well as its social consequences.

My research questions focus on the impacts environmental change may have on place attachment and sense of belonging. Since the three informants in my data have lived in the same place and form a generational chain, I also investigate the transition mechanisms of intergenerational environmental trauma.

Climate Emotions in Videogames: Analyzing The Structure of Feeling of Two Management Ecogames

Carlos Moreno Azqueta

Universidad de Castilla-la Mancha, Spain

The interest on climate emotions is gaining traction in diverse disciplines, from environmental humanities to psychology and sociology. Changes in our natural environment can provoke strong emotional reactions, and sometimes these are part of the affective strategies of the environmentalist movements against global warming. At the same time, the catastrophic effects of the climate crisis are also conveying a sense of pessimism about the future that has been commonly characterized as "climate anxiety", and finds it's counterpart in the rise of post-apocalyptic narratives in popular culture.

Games, at the same time, can be understood as both "environmental texts" with the capacity of simulating complex ecosystems, and affective texts, able to convey emotions. These aspects have been mostly analyzed separately, but the study of the affective relationship of players with ecogames (games in which the natural environment plays a meaningful role) still lacks academic attention.

In this presentation we will analyze the structures of feeling of two management games that deal with the climate crisis in two different ways: Frostpunk, a post-apocalyptic city-builder in which players will confront the danger of authoritarian ecofascism in a fictional Victorian era, and Half Earth Socialism, in which players will try to navigate and solve the ecological crisis after a global ecosocialist revolution places them as world planners. To do that, we will use techniques of game-analysis, interviews and questionnaires to voluntary players, with a sample of university students. The emotions generated by the gameplay will then be compared to those present on the literature about climate emotions, as well as with the affective strategies of environmentalist groups.

420

Taking (...And Not Taking) Ecological Upheaval Into Account In Visions of the Future

Tomas Legon

Institut de la Transition Environnementale / Sorbonne Université, France

Scientific modelling of the interactions between human activities and ecological upheavals indicate that the continuity of current social organizations (and therefore associated lifestyles, particularly in wealthy countries) is the least likely scenario on a 21st century scale (Stoddard et al. 2021; Brulle and Norgaard 2019). How do individuals integrate these report into their imaginations of the future, and the way they project themselves into their own future lives (Suckert 2022)?

Measurement of people's relation to environmental issues (beliefs, attitudes, practices, etc.) has been based mainly on questionnaire surveys, carried out over the past 50 years in a large number of countries. This methodological approach is invaluable for comparing variations in "environmental sensitivity" over time and space. But it also has its limitations: a framing bias that we might call legitimacy bias (Bourdieu 1979), and the fact that it measures representations far from practical contexts.

The first part of the presentation will therefore emphasize the value of an interview method based on ways of imagining the future, in order to capture individual variations in relations to ecological issues.

The second part will detail one of the main findings of the survey: measuring environmental sensitivity by questionnaire can conceal the existence of a strong dissonance between different dispositions to believe (Lahire 1998; Leahy et. al 2010) concerning the future. This dissonance is one mechanism among others that makes the ecological transition of social organizations unthinkable or unfeasible, even though individuals are convinced of its indispensability.

The communication will be based on an interview survey (60 in France, 20 in Argentina) focusing on how people imagine the future and project themselves into their own future

RN12 | T07_02: Air Quality, Health, and Social Inequities

Differential air pollution reduction during and after the COVID-19 pandemic-related lockdown in Helsinki Metropolitan Area, Finland

Ákos Gosztonyi[1], Aleksi Karhula[1,2], Sirkku Juhola[1], Sanna Ala-Mantila[1]

1University of Helsinki, Finland; 2University of Turku, Finland

COVID-19 pandemic-related mitigation measures have positively impacted air quality around the world (Dang & Trinh, 2021). While lockdown measures and reduced economic activity led to a general decline in air pollutants, especially in transportation-heavy metropolitan regions (Venter et al., 2020), disparities in pollution reduction emerged both across socioeconomic and sociogeographical lines (Bluhm et al., 2022; Bonardi et al, 2021). For example, racial and ethnic minority groups experienced disproportionate air pollution reductions, and lower income of neighborhoods was found to be associated with larger air pollution reductions in California, U.S. (Bluhm et al., 2022). Despite strictest measures affecting mobility of residents were introduced in 2020, and most studies focus on data from 2020, the pandemic and its effects, including uneven air pollution reductions extend beyond. Our paper is the first of its kind quantifying air pollution change-related disparities in a metropolitan area utilizing both high-resolution air pollution and socioeconomic data from 2021 as well. Via deploying a generalized difference-in-differences model, we focus on occupation – and income-related socioeconomic gradients' differential air pollution exposure changes. This is of special interest in Helsinki Metropolitan Area, where indications of a non-linear relationship between socioeconomic status and air pollution have been identified (Gosztonyi et al., 2023).

421

Traffic NO2 Exposure and Perinatal Health Outcomes in Madrid: The Role of Socioeconomic Status

Nerea Bello Iglesias

UNED, Spain

Perinatal health, measured here through low birth weight (LBW) and preterm birth (PTB), is a major health determinant closely related to subsequent processes of cumulative (dis)advantage and, therefore, social stratification. This research aims to disentangle the relationship between individual stressors closely related to health at birth, through the measurement of the maternal socioeconomic resources, and the impact of in utero exposure to environmental

pollution, a contextual stressor widely present in large metropolitan areas.

For the Spanish context, Madrid condenses both problematics. It is a city with a strong socio-spatial segregation, where population with lower socioeconomic status (SES) tend to cluster in the southern districts and, in addition, it is a city with high levels of pollution, especially related to traffic. I will use register data from the Childbirth Statistics Bulletin, for the perinatal health and maternal SES variables, and pollution data from The Integrated Air Quality System of the Madrid City Council, focusing on three pollutants: NO2, PM2.5 and PM10.

The objective of this article is to study whether there is a correlation between worse perinatal outcomes and high levels of pollution in Madrid, and whether there is an unequal distribution of these worse outcomes, affecting to a greater extent those geographical areas associated with lower socioeconomic strata in the city of Madrid. Detecting the clustering of stressors (both individual and contextual) that influence health at birth can help to identify socio-spatial segregation and promote policy measures to mitigate this negative impact.

Construction Of Wind Turbines Linked To Reductions In Physical Health-Related Quality Of Life: Empirical Evidence Using Linked Administrative And Panel Data From Germany (2002-2020)

Gundi Knies[1], Jens Jetzkowitz[2], Jascha Wagner[3]

1Thünen-Institute of Rural Studies, Germany; 2Thünen-Institute of Rural Studies, Germany; 3Thünen-Institute of Rural Studies, Germany

The rollout of wind turbines is progressing at high levels – new turbines are erected at suitable locations and dated, smaller systems replaced with more powerful modern systems. Meanwhile, debate continues about the impact of wind turbines on human health and wellbeing. Such impact might occur, some argue, due to noise pollution and infrasound. We combine data from the German Socio-economic Panel (SOEP) with administrative data on more than 30,000 installations in Germany to examine whether there is an impact of wind turbine installations in a radius of 1 to 5 km on health-related quality of life (SF-12). Identification rests on a difference-in-differences design exploiting exact geographical coordinates of households and wind turbines. We find statistically significant negative impacts of wind turbine installations in a radius of 2,5 to 5 km on physical health-related quality of life. Further research using (quasi-)experimental designs is needed to develop societal solutions.

