A Chemical Plant Model in Omola

Abstract

This report is a documentation of a chemical plant modeled in Omola and simulated in OmSim. The plant model is discussed in "Object-Oriented Modeling of Chemical Processes" by Nilsson, 1993. The plant is composed of one pretreatment section, one tank reactor and one distillation unit. The process is controlled by nine PID controllers and four sequential controllers. It also contain Omola libraries for PID controllers and Grafcet primitives.

Introduction

This report is a documentation of a chemical plant model in Omola presented in Chapter 9 in [Nilsson, 1993]. The plant is modeled in the object-oriented modeling language, Omola, and simulated in the Omola simulation environment, OmSim. The plant is composed of one pretreatment section, one tank reactor and one distillation column unit. The plant is controlled by nine PID controllers and four sequential controllers.

The browser in Figure 1 shows all the libraries, 19 in all, and the libraries contain over 200 global Omola classes. The libraries are all printed on the following pages, page 2 to 70, in the order they are loaded into OmSim. The first two libraries, in the bottom in the library list, are predefined OmSim libraries.

An Omola description is found in [Andersson, 1993].