A Citizen Science Approach to Evaluation of the Particulate Matter Exposure on the US – Mexico Border

Dawid Wladyka, Amit Raysoni, Katarzyna Sepielak, Owen Temby, Sai Pinakana, Kasandra Jimenez

The University of Texas Rio Grande Valley, United States of America

Gaining a comprehensive understanding of air quality is pivotal for formulating effective environmental and health policies. In the citizen science pilot project titled B.R.E.A.T.H (Bike & Research: Evaluation of Air for Texans' Health), we collaborated with bicycle users in downtown Brownsville, TX, deploying low-cost air quality sensors developed by open-seneca. This initiative unearthed PM2.5 exposure patterns not detected by the state-run station (TCEQ CAMS) in Brownsville, identifying concerning areas with elevated PM2.5 levels—some reaching classifications of unhealthy, very unhealthy, or hazardous. Particularly troubling were locations near public parks and facilities catering to children and other vulnerable populations. Additionally, we evaluated participants' air quality awareness and the methodology's applicability for future citizen science projects. This multifaceted approach not only deepened scientific insights into local air quality dynamics but also fostered meaningful community engagement.

422

RN12 | T07_03:
Digitalization, Policy, and Narratives in Energy Transitions

Public Involvement in Planning of Possible Small Modular Reactors

Matti Kojo[1], Maare Käis[1], Markku Lehtonen[2]

1LUT University, Finland; 2Univesitat Pompeu Fabra, Spain

In Finland, several cities and power companies have begun to explore the possibility of using small modular reactors (SMRs) for district heat production. The aim is to decarbonise heat production, which is currently heavily dependent on fossil fuels. SMRs are promised to be cheaper, safer and faster to build than conventional, larger nuclear power plants. However, for district heating, they must be built close to the existing district heating network and thus close to often densely populated residential areas. This raises the question of how residents can participate in project planning and decision-making.

Views on the sustainability of nuclear power vary, but in Finland the support for nuclear power is at a record high. The debate on possible SMRs has not thus far generated opposition and critique, either. Hence, conflicts and counter-narratives to the SMR promise, for example in the media, are practically non-existent in Finland.

This paper examines the overall reform of the Finnish Nuclear Energy Act, in particular how the key actors in the sector see public participation. The reform was launched partly in order to streamline the regulatory framework in preparation for the possible introduction of SMRs. In addition to the environmental impact assessment (EIA) procedure and planning, the Nuclear Energy Act sets out the formal framework conditions for citizen involvement. The current pro-nuclear government has set the objective that the new Nuclear Energy Act and its implementing regulations will be reformed by 2026 at the latest.

Democratic And Energy Cultures Of Transformation Of Young People

Jessica Balest, Federico Voltolini

EURAC Research, Italy

Energy plays a crucial role in addressing climate change, as acknowledged by international institutions like COP28 and IPCC 2022, leading to the development of strategies such as the Energy Plan-South Tyrol-2050 (Italy). This plan aims to manage the region sustainably, reducing CO2 emissions and targeting 90% renewable energy consumption. It advocates for actions like optimizing energy efficiency, conservation, renewable energy production, technological innovations, collaborative governance, and cultural changes.

Within this framework, the WAVE project aims to enhance a social and cultural context for optimal energy use in South Tyrol, involving young people in shaping alternative future pathways for a better quality of life and climate.

The WAVE project investigates the extent to which young people are empowered in climate and energy transitions, by actions to reduce inequalities in energy and technology access, amplify societal transformation for deep climate and energy transition (Gantioler et al. 2023), and foster cultures of transformation (Parris et al. 2022). Through education and mutual learning, the project aims to engage young individuals in proactive and resilient approaches to address current and future challenges, cultivating a curiosity for pertinent questions about energy and climate change.

These insights stem from qualitative research, involving 10 focus groups with approximately 200 students and 15 semi-structured interviews with teachers in South Tyrol high schools, Italy. The findings from this case study offer valuable perspectives on cultures of transformation for comprehensive climate and energy transitions, encouraging broader integration between energy cultures (Stephenson et al. 2015) and energy practices (Shove 2021) approaches.

You are Europe. Exploring Policy Narratives of Energy Transition and Digital Technologies for a Sustainable Future

Aleksandra Wagner

Jagiellonian University, Poland

The EU sees itself as a global leader in promoting a sustainable transition to a more democratic, digital and decarbonised world. Various policy documents offer visions that go beyond technical solutions proposing a normative vision of the world of the future.

This presentation aims to provide a more nuanced understanding of the connections between digital technologies and energy transition narratives, moving beyond simplistic representations of AI as either 'helper' or 'enemy' in optimistic or pessimistic views of building a better post-transition world.

The analysis will address key questions such as:

– How are narratives of energy transition and digital technologies framed in EU policy documents? For example, is AI seen as a helpful tool in the transition, or does cloud tech compete with everyday energy needs?

– What are the implications of the different timelines associated with these narratives for socio-technical change?

It will cover strategic documents related to the energy transition (such as the European Green Deal, RePower Europe, the European Climate Law, and the Hydrogen Strategy), as well as those focused on the development of AI and machine learning (such as Artificial Intelligence for Europe, the Coordinated Plan for Artificial Intelligence, the Ethical Guidelines for Trustworthy AI). Using the narrative of change concept, Greimas' analytical framework and the idea of future narratives, the research will explore the envisioned post-transition world in the context of the EU's three

423

pillars for energy transition: decarbonisation, digitalisation and democratisation.This approach aims to uncover contextual arrangements that can shape the future.

The Cost of Convenience: Energy Implications of On-Demand Digital Services

Felippa Ann Amanta

University of Oxford, United Kingdom

More than three-quarters of greenhouse gas emissions can be attributed to household consumption if emissions from upstream production and distribution systems are accounted for. The total emission will change as digitalisation is transforming household consumption behaviour as well as provisioning systems, but the direction and scale of change are yet unknown. One prominent transformation is the rapid rise of on-demand digital services promising fast delivery of various goods and services such as entertainment, food, grocery, retail, and transportation. This research examines the intersection of digitalisation, household consumption, and energy consumption. I use interviews and mini-trials with households in Oxfordshire, United Kingdom to explore how on-demand digital services are changing their experiences, expectations, and behaviours. Household-level insights are then juxtaposed with trends in provisioning systems behind digital services to ascertain the energy implications.

The research finds that the use of on-demand digital services is rife with moral and social tensions arising from a sociotechnical configuration of intra-household dynamics, households' moral economy, socioeconomic factors, social networks, companies' innovation and marketing, and geographical contexts. Despite ongoing tensions, the convenience and speedy delivery provided by on-demand digital services have become normalised and expected. Households reflect that greater use of on-demand digital services increases expectations of immediacy and induces consumption. This consumption pattern is enabled by and simultaneously encourages the intensification of manufacturing and logistics, particularly last-mile delivery, which increases energy consumption. These findings contribute to discussions on the social aspects of demand-side mitigation that are increasingly shaped by digitalisation.

Designing a Robust German Energy System With Regard to Disruptive Events through Stakeholder Involvement

Markus Winkelmann, Martina Haase, Christine Rösch

Karlsruhe Institute of Technology (KIT), Germany

The German energy system is challenged by growing complexities, uncertainties and changes resulting from system external or internal stress phenomena, disasters, shocks, crises or turbulent changes, such as the Energiewende, but also climate change or the Russian war against Ukraine. Interdisciplinary and transdisciplinary research is needed to proactively tackle these challenges and make the energy system not only sustainable, but also robust and resilient.

The Helmholtz Platform for the Design of Robust Energy Systems and Resource Supply (RESUR), developed in collaboration with the Helmholtz Program for Energy System Design (ESD), is dedicated to this purpose.

Besides to technical and socio-economic modelling, interviews with representatives of relevant stakeholder groups for the German energy system are conducted to explore their expectations of a robust energy system. It is necessary to identify and analyze their perceived options for action and needs for support in case of a disruptive event. In addition to generalizable patterns of action against such events, the case study of a 30-day heatwave in the near future is used.

The presentation focuses on first interview results and reflects on ways to combine socio-technical modelling data with the analysis of stakeholder experiences in an interdisciplinary mixed-methods research approach.

424

RN12 | T07_04: Digital Media and Public Engagement in Environmental Campaigns

Pixels for a Purpose: Minecraft, Environmental Campaigns and Activism

Gaia Amadori, Matteo Tarantino, Lavinia Colantoni

Catholic University of the Sacred Heart of Milan, Italy

The communication of urban environmental issues and sustainability is pivotal for city administrators and stakeholders, facing challenges like public apathy, negationism, and disinformation. The emergence of new media necessitates innovative communicative approaches, with video games standing out as a potential tool for promoting awareness, reflection, criticism, and behavioral changes. Previous research on "serious games" has primarily focused on discrete video game software as the main analytical unit, emphasizing educational value and game-based learning for climate change engagement.

This contribution takes a systemic perspective, examining the co-shaping processes between the game software and its assets, the campaign itself, players, commentators (streamers), and the broader controversy it inserts itself into. Acknowledging the multifaceted roles played by video games in sustainability campaigns, the research introduces a multi-dimensional analytical model applied to two top-down environmental campaigns using Minecraft. The first, a 2021 institutional campaign in Venice, promotes sustainable development through green practices. The second, a 2020 corporate campaign, involves grade school pupils building a local power plant in Minecraft to model water uses and envision an environmentally sustainable city.

The research, based on semi-structured interviews with campaign and software developers, explores intersections between urban sustainability issues, the network of actors and stakeholders involved in sustainability communication, and the video game ecosystem, which includes its assets and affordances and the articulation of its community. The analysis reveals trade-offs in the use of video games within sustainability campaigns, carefully navigated by stakeholders to secure funding and reach the target. It emphasizes current limitations in evaluating campaign benefits for the local context, proposing ideas to overcome these limitations and better leverage the potential of video games in addressing such urgent challenges.

Climate Groups' Discourses On Science: (Re)Constructing Scientific Knowledge In Light Of Political Visions

Daniela Ferreira Da Silva[1], Anabela Carvalho[2]

1Institute of Social Sciences (ICS), University of Minho, Portugal; 2Department of Communication Sciences, University of Minho, Portugal

New climate groups, such as Fridays for Future and Extinction Rebellion, have repeatedly pressured governments to take science seriously in political decision-making. Scholars across communication, sociology, and environmental sciences have suggested that science has been 'consecrated' as a guiding force in the discourse of these groups. However, a techno-scientific emphasis may overlook vital values and power dynamics inherent in climate politics, necessitating further investigation in diverse social and political contexts.

This research scrutinizes the discourses of three Portuguese climate groups—Fridays for Future Portugal, Climáximo, and LIDERA—analyzing science-related texts collected from their websites covering January 2018 to July 2022. Drawing on Critical Discourse Analysis and a typification of cited sources, this presentation will examine discursive uses of science and how they are interconnected with the social changes these groups call for.

425

Groups invoke science in three communicative moves: (a) framing science as a strategic ally, (b) transforming climate science into a political and ethical referee and (c) debating and pluralizing science. These climate groups engage in various forms of discursive (re)construction of science, some of which push science away from the dominant symbolic territory of 'universalism' and 'neutrality'. The discussion focuses on how the groups integrate science to (i) discuss social and political contingencies and translate abstract terms (e.g., just transition) into climate politics; and (ii) search for up-to-date scientific information to reproduce an expert-centered understanding of climate change, seeking ´economic development`. In doing so, we suggest that climate groups can simultaneously reinforce and challenge dominant science.

Empowering Energy Transition: Overcoming Communication Barriers Among Audience Segments

Agne Budzyte

Kaunas University of Technology, Lithuania

The global challenge of providing clean, secure, and affordable energy is becoming a critical aspect of everyday life. The increasing global demand for energy necessitates the rapid development of low-carbon energy sources and other technological innovations. Consequently, there are high expectations for various energy transition pathways that not only require political will and business commitment but also aim

to actively involve individuals. This participation among regular consumers might demand meaningful changes in their daily lives, fostering more sustainable solutions, energy conservation practices, and even energy production. Although recent technological innovations in electricity systems already enable the transformation of consumers into prosumers, their potential impact on the energy transition still needs widespread communication to encourage more active engagement. Therefore, this study aims to investigate the attitudes of different audience segments toward their role in the energy transition and identify the main barriers which must be reflected by various stakeholders in communication processes. The main insights gained by implementing the Six Americas Short Survey approach (Chryst et al., 2018) into a representative survey of the Lithuanian public allow for a better understanding of the audience structure in Lithuania and its attitudinal differences regarding climate change and behavioral practices of energy consumption. Measuring the indirect willingness to change energy consumption habits, with or without specific policy incentives, concerns about costs, and other related perceptions among individual consumers, could be important considerations for policymakers to facilitate local energy transition activities and ensure more active public participation in the further stages of it.

Situated Language of Symbols in Citizens-Expert Panels on Climate Change Communication

Veronika Frantova

Charles University, Czech Republic

This paper offers reflections on deliberative Citizen-Expert Panels (CEPs) focused on effective communication on climate change. CEPs were organized in 2023 in three different areas of the Czech Republic. CEPs combined experts' presentations, facilitated Q&A sessions and debates in small groups without the presence of the experts and facilitator and facilitated plenary presentations of participants' decisions. In contrast to the typical use of deliberative methods (e.g. Citizens' Juries), the CEPs were notably applied as an analytical tool that allow to shed light on the dynamics of group negotiations among citizens with different potentials for empowerment (based on gender, age, expertise, or ability to speak in public). The analysis is epistemologically inspired by the concept of "situated knowledges" of Haraway (1988) and methodologically by Clarke's (2017) "situational analysis". It draws on current research in the field of climate communication, with a particular focus on the post-factual emphasis on emotions and the questioning of traditional expertise. The aim is to understand what specific strategies the participants used to achieve consensus. What emotions were associated with particular statements, and how they helped support or refute the „facts"? The main preliminary finding is that what most strongly reinforced consensus among informants with different views or power positions were shared symbols. In particular, they found consensus in

opposing politicians, big firms, and the ill-informing media (although they would disagree on which politicians, firms or media to target) and in supporting increased media coverage of climate and a focus on environmental education in schools.

426

RN12 | T07_05: Environmental Governance and Decision Making

From Climate Facts to Climate Risks. IPCC Experts Ponder on Science for Policy

Rolf Lidskog

Örebro University, Sweden

The IPCC has successfully built its epistemic authority for policy-relevant science, but the question is whether it needs to change its work as the international community and nation states now face the challenge putting agreements and policies into practice. While there have been many proposals on how to develop science for policy and how to further develop global environmental assessments, the scientific experts involved in these assessments have been little studied. This paper analyses the views of the IPCC experts on the type of knowledge needed to guide policy. The empirical material consists of an interview study with experts involved in the IPCC, from its first assessment (1990) to the most recent (2023). The data from the interviews are analysed thematically using NVivo. The analysis shows that there are tensions in the way knowledge, uncertainty, and risk are viewed. It finds a crucial difference between those who focus mainly on knowledge certainties, and those who have a pronounced risk perspective, including societal risks. In conclusion, the paper discusses the implications for the IPCC of using a risk approach in its knowledge assessments.

Reshaping Environmental Governance: Democratic Innovations in Europe

José Ribeiro[2], Roberto Falanga[1]

1Institute of Social Sciences, University of Lisbon;
2Institute of Social Sciences, University of Lisbon

In the wake of the escalating environmental crisis, democratic innovations (DIs) try to contribute to democratic decision-making through citizen participation. In this paper, we aim to explore whether and how Dis can help advance the scholarly debate (and policy practice) of environmental sustainability. Our findings are based on an extensive historical review carried out under the EU-funded project "INCITE-DEM Inclusive Citizenship in a World in Transformation: Co-Designing for Democracy". Here we focus on the 345 peer-reviewed articles, supported by interviews with internationally acknowledged scholars, that delve into the role of Dis for environmental sustainability in Europe. Our findings suggest an emerging connection between processes like deliberative mini-publics and the Sustainable Development Goal 13 (Climate Action), which is most likely based on the role played by climate assemblies in the last few years. Although such assemblies have had some recognition by public bodies, questions remain open about the impact on the policy agenda and, in particular, the political uptake of citizens' recommendations.

Against this backdrop, and by acknowledging the key themes of RN12 Environment & Society, this paper examines the role of DIs in setting out the conditions for policy solutions to emerging environmental challenges, with a focus on Europe. We believe that the transformative nature of DIs can feed new research on citizen participation for environmental policies. Yet, we also alert for risks of over-reliance on initiatives of participation as a panacea for solutions in the environmental field. A critical appraisal of strengths and limitations of DIs in environmental policy is much needed in the scholarly debate, and this paper can hopefully indicates new pathways for future research.

A Network Analysis of Social Barriers in Ecological Restoration

José Javier Mañas-Navarro, Antonio Aledo, Guadalupe Ortiz, Jordi Cortina-Segarra

Universidad de Alicante, Spain

In the field of ecological restoration, the decision-making process unfolds within a complex socio-political context marked by divergent interests. These dynamics frequently pose challenges for effective decision-making and the successful execution of ecological restoration initiatives. The social aspects influencing decision-making in ecological restoration have not undergone thorough scrutiny or systematic interconnected analysis. This research aims to bridge this gap by methodically examining the social barriers that hinder the decision-making processes in ecological restoration. Employing an interpretivism approach, the study utilizes network analysis and mapping techniques to construct a systemic representation of these social barriers. Through the execution of 30 qualitative interviews, 88 social barriers impacting decision-making in ecological restoration were identified. These pivotal factors include the discernible lack of interest from the private sector in ecological restoration initiatives, the significant influence of electoral motivations on political decisions, and systemic inefficiencies within the civil service structure. This study enhances our understanding of the socio-political dimensions intrinsic to ecological restoration and offers valuable insights for surmounting these barriers within the decision-making process. Ultimately, it aims to bolster the governance of ecological restoration efforts.

RN12 | T08_01: Conflicts and Mobilizations for Environmental Justice

Sacrifice Zones: Environmental Harms And Activism In The Land Of Greenhouses.

Thomas Aureliani

University of Milan, Italy

The contemporary world is experiencing a profound ecological crisis in which a complex of inequalities is crystallized, combining environmental inequalities with 'racist', ethnic, gender and class ones. In the Italian context, the transformations of the agricultural sector and capitalist globalization have left a legacy of serious environmental and social consequences. With this premise, this contribution analyses the case of the 'Transformed Strip' ('Fascia Trasformata' in Italian), a vast territory in the province of Ragusa, Sicily, where intensive and protected farming activities (greenhouse cultivation) have replaced traditional seasonal crops since around the 1960s. The massive use of greenhouses has fueled rapid and violent transformations that has produced a complex of structural changes: economically, socially, culturally and in terms of the landscape and environment. Starting from a contextualization of the territory's environmental criticalities, the present work aims to frame – through the conceptual tools of environmental justice studies, green criminology and empirical evidence gathered in the field – the 'Fascia Trasformata' as a 'sacrifice zone', a place where environmental pollution and degradation intersects into inequality, poverty and exploitation and where the physical and mental health and quality of life of human (and non-human) beings are compromised in the name of economic development. In this context, committees and networks of activists have developed as a form of environmental justice mobilization through different repertoire of actions such as demonstrations, 'waste tour', public denounce and awareness-raising. Through participant observation and interviews, a further objective of this contribution is therefore to provide evidence of their concrete actions and their relevance.

"No To Airport Expansion". Mobilizing Capacity Of The Degrowth Framework Based On The Conflict Around The Expansion Of Barcelona Airport

Alejandra Lopez-Martin, Jordi Bonet-Marti

Universitat de Barcelona, Spain

The aim of this presentation is to discuss the capacity of the degrowth discourse to articulate mobilizations against large mobility infrastructures. To accomplish this, we contextualize our analysis of the opposition to the proposed expansion of the Barcelona Airport within the urban political ecology framework, employing the Frame Analysis methodology. Our results show that degrowth, despite being a relevant issue in the debate, fails to articulate a broad mobilization against the economic model. This is because not always the most relevant frames for the organization of the movement are those that achieve greater participation. On the contrary, frames with a greater resonance in the political culture and the popular imaginary achieve a greater capacity for mobilization. On this point, it can be concluded that conservationism and the defense of the territory had a greater capacity to extend and amplify the motivation for collective action. This is why degrowth movements could face similar limitations in future conflicts against the growth paradigm, such as opposition to large mobility infrastructures. Further research about how to transcend frame disputes surrounding the environment-economy dichotomy entrenched in liberal democracies is needed.

Enclosing The Open Landscape – Land Grabbing as Environmental Justice, Insights From Romania

Hestia-Ioana Delibas[1], Irina Velicu[1], Ioana Savin[2]

1Universidade de Coimbra; 2Lucian Blaga University

In the last decade, there has been an increasing focus on the issue of land grabbing in Europe (Franco and Borras, 2013), emerging as a pressing environmental and human rights issue, especially in countries of Eastern Europe, which have become targets for large land acquisitions due to their semi-peripherical position and prominent agrarian population. Although the literature touches upon the many negative impacts land grabbing can have on the environment and the local communities, leading to semi-proletarianization, rural decay, marginalisation of peasants, and soil degradation, there is a lack of approaches to this phenomenon from the point of view of Environmental Justice. By employing an Environmental Justice framework to the study of land grabbing in Romania we aim to uncover how land dispossession disproportionately affects marginalized communities, unveiling patterns of injustice.

428

Using as a case study the land conflict in Hârtibaciu Valley (Central Romania), specifically the concentration of land by Swiss meat producers Karpaten Meat and the civic resistance actions of Peisaj Deschis federation (2023), we will look at the multiple layers of injustices emerging from land conflicts, trying to answer the question of how land grabbing takes place by focusing on the many faces of violence, considering at the same time both direct forms of violence but also structural and more elusive forms of slow violence (Nixon 2011). The study will contribute to the development of an EJ framework in the study of land grabbing, recognizing the dynamics of power in relation to the access to land of human and more-than-human life as a matter of justice.

Social-environmental Implications Of Clay Shrinkage And Swelling: A Sociology Of The Tensions Of Climate Crisis

Sophie Nemoz

University of Bourgogne Franche Comté, France

This communication highlights the social tensions of clay shrinkage and swelling linked to climate change. Since 1989, the damage caused to buildings by the phenomenon has, in France, been the object of the so-called « natural disaster » regime (Cat-Nat). The environmental risk perception has been the focus of much attention since the 1960s, and have been at the heart of discussions concerning policies, behaviors and attitudes. Contrary to other natural hazards, the European sensibilities in face of drought have not been systematically studied. European temperatures are increasing twice as quickly as the world average, with a 0.9°C rise compared with the 1991-2020 reference period. From the multisite field of a research in three countries in Europe, the careful study based on mixed research methods (observations, interviews, questionnaires) examines the plurality of material cultures involved and the exposure to the elements they generate in terms of knowledge and ignorance in dealing with these environmental issues. Ethnography will also detail the use of techniques and what they do to instrumented land. Through this approach via soil and habitat, the analysis aims to better understand how the parties concerned by material and technical systems try to perpetuate trust in their utilization in spite of climate transformation. This presentation consolidates theoretical perspectives that orbit around a critical sociological discussion on the tensions caused by the planetary crisis, examined through the prism of inhabited ground.

Knowledge and Formative Power. On the Transformation of the Social Relations of Nature and Gender on the Example of Climate Activism in Germany

Angelika Poferl, Julia Wustmann

Technical University Dortmund, Germany

The new climate movement marks a notable challenge to existing gender relations, evident in both protest topics and the prominent representation of women among activists and leaders. The intersection of gender and nature relations has historical roots, evident in the gendering of nature ("Mother Nature") and the naturalization of gender roles. This talk explores the ongoing transformations of social nature and gender relations within the current climate movement.

The focus lies on comprehending the specific knowledge concerning gender and nature in the current climate movement and its legitimization. Examining the significance of this knowledge for the emergence of (sub-)political power, insights are drawn from empirical work on Fridays for Future and Extinction Rebellion in Germany. The theoretical framework leans on the concept of structural reflexivity in societal nature and gender relations, whose transformations are interwoven and may propel each other. Reflexive modernization (Beck) is a starting point, supplemented by the concept of cosmopolitics of the social (Poferl). This heuristic framework aims to analyze dynamics such as the inclusion of previously excluded entities, the dissolution of established distinctions, and the re-figuration of social boundaries.

429

An analysis of the "regenerative culture" within the climate movement reveals two aspects renegotiating current nature and gender relations: Firstly, the principle challenges modernity's demarcation of nature and society, proclaiming nature as a societal role model. Secondly, the emphasis on care in regenerative culture contrasts with the prevailing understanding of care solely as 'caring for others,' underscoring the necessity of self-care as an integral part of nature.

RN12 | T08_02: Environmental Behaviours and Antecedents for Lifestyle Change

Sustainability in the Basket: Unravelling Middle-class Perspectives on Sustainable Food Consumption Among Shopping Communities in Hungary

Szabina Kerényi[1], Bernadett Csurgó[2]

1Centre for Social Sciences, Hungary, Centre of Excellence of the Hungarian Academy of Sciences; 2Centre for Social Sciences, Hungary, Centre of Excellence of the Hungarian Academy of Sciences

Using qualitative sociological methods, this paper investigates the emergence of sustainable food consumption communities within shopping initiatives in Hungary. The paper is part of a larger nationwide project researching sustainable patterns of food and energy consumption in the context of social inequalities, analyzing the meanings of sustainability for different social groups. The shopping communities are typically consituted by middle class consumers, where women and families with small children are in the focus. The central question is how community and community activities influence members' attitudes, perceptions and behaviour towards sustainable consumption and climate change.

Shopping communities started mushrooming in the last few years in Hungary, mobilizing different types of communities and services, typically focusing on issues such as health, quality food, sustainability, local consciousness, as well as community values and self-help. This paper is based on participant observation and more than 50 semi-structured interviews with members and organizers of shopping communities in different parts of Hungary. We analyze four different types of shopping communities, ranging from online markets to community-supported agriculture (CSA), and from well-organized, small town communities to loose, extended networks in Budapest. The study sheds light on the multi-faceted attitudes and perspectives of middle-class communities towards short food chains and sustainable food consumption.

The initial findings of the analysis indicate that within the loose networks, health and quality food seem to be more emphatic, while smaller communities facilitate a more complex understanding of sustainability, and play an essential role in sustainable practices in general, as well as knowledge production on sustainable food choices, awareness and behaviour.

Does Environmental Sensitivity of Cyclists and Trail Runners Encourage the Adoption of Eco-friendly Behaviours?

Nicolas Baptiste, Anaïs Degache

Aix-Marseille Université, France

Our communication will focus on the environmental attitudes of trail runners and cyclists in the French Alps. Our research question is : to what extent are practitioners of these sports environmentally sensitive, and how is this environmental sensitivity correlated with 'ecofriendly' behaviours?

Quantitative methodology was employed, relying on two questionnaires. The first pertains to trail running practices and was administered in 11 different running competitions between July 2023 and February 2024 (n = 500). The second focuses on cycling activities and was conducted among cyclists during the summer of 2023 along the route of a cycle route named La Durance à Vélo (n = 345). Both questionnaires were distributed on-site, and in a mountainous region (Hautes-Alpes department, France).

Several studies indicate that practitioners of outdoor activities, especially cycling and trail-running, exhibit positive attitudes towards the environment (Campbell et al., 2021; Mehmood & Zhou, 2023) and this is reflected in more eco-friendly practices (Kil et al., 2014 ; Ribet & Brander, 2020). Unlike Anglo-Saxon literature, French literature demonstrates that environmental sensitivity alone is not sufficient to completely change one's lifestyle (Pautard, 2017; Ginsburger, 2020). Indeed, engaging in cycling or trail-running appears to reveal a social position (Sayagh, 2020), whereas environmental values are linked to high cultural capital (Cafargna et al., 2014).

We hypothesize that both the geographical proximity to outdoor activities and an individual's social position within the social space will influence their environmental sensitivity and the likelihood of engaging in cycling or trail activities. Additionally, we expect that these environmental values do not necessarily translate into 'eco-friendly' behaviours.

430

Experimental Evidence on How Different Frames of the Energy Transition Influence Political Participation and Readiness to Adopt Lifestyle Changes

Felipe G. Santos[1,2], Matthias Hoffmann[2], Dan Mercea[1,2]

1City, University of London, United Kingdom; 2Babeș-Bolyai University, Cluj-Napoca, Romania

Using a vignette experiment embedded in a nationally representative survey of the Romanian population, we test how different ways of framing the energy transition influence

people's readiness to adopt more sustainable lifestyle changes as well as engaging in electoral and non-electoral political participation to advance the adoption of renewable energies. In this experiment, we create six vignettes: one emphasizing the economic benefits of the energy transition, another highlighting the economic loss of failing to adopt renewable energies, and another presenting the energy transition as a trade-off that requires an initial investment of money to obtain future economic savings. Moreover, another three treatments reproduce these three vignettes, adding an emphasis on the importance of political participation to achieve these changes. We test how these six different frames influence Romanians' support of the energy transition as well as their readiness to engage in lifestyle changes, vote and participate in protests to support the adoption of renewable energies. With this paper, we contribute to ongoing debates on the determinants of support for climate justice policies, as well as strategies to foster the transition from fossil fuels to renewable energies.

When the Municipalities Cannot Find the Way Out of A Paper Bag: Informal Street Waste Paper Pickers in Istanbul

Elif Karaduman, Merve Kalkan

İstanbul University, Turkiye

Industrialization, mass production, and the resulting changes in consumption habits have led to the uncontrolled consumption of natural resources and the emergence of waste issues. For the solution of the waste problem, the policies and practices employed by public actors at the municipal level are extremely important. At this point, municipalities are organizing the collection and processing of recyclable waste to reclaim what has been consumed. The correct functioning of the process primarily depends on the conscious separation of waste by individuals. In this sense, municipalities conduct incentive programs to encourage individuals to separate and bring their waste correctly. It is anticipated that the inclusion of the concepts of "circular economy" and "reverse logistics" in incentive programs and the pursuit of an inclusive incentive strategy would make these policies more effective. Yet, even a short touristic journey would let one to observe informal street waste paper pickers wandering around the city. In this study, the concrete results of the concepts of "circular economy" and "reverse logistics" in the field of recycling will be examined through paper and cardboard waste in the context of Zeytinburnu Municipality in Istanbul. Firstly, by relying on the data derived from in-depth interviews with informal street waste paper pickers this study aims to analyze the informal aspects of waste recycling process and tries to point at what is that is missed by municipality policy makers. Additionally, in-depth interviews with other actors enabling the recycling process, such as housaholds, public officials, recycling vehicle operators, waste collection and recovery facility officials will provide a broad understanding of the whole process and possible inclusive strategies for a sustainable city.

RN12 | T08_03: Renewable Energy Communities

Renewable Energy Communities Between Market and Reciprocity Networks. A Critical Analysis from a Comparative Study of Some Italian Cases

Domenica Farinella[1], Monica Musolino[2]

1University of Messina, Italy; 2University of Messina, Italy

Current energy systems have long been undergoing a progressive restructuring, which has recently accelerated through the implementation of EU policies within member states. These processes promote the increasing use of renewable energies by focusing on two pillars: on the one hand, greater economic efficiency linked to market mechanisms; on the other hand, the redefinition of energy systems in a distributed and participatory form, primarily through the implementation of renewable energy communities (RECs). However, empirical research, including our own which we present here, highlighted some problematic aspects in relation to the Italian context: the relationships between RECs and the energy markets; the role of public incentives in shaping the new energy market and the emerging "organizational" fashions; the ambiguity of the concepts of "energy community" and "participation", increasingly mediated by a technological infrastructure and highly individualized. Significant exceptions seem to be the Renewable and Solidarity Energy Communities that enhance the role of the third sector, but also of other local institutional actors (such as local government) who use energy communities as a tool within broader policies of poverty mitigation, urban and social regeneration, making use of gift economy and reciprocity mechanisms. Through a critical perspective, we will explore the differences between these two REC models and the implications for territories.

Methodology. We are carrying out comparative research on emerging energy communities in different Italian areas (Sicily, Sardinia, Campania and Trentino-Alto Adige) based on selected case studies. The methods used to collect data and information are mainly qualitative: semi-structured interviews with the stakeholders of the energy sector and promoters of RECs; socio-ethnographic observation.

431

Our Renewable Energy? Community and Democracy in the Portuguese Transition

Vera Ferreira

University of Lisbon, Institute of Social Sciences

Drawing on a framework informed by energy democracy and community energy literatures, this research explores potential instruments of energy democratization in Portugal, by examining collective and decentralized renewable energy initiatives that self-identify as "renewable energy communities". Following a systematic review of the literature on energy democracy and community energy, an integrated analytical framework to delimit the dimensions and indicators of energy democracy and community energy in Portugal is developed. This situated framework enables the identification of expressions of community energy and instruments of energy democratization in the Portuguese energy transition. In addition, community energy in Portugal is historically contextualized, tracing its trajectory from the beginning of the 20th century to the present day. The first mapping and preliminary characterization of collective and decentralized renewable energy initiatives (collective self-consumption and renewable energy communities) in Portugal is thereby provided. In addition to this overview, this research carries out a detailed analysis of four illustrative case studies – based on document analysis, semi-structured interviews, participant observation and field visits –, in order to assess whether they can be considered expressions of community energy and instruments of energy democratization. It differentiates typologies of community energy, as well as misrepresentations and misappropriations of the concept "renewable energy community". Finally, the possibility of replicating community energy initiatives, the difficulties they face and their overall potential to institutionalize energy democracy in Portugal are assessed.

The Indirect Effect of Institutional Setting on Shaping Technology Diffusion: the Case of Renewable Energy Communities (RECs) in Italy

Alessandro Sciullo[1], Claudio Marciano[2]

1University of Turin, Italy; 2University of Genoa, Italy

Energy transition results from the intertwining of diverse streams of innovation in the technological, social and institutional domains. This paper aims to explore the complex interaction among these three domains by taking RECs as a testbed for this dynamic and aims to show how the socio-technical paradigm might shade a light on the indirect effect of institutional setting on the evolutionary trajectories of technologies.

The ambition is to bridge two traditions of research on innovation. The first is the institutional approach that emphasizes the role that diverse regulation devices (formal norms, practices, networks and market) play in shaping innovation pathways. The second is the Socio-Technical perspective that highlights the mutual shaping of the technological and social components of a system and conceives innovation as a co-evolutionary process. Our hypothesis is that RECs, instead of being just Socio-Technical innovative assemblages affected by regulation, might play as mediator among the domains of RECs regulation and RES technologies deployment. The mediation mechanism relies on REC's incentives scheme that recognizes economic benefits to shared energy. REC promoters must define a social aggregate and identify a technological system able to maximize economic benefits by satisfying its social needs. Case studies from Italy provide first evidences to assess the extent to which diverse strategies at RECs level produce diverse ST assemblages that concretize in diverse technologies adoption,. i.e. the indirect effect of regulation on technological innovation pathways through ST mediation.

432

RN12 | T08_04: Exploring Paths to Sustainable Food Futures

The "Protein Transition". Meat and Meat Alternatives between Sustainability, (De)politicised Consumption and Technologies of the Self.

Martin Winter

Hessische Hochschule für öffentliches Management und Sicherheit, Germany

Meat is facing increasing criticism due to unsustainable production and consumption practices. Three key issues have emerged: ethical concerns regarding the morality of consuming meat, health risks associated with its consumption (such as increased cancer risks and food safety crises), and its significant contribution to greenhouse gas emissions, as highlighted in recent IPCC reports. The background has led many societal actors to advocate for a 'protein transition'. This involves transitioning global protein sources towards sustainability, similar to the proclaimed 'energy transition'.

The study explores how meat and its alternatives are portrayed in the discourse of these actors and the role sustainability plays in shaping this narrative. Using feminist science and technology studies, this study analyses the 'ontological politics' (Annemarie Mol) involved in the creation of meat substitutes. It employs a qualitative research design to examine the discursive practices of vegan/vegetarian NGOs, lobby associations, and marketing strategies for meat and its alternatives. The study reveals a shift. Meat substitutes are marketed towards 'flexitarians' who reduce meat intake without strict abstinence. Therefore, these alternatives are primarily promoted as sources of protein, aligning with nutritional knowledge derived from scientific research. Consequently, meat and its substitutes are considered interchangeable foods and are categorized together as protein sources. Furthermore, protein is associated with strength and a form of traditional masculinity. This raises concerns about the perpetuation of societal power dynamics through strategic discourse practices and whether the promotion of a more sustainable diet is genuinely being considered or if it reinforces the current status quo.

Cultured Meat As "Food For The Future"? Investigating Contentious Science/Public Interfaces In The Anthropocene

Niccolò Bertuzzi[1], Alice Dal Gobbo[2]

1University of Parma; 2University of Trento

Cultured meat is one of the most disruptive – and discussed – food technologies in the making, largely saluted as an effective response to the biggest challenges of animal farming: environmental and health impacts, as well as ethical preoccupations over the (mis)treatment of animals. Although this novel food is slowly being approved and entering the market, several perplexities, questions, and open oppositions are developing across the social and political sphere. The fact that tensions emerge around technoscientific innovation might open up the space for public deliberations around the future of food. Yet, this debate easily becomes polarised between the technoscientific optimistic and straightforward construction of cultured meat as "technofix" – a neutral solution to the challenges of the present – and outright rejection of it by some publics, concerned by the unforeseeable political, occupational, cultural and health implication of this "hybrid". The repertoires and framings of the different actors are often so distant that this might thwart rather than promote productive confrontations across different segments of society. Our presentation draws on ongoing empirical work carried out in Italy in the context of the recent approval of a law that bans cultured meat, involving interviews to scientists and activists engaged in food or environmental justice mobilisations. The aim is to map and analyse this public controversy, looking at the interface between science and publics. Our specific focus regards how different subjects construct this food technology as promoting – or hindering – safe, desirable, sustainable, and just food transitions in the context of ecological crisis and growing food insecurity.

The Alternative Modernity in Permaculture

Karel Němeček

Department of Sociology, Faculty of Social Studies, Masaryk University, Czech Republic

I propose a paper that extends and develops my master's thesis project on relationship between permaculture and modernity. This is my very first ESA Summer School application. I tackle the question of how does permacultural worldview square with ideals of modernity? These ideals – concerning rationality, liberty, equality, progress and prosperity – are based in Peter Wagner's (1994) sociology of modernity.

For Wagner, the history of modernity went through three distinct stages thus far. The arrival of each figuration has been marked by modernizing offensives – seeking to regulate irrational arbitrariness produced by previous figuration, while concurrently pursuing emancipation from these

433

arbitrarities. Each refiguration was framed by narrative of progress. While such narrative has withered in the current stage, there is a debate whether optimistic streaks in environmentalism do not reinvigorate it (Wager 2016).

The results of my thesis research suggest that permacultural literature does. While criticizing modern agriculture, economy and consumerist lifestyles, permacultural texts continue to adhere to modernizing progressive narrative. Their emancipatory promise includes more-than-human umwelt, their regulatory aims promise to tackle inefficiencies of mass agriculture and industry.

I combined exploratory text-mining based quantitative analysis with qualitative content analysis and frame analysis. I worked with 25 books on permaculture. The goal was to identify patterns in worldview and confront them with Wagner's theory of modernity. Afterwards, I analyzed and interpreted how the literature frames its self-legitimizations and critiques contemporary state of affairs. The paper will follow this research, extending the combination of qualitative content and frame analysis on a broader corpus of permacultural texts.

The study aims to cover yet underexplored dimensions of the movement. It proposes a different angle from the more common one seeing permaculture as an alternative lifestyle (Kolářová 2021). Main contribution of my study is in tackling ways in which this optimistic, environmentally-conscious alternative reiterates ideals at the very core of modernity. Therefore, it contributes not only to scholarship on permaculture and similar movements (see Centemeri 2019), but also to the debate about emergence of green critique (Chiapello 2013) or about reinvigoration of progressive ethos (Wagner 2016).

RN12 | T08_05: Urban Green Spaces

Environmental Justice In Urban Planning: An Analysis Of Green And Blue Infrastructure Initiatives In Girona, Spain.

Luz Karime Sánchez Galvis[1], Lucía Alexandra Popartan[1], Àlex Boso Gaspar[2]

1Laboratory of Chemical and Environmental Engineering (LEQUIA), Universitat de Girona, Spain; 2Centro de Investigaciones Energéticas, Medioambientales y Tecnológicas (CIEMAT), Spain

Green and Blue infrastructure (GBI) has gained prominence within sustainability agendas as a comprehensive solution capable of simultaneously addressing environmental, economic, and social challenges in urban areas. Despite its potential, the planning and execution of GBI projects often overlook social considerations, particularly those related to justice. This research aims to further the understanding of integrating Environmental Justice (EJ) into urban GBI planning in middle-sized European cities and is guided by the following research questions: 1) How has the EJ perspective been integrated into the planning and management of urban GBI in mid-sized European cities? 2) What are the main discourses informing GBI projects, and to what extent is EJ considered among them? 3) What tensions exist between different narratives and values shaping these projects. Employing critical discourse analysis (CDA), we delve into the diverse narratives, values, and ideologies shaping GBI initiatives in the city of Girona, Spain. Three dominant discourses emerged: "green capitalism", highlighting the potential of GBI for economic development; "commons" emphasizing social cohesion and democratic decision-making; finally, a "technocratic" approach centered on scientific expertise to address environmental issues. Our findings reveal that justice remains insufficiently recognized among policymakers due to the prevailing influence of green capitalism and technocratic discourses. In contrast, grassroots collectives are integrating EJ principles into the commons discourse, employing them as tools for activism and mechanisms to draw attention to existing environmental injustices in Europe, particularly those related to procedural and recognitional justice. The findings hold significance for the ongoing GBI strategies in Girona and offer insights applicable to similarly positioned middle-sized European cities. Importantly, the research highlights the imperative of integrating an environmental justice perspective to mitigate the exacerbation of environmental inequalities among vulnerable groups, especially within contexts marked by pronounced socio-economic, cultural, and linguistic heterogeneity.

Note: I have not joined an ESA Summer School before.

434

Informal Care For Urban Green Spaces In Czechia – Inconspicuous Practices And Transformative Agency

Anja Decker

Institute of Sociology of the Czech Academy of Sciences, Czech Republic

Informed by the concepts of diverse economies (Gibson-Graham/Dombroski 2020), everyday agency (Jokinen 2015, Selimovic 2019) and quiet sustainability (Smith/Jehlička 2013) and inspired by the empirical heterogeneity of alternative agri-food practices in Central and Eastern Europe, my contribution explores everyday configurations of informal care for urban green spaces in Czechia. I draw from ethnographic encounters with urban dwellers who practically engage with green sites in the surroundings of their homes, such as public parks, backyards or green stripes along roads. What links my interlocutors and makes their example important for debates on social change and environmental governance is their pragmatic, hands-on approach to the (green) space that surrounds them and their low level of collective organization. Whereas their actions arguably have rather significant material effects that contribute to creating, preserving and transforming urban green spaces, they present them as unspectacular, self-evident and matters-of-course practices, which are not primarily driven by ecological motivations. They also do not consider themselves part of an initiative or a social movement. I argue for the importance of inconspicuous practices of care and their effects on social and environmental sustainability in urban environments. I further highlight that the call for taking seriously the transformative agency enacted through mundane practices must go along with an extended concept of political participation in CEE and beyond.

The study is part of the project "Inconspicuous innovations and resilience in the urban context" (lead: Slavomíra Ferenčuhová) that explores the transformative yet largely overlooked potential of mundane practices in contemporary urban environments.

Assessment Community Spaces: Terraces As An Example Of Social And Environmental Sustainability In The Ciutat Vella District Of Barcelona

Montserrat Simó-Solsona, Ana Belén Cano-Hila, Karla Berrens, Marc Pradel-Miquel, Joel Oliveras-Lorente

Department of Sociology, University of Barcelona, Spain

The challenge of adapting built spaces to the changing needs of people at different vital moments is essential to achieve environmental sustainability and promote active ageing of older people. In this context, community terraces can be an asset to be considered in high-density urban contexts. This paper presents the main results from the "Revitalising terraces" research project at Ciutat Vella's district of Barcelona. The project aims to improve rooftops' external spaces, from an ecologically perspective and healthy ageing vision, through the development of low-cost, removable and recyclable solutions for the recovery of existing terraces. Based on a socio-demographic profile's description and the district's equipment's, and on in-depth interviews and focus groups with residents, needs and opportunities of the residents' community are detected. They are used to co-design and construct a prototype to incentivise urban social sustainability. After six months, some of the findings are: 1) the rediscovery of the terrace as a community space after COVID; 2) concerning related to use, access, coexistence, cleanliness and maintenance of this space. Although the space has a lot of potential, the lack of respect for basic rules generates conflicts and encourages further gentrification of the neighbourhood. Finally, 3) the potential for higher quality of life and environmental quality of this space differs according to tourist pressure and the cohesion of the neighbourhood community itself. In more touristic areas and/or communities with low relational density, the neighbourhood is very reluctant to create spaces for community use and prefers to miss out on these positive impacts for fear of further coexistence conflicts.

Potentials and Risks of Urban Community Gardens in Turkey: Case Studies from Ankara, İzmir and İstanbul

435

Işıl Servetoğlu[1], Cigdem Adem[1], F. Hazal İnce[2], Aylin Topal[1], Zuhre Aksoy[2], Fikret Adaman[3]

1Middle East Technical University, Department of Political Science and Public Administration,Turkiye; 2Boğaziçi University, Department of Political Science and International Relations, Turkiye; 3Boğaziçi University, Department of Economics, Turkiye

Community gardens have historically been seen as spaces of alternative food networks, social resistance, inclusion, and emancipation for marginalized groups. Corollary, there is a recent growing interest in urban community gardens both in academic writing as well as in practice. Yet, recent studies also reveal that urban community gardens carry the risk of reinforcing the mechanisms of exclusion and neoliberal governmentality by shifting the responsibilities of food provisioning from the state to individuals and communities. In other words, community gardens include different governance schemes and re-generate state-market-civil society relations. Hence, it does not seem possible to address community garden experiences in a monolithic manner, even within a single country. Based on this, this study will explore the emancipatory and alternative building potentials and risks of the urban community garden experiences in Turkey with their uniqueness. The study was designed in the scope of the CO-SFSC: Co-Creating Sustainable Transformations of Food Supply Chains through Cooperative Business Models and Governance project that is a part of the Belmont Forum Collaborative Research Action Systems of Sustainable Consumption and Production. It aims to answer the question

as to what extent community gardens offer alternatives to existing food supply chains and exclusion relations. In this context, rather than making a collective observation, it will examine what types of community garden experiences are alternative and inclusionary, and what types of experiences are reinforcing, reproducing and exclusionary through the experiences of urban gardens in three major cities in Turkey (Ankara, Istanbul, Izmir). The study will drive upon a field study based on in-depth semi-structured interviews with focus groups and participant observation methods.

RN12 | T09_01: Advancing Environmental Awareness through Diverse Educational Models

Environmental Education in Challenging Times: Practices and Priorities in Portuguese Speaking-Nations

Joao Guerra, Luísa Schmidt, Leonor Prata

University of Lisbon, Institute of Social Sciences – Portugal

Since the Community of Portuguese-Speaking Nations (CPLP) was created in 1996, environmental education (EE) has gained recognition for enhancing multilateral cooperation on environmental protection and sustainability promotion in a post(de)colonial context, rooted and purposeful in their shared language. Conducted online in 2020, the second Environmental Education Survey of CPLP followed a snowball methodology to get answers across all member states. It explored the conditions and approaches of EE within the overall setting of the 2030 UN Agenda, taking the concepts of Canaparo's geo-epistemology – resulting from politically and economically peripheral territories, whose historical legacy, although fractious in specific domains, can lead to a common identity from colonial times to the present –, and Öhman and Östman's selective traditions – primarily educational but also shaped by particular sociocultural considerations – as the underlying framework of analysis. The survey received 196 valid responses from EE Experts and Promoters who hold positions in various institutional backgrounds. Addressing the current state of EE in all nine countries, a picture emerges of significant and ecologically prudent human intervention based on fact-based, normative, and pluralist EE approaches. Overall, findings point to a vibrant activity relevant to sustainable transformation that focuses on young people's empowerment and mobilisation.

Ecomuseums in the Mediterranean Area and the Promotion of Biodiversity

Giulia Mura, Nunzia Borrelli, Lisa Nadia Pigozzi

University of Milan-Bicocca, Italy

The current biodiversity crisis necessitates systemic interventions to instigate a paradigm shift in societal norms, lifestyles, and regulations. The active involvement of public opinion and policymakers is crucial, emphasizing the need

436

for a closer, systemic relationship between science and society.

The National Biodiversity Future Centre focuses on monitoring, conserving, restoring, and enhancing Mediterranean biodiversity through a network of institutions.

Among the actions developed, some aim to widen the audience of citizens interested in biodiversity and integrate science-based and local ecological knowledge.

The center promotes integration and networking with museums and ecomuseums, actors that play a central role in in situ and ex situ conservation and the activation of decentralized cooperation with local populations.

In this framkework, the survey "Ecomuseum and biodiversity" aimed at understading their initiatives in the field of sustainable development and ecological transition.

A sample of 93 institutions from 11 mediterranean countries answered a questionnaire collecting information on various topics, including specific activities dedicated to promoting biodiversity and interactions with the tourism sector.

The sample is mostly composed of small institutions, of various nature, in most cases relying on the work of volunteers. Workers and volunteers tend to have humanitarian backgrounds, and biodiversity is a topic relevant for about half of the sample. Tourists represent an important resource for these institutions, but their network of relations on the local territory is wide and variegate.

The study's findings contribute to disseminating NBFC's knowledge and understanding participative actions in Mediterranean countries, enhancing our grasp of collaborative efforts in biodiversity conservation.

Public Science and Education for Sustainability in Museums and Libraries

Inês Vieira

CeiED, Lusófona University, Portugal

The field of socio-educational action for sustainability, in affirmation and growth over the last decades, has been the scene of interventions from civil society and environmental movements, generating institutional affirmation and political intervention, as well as educational proposals in schools and in non-formal educational contexts, including in collective and public facilities for cultural purposes, such as libraries and museums. One of the driving factors behind education for sustainability is related to public science (very associated with this type of collective equipment), the dissemination and popularization of science, directing communication to non-academic audiences. Among the priority audiences of public science for sustainability we can identify teachers, a professional class that needs to update their knowledge for an informed educational intervention that promotes the Sustainable Development Goals. International recommendations and national policies for museums and libraries have followed the reflexivity specific to each field, framing the action of these equipment with different principles, including sustainability. In this context,

the project 'Public science and educational pathways for sustainability in museums and libraries in Lisbon and São Paulo' (MUBIESUS) encompasses multi-situated participatory research, addressing education for sustainability at the intersection of critical pedagogy (Darder et al.,2018) with critical environmental justice (Pellow,2018). The first results of this project will be presented, regarding public science practices and recommendations for sustainability in museums and libraries, in dialogue with in-service teachers, seeking to understand their expectations of training for sustainability and its potential offer in this type of public equipment.

Environmental Education and Participatory Sustainable Governance: The Case of the Eco-Schools Programme in Portugal

Leonor Prata

University of Lisbon, Portugal

Despite the long-standing recognition of the critical role of education and citizen participation for Sustainable Development as well as for Climate Change mitigation and adaptation, challenges remain beyond curricular integration, as whole-school and community-wide learning and action remain elusive.

The Eco-Schools Programme, established by the International Foundation of Environmental Education (FEEE), was designed to embody such an approach, aiming to promote the principles of Local Agenda 21 in educational communities. Its methodology integrates Environmental Education for Sustainable Development (EE/ESD) pedagogy with intergenerational participatory governance — an approach which is to be localized by FEEE partner organizations, who coordinate the Eco-Schools Programme at a national level.

Present in Portugal in 1996, the Eco-Schools Programme is coordinated nationally by the Blue Flag Association for the Environment and Education (ABAAE), an Environmental Non-Governmental Organization (ENGO). In collaboration with a diverse array of portuguese educational communities, it currently encompasses over two thousand Eco-Schools.

Educators and schools face multiple challenges in implementing transformative approaches to EE/ESD, due to factors such as instability of national policies, the access to resources in initial and continuous teacher training, institutional and labor conditions, as well as meeting the specific requirements of this programme.

Drawing on a doctoral study based with a mixed methodology that comprised of documental, statistical and ethnographic analysis, this paper will present findings that characterize this portuguese network of sustainable schools, as well as ABAAE's approach to the challenges that teachers and schools face in Portugal.

Red Herrings? Reflections On The Promises Of Stories And Storytelling For Oceanic Flourishing

Lydia Dimphena Martens

Keele University, United Kingdom

A central aim of my Leverhulme Major Research Fellowship – Storying Worlds Beyond Fish: Kinship and Connection in the Scottish Minch – is to understand the practices, purposes and value of marine-related stories and storytelling, to deliberate on the potential of storytelling for transforming understandings of marine environments and facilitating marine flourishing. Academic worlds are currently reverberating with a consensus that stories and storytelling are promising tools for shifting environmental values (see recent reviews by Cameron (2012) and Harris (2021)). This consensus transcends disciplinary boundaries whilst simultaneously signalling novel and surprising interdisciplinary scholarly alliances. In the criticisms levelled against science knowledges and in these alliances, the potential of stories is rooted in different purposes. I introduce these purposes and explore what following them means for narrating stories about herring. Clupea Harengus used to be an abundant fish in the Scottish Minch and the North Atlantic, providing nourishment for human and more-than-human populations for centuries before the sophistication of technologically advanced fisheries practices and the inability to reach international agreement on fishing quotas caused overfishing and the near extinction of herring across the North Atlantic in the 1970s. Since that time, herring has not been fished in the Scottish Minch. There are recent signs that the fish may be making some kind of recovery, but what does this mean and why is it important?

Brown Bears as Actors in Biodiversity Conservation Policy: On the Role of Non-Human Agency in Evolving Conservation Institutions

Juha Kotilainen

University of Eastern Finland, Finland
